The IMR-LX6 incorporated in this product has a functionally extended filtering pipeline in addition to the filtering pipeline in previous products.

(1) Overview

The table below shows the differences between the previous and extended pipelines.

Table 56.18 Comparison of Functions between the Previous and Extended Filtering Pipelines

	Previous Pipeline	Extended Pipeline
Bilinear filtering	√	√
Filtering with the use of pyramidal images	√	√
Luminance and hue correction	√	√
Filtering in the 8-bpp, 10-bpp, or 12-bpp format	√	√
Filtering in the 14-bpp or 16-bpp format	—	√
Selecting whether to retain the fractional part following filtering operations	—	√
Rounding off the results of filtering operations	—	√
Logical right-shifting of the value following processing for filtering	—	√
Conversion by the LUT	√	—

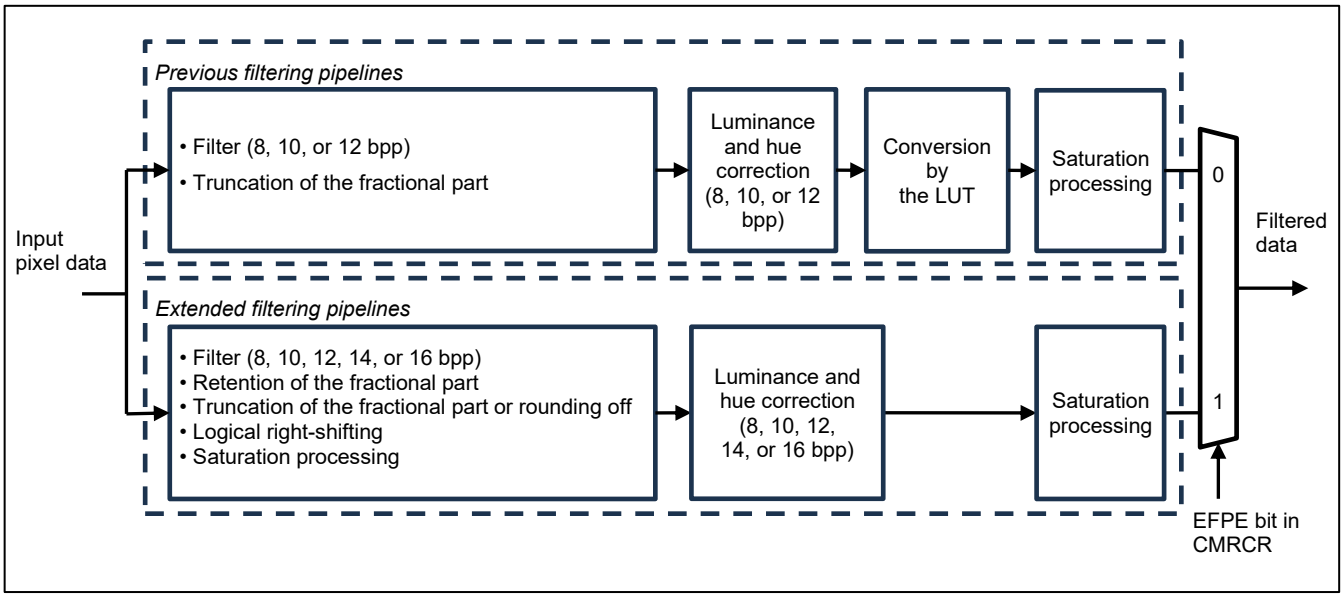

Figure 56.24 Configurations of the Previous and Extended Filtering Pipelines

Figure 56.24 is a block diagram of the previous and extended filtering pipelines. Switching between the two pipelines is possible by using the EFPE bit in CMRCR. The two pipelines have the same register functions. However, they may output different data for the same input data even though settings such as those for pixel format are the same because of the differences in functionality between the pipelines.

The following explains the functions of the extended filtering pipeline.

(2) Filtering of data in the 14-bpp or 16-bpp format

The extended filtering pipeline handles data in the 14-bpp or 16-bpp format.

When handling data in the 14-bpp or 16-bpp format, set bits SY1416, DY1416, SUV1416, and DUV1416 in CMRCR. In such cases, set bits SY12, SY10, Y12, Y10, SUV, and DUV in CMRCR to 0.

When handling data in the YUV422 interleaved mode, specify the same luminance and hue for the pixel format.

(3) Retaining and rounding the fractional parts following extended filtering

The filtering pipeline from the previous products truncates the fractional part and only retains the integer part following filtering operations. The extended filtering pipeline can output data with the specified number of fractional digits being retained after filtering operations.

Refer to the Table 56.13 for possible combinations of SHFE, SHFVAL, UVSHFE and UVSHFVAL in TRIMR.

The below part will describe about the Y plane. For the UV plane, if the image format of external memory is YUV422 Semi-planar or YUV420 Semi-planar, read SHFE as UVSHFE and SHFVAL as UVSHFVAL.

Additionally, while the filtering pipeline from the previous products simply truncates the fractional part following filtering, how to round the fractional part in the results of filtering is specifiable for the extended filtering pipeline as truncation or as rounding up and down. Selecting rounding might reduce the errors in the mathematical operations of filtering.

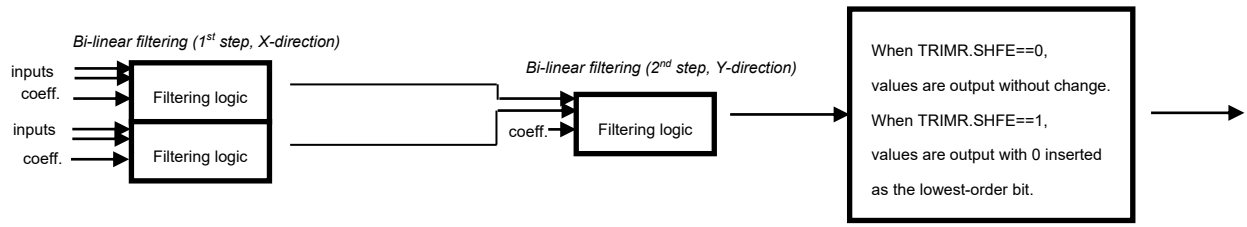

Figure 56.25 Configuration of the Filtering Circuit (when Bilinear Filtering is Enabled)

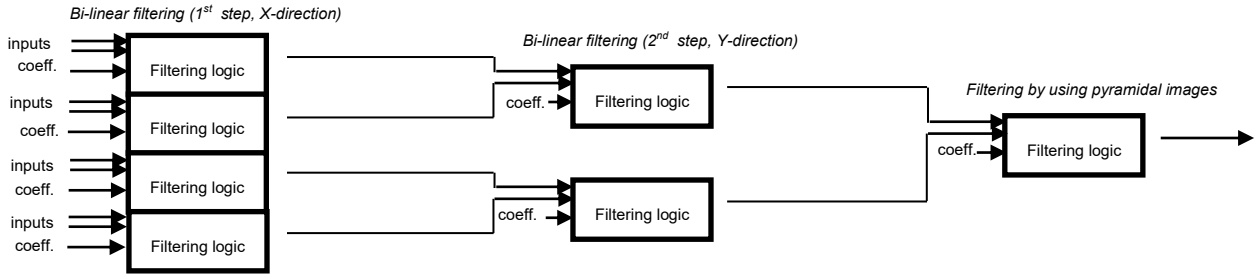

Figure 56.26 Configuration of the Filtering Circuit (when Filtering by using pyramidal images is Enabled)

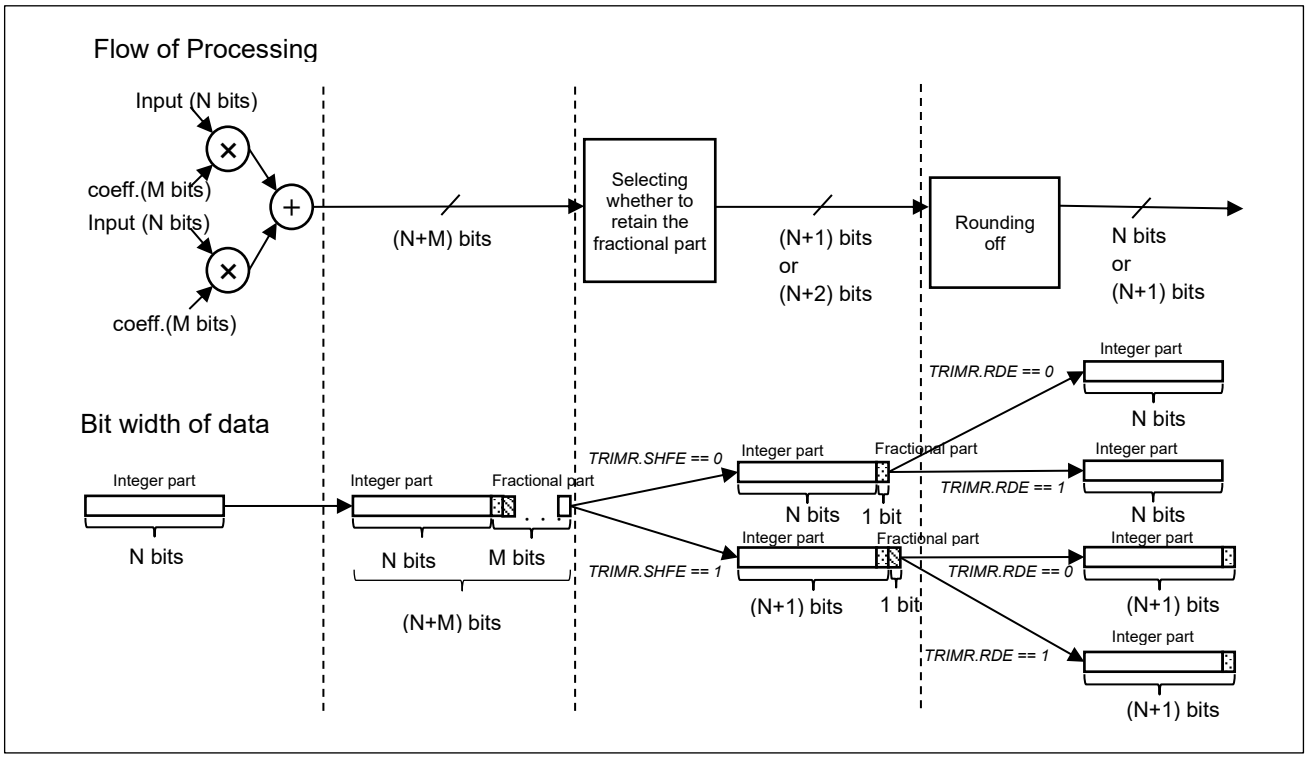

Figure 56.27 Details of the Filtering Circuit

Figure 56.25 and Figure 56.26 show the configuration of the filtering circuit in the extended filtering pipeline. Figure 56.27 shows the details of the filtering circuit.

Each of the filtering circuits first multiplies and accumulates the input values and coefficients. Assume the input values are N bits (positive integer) and the coefficient is M bits (a value between 0.0 and 1.0), the output value from the multiplier-accumulator is (N + M) bits. The higher-order N bits are the integer part and the lower-order M bits are the fractional part.

The output from the multiplier-accumulator is then input to the block for selecting whether to retain the fractional part. When the setting is for truncating the fractional part (the SHFE bit in TRIMR is set to 0), the block outputs an (N + 1)-bit value, where the higher-order N bits are the integer and the highest-order bit of the lower-order M bits is the fractional part. When the setting is for retaining some of the digits of the fractional part (the SHFE bit in TRIMR is set to 1), the given block outputs an (N+2)-bit value, where the higher-order (N + 1) bits are the integer part, and the highest-order bit of the lower-order (M - 1) bits is the fractional part.

The output from the block for selecting whether to retain the fractional part is then input to the block for rounding off. When the setting is for truncation (the RDE bit in TRIMR is 0), the block for rounding off outputs a truncated value, where the bits handled as the fractional part*1 in the previous block are discarded. When the setting is for rounding up or down (the RDE bit in TRIMR is 1), the given block outputs the value after the bit handled as the fractional part in the previous block is added to the integer part.*2

Note: 1. The lowest-order bit of the input to the block for selecting whether to retain the fractional part

2. Figure 56.27 does not show a difference between the output values when TRIMR.RDE is 1 and when it is 0. However, since the output value when TRIMR.RDE is 1 may have been rounded up, the value may be different from that when TRIMR.RDE is 0.

When the setting is for some of the digits of the fractional part to be retained (the SHFE bit in TRIMR is 1), each of the filtering circuits outputs a value with one more bit than the input value. That is, if the input pixel

format before filtering is N bpp, data are output in the (N+3) bpp format after all three filtering operations. Accordingly, the input and output pixel formats, and the number of digits of logical right-shifting must be set in accord with the combination shown in Table 56.19 or Table 56.20.

Table 56.19 Settings for Bilinear Filtering

Input Pixel Format*1	Output Pixel Format*2	Number of Digits of Logical Right-Shifting*3
8 bpp	10 bpp	1
10 bpp	12 bpp	1
12 bpp	14 bpp	1
14 bpp	16 bpp	1

Table 56.20 Setting for Filtering with the Use of Pyramidal Images

Input Pixel Format*1	Output Pixel Format*2	Number of Digits of Logical Right-Shifting*3
8 bpp	10 bpp	1
8 bpp	12 bpp (11 bits)*4	0
10 bpp	12 bpp	1
10 bpp	14 bpp (13 bits)*4	0
12 bpp	14 bpp	1
12 bpp	16 bpp (15 bits)*4	0
14 bpp	16 bpp	1

Notes: 1. The input pixel format can be set by using bits SUV1416, SY1416, SY12, SY10, and SUV in the CMRCR register.
2. The output pixel format can be set by using bits DUV1416, DY1416, Y12, Y10, and DUV in the CMRCR register.
3. The number of the digits of logical right-shifting can be set by using the SHFVAL bit in the TRIMR register.
4. The Output Pixel Formats need to be set as 12 bpp, 14 bpp or 16 bpp, however actual output image data are (N+3) bpp.

(4) Logical right-shifting following filtering

The extended filtering pipeline can apply logical right-shifting on the data following filtering.

The saturation processing applied according to the pixel format of the destination data is handled after the logical right shifting. Accordingly, the saturation processing can be used to limit the data following filtering to be within a specified range.

Use the SHFVAL field in the SHFVAL register to specify the number of bits of logical right-shifting. The parts of the value shifted out of the range by logical right-shifting are always truncated.

56.3.11 Synchronized system between modules

This module has functionality for synchronizing operations with other image processing modules.

(1) Overview

Instructions for inter-module synchronization (WUP and SLP) are available for use in the display list. A module executing one of the inter-module synchronization signals (SLP) causes it to wait for the other inter-module synchronization signal (WUP) from another module. These instructions can be executed in desired positions in the display lists.

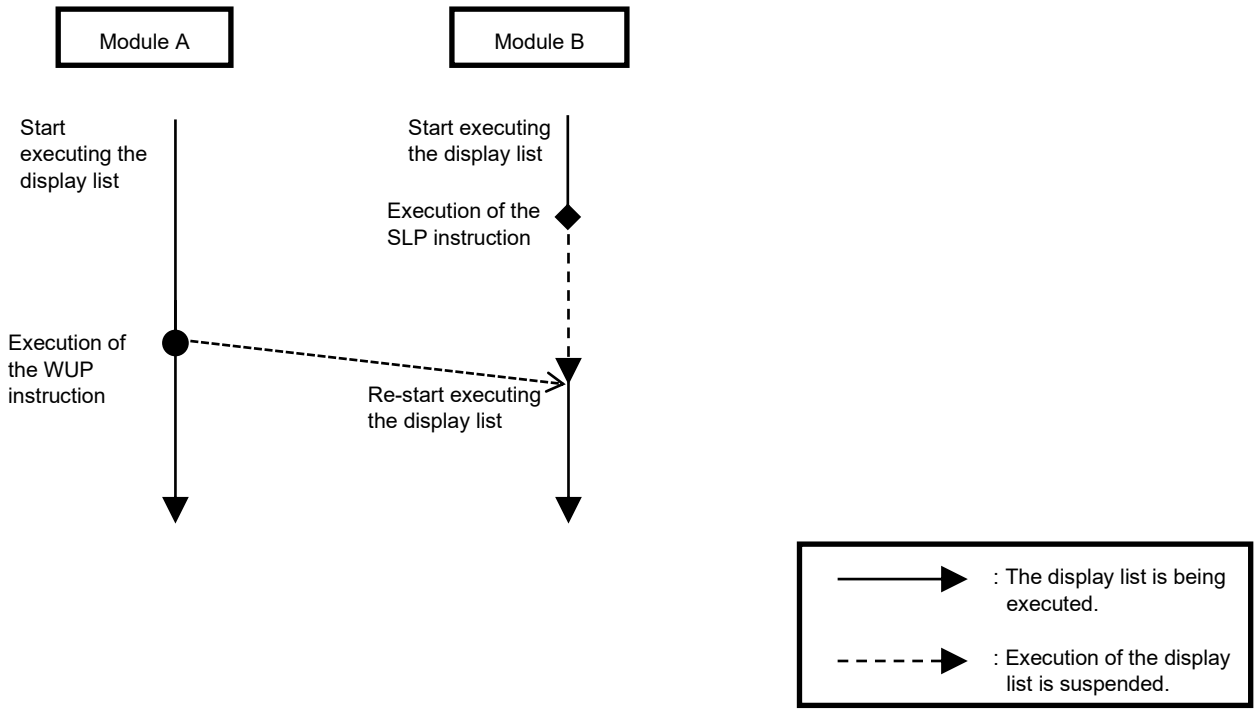

Figure 56.28 Example of One Module Synchronizing its Operation with Another

Figure 56.28 is an example of one module synchronizing its operation with another. In this figure, module B suspends execution of its display list in response to execution of the SLP instruction, and re-starts execution of the subsequent instructions in the display list once it receives the signal produced by module A executing the WUP instruction at the desired position.

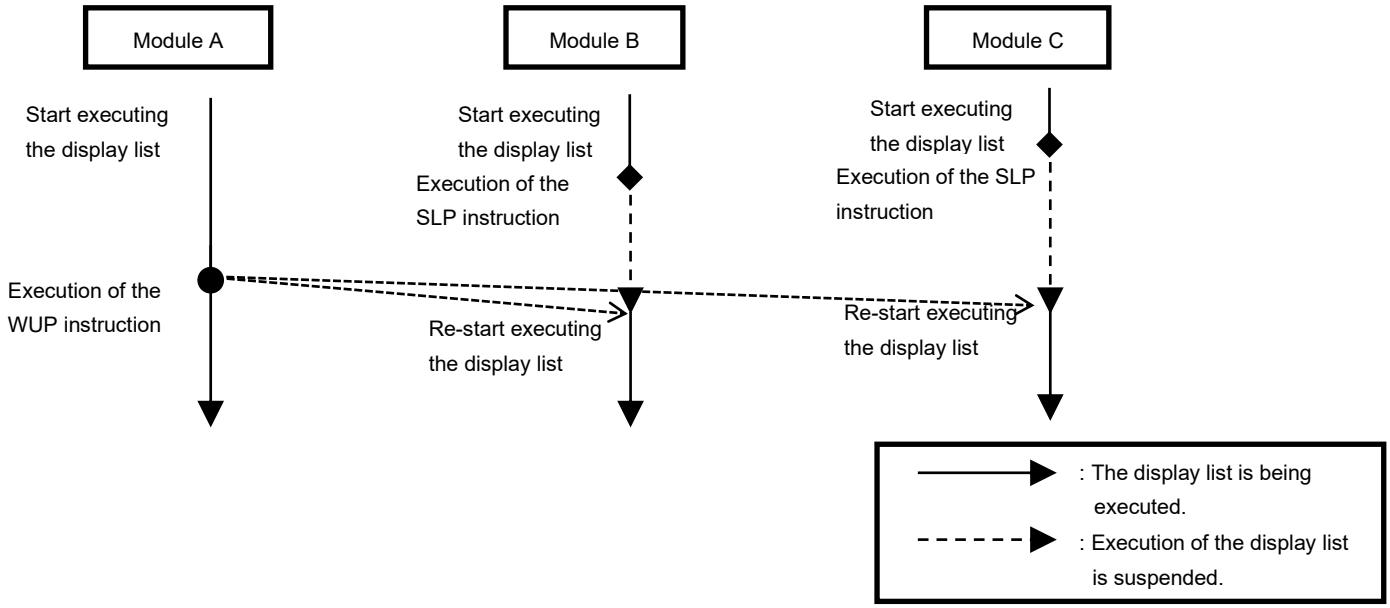

Figure 56.29 Example of One Module Synchronizing its Operation with Two Others

Synchronization between modules is also possible with more than two modules. In Figure 56.29, modules B and C suspend execution of their display lists to wait for execution of the WUP instruction in a desired position in the display list of module A.

In Figure 56.28 and Figure 56.29, the SLP instruction is executed before the WUP instruction, however, there is no particular order of instructions, because the synchronization signal generated by the WUP instruction is held pending in the modules receiving the signal. Also, the signal can be held pending by each of the modules receiving synchronization signals. Therefore, the order of instructions can be reversed for some modules when synchronizing the operations of more than two modules. *

When the module receives another synchronization signal while one is already held pending, a synchronization error is generated. Refer to 56.3.11 (4) Detection of Synchronization Errors for more details.

If a specified module to be synchronized has not been activated, wait till the module is activated and then transmit the WUP signal to it. Note, however, that if the IMR-LX6 receives the WUP signal from the ISP before the IMR-LX6 is activated, a synchronization signal reception error is detected. For details on this type of error, refer to 56.3.11 (4), Detection of Synchronization Errors.

Notes: When a synchronization signal is held pending in the module, executing the TRAP instruction without executing the SLP instruction is prohibited.

(2) Possible Combinations of Modules for Synchronization of Operations

Table 56.21 shows the possible combinations of modules for synchronization with the IMR-LX6 modules. √ indicates that synchronization between the receiving and transmitting modules is possible.

Synchronizing operations with modules not in the table below is not possible.

Table 56.21 Possible Combinations of Modules for Synchronized Operations

Receiving module / Transmitting module	IMR-LX6 ch0	IMR-LX6 ch1	IMR-LX6 ch2	IMR-LX6 ch3	IMP DMAC0 (thread0)	IMP DMAC0 (thread1)	IMP DMAC1 (thread0)	IMP DMAC1 (thread1)	Slim-IMP DMAC0 (thread0)	Slim-IMP DMAC0 (thread1)	Slim-IMP DMAC1 (thread0)	Slim-IMP DMAC1 (thread1)
IMR-LX6 ch0	—	√	√	√	√	√	√	√	√	√	√	√
IMR-LX6 ch1	√	—	√	√	√	√	√	√	√	√	√	√

VIN[1].ch[n]	VIN[1].ch[3]	VIN[1].ch[7]	VIN[1].ch[0] /ch[4]	VIN[1].ch[1] /ch[5]	—	—	—	—	—	—	—	—

(3) Setting the Synchronizing Operations

The modules with operations to be synchronized with the IMR-LX6 can be specified by setting the fields of the synchronization control registers (SYNCCRn), and using the WUP and SLP instructions.

Before execution of the WUP and SLP instructions, the numbers corresponding to the modules for synchronization of operations must be set in the SYNCCm (m = 0 to 15) fields in SYNCCRn. The correspondence between the modules and numbers for selecting the modules is shown in Table 56.22. The Number for Specifying the module from IMP DMAC and Slim-IMP DMAC to IMR-LX6 is different than IMR-LX6. Refer to the U30.IMP DMAC HWM for details.

Table 56.22 Correspondence between the Modules and Numbers for Specifying the Modules

Module	Number for Specifying the Module
IMP DMAC0 (thread0)	H'10
IMP DMAC0 (thread1)	H'11
IMP DMAC1 (thread0)	H'12
IMP DMAC1 (thread1)	H'13
Slim-IMP DMAC0 (thread0)	H'14
Slim-IMP DMAC0 (thread1)	H'15
Slim-IMP DMAC1 (thread0)	H'16
Slim-IMP DMAC1 (thread1)	H'17
IMR-LX6 ch0	H'40
IMR-LX6 ch1	H'41
IMR-LX6 ch2	H'42
IMR-LX6 ch3	H'43
ISP	H'50
VIN[0].ch[0]	H'60
VIN[0].ch[1]	H'61
VIN[0].ch[2]	H'62
VIN[0].ch[3]	H'63
VIN[0].ch[4]	H'64
VIN[0].ch[5]	H'65
VIN[0].ch[6]	H'66
VIN[0].ch[7]	H'67
VIN[1].ch[0]	H'68
VIN[1].ch[1]	H'69
VIN[1].ch[2]	H'6A
VIN[1].ch[3]	H'6B
VIN[1].ch[4]	H'6C
VIN[1].ch[5]	H'6D
VIN[1].ch[6]	H'6E
VIN[1].ch[7]	H'6F

After the number corresponding to the module for synchronizing operations is set in the SYNCCm field of SYNCCRn, set the corresponding bit in the SYNCC enable field of the WUP or SLP instruction. For example, when the module for synchronizing operations is set in the SYNCC0 field, set bit 0 of the SYNCC enable field to 1. When the module for synchronizing operations is set in the SYNCC14 field, set bit 14 of the SYNCC enable field to 1.

Executing the WUP or SLP instruction enables the module specified in the SYNCCm field and SYNCC enable field to transmit the WUP signal or to suspend its operation until it receives the WUP signal, respectively.

Setting more than one bit in the SYNCC enable field to 1 at the same time is also possible. In such cases, the synchronization signals are transmitted to or received from the respective modules simultaneously. *

Notes: It is prohibited to execute WUP or SLP instruction with two or more same modules specified for synchronization. For example, the following settings are prohibited.
The SYNCC enable field of the WUP or SLP instruction is B'0000 0000 0000 1001.
The syncc0 field in SYNCCR0 is H'10. (IMP DMAC0/thread0 is selected)
The syncc3 field in SYNCCR0 is H'10. (IMP DMAC0/thread0 is selected)

(4) Detection of Synchronization Errors

Detection of an overflow of the synchronization signal and the reception of a synchronization signal while the given module is not executing a display list is possible. The detected error can be indicated in the respective bit in SR, and an indicator can be transmitted to the CPU. Operations cannot be guaranteed if a synchronization error is generated.

(a) Overflow Errors of the WUP Signal

The WUP signal generated by executing the WUP instruction is held pending in the receiving module to wait for the execution of the SLP instruction. When another WUP signal is received while one is already held pending, an overflow error is detected.

The number of signals that can be held pending in this product is one.

If an overflow is detected when the setting of the WOVFENB bit in ICR is 1, the WOVF bit in SR is set to 1. If the setting of the WOVFM bit in IMR is 0, an interrupt signal is transmitted to the CPU in response to setting of the WOVF bit in SR to 1.

This error is only used for synchronization between the ISP or VIN and this module. Avoid generating errors in the synchronization of operations between the IMR-X6 and modules other than the ISP or VIN by not executing the WUP instruction two or more consecutive times for this module. Do not set the same module in the different SYNCC enable fields.

(b) Synchronization Signal Reception Errors while the IMR-LX6 is not Executing a Display List

When the IMR-LX6 receives a synchronization signal from the ISP or VIN while it is not executing a display list and the setting of the WERRENB bit in ICR is 1, the WERR bit in SR is set to 1.

If the setting of the WERRM bit in IMR is 0, an interrupt signal is transmitted to the CPU in response to setting of the WERR bit in SR to 1.

This error is only used for synchronization between the ISP or VIN and this module, and is not detected in synchronization between the IMR-X6 and modules other than the ISP or VIN.

In the case that VIN WUP is used by another IP (not used by IMR-X6), WERRENB shall be set to 0 before VIN send the WUP to IMR. Otherwise, IMR may assert the pseudo-WERR. Because, if VIN sends WUP to VSPX or sends WUP interrupts to the CPU, IMR also receives these WUP although IMR does not use them. Therefore, users need to disable the pseudo-WERR.

56.3.12 Filtering for Improved Image Quality in Scaling Images Down by Using Pyramidal Images

When texture mapping is executed, if the destination image is smaller than the source image (i.e. the latter is being scaled-down), using bilinear filtering for texture mapping may lead to deterioration of the image quality. Meanwhile, the image quality in scaling images down can be improved by selecting a texture in accord with the scale-down rate from among the pyramidal images, which are a group of multiple reduced images that are usable as textures, and using these for texture mapping.

56.3.12.1 Filtering by Using Pyramidal Images

An example of scaling down a source image composed of pixels No. 1 to 12 vertically and horizontally into half the original size is given below. To simplify the description, bilinear filtering is off in this example, but even if bilinear filtering is on, the image quality will deteriorate similarly.

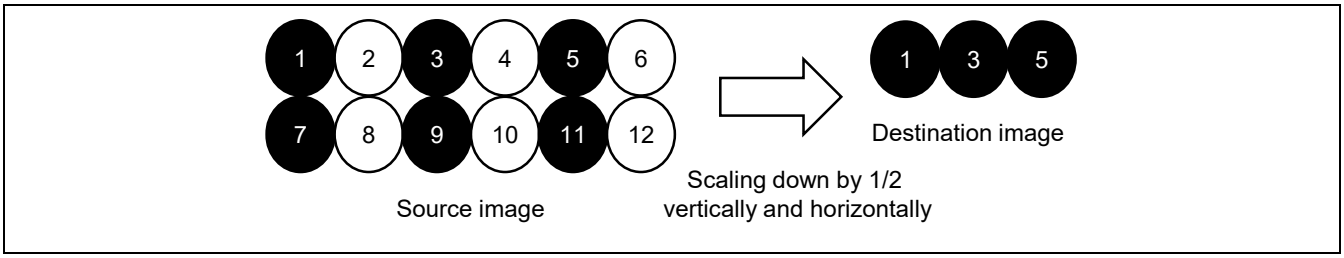

Figure 56.30 Deterioration of Image Quality in Scaling Down

In this example, the reduced image has lost all pixels except for pixels No. 1, 3, and 5. As a result, the original image having continuous black and white vertical lines becomes an image which is entirely black, and the image is thus changed to a different shade and shape.

This module incorporates a function for suppressing such deterioration of image quality by using pyramidal images. A pyramidal image is created by recursively scaling down the original image by 1/2 both vertically and horizontally. In scaling down, the four adjacent pixels in an original image are equally averaged into the pixel in the subsequent image. The Nth image to be created, here, is referred to as map n. This module supports up to map 4.

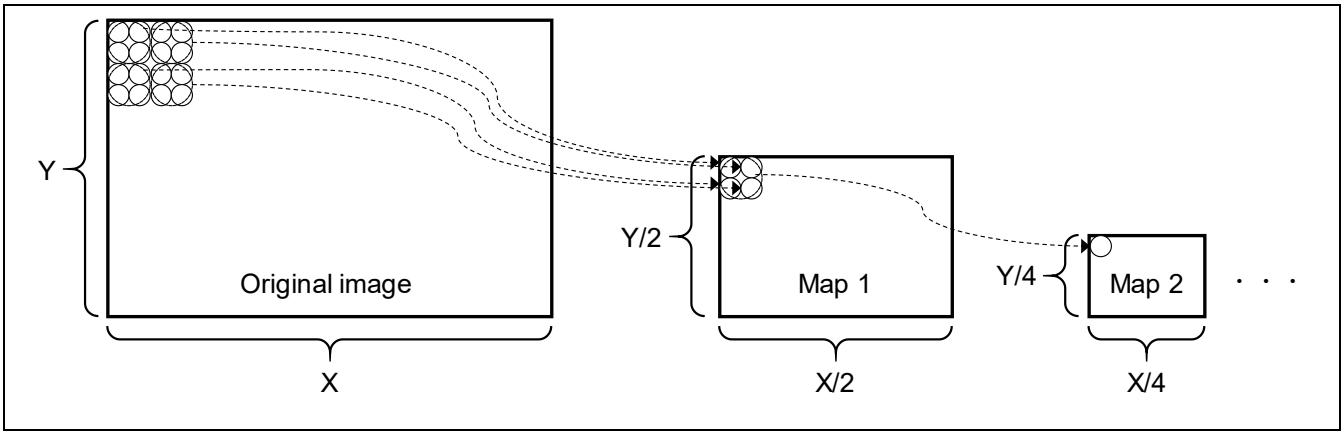

Figure 56.31 Example of Pyramidal Images

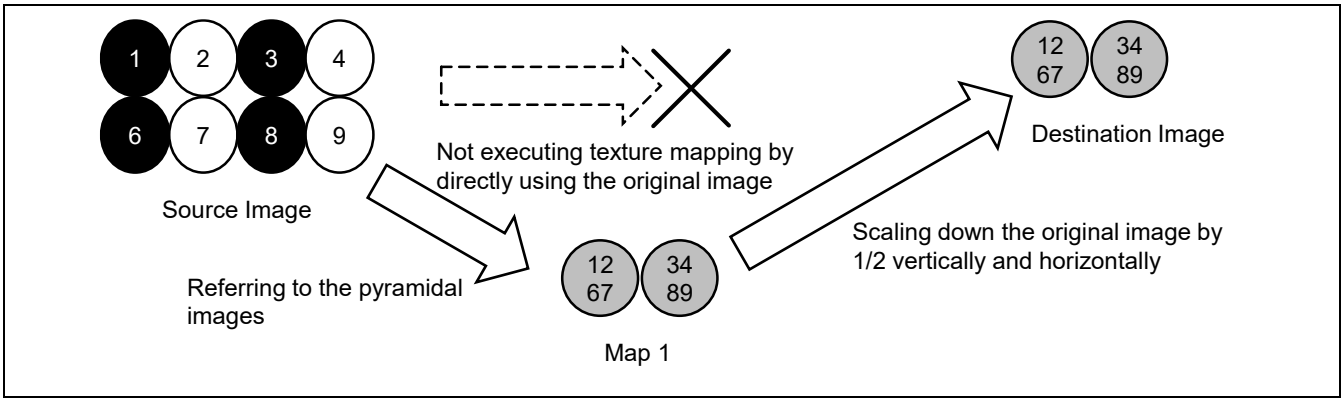

Figure 56.32 Texture Mapping by Using Pyramidal Images

In texture mapping, this module calculates the rate of scaling up or down of the destination image from a source image. For scaling up (scale-up rate ≥ 1), the module refers to the original image, and for scaling down (scale-up rate < 1), the module refers to the pyramidal images whose scale-down rate is the closest to the result of calculation.

The number “n” of the map image to be used is calculated as follows. The original image is taken as map 0.

n_u = min{log2(shrink_ratio_u), MAXLODU }

n_v = min{log2(shrink_ratio_v), MAXLODV }

n = max{n_u, n_v}

shrink_ratio_u: Scale-down rate in the u direction, shrink_ratio_v: Scale-down rate in the v direction

MAXLODU: Maximum setting of the map number for the u direction to be used

MAXLODV: Maximum setting of the map number for the v direction to be used

The value with the part below the floating-point discarded from “n” becomes the number of the map image. In the above example, as the scale-down rate is 1/2 both vertically and horizontally, “n” becomes 1 and texture mapping is executed by referring to map 1. As a result, the destination image does not become an image which is entirely black but a gray image into which the black and white lines in the original image have been blended, thus improving the quality of the resulting image.

If the maximum scale-down rates in the u and v directions are extremely different, the larger number is selected as the map number, which may lead to a fuzzy destination image. For example, if texture mapping where the scale-down rates in the u and v directions are 2 and 8 respectively is executed, map 3 is selected. However, this image is unnecessarily scaled down in the u direction, and thus looks fuzzy. In this case, setting the smaller number by specifying MAXLODU and MAXLODV to 1 and 3 respectively enables suppression of the blurring of the image.

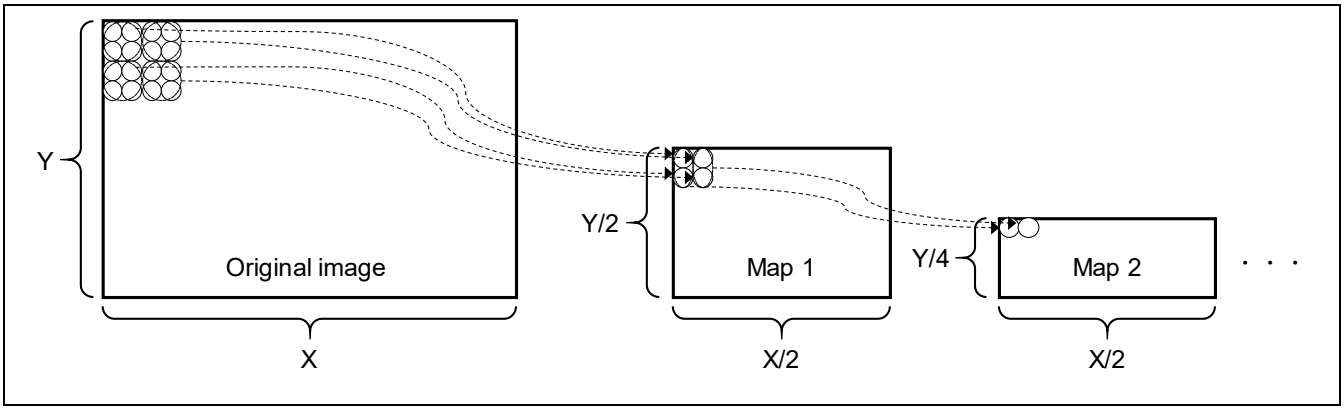

Figure 56.33 Example of Pyramidal Images (MAXLODU = 1, MAXLODV = 4)

The above figure is an example of the pyramidal images where MAXLODU and MAXLODV are set to 1 and 4, respectively. Though the original image is recursively scaled down by 1/2 in the Y direction, it's scaled down by 1/2 into map 1 and then not scaled down into map 2 and subsequent levels in the X direction. This enables retention of the details of the image in the X direction and thus allows texture mapping without images being out of focus even if a large number is selected as the map number.

How to Use Filtering by Pyramidal Images

To enable this function, set the MAXLODU and MAXLODV fields in the TRIMR2 register to any value from 1 to 4. Taking N as whichever is larger of the values of MAXLODU and MAXLODV, drawing is handled with the use of the single image from among map images 1 to N and the original image.

Also prepare and arrange in memory in advance the pyramidal images in accord with the MAXLODU and MAXLODV settings, and set their addresses in memory and the memory stride. To make a setting for map n, use the SSARn, and SSTRn registers. Also use the SSAORn, UVSSARn, UVSSAORn, and UVSSTRn. To set for the original image, use the SSAR and SSTR registers regardless of whether or not you will be using this function. Also, use SSAOR, UVSSAR, UVSSAORn and UVSSTRn.

To create the pyramidal images by recursively scaling down by 1/2, the size of the original image must be a multiple of the MAXLODUth power of two in the X direction and a multiple of the MAXLODVth power of two in the Y direction.

When creating pyramidal images by using the IMR-LX6, use bilinear filtering with the source coordinates (u, v) corresponding to the destination coordinates (X, Y) shifted by +0.5 in both the u and v directions*. Shifting by +0.5 places the four vertices of the source coordinates in the middle of four neighboring pixels, which allows rendering of a pixel that is the average of the four neighboring pixels. When scaling down a source image vertically and horizontally into half the original size as shown in the Figure below, set the source coordinates (0, 0) corresponding to the destination coordinates (0, 0) to (0.5, 0.5).

If you create another map following the first one, do so based on the first map to have been created. Similarly, if you create more maps, do so based on the preceding one each time.

Note: Do not shift both source coordinates by +0.5 unless you intend to scale down the original source image in both the u and v directions. For example, if scaling down is to be in the u direction but not in the v direction, only shift the u source coordinate by +0.5, and leave the v source coordinate unchanged.

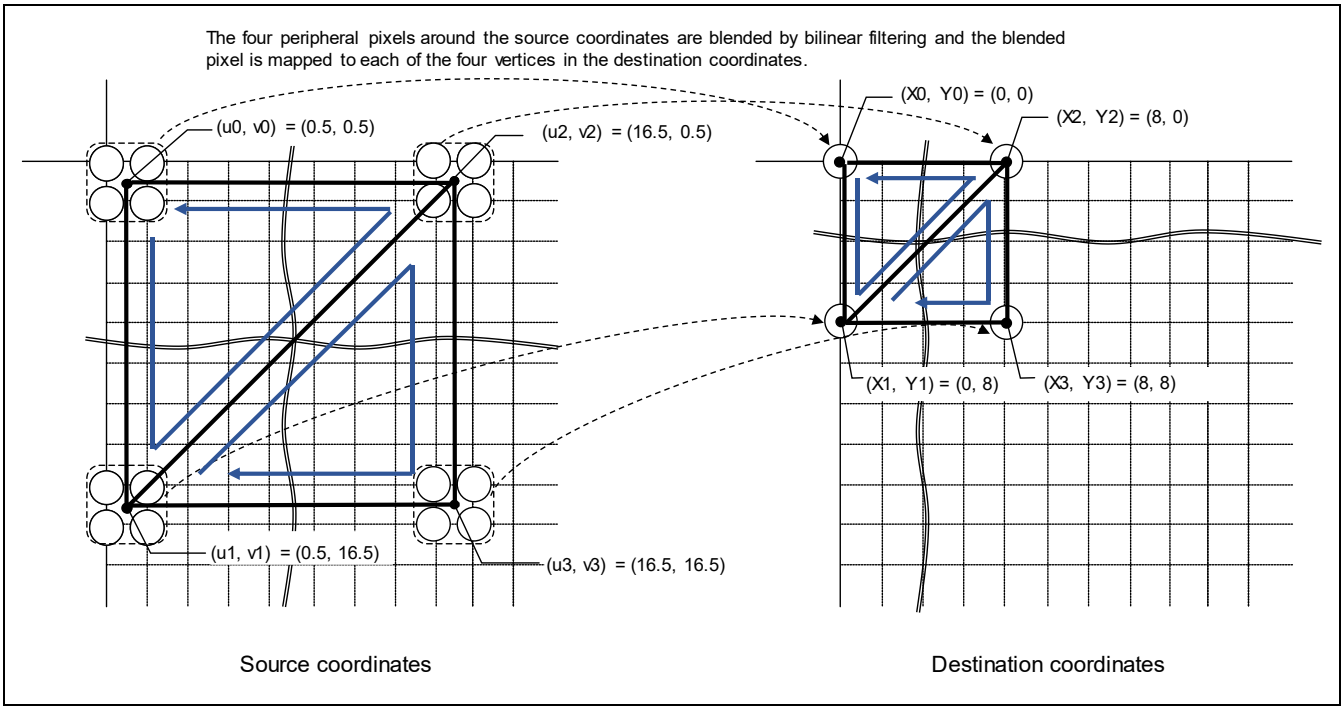

Figure 56.34 Example of the Setting of Coordinates when Creating a Pyramidal Image

56.3.12.2 Blending between Pyramidal Images

While pyramidal images are in use to improve image quality in scaling down, a smooth change in the scale-down rate may lead to the interruption of images in the interstices between the maps in use. To prevent this, set the TFE bit in the TRIMR register to 1 as well as enabling the filtering by using pyramidal images. This enables blending of the map images corresponding to the rates around a scale-down rate which is not a power of two, thus improving the image quality in the case where the scale-down rate changes smoothly.

Specifically, in the following expressions used for selection of the map number which are described on the previous page,

n_u = log2(shrink_ratio_u) > MAXLODU?MAXLODU:log2(shrink_ratio_u),

n_v = log2(shrink_ratio_v) > MAXLODV?MAXLODV:log2(shrink_ratio_v), and

n = max{n_u, n_v},

the calculated n is used to execute a floor function (n_floor) and a ceiling function (n_ceil), and then the map images with the numbers equivalent to the results (n_floor) and (n_ceil) are used for texture mapping (these map numbers are referred to as pix_floor and pix_ceil). The final value of pixels can be calculated from the following expression by using pix_floor, pix_ceil and the fractional part of n.

pix = pix_floor * (1-n_fraction) + pix_ceil * n_fraction

An example for n = 1.4 is given below.

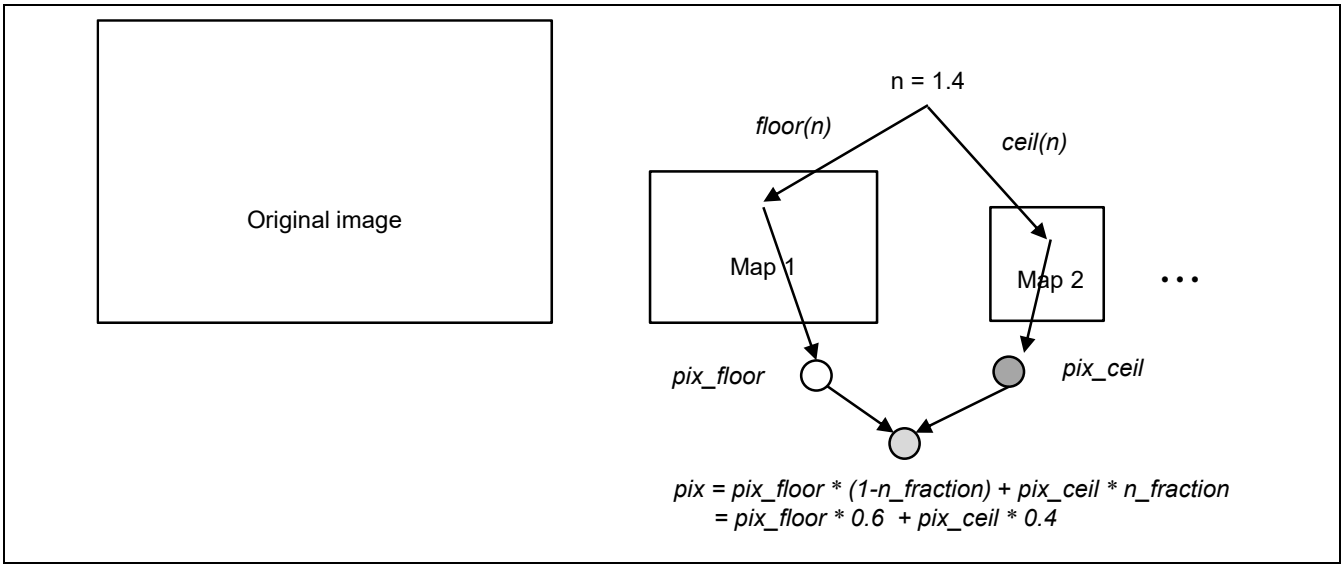

Figure 56.35 Example of Blending between Maps (n = 1.4)

Bilinear filtering must be enabled for the filtering of images by using pyramidal images. Set the TFE and BFE bits in TRIMR to 1 to enable bilinear filtering. Bilinear filtering is applied to the texture mapping of each of pix_floor and pix_ceil described above.

56.3.13 Non-blocking Cache Mode

This module issues source data read request to external memory where the source data is stored. The maximum number of the on-the-fly requests can be controlled by NCME bit of NCMR register.

If the bit is set to 1, this module issues multiple requests even if the leading on-the-fly requests haven't received the responses from the corresponding external memory. Thus, the rendering performance of this module can be improved compared to the case NCME bit is clear to 0.

If the bit is set to 0, this module does not issue any request if the leading on-the-fly request haven't received the responses. Thus, the memory band width consumed by this module can be smaller in a time unit.

The maximum number of destination data write requests is not constrained by NCME bit.

56.3.14 Double luminance plane processing mode

This additional mode will support input precision is 8bpp,10bpp, 12bpp,14bpp,16bpp and setting separated for double Y plane. In case of using DYP mode, set the enable bit CMRCR2.DYP=1.

1. 1st Y plane use CMRCR (SY12, SY10, Y12, Y10, DY1416, SY1416).
2. 2nd Y plane use CMRCR (SUV, DUV, SUV1416, DUV1416).
3. Source address and stride: Use setting of UVSSAR and UVSSTR for second Y plane.
4. Destination address: Use same setting registers with YUV semi-planar mode: DSAR + DSOR for second Y plane.
5. Destination Stride: Using UVDSTR if bit DCCR.UVDSTSEL = 1. Otherwise, use the same setting of DSTR for second Y plane.
6. Support only bilinear filter (BFE), don't support Pyramidal Image Filtering (TFE).
7. Do not support LUT for DYP mode (CMRCR2.LUTE=0).
8. Support output separate mode only.
9. Use same data format for input and output when using double luminance plane. And use same bit depth for double (both) Y plane.
10. Set CMRCR. EFPE = 1 and CMRCR.YISM = 1 when using DYP mode.
11. 2nd Y source data in single color mode depend on value of TRICR3.
12. DYP mode do not support Rotator and Scalar function. Set RSE bit in the RSCR to 0 when DYP mode=1.

Luminance correction function support as below:

1. Set YLMINR/YLMAXR for both Y in DYP mode.
2. Set CMRCR.LUSM, CMRCR.LUOM for both Y in DYP mode.
3. Set DYP_LSCAL and DYP_LOFST of YLCPR for second Y plane in DYP mode.
4. When DYP mode=1, use type (m) and using LUCE values from DL.

56.4 Display List

It is prohibited to use instructions not listed on this section.

56.4.1 TRI (Triangle)

(1) Function

TRI draws N-vertex strip-type triangles according to the number of vertexes, texture coordinates, and destination coordinates specified.

(2) Instruction Format

When destination coordinates (X, Y) or source coordinates (u, v) are automatically generated, omit them from the DL.When destination coordinates or source coordinates are not automatically generated and thus not omitted, arrange u, v, X, and Y in the memory in this order.
For absolute specification, arrange u, v, X, and Y in 16-bit units. Do not allow the automatically generated coordinates to exceed the drawing space in auto mode. If the destination coordinates are equal or larger 2,048, which is the maximum drawing space size, the corresponding pixels are not drawn.
The source drawing space is $0 \leq u < 2,048$ and $0 \leq v < 2,048$. If u or v exceeds the specified range, operation will be undefined.

The size of the circumscribed rectangle of a triangle must be less than 128 pixels for both X-direction and Y-direction.

For inputting the source coordinates to the DL in 16-bit units, the coordinates can be specified using the fixed point. In this case, specify the number of decimal places with UVDPOR (H'70). No register is provided for turning on/off fixed-point mode. Setting 0 to UVDPO in UVDPOR causes integer mode. In the DL figures below, N indicates the number of vertexes. For example, substitute 5 for N to draw a 5-vertex image. N < 3 is prohibited.

Drawing is performed only if the order of the first three vertexes of a specified list of vertexes matches the order that is specified by the TCM bit in the triangle mode register (TRIMR); if there is no match, drawing by the TRI instruction will not be performed.

For luminance/hue correction, specify the parameters in the DL. Even in the mode in which the parameters should be specified in the register, specify dummy parameters in the DL. In case of setting as Table 56.23, do not need to insert dummy parameters in DL. In this case, supported DL types are only the (a), (b) and (c). For details on luminance/hue correction, refer to section 56.3.8, Luminance/Hue Correction.OP CODE is H'8A for all the DL types. The DL type is determined by selecting either automatic coordinate generation mode with the triangle mode register (TRIMR) and enabling or disabling luminance/hue correction with the rendering mode register (CMRCR). When setting in CP32E/CP16E bits of CMRCR is 1, select DL type (a), (b) or (c), selecting others are prohibited.

Table 56.23 Support disable input dummy data in DL if use value of register.

TRIMR	CMRCR					
DIDL	CLSM	CLOM	LUSM	LUOM	CLCE	LUCE
1	0	0	1	1	0	1
1	1	1	0	0	1	0
1	1	1	1	1	1	1

56.4.2 NOP (No Operation)

(1) Function

NOP inserts N cycles of NOP into a drawing pipeline.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0000 (H'80)								Reserved (all 0)								N (1 ≤ N ≤ 65,535)															

It is not guaranteed that inserting N cycles of NOP into the drawing pipeline always delays the drawing completion exactly for N cycles. This is because the NOP cycles may overlap with the periods while drawing is stalled due to bus arbitration or cache hit/miss in the pixel-processing unit.

Substitute the number of NOP cycles to be inserted for N. Therefore, substitute X for N to insert X-number of NOP. Substituting 0 is prohibited. Note that N does not indicate the number of cycles in which stall actually occurs; it indicates the number of NOP instructions to be issued to the following stage.

56.4.3 TRAP

(1) Function

TRAP leads to completion of display list execution followed by the generation of an interrupt. If the TRAP instruction is to be used, insert a SYNCM instruction immediately before the TRAP instruction. If there is no SYNCM instruction, the operation will be undefined.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1111 (H'8F)								Reserved (all 0)																							

56.4.4 WTL (Write Register Long)

(1) Function

WTL writes data in 32-bit units to the N-number of consecutive registers starting at ADD. Set the address to ADD[23:16] in 32-bit (4-byte) units. For example, specify H'19 for TRIMSR (H'064). Note that WTL cannot write data to the registers in the area whose address exceeds 10 bits.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0001 (H'81)								ADD								N															
DATA 0																															
DATA 1																															
DATA 2																															
…																															
DATA N-1																															

N indicates the number of consecutive addresses to be written to. Substitute X for N to write to X-number of registers. Substituting 0 is prohibited. Immediately before writing to the registers related to memory access, a SYNCM instruction must be inserted. For details, refer to the descriptions on the registers.

56.4.5 WTL2 (Write Register Long 2)

(1) Function

WTL2 writes data in 32-bit units to the N-number of consecutive registers starting at ADD. Set the address to ADD[23:10] in 32-bit (4-byte) units. Note that WTL2 cannot write data to the registers in the area whose address exceeds 16 bits.

Although WTL and WTS can only set the registers allocated to the 10-bit address space, WTL2 can set the registers allocated to the 16-bit address space.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0011 (H'83)								ADD														N									
DATA 0																															
DATA 1																															
DATA 2																															
…																															
DATA N-1																															

N indicates the number of consecutive addresses to be written to. Substitute X for N to write to X-number of registers. Substituting 0 is prohibited. A maximum of 512 can be set. Immediately before writing to the registers related to memory access, a SYNCM instruction must be inserted. For details, refer to the descriptions on the registers.

56.4.6 WTS (Write Register Short)

(1) Function

WTS writes 16-bit data to the [15:0] bits in the register indicated by ADD.

Set the address to ADD[23:16] in 32-bit (4-byte) units. For example, specify H'19 for TRIMSR (H'064). Note that WTS cannot write data to the registers in the area whose address exceeds 10 bits.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0010 (H'82)								ADD								DATA															

WTS is a simplified version of WTL for reducing the DL size when writing to non-consecutive registers. Immediately before writing to the registers related to memory access, a SYNCM instruction must be inserted. For details, refer to the descriptions on the registers.

56.4.7 INT (Interrupt)

(1) Function

INT generates an interrupt if interrupts are enabled. To maintain coherence between the main memory and the internal cache when an interrupt is generated, insert a SYNCM instruction immediately before the INT instruction.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1000 (H'88)								Reserved (all 0)								N = 0															

56.4.8 SYNCM (Synchronize Memory)

(1) Function

After completion of the preceding instruction, SYNCM stalls execution of the next instruction until all dirty lines are written from the pixel cache to the memory. For example, SYNCM can be used to control coherence with data in memory. This instruction is essential to handle pre-processing for TRAP instructions. Always place a SYNCM instruction before any TRAP instruction.

For a display list read out to an internal buffer, a SYNCM instruction does not lead to any updating. Even if a display list in main memory is updated after the execution of a SYNCM instruction, the SYNCM instruction may not have any effect on subsequent execution of the display list.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0110 (H'86)								Reserved (all 0)																							

56.4.9 GOSUB (Go Subroutine)

(1) Function

GOSUB allows use of a subroutine call. DL execution jumps to the address specified with GSADD, and is returned to the caller by the RET instruction, which is described in the next section. Only one level of nesting is permitted. With the GOSUB instruction, it is not necessary to prepare two types of DL when issuing TRI instructions to the same coordinates for the same number of times, with different rendering modes and base addresses.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1100 (H'8C)								Reserved (all 0)																							
GSADD																													Reserved (all 0)		

56.4.10 RET (Return)

(1) Function

RET allows jumping to the DL address next to the address at which the GOSUB instruction is executed.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1101 (H'8D)								Reserved (all 0)																							

56.4.11 WUP (Wakeup)

(1) Function

WUP is used to transmit the corresponding synchronization signal to other modules. Once a module has transmitted this synchronization signal, it continues with execution of the subsequent instructions in the display list.

To transmit the synchronization signal to the module specified in the SYNCCm (m = 0 to 15) field of SYNCCRn (n = 0 to 3), set the corresponding bit of the SYNCC enable field to 1. For details, refer to section 56.3.11, Synchronized system between modules.

Be sure to insert at least eight instructions other than WUP between any two WUP instructions in the display list. Do not execute the WUP instruction to send the signal to a channel for which use of this instruction is prohibited. Refer to Table 56.21 Possible Combinations of Modules for Synchronized Operations .

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1010_0000 (H'A0)								Reserved (all 0)								SYNCC enable															

56.4.12 SLP (Sleep)

(1) Function

SLP is used to initiate a wait for the reception of the synchronization signal from other modules. The SLP instruction suspends execution of the subsequent instructions in the display list until the module has received a synchronization signal from the other module with which it is to be synchronized. Once a module has received the synchronization signal, it continues with the execution of the subsequent instructions in the display list.

To cause a wait for the reception of the synchronization signal from the module specified in the SYNCCm (m = 0 to 15) field of SYNCCRn (n = 0 to 3), set the corresponding bit of the SYNCC enable field to 1. For details, refer to section 56.3.11, Synchronized system between modules.

Do not execute the SLP instruction in the channel where use of this instruction is prohibited. and Table 56.21 Possible Combinations of Modules for Synchronized Operations for the applicable channels.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OP CODE = 1010_0001 (H'A1)	Reserved (all 0)	SYNCC enable

56.5 Rotator & Scaler Extension

56.5.1 Overview

This LSI chip incorporates extended functionality to handle the rotation and scaling-down of data processed by the IMR-LX6 and output of the results to external memory. This functionality is only present on certain channels. Rotation and scaling-down are only available for some channels. See Table 56.2 for availability of this function.

Figure 56.36 shows the relationship between the extended functionality for rotation and scaling-down and the basic function blocks. The figure also includes brief names that indicate the operations handled by the individual blocks of the extension.

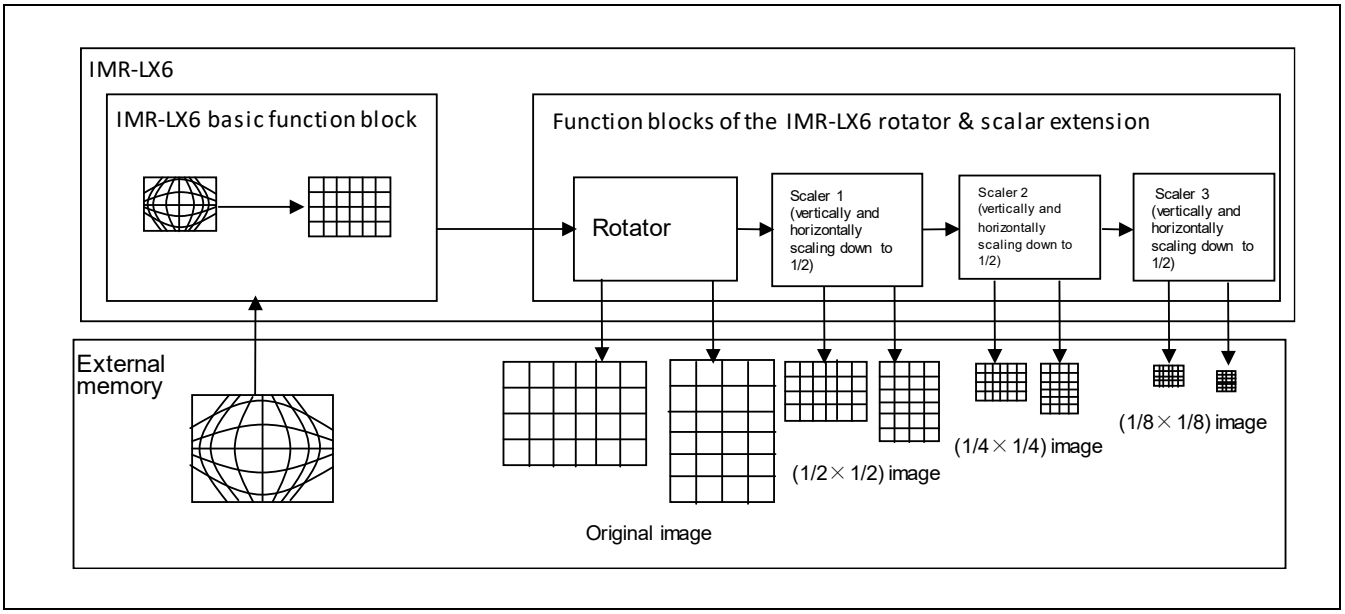

Figure 56.36 Block Diagram of the Rotator & Scaler Extension

The basic function block handles the correction of distortion in image data based on the instructions in the display list in the same way as the standard IMR-LX6. When the extended functions are in use, the basic function block outputs the distortion-corrected data to the extended function blocks instead of to the external memory.

The extended function blocks can handle the following processing of the input data.

- Rotation
  - Generation of flipped images
  - Simultaneous generation of rotated and non-rotated images in response to a single input from the basic function block
- Scaling-down
  - Recursive or simple vertical and horizontal scaling down by 1/2
    - Vertical and horizontal scaling down to 1/8
    - Filtering the results of scaling down (averaging the values of sets of neighboring four pixels)
    - 3x3 Gaussian Filter on Y Plane
  - Rotated or non-rotated images can be scaled down by 1/2, 1/4, or 1/8.
- Supported formats:
  - YUV422/YUV420 semi-planar as described in Table 56.13 (Y processing / UV processing is switched by CMRCR.YCM bit)
  - Bit depths: 8 bpp, 10 bpp, 12 bpp, 14 bpp, or 16 bpp

56.5.1.1 Register Configuration (1)

The registers of the extended functions are mapped to the same space as those of the basic function block. For the base addresses of each channel, see Table 56.2.

Do not write to any address other than those listed in the tables below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

56.5.1.2 Register Configuration (2)

Some of the registers in the IMR-LX6 can be rewritten using the WTS, WTL, or WTL2 instruction in the DL or accessed from a CPU while the IMR-LX6 is drawing data. In the following tables, √ indicates that the register can be rewritten using the WTS, WTL, or WTL2 instruction or that the register can be rewritten from a CPU during drawing operation.

56.5.2 Register Description

[Legend]

Initial value: Register value after a power-on reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should be the same as the read value. Only modify the target bit (Read Modify Write) because the initial value should not be changed.

–/W: Write-only. The read value is undefined.

56.5.2.1 Rotator and Scaler Control Register (RSCR)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RSE	0	R	This bit enables the extended functionality to handle rotation and scaling down. 0: The extended functionality is disabled. 1: The extended functionality is enabled. When the extended functionality is enabled, output from the basic function block is disabled. Set this bit to 0 when the setting of the YUV422E or DYP bit in the CMRCR2 is 1. Operation cannot be guaranteed if this bit is set to 1 while the setting of the YUV422E or DYP bit in the CMRCR2 is 1.
30	RSUVFLT	0	R	Specifies the algorithm to rotate the UV plane in YUV422 format. 0: Rotated in 2x2 block unit 1: Rotated during interpolation When this bit is 1, set this RSUV420 bit to 0.
29 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
25, 24	SC8SHFVAL	00	R	Number of bit positions for logical right shifting of the value following processing for vertical and horizontal reduction to 1/8. Set this field in accord with the combinations shown in Table 56.26 or Table 56.27.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
21, 20	SC4SHFVAL	00	R	Number of bit positions for logical right shifting of the value following processing for vertical and horizontal reduction to 1/4. Set this field in accord with the combinations shown in Table 56.26 or Table 56.27.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
17 to 16	SC2SHFVAL	00	R	Number of bit positions for logical right shifting of the value following processing for vertical and horizontal reduction to 1/2. Set this field in accord with the combinations shown in Table 56.26 or Table 56.27.
15	RSUV420	0	R	Specifies the YUV format of the input image. The algorithm to rotate the UV plane varies depending on the setting of this bit. The operation when the Y plane is input is not affected. 0: YUV422 format 1: YUV420 format When this bit is 1, set this RSUVFLT bit to 0. When processing the YUV420 format, setting 0 in this bit is prohibited.
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
13	BP8E	0	R	This bit selects whether to average or add the values of sets of neighboring four pixels as filtering in scaling down. 0: Four times of the average of the neighboring four pixels. 1: The values of the neighboring four pixels are added. This bit controls the output of data vertically and horizontally in scaling down from 1/4 to 1/8 of the size of the input. Regardless of the setting of this bit, the pixel format of the scaled down data is increased by two bits from that before scaling down proceeds. For example, if the pixel format before scaling down was 10 bpp, the pixel format after scaling down will become 12 bpp. Set the SC8SHFVAL field in this register and OFM8N and OFM8R fields in RSOFR so that the pixel value after scaling down is suitable.
12	RD8E	0	R	This bit specifies the rounding mode in the division when averaging of the neighboring four pixels in scaling down is selected. 0: Rounding down 1: Rounding to the nearest number This bit controls the output of data vertically and horizontally in scaling down from 1/4 to 1/8 of the size of the input. This bit is only valid when the setting of the BP8E bit is 0.

