## Overview

The OS Awareness for PrKERNEL contains special extensions to the TRACE32 Debugger. This manual describes the additional features, such as additional commands and statistic evaluations.

# Brief Overview of Documents for New Users

---

## Architecture-independent information:

- [“Training Basic Debugging”](#) (training\_debugger.pdf): Get familiar with the basic features of a TRACE32 debugger.
- [“T32Start”](#) (app\_t32start.pdf): T32Start assists you in starting TRACE32 PowerView instances for different configurations of the debugger. T32Start is only available for Windows.
- [“General Commands”](#) (general\_ref\_<x>.pdf): Alphabetic list of debug commands.

## Architecture-specific information:

- [“Processor Architecture Manuals”](#): These manuals describe commands that are specific for the processor architecture supported by your Debug Cable. To access the manual for your processor architecture, proceed as follows:
  - Choose **Help** menu > **Processor Architecture Manual**.
- [“OS Awareness Manuals”](#) (rtos\_<os>.pdf): TRACE32 PowerView can be extended for operating system-aware debugging. The appropriate OS Awareness manual informs you how to enable the OS-aware debugging.

## Supported Versions

---

Currently PrKERNEL is supported for the following versions:

- PrKERNELv4 ver2.1 for ARM and NiosII.
- PrKERNELv4 ver3.1 for ARM/Cortex

# Configuration

---

The **TASK.CONFIG** command loads an extension definition file called “prkernel.t32” (directory “`~/demo/<arch>/kernel/prkernel/<ver>`”). It contains all necessary extensions.

Automatic configuration tries to locate the PrKERNEL internals automatically. For this purpose all symbol tables must be loaded and accessible at any time the OS Awareness is used.

If you want to display the OS objects “On The Fly” while the target is running, you need to have access to memory while the target is running. In case of ICD, you have to enable **SYStem.MemAccess** or **SYStem.CpuAccess** (CPU dependent).

For system resource display, you can do an automatic configuration of the OS Awareness. For this purpose it is necessary that all system internal symbols are loaded and accessible at any time, the OS Awareness is used. Each of the **TASK.CONFIG** arguments can be substituted by '0', which means that this argument will be searched and configured automatically. For a fully automatic configuration omit all arguments:

Format:	<b>TASK.CONFIG prkernel</b>
---------	-----------------------------

See also the example “`~/demo/<arch>/kernel/prkernel/<ver>/prkernel.cmm`”.

To get a quick access to the features of the OS Awareness for PrKERNEL with your application, follow the following roadmap:

1. Start the TRACE32 Debugger.
2. Load your application as normal.
3. Execute the command  
TASK.CONFIG ~~/demo/<arch>/kernel/prkernel/<ver>/prkernel.t32"  
(See "[Configuration](#)").
4. Execute the command  
MENU.ReProgram ~~/demo/<arch>/kernel/prkernel/<ver>/prkernel.men  
(See "[PrKERNEL Specific Menu](#)").
5. Start your application.

Now you can access the PrKERNEL extensions through the menu.

In case of any problems, please carefully read the previous Configuration chapter.

## Hooks & Internals in PrKERNEL

---

No hooks are used in the kernel.

For retrieving the kernel data structures, the OS Awareness uses the global kernel symbols and structure definitions. Ensure that access to those structures is possible every time when features of the OS Awareness are used. The PrKERNEL kernel must be compiled with debug information.

# Features

---

The OS Awareness for PrKERNEL supports the following features.

## Display of Kernel Resources

---

The extension defines new commands to display various kernel resources. Information on the following PrKERNEL components can be displayed:

<b>TASK.ALarM</b>	Alarm handlers
<b>TASK.CYClic</b>	Cyclic handlers
<b>TASK.DaTaQueue</b>	Data queues
<b>TASK.FLaG</b>	Event flags
<b>TASK.MailBoX</b>	Mailboxes
<b>TASK.MemPoolF</b>	Fixed sized memory pools
<b>TASK.MemPoolL</b>	Variable sized memory pools
<b>TASK.MuTeX</b>	Mutexes
<b>TASK.MsgBuFfer</b>	Message buffers
<b>TASK.PORe</b>	Ports
<b>TASK.SEMaphore</b>	Semaphores
<b>TASK.TaSK</b>	Tasks

For a description of the commands, refer to chapter “[PrKERNEL Commands](#)”.

If your hardware allows memory access while the target is running, these resources can be displayed “On The Fly”, i.e. while the application is running, without any intrusion to the application.

Without this capability, the information will only be displayed if the target application is stopped.

## Task Stack Coverage

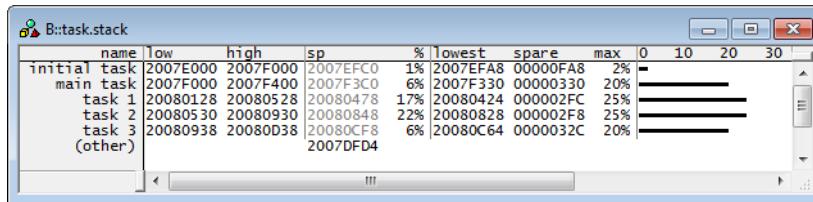

---

For stack usage coverage of tasks, you can use the **TASK.STack** command. Without any parameter, this command will open a window displaying with all active tasks. If you specify only a task magic number as parameter, the stack area of this task will be automatically calculated.

To use the calculation of the maximum stack usage, a stack pattern must be defined with the command **TASK.STack.PATtern** (default value is zero).

To add/remove one task to/from the task stack coverage, you can either call the **TASK.STack.ADD** or **TASK.STack.ReMove** commands with the task magic number as the parameter, or omit the parameter and select the task from the **TASK.STack.\*** window.

It is recommended to display only the tasks you are interested in because the evaluation of the used stack space is very time consuming and slows down the debugger display.

## Task-Related Breakpoints

Any breakpoint set in the debugger can be restricted to fire only if a specific task hits that breakpoint. This is especially useful when debugging code which is shared between several tasks. To set a task-related breakpoint, use the command:

**Break.Set <address>|<range> [/<option>] /TASK <task>** Set task-related breakpoint.

- Use a magic number, task ID, or task name for <task>. For information about the parameters, see “[What to know about the Task Parameters](#)” (general\_ref\_t.pdf).
- For a general description of the **Break.Set** command, please see its documentation.

By default, the task-related breakpoint will be implemented by a conditional breakpoint inside the debugger. This means that the target will *always* halt at that breakpoint, but the debugger immediately resumes execution if the current running task is not equal to the specified task.

**NOTE:** Task-related breakpoints impact the real-time behavior of the application.

On some architectures, however, it is possible to set a task-related breakpoint with *on-chip* debug logic that is less intrusive. To do this, include the option **/Onchip** in the **Break.Set** command. The debugger then uses the on-chip resources to reduce the number of breaks to the minimum by pre-filtering the tasks.

For example, on ARM architectures: *If* the RTOS serves the Context ID register at task switches, and *if* the debug logic provides the Context ID comparison, you may use Context ID register for less intrusive task-related breakpoints:

<b>Break.CONFIG.UseContextID ON</b>	Enables the comparison to the whole Context ID register.
<b>Break.CONFIG.MatchASID ON</b>	Enables the comparison to the ASID part only.
<b>TASK.List.tasks</b>	If <b>TASK.List.tasks</b> provides a trace ID ( <b>traceid</b> column), the debugger will use this ID for comparison. Without the trace ID, it uses the magic number ( <b>magic</b> column) for comparison.

When single stepping, the debugger halts at the next instruction, regardless of which task hits this breakpoint. When debugging shared code, stepping over an OS function may cause a task switch and coming back to the same place - but with a different task. If you want to restrict debugging to the current task,

you can set up the debugger with **SETUP.StepWithinTask ON** to use task-related breakpoints for single stepping. In this case, single stepping will always stay within the current task. Other tasks using the same code will not be halted on these breakpoints.