Bit	Bit Name	Initial Value	R/W	Description
11	BP4E	0	R	This bit selects whether to average or add the values of sets of neighboring four pixels as filtering in scaling down. 0: Four times of the average of the neighboring four pixels. 1: The values of the neighboring four pixels are added. This bit controls the output of data vertically and horizontally in scaling down from 1/2 to 1/4 of the size of the input. Regardless of the setting of this bit, the pixel format of the scaled down data is increased by two bits from that before scaling down proceeds. For example, if the pixel format before scaling down was 10 bpp, the pixel format after scaling down will become 12 bpp. Set the SC4SHFVAL field in this register and OFM4N and OFM4R fields in RSOFR so that the pixel value after scaling down is suitable.
10	RD4E	0	R	This bit specifies the rounding mode in the division when averaging of the neighboring four pixels in scaling down is selected. 0: Rounding down 1: Rounding to the nearest number This bit controls the output of data vertically and horizontally in scaling down from 1/2 to 1/4 of the size of the input. This bit is only valid when the setting of the BP4E bit is 0.
9	BP2E	0	R	This bit selects whether to average or add the values of sets of neighboring four pixels as filtering in scaling down. 0: Four times of the average of the neighboring four pixels. 1: The values of the neighboring four pixels are added. This bit controls the output of data vertically and horizontally in scaling down to 1/2 of the size of the input. Regardless of the setting of this bit, the pixel format of the scaled down data is increased by two bits from that before scaling down proceeds. For example, if the pixel format before scaling down was 10 bpp, the pixel format after scaling down will become 12 bpp. Set the SC2SHFVAL field in this register and OFM2N and OFM2R fields in RSOFR so that the pixel value after scaling down is suitable.
8	RD2E	0	R	This bit specifies the rounding mode in the division when averaging of the neighboring four pixels in scaling down is selected. 0: Rounding down 1: Rounding to the nearest number This bit controls the output of data vertically and horizontally in scaling down to 1/2 of the size of the input. This bit is only valid when the setting of the BP2E bit is 0.
7	RT8E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/8 in response to execution of the OUTROT instruction. 0: The data vertically and horizontally scaled down to 1/8 are not output in response to execution of the OUTROT instruction. 1: The data vertically and horizontally scaled down to 1/8 are output in response to execution of the OUTROT instruction.

Bit	Bit Name	Initial Value	R/W	Description
6	NR8E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/8 in response to execution of the OUTNOR instruction. 0: The data vertically and horizontally scaled down to 1/8 are not output in response to execution of the OUTNOR instruction. 1: The data vertically and horizontally scaled down to 1/8 are output in response to execution of the OUTNOR instruction.
5	RT4E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/4 in response to execution of the OUTROT instruction. 0: The data vertically and horizontally scaled down to 1/4 are not output in response to execution of the OUTROT instruction. 1: The data vertically and horizontally scaled down to 1/4 are output in response to execution of the OUTROT instruction.
4	NR4E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/4 in response to execution of the OUTNOR instruction. 0: The data vertically and horizontally scaled down to 1/4 are not output in response to execution of the OUTNOR instruction. 1: The data vertically and horizontally scaled down to 1/4 are output in response to execution of the OUTNOR instruction.
3	RT2E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/2 in response to execution of the OUTROT instruction. 0: The data vertically and horizontally scaled down to 1/2 are not output in response to execution of the OUTROT instruction. 1: The data vertically and horizontally scaled down to 1/2 are output in response to execution of the OUTROT instruction.
2	NR2E	0	R	This bit controls output of the data vertically and horizontally scaled down to 1/2 in response to execution of the OUTNOR instruction. 0: The data vertically and horizontally scaled down to 1/2 are not output in response to execution of the OUTNOR instruction. 1: The data vertically and horizontally scaled down to 1/2 are output in response to execution of the OUTNOR instruction.
1	RT1E	0	R	This bit controls output of the non-scaled data in response to execution of the OUTROT instruction. 0: The non-scaled data are not output in response to execution of the OUTROT instruction. 1: The non-scaled data are output in response to execution of the OUTROT instruction.
0	NR1E	0	R	This bit controls output of the non-scaled data in response to execution of the OUTNOR instruction. 0: The non-scaled data are not output in response to execution of the OUTNOR instruction. 1: The non-scaled data are output in response to execution of the OUTNOR instruction.

56.5.2.2 Rotator and Scaler Control Set Register (RSCSR)

This register is used to allow or disallow setting of the corresponding bits in the rotator and scaler control register (RSCR) to 1. Before setting a bit in RSCR to 1, write 1 to the corresponding bit in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RSES	0	–/W	0: The RSE bit in RSCR is not set to 1. 1: The RSE bit in RSCR is set to 1.
30	RSUVFLTS	0	–/W	0: The RSUVFLT bit in RSCR is not set to 1 1: The RSUVFLT bit in RSCR is set to 1.
29 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
25, 24	SC8SHFVALS	00	–/W	The bits of this field set the respective bits of the SC8SHFVAL field to 1. That is, writing 1 to a bit of this field sets the corresponding bit of the SC8SHFVAL field to 1. The corresponding bit of the SC8SHFVAL field retains its value in response to 0 being written to a bit of this field.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
21, 20	SC4SHFVALS	00	–/W	The bits of this field set the respective bits of the SC4SHFVAL field to 1. That is, writing 1 to a bit of this field sets the corresponding bit of the SC4SHFVAL field to 1. The corresponding bit of the SC4SHFVAL field retains its value in response to 0 being written to a bit of this field.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
17, 16	SC2SHFVALS	00	–/W	The bits of this field set the respective bits of the SC2SHFVAL field to 1. That is, writing 1 to a bit of this field sets the corresponding bit of the SC2SHFVAL field to 1. The corresponding bit of the SC2SHFVAL field retains its value in response to 0 being written to a bit of this field.
15	RSUV420S	0	–/W	0: The RSUV420 bit in RSCR is not set to 1. 1: The RSUV420 bit in RSCR is set to 1
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
13	BP8ES	0	–/W	0: The BP8E bit in RSCR is not set to 1. 1: The BP8E bit in RSCR is set to 1.
12	RD8ES	0	–/W	0: The RD8E bit in RSCR is not set to 1. 1: The RD8E bit in RSCR is set to 1.
11	BP4ES	0	–/W	0: The BP4E bit in RSCR is not set to 1. 1: The BP4E bit in RSCR is set to 1.
10	RD4ES	0	–/W	0: The RD4E bit in RSCR is not set to 1. 1: The RD4E bit in RSCR is set to 1.
9	BP2ES	0	–/W	0: The BP2E bit in RSCR is not set to 1. 1: The BP2E bit in RSCR is set to 1.
8	RD2ES	0	–/W	0: The RD2E bit in RSCR is not set to 1. 1: The RD2E bit in RSCR is set to 1.
7	RT8ES	0	–/W	0: The RT8E bit in RSCR is not set to1. 1: The RT8E bit in RSCR is set to 1.
6	NR8ES	0	–/W	0: The NR8E bit in RSCR is not set to 1. 1: The NR8E bit in RSCR is set to 1.
5	RT4ES	0	–/W	0: The RT4E bit in RSCR is not set to 1. 1: The RT4E bit in RSCR is set to 1.
4	NR4ES	0	–/W	0: The NR4E bit in RSCR is not set to 1. 1: The NR4E bit in RSCR is set to 1.
3	RT2ES	0	–/W	0: The RT2E bit in RSCR is not set to 1. 1: The RT2E bit in RSCR is set to 1.
2	NR2ES	0	–/W	0: The NR2E bit in RSCR is not set to 1. 1: The NR2E bit in RSCR is set to 1.
1	RT1ES	0	–/W	0: The RT1E bit in RSCR is not set to 1. 1: The RT1E bit in RSCR is set to 1.
0	NR1ES	0	–/W	0: The NR1E bit in RSCR is not set to 1. 1: The NR1E bit in RSCR is set to 1.

56.5.2.3 Rotator and Scaler Control Clear Register (RSCCR)

This register is used to allow or disallow clearing of the corresponding bits in the rotator and scaler control register (RSCR). Before clearing a bit in RSCR, write 1 to the corresponding bit in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSEC	RSUVFLTC	—	—	—	—	SC8SHFVALC		—	—	SC4SHFVALC		—	—	SC2SHFVALC	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	–/W	–/W	R	R	R	R	–/W	–/W	R	R	–/W	–/W	R	R	–/W	–/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSUV420C	—	BP8EC	RD8EC	BP4EC	RD4EC	BP2EC	RD2EC	RT8EC	NR8EC	RT4EC	NR4EC	RT2EC	NR2EC	RT1EC	NR1EC

Bit	Bit Name	Initial Value	R/W	Description
31	RSEC	0	–/W	0: Does not clear the RSE bit in RSCR to 0. 1: Clears the RSE bit in RSCR to 0.
30	RSUVFLTC	0	–/W	0: Does not clear the RSUVFLT bit in RSCR to 0. 1: Clears the RSUVFLT bit in RSCR to 0.
29 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
25, 24	SC8SHFVALC	00	–/W	The bits of this field clear the respective bits of the SC8SHFVAL field to 0. That is, writing 1 to a bit of this field clears the corresponding bit of the SC8SHFVAL field to 0. The corresponding bit of the SC8SHFVAL field retains its value in response to 0 being written to a bit of this field.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
21, 20	SC4SHFVALC	00	–/W	The bits of this field clear the respective bits of the SC4SHFVAL field to 0. That is, writing 1 to a bit of this field clears the corresponding bit of the SC4SHFVAL field to 0. The corresponding bit of the SC4SHFVAL field retains its value in response to 0 being written to a bit of this field.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
17, 16	SC2SHFVALC	00	–/W	The bits of this field clear the respective bits of the SC2SHFVAL field to 0. That is, writing 1 to a bit of this field clears the corresponding bit of the SC2SHFVAL field to 0. The corresponding bit of the SC2SHFVAL field retains its value in response to 0 being written to a bit of this field.
15	RSUV420C	0	–/W	0: Does not clear the RSUV420 bit in RSCR to 0. 1: Clears the RSUV420 bit in RSCR to 0.
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
13	BP8EC	0	–/W	0: Does not clear the BP8E bit in RSCR to 0. 1: Clears the BP8E bit in RSCR to 0.
12	RD8EC	0	–/W	0: Does not clear the RD8E bit in RSCR to 0. 1: Clears the RD8E bit in RSCR to 0.
11	BP4EC	0	–/W	0: Does not clear the BP4E bit in RSCR to 0. 1: Clears the BP4E bit in RSCR to 0.
10	RD4EC	0	–/W	0: Does not clear the RD4E bit in RSCR to 0. 1: Clears the RD4E bit in RSCR to 0.
9	BP2EC	0	–/W	0: Does not clear the BP2E bit in RSCR to 0. 1: Clears the BP2E bit in RSCR to 0.
8	RD2EC	0	–/W	0: Does not clear the RD2E bit in RSCR to 0. 1: Clears the RD2E bit in RSCR to 0.
7	RT8EC	0	–/W	0: Does not clear the RT8E bit in RSCR to 0. 1: Clears the RT8E bit in RSCR to 0.
6	NR8EC	0	–/W	0: Does not clear the NR8E bit in RSCR to 0. 1: Clears the NR8E bit in RSCR to 0.
5	RT4EC	0	–/W	0: Does not clear the RT4E bit in RSCR to 0 1: Clears the RT4E bit in RSCR to 0.
4	NR4EC	0	–/W	0: Does not clear the NR4E bit in RSCR to 0. 1: Clears the NR4E bit in RSCR to 0.
3	RT2EC	0	–/W	0: Does not clear the RT2E bit in RSCR to 0. 1: Clears the RT2E bit in RSCR to 0.
2	NR2EC	0	–/W	0: Does not clear the NR2E bit in RSCR to 0. 1: Clears the NR2E bit in RSCR to 0.
1	RT1EC	0	–/W	0: Does not clear the RT1E bit in RSCR to 0. 1: Clears the RT1E bit in RSCR to 0.
0	NR1EC	0	–/W	0: Does not clear the NR1E bit in RSCT to 0. 1: Clears the NR1E bit in RSCR to 0.

56.5.2.4 Rotator and Scaler Output Format Register (RSOFR)

This register is used to specify the pixel format in the three scalers within the extended function block. Set this register in accord with the combinations shown in Table 56.26 or Table 56.27. Use the CMRCR register to specify the pixel format for the rotator within the extended function block. When changing the setting of this register while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

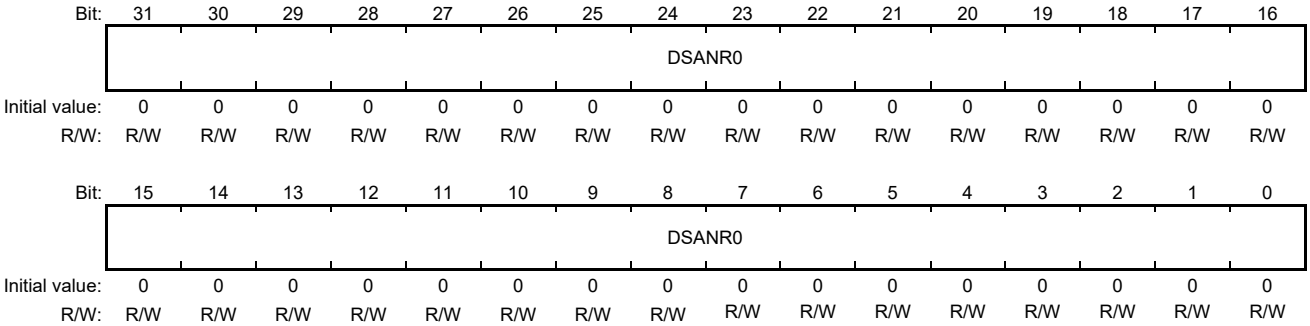
Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
26 to 24	OFM8R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/8. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT8E bit in RSCR is 1. When RT8E and NR8E bits in RSCR are 1, set the same value in OFM8R and OFM8N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	OFM4R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/4. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT4E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT4E and NR4E bits in RSCR are 1, set the same value in OFM4R and OFM4N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
18 to 16	OFM2R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/2. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT2E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT2E and NR2E bits in RSCR are 1, set the same value in OFM2R and OFM2N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	OFM8N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/8. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR8E bit in RSCR is 1. When RT8E and NR8E bits in RSCR are 1, set the same value in OFM8R and OFM8N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6 to 4	OFM4N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/4. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR4E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT4E and NR4E bits in RSCR are 1, set the same value in OFM4R and OFM4N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

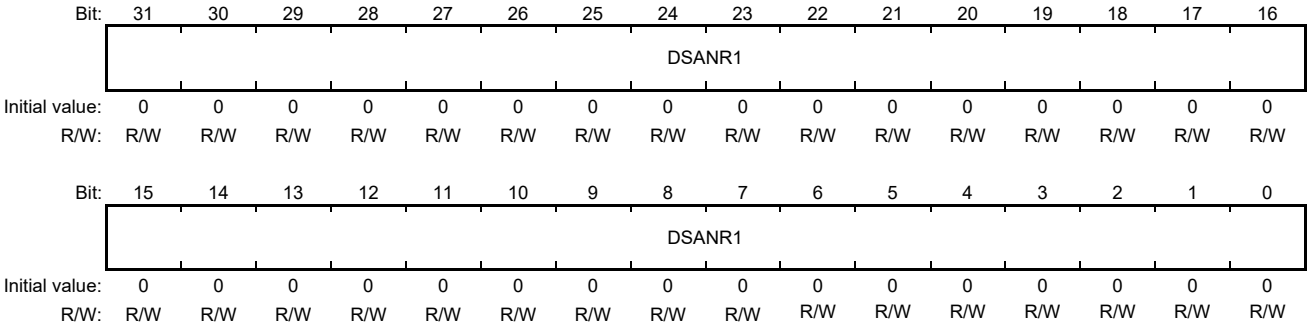
Bit	Bit Name	Initial Value	R/W	Description
2 to 0	OFM2N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/2. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR2E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT2E and NR2E bits in RSCR are 1, set the same value in OFM2R and OFM2N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.

56.5.2.5 Destination Start Address for Non-Rotated Image Register 0 (DSANRR0)



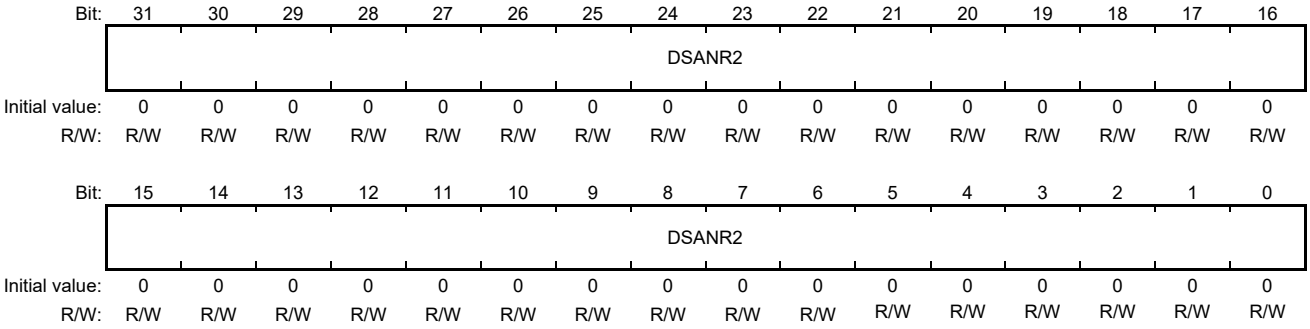
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSANR0	All 0	R/W	These bits specify the base address in bytes of the destination for the output of non-rotated images with unchanged size. Setting should be aligned to 128-byte unit address for 16bpp and 64-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.6 Destination Start Address for Non-Rotated Image Register 1 (DSANRR1)



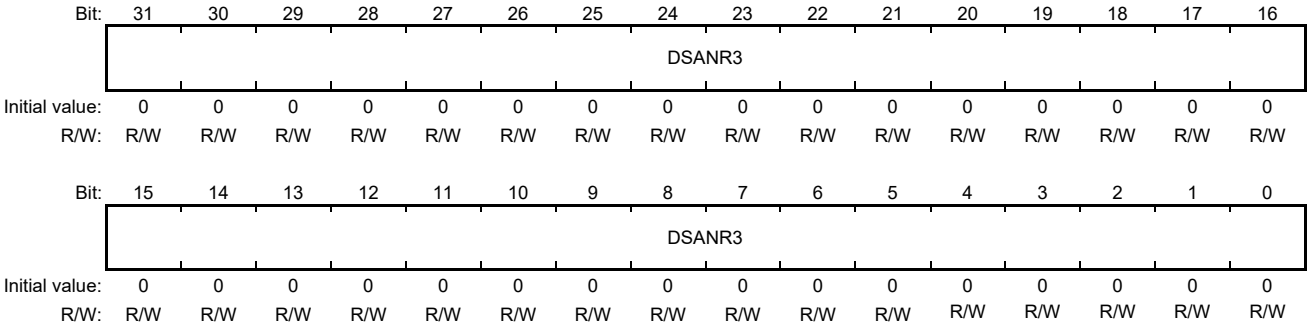
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSANR1	All 0	R/W	These bits specify the base address in bytes of the destination for non-rotated images horizontally and vertically scaled down to 1/2. Setting should be aligned to 64-byte unit address for 16bpp and 32-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register

56.5.2.7 Destination Start Address for Non-Rotated Image Register 2 (DSANRR2)



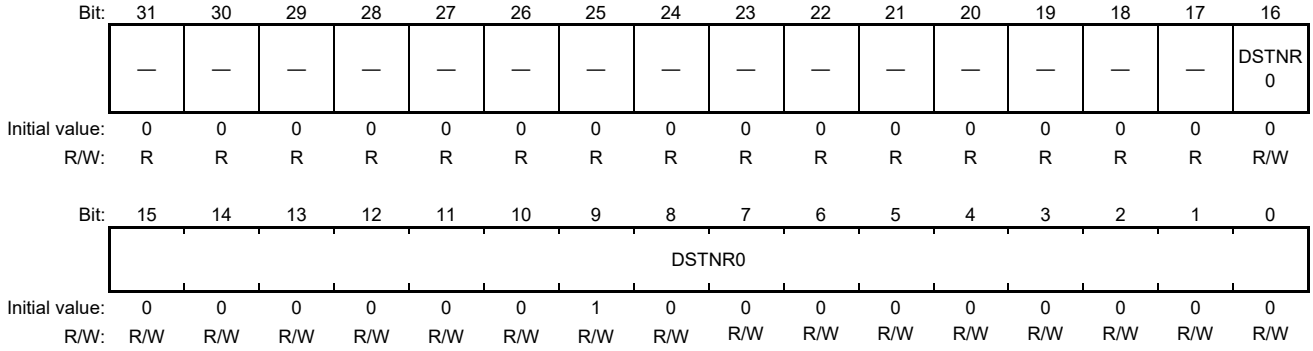
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSANR2	All 0	R/W	These bits specify the base address in bytes of the destination for non-rotated images horizontally and vertically scaled down to 1/4. Setting should be aligned to 32-byte unit address for 16bpp and 16-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.8 Destination Start Address for Non-Rotated Image Register 3 (DSANRR3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSANR3	All 0	R/W	These bits specify the base address in bytes of the destination for non-rotated images horizontally and vertically scaled down to 1/8. Setting should be aligned to 16-byte unit address for 16bpp and 8-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.9 Destination Stride for Non-Rotated Image Register 0 (DSTNRR0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DSTNR0	H'000200	R/W	These bits specify the stride in bytes at the destination for the output of non-rotated images with unchanged size. The minimum setting of this register is 64-byte and the maximum setting of this register is 65,536-byte. And the setting should be aligned to 128-byte unit for 16bpp and 64-byte unit for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.10 Destination Stride for Non-Rotated Image Register 1 (DSTNRR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

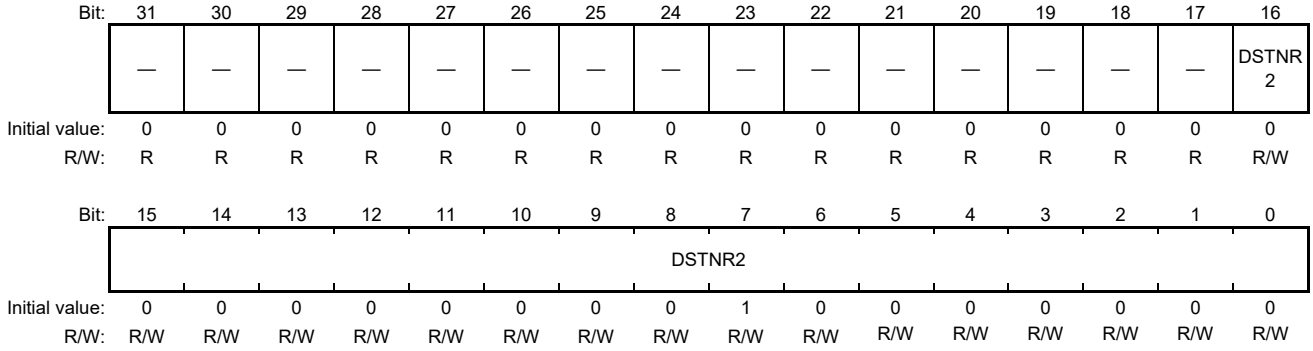
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

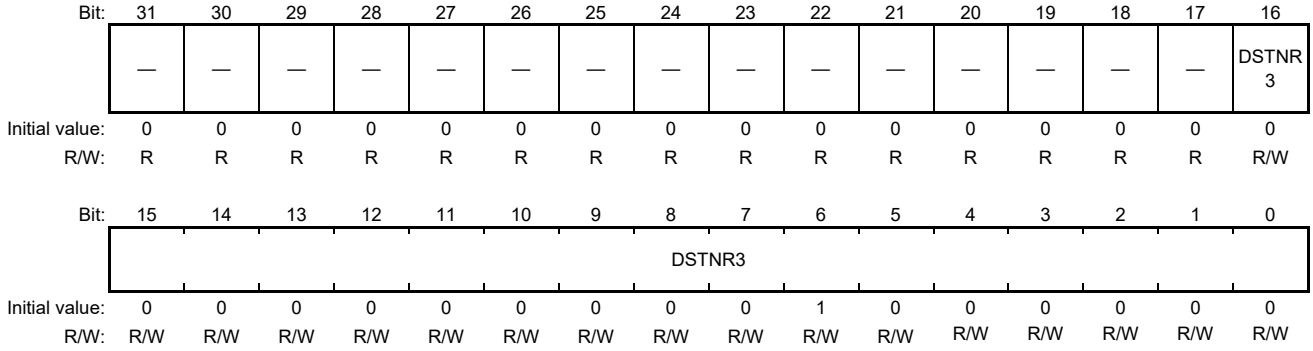
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DSTNR1	H'000100	R/W	These bits specify the stride in bytes at the destination for the output of non-rotated images horizontally and vertically scaled down to 1/2. The minimum setting of this register is 32-byte and the maximum setting of this register is 65,536-byte. And the setting should be aligned to 64-byte unit for 16bpp and 32-byte unit for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.11 Destination Stride for Non-Rotated Image Register 2 (DSTNRR2)



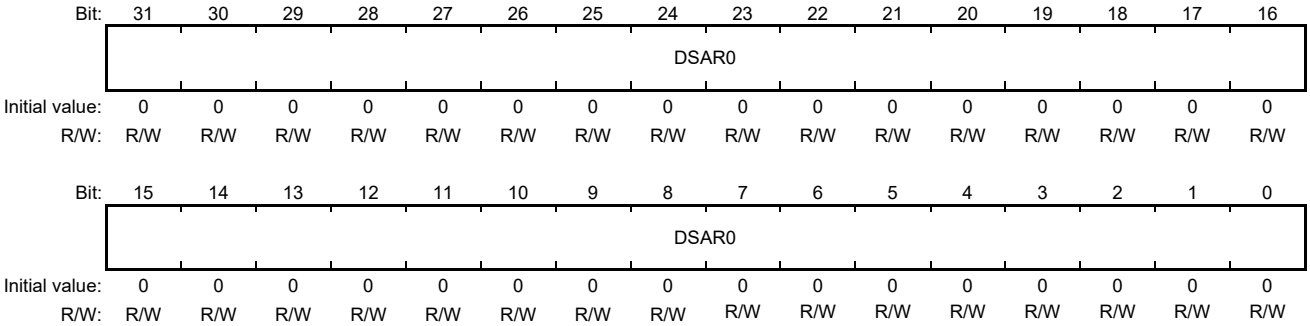
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DSTNR2	H'00080	R/W	These bits specify the stride in bytes at the destination for the output of non-rotated images horizontally and vertically scaled down to 1/4. The minimum setting of this register is 16-byte and the maximum setting of this register is 65,536-byte. And the setting should be aligned to 32-byte unit for 16bpp and 16-byte unit for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.12 Destination Stride for Non-Rotated Image Register 3 (DSTNRR3)



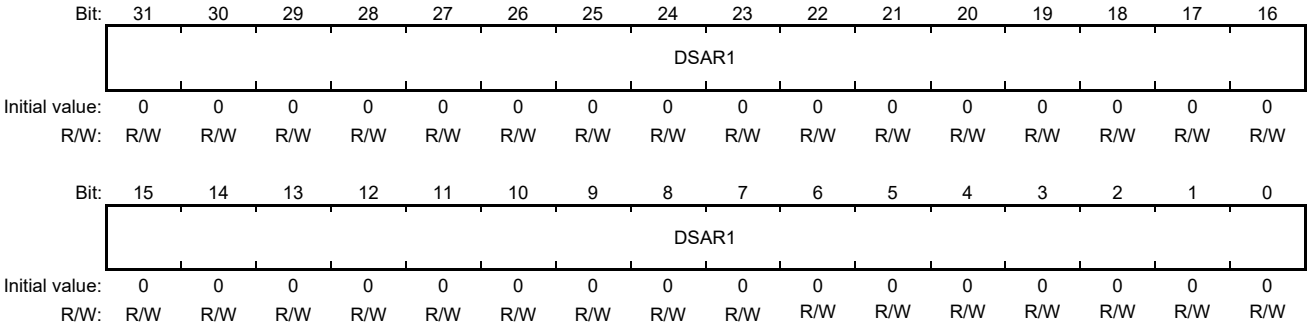
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DSTNR3	H'00040	R/W	These bits specify the stride in bytes at the destination for the output of non-rotated images horizontally and vertically scaled down to 1/8. The minimum setting of this register is 8-byte and the maximum setting of this register is 65,536-byte. And the setting should be aligned to 16-byte unit for 16bpp and 8-byte unit for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.13 Destination Start Address for Rotated Image Register 0 (DSARR0)



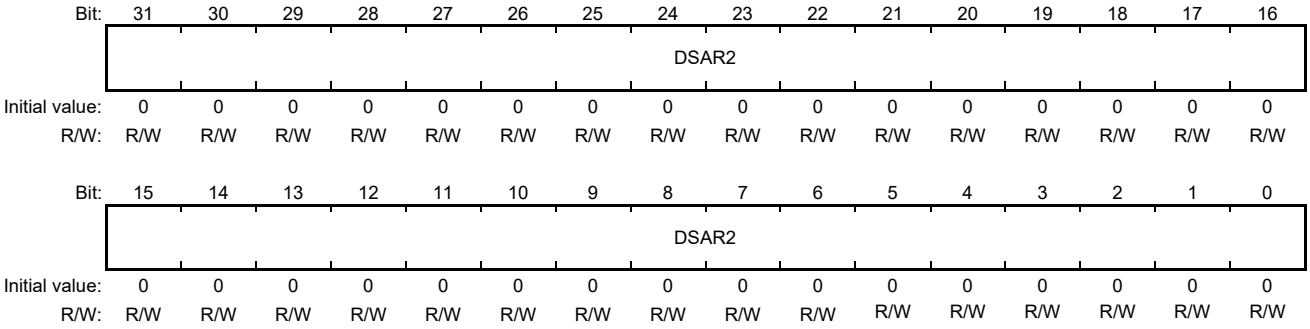
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAR0	All 0	R/W	These bits specify the base address in bytes of the destination for the output of rotated images with unchanged size. Setting should be aligned to 128-byte unit address for 16bpp and 64-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.14 Destination Start Address for Rotated Image Register 1 (DSARR1)



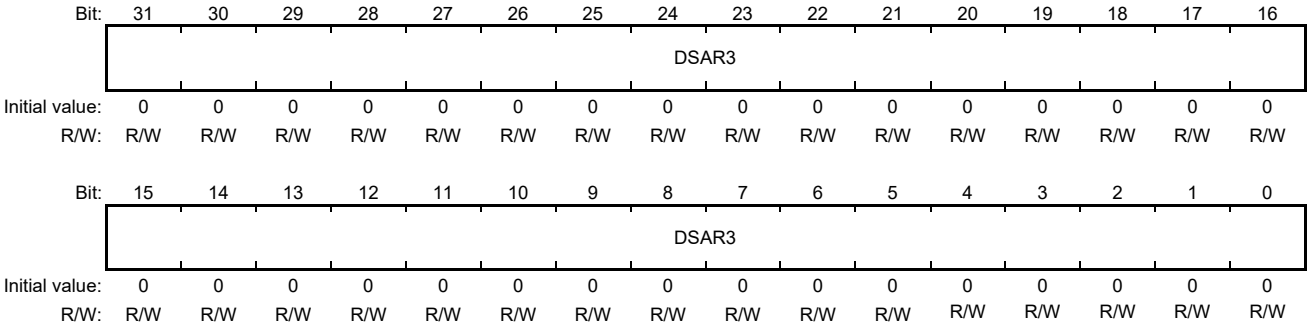
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAR1	All 0	R/W	These bits specify the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/2. Setting should be aligned to 64-byte unit address for 16bpp and 32-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.15 Destination Start Address for Rotated Image Register 2 (DSARR2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAR2	All 0	R/W	These bits specify the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/4. Setting should be aligned to 32-byte unit address for 16bpp and 16-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.16 Destination Start Address for Rotated Image Register 3 (DSARR3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAR3	All 0	R/W	These bits specify the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/8. Setting should be aligned to 16-byte unit address for 16bpp and 8-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.17 Destination Stride for Rotated Image Register 0 (DSTRR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DSTR3	H'00020	R/W	These bits specify the stride in bytes at the destination for the output of rotated images horizontally and vertically scaled down to 1/8. The minimum setting of this register is 8-byte and the maximum setting of this register is 65,536-byte. And the setting should be aligned to 16-byte unit for 16bpp and 8-byte unit for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

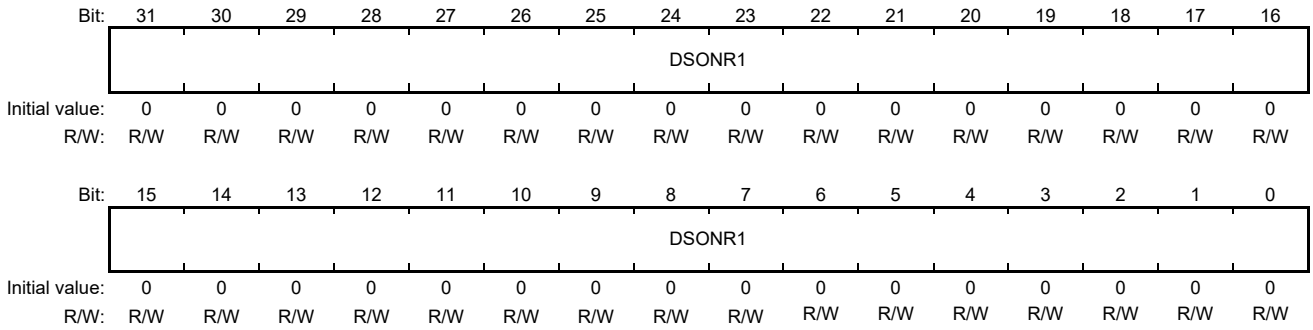
56.5.2.21 Destination Start Address Offset for Non-Rotated Image Register 0 (DSONRR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSONR0															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSONR0															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

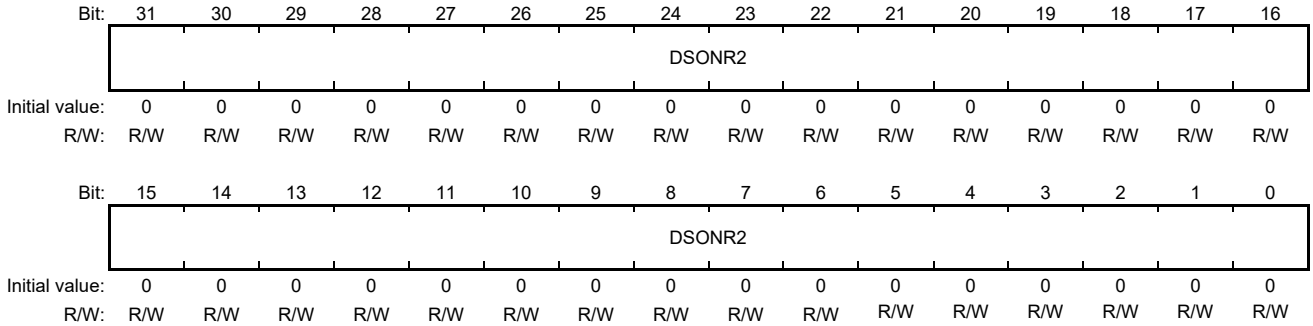
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSONR0	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of non-rotated images with unchanged size. Setting should be aligned to 128-byte unit address for 16bpp and 64-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.22 Destination Start Address Offset for Non-Rotated Image Register 1 (DSONRR1)



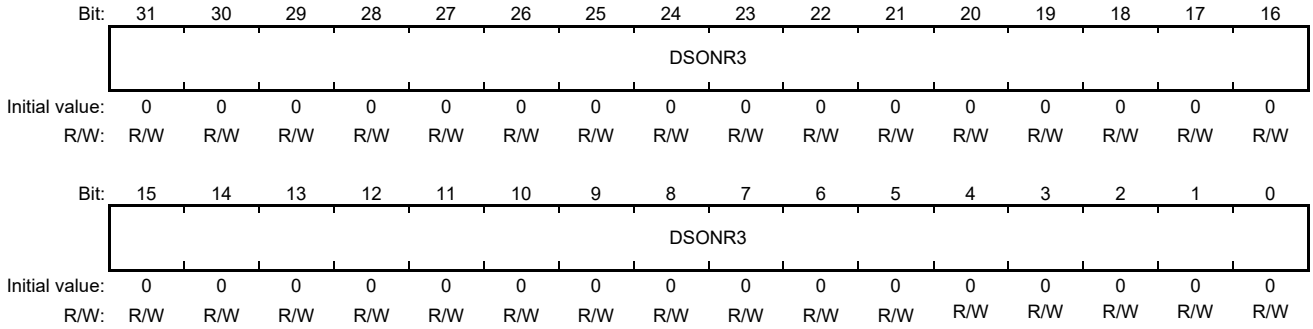
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSONR1	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of non-rotated images vertically and horizontally scaled down to 1/2. Setting should be aligned to 64-byte unit address for 16bpp and 32-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.23 Destination Start Address Offset for Non-Rotated Image Register 2 (DSONRR2)



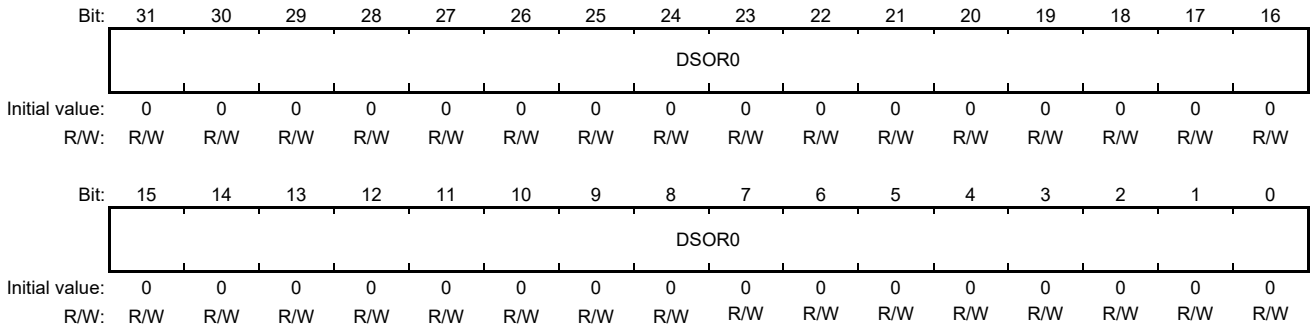
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSONR2	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of non-rotated images vertically and horizontally scaled down to 1/4. Setting should be aligned to 32-byte unit address for 16bpp and 16-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.24 Destination Start Address Offset for Non-Rotated Image Register 3 (DSONRR3)



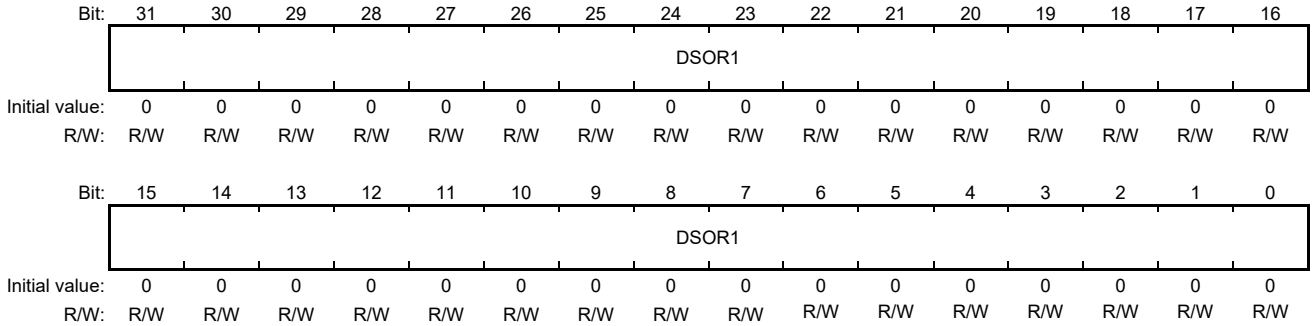
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSONR3	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of non-rotated images vertically and horizontally scaled down to 1/8. Setting should be aligned to 16-byte unit address for 16bpp and 8-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.25 Destination Start Address Offset for Rotated Image Register 0 (DSORR0)



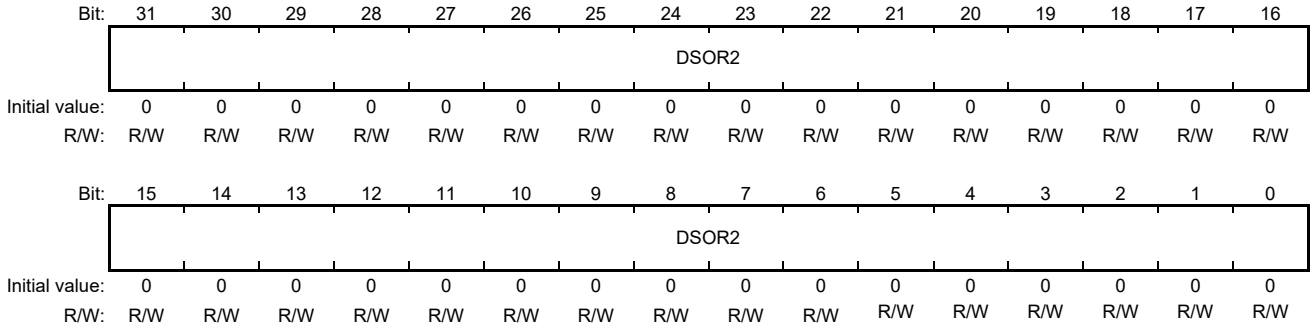
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSOR0	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of rotated images with unchanged size. Setting should be aligned to 128-byte unit address for 16bpp and 64-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.26 Destination Start Address Offset for Rotated Image Register 1 (DSORR1)



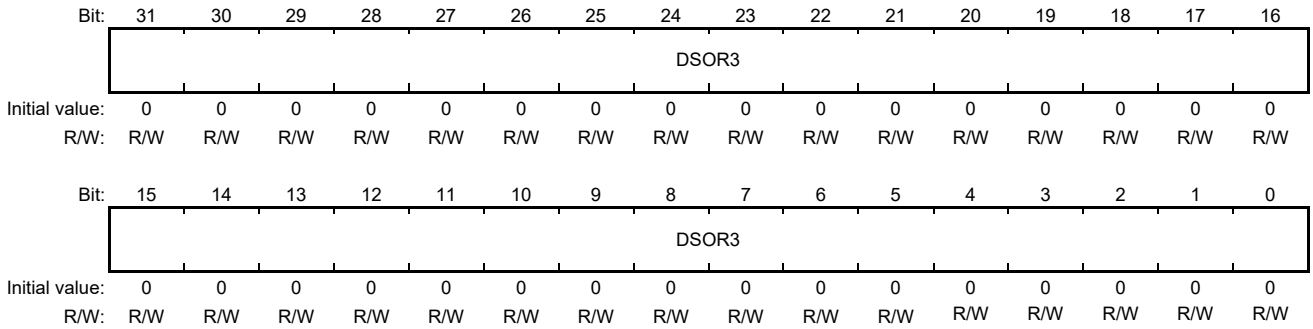
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSOR1	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/2. Setting should be aligned to 64-byte unit address for 16bpp and 32-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.27 Destination Start Address Offset for Rotated Image Register 2 (DSORR2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSOR2	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/4. Setting should be aligned to 32-byte unit address for 16bpp and 16-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.28 Destination Start Address Offset for Rotated Image Register 3 (DSORR3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSOR3	All 0	R/W	These bits specify the offset from the base address in bytes of the destination for the output of rotated images vertically and horizontally scaled down to 1/8. Setting should be aligned to 16-byte unit address for 16bpp and 8-byte unit address for 8bpp. When changing the setting of this bit field while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

56.5.2.29 Gaussian Filter Control Register (GFCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SC8GSFHVAL				SC4GSFHVAL				SC2GSFHVAL

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
27 to 24	SC8GSFHVAL	4	R/W	When calculating the Gaussian filter, this bit sets the number of digits of right-shifting after multiplying by the coefficient. This setting is used for vertically and horizontally scaling down the input image to 1/8 of the original size.
23 to 20	SC4GSFHVAL	4	R/W	When calculating the Gaussian filter, this bit sets the number of digits of right-shifting after multiplying by the coefficient. This setting is used for vertically and horizontally scaling down the input image to 1/4 of the original size.
19 to 16	SC2GSFHVAL	4	R/W	When calculating the Gaussian filter, this bit sets the number of digits of right-shifting after multiplying by the coefficient. This setting is used for vertically and horizontally scaling down the input image to 1/2 of the original size.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
10	GRD8E	0	R/W	Sets the handling of the value after the decimal point in the calculation result when calculating the Gaussian filter. 0: Truncates the value after the decimal point 1: Rounds off the value after the decimal point This setting is used for vertically and horizontally scaling down the input image to 1/8 of the original size.
9	GRD4E	0	R/W	Sets the handling of the value after the decimal point in the calculation result when calculating the Gaussian filter. 0: Truncates the value after the decimal point 1: Rounds off the value after the decimal point This setting is used for vertically and horizontally scaling down the input image to 1/4 of the original size.
8	GRD2E	0	R/W	Sets the handling of the value after the decimal point in the calculation result when calculating the Gaussian filter. 0: Truncates the value after the decimal point 1: Rounds off the value after the decimal point This setting is used for vertically and horizontally scaling down the input image to 1/2 of the original size.
7	UPE	0	R/W	0: Does not apply padding to the top of the image 1: Applies padding to the top of the image if the Gaussian filter is applied This bit can be set to 1 only when the GFE bit of this register is 1. Otherwise, clear it to 0.
6	DPE	0	R/W	0: Does not apply padding to the bottom of the image 1: Applies padding to the bottom of the image if the Gaussian filter is applied This bit can be set to 1 only when the GFE bit of this register is 1. Otherwise, clear it to 0.

5	LPE	0	R/W	0: Does not apply padding to the left edge of the image 1: Applies padding to the left edge of the image if the Gaussian filter is applied This bit can be set to 1 only when the GFE bit of this register is 1. Otherwise, clear it to 0.
4	RPE	0	R/W	0: Does not apply padding to the right edge of the image 1: Applies padding to the right edge of the image if the Gaussian filter is applied This bit can be set to 1 only when the GFE bit of this register is 1. Otherwise, clear it to 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
0	GFE	0	R/W	Gaussian Filter Enable 0: 2x2 averaging filter for scaling-down 1: 3x3 Gaussian filter for scaling-down This bit can be set to 1 only when processing Y plane. When processing UV plane, clear it to 0. This bit should be set before starting to render using the TRI command, to which the desired filter is expected to be applied. It is prohibited to change the setting within one divided area.

56.5.2.30 Rotator and Scaler Control Register 2 (RSCR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

56.5.2.33 Gaussian Filter Output Format Register (GFOFR)

This register is used to specify the pixel format in the three scalers within the extended function block. Set this register in accord with the combinations shown in Table 56.26 or Table 56.27. Use the CMRCR register to specify the pixel format for the rotator within the extended function block. When changing the setting of this register while the module is drawing data, execute the SYNCM instruction immediately before writing to this register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
26 to 24	GFM8R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/8 after the Gaussian Filter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussian Filter exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT8E bit in RSCR is 1. When RT8E bit in RSCR is 1, set the same value in OFM8R bits in RSOFR and GFM8R. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	GFM4R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/4 after the Gaussian Filter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussian Filterexceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT4E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT4E bit in RSCR is 1, set the same value in OFM4R bits in RSOFR and GFM4R. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
18 to 16	GFM2R	000	R/W	These bits specify the format of the image rotated and vertically and horizontally scaled down to 1/2 after the Gaussian Filter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussian Filter exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when RT2E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When RT2E bit in RSCR is 1, set the same value in OFM2R bits in RSOFR and GFM2R. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	GFM8N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/8 after the Gaussian Filter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussian Filter exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR8E bit in RSCR is 1. When NR8E bit in RSCR is 1, set the same value in OFM8N bits in RSOFR and GFM8N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6 to 4	GFM4N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/4 after the Gaussian filter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussan filter exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR4E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When NR4E bit in RSCR is 1, set the same value in OFM4N bits in RSOFR and GFM4N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	GFM2N	000	R/W	These bits specify the format of the non-rotated image vertically and horizontally scaled down to 1/2 after the Gaussianfilter. 0: 8 bpp 1: 10 bpp 2: 12 bpp 3: 14 bpp 4: 16 bpp Others: Setting prohibited When the pixel value calculated in scaling down of Gaussian filter exceeds the range of the format specified in this bit field, the calculated value is saturated to the maximum range of the format specified in this bit field. The saturated pixel value is output to the external memory when NR2E bit in RSCR is 1 and input to the scaler for the next stage of scaling. When NR2E bit in RSCR is 1, set the same value in OFM2N bits in RSOFR and GFM2N. The output image is written to external memory in 1-byte/pixel units if the format setting is 8 bpp, and in 2-byte/pixel units for the other format settings. The output values are flushed to the LSB with all format settings.

56.5.3 Operation

56.5.3.1 Output of the non-rotated or rotated image data

This section explains how to use the extended function blocks on the condition that an executable display list is present for the basic function block. For usage of the basic function block, see sections 56.1 through 56.4.

The settings of some registers are common to the basic and extended function blocks. For example, switching between the Y processing mode and UV processing mode is handled by the YCM bit in CMRCR. The formats of input and output pixels in the rotator and of input pixels in scaler 1 in Figure 56.36 are set by the DUV1416, DY1416, Y12, Y10, and DUV fields in CMRCR.

To use the extended function blocks, set the RSE bit in RSCR to 1.

Note: The number of pixels of the area and the sub-area described in the following section indicates the number of data of the plane to be processed. For example, when processing the UV plane in YUV420 format, the data in one line of the UV plane corresponds to one pixel in the vertical direction of the plane as described in the following section. The line does not correspond to one pixel in the vertical direction of the Y plane.

(1) Dividing up the Image to be Processed

The image dividing method differs depending on the filtering method used for the scaling-down function which will described later in the document. This section first describes the basic 2x2 averaging filter and then its derivation, the 3x3 Gaussian filter. The Gaussian filter can be used only when processing Y plane. It cannot be used when processing UV plane.

(a) Dividing method when applying the 2x2 averaging filter

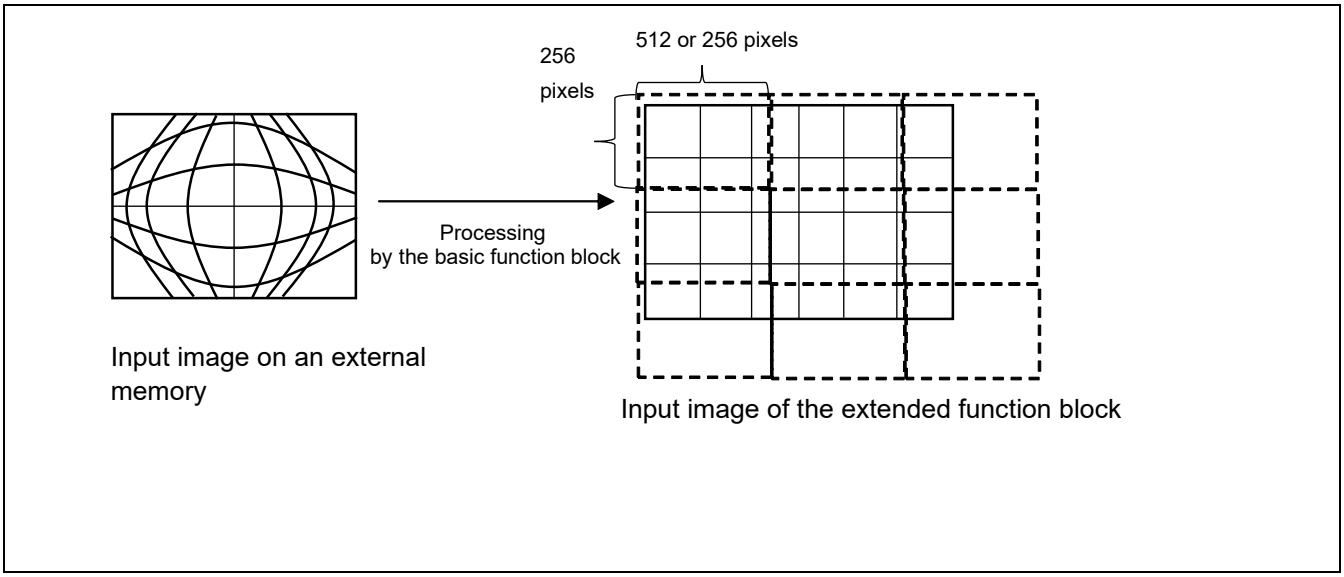

Figure 56.37 Dividing up the Image to be Processed when the Extended Functions are in Use

The function blocks of the extension can handle images with up to 512 pixels horizontally x 256 vertically*1 or with up to 256 pixels horizontally x 256 vertically*2. Accordingly, if the image to be processed in the basic function block exceeds these maximum numbers of pixels, the image has to be divided up.

Figure 56.37 shows the concept of dividing up the image. The dotted rectangles on the input image of the extended function block indicate the maximum size the extended function block can handle. In this example, the input image of the extended function block is divided into nine areas. Here, the display list for processing

by the basic function block must be created such that drawing proceeds in order through the units of the rectangular regions indicated by the broken lines. Drawing operations that straddle boundaries between the rectangular regions are prohibited.

Before starting to draw in each area, set the registers DSANRRn, DSTNRRn, DSARRn, DSTRRn, DSONRRn, and DSORRn so that each area is drawn in the desired location. Also set the NRnE and RTnE bits in RSCR as required. For details, see the descriptions of the respective registers.

Notes: 1. When the input from the basic function block is 8 bpp and all of the outputs from the extended function block are 8 bpp.
2. When the input from the basic function block is more than 8 bpp or any of the outputs from the extended function block is more than 8 bpp.

(b) Dividing method when applying the 3x3 Gaussian filter

The size of the output image after being applied the 3x3 Gaussian filter is one pixel smaller at each border per down-scale level. Therefore, for the image dividing process that requires this extended function, an overlapping area is required between the divided images.

The dividing process is as below:

1. Divide the entire image into 512 x 256 (8bpp) or 256 x 256 (others) similar to when the 2x2 averaging filter is applied[*1]. If there is any area smaller than 512 x 256 or 256 x 256 left, put it at the right bottom edge.
2. Expand the up, down, left, right edges of that area by 7 pixels and take it as the divided area. However, the areas that touch the top, bottom, left and right edges of the divided image are not expanded.

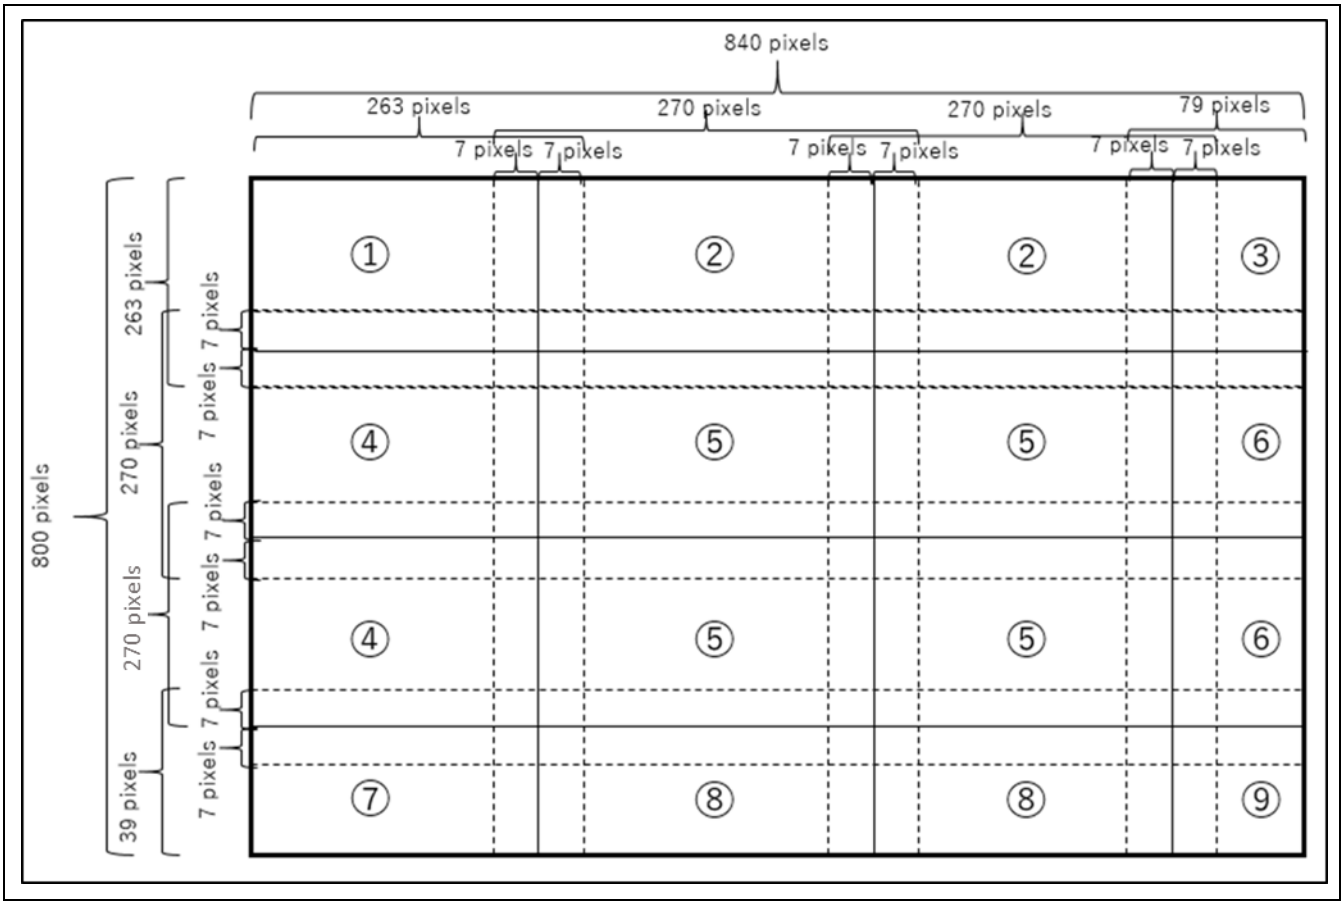

Figure 56.38 Example of dividing an 840x800 image (2-Byte/pixel) using 3x3 Gaussian filter

The figure above shows an example of dividing an input image with 2-Byte/pixel. 9 areas are created depending on the size after dividing. For example, after ⑤ is divided into 256x256 areas, expand all the up, down, left, right edges by 7 pixels, each area will increase to the size of 270x270. Additionally, ⑤ has areas that overlap with all areas that touch the up, down, left, right edges. On the other hand, in ⑨, dividing 840x800 area by 256 both vertically and horizontally results in 72x32. The right and bottom edges touch the outer circumference of the divided image and will not be expanded. The left and top edges will be expanded by 7 pixels and the size of the area increases to 79x39.

(2) Further dividing up the first area following initial division

The method to divide into sub-areas described in this section is also different depending on whether the 2x2 averaging filter or 3x3 Gaussian filter is used. First, the section describes the dividing method when the 2x2 averaging filter is used and then the method when the 3x3 Gaussian filter is used.

(a) Dividing method when using 2x2 averaging filter

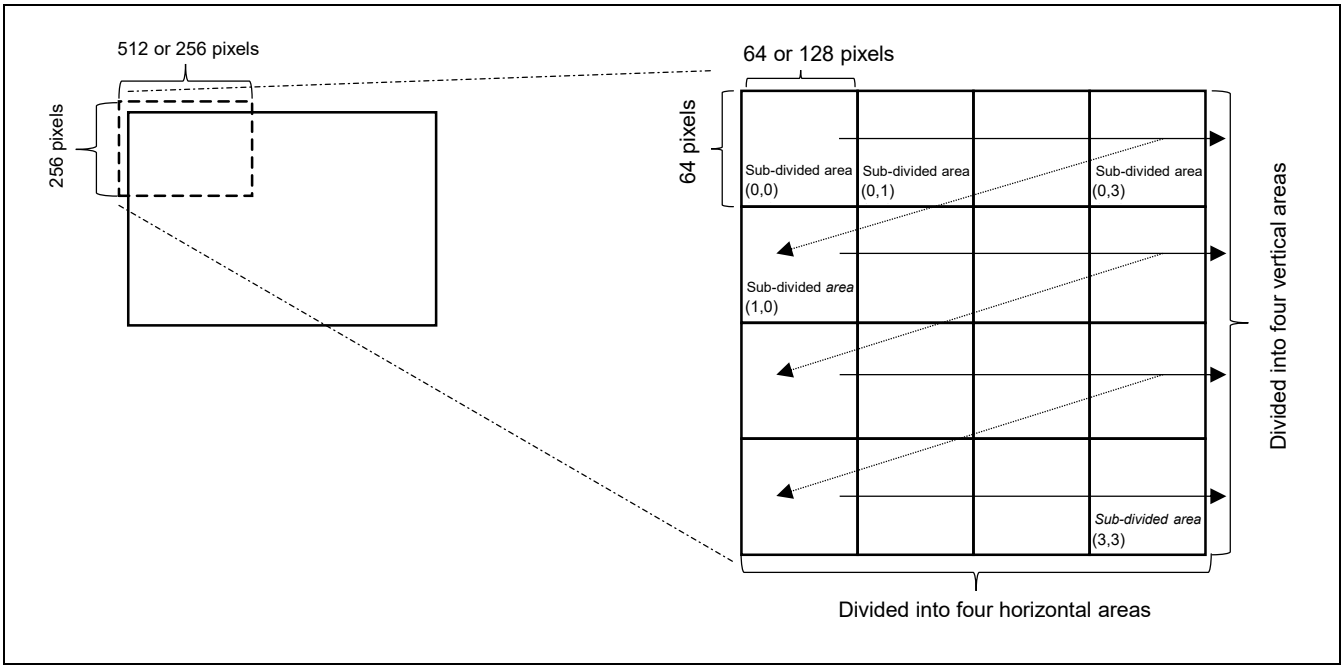

Figure 56.39 Further Dividing the First Area Following Initial Division

For the processing in the extended function block, the divided areas need to be further divided into four sub-divided areas vertically and horizontally.

Figure 56.39 shows the concept of further dividing the first divided area. Each divided area is further divided into sub-divided areas with 128 horizontal x 64 vertical pixels (when the input from the basic function block is 8 bpp) or 64 horizontal x 64 vertical pixels (when the input from the basic function block is not 8 bpp). If input from the basic function block is 8 bpp and any output of the extended function block is other than 8 bpp, usage with the 256-pixel horizontally x 256-pixel vertically area horizontally divided in two and vertically divided into four so that there are eight small areas in all is possible. The size of each small area thus becomes 128 x 64. In other cases, usage with the 512 x 256 or 256 x 256 area horizontally and vertically divided into four so that there are 16 small areas is possible. The explanation below is on the assumption of horizontal and vertical division into four.

You should organize the display list for the basic function block so that it specifies the image to be drawn in the 128 x 64 or 64 x 64 units of the sub-divided areas. It also should specify the X and Y coordinates of the top left of the sub-divided areas to be (0,0). The u and v values do not require a change.

In general, drawing should start from the top left and proceed along the X-axis in the positive direction, and then along the Y-axis in the positive direction, and so on (as indicated by the arrows in Figure 56.39). But, if necessary, user can change the drawing order, it is user responsibility to confirm the rendering is finished for the target ROW or COLUMN before OUTNOR or OUTROT instructions are executed.

Note: Figure 56.39 shows further dividing the first area following initial division except for processing the UV plane in YUV420 format, For UV plane in YUV420 format refer to Figure 56.40.

When processing the UV plane in YUV420 format, as described in Figure 56.40 for the sub-area of 4 rows, only 2 rows from the top can be used. Therefore, the output data in one line corresponds to the image of two pixels in vertical direction, the number of lines in each divided area is 128 lines. Please refer to the Table 56.13, Note 6 before creating the TRI command in DL for processing of the UV plane in YUV420 format in Rotator & Scaler extension.