If you want to halt program execution as soon as a specific task is scheduled to run by the OS, you can use the **Break.SetTask** command.

## Task Context Display

You can switch the whole viewing context to a task that is currently not being executed. This means that all register and stack-related information displayed, e.g. in **Register**, **Data.List**, **Frame** etc. windows, will refer to this task. Be aware that this is only for displaying information. When you continue debugging the application (**Step** or **Go**), the debugger will switch back to the current context.

To display a specific task context, use the command:

**Frame.TASK** [<task>]      Display task context.

- Use a magic number, task ID, or task name for <task>. For information about the parameters, see [“What to know about the Task Parameters”](#) (general\_ref\_t.pdf).
- To switch back to the current context, omit all parameters.

To display the call stack of a specific task, use the following command:

**Frame /Task** <task>      Display call stack of a task.

If you'd like to see the application code where the task was preempted, then take these steps:

1. Open the **Frame /Caller /Task** <task> window.
2. Double-click the line showing the OS service call.

**NOTE:**

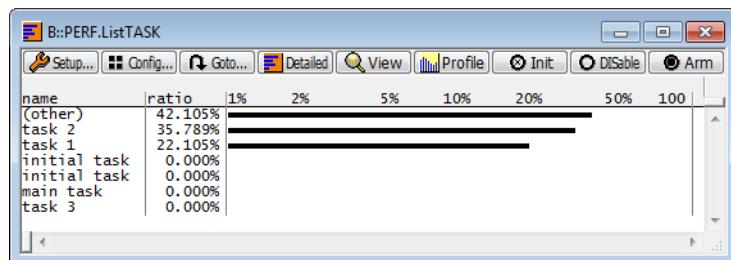

This feature is only available on some configurations. Contact Lauterbach if you miss the context display in your environment.

# Dynamic Task Performance Measurement

The debugger can execute a dynamic performance measurement by evaluating the current running task in changing time intervals. Start the measurement with the commands **PERF.Mode TASK** and **PERF.Arm**, and view the contents with **PERF.ListTASK**. The evaluation is done by reading the ‘magic’ location (= current running task) in memory. This memory read may be non-intrusive or intrusive, depending on the **PERF.METHOD** used.

If **PERF** collects the PC for function profiling of processes in MMU-based operating systems (**SYStem.Option.MMUSPACES ON**), then you need to set **PERF.MMUSPACES**, too.

For a general description of the **PERF** command group, refer to “**General Commands Reference Guide P**” (general\_ref\_p.pdf).

## Task Runtime Statistics

**NOTE:** This feature is *only* available, if your debug environment is able to trace task switches (program flow trace is not sufficient). It requires either an on-chip trace logic that is able to generate task information (eg. data trace), or a software instrumentation feeding one of TRACE32 software based traces (e.g. **FDX** or **Logger**). For details, refer to “**OS-aware Tracing**” (glossary.pdf).

Based on the recordings made by the **Trace** (if available), the debugger is able to evaluate the time spent in a task and display it statistically and graphically.

To evaluate the contents of the trace buffer, use these commands:

**Trace.List List.TASK DEFault**

Display trace buffer and task switches

**Trace.STATistic.TASK**

Display task runtime statistic evaluation

<b>Trace.Chart.TASK</b>	Display task runtime timechart
<b>Trace.PROfileSTATistic.TASK</b>	Display task runtime within fixed time intervals statistically
<b>Trace.PROfileChart.TASK</b>	Display task runtime within fixed time intervals as colored graph
<b>Trace.FindAll Address TASK.CONFIG(magic)</b>	Display all data access records to the “magic” location
<b>Trace.FindAll CYcle owner OR CYcle context</b>	Display all context ID records

The start of the recording time, when the calculation doesn't know which task is running, is calculated as “(unknown)”.