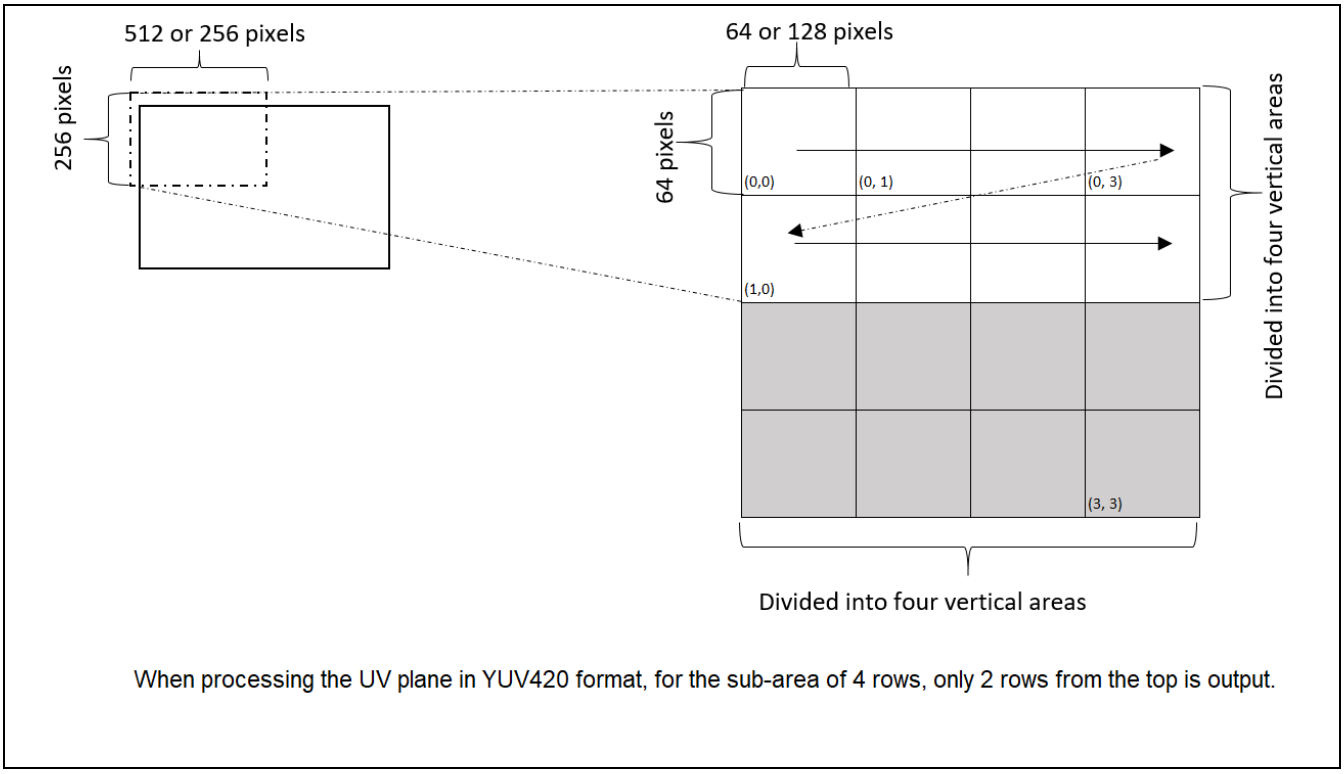

Figure 56.40 Further Dividing the First Area Following Initial Division When processing the UV plane in YUV420 format

(b) Dividing method when using 3x3 Gaussian filter

When applying 3x3 Gaussian filter, the method to divide into 4x4 sub-areas is similar to when applying 2x2 averaging filter. However, the size of each sub-area is different. The size also varies depending on the position of the area to be divided into sub-areas in the entire output image. The rendering order is the same as when using the 2x2 averaging filter.

The content below explains the basic case in which the area does not touch the outer circumference of the entire output image, and then the case in which it touches each of four edges of the outer circumference.

In either case, regardless of whether there are any empty area, the origin of the x/y coordinate to be rendered is the upper left end of the sub-area specified by STRECT.

If the area does not touch the outer circumference

This section describes the division when the area to be divided does not touch any of the four edges of the entire output image. It corresponds to area ⑤ in Figure 56.38.

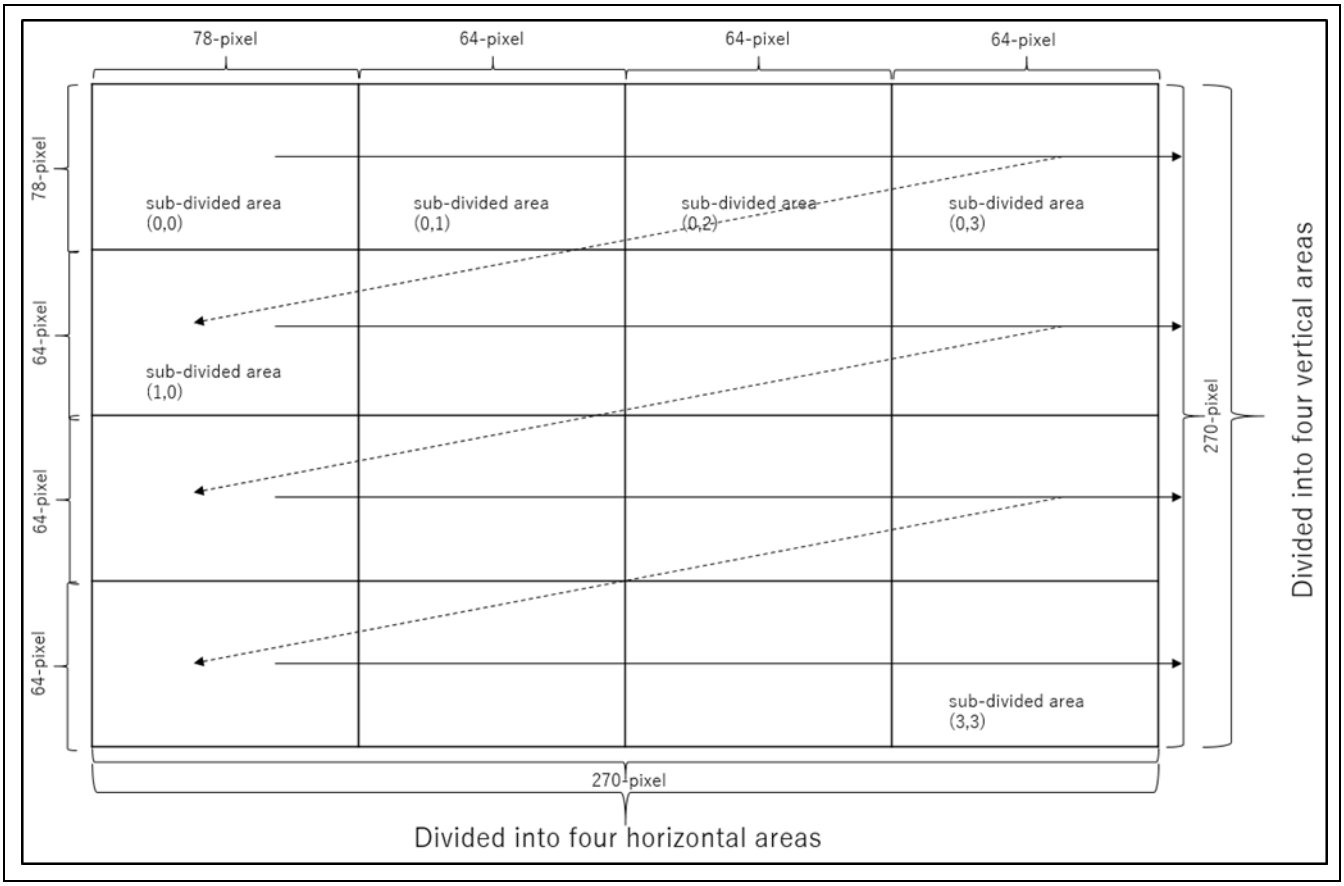

Figure 56.41 Dividing into sub-areas – If the area does not touch any of the four edges of the output image (2-Byte/pixel)

Figure 56.41 shows the division into sub-areas when the pixel input from the basic function block is 2-Byte/pixel. The 270x270 area is divided into 4x4 sub-areas. The height of the sub-area in the top-edge rows is 78 pixels, the width of the sub-area in the left-edge column is 78 pixels, the height and width of other small areas are both 64 pixels.

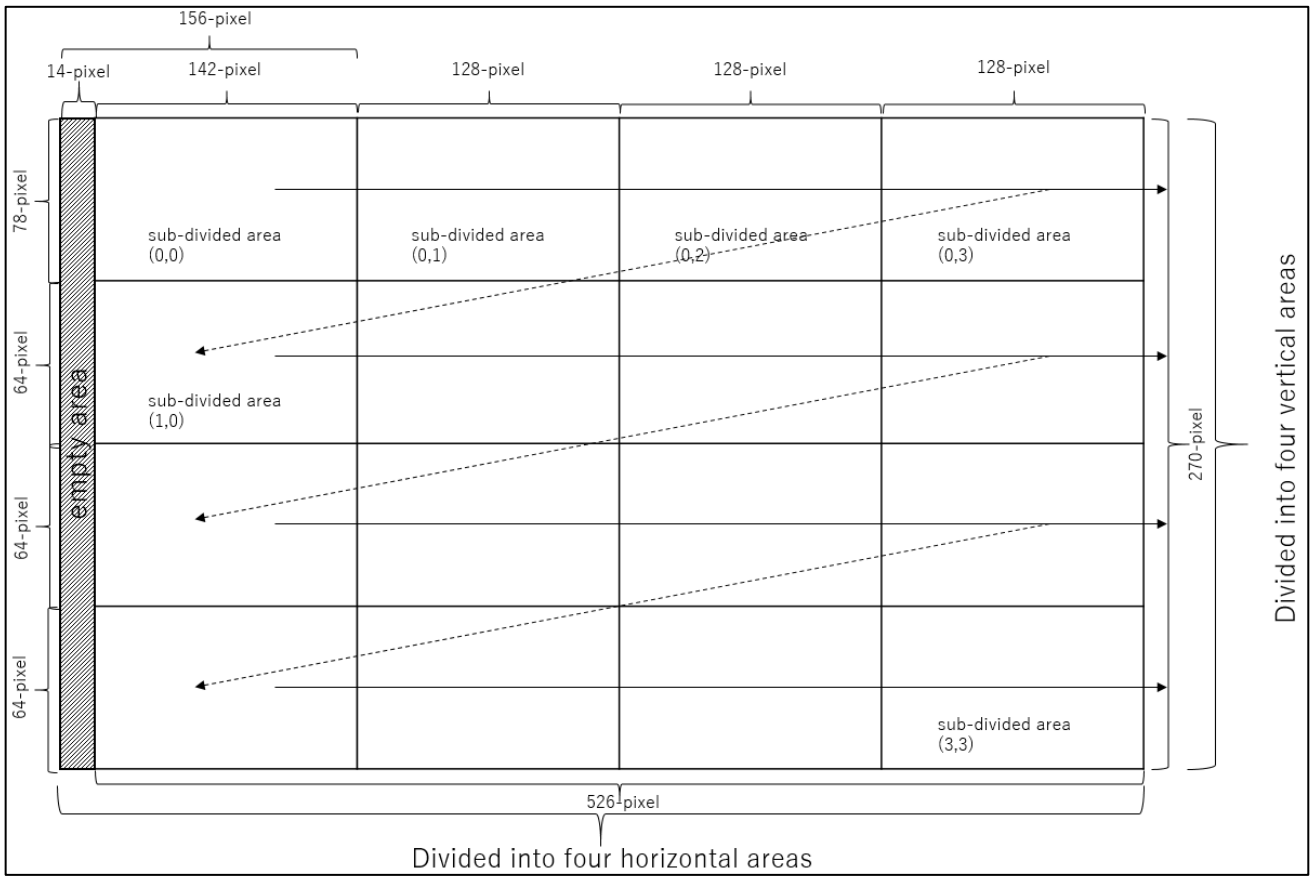

Figure 56.42 Dividing into sub-areas – If the area does not touch any of the four edges of the output image (1-Byte/pixel)

Figure 56.42 shows the division when the pixel input from the basic function block is 1-Byte/pixel. The 526x270 area is divided into 4x4 small areas. The width of the sub-area in the top-edge row is 142 pixels, the height of the sub-areas in the left-edge column is 78 pixels. The width and height of other sub-areas is 128 pixels and 64 pixels, respectively.

Besides, an empty area with a width of 14 pixels is generated at the left edge of the entire area (the shaded area). When specifying to render one of these sub-areas (0, 0), (1, 0), (2, 0), (3, 0) using the STRECT command, which is described later, the coordinate with the x coordinate corresponding from 0 to 13 (the place indicated by "empty area" in Figure 56.42) should not be written to and also should not be rendered.

When the area touches the upper edge

This section describes the division when the target area to be divided into sub-areas touches the upper edge of the entire output image. It corresponds to sub-areas ①, ②, ③ in Figure 56.38.

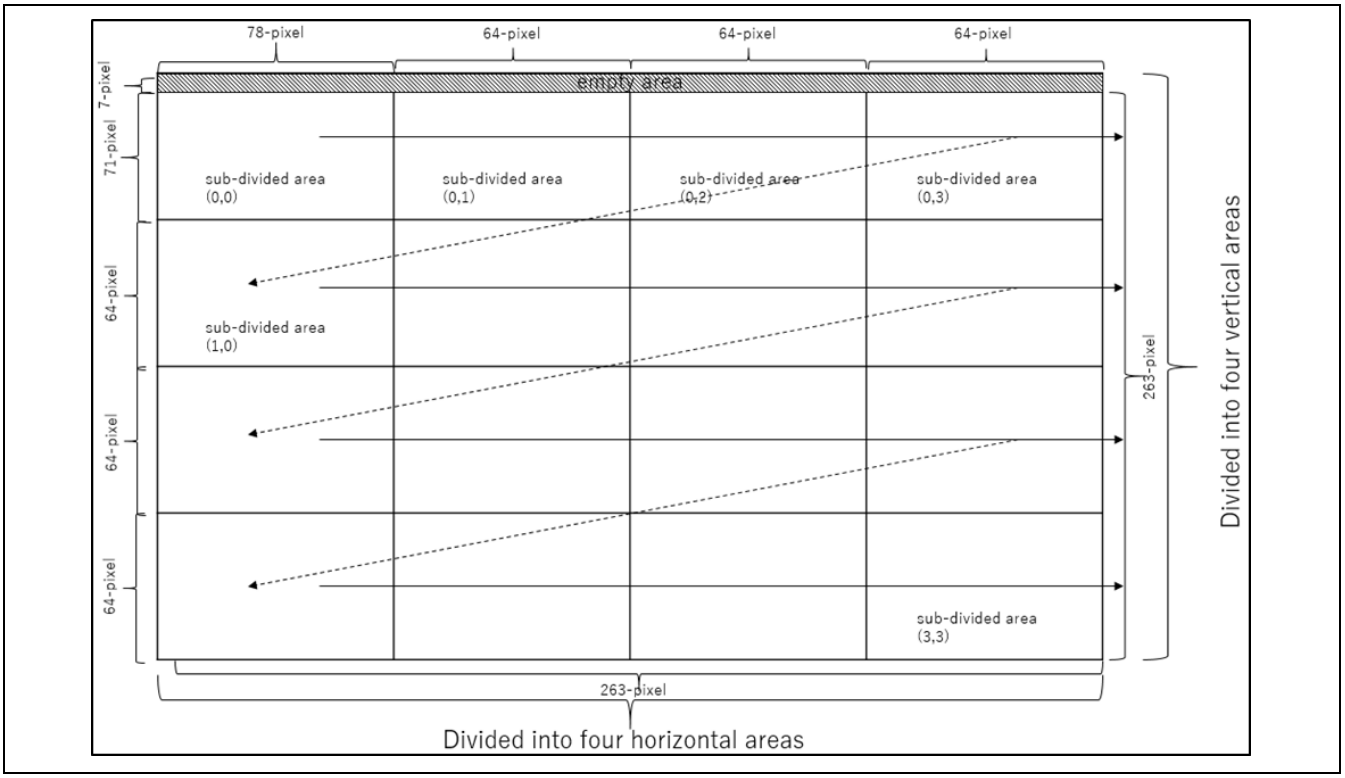

Figure 56.43 Dividing into sub-areas – When the area touches the upper edge of the output image (2-Byte/pixel)

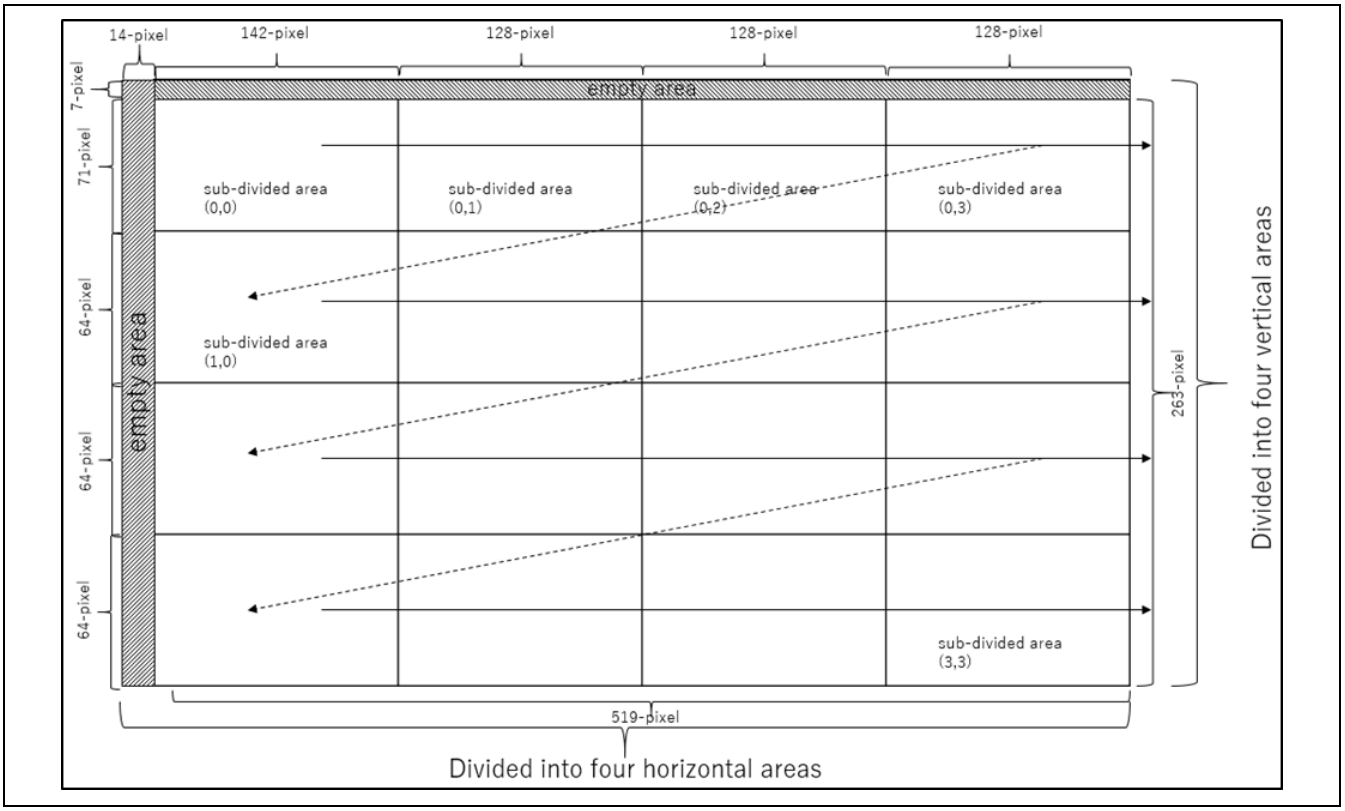

Figure 56.44 Dividing into sub-areas – When the area touches the upper edge of the output image (1-Byte/pixel)

Figure 56.43 shows the division when it touches the upper edge and the pixel input from the basic function block is 2-Byte/pixel. And Figure 56.44 shows the division when the area touches the upper edge and the pixel input from the basic function block is 1-Byte/pixel.

When the area touches the upper edge, an empty area with a height of 7 pixels will appear at the top edge of the entire area (the shaded area). Therefore, when specifying to render one of these sub-areas (0, 0), (0, 1), (0, 2), (0, 3) with STRECT, which is described later, the coordinate with the y coordinate corresponding from 0 to 6 (the place indicated by "empty area" at the top of Figure 56.43 and Figure 56.44) should not be written to and also should not be rendered. Also, similar to the case when the area does not touch the outer circumference, and the pixel input from the basic function block is 1-Byte/pixel, if specifying to render one of these sub-areas (0, 0), (1, 0), (2, 0), (3, 0) using the STRECT command, which is described later, the coordinate with the x coordinate corresponding from 0 to 13 (the place indicated by "empty area" at the left of Figure 56.44) should not be written to and also should not be rendered.

When the area touches the lower edge

This section describes the division when the target area to be divided into sub-areas touches the lower edge of the entire output image. It corresponds to small areas ⑦, ⑧, ⑨ in Figure 56.38.

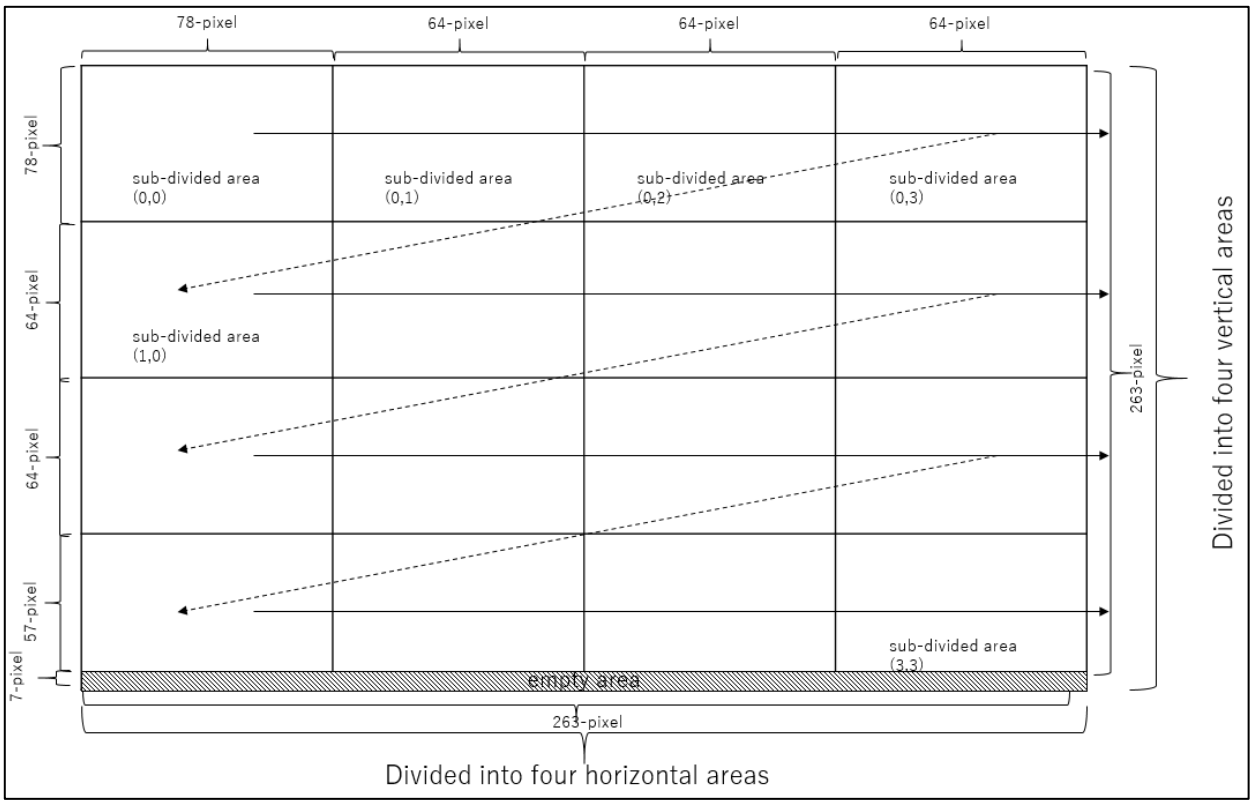

Figure 56.45 Dividing into sub-areas – When the touches the lower edge of the output image (2-Byte/pixel)

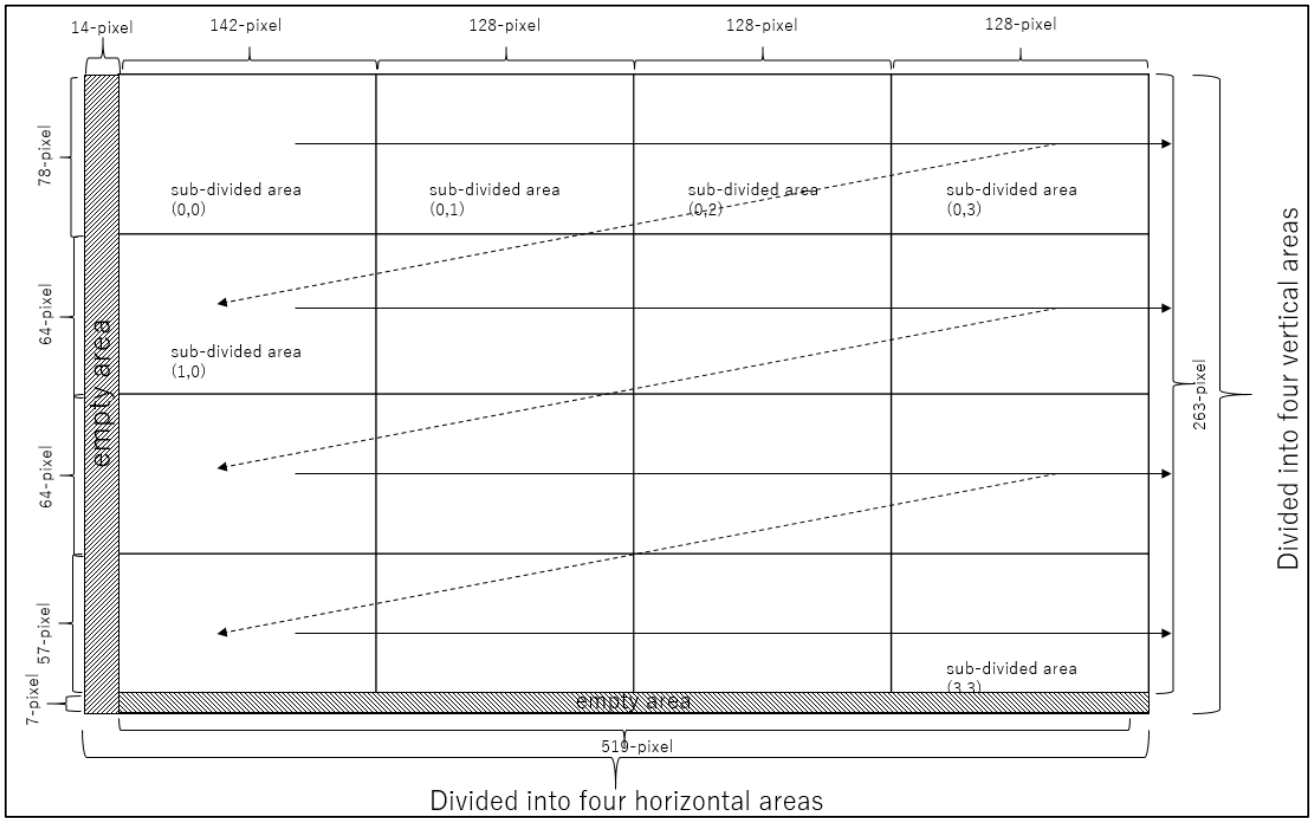

Figure 56.46 Dividing into sub-areas – When the touches the lower edge of the output image (1-Byte/pixel)

Figure 56.45 shows the division when the area touches the lower edge and the pixel input from the basic function block is 2-Byte/pixel. And Figure 56.46 shows the division when the area touches the lower edge and the pixel input from the basic function block is 1-Byte/pixel.

When the area touches the lower edge, an empty area with a height of 7 pixels will appear at the bottom edge of the entire area (the shaded area). Therefore, when specifying to render one of these sub-areas (3, 0), (3, 1), (3, 2), (3, 3) with STRECT, which is described later, the coordinate with the y coordinate corresponding from 57 to 63 (the place indicated by "empty area" at the bottom of Figure 56.45 and Figure 56.46 should not be written to and also should not be rendered. Also, similar to the case when the area does not touch the outer circumference, and the pixel input from the basic function block is 1-Byte/pixel, if specifying to render one of these sub-areas (0, 0), (1, 0), (2, 0), (3, 0) with the STRECT command, which is described later, the coordinate with the x coordinate corresponding from 0 to 13 (the place indicated by "empty area" at the left of Figure 56.46) should not be written to and also should not be rendered.

If the number of pixels in the vertical direction to be rendered is less than the number of pixels shown above, specify the number of pixels in the YWIDTH field of the OUTNOR and OUTROT commands, which are described later.

When the area touches the left edge

This section describes the division when the target area to be divided into sub-areas touches the left edge of the entire output image. It corresponds to small areas ①, ④, ⑦ in Figure 56.38.

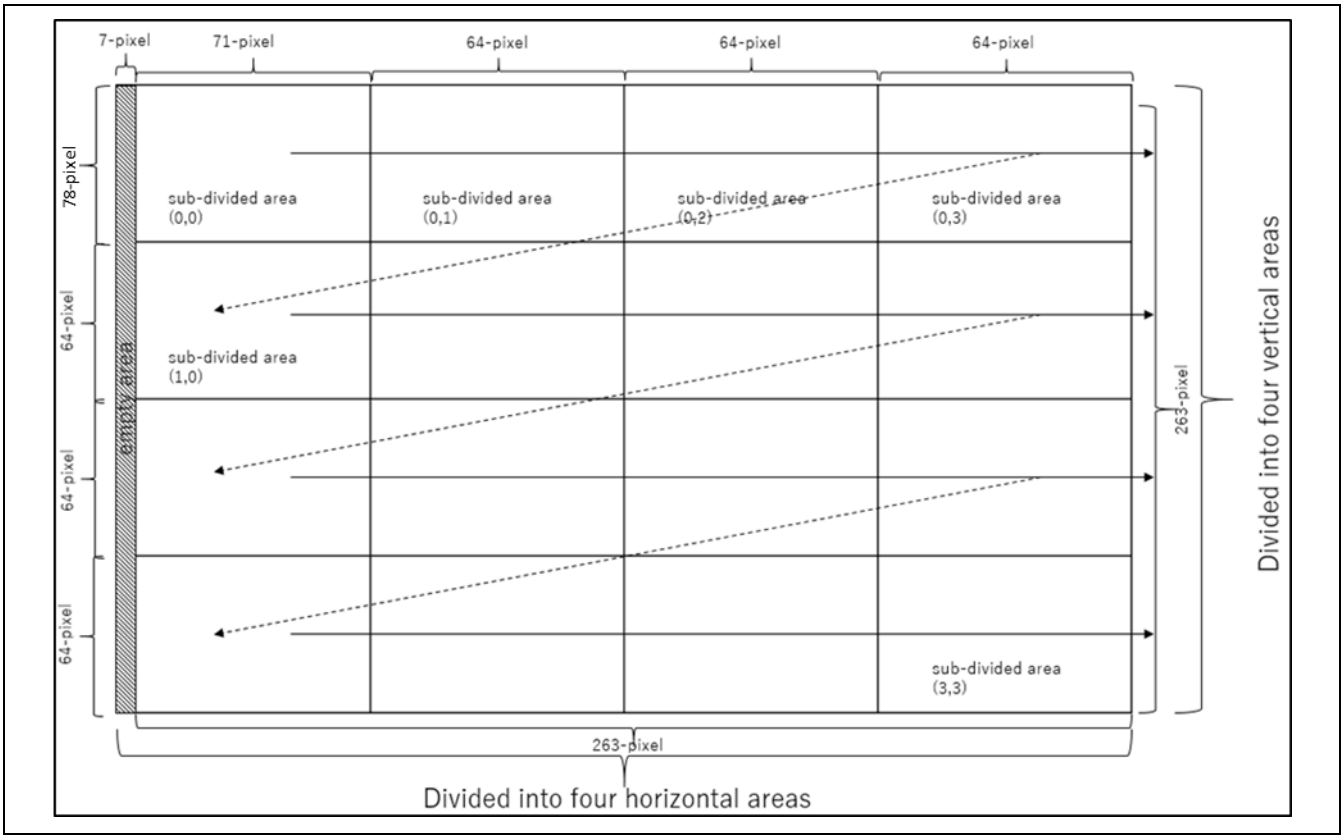

Figure 56.47 Dividing into sub-areas – When the area touches the left edge of the output image (2-Byte/pixel)

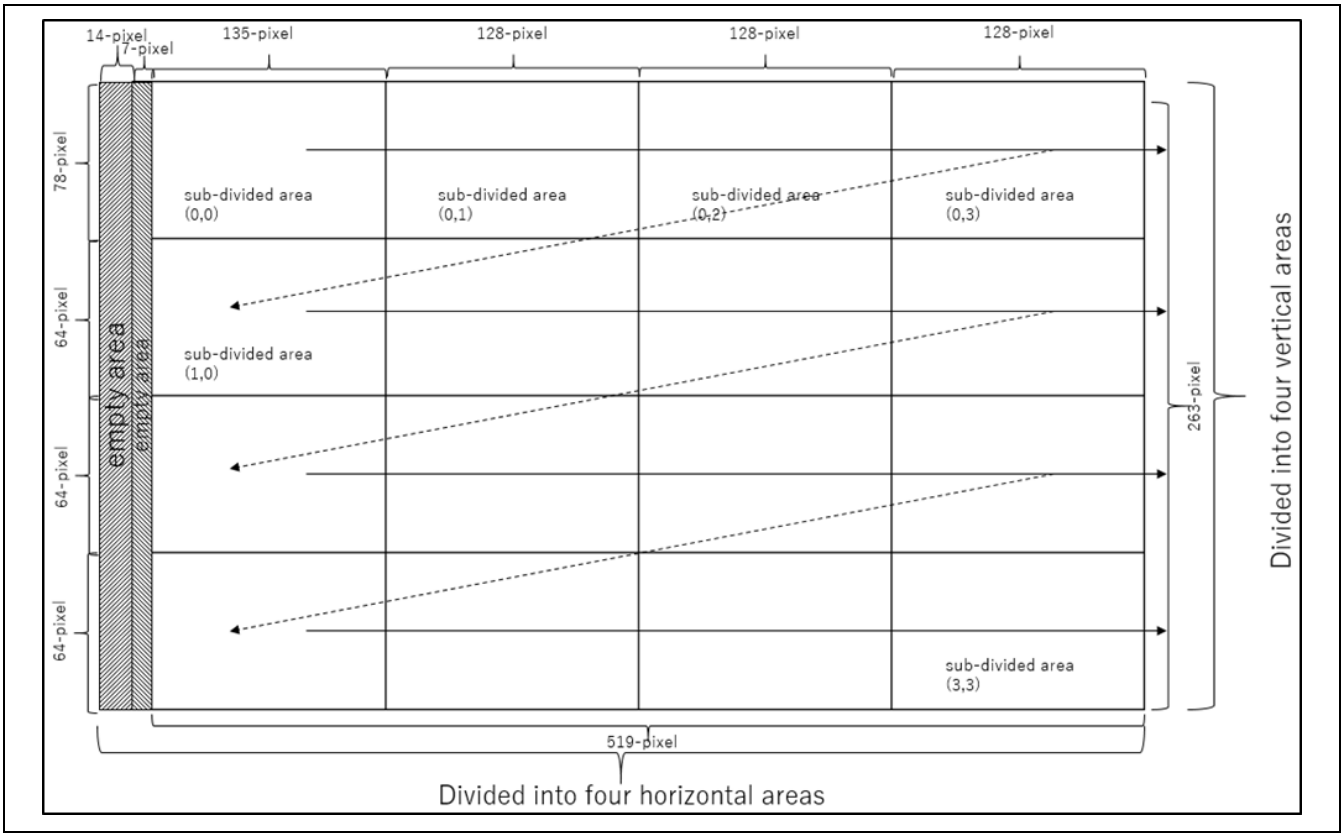

Figure 56.48 Dividing into sub-areas – When the area touches the left edge of the output image (1-Byte/pixel)

Figure 56.47 shows the division when the area touches the left edge and the pixel input from the basic function block unit is 2-Byte/pixel. And Figure 56.48 shows the division when the area touches the left edge and the pixel input from the basic function block is 1-Byte/pixel.

When the area touches the left side, an empty area with a width of 7 pixels will appear at the left edge of the entire area (the shaded area). Therefore, when specifying to render one of these sub-areas (0, 0), (1, 0), (2, 0), (3, 0) with the STRECT, which is described later, if the input from the basic function block is 1-Byte/pixel, the coordinate with the x coordinate corresponding from 0 to 20 (the 2 places indicated by "empty area" in Figure 56.48) should not be written to and should not be rendered; if the input from the basic function block is 2-Byte/pixel, the coordinate with the x coordinate corresponding from 0 to 6 (the place indicated by "empty area" in Figure 56.47) should not be written to and should not be rendered.

When the area touches the right edge

This section describes the division when the target area to be divided into sub-areas touches the right edge of the entire output image. It corresponds to small areas ③, ⑥, ⑨ in Figure 56.38.

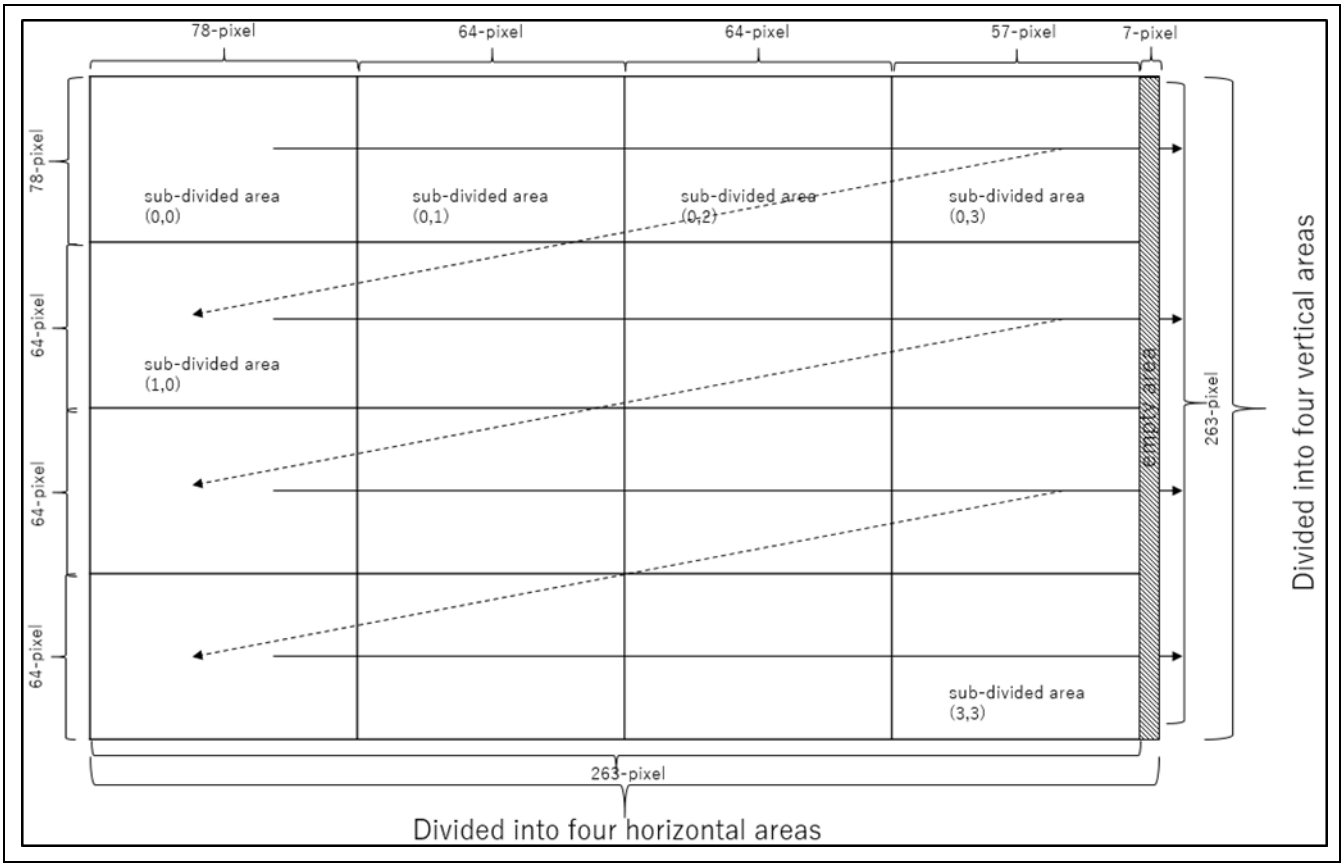

Figure 56.49 Dividing into sub-areas – When the area touches the right edge of the output image (2-Byte/pixel)

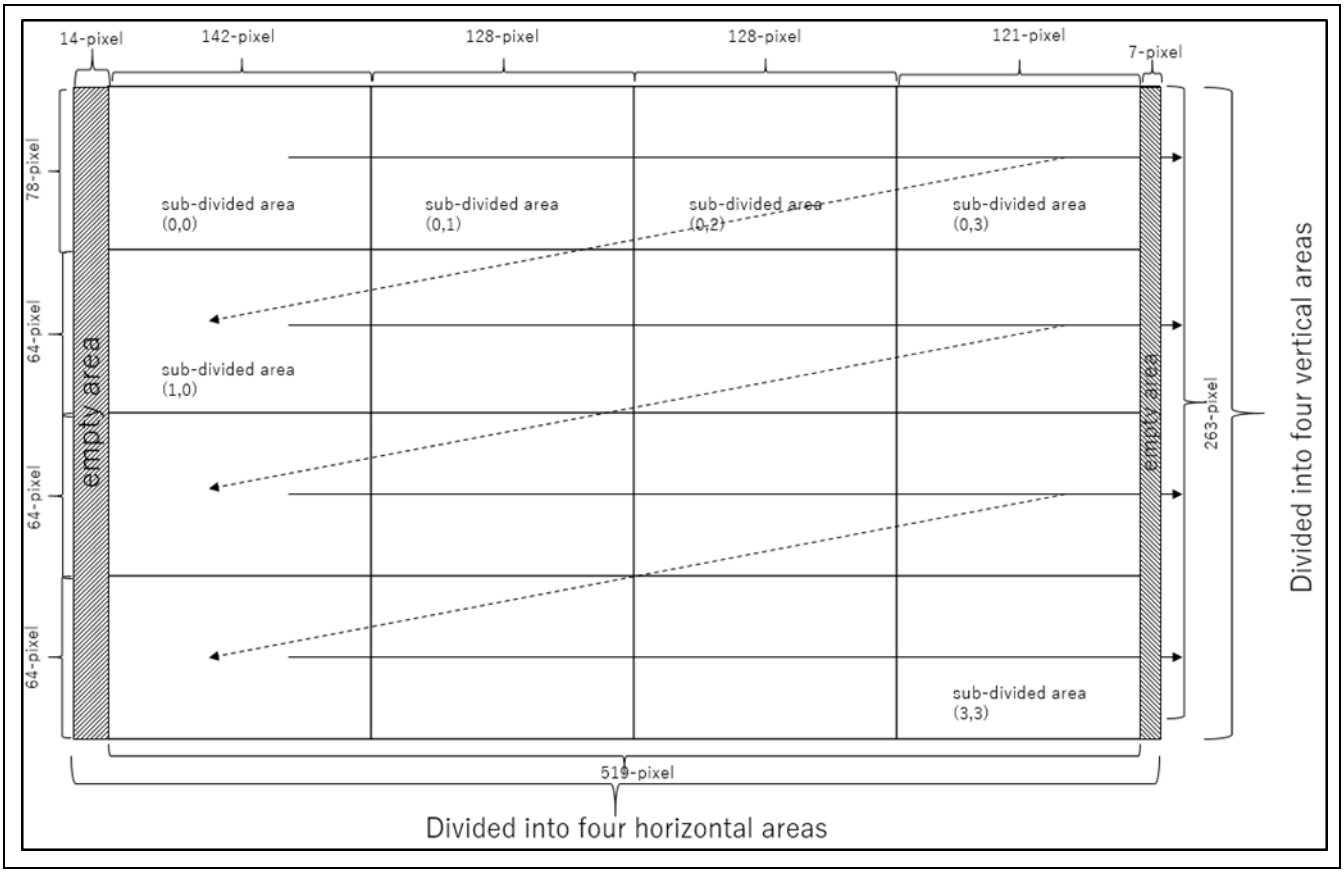

Figure 56.50 Dividing into sub-areas – When the area touches the right edge of the output image (1-Byte/pixel)

Figure 56.49 shows the division when the area touches the right edge and the pixel input from the basic function block is 2-Byte/pixel. And Figure 56.50 shows the division when the area touches the right edge and the pixel input from the basic function block is 1-Byte/pixel.

When the area touches the right edge, an empty area with a width of 7 pixels will appear at the right edge of the entire area (the shaded area). Therefore, when specifying to render one of these sub-areas (0, 3), (1, 3), (2, 3), (3, 3) with the STRECT, which is described later, if the input from the basic function block is 1-Byte/pixel, the coordinate with the x coordinate corresponding from 121 to 127 (the place indicated by "empty area" at the right of Figure 56.50) should not be written to and should not be rendered; if the input from the basic function basic function block is 2-Byte/pixel, the coordinate with the x coordinate corresponding from 57 to 63 (the place indicated by "empty area" at the right of Figure 56.49) should not be written to and should not be rendered. Also, similar to the case when the area does not touch the outer circumference, and the pixel input from the basic function block is 1-Byte/pixel, if specifying to render one of these sub-areas (0, 0), (1, 0), (2, 0), (3, 0) with the STRECT command, which is described later, the coordinate with the x coordinate corresponding from 0 to 13 (the place indicated by "empty area" at the left of Figure 56.50) should not be written to and also should not be rendered.

If the number of pixels in the horizontal direction to be rendered is less than the number of pixels shown above, specify the number of pixels in the XWIDTH field of the OUTNOR and OUTROT commands, which are described later.

When the area touches multiple edges

This section describes the division when the target area to be divided into sub-areas touches multiple edges of the entire output image, this combines 4 cases that were described before. It corresponds to small areas ①, ③, ⑦, ⑨ in Figure 56.38.

Figure 56.51 shows the division when the area touches the left edge and the upper edge and the pixel input from the basic function block is 2-Byte/pixel. And Figure 56.52 shows the division when the area touches the lower and right edge and the pixel input from the basic function block is 1-Byte/pixel.

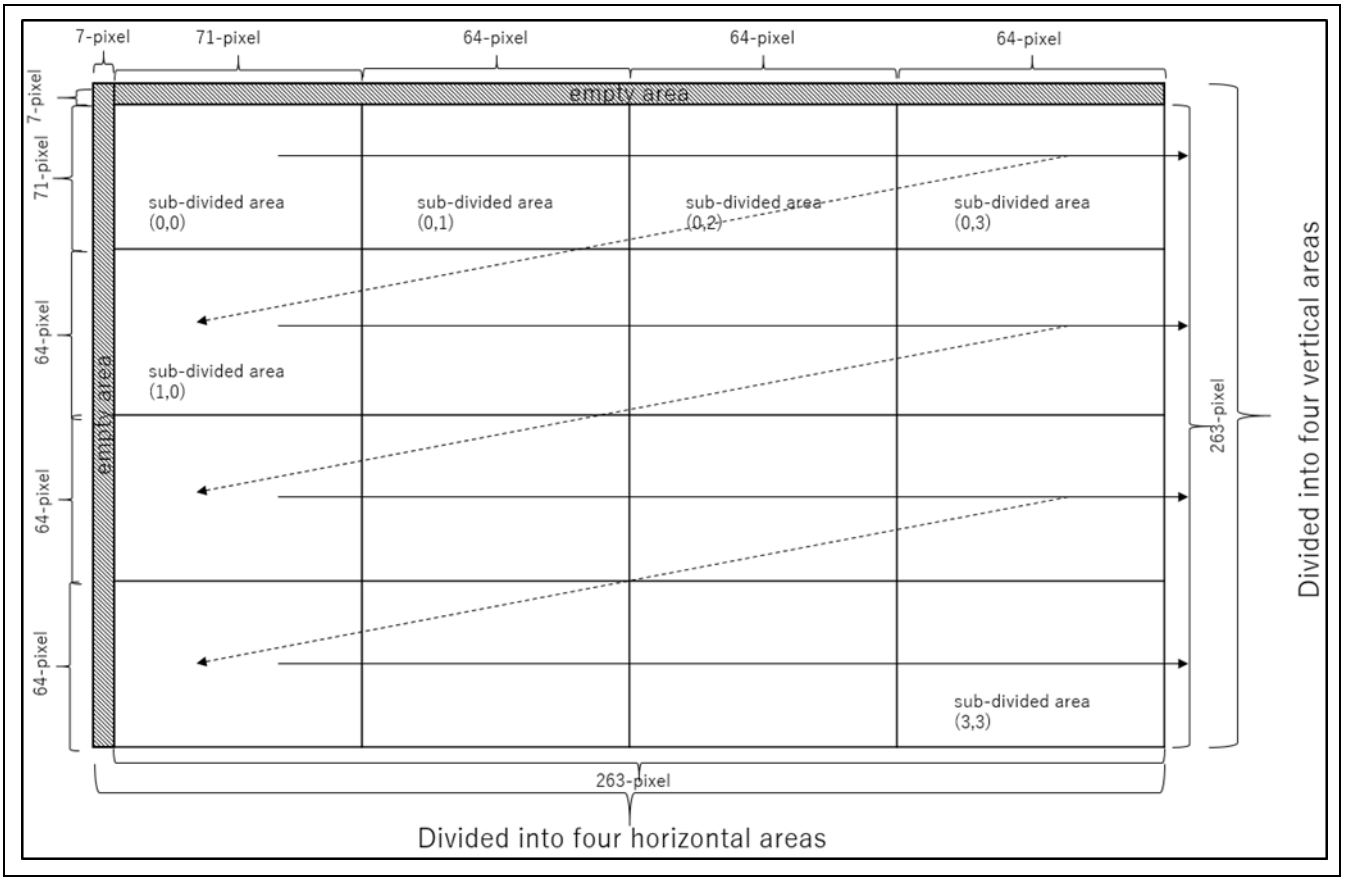

Figure 56.51 Dividing into sub-areas – When the area touches the left edge and the upper edge of the output image (2-Byte/pixel)

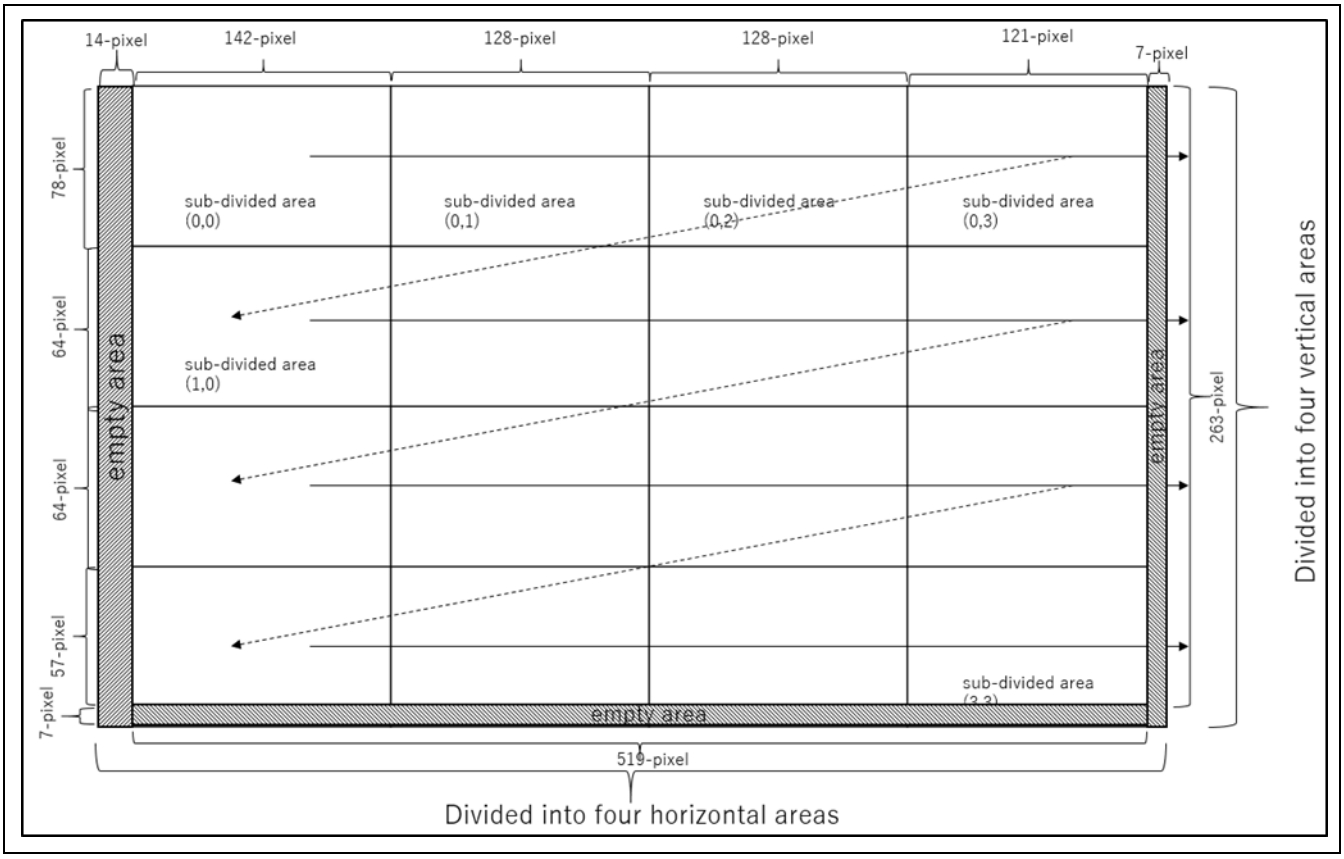

Figure 56.52 Dividing into sub-areas – When the area touches the right edge and the lower edge of the output image (1-Byte/pixel)

(3) Inserting the instructions for synchronization and to start processing

The synchronization instruction (STRECT) needs to be inserted before the processing of each area starts. Also, the instruction to start processing (OUTNOR or OUTROT) needs to be inserted when drawing of the rows and columns configuring each sub-divided area is completed. For details of each instruction, see section 56.5.4, Display List.

The synchronization instruction (STRECT) should be inserted before the drawing of each sub-divided area starts. For example, organize the display list as follows when drawing sub-divided areas in the order (0,0), (0,1), and (0,2).

```
STRECT 0, 0
(Setting and drawing instructions for sub-divided area (0,0) )
STRECT 0, 1
(Setting and drawing instructions for sub-divided area (0,1) )
STRECT 0, 2
(Setting and drawing instructions for sub-divided area (0,2) )
```

Figure 56.53 Example of Inserting the STRECT Instruction

The OUTNOR and OUTROT instructions are respectively used for the output of a non-rotated image and rotated image. They should be executed with the following timing.

- Execute the OUTNOR instruction when drawing of a row in a sub-divided area is completed.
- Execute the OUTROT instruction when drawing of a column in a sub-divided area is completed.

After OUTNOR is executed on the row N, it is prohibited to execute TRI instructions which overwrites the row N before executing OUTNOR on the other rows or OUTROT on any column. Also, after OUTROT is executed on the column N, it is prohibited to execute TRI instructions which overwrites the column N before executing OUTROT on the other columns or OUTNOR on any row. Execute SYNCM instruction between OUTNOR/OUTROT and TRI instructions if these cases occur.

Figure 56.54 and Figure 56.55 show examples.

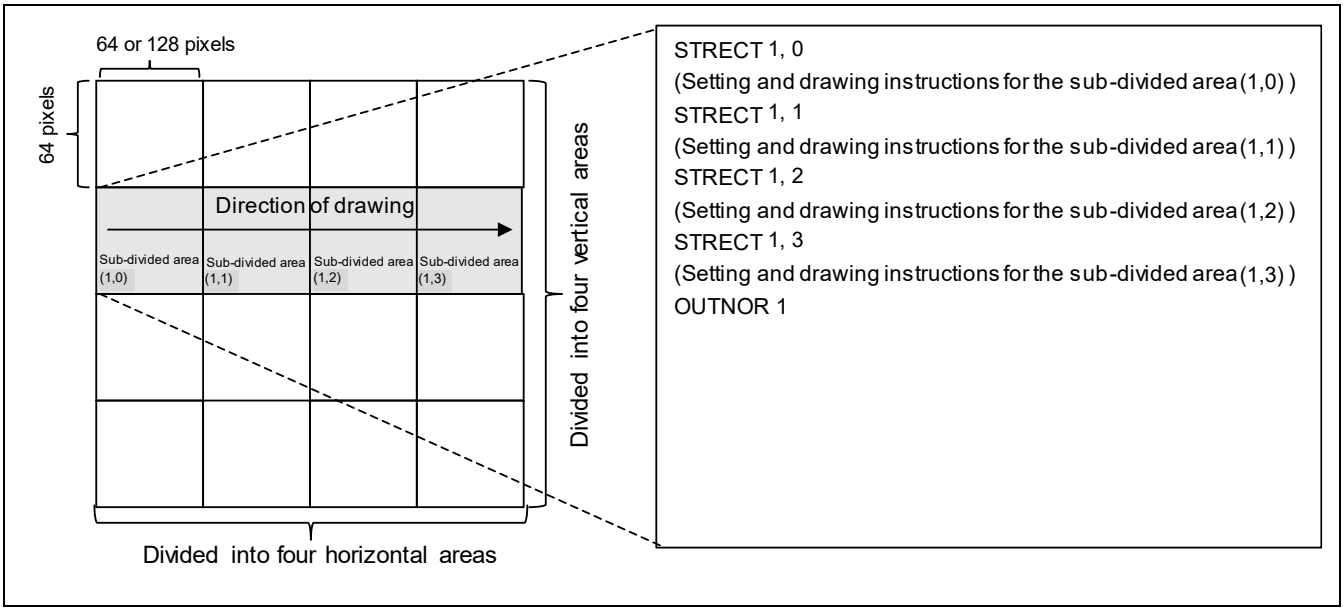

Figure 56.54 Example of Executing the OUTNOR Instruction with 3x3 Averaging Filter

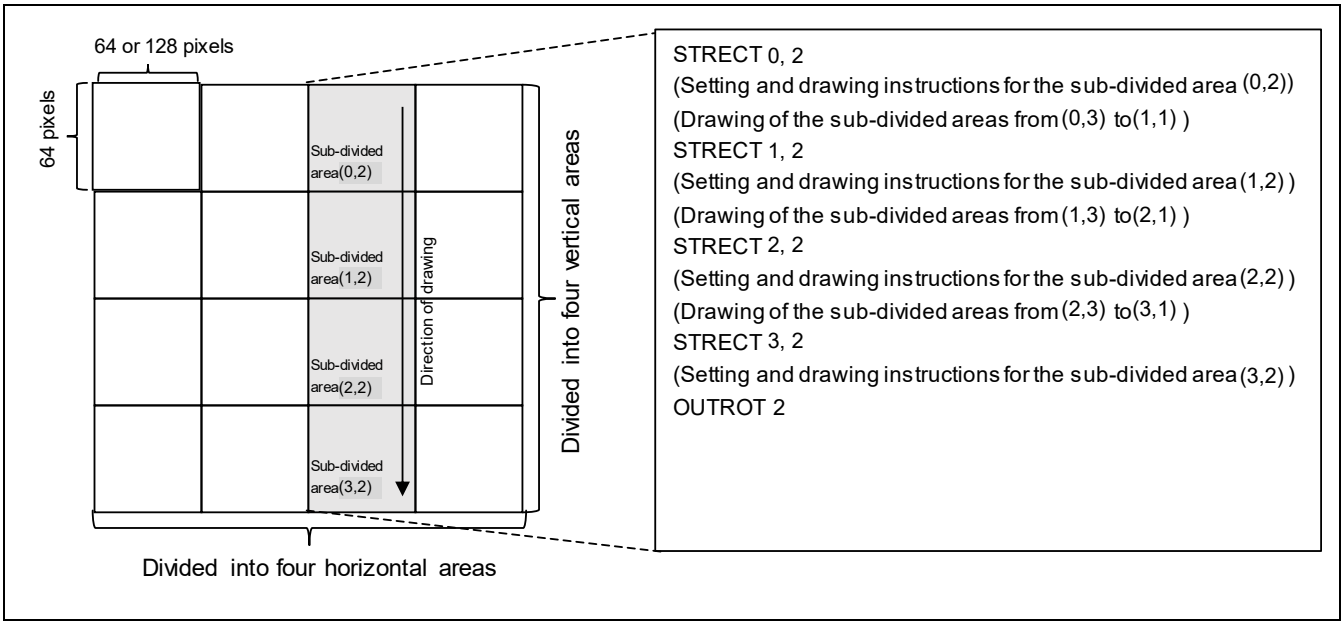

Figure 56.55 Example of Executing the OUTROT Instruction with 3x3 Averaging Filter

The OUTNOR and OUTROT instructions can be mixed in a single display list. Accordingly, output of the non-rotated and rotated images at the same time can be handled by executing a single display list.

Drawing of all the pixels in a sub-divided area may not necessarily be required, depending on how the processing area is divided up. In cases where this is not required, processing for such sub-divided areas can be skipped and the OUTNOR or OUTROT instruction can immediately be executed.

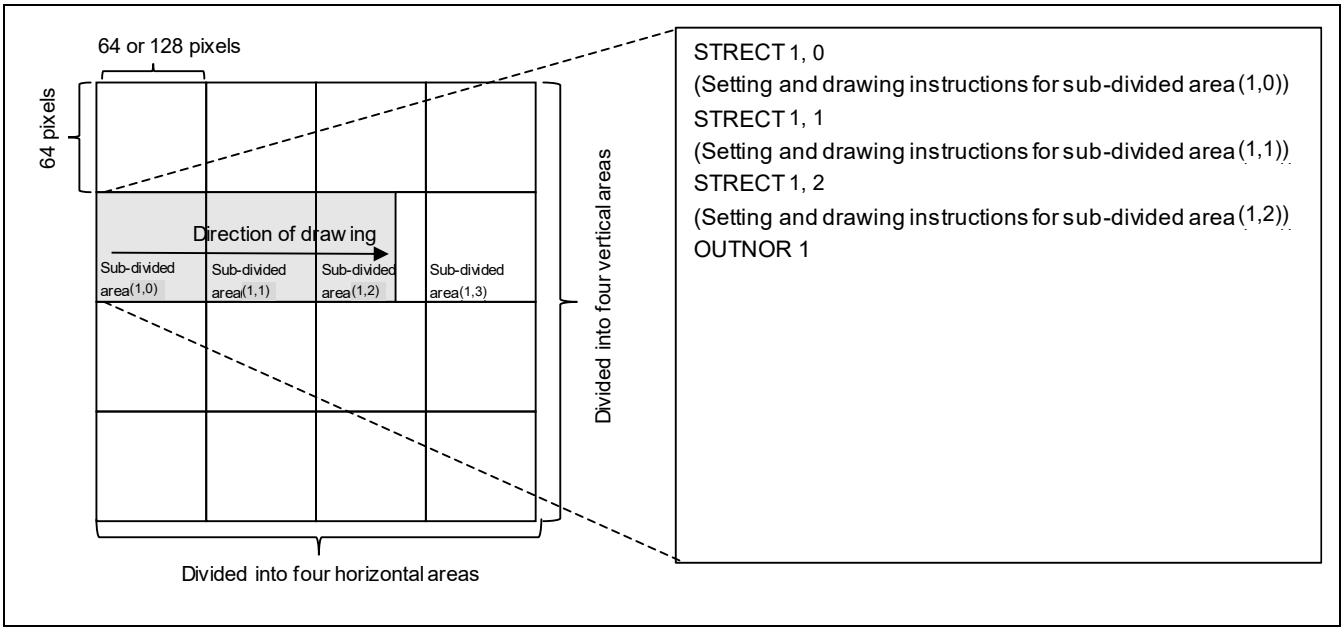

Figure 56.56 Example of Executing the OUTNOR Instruction when Processing for a Sub-Divided Area is Skipped with 3x3 Averaging Filter

The pixel values in a skipped sub-divided area are written to the external memory as undefined values.

(4) Rotation

(a) Y plane rotation

If the YCM bit in CMRCR of the basic function block is 0, the input of this extended function block is regarded as Y plane and rotation is performed.

The Y plane rotation is done by transposing the pixels of each coordinate. An example is shown below.

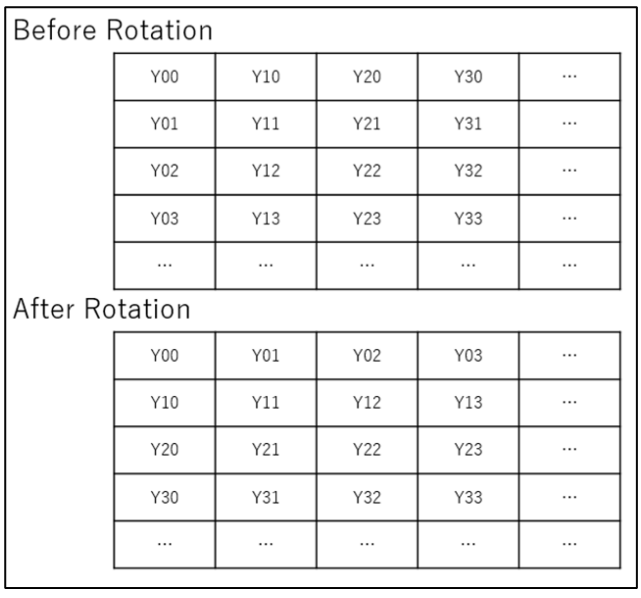

Figure 56.57 Example of Y plane rotation

(b) UV plane rotation (YUV422 format)

If the YCM bit in CMRCR of the basic function block is 1, and the RSUV420 bit in RSCR is 0, the input of this extended function block is regarded as UV plane in YUV422 format and rotation is performed.

The rotation of UV plane in YUV422 format can be selected from two kinds of algorithms.

If the RSUVFLT bit in RSCR is 0, transpose UV data in unit of 2x2 blocks. An example is shown in the figure below.

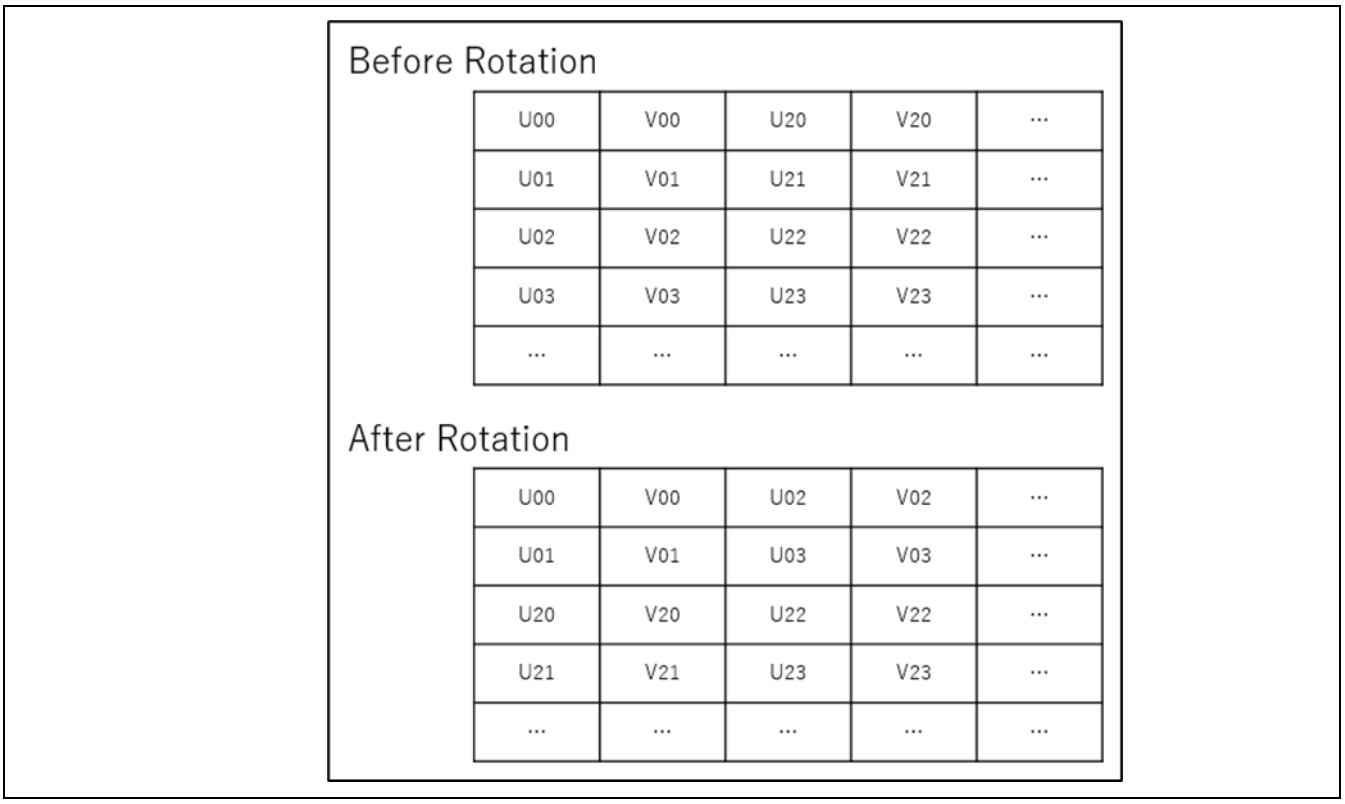

Figure 56.58 Example of UV plane rotation in YUV422 format (RSUVFLT=0)

When the RSUVFLT bit in RSCR is 1, transposition is performed while interpolating between pixel data. An example is shown in the figure below. When number line before rotation is odd, then interpolation process cannot be done for odd line. Therefore, please arrange the UV data with even line before rotation.

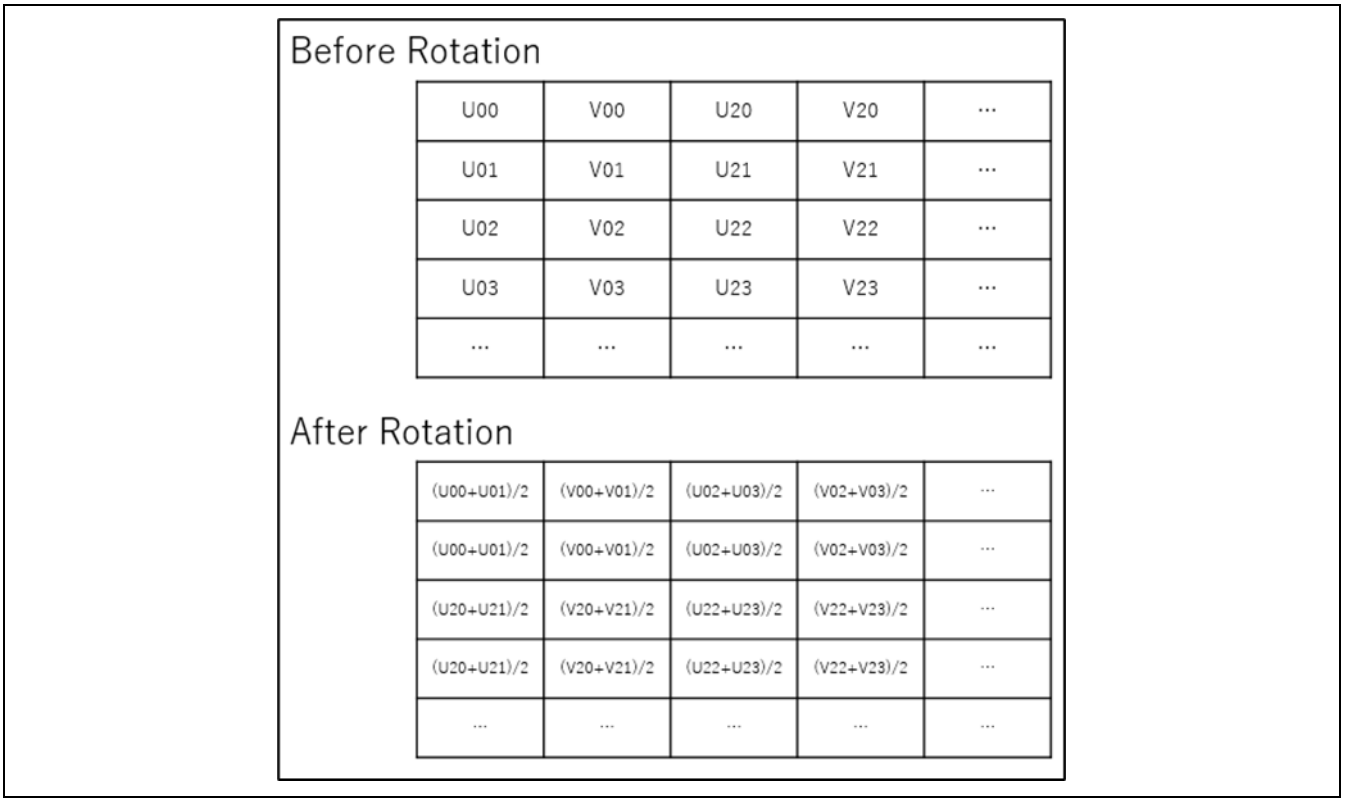

Figure 56.59 Example of UV plane rotation in YUV422 format (RSUVFLT=1)

(c) UV plane rotation (YUV420 format)

If the YCM bit in CMRCR of the basic function block is 1, and the RSUV420 bit in RSCR is 1, the input of this extended function block is regarded as UV plane in YUV420 format and rotation is performed.

Rotation is done by assuming the adjacent U and V as 1 pixel and transposing it. An example is shown in the figure below.

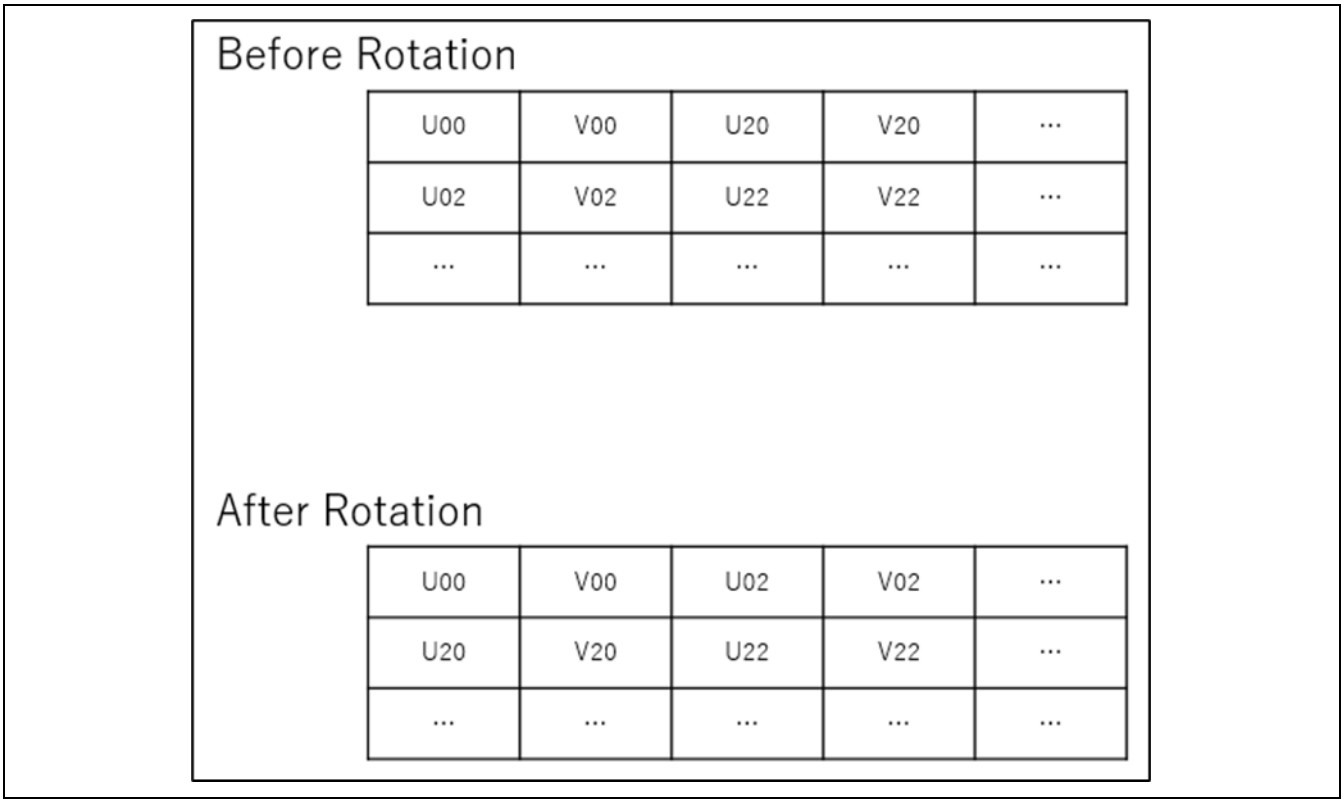

Figure 56.60 Example of UV plane rotation in YUV420 format

56.5.3.2 Using the Scaling-down Function

An image output by executing the OUTNOR and OUTROT instructions explained earlier can be recursively (up to three times) scaled down to 1/2, vertically and horizontally.

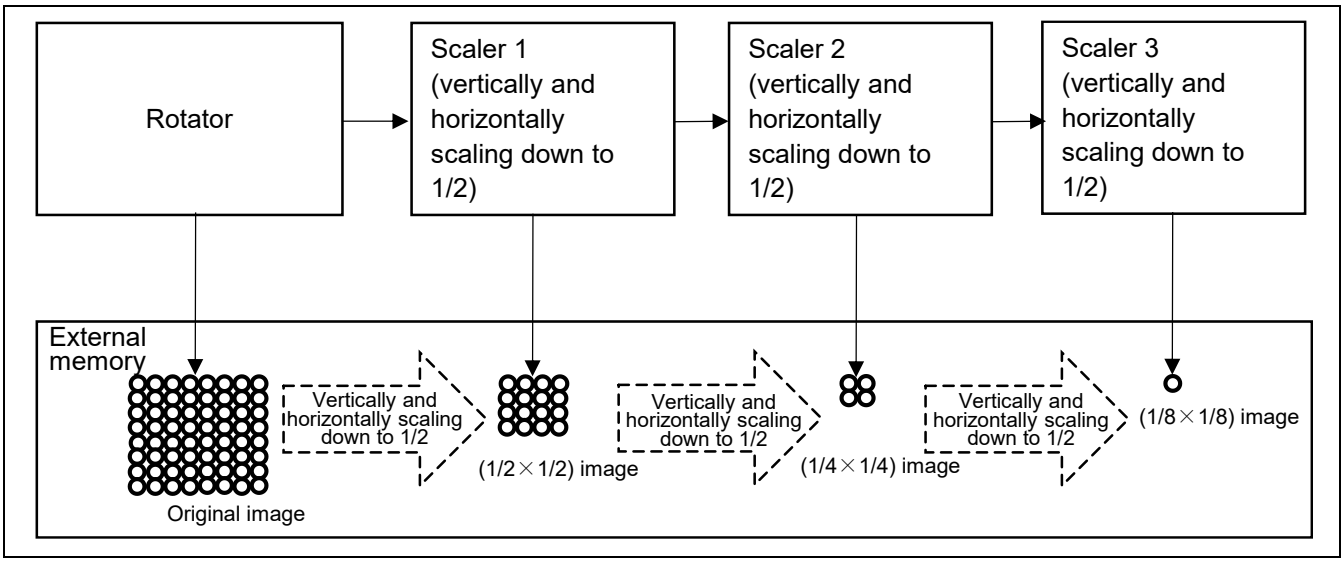

Figure 56.61 Overview of Scaling Down in the Extended Function Block

Figure 56.61 shows an overview of scaling down. The image processed by the rotator is output to the scaler and the image can be scaled down to 1/2 by each of three scalers.

(1) Enabling or Disabling Output of the Scaled-Down Images

Output of the scaled down images can be enabled or disabled by the rotator and scaler control register (RSCR).
The NRnE bit can be used to enable or disable output of a non-rotated image. The RTnE bit can be used to enable or disable output of a rotated image.

Furthermore, set the base addresses, strides, and offsets from the base addresses for all outputs in the following registers: DSANRRn, DSTNRRn, DSARRn, DSTRRn, DSONRRn, and DSORRn. Refer to the descriptions of the register settings for details.

(2) Setting for Scaling-Down Filtering

The scaling-down filtering is applied as part of the processing in each scaler. It is possible to select 2x2 averaging filter and 3x3 Gaussian filter as filtering method of Y plane. UV plane can only use the 2x2 averaging filter

When using the 2x2 averaging filter, clear the GFE bit of GFCR register to 0 and clear all the AFB8E bit, the AFB4E bit, and the AFB2E bit in RSCR2 register to 0.

When using the 3x3 Gaussian filter, set the GFE bit of GFCR register to 1 and set all the AFB8E bit, the AFB4E bit, and the AFB2E bit in RSCR2 register to 1.

Set the filtering method before starting to render by the TRI command, to which the desired filter is expected to be applied. It is prohibited to change the setting within one divided area.

The rendering method will change depending on the filtering method. For details, refer to 56.5.3.1.

2x2 averaging filter

When selecting the 2x2 averaging filter, clear the GFE bit of GFCR register to 0 and clear all the AFB8E bit, the AFB4E bit, and the AFB2E bit in RSCR2 register to 0.

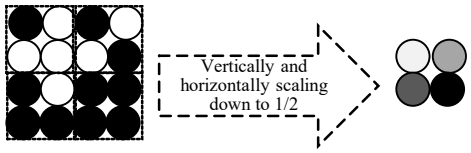

Figure 56.62 Scaling-Down Filtering

When the setting of the BPnE bit in RSCR is 0, the pixel values in the images after scaling down are determined by averaging the pixel values of the 2- x 2-pixel areas in the image before scaling down. When the setting of the BPnE bit in RSCR is 1, the pixel values in the image after scaling down are determined by adding the pixel values of the 2- x 2-pixel areas in the images before scaling down.

When the setting of the BPnE bit is 0, the rounding mode for use in averaging of the pixel values can be selected. When the RDnE bit in RSCR is 0, rounding down is selected, and when it is set to 1, rounding off to the nearest number is selected.

Regardless of the setting of BPnE, if the pixel format of the images before scaling down is N bpp, the pixel format of the images after scaling down becomes (N+2) bpp. ‘00’ is added to the LSB of the averaged pixel values when the setting of the BPnE bit is 0. Accordingly, set the format of input and output images and the size in bits of the logical right-shifting in the three scalers in accord with one of the combinations listed in Table 56.26 or Table 56.27. Setting of combinations other than those in the tables is prohibited.

Table 56.26 Combination when the BPnE Bit in RSCR is Set to 0

Input Pixel Format *1	Output Pixel Format *2	Number of Digits of Logical Right-Shifting *3
8 bpp	8 bpp	2
10 bpp	10 bpp	2
12 bpp	12 bpp	2
14 bpp	14 bpp	2
16 bpp	16 bpp	2

Table 56.27 Combination when the BPnE Bit in RSCR is Set to 1

Input Pixel Format *1	Output Pixel Format *2	Number of Digits of Logical Right-Shifting *3
8 bpp	10 bpp	0
10 bpp	12 bpp	0
12 bpp	14 bpp	0
14 bpp	16 bpp	0

Notes: 1. The following shows the registers for use in specifying the input pixel formats for the three scalers.
As settings for scaler 1, the values of the DY1416, Y12, and Y10 bits of CMRCR are used in Y processing and those of the DUV1416 and DUV bits of CMRCR are used in UV processing.
As settings for scaler 2, the values of the OFM2N bits of RSOFR are used in the case of an OUTNOR instruction and those of the OFM2R bits of RSOFR are used in the case of an OUTROT instruction.
As settings for scaler 3, the values of the OFM4N bits of RSOFR are used in the case of an OUTNOR instruction and those of the OFM4R bits of RSOFR are used in the case of an OUTROT instruction.

2. The following shows the registers for use in specifying the output pixel formats for the three scalers.
As settings for scaler 1, the values of the OFM2N bits of RSOFR are used in the case of an OUTNOR instruction and those of the OFM2R bits of RSOFR are used in the case of an OUTROT instruction.
As settings for scaler 2, the values of the OFM4N bits of RSOFR are used in the case of an OUTNOR instruction and those of the OFM4R bits of RSOFR are used in the case of an OUTROT instruction.
As settings for scaler 3, the values of the OFM8N bits of RSOFR are used in the case of an OUTNOR instruction and those of the OFM8R bits of RSOFR are used in the case of an OUTROT instruction.

3. The following shows the registers for use in specifying the number of bits of logical right-shifting in the three scalers.
As settings for scaler 1, the values of the SC2SHFVAL bits of RSCR are used.
As settings for scaler 2, the values of the SC4SHFVAL bits of RSCR are used.
As settings for scaler 3, the values of the SC8SHFVAL bits of RSCR are used.

3x3 Gaussian filter

When using the 3x3 Gaussian filter, set the BPnE bit in RSCR to 0 and AFBnE in RSCR2 to 1. Accordingly, set the format of input and output images and the size in bits of the logical right-shifting in the three scalers in accord with one of the combinations listed in Table 56.28 Setting of combinations other than those in the tables is prohibited.

Table 56.28 Combination for input and output format when using Gaussian filter

Input Pixel Format *1	Output Pixel Format *2	Number of Digits of Logical Right-Shifting in Gaussian filter *3	Number of Digits of Logical Right-Shifting *4
8 bpp	8 bpp	4	2
10 bpp	10 bpp	4	2
12 bpp	12 bpp	4	2
14 bpp	14 bpp	4	2
16 bpp	16 bpp	4	2
8 bpp	10 bpp	2	2
10 bpp	12 bpp	2	2
12 bpp	14 bpp	2	2
14 bpp	16 bpp	2	2

Notes: 1. The following shows the registers for use in specifying the input pixel formats for the three scalers.
As settings for scaler 1, the values of the DY1416, Y12, and Y10 bits of CMRCR are used in Y processing and those of the DUV1416 and DUV bits of CMRCR are used in UV processing.

As settings for scaler 2, the values of the OFM2N bits of RSOFR and GFM2N bits of GFOFR are used in the case of an OUTNOR instruction and those of the OFM2R bits of RSOFR and GFM2R bits of GFOFR are used in the case of an OUTROT instruction.

As settings for scaler 3, the values of the OFM4N bits of RSOFR and GFM4N bits of GFOFR are used in the case of an OUTNOR instruction and those of the OFM4R bits of RSOFR and GFM4R bits of GFOFR are used in the case of an OUTROT instruction.

2. The following shows the registers for use in specifying the output pixel formats for the three scalers.
As settings for scaler 1, the values of the OFM2N bits of RSOFR and GFM2N bits of GFOFR are used in the case of an OUTNOR instruction and those of the OFM2R bits of RSOFR and GFM2R bits of GFOFR are used in the case of an OUTROT instruction.

As settings for scaler 2, the values of the OFM4N bits of RSOFR and GFM4N bits of GFOFR are used in the case of an OUTNOR instruction and those of the OFM4R bits of RSOFR and GFM4R bits of GFOFR are used in the case of an OUTROT instruction.

As settings for scaler 3, the values of the OFM8N bits of RSOFR and GFM8N bits of GFOFR are used in the case of an OUTNOR instruction and those of the OFM8R bits of RSOFR and GFM8R bits of GFOFR are used in the case of an OUTROT instruction.

3. The following shows the registers for use in specifying the number of bits of logical right-shifting in the three scalers.
As settings for scaler 1, the values of the SC2GSHFVAL bits of GFCR are used.
As settings for scaler 2, the values of the SC4GSHFVAL bits of GFCR are used.
As settings for scaler 3, the values of the SC8GSHFVAL bits of GFCR are used.

4. The following shows the registers for use in specifying the number of bits of logical right-shifting in the three scalers.
As settings for scaler 1, the values of the SC2SHFVAL bits of RSCR are used.
As settings for scaler 2, the values of the SC4SHFVAL bits of RSCR are used.
As settings for scaler 3, the values of the SC8SHFVAL bits of RSCR are used.

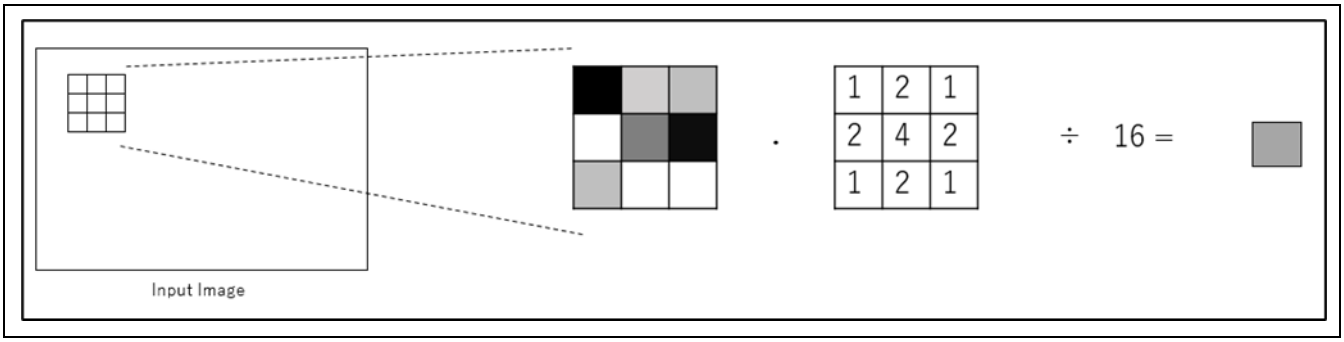

Figure 56.63 Operation of 3x3 Gaussian filter.

When using the 3x3 Gaussian filter, set the GFE bit of GFCR register to 1 and set all the AFB8E bit, the AFB4E bit, and the AFB2E bit in RSCR2 register to 1.
The 9 pixels around each coordinate of the input image are multiplied by the coefficient shown in the Figure 56.63, and the average value is taken as the output.

When processing the pixels that touches the upper, lower, left and right edges of the input image, one of the surrounding 9 pixels does not exist. Therefore, when the target area to be processed by OUTNOR or OUTROT touches the upper, lower, left or right edges of the input image, set the UP, DP, LP, or RP bit in the GFCR register to 1 depending on the contact side. Table 56.29 shows the setting condition of each bit.

Table 56.29 Setting condition of UP, DP, LP, RP bit in GFCR register

Bit name	Setting condition
UP	It touches the upper edge
DP	It touches the lower edge
LP	It touches the left edge
RP	It touches the right edge

The output format of each Scaler follows the setting of GFOFR register and RSOFR register. If the calculation result will be saturated if it exceeds the value range of the set format. The setting of GFOFR register and RSOFR register should be the same. This setting applies to both output to external memory and output to the next Scaler stage.

After implementing 3x3 filter processing on all coordinates of each image input as a segmented area, scaling is taken place as in the Figure 56.64. Even pixels and even lines will be output after 3x3 filter processing in each scalar output 1/2, 1/4, and 1/8.

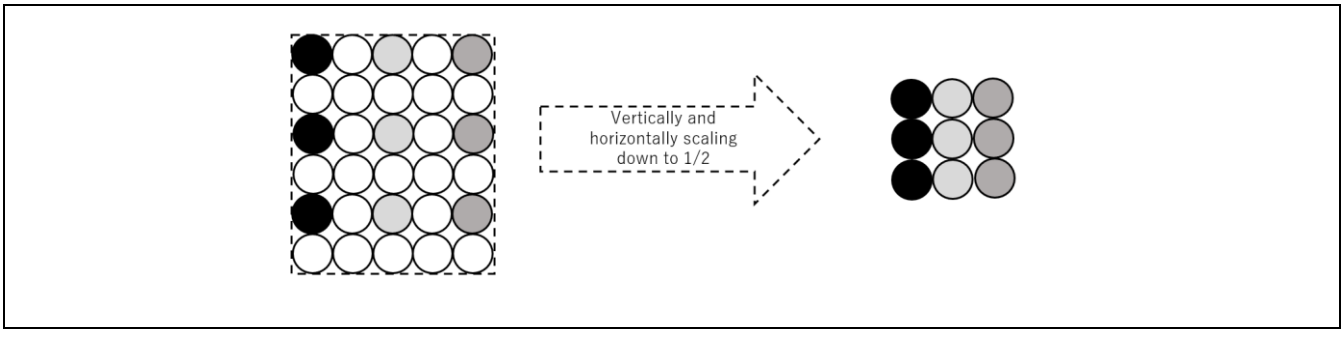

Figure 56.64 Scaling-Down 3x3 Gaussian filter

(3) Settings for Logical Right-Shifting

When logical right-shifting the pixel value after applying the 2x2 averaging filter, set SC2SHFVAL, SC4SHFVAL, SC8SHFVAL in the RSCR register.

Also, when logical right-shifting the pixel value after applying the 3x3 Gaussian filter, set SC2GSHFVAL, SC4GSFHVAL, SC8GSHFVAL in the GFCR register. This setting is also used for the division in the Gaussian filter calculation, and it is shifted 4 bits to the right by default. Note that the divisor of the division operation will also be changed if the setting is changed.

The shift down setting applies to both output to external memory and output to the next Scaler stage.

56.5.3.3 Supported data format and Data Location in Memory

(1) Supported data format

This extended block supports processing of only Y plane or only UV plane of Semi-planar format. The simultaneous processing of Y/UV plane in Interleaved format or Semi-planar format is not supported. Therefore, also follow this constraint for processing in the basic function block.

The Y and UV planes support YUV422 format and YUV420 format. Switching YUV422/YUV420 in UV plane is performed by the RSUV420 bit of RSCR register.

The pixel accuracy supports 8-bpp, 10-bpp, 12-bpp, 14-bpp, 16-bpp for both input and output. The input accuracy of this extended block is set in the pixel format of the destination data in the basic function block. About the output accuracy, the non scaled-down image follows the destination image output format of the basic function block. Additionally, the scaled-down image group is set by the RSOFR register when using the 2x2 averaging filter, and by the GFOFR register when using the 3x3 Gaussian filter. Each scaling output can be set as non-rotated/rotated separately.

(2) Data Location in Memory

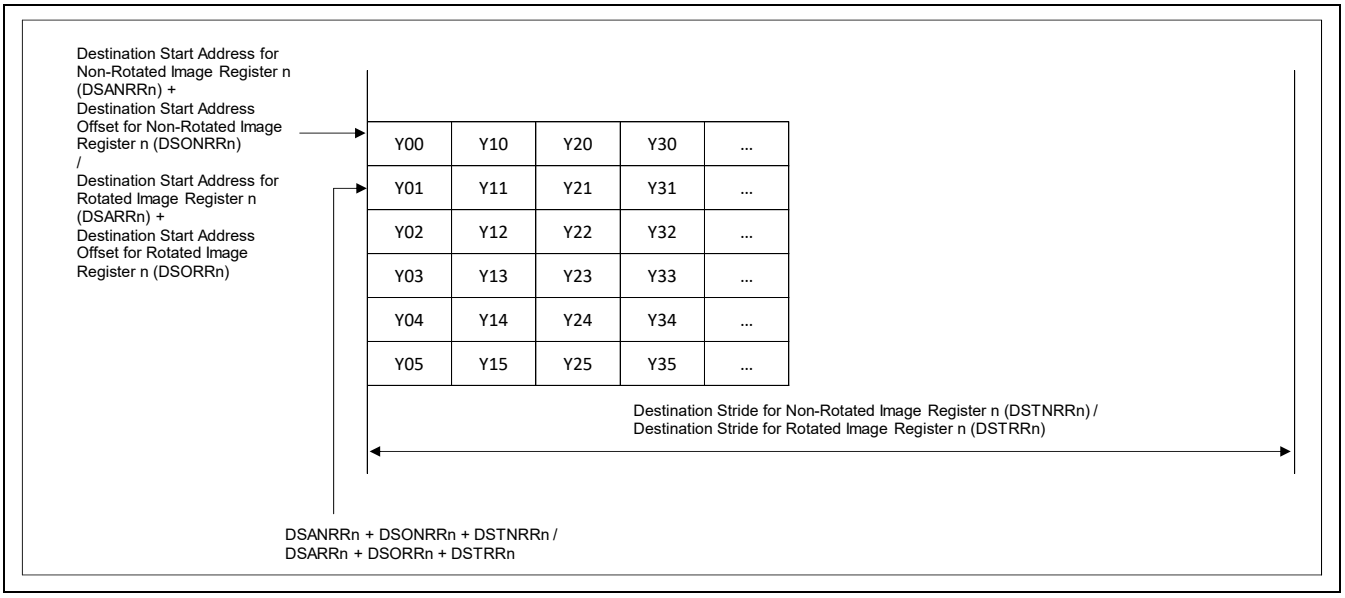

Figure 56.65 Memory allocation for Y plane output in extended block

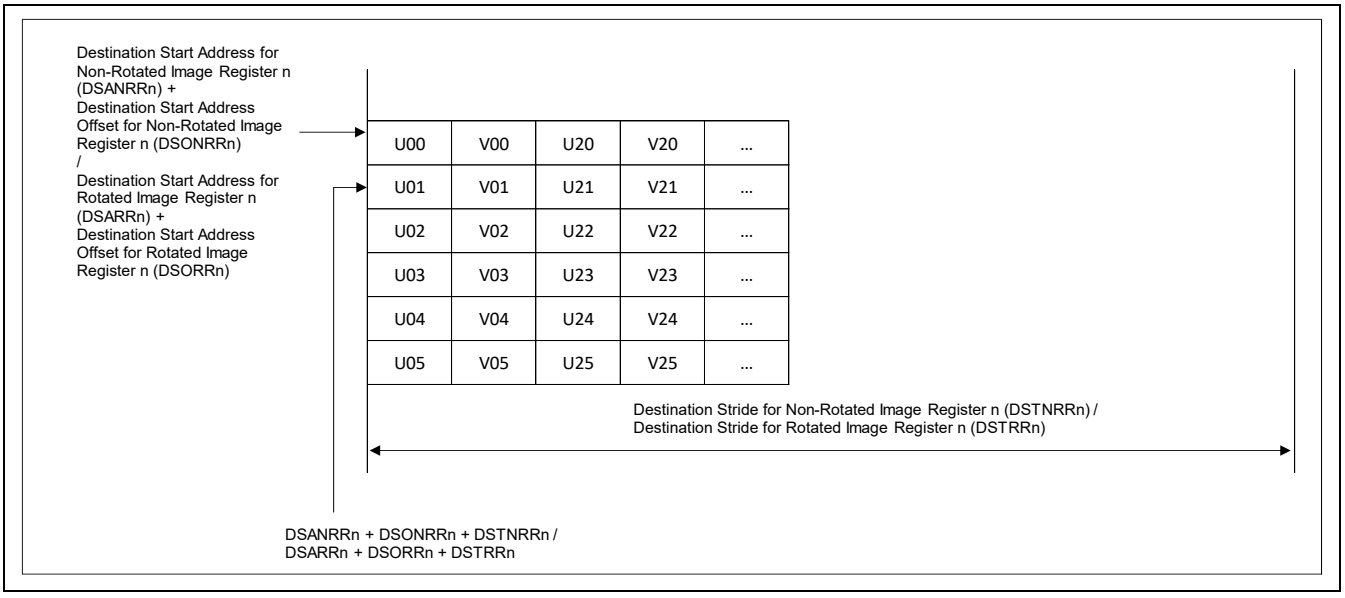

Figure 56.66 Memory allocation for UV plane output in extended block

Figure 56.65 shows the relationship between the memory allocation for Y plane output in this extended unit and the register setting, and Figure 56.66 shows the relationship between the memory allocation for UV plane output and the register setting. “n” indicates the setting register of each scaling-down ratio, n = 0, 1, 2, or 3.

The start address, to where output data is written, is obtained by adding DSANRRn and DSONRRn for the non-rotated image, and is obtained by adding DSARRn and DSORRn for the rotated image. This applies for both Y and UV planes. The memory stride is common for Y plane and UV plane, it is set by DSTNRRn for non-rotated image and by DSTRRn for rotated image.

The U and V order of the UV plane is the same as the output from the basic function unit. If you want to change the order, change the setting of the basic function unit.

56.5.3.4 Usage Note

Assuming that the highest scaling ratio is 1/N, the size of the non-scaled image should be a multiple of N vertically and horizontally.

56.5.4 Display List

The use of instructions not listed in this section is prohibited.

This section only explains the instructions used to control the extended function blocks. For the instructions used to control the basic function block, see section 56.5, Display List.

Do not execute the instructions listed in this section in a channel which is not capable of rotation and scaling-down. Refer to Table 56.2 for the applicable channels. Additionally, do not execute the instructions when the setting of the RSE bit in SCR is 0.

56.5.4.1 STRECT (STart RECTangle)

(1) Function

STRECT is used to specify the sub-divided areas of the image for drawing. The ROW field specifies the vertical size and the COLUMN field specifies the horizontal size.

Set the ROW and COLUMN fields to values from 0 to 3. Setting values outside this range is prohibited.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_0111 (H'87)								Reserved (all 0)																ROW				COLUMN			

56.5.4.2 OUTNOR (OUTput NORmally)

(1) Function

OUTNOR is used to specify the output of a non-rotated image when the drawing of a row in a sub-divided area is completed.

A row in the sub-divided area specified by the ROW field is output without being rotated. Set the ROW field to a value from 0 to 3. Setting values outside this range is prohibited.

All output 8bbp:

When the input image format from the basic function block is 8 bpp and the format for output from all three scalers of the extended function block is 8 bpp, set the XWIDTH field to **H'1FF**.

+ For right block (refer Figure 56.37) is equal or smaller than **512 pixels,** XWIDTH can be set to **H'1FF**.

+ For right block (refer Figure 56.37) is equal or smaller than **384 pixels,** XWIDTH can be set to **H'17F**.

+ For right block (refer Figure 56.37) is equal or smaller than **256 pixels,** XWIDTH can be set to **H'0FF**.

+ For right block (refer Figure 56.37) is equal or smaller than **128 pixels,** XWIDTH can be set to **H'07F**.

Always set the YWIDTH field to H'3F.

Other:

set XWIDTH to **H'0FF** in other cases.

+ For right block (refer Figure 56.37) is equal or smaller than **256 pixels,** XWIDTH can be set to **H'0FF.**

+ For right block (refer Figure 56.37) is equal or smaller than **192 pixels,** XWIDTH can be set to **H'0BF**.

+ For right block (refer Figure 56.37) is equal or smaller than **128 pixels,** XWIDTH can be set to **H'07F**

+ For right block (refer Figure 56.37) is equal or smaller than **64 pixels,** XWIDTH can be set to **H'03F**

Always set the YWIDTH field to **H'3F**.

After OUTNOR is executed on row N, the execution TRI instructions which overwrite row N before executing OUTNOR on the other rows or OUTROT on any column is prohibited. Execute a SYNCM instruction between the OUTNOR and TRI instructions if this kind of procedure is necessary.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1001 (H'89)								ROW				Reserved (all 0)			XWIDTH									YWIDTH							

56.5.4.3 OUTROT (OUTput ROTationally)

(1) Function

OUTROT is used to specify the output of a rotated image when the drawing of a column in a sub-divided area is completed.

A column in the sub-divided area specified by the COLUMN field is output after being rotated. Set the COLUMN fields to values from 0 to 3. Setting values outside this range is prohibited.

All output 8bbp:

When the input image format from the basic function block is 8 bpp and the format for output from all three scalers of the extended function block is 8 bpp, set the XWIDTH field to **H'07F. S**et the YWIDTH field to **H'FF.**

+For bottom block (refer Figure 56.37) is equal or smaller than **256 lines,** YWIDTH can be set to **H'FF**.

+For bottom block (refer Figure 56.37) is equal or smaller than **192 lines,** YWIDTH can be set to **H'BF.**

+For bottom block (refer Figure 56.37) is equal or smaller than **128 lines,** YWIDTH can be set to **H'7F.**

+For bottom block (refer Figure 56.37) is equal or smaller than **64 lines,** YWIDTH can be set to **H'3F.**

Other:

Set XWIDTH field to **H'03F** in other cases.

Set the YWIDTH field to **H'FF.**

+For bottom block (refer Figure 56.37) is equal or smaller than **256 lines,** YWIDTH can be set to **H'FF.**

+For bottom block (refer Figure 56.37) is equal or smaller than **192 lines,** YWIDTH can be set to **H'BF.**

+ For bottom block (refer Figure 56.37) is equal or smaller than **128 lines,** YWIDTH can be set to **H'7F.**

+For bottom block (refer Figure 56.37) is equal or smaller than **64 lines,** YWIDTH can be set to **H'3F.**

After OUTROT is executed on column N, the execution of a TRI instruction which overwrites column N before the execution of OUTROT on another column or OUTNOR on any row is prohibited. Execute a SYNCM instruction between the OUTROT and TRI instructions if this kind of procedure is necessary.

(2) Instruction Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OP CODE = 1000_1011 (H'8B)								COLUMN				Reserved (all 0)			XWIDTH									YWIDTH							

56.6 Usage Notes

56.6.1 Module Standby Mode

The module standby mode enables stoppage of the clock signals supplied to the IMR-LX6. Before placing the IMR-LX6 on module standby, first make sure that the IMR-LX6 is not operating and then stop supply of its clock signals. Do not attempt access to the registers of the IMR-LX6 while it is on module standby.

Be sure to apply a software reset to the clock pulse generator (CPG) before releasing the IMR-LX6 from module standby or to use the SWRST bit in CR to apply a software reset to this module after releasing it from module standby.

Refer to section 9, Module Standby, Software Reset, regarding the settings for module standby and software reset.

56.6.2 Software Reset by the Clock Pulse Generator (CPG)

A software reset applied to the IMR-LX6 by the CPG is equivalent to a power-on reset. Accordingly, operation cannot be guaranteed if the IMR-LX6 is reset while it is operating.

Do not attempt access to the registers of the IMR-LX6 while a software resetting is being applied to it.

56.6.3 Display list pre-fetch maximum data size information

IMR-LX6 has pre-fetch function of display list.

The maximum pre-fetch data size for IMR-LX6 is 1536-bytes. Therefore, DL must be placed in memory block so that 1536-bytes space is available for maximum pre-fetch after the TRAP/RET/GOSUB instruction.

Note: It is prohibited to compress the display List (DL), so place the DL including maximum pre-fetch data area only to the uncompressed region.

56.7 Synchronized system between modules

(1) The modules must be released from reset state when image processing modules are to be synchronized. For the settings related to power control, refer to section 11, System Controller (SYSC). For controlling the clock signals and resetting, refer to section 9. Module Standby, Software Reset.

(2) Synchronization between modules by the WUP and SLP instructions must be started by a module that is not in operation.

(3) Do not transmit the WUP signal two or more consecutive times to the same module. Be sure to use the SLP instruction to suspend execution of the display list to allow the reception of a WUP signal from another module and then allow the transmitting module to transmit the subsequent WUP signal. Note, however, that since the SLP instruction is not available in the image signal processor (ISP) and VIN, the ISP or VIN might transmit the WUP signal to the IMR-LX6 two or more consecutive times. When an error is detected by reading the WOVF bit in SR, ensure that operation of this module is ended by a TRAP instruction and then stop the operation of the ISP or VIN.

(4) The ISP or VIN transmits the WUP signal regardless of whether or not the IMR-LX6 is activated. Accordingly, when synchronizing the operations between the ISP or VIN and this module, start by activating this module and then transmit the WUP signal form the ISP or VIN.

(5) When an error is detected by reading the WERR bit in SR before the RS bit in CR of this module has become 1, do not activate this module but stop the operation of the ISP or VIN. When an error is detected after the RS bit in CR has been set to 1, ensure that operation of this module is ended by a TRAP instruction and then stop the operation of the ISP or VIN.

56.8 Data compression

For the DATA compression, refer to 63. FCPR HWM for the details. The transmission size of the IMR-LX6 shall be 256-byte when using DATA compression. We can compress data of Rotator and Scalar only. The compression is possible for below combination only.

Table 56.30 List of data compression support in IMR-LX6

Data precision Rotator and Scalar output Refer Table 56.26, Table 56.27, and Table 56.28	Non-rotate non-scale output (RSCR.NR1E=1)	Non-rotate scaled down to 1/2 (RSCR.NR2E=1)	Rotated non-scaled data (RSCR.RT1E=1)	Rotated scaled down to 1/2 (RSCR.RT2E=1)
1-byte/pixel (8 bpp)	○ OUTNOR.XWIDTH= **H'1FF or H'0FF**	○ OUTNOR.XWIDTH= **H'1FF**	x	x
2-byte/pixel (10 bpp, 12 bpp, 14 bpp, 16 bpp)	○ OUTNOR.XWIDTH= **H'0FF**	○ OUTNOR.XWIDTH= **H'0FF**	○ OUTROT.YWIDTH= **H'FF**	○ OUTROT.YWIDTH= **H'FF**

56.9 Safety Mechanism

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

56.9.1 Block diagram for safety mechanism.

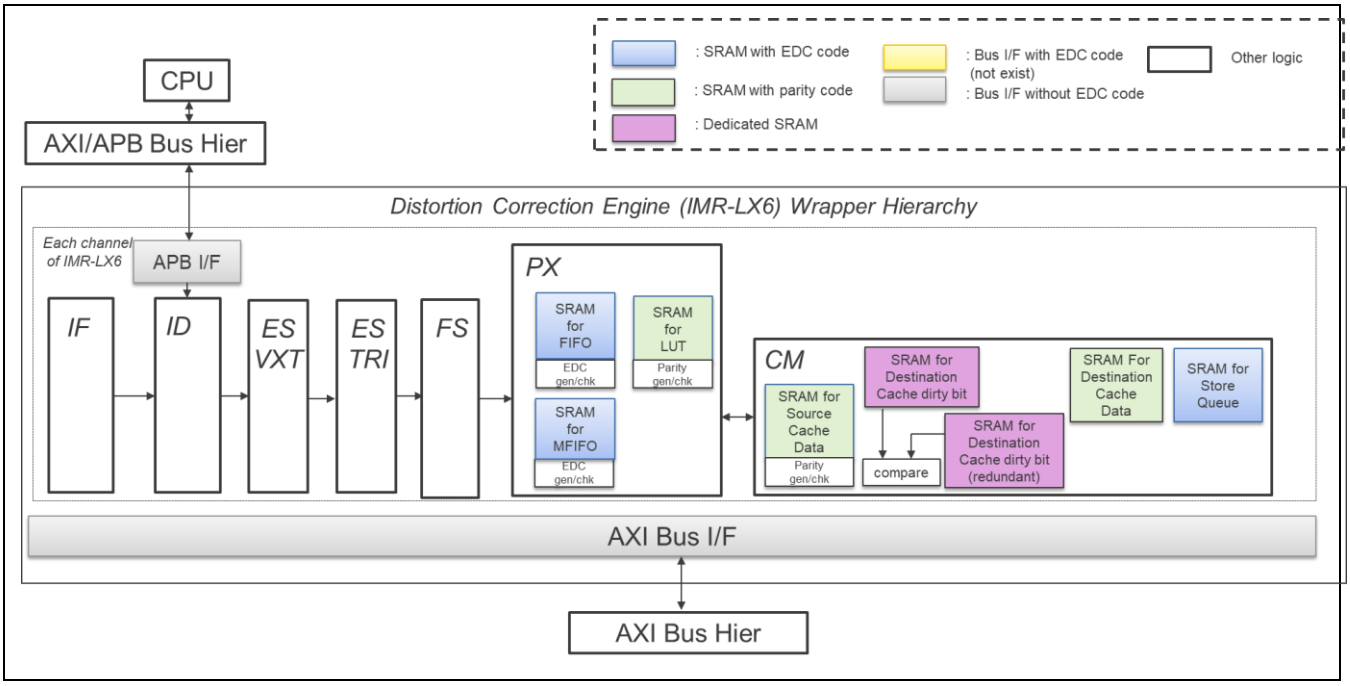

Figure 56.67 IMR0/1 Block Diagram

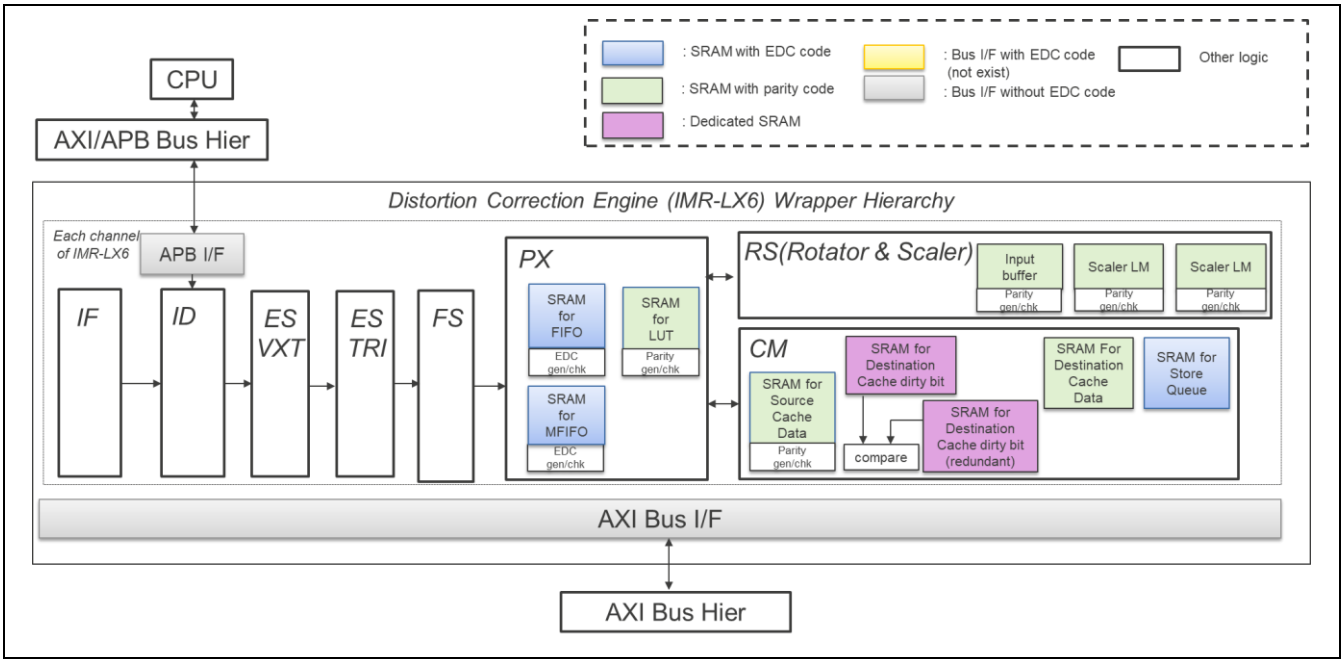

Figure 56.68 IMR2/3 Block Diagram

56.9.2 Hardware Description

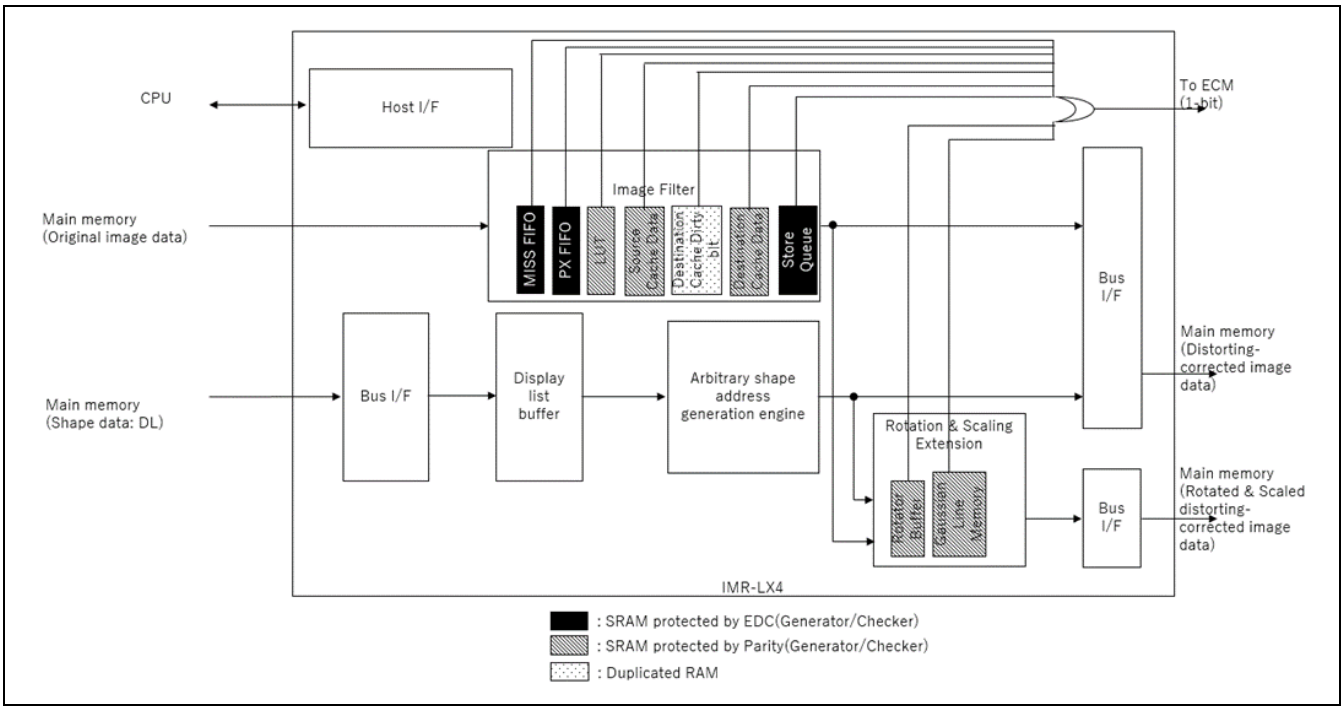

Figure 56.69 Block diagram of SRAM protection for IMR-LX6

56.9.2.1 Parity for IMR-LX6

(1) Overview

Parity check is applied to the following internal RAMs of IMR-LX6. Parity check is always enabled.

- SRAM for LUT
- SRAM for Source Cache Data
- SRAM for Destination Cache Data
- SRAM for Rotator Buffer*1
- SRAM for Line Memory*1

Note *1: These RAMs are implemented if the channel of IMR-LX6 has Rotator & Scaler extension. Refer to Section 56.1 which channel of IMR-LX6 has the extension.

The parity code is generated and written to SRAMs describe above when data is written to each SRAM. And the data and the corresponding code are compared when it is read out. If the result of the comparison is mismatched, the corresponding bit in the EDC Status Register is set to 1.

The values of all bits including all protection method in the EDC Status Register is output to ECM as the error signal of IMR-LX6.

56.9.2.2 EDC for IMR-LX6

(1) Overview

EDC is applied to the following internal RAMs of IMR-LX6. EDC check is always enabled.

- SRAM for PX FIFO
- SRAM for MISS FIFO
- SRAM for Store Queue

The EDC code is generated and written to SRAMs describe above when data is written to each SRAM. And the data and the corresponding code are compared when it is read out. If the result of the comparison is mismatched, the corresponding bit in the EDC Status Register is set to 1.

The values of all bits including all protection method in the EDC Status Register is output to ECM as the error signal of IMR-LX6.

56.9.2.3 Hardware Redundancy for SRAM in IMR-LX6

(1) Overview

The following internal RAM of IMR-LX6 is duplicated. This safety mechanism is always enabled.

- SRAM for Destination Cache dirty bit

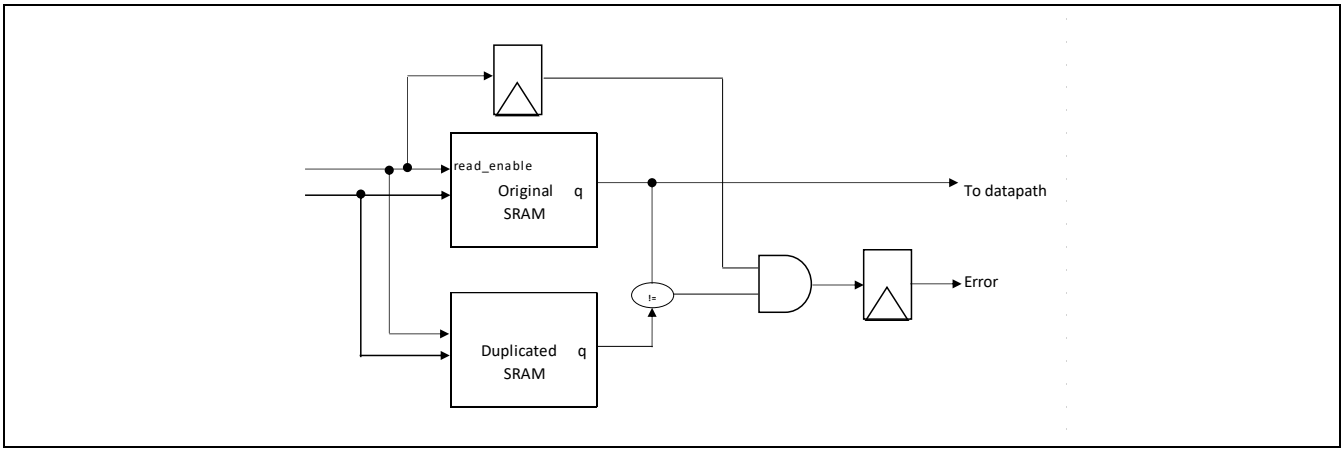

Figure 56.70 Block diagram Hardware Redundancy for SRAM in IMR-LX6

The SRAM described in above consists of two SRAM structure: the original SRAM and the duplicated SRAM. The same data is written to the original SRAM and the duplicated SRAM at the same cycle when the write request is issued to the SRAM. And the read data from both the original SRAM and the duplicated SRAM are compared when the SRAM is read out. If the result of the comparison is mismatched, the corresponding bit in the EDC Status Register is set to 1.

The values of all bits including all protection method in the EDC Status Register is output to ECM as the error signal of IMR-LX6.

57.Video Encoding Processor for inter-device video transfer (iVCP1E)

57.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The iVCP1E is a video encoder which provides low-latency encoding capability on the basis of H.264/AVC video coding standard. Require software or the library to RENESAS for operating this module.

The iVCP1E has an AXI-bus interface and an APB-bus interface (Figure 57.1).

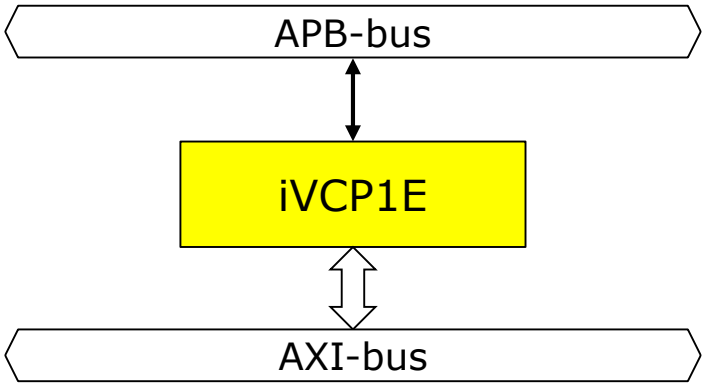

Figure 57.1 Overview of the iVCP1E

57.1.1 Features

The iVCP1E has the following features.

- Support for H.264/AVC with 8/10/12-bit depth
- Low-latency encoding with precise CBR (Constant Bit Rate) control
- Support 1920 x 1080 resolution
- Data handling on a picture-by-picture basis

Table 57.1 Main Function of the iVCP1E

Item	Description
Encoding standard supported	H.264/AVC Baseline Profile @Level 4.2 (The arbitrary slice order, the flexible macroblock order and the redundant slice aren't supported), Constrained Baseline Profile @Level 4.2, High Profile @Level 4.2, Main Profile @Level 4.2, Constrained High Profile @Level 4.2, Progressive High Profile @Level 4.2, High 10 Profile @Level 4.2, High 10 Intra Profile @Level 4.2 High 4:2:2 Profile @Level 4.2 High 4:2:2 Intra Profile @Level 4.2 High 4:4:4 Predictive Profile @Level 4.2 (*1) High 4:4:4 Intra Profile @Level 4.2 (*1) CAVLC 4:4:4 Intra Profile @Level 4.2 (*1) (*1) The 8-bit, 10-bit, 12-bit depth samples are supported. The YCbCr 4:4:4 is not supported.
Maximum pixel rate	4:2:0/8bit: 1920 x 1080p x 120 fps, or 1280 x 720p x 240 fps Others: 1920 x 1080p x 60 fps, or 1280 x 720p x 120 fps
Maximum bit rate	200 Mbps @ CBR
Maximum bit per picture	4 Mbit / picture
Picture size supported	Minimum size: Horizontal 176 pixels x Vertical 144 lines Maximum size: Horizontal 1920 pixels x Vertical 1088 lines Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines. Additionally, 1080 x 1920 and 1088 x 1920 are supported.
Input color format	YCbCr 4:2:0, YCbCr 4:2:2 and YCbCr 4:0:0 are supported, in YCbCr 4:2:0, YCbCr 4:2:2 case, the following planar format is supported: YCbCr 4:2:0 planar (Y, Cb and Cr plane) YCbCr 4:2:0 semi-planar (Y and C plane) (*1) YCbCr 4:2:2 planar (Y, Cb and Cr plane) (*2) YCbCr 4:2:2 semi-planar (Y and C plane) (*1)(*2) (*1) Cb/Cr and Cr/Cb interleaving order is supported in the semi-planar format. (*2) YCbCr 4:2:2 is down-sampled to YCbCr 4:2:0 before encoding or YCbCr 4:2:2 encoding.
Encode color format	YCbCr 4:2:0 / 4:2:2 / 4:0:0 format

Item	Description
Input bit depth	8bit, 10bit and 12bit 12bit pixels can be truncated to 10bit or 8bit pixels before encoding. 10bit pixels can also be truncated to 8bit pixels and encoded as 8bit pixels. A single pixel of 10 or 12bit depth shall be placed in consecutive 2 bytes. In case of chroma bit depth is 8bit, luma bit depth can be 8bit, 10bit or 12bit. For others, they should be the same.
Encode bit depth	8bit, 10bit or 12bit Luma pixels and chroma pixels shall have an identical bit depth.
Picture order count type	Type 0, Type 1 and Type 2
Bit stream format	Video elementary stream as follows: H.264 NAL units which can include SPS, PPS, AUD, VCL and Filler. SPS can include VUI which signals a low-latency indicator. Function to insert the emulation prevention byte in the H.264 bit stream is supported.
Picture structure	Frame structure

57.1.2 Register Configuration

Below table shows the register configuration related to EDC for SRAM which the host CPU can read and write directly. All registers are writable and readable by only 32-bit unit.

Table 57.2 Register Configuration of iVCP1E

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size
EDC control register	VP_EDC_CTRL	R/W	H'FEA0 03A0	H'0000 0000	32
EDC status register	VP_EDC_STA	R/W	H'FEA0 03A4	H'0000 0000	32

57.1.3 Connected Module

Table 57.3 shows modules connected to the iVCP1E.

Table 57.3 Connected Module

Connected Module	Function of the Connected Module
CPG	Reset and Clock Stop Signal Supplier
INTTOP	Interrupt Controller
ECM	Error Interrupt Controller

57.2 Register Description

57.2.1 EDC Control Register (VP_EDC_CTRL)

This register controls the behavior of a SRAM EDC checking function and injecting dummy EDC error to test itself.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	FERRN	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	EDCD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved These bits are read as 0. The write value shall always be 0.
24	FERRN	0	R/W	This bit forces the EDC error notification signal (errreq_iv1es_ecc_p) to be asserted. 0: Does not assert EDC error notification signal forcibly. 1: Asserts EDC error notification signal forcibly.
23 to 1	-	All 0	R	Reserved These bits are read as 0. The write value shall always be 0.
0	EDCD	0	R/W	This bit specifies the disable flag of EDC checking function. 0: Enables SRAM-EDC checking function. 1: Disables SRAM-EDC checking function.

57.2.2 EDC Status Register (VP_EDC_STA)

VP_EDC_STA indicates the status of a SRAM-EDC error. If EDC error occurs, the SRAM-EDC error status bit (EDC bit) is set to 1. iVCP1E issues the error notification signal to the external error controller if the VP_EDC_CTRL.EDCD is 0 and the EDC bit is 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	EDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0. The write value shall always be 0.
0	EDC	0	R/W	This bit indicates SRAM-EDC error. 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.

57.3 Operation

The LSI supports module standby mode in which clock supply to the iVCP1E is stopped. Don't access iVCP1E registers during module standby mode.

57.3.1 Module Standby Mode

57.3.1.1. Transition to Module Standby Mode

1. Confirm that iVCP1E is not encoding a picture.
2. Set MSTP16 bit to 1 in MSTPCR6 of the clock pulse generator (CPG) module.
3. Confirm that MSTP16 bit to 1 in MSTPSR6 of CPG module.

For detail of registers of CPG, refer to section 9.

57.3.1.2. Cancellation of Module Standby Mode

1. Set MSTP16 bit to 0 in MSTPCR6 of the clock pulse generator (CPG) module.
2. Confirm that MSTP16 bit to 0 in MSTPSR6 of CPG module.
3. Set SRT16 bit to 1 in the Software Reset Register 6 (SRCR6) of CPG module.
4. Set SRTCLR16 to 1 in Software Reset Clearing Register 6 (SRSTCLR6) of CPG module.

For detail of registers of CPG, refer to section 9.

57.4 Usage Notes

57.4.1 Limitations on Software Reset, Module Standby and power-shutoff

Before executing the following operations for the iVCP1E, confirm that the iVCP1E is not encoding a picture. If the iVCP1E is encoding a picture, wait completion of encoding the picture before executing the following operations. Moreover, It's necessary to supply clock when execute Software Reset by CPG.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG
- Enter power-shutoff status (stop power supply) by SYSC

57.5 Safety Mechanism

57.5.1 Overview

EDC protection is applied to all internal SRAMs in iVCP1E.

57.5.2 Related Registers

Below table shows the registers related to EDC for SRAM.

Table 57.4 Related Registers

Register Name	Abbreviation
EDC control register	VP_EDC_CTRL
EDC status register	VP_EDC_STA

Behavior of notification signal can be turned on or off by VP_EDC_CTRL register. If VP_EDC_CTRL.EDCD is set to 0, the notification is enabled. If it is set to 1, the error notification signal is not asserted, and it is always negated.

When an EDC error occurs, the status register VP_EDC_STA.EDC becomes 1. If VP_EDC_STA.EDC is 1 and VP_EDC_CTRL.EDCD is 0, the error notification signal continues to be asserted. When software writes 0 to VP_EDC_STA.EDC, it is cleared and the error notification signal is also negated.

Writing 1 to VP_ EDC_CTRL.FERRN forces the error notification to be asserted. When 0 is written, the forced assertion is canceled. This bit can be used for checking connection of EDC error notification signals between iVCP1E and ECM without activating iVCP1E.

57.5.3 Hardware Description

iVCP1E checks all internal SRAMs for data corruption. iVCP1E generates a checksum (EDC) at the time of data writing to SRAM and stores it with data in SRAM. When iVCP1E read from the SRAM, it checks whether the read data matches the EDC. If they do not match, the notification signals to the error control module (ECM) is asserted.