## Function Runtime Statistics

**NOTE:** This feature is *only* available, if your debug environment is able to trace task switches (program flow trace is not sufficient). It requires either an on-chip trace logic that is able to generate task information (e.g. data trace), or a software instrumentation feeding one of TRACE32 software based traces (e.g. [FDX](#) or [Logger](#)). For details, refer to “[OS-aware Tracing](#)” (glossary.pdf).

All function-related statistic and time chart evaluations can be used with task-specific information. The function timings will be calculated dependent on the task that called this function. To do this, in addition to the function entries and exits, the task switches must be recorded.

To do a selective recording on task-related function runtimes based on the data accesses, use the following command:

```
; Enable flow trace and accesses to the magic location
Break.Set TASK.CONFIG(magic) /TraceData
```

To do a selective recording on task-related function runtimes, based on the Arm Context ID, use the following command:

```
; Enable flow trace with Arm Context ID (e.g. 32bit)
ETM.ContextID 32
```

To evaluate the contents of the trace buffer, use these commands:

<b>Trace.ListNesting</b>	Display function nesting
<b>Trace.STATistic.Func</b>	Display function runtime statistic
<b>Trace.STATistic.TREE</b>	Display functions as call tree
<b>Trace.STATistic.sYmbol /SplitTASK</b>	Display flat runtime analysis
<b>Trace.Chart.Func</b>	Display function timechart
<b>Trace.Chart.sYmbol /SplitTASK</b>	Display flat runtime timechart

The start of the recording time, when the calculation doesn't know which task is running, is calculated as “(unknown)”.

## PrKERNEL specific Menu

---

The menu file “prkernel.men” contains a menu with PrKERNEL specific menu items. Load this menu with the **MENU.ReProgram** command.

You will find a new menu called **PrKERNEL**.

- The **Display** menu items launch the kernel resource display windows.
- The **Stack Coverage** submenu starts and resets the PrKERNEL specific stack coverage and provides an easy way to add or remove tasks from the stack coverage window.

In addition, the menu file (\*.men) modifies these menus on the TRACE32 [main menu bar](#):

- The **Trace** menu is extended. In the **List** submenu, you can choose if you want a trace list window to show only task switches (if any) or task switches together with the default display.
- The **Perf** menu contains additional submenus for task runtime statistics and statistics on task states.

## TASK.ALarM

Display alarm handlers

---

Format: **TASK.CYClic**

Displays the table of installed alarm handlers.

magic	name	id	handler
20083C00	al hdr1	1.	08103200 firstAlmHdr
20083C30	al hdr2	2.	08103300 secondAlmHdr

“magic” is a unique ID, used by the OS Awareness to identify a specific alarm handler (address of the alarm control structure).

The fields “magic” and “handler” are mouse sensitive. Double-clicking on them open appropriate windows. Right clicking on them will show local menu.

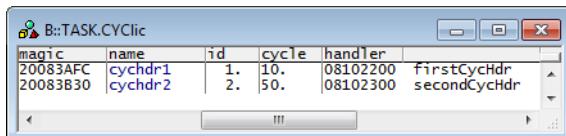

## TASK.CYClic

Display cyclic handlers

---

Format: **TASK.CYClic**

Displays the table of installed cyclic handlers.

magic	name	id	cycle	handler
20083AFC	cyclic1	1.	10.	08102200 FirstCycHdr
20083B30	cyclic2	2.	50.	08102300 secondCycHdr

“magic” is a unique ID, used by the OS Awareness to identify a specific cyclic handler (address of the cyclic control structure).

The fields “magic” and “handler” are mouse sensitive. Double-clicking on them open appropriate windows. Right clicking on them will show local menu.

Format: **TASK.DaTaQueue [<queue>]**

Displays the data queue table of PrKERNEL or detailed information about one specific data queue.

Without any arguments, a table with all created data queues will be shown.

Specify a data queue magic number to display detailed information on that data queue.