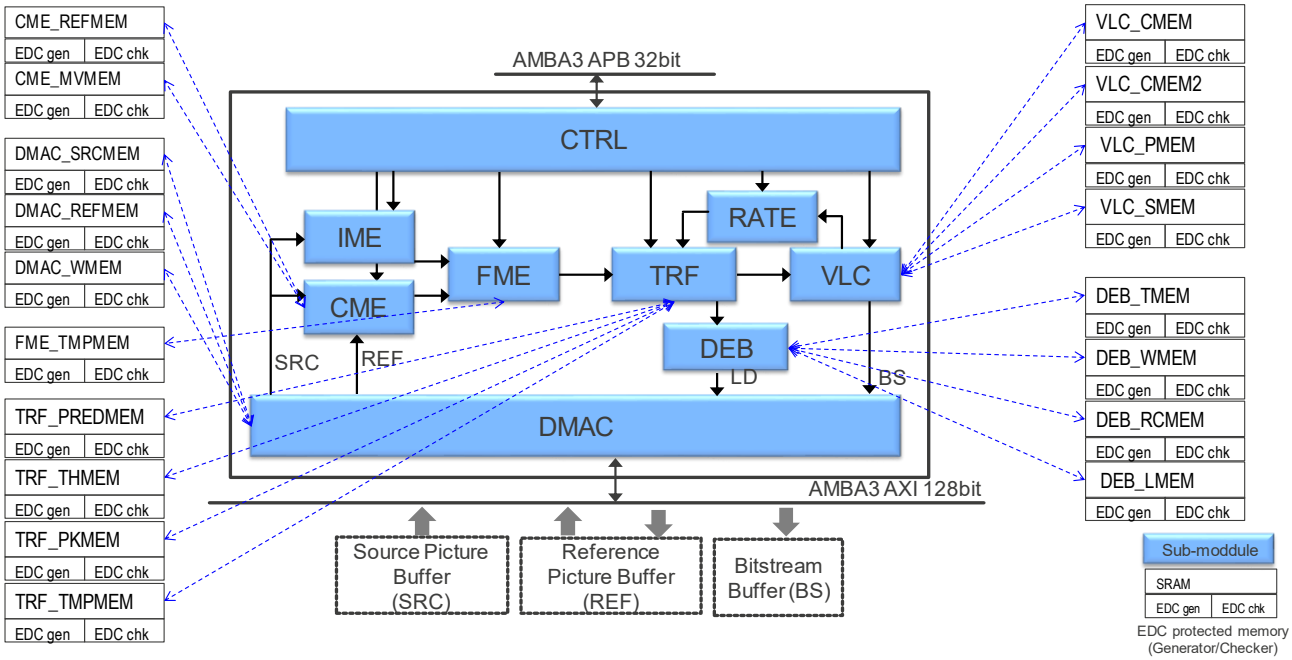

Figure 57.2 EDC Protected SRAMs and Error Notification Signals

58. Image Processing Unit (IMP-X7)

58.1 Overview

The image processing unit extended 7 (hereafter referred to as IMP-X7) captures image data from the DDR-SDRAM and processes images. The IMP-X7 is a collective term for the extended image processing unit incorporated in the fourth-generations R-Car series products.

58.1.1 Features

The IMP-X7 which includes the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, IMP CNN, IMP DTA and VDSP acts as an accelerator for image processing at high speed. Co-operation between hardware and software reduces the load on the CPU and improves the efficiency of image processing. The number of cores in each IP depends on the product. For details, refer to Table 58.1.

(1) IMP core

The IMP core is capable of local parallel operations: multiple image-processing functions are run on a basis of 1 pixel/cycle or 2 pixels/cycle. High-speed pre-processing, post-processing, and histogram processing (two types can be processed simultaneously) are achieved by a pipelined architecture. The operating frequency is improved, and features are added compared to the IMP core included in the IMP-X6 of the third-generation R-Car series products.

(2) CVe

Core with a programmable parallel processing engine that is capable of processing operations in 32-bit integer or 32-bit floating point precision. The operating frequency is improved, and features are added compared to the CVe included in the IMP-X6 of the third-generation R-Car series products.

(3) IMP DMAC

A DMA controller which can improve the efficiency of accessing the DDR-SDRAM by fast copying of data to IMP-X7 internal memory and by synchronization with other IPs inside IMP-X7.

(4) Slim-IMP DMAC

A DMA controller in which usable functions are limited compared to the IMP DMAC.

(5) IMP PSC

A scaling engine which can generate reduced-size image data (up to 4 variations at once). The scaling ratios for horizontal and vertical can be set independently. Bilinear filtering is used as the image interpolation algorithm.

(6) IMP CNN

The IMP CNN module is a module enabling a fast execution of a Convolutional Neural Network with optional enabling of Rectified Linear Units (RELU) and pooling option for up to 16 input DMA and 32 output DMA channels with a simple instruction set.

(7) IMP DTA

Debug and Trace Agent supports debugging of the IMP-X7 sub system. To debug the synchronization between the different components, the Debug and Trace Agent can interrupt processing of each component or break all components.

(8) VDSP

Refer VDSP HWM for details.

58.1.2 Specifications of the IMP-X7 by Products

Table 58.1 shows the specifications of the IMP-X7 in the fourth-generation R-Car series products.

Table 58.1 Specifications of the IMP-X7 by Products

Function Name	Specification	Fourth-Generation R-Car Series Products (Unit Name in each Product)
		IMP-X7-V4M
AXI master	AXI Master 0 Bus width	256
	Operating frequency	SVD1_IRφ
	AXI Master 1 Bus width	256
	Operating frequency	SVD1_IRφ
AXI slave	Bus width	64
	Operating frequency	SVD1_IRφ
IMP-X7 internal memory [Scratchpad memory (SPM)]	Capacity	2M bytes (256 Kbyte × 8 banks) SPMI
	Operating frequency	SVD1_IRφ
	Capacity	2M bytes + 0.5 M bytes SPMC0 + SPMC1
	Operating frequency	IMPAD1φ
IMP core	Number of cores	2
	Operating frequency	SVD1_IRφ
CVe	Number of clusters	4*
	Operating frequency	SVD1_IRφ
IMP DMAC	Number of cores	2
	Operating frequency	SVD1_IRφ
IMP PSC	Number of cores	1
	Operating frequency	SVD1_IRφ
IMP CNN	Number of cores	1
	Operating frequency	IMPAD1φ
Slim-IMP DMAC	Number of cores	2
	Operating frequency	IMPAD1φ
IMPDTA	Number of cores	1
	Operating frequency	SVD1_IRφ
VDSP	Number of cores	2
	Operating frequency	IMPAD1φ
	AXI master	SVD1_IRφ /256-bit SVD1_IRφ /128-bit
	AXI slave	SVD1_IRφ /64-bit

Note: CVe clusters 1, 2 and 3 are light CVe with reduced area and reduced power.

58.1.3 Block Diagram

Figure 58.1 respectively show a block diagram of the IMP-X7 in the R-Car Gen4.

Note: * Number of input DMA channels n = 16, number of DMA3DC, Convolution, RELU, MAXOUT, POOL_XY and output DMA channels m = 32

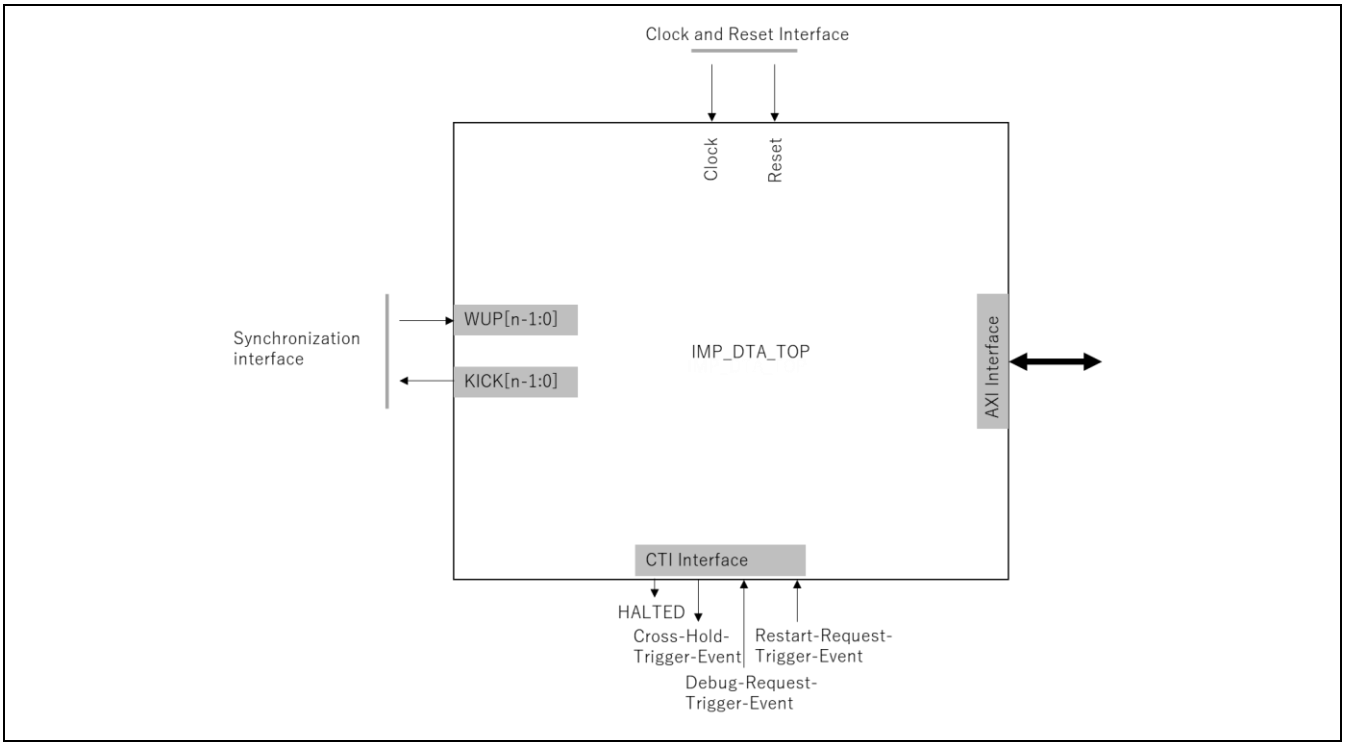

Figure 58.8 Block Diagram of IMPDTA

Refer U39.VDSP HWM for Block diagram.

The main features of each module in the IMP-X7 are shown below.

- IMP-X7:
  This is an image processing module that incorporates the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, IMP CNN, IMPDTA, and processes images in parallel.
- AXI master (ch0/1):
  Performs arbitration of AXI master access from the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, and IMP CNN. The AXI master of the IMP-X7 has two channels.
- AXI slave (IMPSLV):
  Performs routing for AXI slave access in the IMP-X7.
- Interrupt control logic:
  Controls output of various interrupt signals from each internal core. The grouping can be realized up to **7**.
- IMP-X7 internal memory (Scratchpad memory):
  By storing the intermediate processing data, e.g., the efficiency of bus access can be improved. Scratchpad memory or IMP-X7 internal memory is also named as SPMC0/1 Scratchpad memory dedicated to IMP CNN and Slim-IMP DMAC) and SPMI (Scratchpad memory dedicated to other IMP IPs like IMP core, CVe, IMP PSC, IMPDMAC).
- IMP core
  - Host interface:
    This is an interface module for AXI slave access. Handles slave access (in 4-byte units only) set via registers.
  - Interrupt control (INTC):
    Controls output of various interrupt signals.
  - Address processor (AP):
    Generates various addresses in accordance with register settings, provides data to the image processor through AXI master access, and writes the result of processing to the DDR-SDRAM through AXI master access.
  - Image processor*[1]:
    Processes image data loaded from the DDR-SDRAM to the IMP in accordance with register settings in the order of pre-processing → image processing (e.g., density conversion, kernel processing and labeling) → post-processing. The result of processing is sent to the HP or AP before being written to the DDR-SDRAM.
  - Histogram processor (HP)*[2]:
    Processes various types of histograms. Two cores of the histogram processing modules in the HP can execute two types of histogram processing simultaneously.
- CVe
  - Host interface:
    This is an interface module for AXI slave access. Handles AXI slave access (in 4-byte units only) set via registers.
  - Interrupt control (INTC):
    Controls output of various interrupt signals.
  - Thread (==Unified processor)
    This is a processor for loading, storing and operating pixel data in accordance with a designated program. 32-bit integer and 32-bit floating-point operations are supported.
  - Data cache:
    This is the caching logic for the data which is processed by Thread. And it is also the input/output interface of the DDR-SDRAM access.
  - Instruction cache:
    This is the caching logic for the instruction which is issued by Thread.
  - Shared operation unit:
    Arithmetic logical unit shared by all Threads.
  - Working memory:
    This is a storage unit which Thread can use to fast load/store intermediate processing data.

- IMP DMAC and Slim-IMP DMAC:
  This is a DMA controller that performs burst transfer to transfer data between the DDR-SDRAM and IMP-X7 internal memory for achieving efficient bus access.
  - Host interface:
    This is an interface module for AXI slave access. Handles AXI slave access (in 4-byte units only) set via registers.
  - Interrupt control (INTC):
    Controls output of various interrupt signals.
  - Logical Operation (LOP) *1:
    Logical operations using two pieces of input image data is possible.
  - Bit count*1:
    The number of 1s in image data can be counted in 8-, 16-, or 32-bit units.
  - SHIFT*1:
    Applying shifting, rounding, and saturation processing to the outputs from logical operations.

Note: 1. Slim-IMP DMAC does not support LOP, Bit count and SHIFT functions.

- IMP PSC:
  This is an image scaling engine. It can generate up to 4 reduced-size image data variations at once.
  - Host interface:
    This is an interface module for AXI slave access. Handles AXI slave access (in 4-byte units only) set via registers.
  - Interrupt control (INTC):
    Controls output of various interrupt signals.
  - Line memory:
    This is the storage unit to realize the bilinear filtering.
  - Scaling plane0-3:
    Due to the register settings, it can be generated 4 reduced-size image data in parallel.
- IMP CNN:
  - Host interface:
    This is an interface module for AXI slave access. Handles AXI slave access (in 4-byte units only) set via registers.
  - Interrupt control (INTC):
    Controls output of various interrupt signals.
  - Input DMA (DMAI):
    This module transfers data from the IMP-X7 internal memory (SPMC0) through the CNN <->SPMC0 dedicated interface to the line memory.
  - Line memory:
    Line memory stores the row-data to perform the next process.
  - Convolution:
    Convolution module is responsible for performing the convolution for up to 16 input DMA and 32 output DMA channels.
  - RELU:
    REctified Linear Unit (RELU) module is responsible for performing the activation function.
  - MAXOUT:
    MAXOUT operation is responsible for performing a selection operation by taking the maximum value out of 32 neighbored channels.
  - POOL_XY (POOL):
    POOL operation is responsible for performing a selection operation by taking the maximum value out of an XY area.

— Output DMAO:

This module transfers data from the output of the IMP CNN module to the IMP-X7 internal memory (SPMC0/1) through the CNN <->SPMC0/1 dedicated interface.

— DMA3DC:

The DMA3DC is responsible for the intermediate data transfer from IMP-X7 internal memory (SPMC1) to convolution module of IMP CNN through the CNN <->SPMC1 dedicated interface.

58.1.4 Connected Module

Table 58.2 Connected Modules

Connected Module	Function of the Connected Module
AP-system core	Access to registers
Clock pulse generator (CPG)	Supply of clock signals
System controller (SYSC)	Power shutdown
Module standby	Supply and control of clock signals
Software reset	Supply and control of software reset signal
INTC-AP	Interrupt
External bus controller (DBSC5)	DDR-SDRAM access
Image renderer light extended 6 (IMR-LX6)	Distortion correction engine. Drawing processor with a simple instruction system. (IMP-X7 and IMR-LX6 can WUP/SLP)
Image signal processor (ISP)	Image pixel correction engine. Correct the input image signal from the video input interface. (IMR-LX6 and ISP are connected through IMP-X7)

58.2 Operation

58.2.1 Image Processing (IMP Core)

Table 58.3 lists some of the image-processing functions supported by the hardware of the IMP core of the IMP-X7. All IMP cores inside IMP-X7 have the same functionality. Pipeline processing in the order of pre-processing → other image processing (those following post-processing in Table 58.3) → post-processing, for example, is possible. Detailed functions are specifiable for each of the processes.

Table 58.3 Image-Processing Functions (Excerpt)

Feature	Details
Pre-processing (by the pre-processor)	Masking, density conversion, bit inversion, normalization, and differential absolute value
Post-processing (by the post-processor)	Absolute-value processing, normalization, density conversion, masking, and square-root operation
Pixel conversion*1	Through mode, addition and subtraction of constants, output of maximum and minimum values, etc.
Arithmetic operations between images*1	Addition, subtraction, multiplication, division, modulo, squared addition, subtraction, and output of the maximum and minimum values, etc.
Logical operations between images*1	Logical multiplication (AND), logical addition (OR), exclusive OR, logical AND with a constant, logical OR with a constant, Logical AND bit count, etc.
Convolution*2	3 × 3, 1 × 9, 4 × 4, 1 × 16, 5 × 5, 1 × 25, or 7 × 7 kernel operation
Rank filtering	3 × 3 kernel operation and 5 × 5 min./max. processing
Binary image matching filtering	The number of bits matching the template is output in 9 × 9 units.
Normalized correlation operation and cumulative difference operation	Normalized correlation operation and cumulative difference operation
Local parallel operation (normalized correlation/difference)	Extra cumulative difference operation of the normalized correlation operation is locally performed as 25 parallel operations.
Labeling	Labeling of binary images
Form conversion	Thinning and erosion
Binary-format filtering	23 types of image processing for binary images are performed in a pipeline.
Histogram processing*2	Cumulative density, extraction of maximum and minimum values, and projection
Others	Color-support arithmetic operation, Sobel-filter support, local difference operation, integral image, peripheral increment sign, edge code calculation, support for histograms of oriented gradients (HOG) feature calculation, etc.

Notes: 1. Handling of two pixels per cycle is possible.
2. Handling of two pixels per cycle is possible but some restrictions apply.

58.2.2 CV engine (CVe)

The CVe is a programmable parallel processing engine. It is capable of processing operations in 32-bit integer or 32-bit floating point precision. For details, refer to the U- Chapter of the CV engine.

58.2.3 DMA Transfer (IMP DMAC)

The IMP DMAC is a DMA controller with a read/write function specific for the IMP-X7. Any IP can synchronize with the IMP DMAC via the IMP-X7 internal memory, the efficiency of access to the DDR-SDRAM can be improved.

Table 58.4 IMP DMAC Functions

Feature	Details
Processing size	8 bpp: 8192 × 8192 pixels 16 bpp: 4096 × 4096 pixels 32 bpp: 2048 × 2048 pixels
Access addressing	Linear addressing Tile addressing Linear–tile addressing interconversion*1
Pixel operation*2	16 types of logical operations Bit count, Logic shift, Rounding, Saturation

Notes: 1. A tile of 16 bytes × 4 lines which is supported by the IMR-LX6 can be processed.
2. Usage of the pixel operation function is prohibited during linear–tile addressing interconversion.

58.2.4 DMA Transfer (Slim-IMP DMAC)

The Slim-IMP DMAC is a DMA controller with a read/write function specific for the IMP-X7. By co-operating the IMP CNN processing with the Slim-IMP DMAC via the IMP-X7 internal memory, the efficiency of access to the DDR-SDRAM can be improved.

Table 58.5 Slim-IMP DMAC Functions

Feature	Details
Processing size	8 bpp: 8192 × 8192 pixels 16 bpp: 4096 × 4096 pixels 32 bpp: 2048 × 2048 pixels
Access addressing	Linear addressing
Pixel operation	Pixel operations are not supported

58.2.5 Image scaling (IMP PSC)

The IMP PSC is a scaling engine to generate the reduced-size image data. It can generate up to 4 reduced-size image data variations at once. IMP PSC stores the generated image data to DDR-SDRAM or IMP-X7 internal memory.

Table 58.6 IMP PSC Functions

Feature	Details
Image format	unsigned 8/10/12/16-bit signed 8/16-bit
Processing size	unsigned/signed 8-bit: 4096 × 4096 pixels others: 2048 × 4096 pixels

Feature	Details
Scaling ratio	Scaling ration is 0.5 to 1.0 - The scaling ratios for horizontal and vertical can be set independently. - 20-bit fixed point expression, 1/1048576 step.
Image interpolation	Bilinear filtering

58.2.6 Convolutional Neural Network (IMP CNN)

The IMP CNN is an engine to enable a fast execution of a Convolutional Neural Network. It supports up to 16 input DMA and 32 output DMA channels. Next to the convolution with a size of up to 5×5, optional a Rectified Linear Units (RELU) or pooling over output channels and x/y direction is supported. The IMP CNN supports the following features:

Table 58.7 IMP CNN Functions

Function	Details
Image format	unsigned 8-bit signed 8/16-bit
Processing size	Tile size up to 2048 line times 128 pixels
Input channel	Up to 16 channel (Input DMAI)
Output channel	Up to 32 channel (Output DMAO)
Convolution size	Up to 5 x 5
Magnification setting	1/5, 1/4, 1/3, 1/2, 1, 2, 3, 4, 5

58.3 Bus Access Latency Reduction

The internal bus of the IMP-X7 has the following features to reduce the latency for bus access to outside of the IMP-X7.

58.3.1 IMP-X7 internal memory (Scratchpad Memory)

An SRAM is included in the internal bus of the IMP-X7. The bus access latency can be reduced by making use of the IMP-X7 internal memory so that the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, and IMP CNN perform processing efficiently. These are commonly named as SPMC0/1 (Scratchpad memory dedicated to IMP CNN and Slim-IMP DMAC) and SPMI (Scratchpad memory dedicated to other IMP IPs like IMP core, CVe, IMP PSC, IMPDMAC). Refer U34.IMP-X7_System chapter for the details of SPMI and SPMC.

58.4 Starting and Stopping Module Operation

Image processing starts to operate when mode settings are made in the corresponding registers of IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, and IMP CNN. While image data in an area of the image memory is being processed, the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, and IMP CNN being used are busy and all accesses from the CPU, except the access for checking the status, is prohibited. On completion of the image processing, interrupt signals are output based on the pre-defined interrupt information in each unit, and each of the interrupt signals is converted by the interrupt control unit to be sent to the CPU to notify it of the completion of image processing. Every time the processing of image data is completed, the processing result of the executed image processing is reflected in the states of the registers and memory in each unit or each area of the image memory.

58.4.1 Power-On Reset

The IMP-X7 enters the power shutdown mode (a state in which the power supply is stopped) after a power-on reset. For the settings to recover the IMP-X7 from the power shutdown mode, refer to section 11, System Controller (SYSC). Figure 58.9 shows the flow of supplying power to the IMP-X7 after a power-on reset.

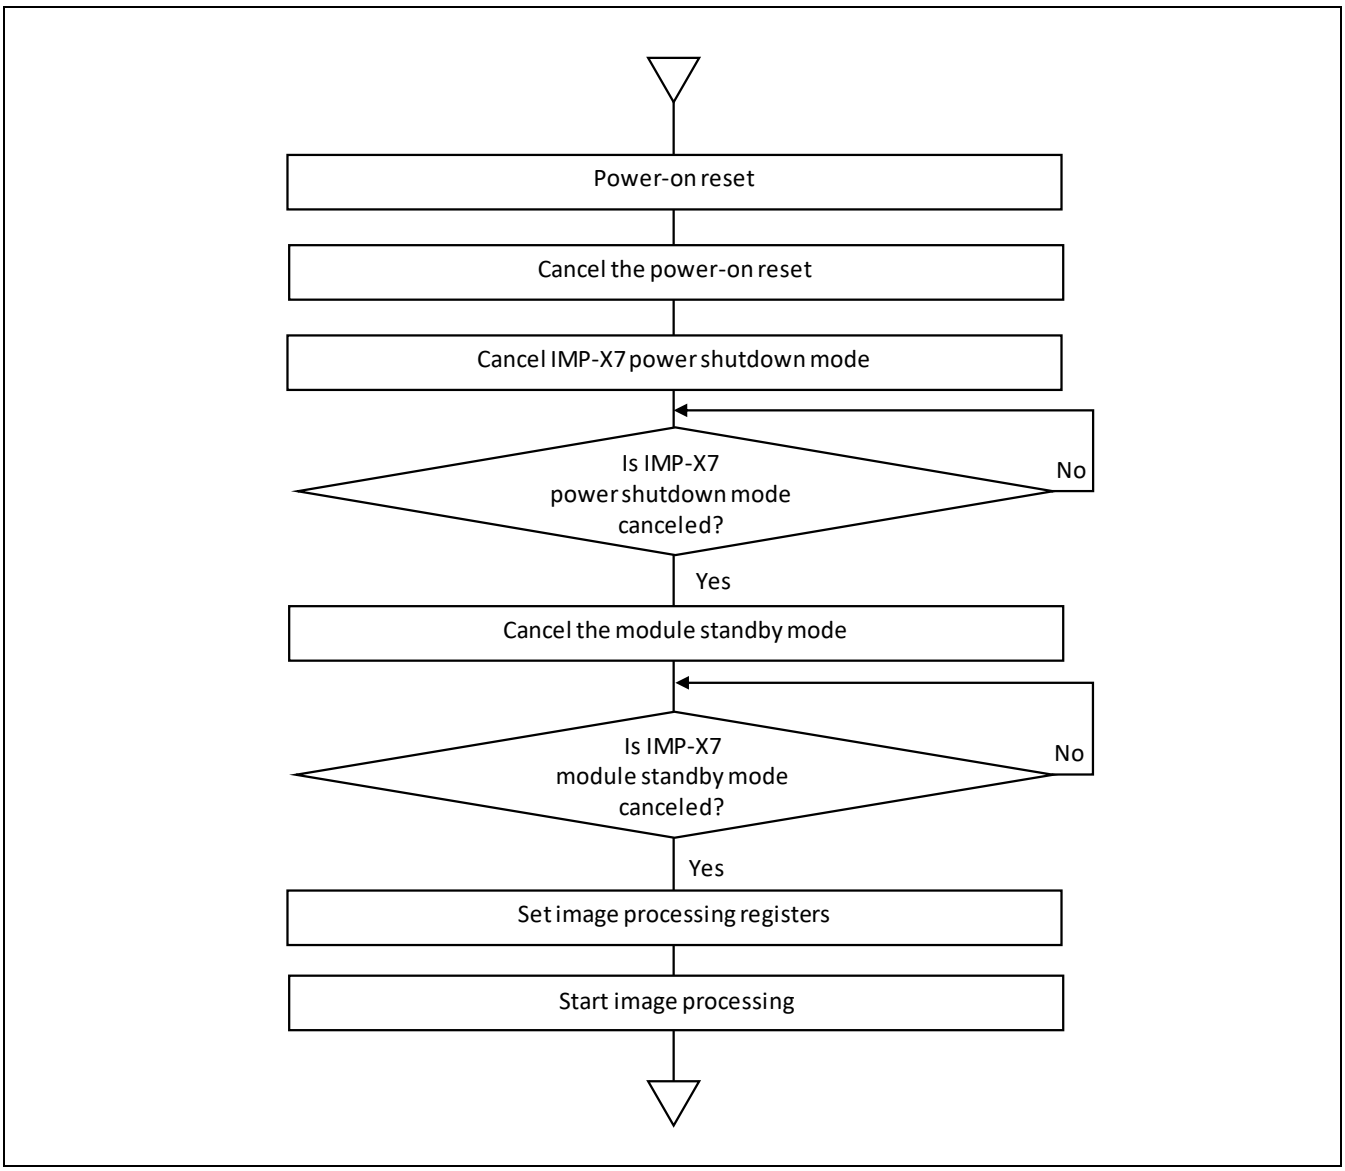

Figure 58.9 Startup Flow of IMP-X7

58.4.2 Low Power Consumption Modes

The IMP-X7 has the following three low power consumption modes.

(1) Power shutdown mode

Power to the IMP-X7 is shut down and clock supply to the IMP-X7 is stopped.

For details on transiting to power shutdown mode and recovering from it, refer to section 11, System Controller (SYSC).

(2) Module Standby mode

Clock supply to the IMP-X7 is stopped.

For details on stopping and restarting clock supply to the IMP-X7, refer to section 9, Module Standby, Software Reset.

58.5 Inter-Module Synchronization

Each module in the IMP-X7 has functionality for synchronizing the command list (CL) controllers between image processing modules.

The inter-module synchronization allows the IMP core, CVe, IMP DMAC, Slim-IMP DMAC, IMP PSC, IMP CNN, VDSP and IMPDTA modules to synchronize their command list controllers by executing WUP and SLP instructions for the specified modules. For details refer to the U34.IMP-X7_System U-Chapter.

58.6 Address Map

Figure 58.10 show the address map of the IMP-X7 in the R-Car Gen4. Other modules can access 4 bytes to this area through the AXI bus. Below addresses are base address for registers of each module in IMP-X7 (IMP core, IMPDMAC, Slim-IMP DMAC, IMP PSC, IMP CNN, CVe, IMP DTA, IMP local bus registers). IMP-X7 Scratchpad memory (SPMI, SPMC0/1) address map is described in **U34.1.3 Address map of Scratchpad memory**. Refer to the U39.VDSP U-Chapter for VDSP.

H'FF90 0000	IMPSLV (24 Kbytes)
H'FF90 6000	Reserved (1000 Kbytes)
H'FFA0 0000	IMP core 0 (128 Kbytes)

Figure 58.10 Address Map of IMP-X7

58.7 Usage Notes

Shutting down the power supply, placing the modules in the module standby mode, and software reset by the clock pulse generator (CPG) is possible for the domains shown in Table 58.8 and Table 58.9. Table 58.8 lists the domains and the modules within each power domain and Table 58.9 lists the domain and the modules in CPG. For details on transition to and recovery from the power shutdown mode, refer to section 11, System Controller (SYSC). For details on the module standby mode and software reset from the CPG, refer to section 9, Module Standby, Software Reset.

58.7.1 Shutting Down the Power Supply

1. Do not attempt to access to the registers of the modules in a domain to which the supply of power has been shut down.
2. Before shutting down the power supply to a domain, ensure that no modules in the target domain are operating. Operation cannot be guaranteed if the power supply is shut down while any of the modules is operating.
3. Table 58.8 is power domain structure. When one of those power domains need to be Power-Down, which are located to the left the domain must be also Power-Down state and domains written right the domain must be in Power-ON state.
4. When one of those power domains need to be Power-ON, which are located to the right the domain must be also Power-ON state and domains which are written left the domain must be in Power-Down state.

Table 58.8 Configuration of Power Domains

Power Domain (SYSC)	Module Description	Power Domain (SYSC)	Module Description	Power Domain (SYSC)	Module Description
A1CN0	CNN, Slim-IMP DMAC0/1	**A2CN0**	High Speed Domain incl. CNN, CNN RAM0(SPMC), Slim-IMP DMAC0/1 and, VDSP 0/1	**C4**	Image Recognition IP Including IMPSLV, SPMI and IMP DTA
A1DSP0	VDSP0 (DSP core0)				
A1DSP1	VDSP1 (DSP core1)				
		A2IMP01	IMP core0/1		
		A2PSC	IMPDMA0		
			IMPPSC		
		A2DMA	IMPDMA1		
		A2CV0	CVe0		
		A2CV1	CVe1		
		A2CV2	CVe2		
		A2CV3	CVe3		

58.7.2 Module Standby Mode

1. Do not attempt to access to the registers of the modules in a domain that is in the module standby mode.
2. Before releasing a domain from the module standby mode, be sure to reset the target domain by a software reset from the clock pulse generator. Otherwise, reset the modules once they are released from the module standby mode.
3. Before placing a domain in the module standby mode, ensure that none of the modules in the target domain are operating. Operation cannot be guaranteed if a target domain is placed in the module standby mode while any of its modules is operating.
4. Table 58.9 shows the CPG domain structure for IMP-X7. Before placing any domain in the module standby mode, ensure that, all domains which are written left the domain has been shut down, or that they are in the module standby mode, or have been placed in the software reset state by the CPG, and all domains which are located to the right of the domain has not been shut down, or that they are not in the module standby mode, or not been placed in the software reset state by the CPG. Note that IMPSLV and SPMI need to place in module standby in one set. First place SPMI to module standby mode and last place IMPSLV to module standby mode.

   For example, if SPMC need to be placed in module standby mode then ensure that IMPCNN has been shut down, or it is in module standby mode, or it has been placed in the software reset state by the CPG and IMPSLV and SPMI must not be Power-Down state, or must not be in module standby mode, or must not be in software reset state by the CPG.
5. Before releasing any domain from the module standby mode, ensure that, all domains which are written left the domain has been shut down, or that they are in the module standby mode, or have been placed in the software reset state by the CPG, and all domains which are located to the right of the domain has not been shut down, or that they are not in the module standby mode, or not been placed in the software reset state by the CPG. Note that IMPSLV and SPMI need to release from module standby in one set. First release IMPSLV from module standby mode and last release SPMI from module standby mode.

   For example, if SPMC need to be released module standby mode then ensure that IMPCNN has been shut down, or it is in module standby mode, or it has been placed in the software reset state by the CPG and IMPSLV and SPMI must not be Power-Down state, or must not be in module standby mode, or must not be in software reset state by the CPG.

Table 58.9 Configuration of CPG Domains

Domain (CPG)	Module Description	Domain (CPG)	Module Description	Domain (CPG)	Module Description
IMPCNN	IMP CNN Slim-IMP DMAC0/1	**SPMC**	High Speed Domain (SPMC)	**IMPSLV** **SPMI**	**Image Recognition IP** Including (**IMPSLV and SPMI)**
		IMP0	IMP core0		
		IMP1	IMP core1		
		IMPDMA0	IMPDMAC0		
		IMPPSC0	IMPPSC0		
		OCV0	CVe0		
		OCV1	CVe1		
		OCV2	CVe2		
		OCV3	CVe3		
		IMPDMA1	IMPDMAC1		
		IMP DTA	IMP DTA		

58.7.3 Software Reset by the Clock Pulse Generator (CPG)

1. Do not attempt to access to the registers of the modules in a domain to which a software reset is being applied by the clock pulse generator.
2. Before applying a software reset to a target domain by using the CPG, ensure that none of the modules in the domain are operating. A software reset applied to a target domain by the CPG is equivalent to a power-on reset. Accordingly, operation cannot be guaranteed if a domain is reset while any of its modules is operating.
3. Ensure that software reset is released by reading the CPG register after reset is released before accessing the IMP modules.
4. Table 58.9 shows the CPG domain structure for IMP-X7. Before applying a software reset to the any domain by using the CPG, ensure that, all domains which are written left the domain has been shut down, or that they are in the module standby mode, or have been placed in the software reset state by the CPG, and all domains which are located to the right of the domain has not been shut down, or that they are not in the module standby mode, or not been placed in the software reset state by the CPG. Note that IMPSLV and SPMI need to reset in one set. First place SPMI to software reset mode and last place IMPSLV to software reset.

   For example, if SPMC need to be software reset by CPG then ensure that IMPCNN has been shut down, or it is in module standby mode, or it has been placed in the software reset state by the CPG and IMPSLV and SPMI must not be Power-Down state, or must not be in module standby mode, or must not be in software reset state by the CPG.
5. Before releasing a software reset to the any domain by using the CPG, ensure that, all domains which are written left the domain has been shut down, or that they are in the module standby mode, or have been placed in the software reset state by the CPG, and all domains which are located to the right of the domain has not been shut down, or that they are not in the module standby mode, or not been placed in the software reset state by the CPG. Note that IMPSLV and SPMI need to be released from software reset in one set. First release IMPSLV from software reset mode and last release SPMI from software reset mode.

   For example, if SPMC need to be released module standby mode then ensure that IMPCNN has been shut down, or it is in module standby mode, or it has been placed in the software reset state by the CPG and IMPSLV and SPMI must not be Power-Down state, or must not be in module standby mode, or must not be in software reset state by the CPG.

60. Video Signal Processor (VSP2)

60.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The VSP2 is the successor IP of Renesas' VSP-IP series which supports image processing such as image blending, interleaver, interface to Display Unit (DU), interface of ISP streaming IP and Display Output Compare (DISCOM).

Description of Display Output Compare (DISCOM) is shown in the section 60.5.2.

60.1.1 Features

This LSI incorporates different types of VSP2 modules (VSPX VSPD) as image processing systems. Table 60.1 shows the number of VSP for each product.

The VSPX read data from external memory, and send the data to ISP via Streaming IP.

The VSPD supports image processing such as image blending, interface to Display Output Compare (DISCOM), and output image data to Display Unit (DU) with or without writing back the image data to memory.

Table 60.1 VSP2 configuration

Module Name	Number of channels
VSPX	1
VSPD	1

Each VSPs features are shown in from section 60.1.1.1 to 60.1.1.2

60.1.1.1 Features of VSPX

- Supports reading data from external memory to ISP via Streaming IP
  - Supports RAW8, RAW10, RAW12, RAW14, RAW16, RAW20 and RAW24 for RPF0
  - Supports RAW8, RAW10, RAW12 for RPF1
  - Supports up to 2 exposures (2 raw data)
  - Supports reading ISP config data from memory to ISP.
  - Supports up to 5120 pixels x 4096 lines
- Supports wake up assertion from VIN
- Up to 16 VINs
- Performance of VSPX
  - 720 Mpix/s process rate per 1 set of VSPX.
  - Refer to 60.4.7.2 for more detail

60.1.1.2 Features of VSPD

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane
  - Supports reading high pixel bitdepth (10 bits or 12 bits per each component Y, Cb, Cr, R, G, B) (*1)
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha
  - Supports generating pre multiplied alpha
- Video processing
  - Blending of five picture layers and raster operations (ROPs)
- Direct connection to display module
  - Supporting 6144 pixels in horizontal direction
  - Writing back image data which is transferred to Display Unit (DU) to memory
- Supports DISCOM function
  - Support 2 set of DISCOM per 1 VSPD
  - Support same size with VSPD
  - CRC calculation area is configlable
  - Support detection of unmatching the expectation CRC value
  - Support detection of matching image data over multiple frames for detecting image frozen
  - Support both RGB and YCbCr color space

(*1) For supporting 10 bits / 12 bits in each module, refer to section 60.1.2.12

60.1.2 Block Diagram

60.1.2.1 Block Diagram of Each VSP

Figure 60.1 to Figure 60.2 shows the configuration of VSPX and VSPD sub modules.

All the registers and functions which doesn't appears in the each VSP2 unit's block diagram should be treated as un-implemented functions in each VSP2 unit. Do not set any registers related to the un-implemented function without any statement.

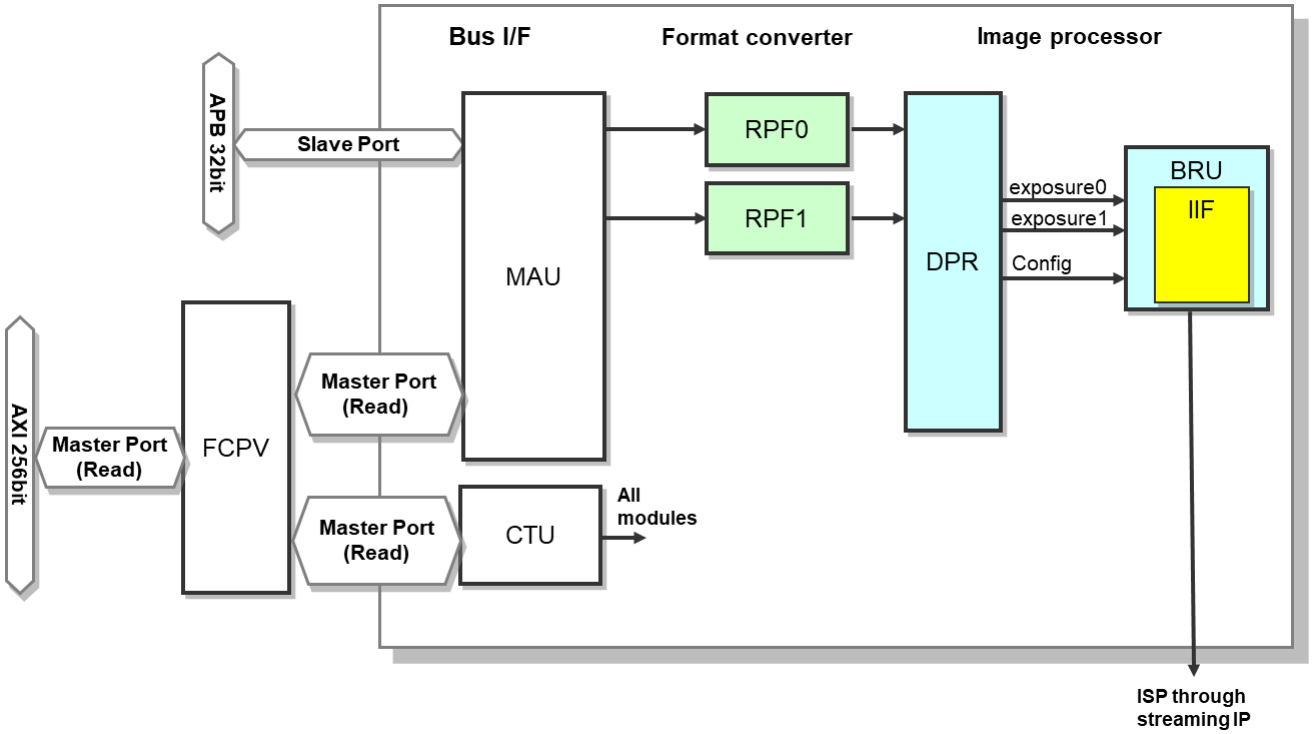

Figure 60.1 VSPX Module Configuration

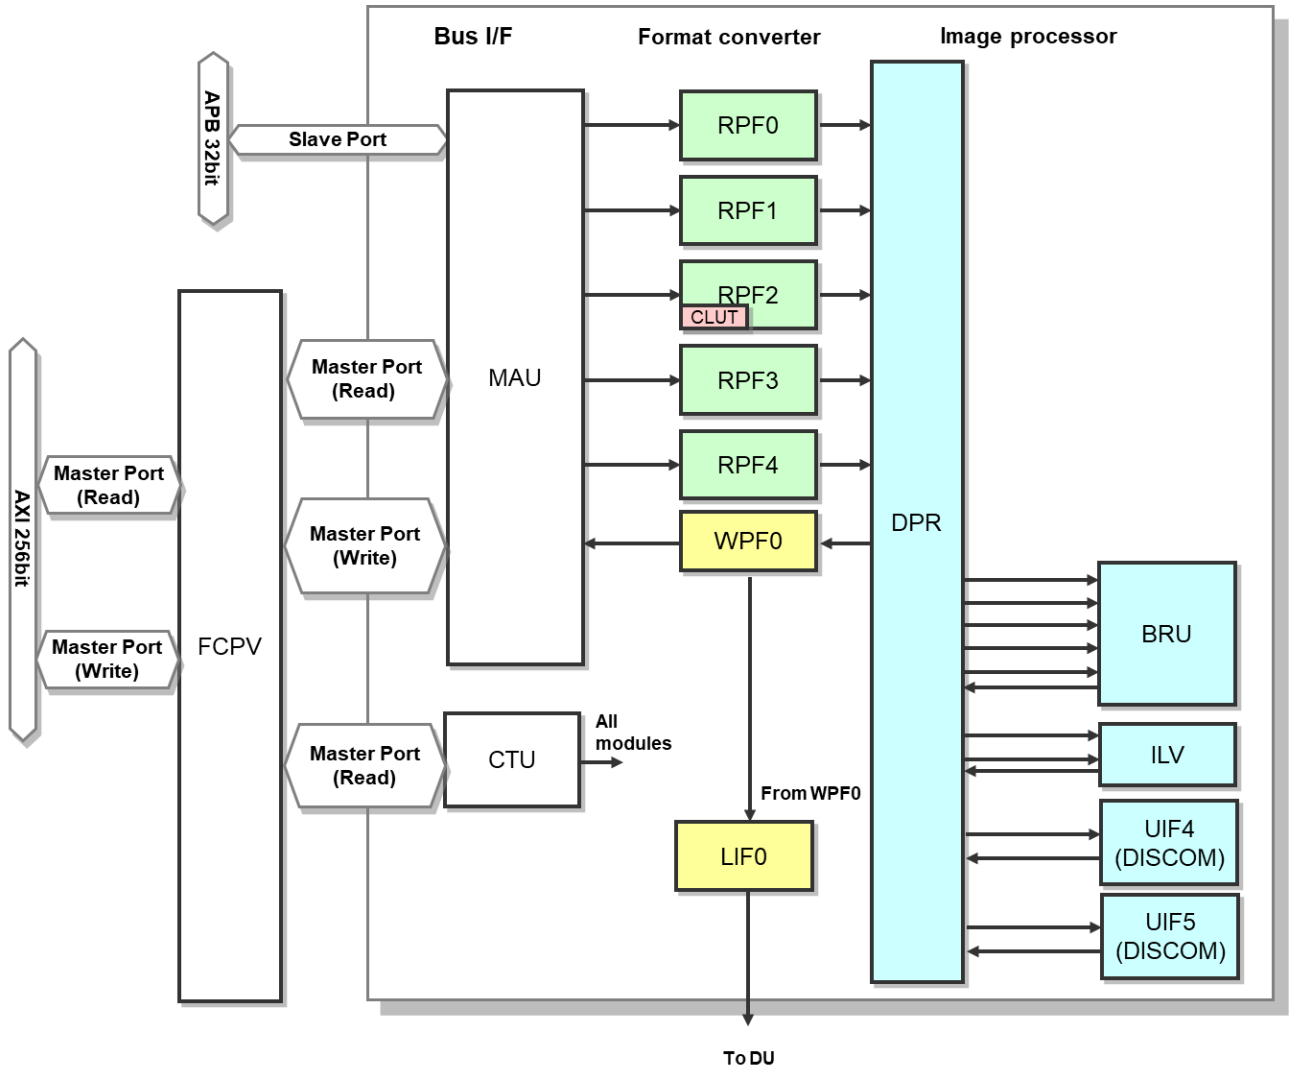

Figure 60.2 VSPD Module Configuration

The following gives an overview of each block function shown in Figure 60.1 to Figure 60.2.

The operation of these functions is determined by the register setting explained in section 60.2. Refer to section 60.2 for the relationship between the register setting and the functional behavior.

60.1.2.2 Memory Access Unit (MAU)

The VSP2 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSP2 necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSP2.

60.1.2.3 Command Transfer Unit (CTU)

The VSP2 can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

60.1.2.4 Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, an index color expanding unit (OSD-CLUT), a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. Figure 60.3 show the processing flow in the RPF.

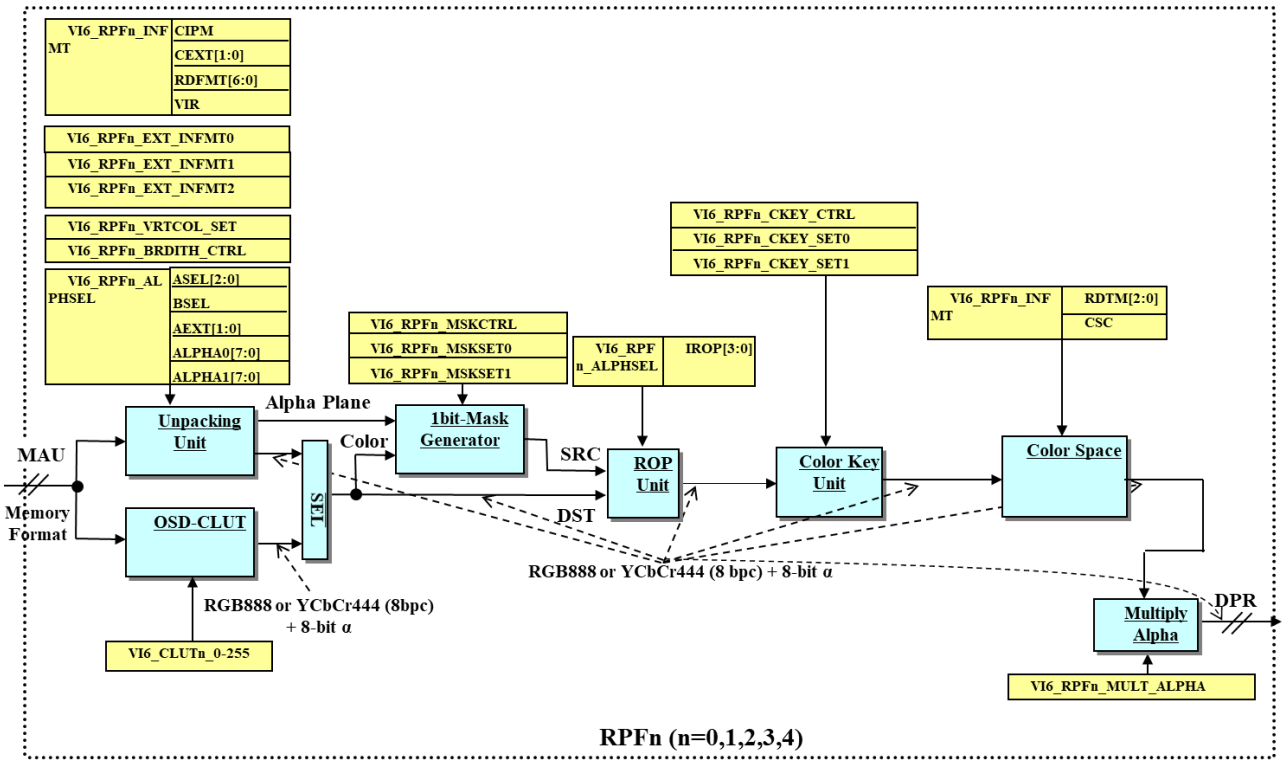

Figure 60.3 RPF Processing Flow

The input format unpacking unit and index color expanding unit (OSD-CLUT) expand the image data input from the MAU into the image format for internal processing (YCbCr444 8bpc or RGB888 8bpc), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit and OSD-CLUT. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSP2 provides maximum two RPF modules (RPF0 to RPF4). The implementation of OSD-CLUT depends on the configuration of each VSP.

60.1.2.5 Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRU, IIF, UIF or ILV), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

60.1.2.6 Blend ROP Unit (BRU)

The BRU is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRU has five blend/ROP operation units (blend/ROP unit m, m = A to E), an ROP operation unit, a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

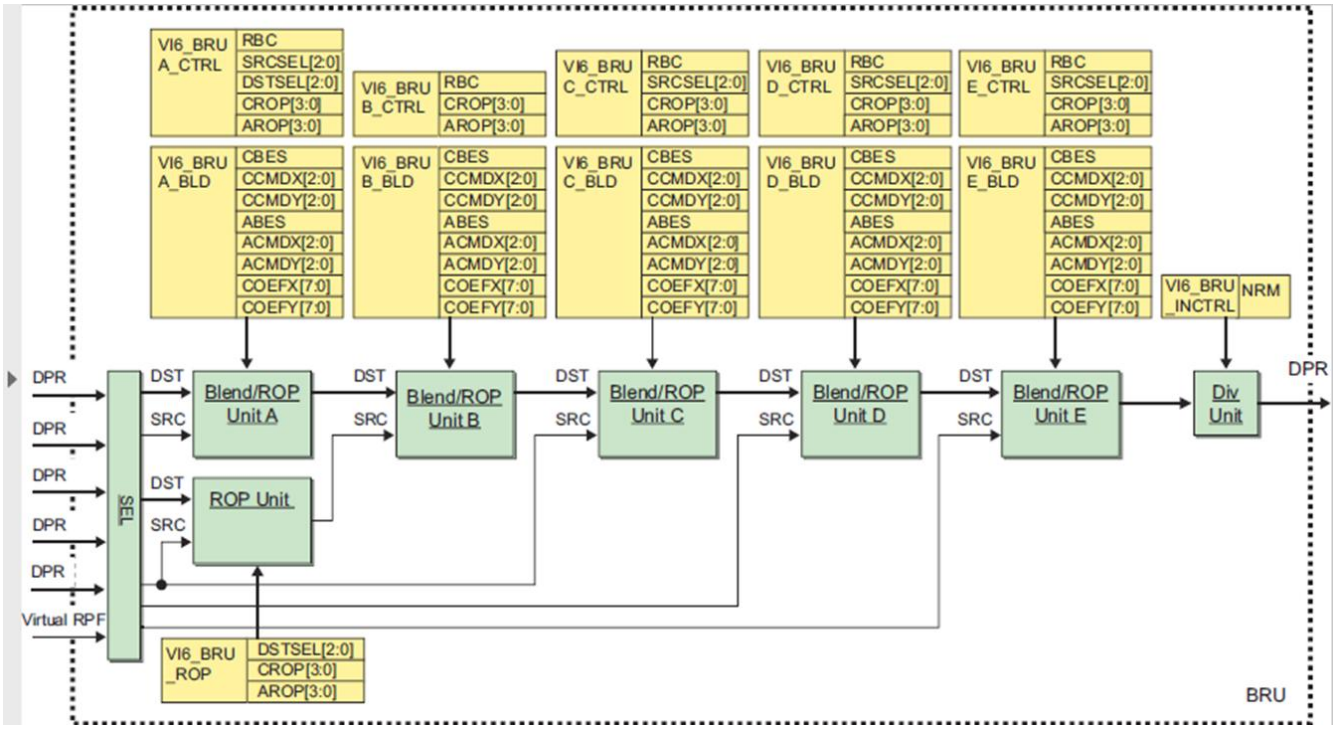

Figure 60.4 BRU Processing Flow

Each of the five blend-ROP operation units (blend/ROP unit m) receives the output from the SEL, blend/ROP Unit m, or ROP unit, and executes blending or raster operation (ROP) of images. The ROP unit receives the output from the SEL

and executes 2-input raster operation (ROP2). By combining the ROP operation in the blend/ROP unit m and ROP2 operation in the ROP unit, 256-type 3-input raster operation (ROP3) can be implemented.

The divider for normalization (div unit) divides the pixel value by the α value.

BRU has an IIF function. IIF is only implemented for VSPX. Refer to 60.1.2.9 for IIF function.

60.1.2.7 Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8-bitα) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSP2 image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

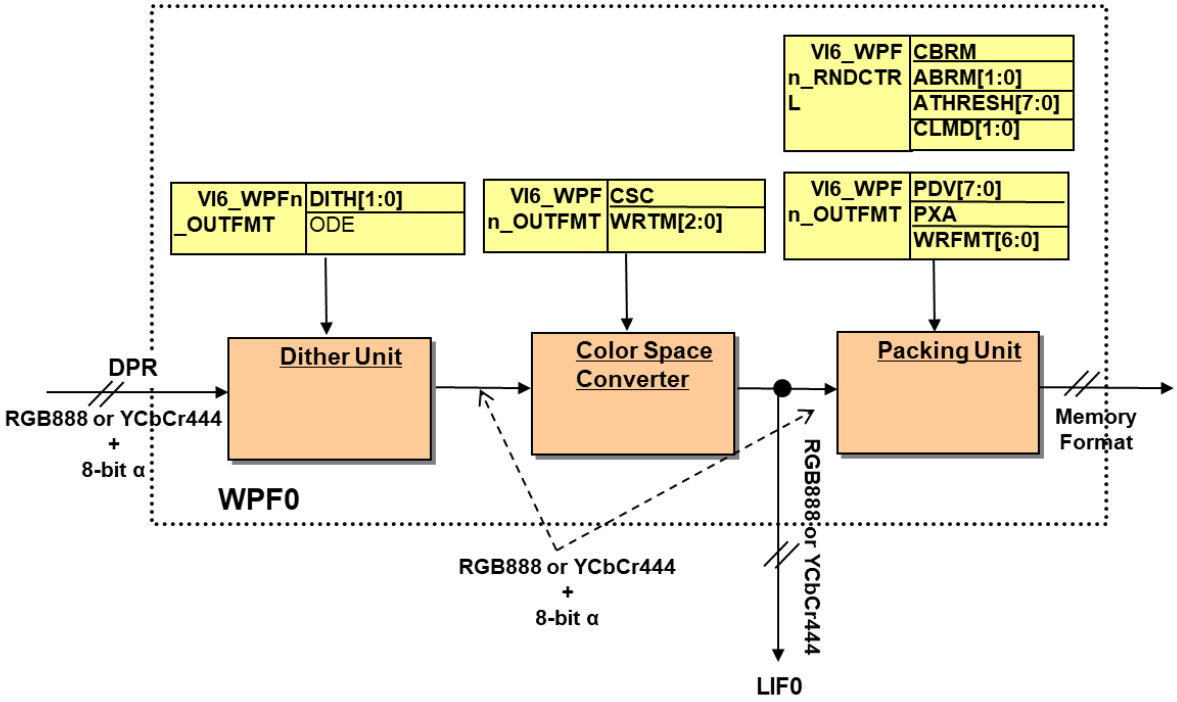

Figure 60.5 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSP2 provides two WPF0. The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

60.1.2.8 Display Unit InterFace (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIF module is connected to WPF, and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in Figure 60.28.

60.1.2.9 ISP InterFace (IIF)

The IIF concatenates raw data of up to 2 exposures synchrornously in pixel unit then send this data to streaming IP. The active exposure is read from external memory through RPF0 to RPF1 with format RGB332 (for RAW8 of 1-byte), RGB565 (for RAW8 of 2-byte container, RAW10, RAW12, RAW14, RAW16) or ARGB8888 (for RAW20, RAW24).The IIF also send ISP config data frome external memory through RPF0. IIF is a function of BRU, as shown in Figure 60.1, and works by setting 1 to VI6_DPR_BRU_ROUTE.IIFSEL. Refer to section 60.3.8 for detailes.

60.1.2.10 User Logic InterFace (UIF)

The UIF module is used for transferring image data to the User Logic module (DISCOM).

The UIF is a module connected to the DPR and can transfer image data to the User Logic module and can receive image data from the User Logic module after the User Logic module execute its image processing.

60.1.2.11 Detail Function

Table 60.2 Detail Function of VSP2

Image Data Transfer Function

Bus interface	Protocol		AXI 256 bits through FCPV
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
Tile transfer mode			Supported by RPF0 to RPF4
YCbCr memory storage format			Interleaved, planar, or semi-planar

Display list/Extended Display List Transfer Function

Bus interface	Protocol		AXI 256 bits through FCPV
	Data alignment	Conversion method	Byte, Word, LW data swapping
			Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	-	Not available

Read Pixel Formatter (RPF)

Number of channels			Five channels (RPF0 to RPF4 for VSPD) Two channels (RPF0 to RPF1 for VSPX)
Input color bit-depth		Color	2 ~ 8bit / 10bit / 12bit
		Alpha	1/2/4/8 bit
Operation bit-depth		Color	8bit
		Alpha	8bit
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555, RGB10, RGB10A2, A2RGB10 α plane (8 bpp, 1 bpp)

Read Pixel Formatter (RPF)

		YCbCr	YCbCr4:4:4 (8bpc) Planar/Semi planar/Interleaved YCbCr4:2:2 (8/10/12 bpc) Planar/Semi planar/Interleaved (*) YCbCr4:2:0 (8 bpc) Planar/Semi planar/Interleaved YCbCr4:2:0 (10/12 bpc) Planar/Semi planar (*) α plane (8 bpp, 1 bpp) (*): bpc of Y and Cb/Cr can be equal or different for Planar/Semi planar and shall be equal for Interleaved.
		RAW	RAW8 1byte, RAW8 2byte, RAW10, RAW12, RAW14, RAW16, RAW20, RAW24
		Maximum size	8190 × 8190 pixels [VSPD] 5120 × 4096 pixels [VSPX] The internal data path modules have separate restrictions on the maximum image size. For details, refer to section 60.4.3
		Minimum size	128 x 96 pixel [VSPD] 128 × 32 pixel [VSPX] The internal data path modules have separate restrictions on the minimum image size. For details, refer to section 60.4.3.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB or Y (8 bpc)
		Replaced data	αRGB or αYCbCr (8 bpc for R, G, B, Y, Cb, Cr, α)
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF4
	Transparent color	Compared data	RGB or Y (8 bpc)
		Replaced data	α 8bpp
		Comparison Mode	Matched color mode, Luma threshold mode
		Input source	RPF0 to RPF4
OSD/CLUT	Format	Memory storage format	8 bpp
		Image format	α RGB32 or α YCbCr32
	Input channel		RPF2

Read Pixel Formatter (RPF)

Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF4. Note that 1-bpp α is converted to αRGB or αYCbCr4:4:4. (8 bpc)
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT601 (16, 235/240) RGB (0, 255) to BT709 (16, 235/240) RGB (0, 255) to BT601 (0, 255) RGB (16, 235) to BT709 (16, 235/240)
		Target of conversion	RPF0 to RPF4
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	RPF0 to RPF4
Changing number of colors	Bit extension	Extended bits	Input bitdepth (2bpc ~ 6bpc) to operation bitdepth 8bpc
		Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Bit reduction method	Padded with 0. Copied from the most significant bits.
		Target of conversion	RPF0 to RPF4
	Bit reduction	Reduced bits	Input bitdepth 10/12 bpc to operation bitdepth 8bpc
		Target format	RGB10bpc, YCbCr 4:2:2 10/12 bpc Semiplanar/Planar/Interleaved, YCbCr 4:2:0 10/12 bpc Semiplanar/Planar
		Rounding method	Truncation or Rounding-off or dithering
		Dithering method	Ordered dither
		Dithering target component	R/G/B/Y
	YCbCr444 generation	Vertical	CbCr copying
		Horizontal	copying or interpolation.
α bit count conversion	Bit extension	Extended bits	Input bitdepth 1bpc to operation bitdepth 8bpc
		Method	Padded with 0. Copied from the most significant bits.
Multiply-alpha function	Fade-alpha		RPF0 to RPF4
			Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		RPF0 to RPF4
Virtual display	RPF0 to RPF4	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 8190 × 8190 pixels Minimum: 4 × 4 pixels

Write Pixel Formatter (WPF)

Number of channels			One channel (WPF0)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	8190 × 8190 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to section 60.4.4
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to section 60.4.4
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)
Image Compositing			
α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels

Image Compositing

		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Layer A: Upper layer Layer B: Lower layer	xA + yB, xA - yB Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 - α for layer A), (α for layer B), (1 - α for layer B)
	Output α value selection	RGB	Fixed α value, x (α for layer A) + y (α for layer B), x (α for layer A) – y (α for layer B) Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 - α for layer A), (α for layer B), (1 - α for layer B)
	Blending layers	Number of layers	Five layers selected from RPF0 to RPF4 and video processing function output, and virtual RPF; six layers in total
		Order of layers	The order of six layers selected from RPF0 to RPF4, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF4
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF4, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.

Direct connection to Display module

Display I/F	Destination	DU
	Direct connection	Can transfer data without going through external memory to DU
Line padding	Padding cycles	1 to 32 cycles
	Padding pattern	Arbitrarily setting up to 32 cycles

Interface with ISP		
Exposures	Number of exposure	1 to 2 exposures reading through RPF0 to RPF1 (active exposure shall be set in order RPF0 to RPF1)
	Format	RAW8 1byte, RAW8 2bytes, RAW10, RAW12, RAW14, RAW16, RAW20, RAW24
Config data for ISP		ISP config data can be read through RPF0.
Wake up	Features	VSPX can wait for reading image data of specified lines output from VIN without S/W intervention.
	Supported VIN channels	16 channels (VIN0 to VIN15)
		Independent wake-up counter per channel.
		Can elect which channel wake-up is recognized.
	Outstanding of wake-up	Up to 15 outstanding of wake-up.
Size	Maximum size	5120 pixels x 4096 lines
	Minimum size	128 pixels x 32 lines
	Other	All exposures shall have same size

60.1.2.12 Supporting 12 Bits Processing

Table 60.3 shows which module supports 12 bits processing for VSPD.

Table 60.3 VSPD sub modules which supports 12 bits processing

Module	12 bits processing
RPF	√(*1)
WPF	
BRU	
DISCOM	
ILV	
LIF	

(*1) VSPD doesn't support RPF 12 bits processing. But RPF supports 10 bits / 12 bits input pixel format, and data is rounded from 12 bits / 10 bits to 8 bits at the RPF input point.

60.1.3 External Pins

VSP2 doesn't have external pins.

60.1.4 Register Configuration

(1) Base Address

Below are the base addresses of each VSP unit. VSPX has 32Kbyte address space. VSPD has 28Kbyte address space.<

VSPD0 H'FEA2 0000
VSPX0 H'FEDD 0000

(2) Register/Table Address

Table 60.4 shows the VSP2 register configuration (represents in relative address).

Table 60.4 VSP2 Register Configuration

Register Name	Abbr.	R/W	Offset Address	Initial value	Access Size
VSP2 Start Registers 0	VI6_CMD0	R/W*1	H'0000	H'0000 0000	32
Clock Control Register0	VI6_CLK_CTRL0	R/W	H'0010	H'0000 0000	32
Clock Control Register1	VI6_CLK_CTRL1	R/W	H'0014	H'0000 0000	32
Dynamic Clock Stop Control Register	VI6_CLK_DCSWT	R/W	H'0018	H'0000 0000	32
Dynamic Clock Stop Disable Register0	VI6_CLK_DCSM0	R/W	H'001c	H'0000 0000	32
Dynamic Clock Stop Disable Register1	VI6_CLK_DCSM1	R/W	H'0020	H'0000 0000	32
Software Reset Register	VI6_SRESET	R/W	H'0028	H'0000 0000	32
Module Reset Enable Register0	VI6_MRESET_ENB0	R/W	H'002c	H'0000 0000	32
Module Reset Enable Register1	VI6_MRESET_ENB1	R/W	H'0030	H'0000 0000	32
Module Reset Issuing Register	VI6_MRESET	R/W	H'0034	H'0000 0000	32
Operating Status Register	VI6_STATUS	R	H'0038	H'0000 0000	32
WPF0 Interrupt Enable Registers	VI6_WPF0_IRQ_ENB	R/W	H'0048	H'0000 0000	32

(*1) Read only bits or write only bits or read/write bits are mixed in the registers.

(*2) DISCOM registers is explained in the section 60.5.2

(*3) Initial value of IP version registers depend on product and Modules. See section 60.2.12.1 for more detail.

60.1.5 Connected Module

Table 60.5 shows modules connected to the VSP2. Table 60.6 shows channel number of DU which each VSPD/LIF is connected.

Table 60.5 Connected Module

Module	Connected Module	Description
VSPX	FCPVX	FCPV for VSPX
	VIN	Video Input Module
	ISP	Image signal processor
VSPD	FCPVD	FCPV for VSPD
	VIN	Video Input Module
	DU	Display Unit
	TX-LINK	DSI/CSI2 TX LINK

Table 60.6 Correspondence between ch number of VSPD/LIF and ch number of DU

VSPD ch	LIF ch	DU ch
VSPD0	LIF0	DU0

Bus access of VSP2 is carried out through FCPV (Frame Compression IP for VSP) module in R-Car. So, refer to also FCP User's Manual.

60.2 Register Description

60.2.1 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the VSP2 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, VI6_RPFn_SRC_BSIZE.BHSIZE (n = 0, 1, 2, 3, 4) indicates the BHSIZE bit in five registers VI6_RPF0_SRC_BSIZE.BHSIZE, VI6_RPF1_SRC_BSIZE.BHSIZE, VI6_RPF2_SRC_BSIZE.BHSIZE, VI6_RPF3_SRC_BSIZE.BHSIZE and VI6_RPF4_SRC_BSIZE.BHSIZE. For RPFn and UIFn, when the range of value n is not defined, RPFn (n = 0, 1, 2, 3, 4) and UIFn (n = 4, 5) are assumed.
4. In each subsection for register description in section 60.2, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

60.2.2 Restrictions on Access to Registers and Lookup Tables

The VSP2 has control registers and lookup tables. All VSP2 registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSP2 will not operate correctly.

1. For the read-only bits and reserved bits in all VSP2 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 60.1.4 are reserved areas and write access is prohibited in these areas. Addresses undefined in section 60.5.2.4 for UIF4/UIF5 (DISCOM) are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMD0, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDR0, VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to section 60.3.2.

Table 60.7 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n=0 to 4)	VI6_RPFn_*
WPF0	VI6_WPF0_*
DPR	VI6_DPR_*
UIFn (n=4, 5)	VI6_UIFn_*
BRU	VI6_BRU_*
ILV	VI6_ILV_*
LIF0	VI6_LIF0_*

60.2.3 Register Classification

The VSP2 registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSP2, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 60.2.4.

1. General control registers
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1, 2, 3, 4))
4. WPF control registers (VI6_WPF0_*)
5. DPR control registers (VI6_DPR_*)
6. BRU control registers (VI6_BRU_*)
7. ILV control register (VI6_ILV_CTRL)
8. LIF control registers (VI6_LIF0_*)
9. VSP Internal Registers
10. IIF control registers (VI6_IIF_CTRL)

The VSP2 has five RPF channels and the register configuration is the same for all of RPF0 to RPF4. However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. The restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to section 60.1.4

60.2.4 General Control Registers

60.2.4.1 VSP2 Start Registers (VI6_CMD0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	UPDHDR	–	–	–	STRCMD
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5, 3 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

4	UPDHDR	0	R/W	Reserved state of updating DLH address. UPDHDR can be negated by software reset (VI6_SRESET.SRSTn). [Write] 0: NOP 1: Don't set 1 to this bit [Read] 0: Not reserved to update DLHeader address 1: Reserved to update DLHeader address Set 0 to this bit when STRCMD bit is set to 1.
0	STRCMD	0	R/W	Start reservation of each WPF VSP2 has two output channels (WPFs). Two WPFs can be started at the same time. VI6_CMD0.STRCMD controls WPF0. Writing 1 to this bit starts WPF0 in VSP2. Set this bit for activation only after all register settings in each output channel have been completed. If WPF0 is idle, WPF0 starts right after this bit is set to 1. If WPF0 is active, writing 1 to this bit reserves starting WPF0 operation. Wait to set 1 to VI6_CMD0.STRCMD until this bit is read as 0. VI6_CMD0.STRCMD can be negated by software reset (VI6_SRESET.SRST0). [Write] 0: Start reservation of WPF0 is canceled. 1: Start reservation of WPF0 is set. [Read] 0: Starting VSP is not reserved. 1: Starting VSP is reserved.

The basic concept of image processing operation started by activating the VSP2 is shown in Figure 60.6. The actual data input/output is executed by the MAU, which is the bus interface module, as described in section 60.1.2, but conceptually the RPF works as the data entry point to the VSP2 and the WPF works as the data exit point. To process images through the VSP2, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPF0, specify RPFn as the source RPF for WPF0 in VI6_WPF0_SRCRPF, which is a register for WPF0 (refer to section 60.2.7.1). This setting determines that RPFn will be started when WPF0 is started through VI6_CMD0.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSP2 between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to section 60.2.8).

After a data path is formed (RPFn → WPF0) as described above, starting output module WPF0 in the VSP2 through VI6_CMD0 starts all function modules connected to WPF0 and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSP2.

There are two types of data path configuration in the VSP2; one is "a single input module to a single output module" as shown in Figure 60.6 (A), and the other is "multiple input modules to a single output module" as shown in Figure 60.6 (B).

Figure 60.6 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR.

Figure 60.6 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR.

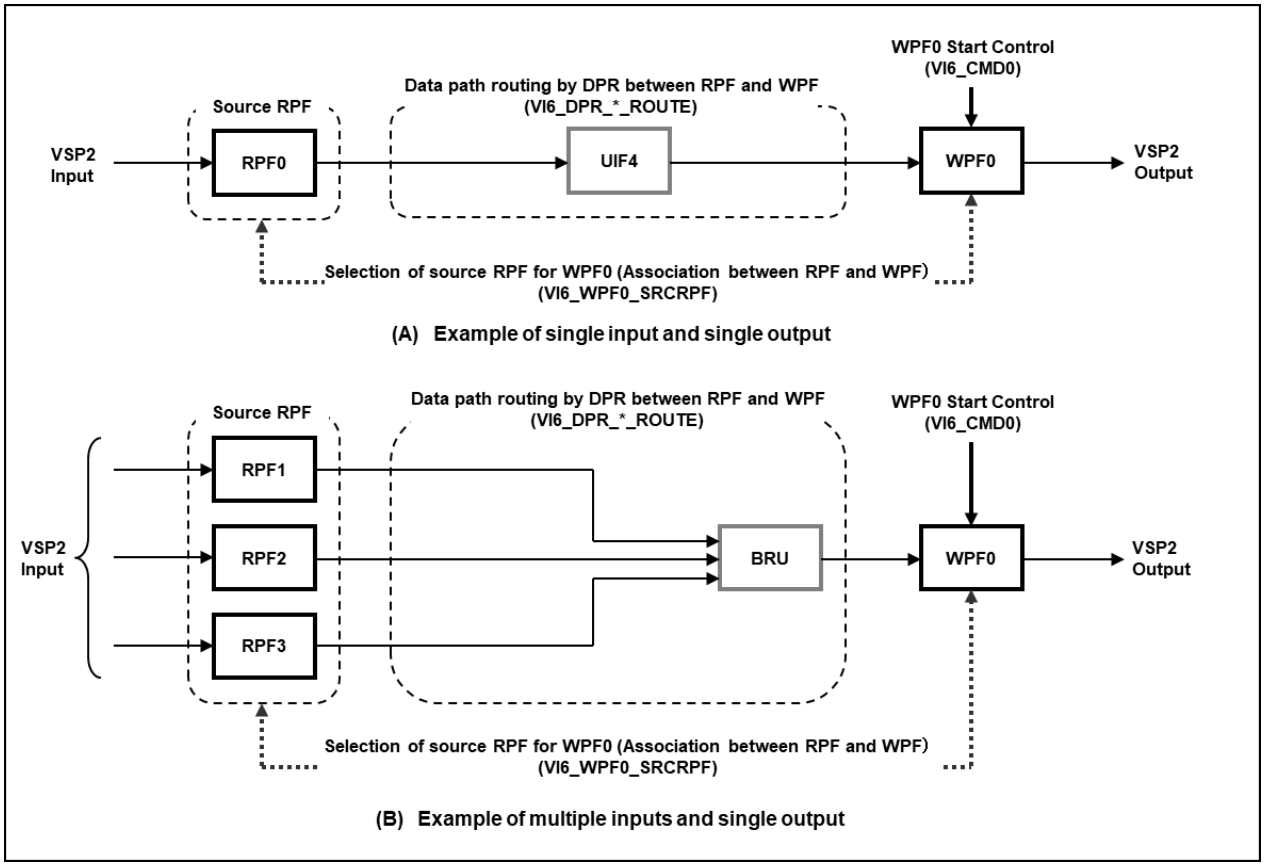

Figure 60.6 Basic Concept of VSP2 Startup

60.2.4.2 Clock Control Register 0 (VI6_CLK_CTRL0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	GCS0	–	–	–	–	–	–	–	–	–	–	–	GCS1
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	GCS2				–	–	–	GCS3				
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

31 to 29, 27 to 17, 15 to 12, 7 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	GCS0	0	R/W	Clock Control Setting0
16	GCS1	0	R/W	Clock Control Setting1
11 to 8	GCS2	0	R/W	Clock Control Setting2
4 to 0	GCS3	0	R/W	Clock Control Setting3

VSP2 can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H'0000 0000
- VI6_CLK_CTRL1 = H'0000 0000
- VI6_CLK_DCSWT = H'0000 0808
- VI6_CLK_DCSM0 = H'0000 0000
- VI6_CLK_DCSM1 = H'0000 0000

To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H'1001 0F1F
- VI6_CLK_CTRL1 = H'FFFF FFFF
- VI6_CLK_DCSWT = H'0033 0808
- VI6_CLK_DCSM0 = H'1FFF 0F1F
- VI6_CLK_DCSM1 = H'FF10 FFFF

When the clock gating is enabled, the supply of the clock signal is stopped for the module which is not operated. If the bit field of this register is changed from 0 to 1, the supply of the clock signal for the module is immediately started. If the bit field of the register is changed from 1 to 0, the clock supply is immediately stopped. Therefore, please do not change this register field from 1 to 0 in operation because the VSP2 may be stalled.

60.2.4.3 Clock Control Register 1 (VI6_CLK_CTRL1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

60.2.4.7 Software Reset Register (VI6_SRESET)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	SRST0
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

0	SRST0	0	R/W	WPF0 Software Reset Writing 1 to this bit aborts the current processing in WPF0 (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPF0_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0. 0: NOP 1: WPF0 software reset (*1)

(*1) Applying a software reset to each WPF has the following restrictions.

1. The end of software reset processing is notified through the FRE bit in VI6_WPF0_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSP2 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSP2 completes operation.
2. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.
3. When software reset is issued to VSP, issue software reset to also FCPV. See Figure 60.36 for VSPD software reset sequence. See FCP User's Manual for VSPX software reset sequence.

60.2.4.8 Module Reset Enable Register 0 (VI6_MRESET_ENB0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	MRST

Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MRST	0	R/W	Module Reset Assertion This register is for purpose of h/w debugging.

This register is for purpose of h/w debugging.

60.2.4.11 Operating Status Register (VI6_STATUS)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	-	FLDST0	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	-	SYS0_ACT	–	–	–	–	–	–	–	DBG
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 9, 7 to 1	–	All 0	R	Reserved These bits are read as 0 or 1. Do not care about this value. Write access is prohibited.
28	FLDST0	0	R	Field status of previous frame of WPF0. 0: Previous finished frame is TOP field. 1: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
8	SYS0_ACT	0	R	WPF0 Operating Status Each bit indicates the operating or stopped state of control channel n (WPF0). 0: WPF0 is stopped. 1: WPF0 is operating.

0	DBG	0	R	This register is for purpose of h/w debugging.

60.2.4.12 WPF0 Interrupt Enable Registers (VI6_WPF0_IRQ_ENB)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	UNDE
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	DFEE	FREE
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 2	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	UNDE	0	R/W	Interrupt Enable for WPF0 Underrun in case of DU connection.
1	DFEE	0	R/W	Interrupt Enable for WPF0 Display List Frame End
0	FREE	0	R/W	Interrupt Enable for WPF0 Frame End

Each bit in VI6_WPF0_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPF0_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPF0_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPF0_IRQ_STA is set to 1.

60.2.4.13 WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	UND
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	DFE	FRE
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0 : No interrupt

1 : Interrupt activated

[Write Access] Interrupt Clear

0 : The interrupt status is cleared to 0

1 : Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to to 2	–	All 0	R	Reserved These bits are read as 0 or 1. Do not care about this value. The write value should always be 0.
16	UND	0	R/W	Interrupt Status and Clear for WPF0 Underrun in case of DU connection. This interrupt source bit is set to 1 when data underrun occurs in case of DU connection. Timing that this bit is set to 1 is at end of 1 frame.
1	DFE	0	R/W	Interrupt Status and Clear for WPF0 Display List Frame End This interrupt source bit is set to 1 when VSP2 completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to section 60.3.3.2). When display lists are not used, this bit is not used. In this case, clear VI6_WPF0_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.
0	FRE	0	R/W	Interrupt Status and Clear for WPF0 Frame End This interrupt source bit is set to 1 when VSP2 completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed.

				The interrupt status is set to 1 by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSP is processing. c) One frame's data from DU is displayed while VSP couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

VI6_WPF0_IRQ_STA indicates the state of the interrupt sources generated in the VSP2. Whether to output a VSP2 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPF0_IRQ_ENB. While an interrupt is disabled in VI6_WPF0_IRQ_ENB, the VSP2 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

60.2.4.14 Display-0 Interrupt Enable Register (VI6_DISP0_IRQ_ENB)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	DSTE	–	–	MAEE	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R	R

Each bit controls the interrupt enable of the corresponding interrupt source.

0 : Interrupt Disabled

1 : Interrupt Enabled

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 6, 4 to 0	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DSTE	0	R/W	Interrupt Enable for Display Start
5	MAEE	0	R/W	Interrupt Enable for Display Read Data End

60.2.4.15 Display-0 Interrupt Status Register (VI6_DISP0_IRQ_STA)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	DST	–	–	MAE	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R	R

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 6, 4 to 0	–	All 0	R	Reserved These bits are always read as 0 or 1. The write value should always be 0.
8	DST	0	R/W	Interrupt Status and Clear for Display Start This bit is set to 1 when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module.
5	MAE	0	R/W	Interrupt Status and Clear for Display Read Data End This bit is set to 1 when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit.

60.2.4.16 Wake-up0 Interrupt Enable Registers (VI6_WUP0_IRQ_ENB)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	VWER15E	0	R/W	Interrupt Enable for VINn Wake up Error. (VWERnE: n= 0 to 15)
14	VWER14E	0	R/W	
13	VWER13E	0	R/W	
12	VWER12E	0	R/W	
11	VWER11E	0	R/W	
10	VWER10E	0	R/W	
9	VWER9E	0	R/W	
8	VWER8E	0	R/W	
7	VWER7E	0	R/W	
6	VWER6E	0	R/W	
5	VWER5E	0	R/W	
4	VWER4E	0	R/W	
3	VWER3E	0	R/W	
2	VWER2E	0	R/W	
1	VWER1E	0	R/W	
0	VWER0E	0	R/W	

Each bit in VI6_WUP0_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WUP0_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WUP0_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WUP0_IRQ_STA is set to 1.

60.2.4.17 Wake-up0 Interrupt Status Registers (VI6_WUP0_IRQ_STA)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

3	VWER3	0	R/W	
2	VWER2	0	R/W	
1	VWER1	0	R/W	

0	VWER0	0	R/W	

60.2.5 Display List Control Registers

60.2.5.1 Display List Control Register (VI6_DL_CTRL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT [15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	DC2	–	–	–	DC1	–	–	–	DC0	RLM0	CFM0	NH0	DLE0
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT [15:0]	All 0	R/W	Display List Control Setting Always specify 256.
15 to 13, 11 to 9, 7 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DC2	0	R/W	This bit doesn’t affect anything to VSP (NOP)
8	DC1	0	R/W	This bit doesn’t affect anything to VSP (NOP)
4	DC0	0	R/W	This bit doesn’t affect anything to VSP (NOP)
3	RLM0	0	R/W	Loading two plane Registers Mode for WPF0. 0: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.
2	CFM0	0	R/W	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are

				used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started
1	NH0	0	R/W	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSP2 is stopped. And also make sure the following before starting VSP2. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0: Use Display List Header (Normal DL Mode) 1: Don't use Display List Header (Header-less Mode) Note0: When DLE0 bit is 0, set 0 to NH0 bit.
0	DLE0	0	R/W	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in section 60.2.2. 0: The display list function is disabled 1: The display list function is enabled

60.2.5.2 Display List-0 Data Swapping Register (VI6_DL_SWAP0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	LWS	WDS	BTS
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
30 to 3	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LWS	0	R/W	Display List Data Swapping in long word Units The effect of this bit setting is defined in Table 60.8.

				0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	WDS	0	R/W	Display List Data Swapping in Word Units The effect of this bit setting is defined in Table 60.8. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	BTS	0	R/W	Display List Data Swapping in Byte Units The effect of this bit setting is defined in Table 60.8. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 60.8 shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as Table 60.34, set 3'b111 to {LWS, WDS, BTS}. If data order is not the same as the definition, change data order within 8byte unit by these bits as shown in Table 60.8.

Table 60.8 Changing data order according to display list swap register

Data order in memory									*_LWS	*_WDS	*_BTS
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7			
Data	0	1	2	3	4	5	6	7	1	1	1
	1	0	3	2	5	4	7	6	1	1	0

	5	4	7	6	1	0	3	2	0	1	0
	6	7	4	5	2	3	0	1	0	0	1
	7	6	5	4	3	2	1	0	0	0	0

⇩

Data order defined in Table 60.34								
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7
Data	0	1	2	3	4	5	6	7

60.2.5.3 Display List-0 Header Address Register (VI6_DL_HDR_ADDR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_PTR-0 [31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_PTR-0 [15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-0 [31:0]	All 0	R/W	Display List-0 Header Address These bits specify the address of the display list header to be read for display list-0 in 16-byte units (the lower-order four bits are read-only). When WPF0 is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. When VI6_DL_CTRL.NH0 is 0, writing header address to this register reserves updating two plane registers for the next frame. Two plane registers is VI6_DL_HDR_ADDR0. A value from H'0000 0000 to H'FFFF FFF0 can be specified.

60.2.5.4 Extended Display List Control Register (VI6_DL_EXT_CTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	NWE
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	POLINT [5:0]						–	–	DLPRI	EXPRI	–	–	–	EXT
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15, 14, 7, 6, 3 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NWE	0	R/W	No Wait for Polling When this bit is set to 1, the polling condition for extended display lists is always assumed to be true.
13 to 8	POLINT [5:0]	All 0	R/W	Extended Display List Command Control Always specify 2.
5	DLPRI	0	R/W	Display List Control 0 Always specify 1.
4	EXPRI	0	R/W	Display List Control 1 Always specify 0.
0	EXT	0	R/W	Extended Display List for WPF0

				Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0: No extended display lists are used 1: Extended display lists are used [Note] When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLEn); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode. Extended Display List is to realized AUTO-FLD or AUTO-DISP.

60.2.5.5 Display List Body Size Register-n (VI6_DL_BODY_SIZE0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	UPD0	–	–	–	–	–	–	–	BS0[16]
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BS0[15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25, 23 to 17	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	UPD0	0	R/W	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1 to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0 after VI6_DL_HDR_ADDR0 and VI6_DL_BODY_SIZE0.BS0 is downloaded in H/W side. When this bit is set to 1, the value of VI6_DL_HDR_ADDR0 and VI6_DL_BODY_SIZE0.BS0 should not be changed. 0: Updating display list for the next frame is not reserved 1: Updating display list for the next frame is reserved
16 to 0	BS0[16:0]	0	R/W	Header-less Display List Body Size These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

See section 60.3.6.2 for detail.

60.2.5.6 Display List-0 Header Reference Address Register (VI6_DL_HDR_REF_ADDR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DL_HDR_REF_PTR-0 [31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL_HDR_REF_PTR-0 [15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_PTR-0 [31:0]	All 0	R	Display List-0 reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDR0 for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSP2-H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDR0 is read out. For details, refer to section 60.3.6

60.2.5.7 Display List VIN Wake Up Counter 0 Register (VI6_DL_VIN_WUPCNT0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUPCNT7 [3:0]				WUPCNT6 [3:0]				WUPCNT5 [3:0]				WUPCNT4 [3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WUPCNT3 [3:0]				WUPCNT2 [3:0]				WUPCNT1 [3:0]				WUPCNT0 [3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	WUPCNT7 [3:0]	0	R/W	

27 to 24	WUPCNT6 [3:0]	0	R/W	Wake Up counter for VINn (WUPCNTn: n=0 to 7) [Read Access] Wake-up counter is read out. [Write Access] 4'h0 : The counter is cleared as 0. 4'hf : Hold the counter value. others : Wrtting other values are prohibitted. The counter increments when wake-up signal from VIN{n} asserts. The counter decrements by all three following conditions: (1) The counter is equall to or bigger than 1. (2) Processing of frame, which wait_wup in display list header is 1, is started. (3) VI6_DL_VIN_WUPEN0.WE_Vn is 1 When this counter is 15 and wake-up signal from VINn asserts, VI6_WUP0_IRQ_STA.VWERn asserts. These bits doen't decrement by VSPX start until VI6_WUP0_IRQ_ST.VWERn is cleared as 0 after VI6_WUP0_IRQ_STA.VWERn asserts except writting 4'h0 to these bits. Therefore, set 0 to VI6_WUP0_IRQ_STA.VWERn for releasing the lock of WUPCNTn [3:0] before activating VSPX. Set 0 to also these bits before VINn starts working with VSPX. Set H'F to the other bits to hold the value. Ex. Set 32'hFFFF F0F0 to initialze VIN0 and VIN2 wakeup counter. The value of the wake-up counters of VIN1, VIN3 to VIN7 are retained.
23 to 20	WUPCNT5 [3:0]	0	R/W	
19 to 16	WUPCNT4 [3:0]	0	R/W	
15 to 12	WUPCNT3 [3:0]	0	R/W	
11 to 8	WUPCNT2 [3:0]	0	R/W	
7 to 4	WUPCNT1 [3:0]	0	R/W	
3 to 0	WUPCNT0 [3:0]	0	R/W	

60.2.5.8 Display List VIN Wake Up Counter 1 Register (VI6_DL_VIN_WUPCNT1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUPCNT15 [3:0]				WUPCNT14 [3:0]				WUPCNT13 [3:0]				WUPCNT12 [3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

60.2.6 RPF Control Registers

60.2.6.1 RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	BHSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	BVSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	BHSIZE [12:0]	0	R/W	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
12 to 0	BVSIZE [12:0]	All 0	R/W	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 60.7 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSP2.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance

(number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

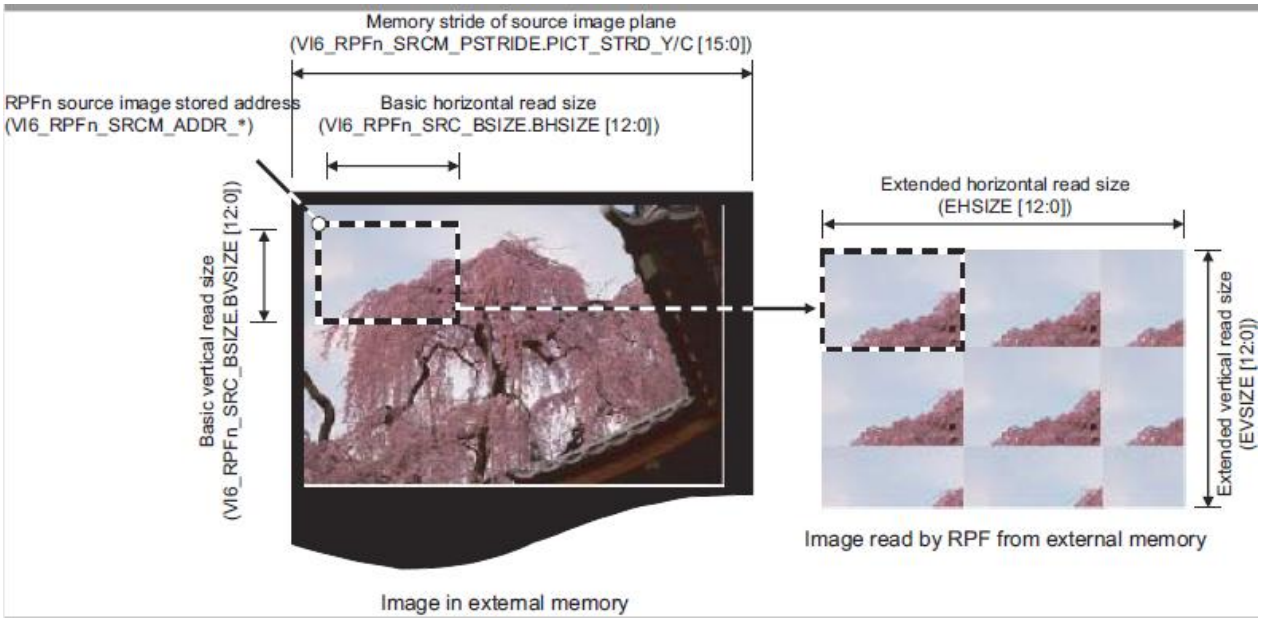

Figure 60.7 Relationship between Basic Read Size and Extended Read Size

60.2.6.2 RPFn Extended Read Size Registers (VI6_RPFn_SRC_ESIZE)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	EHSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	EVSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29,	–	All 0	R	Reserved These bits are always read as 0. The write value should always

15 to 13				be 0.
28 to 16	EHSIZE [12:0]	All 0	R/W	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 60.7 , the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.
12 to 0	EVSIZE [12:0]	All 0	R/W	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 60.7, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in section 60.2.8 and later sections are all applied to the image in the extended read size shown on the right side in Figure 60.7.

60.2.6.3 RPFn Input Format Registers (VI6_RPFn_INFMT)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	VIR	–	–	–	–	–	–	–	–	–	–	–	CIPM
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	CEXT [1:0]		RDTM [2:0]			CSC	–	RDFMT [6:0]						
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 17,	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

7				
28	VIR	0	R/W	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSP2. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in section 60.2.6.11 can be used. 0: RPFn uses general input. 1: RPFn uses virtual input.
16	CIPM	0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSP2 in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in Figure 60.8 for internal processing. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (0x47). When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (0x47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (0x41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (0x42). When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (0x47). In other cases, set this bit to 0.
13, 12	CEXT [1:0]	All 0	R/W	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from Table 60.10 through the RDFMT bits, VSP2 internally extends each color component to 8 bits before using the data. These bits select this extension method. b'00: Lower-order bits of color data are extended with 0. b'01: Upper-order bits of color data are copied to the lower - order bits. b'10: Lower-order bits of color data are extended with 0. The maximum value is limited to 0xFF.

				b'11: Setting prohibited
11 to 9	RDTM [2:0]	All 0	R/W	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting. (*1) When using the virtual input (VIR = 1), specify 0. 0: Color space conversion is disabled. 1: Color space conversion is enabled.
6 to 0	RDFMT [6:0]	All 0	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in Table 60.10, Table 60.11, and Table 60.12. When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. Set 0x00 (RGB332) to this bit when reading RAW8 1byte for VSPX. Set 0x06 (RGB565) to this bit when reading RAW8 2byte, RAW10, RAW12, RAW14, RAW16 for VSPX. Set 0x13 (ARGB8888) to this bit when reading RAW20, RAW24 for VSPX. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE. [Note 2] OSD-CLUT Setting When the RDFMT bits are set to 0x3F, RGB color data should be stored in the OSD-CLUT. When these bits are set to 0x7f, YCbCr color data should be stored in the OSD-CLUT. Note that while the target WPF is operating, the RPF is also operating and the OSD-CLUT cannot be read or written to.

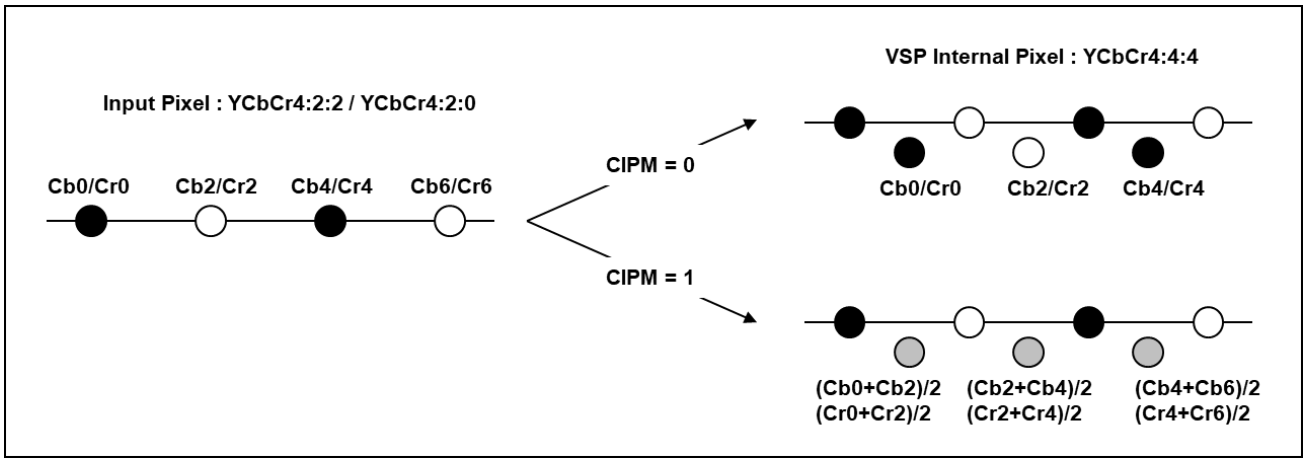

Figure 60.8 Chrominance Interpolation Methods Selectable through CIPM Setting

(*1) Note on color space settings

The color space for the image output from the RPF to VSP2 internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (Table 60.9). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSP2 internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSP2 internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 60.9 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(0x00 to 0x3f)*1	Disabled	(0) *1	RGB
		Enabled	(1) *1	YCbCr
YCbCr	(0x40 to 0x7f)*1	Disabled	(0) *1	YCbCr
		Enabled	(1) *1	RGB

*1 Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in Table 60.9, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPF0_OUTFMT.WRFMT.

Figure 60.9 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSP2 internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in Table 60.9 and Figure 60.9. The user should first determine whether the image processing in the VSP2 is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSP2 depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in Figure 60.9. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPF0_OUTFMT.WRFMT). For example, in the flow shown in Figure 60.9, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

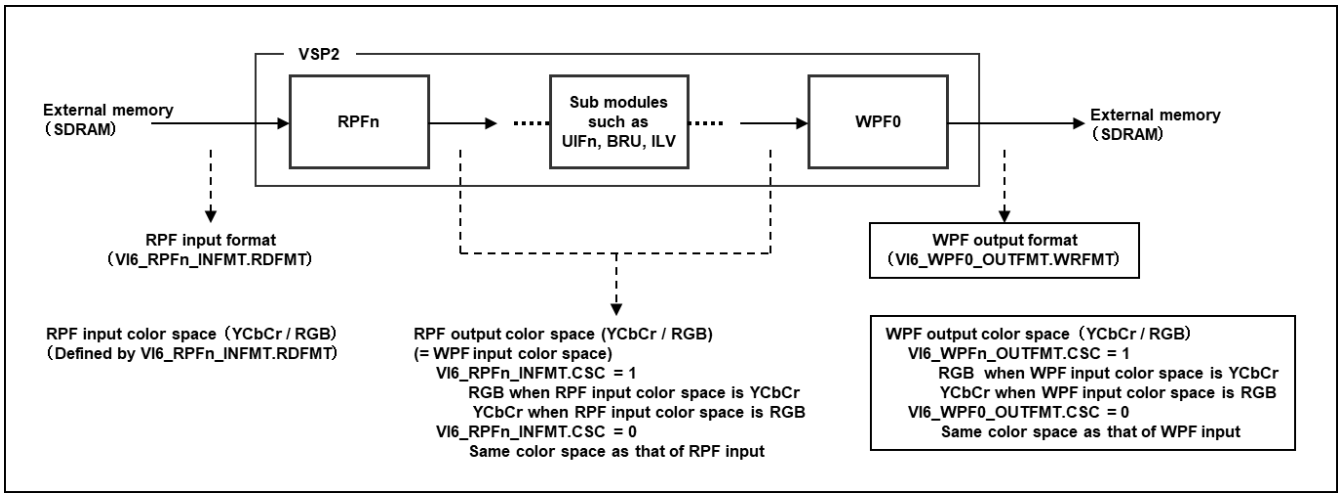

Figure 60.9 Relationship between Input/output Format and Color Space

Table 60.10 Packed Formats for RPF Input

RDFMT [6:0]	Bit per pixel	Phase	upper row – address / bottom row – bit field

To specify input format shown in Table 60.11, set 0x30 to VI6_RPFn_INFMT.RDFMT [6:0] and set the following registers additionally.

[1] RGB10

VI6_RPFn_EXT_INFMT0 [31:0] = 0x00000003

VI6_RPFn_EXT_INFMT1 [31:0] = 0x000A1400

VI6_RPFn_EXT_INFMT2 [31:0] = 0x0A0A0A00

[2] RGB10A2

VI6_RPFn_EXT_INFMT0 [31:0] = 0x00000003

VI6_RPFn_EXT_INFMT1 [31:0] = 0x000A141E

VI6_RPFn_EXT_INFMT2 [31:0] = 0x0A0A0A02

[3] A2RGB10

VI6_RPFn_EXT_INFMT0 [31:0] = 0x00000003

VI6_RPFn_EXT_INFMT1 [31:0] = 0x020C1600

VI6_RPFn_EXT_INFMT2 [31:0] = 0x0A0A0A02

Table 60.12 Packed YCbCr Formats for RPF Input

RDFMT [6:0]	Packed YCbCr Input Format	
0x40	YCbCr4:4:4 semi-planar	Figure 60.10*6

0x41	YCbCr4:2:2 semi-planar (NV16, NV61*1) *9	
0x42	YCbCr4:2:0 semi-planar (NV12, NV21*1) *7 *9	
0x43 to 0x45	Reserved	–
0x46	YCbCr4:4:4 interleaved	Figure 60.11*6
0x47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3) *9	
0x48	YCbCr4:2:2 interleaved type 1 *9	
0x49	YCbCr4:2:0 interleaved*8	
0x4a	YCbCr4:4:4 planar	Figure 60.12*6
0x4b	YCbCr4:2:2 planar (YV16) *9	
0x4c	YCbCr4:2:0 planar (YV12, I420) *7 *9	
0x4d to 0x7e	Reserved	–
0x7f	YCBCR_CLUT_DATA*4 *5	–

*1 When the input format is NV61 or NV21, set the SPUVS bit to 1.

*2 When the input format is YUY2, set the SPYCS bit to 1.

*3 When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.

*4 When the RDFMT [6:0] bits are set to 0x7F, it is necessary to set up the OSD-CLUT in the YCbCr color space.

*5 The Monochrome format can be implemented through the OSD-CLUT.

*6 Figure 60.13 shows the definition of memory address for each pixel in Figure 60.10 to Figure 60.12.

*7 Each line of C plane is read twice, so byte/pixel of YCbCr420 is 2 byte/pixel (same as YCbCr422).

*8 Each line of plane is read twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

*9 Only input format YUV422/YUV420 semi-planar, YUV422 interleaved, YUV422/YUV420 planar support 10bpc, 12bpc for Y/Cb/Cr by setting register VI6_RPFn_EXT_INFMT0.

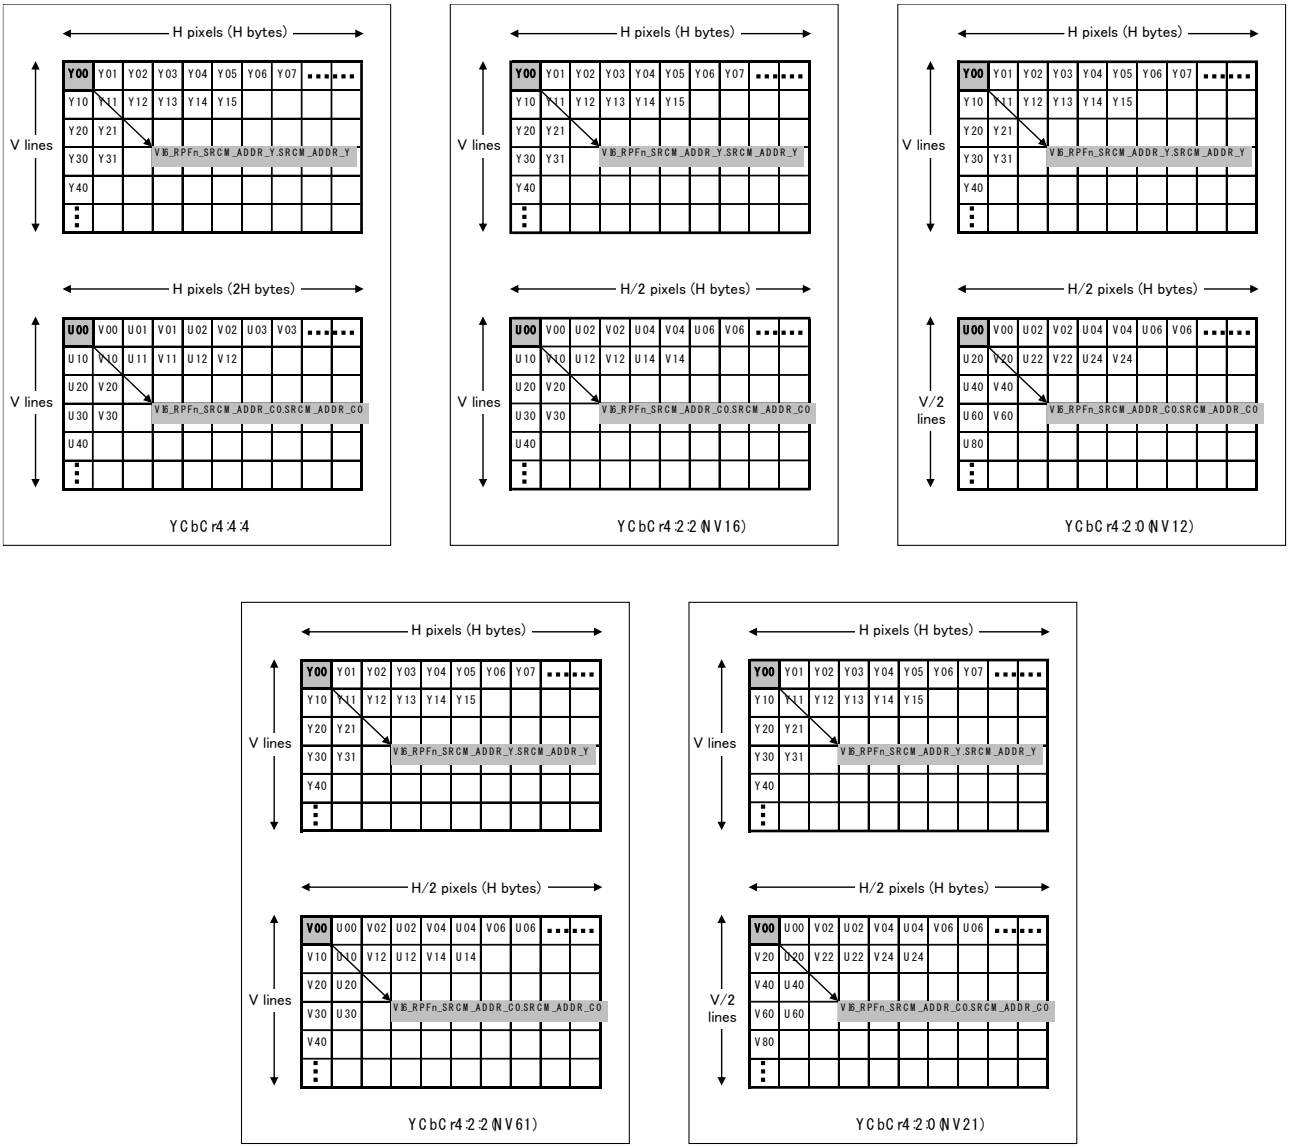

Figure 60.10 YCbCr Semi-Planar Formats (*1)

(*1) This figure is for 8bpc. When bits per component of Y/Cb/Cr is 10bpc/12bpc the pixel memory area shall be 2bytes as defined in Figure 60.14.

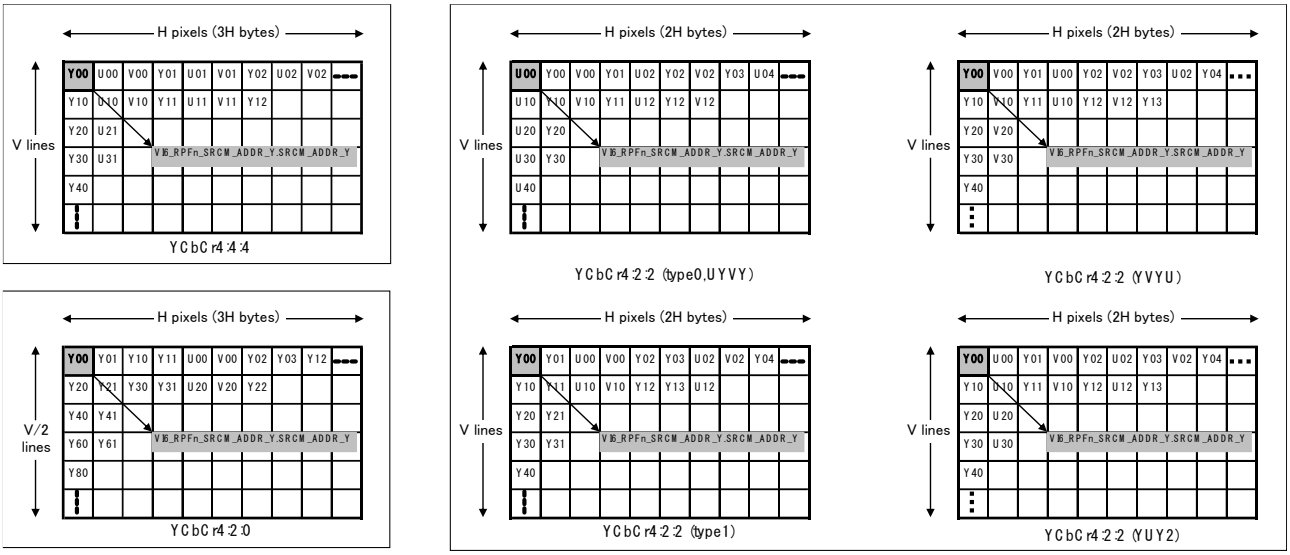

Figure 60.11 YCbCr Interleaved Formats (*1)

(*1) This figure is for 8bpc. When bits per component of Y/Cb/Cr is 10bpc/12bpc the pixel memory area shall be 2bytes as defined in Figure 60.14.

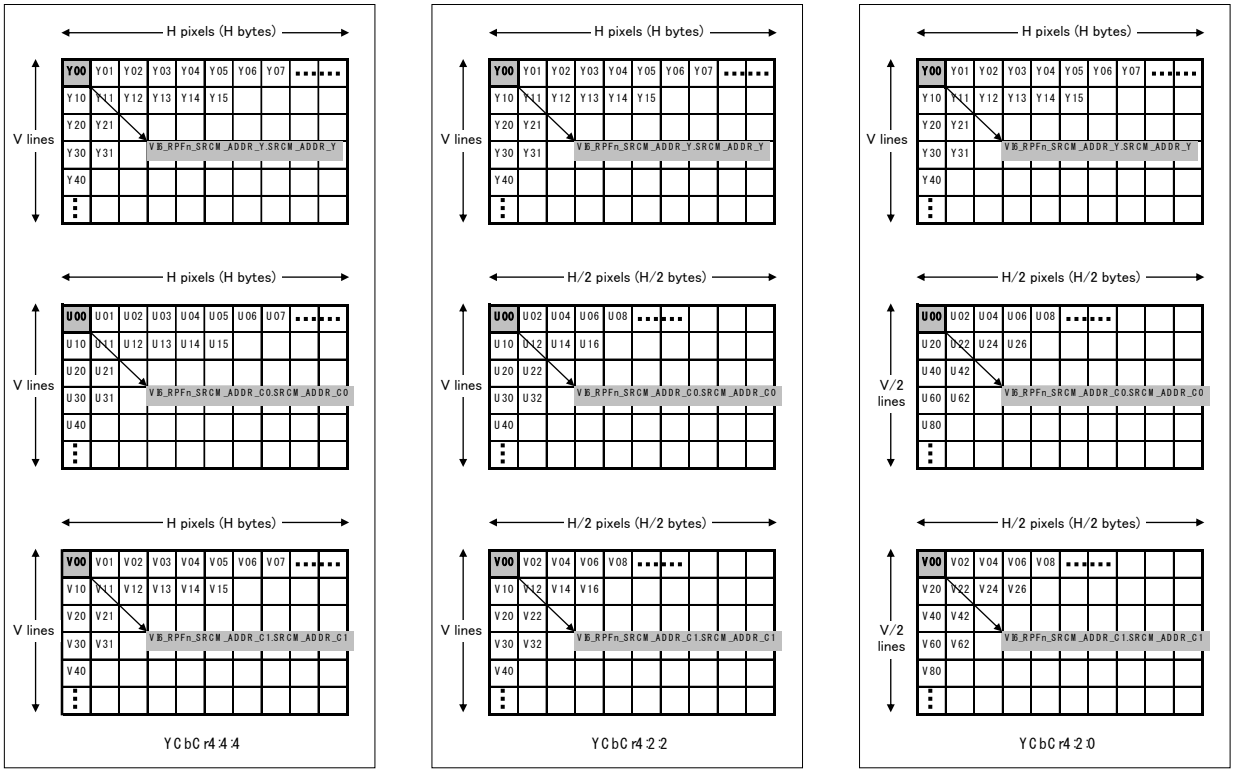

Figure 60.12 YCbCr Planar Formats(*1)

(*1) This figure is for 8bpc. When bits per component of Y/Cb/Cr is 10bpc/12bpc the pixel memory area shall be 2bytes as defined in Figure 60.14.

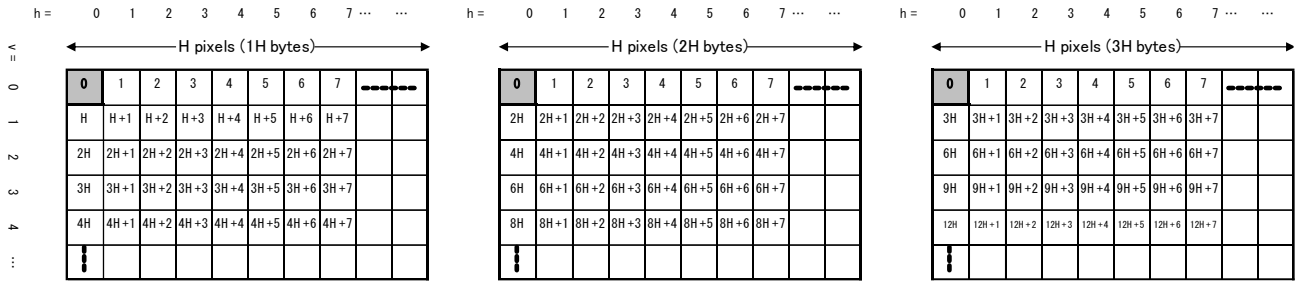

Figure 60.13 Memory address for the corresponding pixel's position

Legend of Figure 60.13

- H is horizontal image size in pixel unit.
- 1H, 2H and 3H is corresponding to the case 1 pixel has 1byte, 2bytes, 3bytes of data respectively.

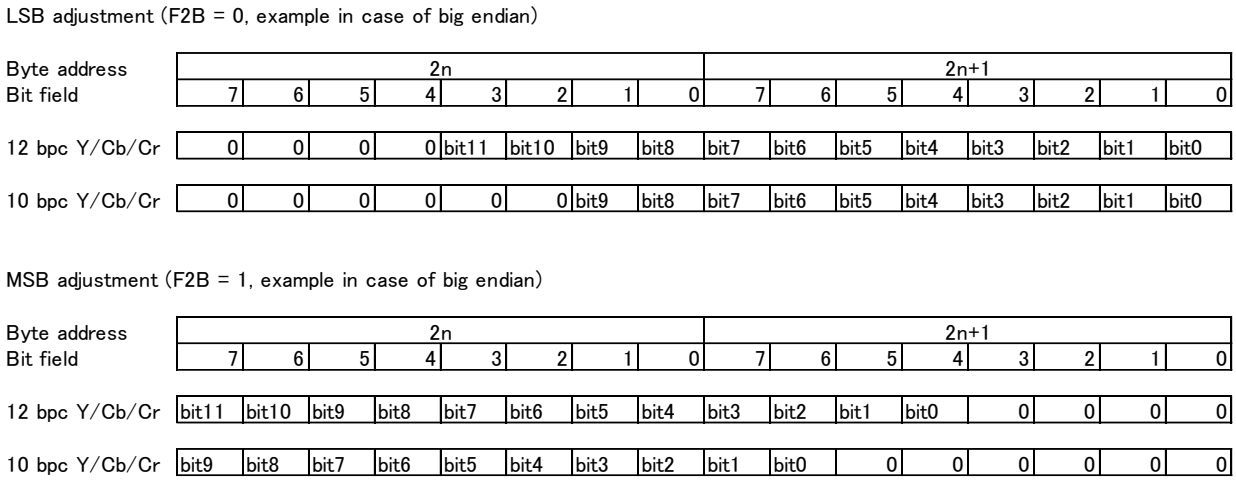

Figure 60.14 Pixel bit alignment of Y/Cb/Cr 10bpc, 12bpc

[OSD-CLUT Setting]

To set up the OSD-CLUT, store the values to replace each of R (Cr), G (Y), and B (Cb) components in the OSD-CLUT allocated as shown in Table 60.13. The OSD-CLUT space has 256 32-bit entries, which should be accessed in 32 bits in the same way as for register access. The address for each entry is obtained from the start address of each space (Table 60.13) + entry number ´ 4. For example, the OSD-CLUT address of entry 7 for RPF2 is (offset address) + 0x481C. Figure 60.15 shows the OSD-CLUT format.

Table 60.13 OSD-CLUT Space for Each RPF

RPF	Address Area for CLUT Space
RPF0	(offset address) + 0x4000 to (offset address) + 0x43FF
RPF1	(offset address) + 0x4400 to (offset address) + 0x47FF

RPF2	(offset address) + 0x4800 to (offset address) + 0x4BFF

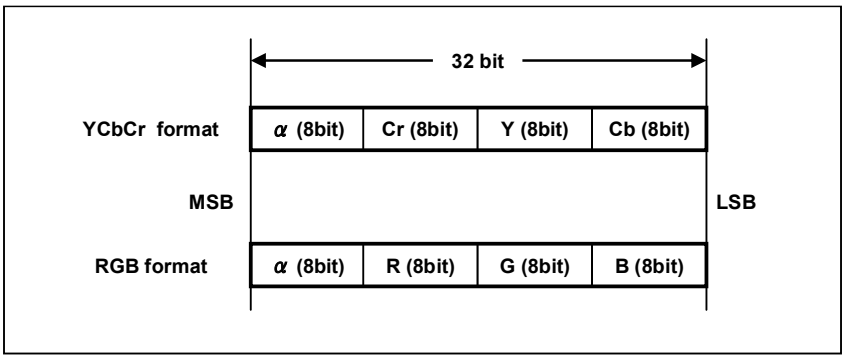

Figure 60.15 OSD-CLUT Format

According to the specified 256-entry replacement table (OSD-CLUT), input data is replaced as shown in Figure 60.16. Input data is 8 bits but output data is 32 bits including α and RGB or YCbCr components.

When writing to an entry in the OSD-CLUT, the host CPU writes all components at the same time. Therefore, specify replacement data for all components in the OSD-CLUT at the same time as shown in Figure 60.15.

Note that write access to the OSD-CLUT space is prohibited while the RPF is operating.

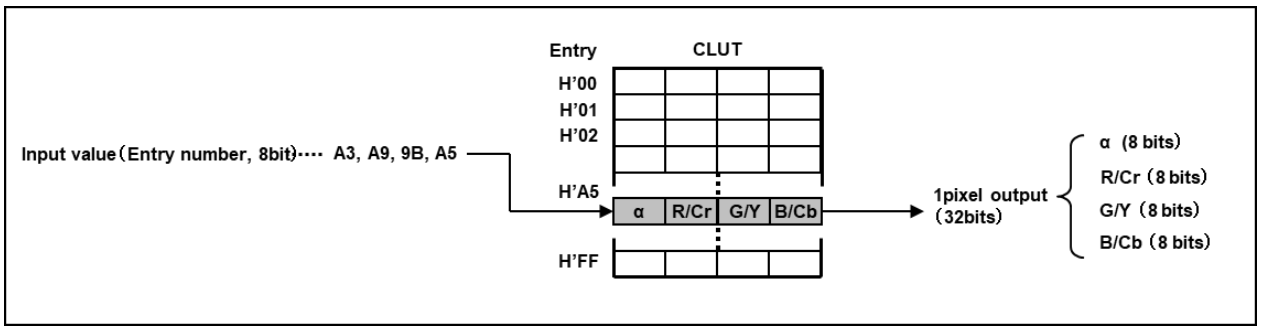

Figure 60.16 Replacement of Input Data with Pixel Values Specified in OSD-CLUT

60.2.6.4 RPFn Data Swapping Registers (VI6_RPFn_DSWAP)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28, 23 to 12, 7 to 4	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	C_LLS	0	R/W	Extended Chroma Plane Data Swapping in LONG LWORD Units (64-bit) This register is available when input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), specifies data swapping of color different planes (CbCr, U, V). 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
26	C_LWS	0	R/W	Extended Chroma Plane Data Swapping in long word Units (32-bit) This register is available when input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), specifies data swapping of color different planes (CbCr, U, V) . 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
25	C_WDS	0	R/W	Extended Chroma Plane Data Swapping in word Units (16-bit) This register is available when input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), specifies data swapping of color different planes (CbCr, U, V) . 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
24	C_BTS	0	R/W	Extended Chroma Plane Data Swapping in byte Units This register is available when input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), specifies data swapping of color different planes (CbCr, U, V) . 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled
11	A_LLS	0	R/W	α Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
10	A_LWS	0	R/W	α Plane Data Swapping in long word Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
9	A_WDS	0	R/W	α Plane Data Swapping in Word Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
8	A_BTS	0	R/W	α Plane Data Swapping in Byte Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in byte (8-bit) units is disabled

				1: Data swapping in byte (8-bit) units is enabled
3	P_LLS	0	R/W	Picture Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
2	P_LWS	0	R/W	Picture Plane Data Swapping in long word Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
1	P_WDS	0	R/W	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
0	P_BTS	0	R/W	Picture Plane Data Swapping in Byte Units The effect of this bit setting is defined in Table 60.14. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Plannar or Semi-Plannar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 60.14 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as Table 60.10 for RGB format and Figure 60.10 to Figure 60.12 for YCbCr format, set 4'b1111 to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in Table 60.14.

Table 60.14 Changing data order according to swap register

60.2.6.5 RPFn Display Location Registers (VI6_RPFn_LOC)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	HCOORD [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	VCOORD [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 8189 can be specified.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the

				DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 8189 can be specified.

Figure 60.17 shows an example of RPF1 and RPF2 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1 and RPF2, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPF0 (the VI6_WPF0_SRCRPF setting). For details, refer to section 60.2.7.1.

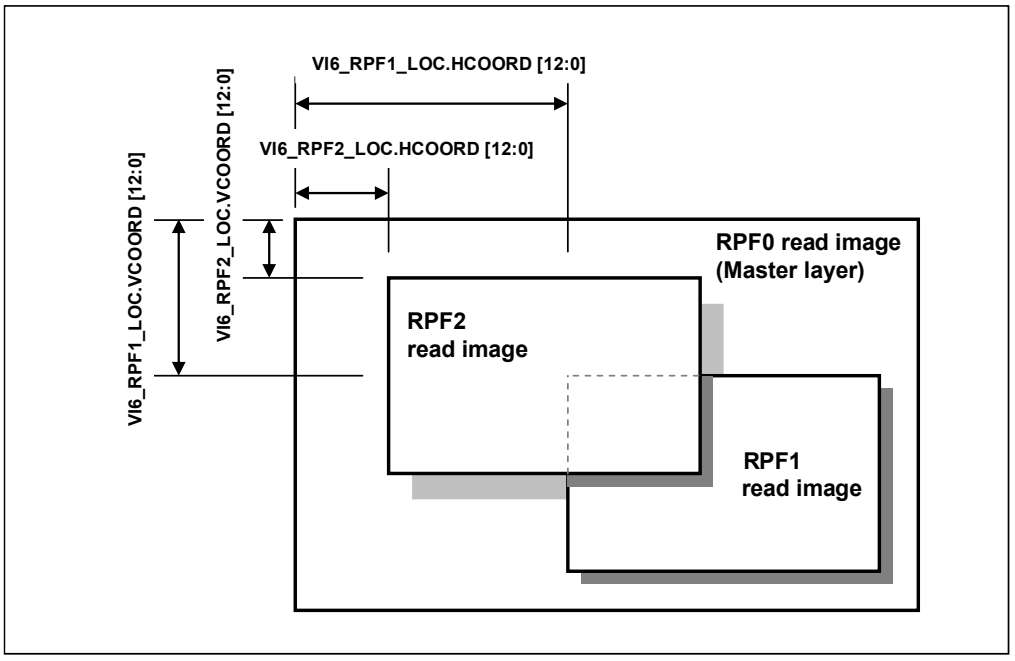

Figure 60.17 RPF1 and RPF2 Offsets from Master Layer

60.2.6.6 RPFn A Plane Selection Control Registers (VI6_RPFn_ALPH_SEL)

R/W :	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ALPHA1 [7:0]								ALPHA0 [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 22 to 20, 17, 16	–	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	ASEL [2:0]	All 0	R/W	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSP2 assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in Figure 60.18 and then output to the subsequent modules. The output α value is used, for example, for blending in the BRU. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in Figure 60.18. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4. 0: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 1: 8-bit plane α

				The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in Figure 60.18 without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 2: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in Figure 60.18 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 3: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in Figure 60.18 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 4: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 5 to 7: Setting prohibited.
27 to 24	IROP [3:0]	All 0	R/W	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in Figure 60.18. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to b'0000. b'0000: NOP(D)

				b'0001: AND(S & D) b'0010: AND_REVERSE(S & ~D) b'0011: COPY(S) b'0100: AND_INVERTED(~S & D) b'0101: CLEAR(0) b'0110: XOR(S ^ D) b'0111: OR(S | D) b'1000: NOR(~(S | D)) b'1001: EQUIV(~(S ^ D)) b'1010: INVERT(~D) b'1011: OR_REVERSE(S | ~D) b'1100: COPY_INVERTED(~S) b'1101: OR_INVERTED(~S | D) b'1110: NAND(~(S & D)) b'1111: SET(all 1)
23	BSEL	0	R/W	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in Figure 60.18. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect. 0: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to b'1; when the value is 0, it is converted to b'0. 1: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.
19, 18	AEXT[1:0]	All 0	R/W	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. b'00: The lower-order bits of α value are extended with 0. b'01: The upper-order bits of α value are copied to the lower-order bits. b'10: The lower-order bits of α value are extended with 0. The maximum value is limited to 0xFF. b'11: Setting prohibited
15 to 8	ALPHA1[7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 60.18 is b'1. This setting is valid when the ASEL bits are set to b'010 or b'011. A value from 0 to 255 can be specified.
7 to 0	ALPHA0 [7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 60.18 is b'0. This setting is valid when the ASEL bits are set to b'010 or b'011. A value from 0 to 255 can be specified.

Figure 60.18 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

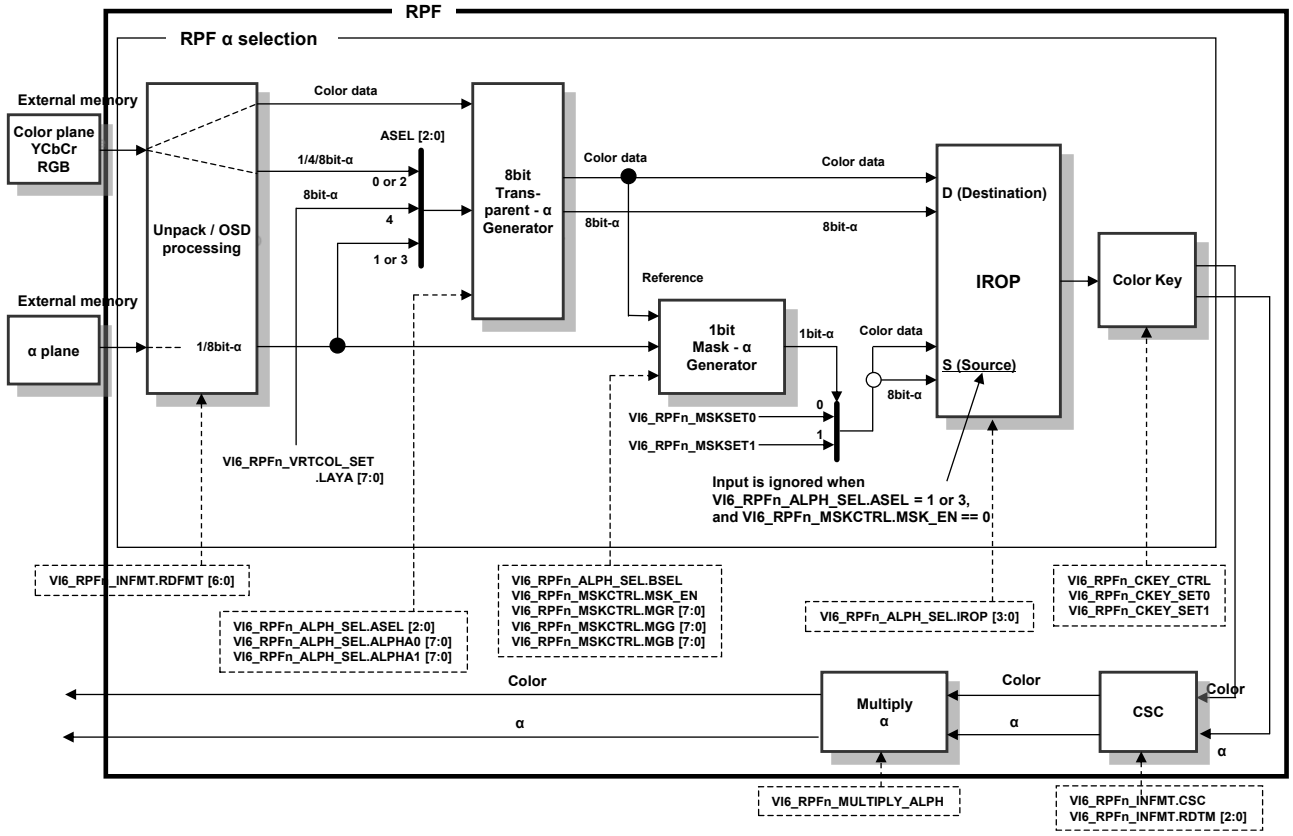

Figure 60.18 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in Figure 60.18. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of b'0 is generated; if the value is not 0, a 1-bit α value of b'1 is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is b'0, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is b'1, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in Figure 60.18, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to section 60.2.6.8), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in Table 60.15. Where the source input state is indicated as "Valid" in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 60.15 Source Input State in IROP Operation Unit

VI6_RPFn_ALPH_SEL.ASEL [2:0]		VI6_RPFn_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
b'000	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
b'001	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
b'010	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
b'011	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
b'100	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

For the handling of the α values shown in Figure 60.18 and Table 60.15, the relationship between the RPF input format and RPF output α value is shown in Table 60.16. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 60.16 α Value Selected and Output according to ASEL Bits in Each Input Format
*Fixed value 0xFF is output because packed α is not included in YCbCr.