B::TASK.DaTaQueue					
magic	name	id	count	max	waiting
2007F9B4	dtq1	1.	0.	4.	rcv: 5.
2007F9FC	dtq2	2.	5.	5.	snd: 2.

“magic” is a unique ID, used by the OS Awareness to identify a specific data queue (address of the data queue control structure).

The “waiting” column shows the task IDs waiting for receiving (“rcv:”) or sending (“snd:”) data.

The fields “magic”, “start” and “read” are mouse sensitive. Double-clicking on them opens appropriate windows. Right clicking on them will show a local menu.

Format: **TASK.FLaG**

Displays the event flag table of PrKERNEL

B::TASK.FLaG					
magic	name	id	events	waiting	
2007F8B0	evtf1g1	1.	00000000		
2007F8E4	evtf1g2	2.	00000000	4.	

“magic” is a unique ID, used by the OS Awareness to identify a specific event flag (address of the event flag control structure).

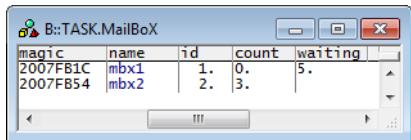

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.MailBox [<mailbox>]**

Displays the mailbox table of PrKERNEL or detailed information about one specific mailbox.

Without any arguments, a table with all created mailboxes will be shown.

Specify a mailbox magic number to display detailed information on that mailbox.

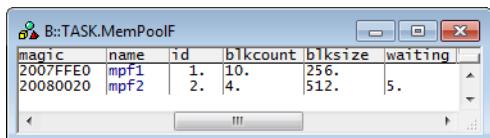

magic	name	id	count	waiting
2007FB1C	mbx1	1.	0.	5.
2007FB54	mbx2	2.	3.	

“magic” is a unique ID, used by the OS Awareness to identify a specific mailbox (address of the mailbox control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.MemPoolF**

Displays the table of fixed sized memory pools.

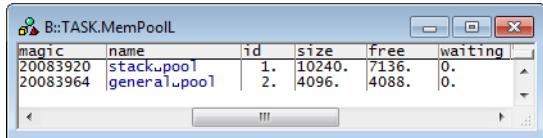

magic	name	id	blkcount	blksize	waiting
2007FFE0	mpf1	1.	10.	256.	
20080020	mpf2	2.	4.	512.	5.

“magic” is a unique ID, used by the OS Awareness to identify a specific memory pool (address of the memory pool control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.MemPoolL**

Displays the table of variable sized memory pools.

magic	name	id	size	free	waiting
20083920	stackpool	1.	10240.	7136.	0.
20083964	generalpool	2.	4096.	4088.	0.

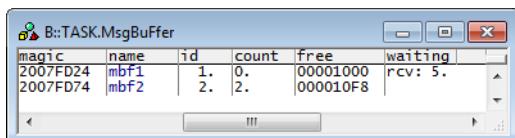

“magic” is a unique ID, used by the OS Awareness to identify a specific memory pool (address of the memory pool control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.MsgBuFfer**

*Only available on PrKERNELv4 version 3.*

Displays the message buffer table of PrKERNEL.

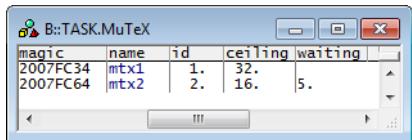

magic	name	id	count	free	waiting
2007FD24	mbf1	1.	0.	00001000	rcv: 5.
2007FD74	mbf2	2.	2.	000010F8	

“magic” is a unique ID, used by the OS Awareness to identify a specific message buffer (address of the buffer control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.MuTeX**

Displays the mutex table of PrKERNEL.