ASEL Setting		α Value Output for Each Input Format		
		RGB	YCbCr	OSD-CLUT
b'000	(8-, 4-, or 1-bit packed α is input)	1- ,4-, or 8-bit pixel α	0xFF*	α value in CLUT
b'001	(8-bit plane α is input)	8-bit α plane	8-bit α plane	8-bit α plane
b'010	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	0xFF*	0xFF
b'011	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
b'100	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting		

60.2.6.7 RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LAYA [7:0]								LAYR [7:0]

R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	LAYG [7:0]								LAYB [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA [7:0]	All 0	R/W	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR [7:0]	All 0	R/W	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG [7:0]	All 0	R/W	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB [7:0]	All 0	R/W	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

60.2.6.8 RPFn Mask Control Registers (VI6_RPFn_MSKCTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	MSK_EN	MGR [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG [7:0]								MGB [7:0]							

Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	MSK_EN	0	R/W	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in Figure 60.18. 0: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is 0x00; otherwise, the 1-bit mask value is 1. 1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0.
23 to 16	MGR [7:0]	All 0	R/W	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG [7:0]	All 0	R/W	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.
7 to 0	MGB [7:0]	All 0	R/W	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

60.2.6.9 RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSA0 [7:0]								MSR0 [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSG0 [7:0]								MSB0 [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0 [7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 60.18). A value from 0 to 255 can be specified.
23 to 16	MSR0 [7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0 [7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0 [7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

60.2.6.10 RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSA1 [7:0]								MSR1 [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSG1 [7:0]								MSB1 [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1 [7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (Figure 60.18).
23 to 16	MSR1 [7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1 [7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1 [7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 60.18). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

60.2.6.11 RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	–	–	–	–	–	–	–	LTH	–	–	–	CV	–	–	SAPE1	SAPE0
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 5, 3, 2	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	LTH	0	R/W	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Luma threshold mode is disabled (Matched color mode) 1: Luma threshold mode is enabled
4	CV	0	R/W	Color Replacement Control This bit controls the color replacement function in the color keying module shown in Figure 60.3. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Color replacement function is disabled (transparent color mode). 1: Color replacement function is enabled.
1	SAPE1	0	R/W	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the

				transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Comparison color data setting 1 is disabled. 1: Comparison color data setting 1 is enabled.
0	SAPE0	0	R/W	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0. 0: Comparison color data setting 0 is disabled. 1: Comparison color data setting 0 is enabled.

60.2.6.12 RPFn Color Keying Color Setting Registers-m (VI6_RPFn_CKEY_SETm : M=0, 1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	APm [7:0]								Rm [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GYm [7:0]								Bm [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

31 to 24	APm [7:0]	All 0	R/W	α Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. • In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. • In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm [7:0]	All 0	R/W	R*1/Cr Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	GYm [7:0]	All 0	R/W	G*1/Y Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. • In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. • In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
7 to 0	Bm [7:0]	All 0	R/W	B*1/Cb Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored.

				• In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

(*1) When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

60.2.6.13 RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PICT_STRD_Y [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	All 0	R/W	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to Figure 60.19 for settings.
15 to 0	PICT_STRD_C [15:0]	All 0	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to Figure 60.19 for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in Figure 60.19. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in Figure 60.19. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α

plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to section 60.2.6.6.

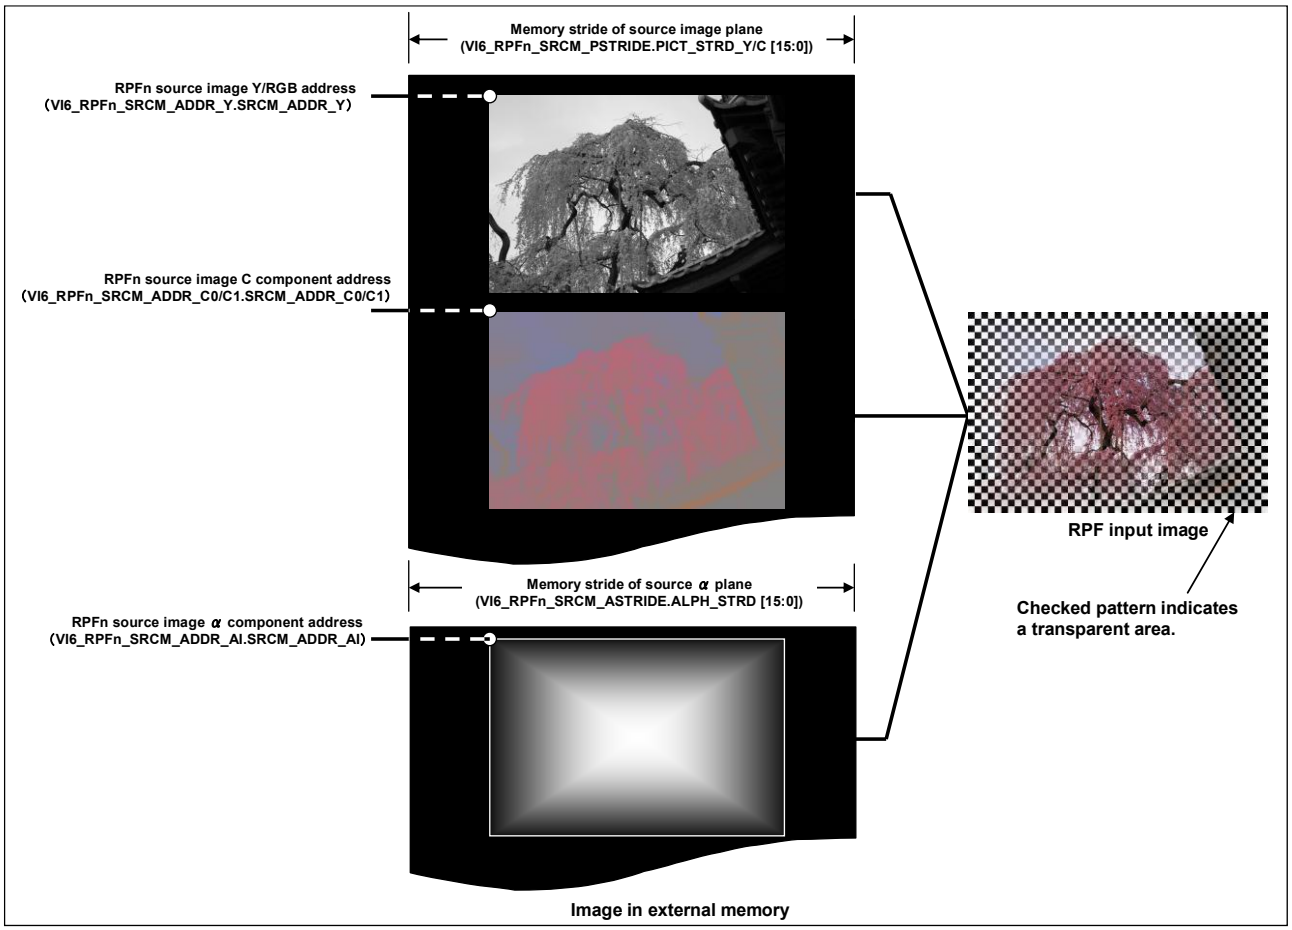

Figure 60.19 Reading an Image from RPFn Source Area

60.2.6.14 RPFn Source A Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C0 [31:0]	All 0	R/W	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 60.12 or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to Figure 60.19 for settings.

60.2.6.17 RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_C1 [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C1 [31:0]	All 0	R/W	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in Table 60.12 is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to Figure 60.19 for settings.

60.2.6.18 RPFn Source A Address Registers (VI6_RPFn_SRCM_ADDR_AI)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_AI [31:16]															

Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCM_ADDR_AI [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_AI [31:0]	All 0	R/W	Source Image α Plane Storing Address These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to Figure 60.19 for settings.

60.2.6.19 RPFn Bus Access Control Registers (VI6_RPFn_BAC)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	B512

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	CPOS2 [5:0]						–	–	CPOS3 [5:0]					
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30, 23, 22, 15, 14, 7, 6	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	CPOS0 [5:0]	0	R/W	Bit position of color component register 0
21 to 16	CPOS1 [5:0]	0	R/W	Bit position of color component register 1
13 to 8	CPOS2 [5:0]	0	R/W	Bit position of color component register 2
5 to 0	CPOS3 [5:0]	0	R/W	Bit position of color component register 3

Specify bit position of color components in a pixel of RGB packed data format RGB10, RGB10A2, A2RGB10. Set this register referring to Table 60.11

60.2.6.23 RPFn Extended Input Format Registers 2 (VI6_RPFn_EXT_INFMT2)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	CLEN0 [4:0]					–	–	–	CLEN1 [4:0]

Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29 , 23 to 21, 15 to 13, 7 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	CLEN0 [4:0]	0	R/W	Bit width of color components register 0
20 to 16	CLEN1 [4:0]	0	R/W	Bit width of color components register 1
12 to 8	CLEN2 [4:0]	0	R/W	Bit width of color components register 2
4 to 0	CLEN3 [4:0]	0	R/W	Bit width of color components register 3

Specify bit width of color components in a pixel of RGB packed data format RGB10, RGB10A2, A2RGB10. Set this register referring to Table 60.11.

60.2.6.24 RPFn Bit Reduction and DITHer ConTRoL (VI6_RPFn_BRDITH_CTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	ODE	–	–	–	–	–	–	–	CBRM
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

8	ODE	0	R/W	Ordered Dither (mode A) Enable/Disable for when reducing from 10 bits (for Y, R, G, B) or 12 bits (Y) to 8bits after reading YCbCr/RGB format data from memory 0: Ordered dither (mode A) is disabled. 1: Ordered dither (mode A) is enabled. Refer to Table 60.19 for usage.
0	CBRM	0	R/W	Bit count Reduction Method selection for component, Y, Cb, Cr, R, G, B when reducing from 10 bits (for Y, Cb, Cr, R, G, B) or 12bits (for Y, Cbr, Cr) to 8bits after reading YCbCr/RGB format data from memory 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off) Refer to Table 60.19 for usage.

Table 60.19 Usage of RPF bit count reduction registers

Setting of VI6_RPFn_BRDITH_CTRL		Operation of bit count reduction from 10bpc/12bpc to 8bpc	
ODE	CBRM	For R/G/B/Y	For Cb/Cr
0	0	The lower-order bits are truncated	The lower-order bits are truncated
0	1	Rounding off	Rounding off
1	0	Ordered dither (mode A)	The lower-order bits are truncated
1	1	Ordered dither (mode A)	Rounding off

60.2.7 WPF Control Registers

60.2.7.1 WPF0-Source-RPF Registers (VI6_WPF0_SRCRPF)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	VIR_ACT [1:0]		–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	RPF4_ACT [1:0]		RPF3_ACT [1:0]		RPF2_ACT [1:0]		RPF1_ACT [1:0]		RPF0_ACT [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30, 27, 26, 23 to 10	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29,	VIR_ACT	All 0	R/W	Virtual RPF Start Enable in BRU

28	[1:0]			These bits enable start of the virtual RPF in the BRU as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. Section 60.2.9.1, BRU Input Control Register (VI6_BRU_INCTRL) Section 60.2.9.2, Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE) Section 60.2.9.3, Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC) Section 60.2.9.4, Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL)Note that the virtual RPF is in the BRU as shown in Figure 60.25 and there are no register bits for DPR setting related to the virtual RPF. 0: The virtual RPF in the BRU is not started. 1: The virtual RPF in the BRU is started as a sublayer source RPF for the WPF0. 2: The virtual RPF in the BRU is started as the master-layer source RPF for the WPF0. 3: Setting prohibited
9, 8	RPF4_ACT [1:0]	All 0	R/W	RPFn Start Enable (RPFn_ACT, n=0 to 4) These bits enable start of RPFn as the source RPF for the WPF0 when the WPF0 is started. When RPFn is not used, set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to D'63. When ILV is used and image size of ILV output is equal to output size of the WPF0, set the RPFn_ACT, which ILVL (ILV left) is connected, to 2. 0: RPFn is not started. 1: RPFn is started as a sublayer source RPF for the WPF0. 2: RPFn is started as the master-layer source RPF for the WPF0. 3: Setting prohibited
7, 6	RPF3_ACT [1:0]	All 0	R/W	
5, 4	RPF2_ACT [1:0]	All 0	R/W	
3, 2	RPF1_ACT [1:0]	All 0	R/W	
1, 0	RPF0_ACT [1:0]	All 0	R/W	

When the WPF0 is started through the VSP2 start register (VI6_CMD0), the RPF and virtual RPF in the BRU specified as the source RPF in this register are also started to supply data to the VSP2 internal modules.

Note the following when specifying the source RPF.

(1) When blending, ROP or IIF operation is applied to multiple images through the BRU, multiple source RPFs are necessary. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs. Do not assign all RPFs as sublayer source RPFs (VI6_WPF0_SRCRPF = 0x00000015) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = 0x0000025A) (such settings are prohibited).
(2) When the BRU is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

60.2.7.2 WPF0 Horizontal Input Size Clipping Registers (VI6_WPF0_HSZCLIP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	HCEN	–	–	–	–	HCL_OFST [7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	HCL_SIZE [12:0]												
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 24, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	HCEN	0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPF0 input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
23 to 16	HCL_OFST [7:0]	All 0	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (Figure 60.20). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the left-side offset size (pixels) for the image. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 60.20 is made, VSP2 does not operate correctly.
12 to 0	HCL_SIZE [12:0]	All 0	R/W	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPF0 input image are discarded. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the horizontal clipping size for the image.

				A value from 1 to 8190 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 60.20 is made, VSP2 does not operate correctly.

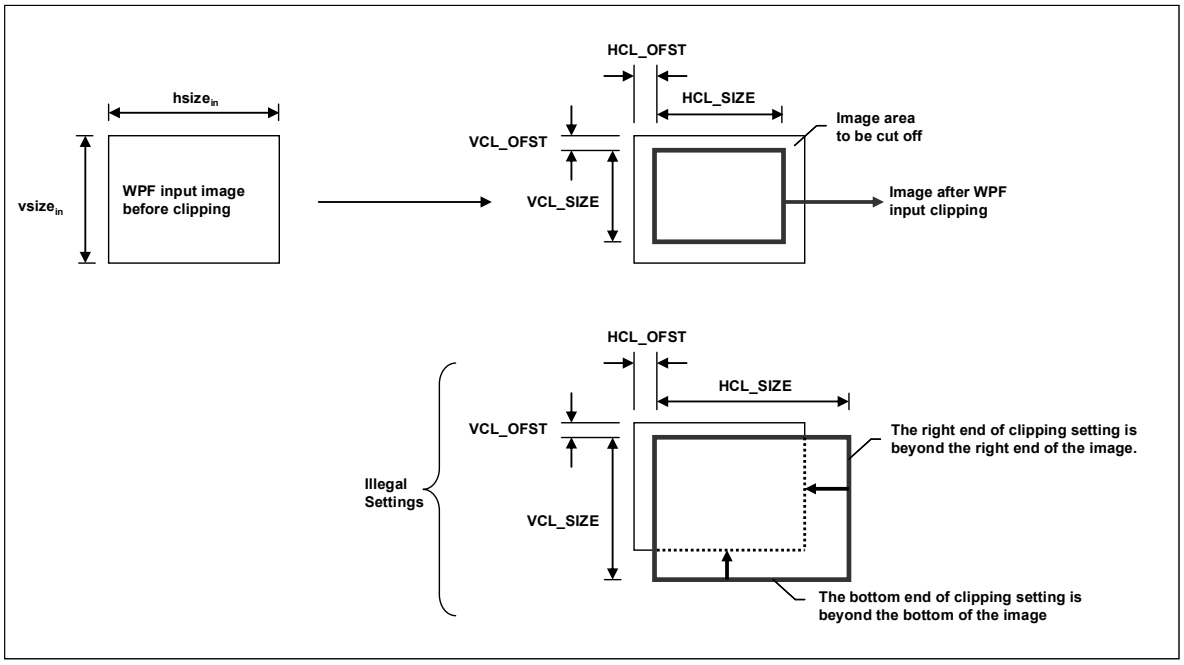

Figure 60.20 Image Clipping in WPF Input Section

60.2.7.3 WPF0 Vertical Input Size Clipping Registers (VI6_WPF0_VSZCLIP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	VCEN	–	–	–	–	VCL_OFST [7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	VCL_SIZE [12:0]												
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

31 to 29, 27 to 24, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VCEN	0	R/W	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPF0 input image. 0: Vertical size clipping is disabled 1: Vertical size clipping is enabled
23 to 16	VCL_OFST [7:0]	All 0	R/W	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (Figure 60.20). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the top offset size (pixels) for the image. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 60.20 is made, VSP2 does not operate correctly.
12 to 0	VCL_SIZE [12:0]	All 0	R/W	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPF0 input image are discarded. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the vertical clipping size for the image. A value from 1 to 8190 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 60.20 is made, VSP2 does not operate correctly.

60.2.7.4 WPF0 Output Format Registers (VI6_WPF0_OUTFMT)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV [7:0]								PXA	ODE	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH [1:0]		WRTM [2:0]			CSC	–	WRFMT [6:0]						
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
21 to 16, 7	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
31 to 24	PDV [7:0]	All 0	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 60.20. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0	R/W	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in Table 60.20. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in Table 60.20 are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPF0_RNDCTRL.ABRM setting. For bit count reduction, refer to Figure 60.21 and the description of VI6_WPF0_RNDCTRL.ABRM. 0: The value specified in the PDV bits is stored in the PAD shown in Table 60.20. 1: The α value output from DPR in pixel units is stored in the PAD shown in Table 60.20.
22	ODE	0	R/W	Ordered Dither (mode A) Enable/Disable 0: Ordered dither (mode A) is disabled. 1: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
15	SPYCS	0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (0x47). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (0x47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (0x41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (0x42). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (0x47). In other cases, set this bit to 0.
13, 12	DITH [1:0]	All 0	R/W	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp

				(260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPF0_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 0: Dithering (mode B) is disabled 3: Dithering (mode B) is enabled 1, 2: Setting prohibited When ODE bit in the register is 1, set this bit to 0.
11 to 9	WRTM [2:0]	All 0	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is YCbCr, or YCbCr to RGB when the format specified in the WRFMT bits is RGB. 0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF0. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in section 60.2.6.3 RPFn Input Format Registers (VI6_RPFn_INFMT). 0: Color space is not converted. 1: Color space is converted.
6 to 0	WRFMT [6:0]	All 0	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPF0 to the external memory from among those listed in Table 60.20 and Table 60.21. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. [Note 2] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) [Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

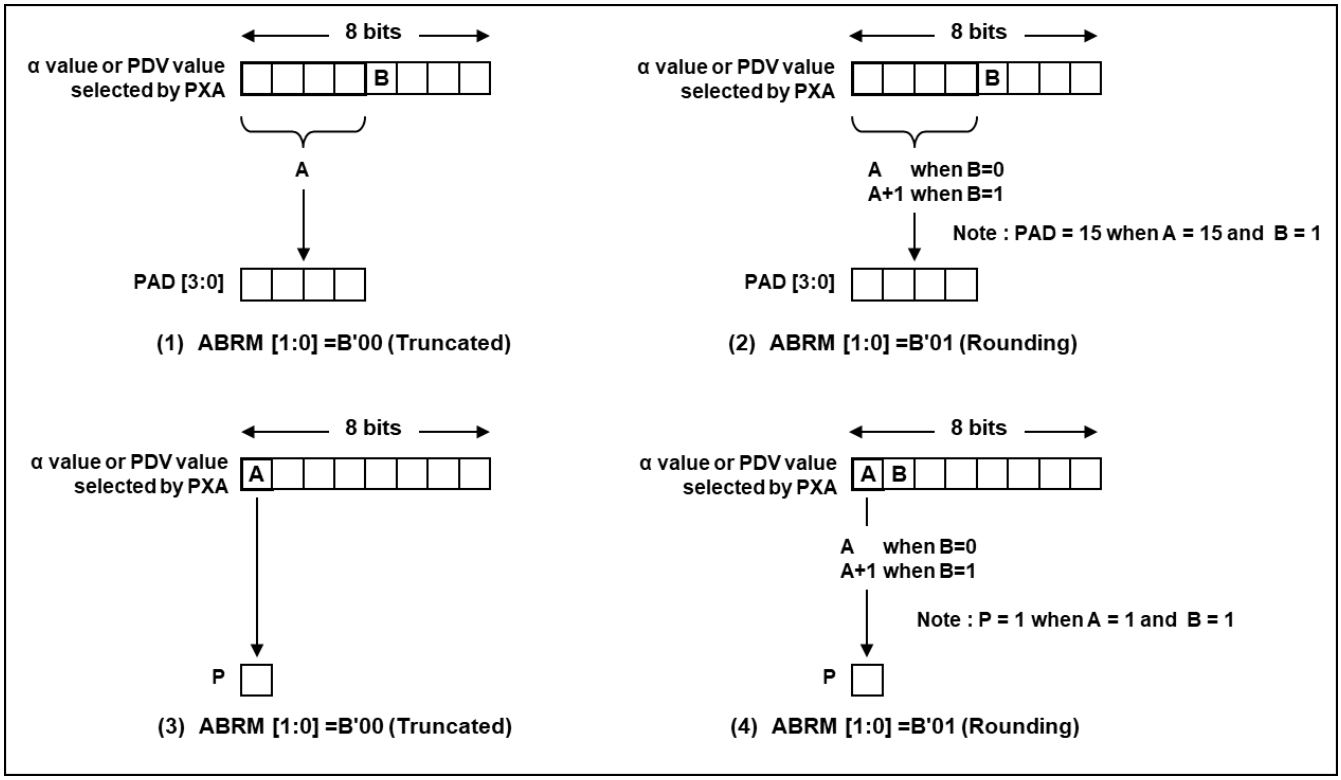

Figure 60.21 Selection of PAD Value and Reduction of Bit Count through PXA Setting

Table 60.21 Packed YCbCr Formats for WPF Output

WRFMT [6:0]	Packed YCbCr Output Format	
0x40	YCbCr4:4:4 semi-planar	Figure 60.10*4
0x41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
0x42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
0x43 to 0x45	Reserved	—
0x46	YCbCr4:4:4 interleaved	Figure 60.11*4
0x47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
0x48	YCbCr4:2:2 interleaved type 1	
0x49	YCbCr4:2:0 interleaved *5	
0x4a	YCbCr4:4:4 planar	Figure 60.12*4
0x4b	YCbCr4:2:2 planar (YV16)	
0x4c	YCbCr4:2:0 planar (YV12, I420)	
0x4d to 0x7f	Reserved	—

*1 When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

*2 When the output format is YUY2, set SPYCS (bit 15) to 1.

*3 When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

*4 Figure 60.13 shows the definition of memory address for each pixel in Figure 60.10 to Figure 60.12.

*5 Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to Figure 60.10, Figure 60.11, Figure 60.12, and Figure 60.13. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures) ® (Corresponding WPF registers)

VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y → VI6_WPF0_DSTM_ADDR_Y.DSTM_ADDR_Y

VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0 → VI6_WPF0_DSTM_ADDR_C0.DSTM_ADDR_C0

VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1 → VI6_WPF0_DSTM_ADDR_C1.DSTM_ADDR_C1

60.2.7.5 WPF0 Data Swapping Registers (VI6_WPF0_DSWAP)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	P_LLS	P_LWS	P_WDS	P_BTS
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	P_LLS	0	R/W	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 60.14. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0	R/W	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 60.14. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0	R/W	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 60.14. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0	R/W	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 60.14. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 60.14 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in Table 60.20 for RGB format Figure 60.12 for YCbCr format, set 4'b1111 to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in Table 60.14.

60.2.7.6 WPF0 Rounding Control Registers (VI6_WPF0_RNDCTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	CBRM	–	–	ABRM [1:0]		ATHRESH [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	CLMD [1:0]		–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27, 26, 15,14, 11 to 0	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 60.20 and the target bit fields are not 8 bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
25, 24	ABRM [1:0]	All 0	R/W	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPF0_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in Table 60.20 and the target bit field is four bits or one bit. A value of b'10 can be specified only when the packed RGB format specified through VI6_WPF0_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPF0_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. b'00: Bit count conversion: The lower-order bits are truncated b'01: Bit count conversion: Rounding (rounding off) b'10: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) b'11: Setting prohibited
23 to 16	ATHRESH [7:0]	All 0	R/W	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to b'10. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
13, 12	CLMD [1:0]	All 0	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. b'00: Output value is not clipped (0-255) b'01: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) b'10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) b'11: Setting prohibited

60.2.7.7 WPF0 Destination Y Plane Memory Stride Registers (VI6_WPF0_DSTM_STRIDE_Y)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

15 to 0	PICT_STRD_C [15:0]	0	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF0 as shown in Figure 60.22. When the WPF0 outputs images in an RGB format, this setting is not used. When the WPF0 outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from 0x0000 to 0xFFFF can be specified.

60.2.7.9 WPF0 Destination Y/RGB Address Registers (VI6_WPF0_DSTM_ADDR_Y)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_Y [31:0]	0	R/W	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPF0 in the method described later. A value from H'0000 0000 to H'FFFF FFFF can be specified.

60.2.7.10 WPF0 Destination Chroma Address Registers 0 (VI6_WPF0_DSTM_ADDR_C0)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C0 [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C0 [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial	R/W	Description

		Value		
31 to 0	DSTM_ ADDR_C0 [31:0]	0	R/W	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPF0. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 60.21 or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from H'0000 0000 to H'FFFF FFFF can be specified.

60.2.7.11 WPF0 Destination Chroma Address Registers 1 (VI6_WPF0_DSTM_ADDR_C1)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_C1 [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_C1 [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_C1 [31:0]	0	R/W	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPF0 outputs images to the external memory in YCbCr planar format shown in Table 60.21. Refer to the description of VI6_WPF0_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from H'0000 0000 to H'FFFF FFFF can be specified.

60.2.7.12 WPF0 LIF Write Back Control Registers (VI6_WPF0_WRBCK_CTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	WBMD	0	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIF0_CTRL.LIF_EN bit is set to 1. Relation between register setting and destination of output image is shown in Table 60.22. 0 : Write Back Disabled 1 : Write Back Enabled

Table 60.22 Register settings and destination of output image

Register setting		Destination	
VI6_LIF0_CTRL .LIF_EN	VI6_WPF0_WRBCK_CTRL. WBMD	Output image to display	Output image to memory
0	0		✓
0	1	Forbidden	
1	0	✓	
1	1	✓	✓

60.2.8 DPR Control Registers

60.2.8.1 Concept of DPR Settings

Figure 60.23 shows node value of all sub modules implemented in all VSPs.

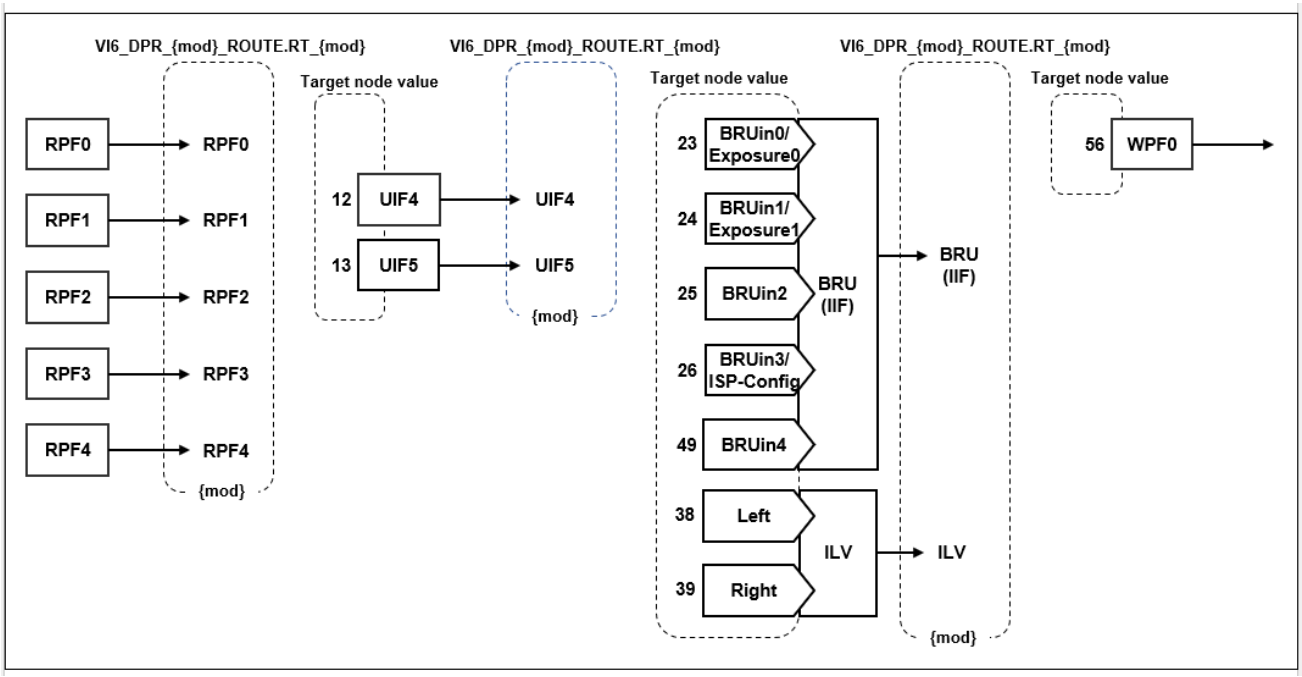

Figure 60.23 Node Register Names and Target Node Values on Data Path Router

In the VSP2 internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_RPFn_ROUTE (n = 4) corresponding to RPFn is not implemented in VSP which doesn't have RPFn (n = 4). Note: VI6_DPR_{mod}_ROUTE corresponding to {mod} is not implemented in VSP which doesn't have {mod}. See Figure 60.1 to Figure 60.2 whether each VSP has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF4 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRU input port, but all RPFs specified as the sources for a BRU input port should have the same target WPF. Same manner must be applied for ILV.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRU input ports are the same. Same manner must be applied for ILV.
6. Do not connect the output of any module as the input to the same module (in the BRU case, any input port) even when there is another module between the output and input (creating a loop is prohibited).

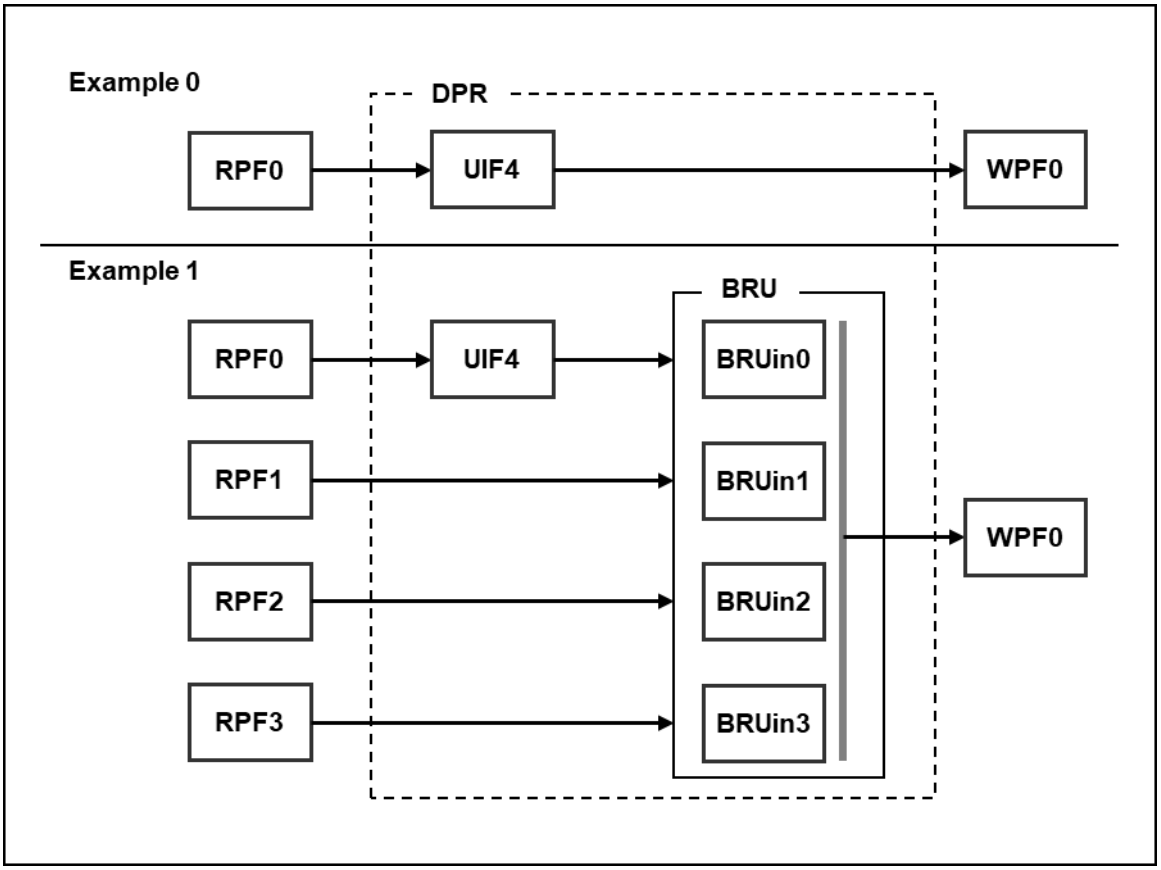

Figure 60.24 Examples of Internal Data Path Routing

Figure 60.24 shows examples of internal data path routing. The VI6_ DPR_*_ROUTE settings for these examples are shown in Table 60.23. The bit fields for the modules that are not used in the examples should be set to 63.

Table 60.23 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in Figure 60.25

	Register Name	Setting
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	12 (To UIF4)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63 (UNUSED)
	VI6_DPR_RPF2_ROUTE.RT_RPF2	63 (UNUSED)
	VI6_DPR_RPF3_ROUTE.RT_RPF3	63 (UNUSED)
	VI6_DPR_RPF4_ROUTE.RT_RPF4	63 (UNUSED)
	VI6_DPR_UIF4_ROUTE.RT	56 (To WPF0)
	VI6_DPR_ILV _ROUTE.RT	63 (UNUSED)
	VI6_DPR_BRU_ROUTE.RT	63 (UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	12 (To UIF4)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	24 (To BRUin1)
	VI6_DPR_RPF2_ROUTE.RT_RPF2	25 (To BRUin2)
	VI6_DPR_RPF3_ROUTE.RT_RPF3	26 (To BRUin3)
	VI6_DPR_RPF4_ROUTE.RT_RPF4	63 (UNUSED)
	VI6_DPR_UIF4_ROUTE.RT	23 (To BRUin0)

	VI6_DPR_BRU_ROUTE.RT	56 (To WPF0)

Although both examples shown in Figure 60.24 include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

60.2.8.2 RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n=0, 1, 2, 3, 4)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	RT_RPFn [5:0]					
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	RT_RPFn [5:0]	All 0	R/W	RPFn Target Node Value These bits specify the target node value for RPFn. When using RPFn, refer to Figure 60.23 for settings. When RPFn is not started through the VI6_WPF0_SRCRPF setting, specify 63.

60.2.8.3 WPF0 Timing Control Register (VI6_DPR_WPF0_FPORCH)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	FP_WPF0 [5:0]						–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W :	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14, 7 to 0	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	FP_WPF0 [5:0]	All 0	R/W	WPF0 Internal Operation Timing Setting Specify 5.

60.2.8.4 {mod} Routing Register (VI6_DPR_{mod}_ROUTE : {mod}=ILV,UIFn (n=4, 5) ,BRU)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	IIFSEL	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	FP [5:0]						–	–	RT [5:0]					
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 14, 7, 6	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	IIFSEL	0	R/W	This bit is valid only for VI6_DPR_BRU_ROUTE. 0: BRU is selected 1: IIF is selected Set 0 to this bit for VSPD to select BRU. Set 1 to this bit for VSPX to select IIF. BRU and IIF shares data path route. When IIF is selected (VSPX), the VSP outputs data to the connected streaming IP. When BRU is selected (VSPD), the VSP outputs data to external memory or DU display according to setting of VI6_LIF0_CTRL.
13 to 8	FP [5:0]	All 0	R/W	{mod} Internal Operation Timing Setting Specify 0.
5 to 0	RT [5:0]	All 0	R/W	{mod}Target Node Value These bits specify the target node value for the {mod}. When using the {mod}, refer to Figure 60.23 for settings. When not using the {mod}, specify 63.

60.2.9 BRU Control Registers

60.2.9.1 BRU Input Control Register (VI6_BRU_INCTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	NRM	ODE4	DITH 4 [2:0]			–	–	–	D4ON	D3ON	D2ON	D1ON	D0ON
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ODE3	DITH3 [2:0]			ODE2	DITH2 [2:0]			ODE1	DITH1 [2:0]			ODE0	DITH0 [2:0]		
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 23 to 21	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	NRM	0	R/W	Color Data Normalization Enables or disables division by the α value of the color data in BRU blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in Figure 60.25) does not divide the color value by α 1: Divider (DIV unit in Figure 60.25)) divides the color value by α
27	ODE4	0	R/W	Ordered Dither (mode A) of CH4 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin4 is disabled. 1: Ordered dither (mode A) of BRUin4 is enabled. Ordered dither is available only for 18bpp. So, when ODE4 bit is equal to 1, set DITH4 = 1. When ODE4 bit is equal to 0, BRUin4 dither method is specified by D4ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
26 to 24	DITH4[2:0]	0	R/W	Dithering of CH4 Input to BRU These bits specify how to perform dithering of the CH4 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin4 and D4ON replacing BRUin4 and D4ON, respectively.
20	D4ON	0	R/W	Ordered dither (mode B) Enable of BRU Input 4 Enables or disables dithering (color reduction) of BRU input 4 (BRUin4 in Figure 60.25)). 0: Dithering (mode B) of BRUin4 is disabled 1: Dithering (mode B) of BRUin4 is enabled When ODE4 in this bit is set to 1, set 0 to this bit.
19	D3ON	0	R/W	Ordered dither (mode B) Enable of BRU Input 3 Enables or disables dithering (color reduction) of BRU input 3 (BRUin3 in Figure 60.25)). 0: Dithering (mode B) of BRUin3 is disabled 1: Dithering (mode B) of BRUin3 is enabled When ODE3 in this bit is set to 1, set 0 to this bit.
18	D2ON	0	R/W	Ordered dither (mode B) Enable of BRU Input 2

				Enables or disables dithering (color reduction) of BRU input 2 (BRUin2 in Figure 60.25). 0: Dithering (mode B) of BRUin2 is disabled 1: Dithering (mode B) of BRUin2 is enabled When ODE2 in this bit is set to 1, set 0 to this bit.
17	D1ON	0	R/W	Ordered dither (mode B) Enable of BRU Input 1 Enables or disables dithering (color reduction) of BRU input 1 (BRUin1 in Figure 60.25). 0: Dithering (mode B) of BRUin1 is disabled 1: Dithering (mode B) of BRUin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	0	R/W	Ordered dither (mode B) Enable of BRU Input 0 Enables or disables dithering (color reduction) of BRU input 0 (BRUin0 in Figure 60.25). 0: Dithering (mode B) of BRUin0 is disabled 1: Dithering (mode B) of BRUin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15	ODE3	0	R/W	Ordered Dither (mode A) of CH3 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin3 is disabled. 1: Ordered dither (mode A) of BRUin3 is enabled. Ordered dither is available only for 18bpp. So, when ODE3 bit is equal to 1, set DITH3 = 1. When ODE3 bit is equal to 0, BRUin3 dither method is specified by D3ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
14 to 12	DITH3 [2:0]	All 0	R/W	Dithering of CH3 Input to BRU These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D3ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. 0: Dithering of BRUin3 input image is disabled 1: Dithering of BRUin3 input image at 18 bpp (RGB666: 260000 colors) 2: Dithering of BRUin3 input image at 16 bpp (RGB565: 65535 colors) 3: Dithering of BRUin3 input image at 15 bpp (RGB555: 32768 colors) 4: Dithering of BRUin3 input image at 12 bpp (RGB444: 4096 colors) 5: Dithering of BRUin3 input image at 8 bpp (RGB332: 256 colors) 6, 7: Setting prohibited
11	ODE2	0	R/W	Ordered Dither (mode A) of CH2 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin2 is disabled. 1: Ordered dither (mode A) of BRUin2 is enabled. Ordered dither is available only for 18bpp. So, when ODE2 bit is equal to 1, set DITH2 = 1. When ODE2 bit is equal to 0, BRUin2 dither method is specified by D2ON in the register

				Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
10 to 8	DITH2 [2:0]	All 0	R/W	Dithering of CH2 Input to BRU These bits specify how to perform dithering of the CH2 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin2 and D2ON replacing BRUin3 and D3ON, respectively.
7	ODE1	0	R/W	Ordered Dither (mode A) of CH1 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin1 is disabled. 1: Ordered dither (mode A) of BRUin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRUin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
6 to 4	DITH1 [2:0]	All 0	R/W	Dithering of CH1 Input to BRU These bits specify how to perform dithering of the CH1 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin1 and D1ON replacing BRUin3 and D3ON, respectively.
3	ODE0	0	R/W	Ordered Dither (mode A) of CH0 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin0 is disabled. 1: Ordered dither (mode A) of BRUin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1. When ODE0 bit is equal to 0, BRUin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	All 0	R/W	Dithering of CH0 Input to BRU These bits specify how to perform dithering of the CH0 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin0 and D0ON replacing BRUin3 and D3ON, respectively.

Figure 60.25 shows the configuration of the BRU. For the BRU inputs, there are five inputs from the DPR and one internal input as a virtual RPF. BRUin0 to BRUin4 are input ports that have the target node values shown in Figure 60.23, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the five inputs from the DPR to the BRU.

The virtual RPF inside the BRU is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRU. Starting of the virtual RPF is controlled by VI6_WPF0_SRCRPF.VIR_ACT, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRUin0 to BRUin4. The color space for the single color to be set for the virtual RPF needs to match the color space of the five inputs from the DPR to the BRU. For this setting method, see section 60.2.9.4.

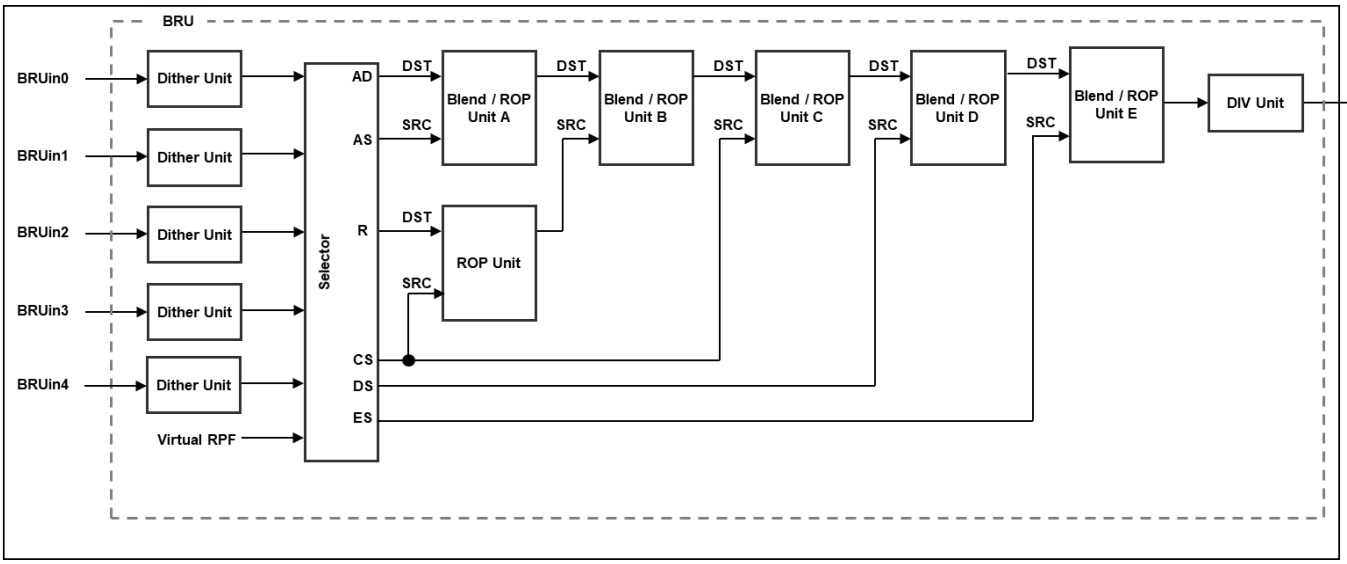

Figure 60.25 BRU Configuration

The selector in Figure 60.25 is used to select the SRC and DST inputs to blending/ROP units A to E and the ROP unit from BRUin0 to BRUin4 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to E and the ROP unit are either uniquely determined based on the configuration shown in Figure 60.25 (Table 60.24) or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS, R, CS, DS and ES, which correspond to the registers shown in Table 60.25.

Table 60.24 SRC and DST with Unique Input Sources

Input	Input Source	Register Bits
Blending/ROP unit B - DST	Output from blending/ROP unit A	–
Blending/ROP unit B - SRC	Output from ROP unit	–
Blending/ROP unit C - DST	Output from blending/ROP unit B	–
Blending/ROP unit D - DST	Output from blending/ROP unit C	–
Blending/ROP unit E - DST	Output from blending/ROP unit D	–
ROP unit - SRC	CS which is a selector output	VI6_BRUC_CTRL.SRCSEL

Table 60.25 Correspondence between Selector Output Destinations and Register Bits

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRUA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRUA_CTRL.SRCSEL
R	ROP unit - DST	VI6_BRU_ROP.DSTSEL
CS	Blending/ROP unit C - SRC	VI6_BRUC_CTRL.SRCSEL
DS	Blending/ROP unit D - SRC	VI6_BRUD_CTRL.SRCSEL
ES	Blending/ROP unit E - SRC	VI6_BRUE_CTRL.SRCSEL

60.2.9.2 Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	VIR_HSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	VIR_VSIZE [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VIR_HSIZE [12:0]	All 0	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in Figure 60.25. A value from 1 to 8190 can be specified.
12 to 0	VIR_VSIZE [12:0]	All 0	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in Figure 60.25. A value from 1 to 8190 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRU input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

Note that the virtual RPF is fixed to input port 5 of the BRU, and the data path route cannot be changed by the DPR.

60.2.9.3 Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	HCOORD [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	VCOORD [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT, set these bits to 0.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPF0_SRCRPF.VIR_ACT, set these bits to 0.

60.2.9.4 Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COL_A [7:0]								COL_RCR [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COL_GY [7:0]								COL_BCB [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A [7:0]	All 0	R/W	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	All 0	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY [7:0]	All 0	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	All 0	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRU is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

(Case 1: When an input other than the virtual RPF is used)

When the source RPF is connected to any one of the BRU input ports (BRUin0 to BRUin4) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRU inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of "all BRU inputs must have the same color space", as described in section 60.2.8.1 or 60.2.9.1.

(Case 2: When only the virtual RPF is used)

When only the virtual RPF is used as the source RPF of WPF0, RPFn is not connected to the BRU, as shown in Figure 60.26. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRU is determined by the WPF setting.

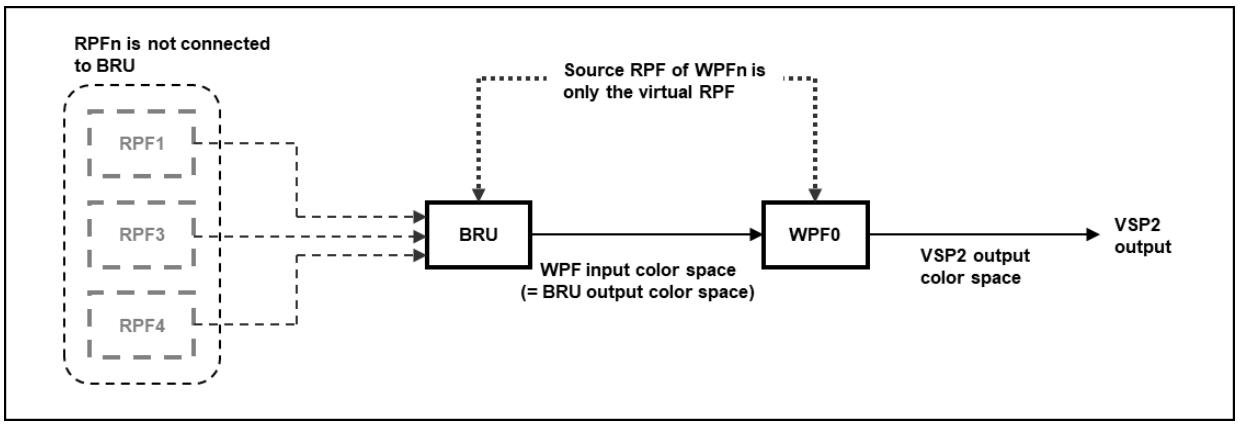

Figure 60.26 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 60.26, the output color space of the VSP2 (= output color space of WPF0) is determined by VI6_WPF0_OUTFMT.WRFMT. When bit 6 in VI6_WPF0_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRU output color space) is determined by the relationship between the WPF output color space and VI6_WPF0_OUTFMT.CSC. When VI6_WPF0_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRU output color space) are the same. When VI6_WPF0_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRU output color space) are the opposite. This relationship is summarized in Table 60.26.

The color space for the virtual RPF's color information should be set in this register according to the "BRU output color space" shown in Table 60.26.

Table 60.26 Relationship between WPF Output Color Space and BRU Output Color Space

VI6_WPF0_OUTFMT Register Bit Settings		BRU Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT	CSC	
0 (WPF output is RGB)	0 (YCbCr → RGB conversion is disabled)	RGB
0 (WPF output is RGB)	1 (YCbCr → RGB conversion is enabled)	YCbCr
1 (WPF output is YCbCr)	0 (RGB → YCbCr conversion is disabled)	YCbCr
1 (WPF output is YCbCr)	1 (RGB → YCbCr conversion is enabled)	RGB

60.2.9.5 BRU Control Registers (VI6_BRUm_CTRL: M=A, B, C, D, E)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	–	–	–	–	–	–	–	–	DSTSEL [2:0]			–	SRCSEL [2:0]		
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	CROP [3:0]				AROP [3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0	R/W	Operation Type of Blending/ROP Unit m (m = A, B, C, D, E) Specifies the operation type for blending/ROP unit m (m = A, B, C, D, E) shown in Figure 60.25. 0: ROP (raster operation) 1: Blending operation
30 to 23, 19, 15 to 8	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

22 to 20	DSTSEL [2:0]	All 0	R/W	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in Figure 60.25. These bits specify the connection between the BRU input port and the DST separately from the setting of connections between other modules and the BRU input port through the DPR. b'000: BRU input 0 (BRUin0) is input to DST b'001: BRU input 1 (BRUin1) is input to DST b'010: BRU input 2 (BRUin2) is input to DST b'011: BRU input 3 (BRUin3) is input to DST b'100: Virtual RPF is input to DST b'101: BRU input 4 (BRUin4) is input to DST b'110 to 111: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit m (m = B, C, D, E) are reserved according to Table 60.24. The write value should always be 0.
18 to 16	SRCSEL [2:0]	All 0	R/W	Input Selection for SRC Side of Blending/ROP Unit m (m = A, C, D, E) These bits select the input for the SRC side of blending/ROP unit m (m = A, C, D, E) shown in Figure 60.25. These bits specify the connection between the BRU input port and the SRC separately from the setting of connections between other modules and the BRU input port through the DPR. b'000: BRU input 0 (BRUin0) is input to SRC b'001: BRU input 1 (BRUin1) is input to SRC b'010: BRU input 2 (BRUin2) is input to SRC b'011: BRU input 3 (BRUin3) is input to SRC b'100: Virtual RPF is input to SRC b'101: BRU input 4 (BRUin4) is input to SRC b'110 to 111: Setting prohibited [Note] The SRCSEL bits for blending/ROP unit B are reserved according to Table 60.24. The write value should always be 0.
7 to 4	CROP [3:0]	All 0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B, C, D, E). Select the opcode for ROP operation from Table 60.27.
3 to 0	AROP [3:0]	All 0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B, C, D, E). Select the opcode for ROP operation from Table 60.27.

Table 60.27 ROP Operator of Blending/ROP Unit m (m = A, B, C, D)

Opcode	Operator
b'0000	NOP(D)
b'0001	AND(S & D)
b'0010	AND_REVERSE(S & ~D)
b'0011	COPY(S)
b'0100	AND_INVERTED(~S & D)

b'0101	CLEAR(0)
b'0110	XOR(S ^ D)
b'0111	OR(S | D)
b'1000	NOR(~(S | D))
b'1001	EQUIV(~(S ^ D))
b'1010	INVERT(~D)
b'1011	OR_REVERSE(S | ~D)
b'1100	COPY_INVERTED(~S)
b'1101	OR_INVERTED(~S | D)
b'1110	NAND(~(S & D))
b'1111	SET(all1)

60.2.9.6 BRU Blend Control Registers (VI6_BRUm_BLD : M=A, B, C, D, E)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX [2:0]			–	CCMDY [2:0]			ABES	ACMDX [2:0]			–	ACMDY [2:0]		
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFX [7:0]								COEFY [7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRU (VI6_BRUm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: CCMDX * (DST color data) + CCMDY * (SRC color data) 1: CCMDX * (DST color data) – CCMDY * (SRC color data)
30 to 28	CCMDX [2:0]	All 0	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. b'000: DST α data is used as blending coefficient X b'001: 255 – (DST α data) is used as blending coefficient X b'010: SRC α data is used as blending coefficient X b'011: 255 – (SRC α data) is used as blending coefficient X b'100: Fixed α value 0 (COEFX setting)
27, 19	–	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	CCMDY [2:0]	All 0	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression

				determined by the CBES bit. b'000: DST α data is used as blending coefficient Y b'001: 255 – (DST α data) is used as blending coefficient Y b'010: SRC α data is used as blending coefficient Y b'011: 255 – (SRC α data) is used as blending coefficient Y b'100: Fixed α value 1 (COEFY setting)
23	ABES	0	R/W	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B, C, D, E). α creation coefficients are specified by the ACMDX and ACMDY bits. 0: ACMDX * (DST α data) + ACMDY * (SRC α data) 1: ACMDX * (DST α data) – ACMDY * (SRC α data)
22 to 20	ACMDX [2:0]	All 0	R/W	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. b'000: (α creation coefficient X) = (DST α data) b'001: (α creation coefficient X) = 255 – (DST α data) b'010: (α creation coefficient X) = (SRC α data) b'011: (α creation coefficient X) = 255 – (SRC α data) b'100: (α creation coefficient X) = Fixed α value 0 (COEFX setting) b'101 to b'111: Setting prohibited
18 to 16	ACMDY [2:0]	All 0	R/W	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. b'000: (α creation coefficient Y) = (DST α data) b'001: (α creation coefficient Y) = 255 – (DST α data) b'010: (α creation coefficient Y) = (SRC α data) b'011: (α creation coefficient Y) = 255 – (SRC α data) b'100: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) b'101 to b'111: Setting prohibited
15 to 8	COEFX [7:0]	All 0	R/W	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to b'100. A value from 0x00 to 0xFF can be specified.
7 to 0	COEFY [7:0]	All 0	R/W	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to b'100. A value from 0x00 to 0xFF can be specified.

60.2.9.7 BRU Raster Operation Control Register (VI6_BRU_ROP)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	DSTSEL [2:0]			–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	CROP [3:0]				AROP [3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23, 19 to 8	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	DSTSEL [2:0]	All 0	R/W	Input Selection for DST Side of ROP Unit These bits select the input for the DST side of the ROP unit. For the SRC side, the same data as the input for the SRC side of blending/ROP unit C is input. b'000: BRU input 0 (BRUin0) is input to DST b'001: BRU input 1 (BRUin1) is input to DST b'010: BRU input 2 (BRUin2) is input to DST b'011: BRU input 3 (BRUin3) is input to DST b'100: Virtual RPF is input to DST b'101: BRU input 4 (BRUin4) is input to DST b'110 to 111: Setting prohibited
7 to 4	CROP [3:0]	All 0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in the ROP unit. Select the opcode for ROP operation from Table 60.27.
3 to 0	AROP [3:0]	All 0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in the ROP unit. Select the opcode for ROP operation from Table 60.27.

60.2.10 ILV Control Register

60.2.10.1 ILV Control Register (VI6_ILV_CTRL)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	ILV_MODE [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	ILV_EN
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18, 15 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 16	ILV_MODE [1:0]	0	R/W	Format Setting for 3D-Format Conversion These bits specify the format for 3D-format conversion. 0: Side by side (output is enlarged twice in horizontal direction) 1: Line by line (output is enlarged twice in vertical direction) 2: Pixel by pixel (output is enlarged twice in horizontal direction) 3: Doubler (output is enlarged twice in horizontal and vertical directions)
0	ILV_EN	0	R/W	3D-Format Conversion Enable/Disable Enables or disables 3D-format conversion by the ILV. Before setting this bit to 1, make appropriate connections with the DPR so that valid image data is sent to two input lines of the ILV. When this bit is set to 0, the input to the ILVL passes through the ILV and the output size becomes the same as the input size. 0: 3D-format conversion is disabled. 1: 3D-format conversion is enabled.

Interleave method of ILVL and ILVR is shown in Figure 60.27. "ILVL" or "L" in the figure is output image from module that target node setting is 38. "ILVR" or "R" in the figure is output image from module that target node setting is 39. See section 60.2.8.1 about target node.

4 to 0	CTRL	0	W	A single write access to this register is required before activating VSPX in order to transfer ISP config data. Set 0x13 before starting VSPX to this register. Read value is not guaranteed. These bits are only for VSPX.

60.3 Operation

60.3.1 Registers to Set Fixed Value

Set fixed value to following registers in any case.

[1] Always set H'0000 0808 to VI6_CLK_DCSWT

[2] Always set D'256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set D'2 to VI6_DL_EXT_CTRL.POLINT [5:0] in case of using extended display list of WPF0.

[4] Always set D'1 to VI6_DL_EXT_CTRL.DLPRI in case of using extended display list of WPF0.

[5] Always set D'0 to VI6_DL_EXT_CTRL.EXPRI in case of using extended display list of WPF0.

[6] Always set H'0000 0500 toVI6_DPR_WPF0_FPORCH in case of using WPF0.

[7] For VSPD, always set D'3000 to VI6_LIF0_CTRL.OBTH[11:0] in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set D'1 to VI6_LIF0_CTRL.REQSEL in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set D'0 to VI6_LIF0_CSBTH in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

60.3.2 Concept of VSP2 Operation Starting and Stopping

The VSP2 provides one channel (WPF0) of image processing. The WPF0 is started by setting the corresponding start register. Use the start registers shown in Table 60.28 to start WPF0 module.

After the WPF0 is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in Table 60.28; clearing a source register cancels the corresponding interrupt signal (for details of interrupt processing, refer to section 60.3.4, Interrupt Processing). Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops.

Table 60.28 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT

Figure 60.29 shows relation between start reservation and operating status. When start is reserved while VSP2 is operating, the reservation is accepted after VSP2 status is moved from "operating" into "idle" as shown in Figure 60.29. Therefore, when start reservation is used for VSPX as shown in section 60.3.7, take following procedure to confirm VSP2 isn't operating.

<1> Check VI6_CMD0.STRCMD is zero (Start is not reserved)

<2> Check VI6_STATUS.SYS0_ACT is zero (VSP2 is IDLE status)

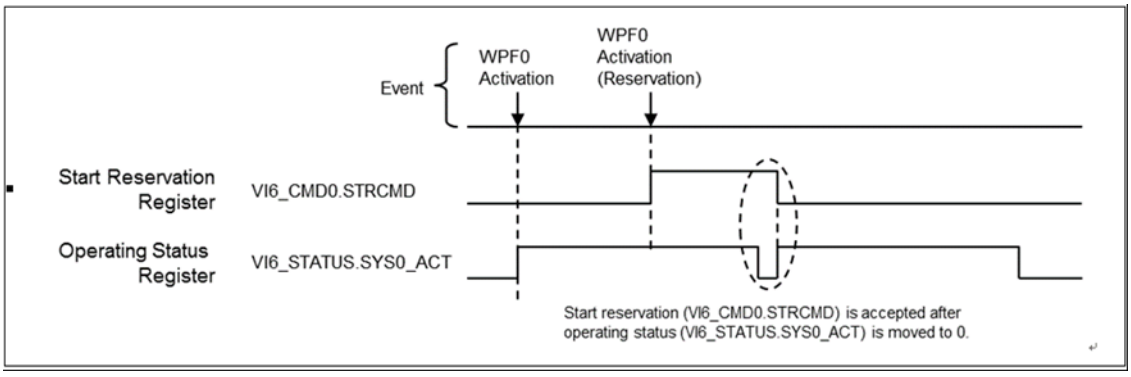

Figure 60.29 VSP2 Start reservation and Operating status

60.3.3 Display List

60.3.3.1 Functional Description

The VSP2 provides the display list function. As a display list, the VSP2 automatically downloads the register settings except for the control registers (sections 60.2.4 and 60.2.5) from external memory and stores the settings in the VSP2 registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSP2 processing are prepared in advance in external memory such as SDRAM.

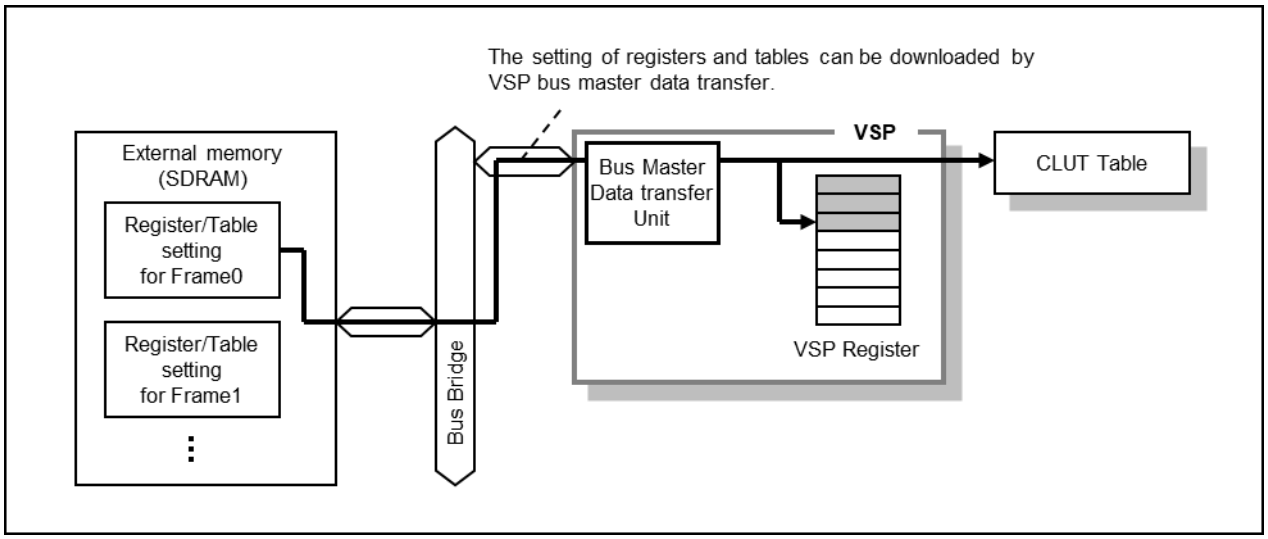

Figure 60.30 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in section 60.2.5. The register settings or various types of information should be stored in external memory in the format described in section 60.3.3.2. Figure 60.31 shows the difference between VSP2 operation through normal register settings and through display lists.

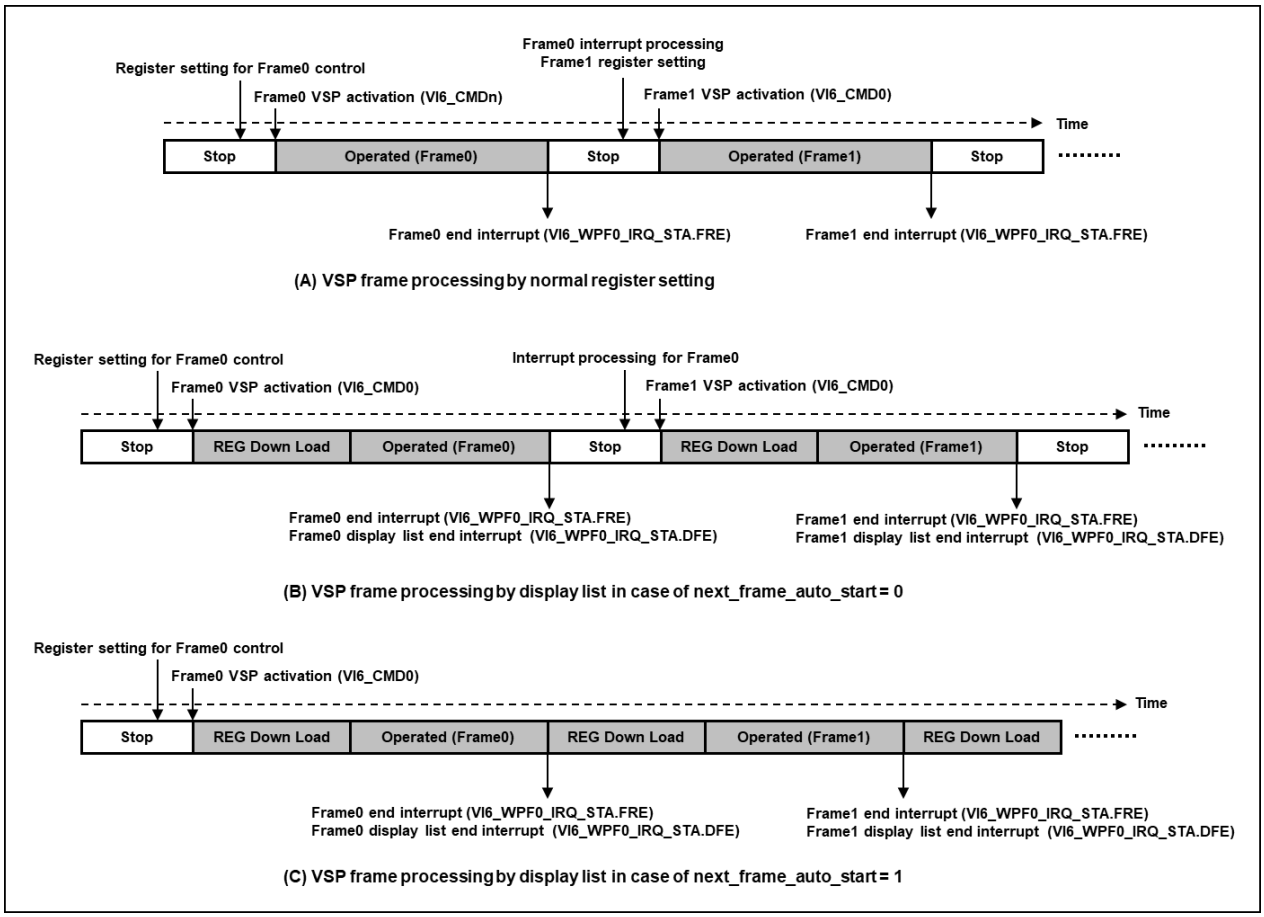

Figure 60.31 Comparison of VSP2 Operation between Normal Register Settings and Display Lists

As shown in Figure 60.31 (A), in the VSP2 processing through normal register settings, all registers should be set up before the VSP2 is started for each frame. After the VSP2 processing is completed, the VSP2 outputs a frame end interrupt (VI6_WPF0_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSP2 automatically downloads register settings from external memory as shown in Figure 60.31 (B) and (C), which reduces the load on the CPU between frames.