The screenshot shows a Windows-style application window titled 'B::TASK.MuTeX'. The window contains a table with four columns: 'magic', 'name', 'id', and 'ceiling'. There are two rows of data: the first row has 'magic' value '2007FC34', 'name' 'mtx1', 'id' '1.', and 'ceiling' '32.'; the second row has 'magic' value '2007FC64', 'name' 'mtx2', 'id' '2.', and 'ceiling' '16.'. The 'waiting' column is empty in both rows. The window has standard Windows controls (minimize, maximize, close) and a scroll bar.

magic	name	id	ceiling
2007FC34	mtx1	1.	32.
2007FC64	mtx2	2.	16.

“magic” is a unique ID, used by the OS Awareness to identify a specific mutex (address of the mutex control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

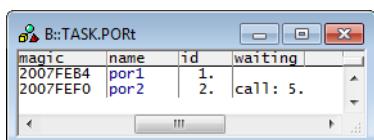

## TASK.PORT

Display ports

Format: **TASK.PORT**

Only available on PrKERNELv4 version 3.

Displays the port table of PrKERNEL.

The screenshot shows a Windows-style application window titled 'B::TASK.PORT'. The window contains a table with four columns: 'magic', 'name', 'id', and 'waiting'. There are two rows of data: the first row has 'magic' value '2007FEB4', 'name' 'port1', 'id' '1.', and 'waiting' 'call: 5.'; the second row has 'magic' value '2007FEF0', 'name' 'port2', 'id' '2.', and 'waiting' empty. The 'ceiling' column is empty in both rows. The window has standard Windows controls (minimize, maximize, close) and a scroll bar.

magic	name	id	waiting
2007FEB4	port1	1.	call: 5.
2007FEF0	port2	2.	

“magic” is a unique ID, used by the OS Awareness to identify a specific port (address of the port control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.SEMaphore**

Displays the semaphore table of PrKERNEL.

magic	name	id	count	max	waiting
2007F700	sem1	1.	1.	3.	
2007F7F0	sem2	2.	0.	5.	5.

“magic” is a unique ID, used by the OS Awareness to identify a specific semaphore (address of the semaphore control structure).

The field “magic” is mouse sensitive. Double-clicking on it opens an appropriate window. Right clicking on it will show a local menu.

Format: **TASK.TaSK [<task>]**

Displays the task table of PrKERNEL or detailed information about one specific task.

Without any arguments, a table with all created tasks will be shown.  
Specify a magic number to display detailed information on that task.

magic	name	id	state	prio	entry
2007F400	initialtask	1.	dormant	32.	T:0000023A8 ktsk_inittask_entry
2007F450	maintask	2.	dormant	32.	T:0000003DA sample_main
2007F4A0	tasku1	3.	waiting delay	32.	T:000000300 sample_task_1
2007F4F0	tasku2	4.	waiting eventflag	32.	T:00000035A sample_task_2
2007F540	tasku3	5.	dormant	32.	T:0000003B4 sample_task_3

magic	name	id	state	prio	entry
2007F4F0	tasku2	4.	waiting e	32.	T:00000035A sample_task_2
priority base initial current					
32. 32. 32.					
mutex locked					
none					
counter activation wakeup suspension					
0. 0. 0.					
exception pattern routine					
0000 00000000					
stack initial size pointer					
20080530 00000400 20080848					

“magic” is a unique ID, used by the OS Awareness to identify a specific task (address of the task control structure).

The fields “magic” and “entry” are mouse sensitive, double clicking on them opens appropriate windows. Right clicking on them will show a local menu.

There are special definitions for PrKERNEL specific PRACTICE functions.

## **TASK.CONFIG()**

OS Awareness configuration information

Syntax: **TASK.CONFIG(magic | magicsize)**

**Parameter and Description:**

<b>magic</b>	<b>Parameter Type:</b> String ( <i>without</i> quotation marks). Returns the magic address, which is the location that contains the currently running task (i.e. its <a href="#">task magic number</a> ).
<b>magicsize</b>	<b>Parameter Type:</b> String ( <i>without</i> quotation marks). Returns the size of the task magic number (1, 2 or 4).

**Return Value Type:** Hex value.