Figure 60.31 (B) shows the display list usage where the VSP2 stops at the end of every frame; only the VSP2 start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSP2 is large. In the case shown in Figure 60.31 (C), as soon as the frame processing ends, the VSP2 automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 60.29 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 60.29 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

60.3.3.2 Normal Display List Mode

The VSP2 display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. Figure 60.32 shows the display list structure.

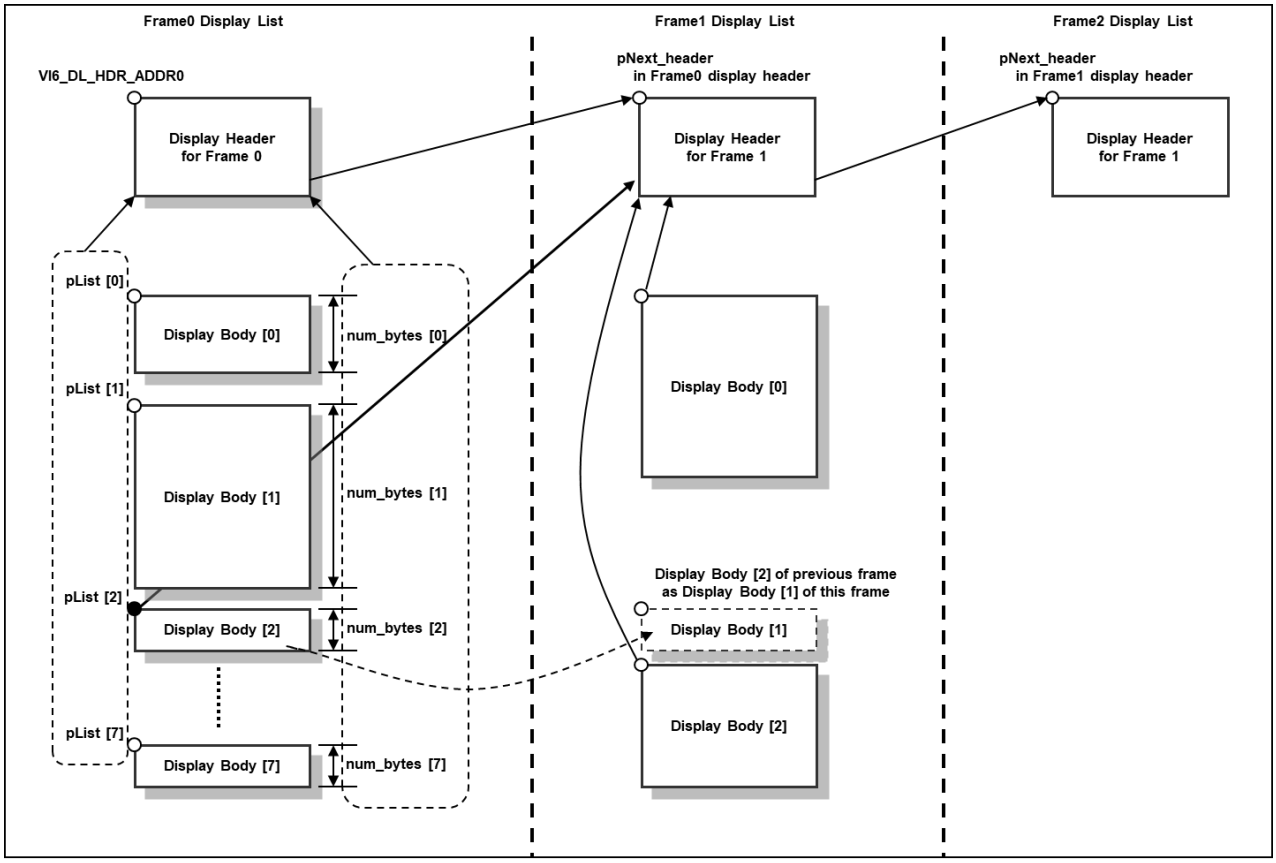

Figure 60.32 Structure and Concept of VSP2 Display List

A VSP2 display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSP2 analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSP2 registers described in section 60.2.5. When activated in a mode that uses display lists, the VSP2 downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0, analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSP2 becomes ready for frame image processing; the VSP2 then starts the actual frame processing.

After processing of a frame ends, the VSP2 proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in . In one mode, the VSP2 stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSP2 is stopped. When the VSP2 is started after a correct value is specified, the VSP2 starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSP2 after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSP2 downloads the

next display header as soon as the previous frame processing ends. After downloading ends, the VSP2 starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSP2 continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, Table 60.30 defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, Table 60.31 defines the header section format of a display list and Table 60.32 defines the body section format and Table 60.33 defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. Table 60.34 shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP.

Table 60.30 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i=0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSP2 keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
wait_wup	When this bit is 1, VSP2 starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0.
ignore_upd_dl	If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSP2 H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSP2 H/W at next frame of the processing which this bit is 0. This bit is available for WPF0.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPF0_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPF0_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPF0_IRQ_ENB.DFEE is set to 1), the VSP2 generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSP2 starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the

	pNext_header address specified in this display header. If this bit is set to 0, the VSP2 stops operation when one-frame processing by this display header ends. In this case, start the VSP2 through VI6_CMD0 to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP2 executes the extended display list for frame preprocessing. The VSP2 does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 60.32 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
for (i=0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. Note : Register space of VSP is 32Kbyte (0x0000 - 0x7FFC). So, set 0 to upper 17bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

Table 60.33 Format of Extended Display List Body Section

60.3.3.3 Header-less Display List Mode

The header-less display list does not have the display header listed in Table 60.31, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the section 60.2.5.1) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

60.3.3.4 Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP2 is not guaranteed.
2. Do not execute write access to the same OSD-CLUTlookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP2 is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 60.35.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same OSD-CLUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 60.35.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in section 60.2.2.
6. Manipulation and setting of the registers described in sections section 60.2.4 and 60.2.5 through a display list is prohibited.

60.3.4 Interrupt Processing

When the VSP2 module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in each WPF independently, the VSP2 has the following registers to control interrupts in each WPF.

WPF0 Interrupt Enable Registers (VI6_WPF0_IRQ_ENB)

WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA)

(Note1)

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSP2.

60.3.5 Lookup Table Settings

60.3.5.1 OSD-CLUT

For a single entry to the OSD-CLUT space (Table 60.35) of the VSP2, the OSD-CLUT data is set by a write access in the format shown in Figure 60.33.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the OSD-CLUT2 space is (offset address) + 0x4800 + 7 × 4 = (offset address) + 0x481C.

Table 60.35 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation, undefined values will be read out. VI6_STATUS shows operation status.

Table 60.35 OSD-CLUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_CLUT2_TBL	(offset address) + 0x 4800 to (offset address) + 0x 4BFC	256	RPF2

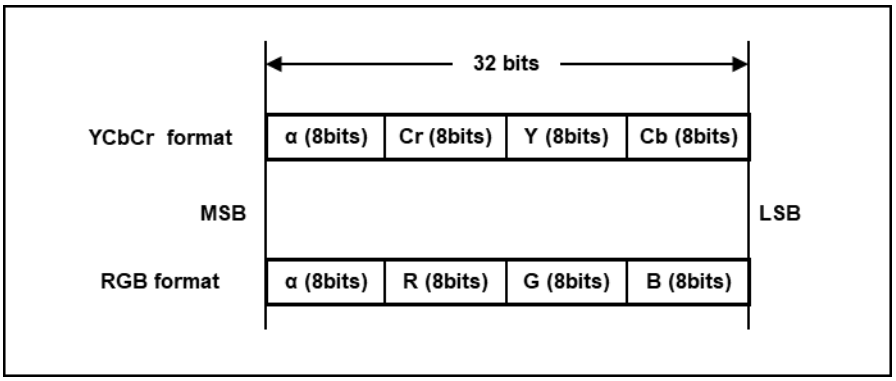

Figure 60.33 VI6_CLUT_TBL Formats

60.3.6 Linked with DU

60.3.6.1 Operation Flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to section 60.3.3.2.

Figure 60.34 to Figure 60.36 shows a procedure (register setting flow) to display image data to display panel. Setting not only VSPD registers, but also FCPV/DU registers are needed. So, see FCP User's Manual / DU User's Manual to know the contents of FCPV/DU registers mentioned in Figure 60.34 and Figure 60.36.

Figure 60.34 shows setting flow to start VSPD linked with DU. Figure 60.35 shows setting flow to update display image. Figure 60.36 shows setting flow to stop VSPD linked with DU.

Using display list with enabling next_frame_auto_start shown in section 60.3.3 is required to take the flow from Figure 60.34 to Figure 60.36.

Note: If display sync operation ([1-8] step in Figure 60.34) is set before activating the VSPD, background color specified in DU register (BPORn or DOORn) is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

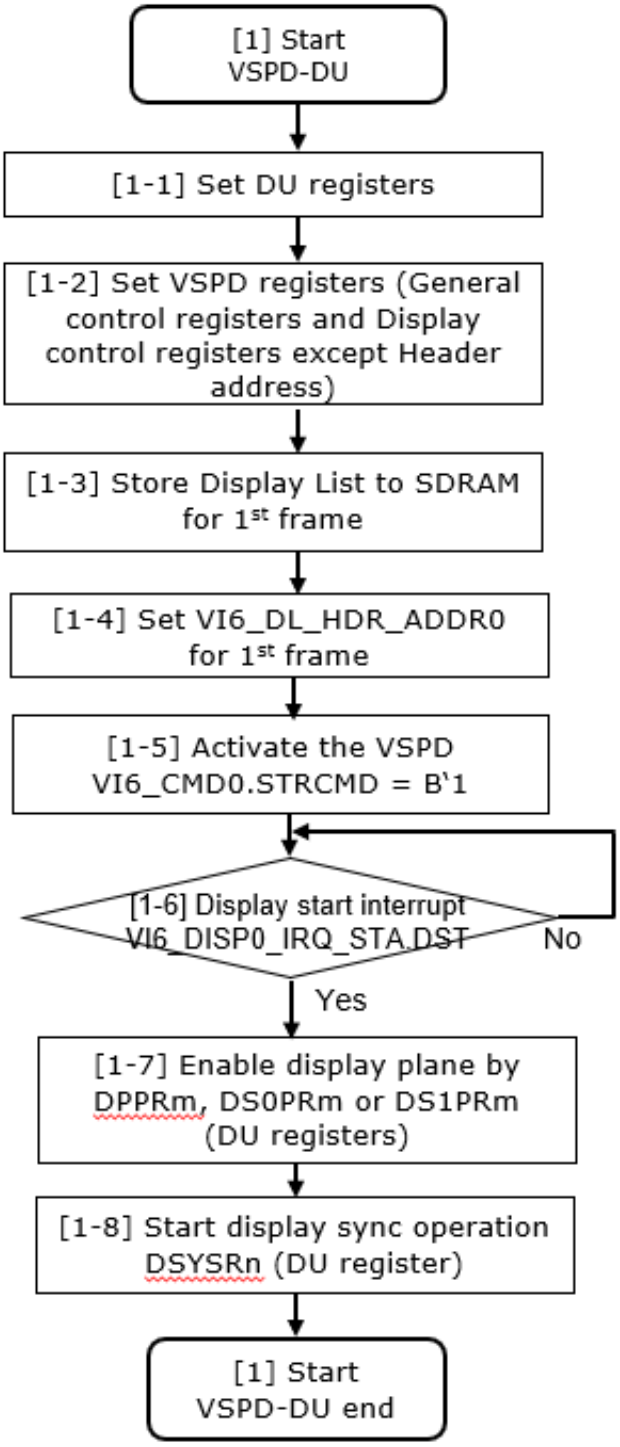

Figure 60.34 Setting flow to start VSPD linked with DU

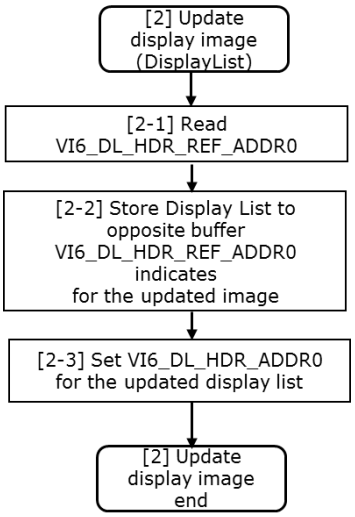

Figure 60.35 Setting flow to update display image

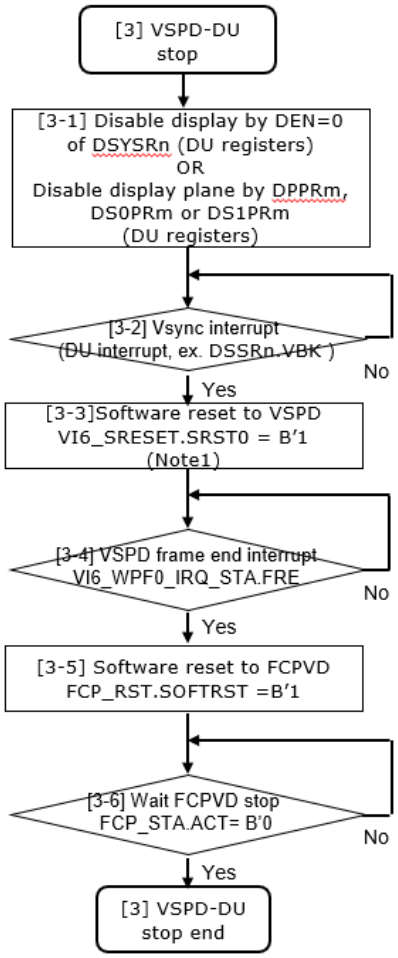

Figure 60.36 Setting flow to stop VSPD linked with DU

Note1: As shown in WPF0 Interrupt Status Registers (VI6_WPF0_IRQ_STA), FRE interrupt can occur by 3 factors. Therefore, clear the interrupt before applying software reset not to mistake FRE interrupt of finishing one frame for the FRE interrupt of completing software reset.

It is possible to update display list at any time (arbitrary timing) as shown in Figure 60.35. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSP2 is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in section 60.2.5.6, when VSP2 is reading display list from external memory (Period [A] in Figure 60.37), VI6_DL_HDR_REF_ADDR0 indicates header address of the display list referred by VSP2. When VSP2 is not reading display list from external memory (Period [B] in Figure 60.37), VI6_DL_HDR_REF_ADDR0 indicates the value of VI6_DL_HDR_ADDR0, and there is possibility that the display list is being read soon by VSP2 at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSP2-H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSP2.

[2] Set header address of new display list into VI6_DL_HDR_ADDR0.

[3] VSP2 reads display list from the external memory area pointed by VI6_DL_HDR_ADDR0 at frame start timing.

Refer also to section 60.2.5.3 and section 60.2.5.6 .

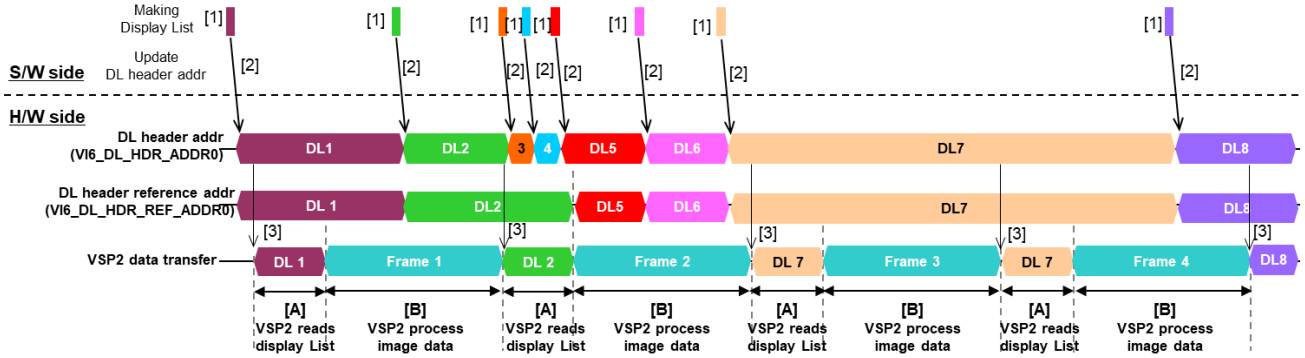

Figure 60.37 Updating display list at arbitrary timing

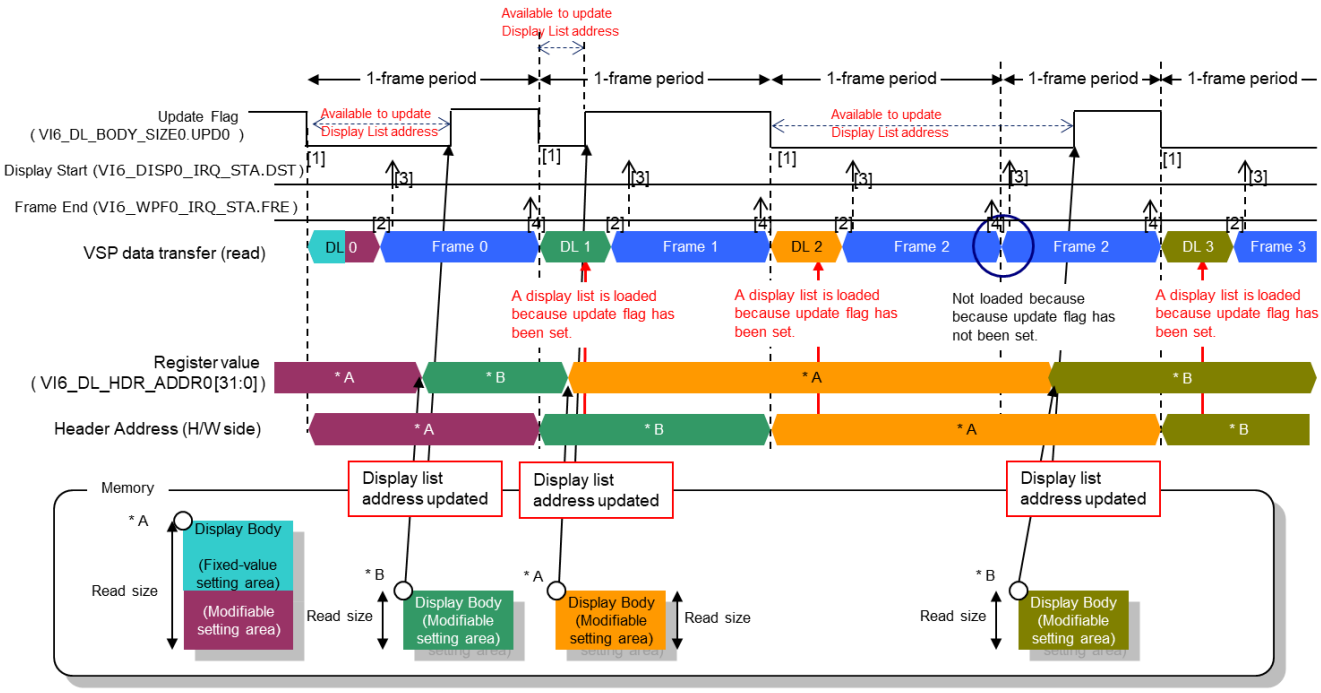
60.3.6.2 Controlling Two Register Planes Using Display Lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in section 60.3.6.1 except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in Figure 60.34. The procedure to update display list is different with Normal Display List Mode, and is described later. Figure 60.38 shows the control of two register planes using header-less display lists (see section 60.3.3.3) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.



Display list plane A: "Fixed-value settings" and “modifiable settings" are stored as a set in contiguous area A.
Display list plane B: Only the “modifiable settings" are stored in area B, which is separate from display list A.

To switch settings for every frame, modify two display list planes alternately. After every modification, update the display list address register (VI6_DL_HDR_ADDR0[31:0]) and writing 1 to update flag (VI6_DL_BODY_SIZE0.UPD0) in the VSP.
Update flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically after Header Address is loaded into H/W side.

Figure 60.38 Controlling Two Register Planes Using a Display List

The VSP2 downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSP2 downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSP2-H/W Events mentioned as [1], [2], [3] and [4] in Figure 60.38 are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSP2-H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP0_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from "[4] VI6_WPF0_IRQ_STA.FRE" to next "[3] VI6_DISP0_IRQ_STA.DST", because VSP is reading the display list for the period.

60.3.6.3 Auto Display Function (AUTO-DISP)

VSPD have AUTO-DISP function. This function allows VSPD to display latest image in triple buffer output from VIN without S/W control of triple buffer. And VSPD selects the field which should be read from TOP or BOTTOM automatically without S/W control. Outline of this function is shown in Figure 60.39. VSPD replaces source address registers with source address information stored in pre extended display list according to latest buffer information from VIN and field information from DU.

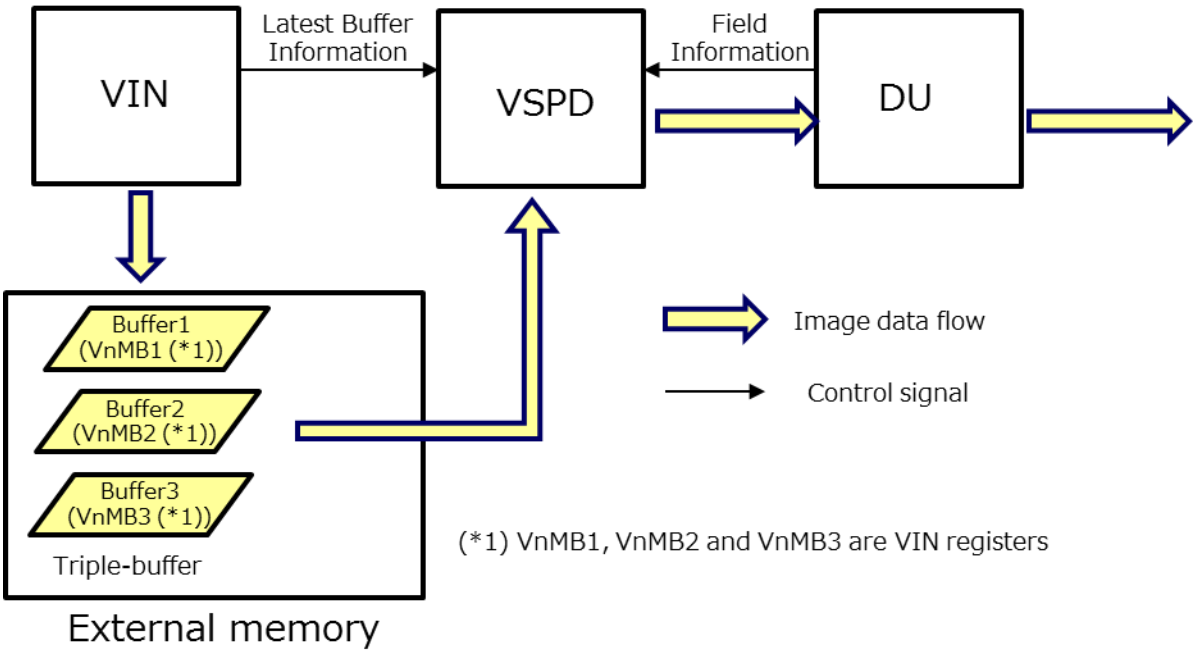


Figure 60.39 Outline of AUTO-DISP

Method to realize this function is shown below.

[1] Use Display List (Normal Display List Mode)

Register setting about display list is shown below.

VI6_DL_CTRL.DLEn = 1

VI6_DL_CTRL.NH0 = 0

VI6_DL_CTRL.CFM0 = 0

VI6_DL_CTRL.RLM0 = 0

VI6_DL_HDR_ADDR0 = <Set start address of Display list header>

[2] Use extended display list.

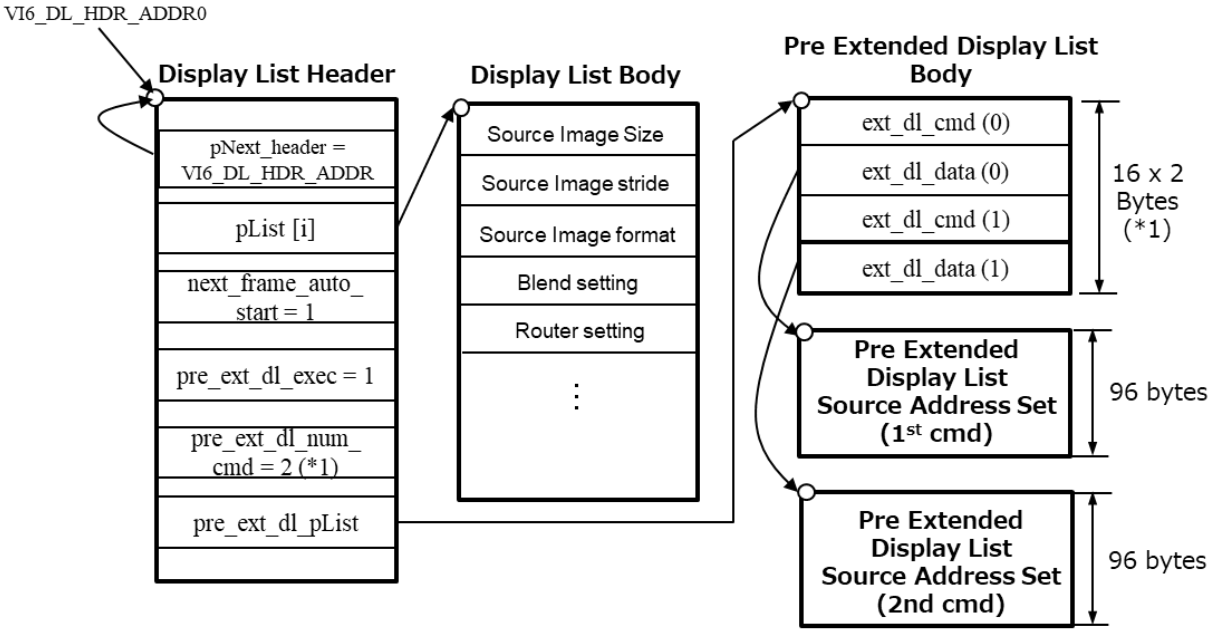
Register setting about extended display list is shown below.

VI6_DL_EXT_CTRL = H'0000 0221

[3] Contents of display list

Structure of display list to realize AUTO-DISP function is shown in blow figure. Contents of each display list is shown below.

- Display List Header: Table 60.36
- Display List Body: Prepare it in the same way with the case which AUTO-DISP is not used.
- Pre Extended Display List Body: Table 60.37
- Pre Extended Display List Source Address Set: Table 60.38



(*1) This example : Blending two images output from two channels of VIN, and displaying it.

Figure 60.40 Structure of DisplayList of AUTO-DISP

Table 60.36 Display List Header for AUTO-DISP

Syntax	Value
num_list_minus1	Set these bits in the same way with the case which AUTO-DISP is not used.
num_bytes [i]	Set these bits in the same way with the case which AUTO-DISP is not used.
pList [i]	Set these bits in the same way with the case which AUTO-DISP is not used.
pNext_header	Set same address of VI6_DL_HDR_ADDR0 for progressive display. See Figure 60.42 and Figure 60.43 for interlace display. Be sure to specify an address aligned with a 8-byte boundary (lower-order three bits are 0).
current_frame_int_enable	0
next_frame_auto_start	1
pre_ext_dl_exec	1

post_ext_dl_exec	0
pre_ext_dl_num_cmd	Set the number of connected VIN channels <1 to 4>
pre_ext_dl_pList	Set start address of extended display list body Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
post_ext_dl_num_cmd	0
post_ext_dl_pList	0

Table 60.37 Pre Extended Display List Body for AUTO-DISP

Bit String	bits	Symbol	value
ext_dl_cmd	63 to 40	-	0
	39 to 32	Opcode	2 (AUTO_DISP is selected)
	31 to 14	-	0
	13 to 11	VIN ch no	Set VIN channel number <0 ~ 3> 0: for VIN0 1: for VIN1 2: for VIN8 3: for VIN9 4~7: Reserved
	10 to 8	RPF ch no	Set RPF channel number <0 ~ 4>
	7 to 3	-	0
	2	1st field	0: TOP field first (DSMRn.ODEV=1) 1: BOT field first (DSMRn.ODEV=0)
	1	Correction	Set 0 for progressive display. See Figure 60.43 and Figure 60.44 for interlace display.
	0	Int	0: Progressive display 1: Interlace display
ext_dl_data	63 to 32	pAddres_set	Set start address of Source Address Set Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
	31 to 0	Reserved	0

Table 60.38 Pre Extended Display List Source Address Set for AUTO-DISP

Address	Contents
ext_dl_data [63:32] + 0	Buffer1 TOP field address of Y/RGB

ext_dl_data [63:32] + 4	Buffer1 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 8	Buffer1 TOP field address of C0
ext_dl_data [63:32] + 12	Buffer1 BOTTOM field address of C0
ext_dl_data [63:32] + 16	0
ext_dl_data [63:32] + 20	0
ext_dl_data [63:32] + 24	0
ext_dl_data [63:32] + 28	0
ext_dl_data [63:32] + 32	buffer2 TOP field address of Y/RGB
ext_dl_data [63:32] + 36	buffer2 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 40	buffer2 TOP field address of C0
ext_dl_data [63:32] + 44	buffer2 BOTTOM field address of C0
ext_dl_data [63:32] + 48	0
ext_dl_data [63:32] + 52	0
ext_dl_data [63:32] + 56	0
ext_dl_data [63:32] + 60	0
ext_dl_data [63:32] + 64	buffer3 TOP field address of Y/RGB
ext_dl_data [63:32] + 68	buffer3 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 72	buffer3 TOP field address of C0
ext_dl_data [63:32] + 76	buffer3 BOTTOM field address of C0
ext_dl_data [63:32] + 80	0
ext_dl_data [63:32] + 84	0
ext_dl_data [63:32] + 88	0
ext_dl_data [63:32] + 92	0

How VSPD replaces source address registers is described as below. VSP reads extended display list body specified in Table 60.37 and source address set specified in Table 60.38 during the term of “Ext-DL” specified in Figure 60.41. And VSPD replaces source address registers by step 1 to step 7 as below.

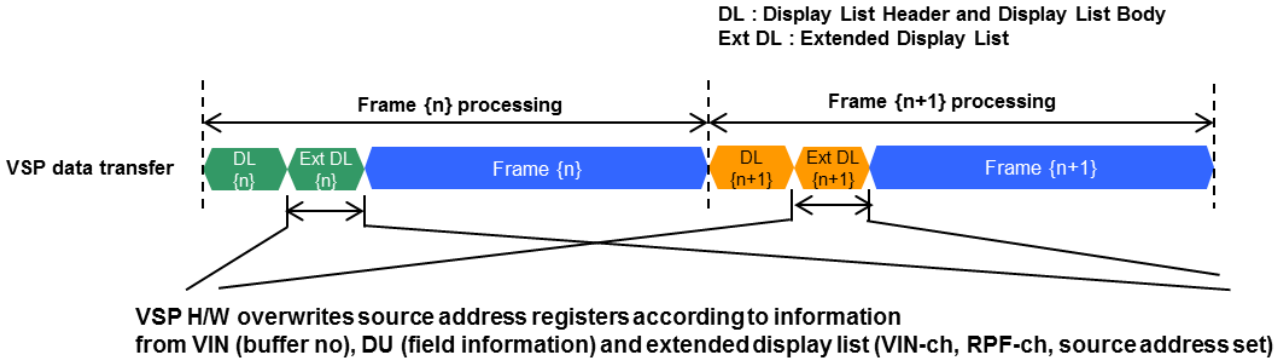


Figure 60.41 Timing to read extended display list

1. VSP reads extended display list body from external memory
2. VSP gets latest buffer information from VINs.

Note: information is updated at only 1st field in case of interlace.

3. VSP gets field information from DU.
4. VSP reads address information of the latest buffer of the VIN ext_dl_cmd [13:11] indicates from source address set specified in Table 60.38.
5. VSP selects source address from TOP (*1) address or BOTTOM (*1) address in source address set according to ext_dl_cmd [2:0].

   Note: Set start address of progressive image in both TOP address bits and BOTTOM address bits in extended display list source address set in case of progressive display.
6. VSP overwrites source address registers for the RPF specified in ext_dl_cmd [10:8] at source address read from external memory.

   Note: C1 address and Alpha address registers for the RPF are overwritten by 0 value for the RPF specified in ext_dl_cmd [10:8].
7. VSP repeats step 4 to step 6 for number of times of pre_ext_dl_num_cmd.

(*1) In this document, TOP field is used as field image including 0th, 2nd, 4th … line. BOTTOM field is used as field image including 1st, 3rd, 5th … line.

[4] Progressive and Interlace

There are restrictions about combination of interlace and progressive for input/output as shown in Table 60.39. When VIN captures interlace image, DU should display image in interlace method. When VIN captures progressive image, DU should display image in progressive method.

[4-1] Particular restriction for VIN registers

- Set full interlace mode in VIN register (VnMC.IM[1:0]=3) in case of interlace display.

- No particular restriction is required in case of progressive display.

[4-2] Particular restriction for DU registers

- No particular restriction is required

[4-3] Particular setting and status of VSP

- Set <2 x source stride> to source stride register (VI6_RPFn_SRCM_PSTRIDE) in case of interlace display.

- VI6_STATUS.FLDST0 in section 60.2.4.11 indicates field information of last displayed frame.

[4-4] The number of Display List Header and Pre Extended Display List body

One display list header and one pre extended display list body is needed for progressive display. All frames can be controlled by one display list. Set same value of VI6_DL_HDR_ADDR0 to pNext_haeder.

Field signal from DU is not stable in first two fields. Therefore, to display first two fields by appropriate field (TOP or BOTTOM), set bit1 in ext_dl_cmd as shown in Figure 60.42 for TOP field first and Figure 60.43 for BOTTOM field first. Three display list headers and three pre extended display list bodies are needed to adjust first two fields for interlace display.

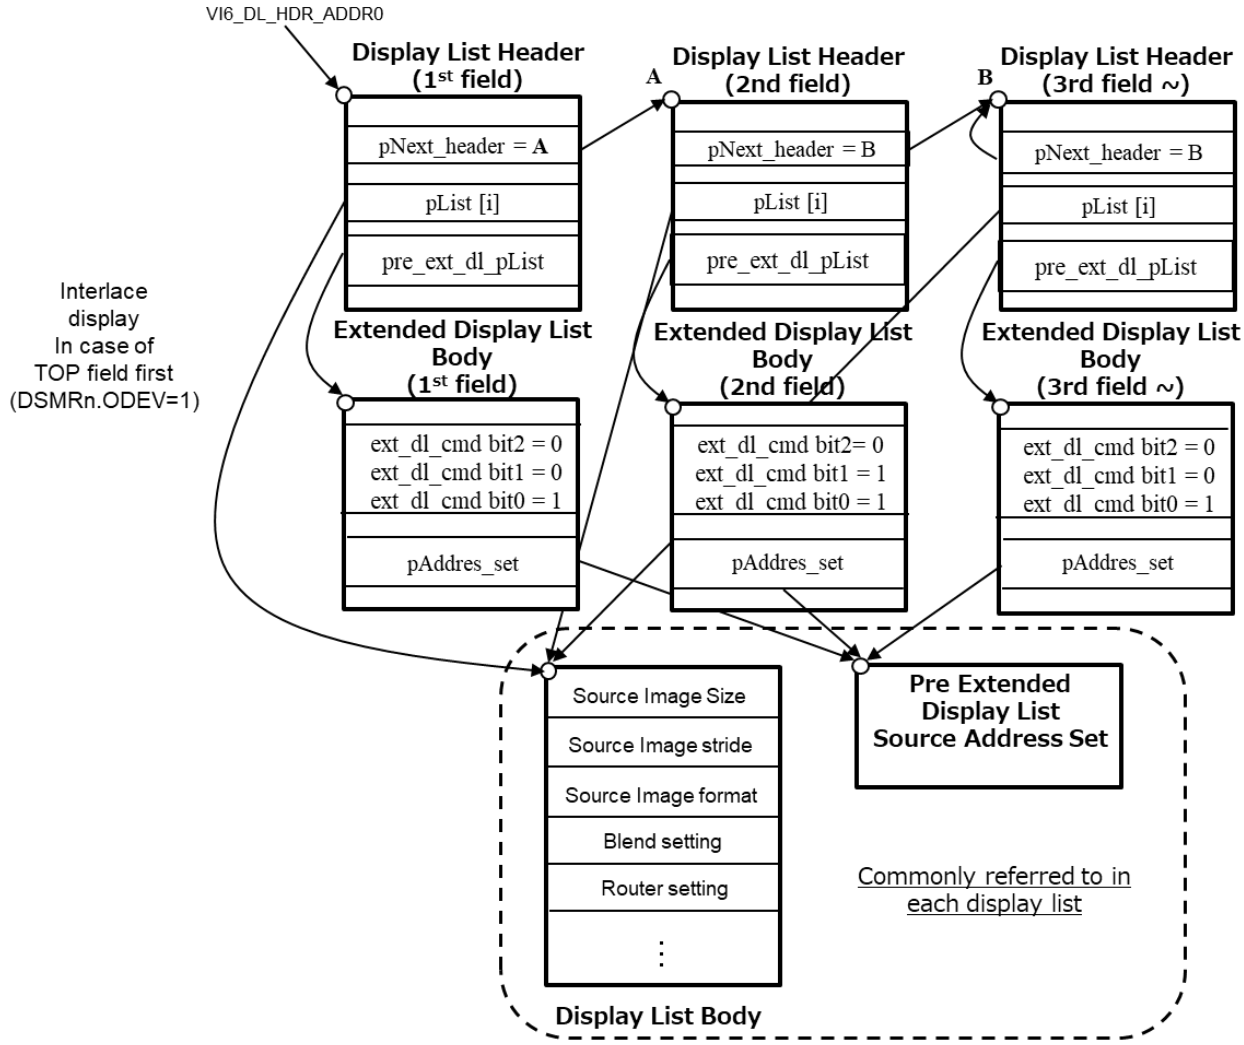

Figure 60.42 Correcting first two fields in case of TOP field first

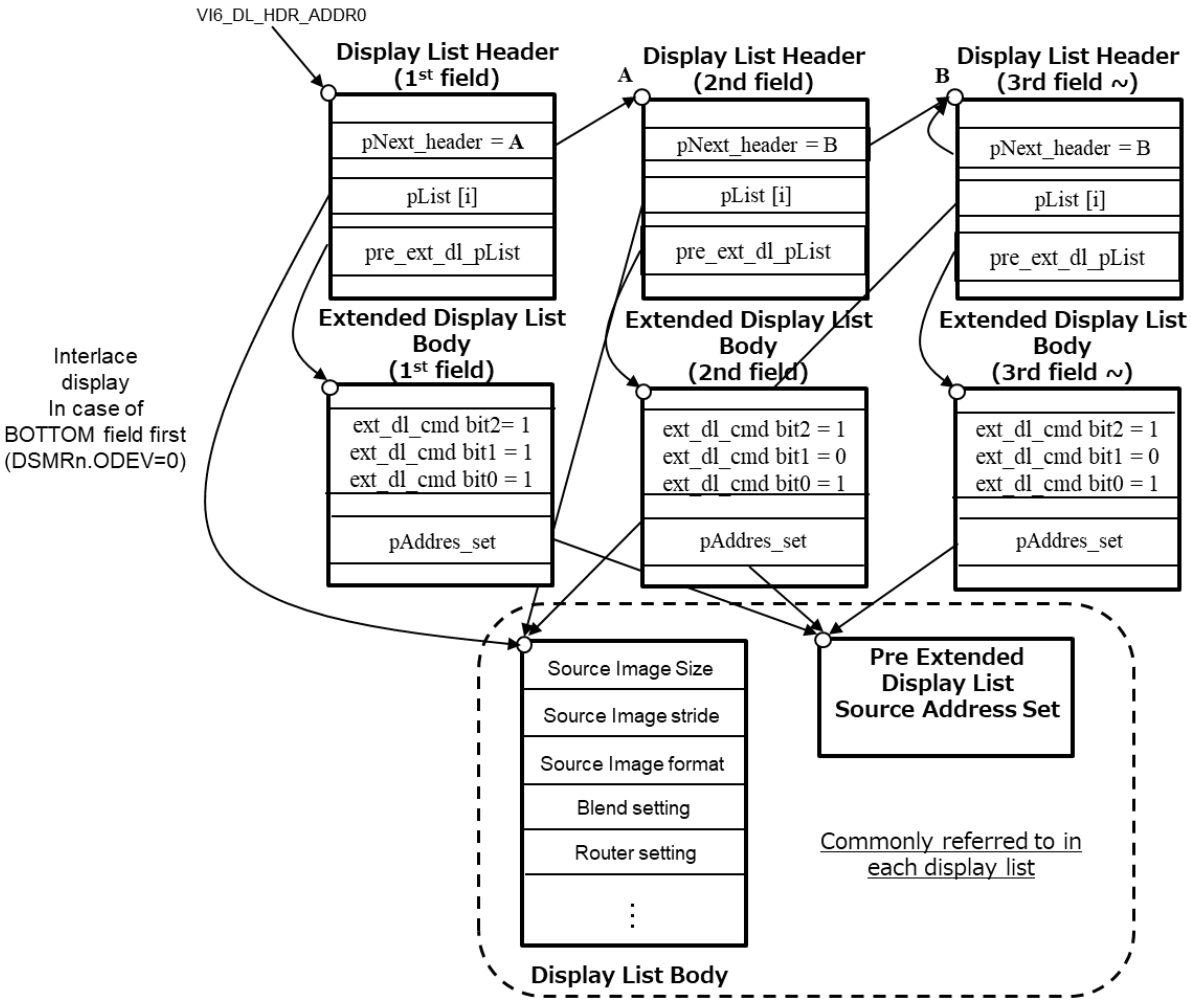

Figure 60.43 Correcting first two fields in case of BOTTOM field first

[5] Startup image before first image is output from VIN

VSP reads image data in buffer3 address specified in extended display list source address set until VIN completes writing first frame's image into buffer1. Therefore, prepare startup image in buffer3. This image is overwritten after VIN is activated.

[6] Procedure of activation

Activate VIN with continuous frame capture mode (VnFC.CC=1). After that, activate VSPD and DU by procedure of Figure 60.34. Activating VIN and VSPD should be after initializing both VIN and VSPD. The operation is not guaranteed if VIN is initialized during VSPD operation.The reverse is also true.

[7] Restrictions

There are several restrictions as shown below.

[7-1] Restriction about combination of interlace and progressive for input/output

There are restriction about combination of interlace and progressive for input/output as shown in below table.

Table 60.39 Restriction about combination of interlace and progressive for input/output

Video IN	Display	Support
Progressive	Progressive	√
Progressive	Interlace	
Interlace	Progressive	
Interlace	Interlace	√

[7-2] Restriction about frame rate of input and output

Frame rate of VIN should be equal to or smaller than frame rate of display.

[7-3] Restriction about selecting VIN channel.

There is following restriction about selecting VIN channel.

VSPD can read VIN0, VIN1, VIN8, VIN9 output image when this function is used.

There is no restriction about selecting VIN channel.

60.3.7 Start Reservation for VSPX

This section shows sequence of software when start reservation is used. The way of start reservation is for VSPX.

Software can reserve starting VSPX processing of one frame is completed. Start reservation can remove interrupt response time and software overhead by reserving execution of VSPX before completion of previous frame. Use frame end interrupt (VI6_WPF0_IRQ_ENB.FRE) for VSPX.

(a) below shows software sequence of start reservation.

(b) below shows software sequence to manage the number of interrupt generation.

(a) Software sequence of start reservation

[1] ~ [9] shown in shows S/W flow to set registers for start reservation of VSPX

[1] Wait until 0 is read from VI6_CMD0.STRCMD to confirm that starting WPF0 is not reserved.

[2] Wait until 0 is read from VI6_STATUS.SYS0_ACT to confirm WPF0 is IDLE.

[3] Set registers with two planes for frame 0 (1st frame) except DLH (Display List Header) address. Vi6_DL_HDR_ADDR0 has two planes.

[4] Set header address of display list for frame 0 to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSP2 to indicate downloading registers with two planes is reserved.

[5] Activate WPF0 for frame 0 (1st frame) by writing H'0000 0001 to VI6_CMD0.

If next frame's execution of VSPX is needed, go to step [6].

[6] Wait until start reservation is accepted and registers with two planes are downloaded into H/W side. If 0 is read from VI6_CMD0, it means that starting WPF0 is accepted and register with two planes are downloaded into internal registers H/W side refers.

[7] Set registers with two planes for next frame (fr{m}) except DLH (Display List Header) address.

[8] Set header address of display list for next frame (fr{m}) to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSP2 to indicate downloading registers with two planes is reserved.

[9] Reserve activating WPF0 for next frame (fr{m}) by writing H'0000 0001 to VI6_CMD0.

If next frame's execution of VSPX is needed, go to step [6].

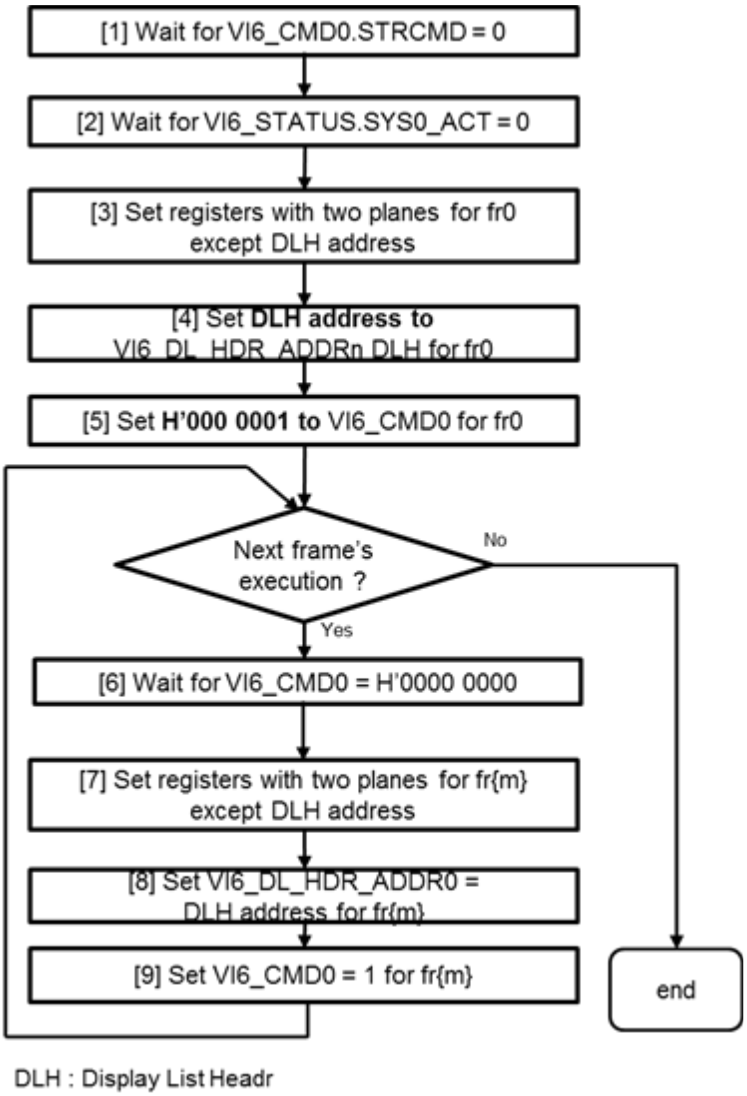

Figure 60.44 Flow chart of setting registers by S/W in case of VSPX start reservation

(b) Software sequence to manage the number of interrupt generation.

The way of using interrupt is shown below.

[1] Set 1 to the VI6_WPF0_IRQ_ENB.FREE to use frame end interrupt (VI6_WPF0_IRQ_STA.FRE)

[2] Write 0 to VI6_WPF0_IRQ_STA.FRE to clear status after interrupt processing as shown in Figure 60.45.

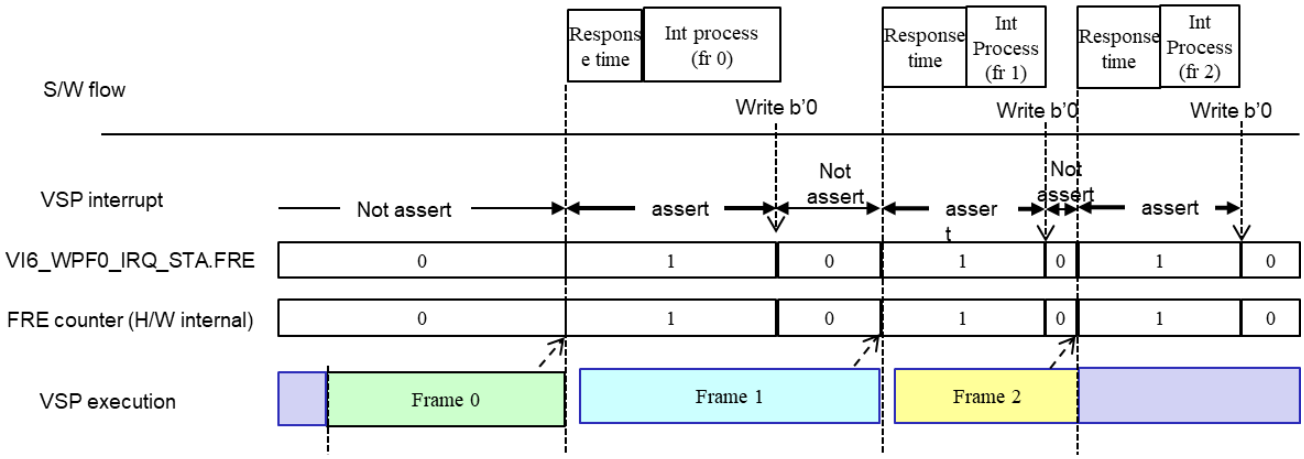

Figure 60.45 Timing of interrupt processing by S/W in case of VSPX start reservation (Case1)

Be careful following points as shown in Figure 60.46.

[1] Set 0 to VI6_WPF0_IRQ_STA.FRE for the number of interrupt generation to clear VI6_WPF0_IRQ_STA.FRE.

[2] The VSPX H/W can count at most two of interrupt generation. If three times of interrupts occur before clearing the interrupt factor, interrupt counter overflows. Therefore, wait to reserve starting VSPX of frame {n+2} until interrupt factor of the frame {n} is cleared.

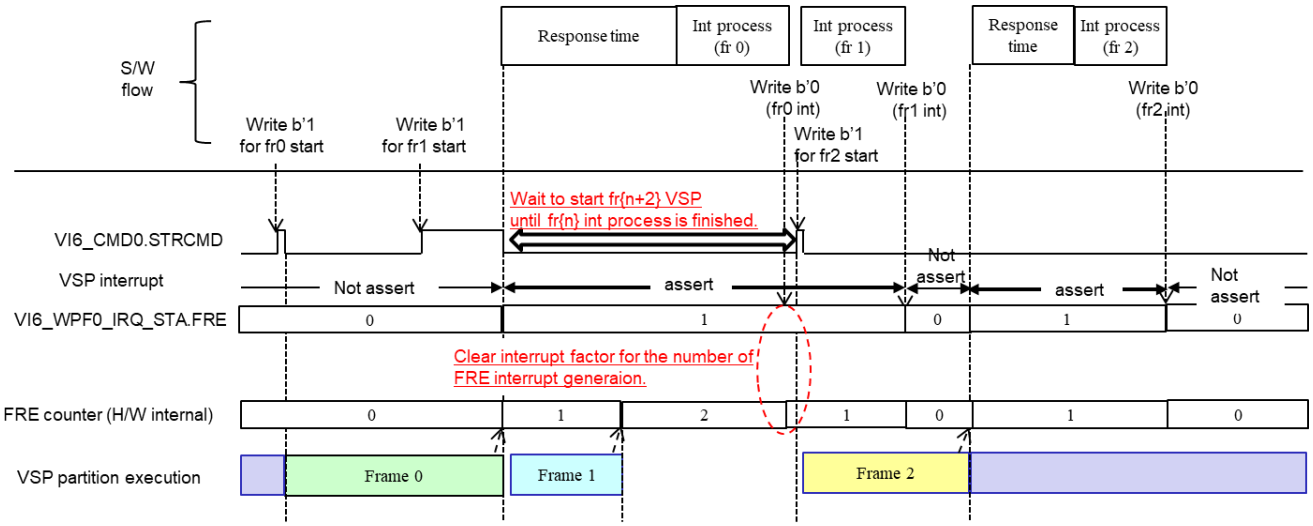

Figure 60.46 Timing of interrupt processing by S/W in case of VSPX start reservation (Case2)

60.3.8 VSPX Setting and Operation

60.3.8.1 VSPX function and restriction

VSPX inputs RAW image and ISP-Config data from external memory and sends to ISP. In other word, VSPX functions as a bus interface for data input of ISP. There are following restrictions.

- RAW image
  - Up to 2 RAW image data can be read to support multi exposures.
  - RPF0, RPF1 can be used for reading RAW image. Use RPF0 in case of 1 RAW image, and use RPF0 and RPF1 in case of 2 RAW images.
  - RAW8/RAW10/RAW12/RAW14/RAW16/RAW20/RAW24 can be read for RPF0
  - RAW8/RAW10/RAW12 canbe read for RPF1
  - All RPFs must have the same image size.
- ISP Config data
  - It can be transferred in the same frame as RAW image.
  - RPF0 can be used for reading ISP config data.
  - VSPX reads the number of bytes corresponding to the horizontal size x vertical size as the ISP config data.
  - Set 19 (4 byte/pix) to VI6_RPF0_INFMT.RDFMT. VSPX transfers the number of bytes equal to VI6_RPF0_SRC_BSIZE.BHSIZE x VI6_RPF0_SRC_BSIZE.BVSIZE x 4 to the ISP as ISP-Config data.
  - Set 19 to VI6_IIF_CTRL.
  - When transferring ISP-Config data, the horizontal size (VI6_RPF0_SRC_BSIZE.BHSIZE, VI6_RPFn_SRC_ESIZE.EHSIZE) should be set in 2-pixel units. If the required ISP Config data is less than the size calculated by VI6_RPF0_SRC_BSIZE.BHSIZE x VI6_RPF0_SRC_BSIZE.BVSIZE x 4, store dummy data in the latter half. For details of format of ISP Config data, refer to the ISP manual.
  - ISP Config data and RAW data cannot be transferred to ISP in the same frame of VSPX processing. Frame of VSPX for RAW data transfer should be executed after ISP-Config data transfer frame. By setting 1 to next_frame_auto_start in Display List Header for ISP-config frame, it is possible for S/W to active VSPX only once per two frames.

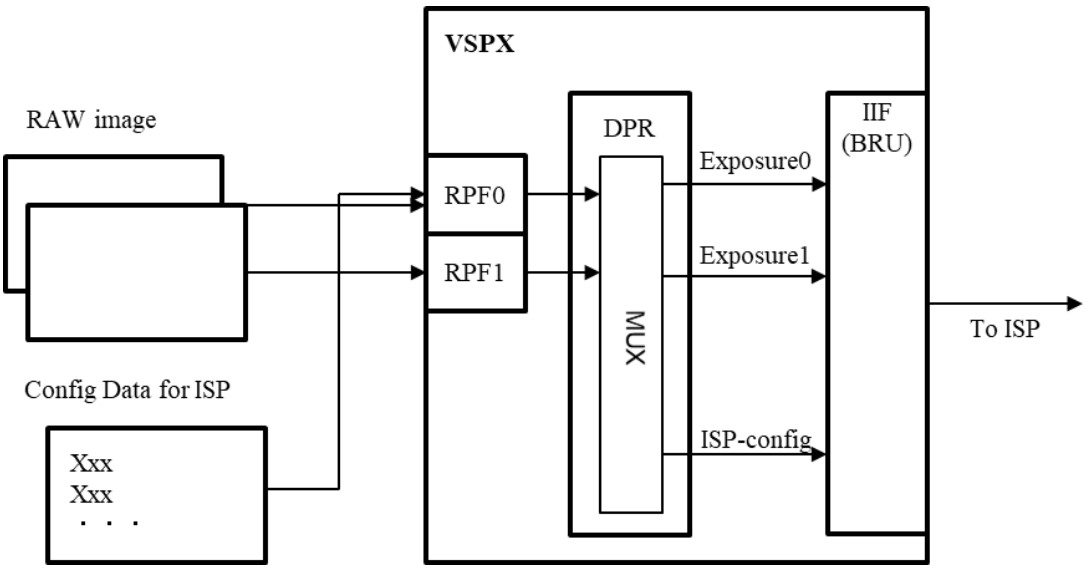

Figure 60.47 VSPX data flow

In the usecase where the output image from VIN to the memory is input to VSPX, VSPX can start a frame processing after waiting for the wake-up assertion from VIN.

- Features of VIN wake-up
  - Wake-up counter per each VIN channel (Total 16 channels VIN 0 to VIN15)
  - Enabling/disabling wake-up assertion of VIN is in the VIN register
  - When wait_wup in display list is 1, VSPX waits for the wake-up from the VIN channel enabled by corresponding bit in VI6_DL_VIN_WUPEN0, and start the frame operation.
    - Ex. If wait_wup is 1 and VI6_DL_VIN_WUPEN0.WE3 is 1, VSPX waits for assertion of VIN3 wake-up, and start the frame operation after that.
  - The maximum outstanding number of wake-up is 15 (4-bit wake-up counter)
    - Wake-up counter increments by assertion of wake-up from each VIN.
    - Wake-up counter decrements when the processing of the frame in which wait_wup in display list is 1 and the corresponding bit of VI6_DL_VIN_WUPEN0 is set to 1 is started.
  - Error detection
    - Wake-up error (VI6_WUP0_IRQ_STA.VWERn) occurs when wake-up counter (VI6_DL_VIN_WUPCNT0.WUPCNTn / VI6_DL_VIN_WUPCNT1.WUPCNTn) is 15 and wake-up from VINn asserts. Wake-up cannot be recognized correctly when error occurs, so user needs to control VSPX so that this error does not occur.
    - Ignore any errors other than the VIN channel that output image that VSPX inputs. Interrupt can be masked by the interrupt enable register.

60.3.8.2 VSPX Related Registers

This section shows registers that can be set in VSPX. For VSPX, the registers shown in Table 60.40 can be set. All registers except Table 60.40 are reserved area for VSPX.

Table 60.40 Registers VSPX supports

Classification	Register Name	Restriction
General Control Registers	VI6_CMD0	
	VI6_CLK_DCSWT	
	VI6_SRESET	
	VI6_STATUS	
	VI6_WPF0_IRQ_ENB	UNDE bit cannot be used.
	VI6_WPF0_IRQ_STA	UND bit cannot be used.
	VI6_WUP0_IRQ_ENB	
	VI6_WUP0_IRQ_STA	
	VI6_WPF0_WDT	
Display List Control Registers	VI6_DL_CTRL	
	VI6_DL_HDR_ADDR0	
	VI6_DL_SWAP0	
	VI6_DL_BODY_SIZE0	
	VI6_DL_HDR_REF_ADDR0	
	VI6_DL_VIN_WUPCNT0	
	VI6_DL_VIN_WUPCNT1	
	VI6_DL_WUPCNT0	
DPR Control Registers (*1)	VI6_DPR_RPF0_ROUTE	Set D'23 to RT [5:0] (BRUin0/Exposure0) when RPF0 reads raw-image. Set D'26 to RT [5:0]: (BRUin3/ISP-Config) when RPF0 reads ISP-config.
	VI6_DPR_RPF1_ROUTE	Set D'24 to RT [5:0] (BRUIN1/Exposure1) when RPF1 read raw-image..
	VI6_DPR_WPF0_FPORCH	Set D'5 to FP_WPF0 [5:0]
	VI6_DPR_BRU_ROUTE	Set D'56 to RT [5:0] (WPF0). Set D'1 to IIFSEL.
RPF Control Registers (RPF0, 1)	VI6_RPFn_SRC_BSIZE (n=0, 1)	Set same size for all RPFs.
	VI6_RPFn_SRC_ESIZE (n=0, 1)	It should be same setting with VI6_RPFn_SRC_BSIZE
	VI6_RPFn_INFMT (n=0, 1)	Set 0 (RAW 1-byte/pix), 6 (RAW 2-byte/pix) or 19 (RAW 4-byte/pix) to RDFMT of RPF0 for RAW data. Set 0 (RAW 1-byte/pix) or 6 (RAW 2-byte/pix) to RDFMT of RPF1.

		Set 19 to RDFMT of RPF0 for ISP config data. All bits except RDFMT are reserved bits.
	VI6_RPFn_DSWAP (n=0, 1)	All bits except P_LLS, P_LWS, P_WDS and P_BTS are reserved bits.
	VI6_RPFn_ALPH_SEL (n=0, 1)	Set H'0000 0000 in the register.
	VI6_RPFn_SRCM_PSTRIDE (n=0, 1)	
	VI6_RPFn_SRCM_ADDR_Y(n=0, 1)	
IIF Control Registers	VI6_IIF_CTRL	Set 0x13 in the register before starting VSPX
WPF Control Registers (WPF0)	VI6_WPF0_SRCRPF	All bits except RPF0_ACT [1:0] and RPF1_ACT [1:0] are reserved bits.

(*1) IIF is a function of BRU, and works by setting 1 to VI6_DPR_BRU_ROUTE.IIFSEL. Therefore, the BRU must be connected to the DPR to use IIF.

60.3.8.3 Operation in case of using wake-up of VIN

The figure below shows the connection of the VIN wake-up signals. Wake-up signals are shared by multiple VSPX and other modules like IMR. In wake-up control, the operation method in the case of Multi-Exposure and the case of Multi-Sensor is shown below. There is also a use-cause that wake-up asserts at a specific vertical position on the image (vertical segmentation). The operation method at the vertical segmentation is described in section 60.3.8.3.

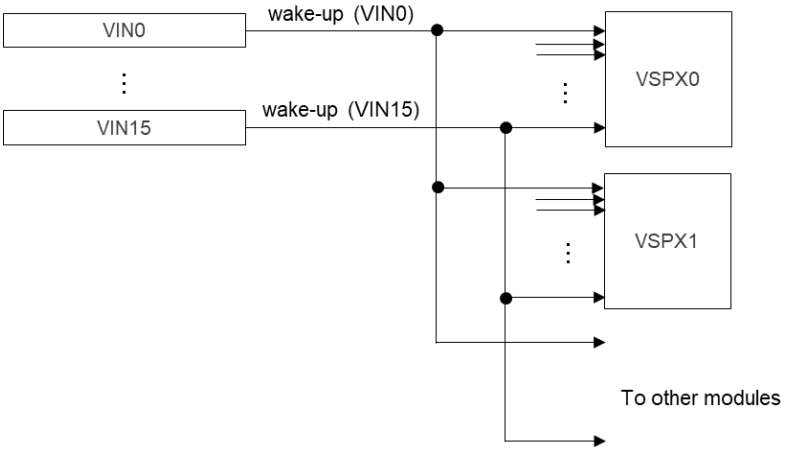

Figure 60.48 wake-up connection

The startup method for processing the images output from two sensors via VIN in a time-sharing method using one VSPX is explained. As an example, one sensor (sensor0) is a multi-exposure of VIN0, VIN1 and VIN2, the other sensor (sensor1) is the case of single-exposure of VIN7.

- Settings before operation (sensor0)

  1. Set wake-up related registers of VIN0, VIN1, and VIN2. It is also possible to set wake-up related registers of only the VIN that memory output is completed lastly. Refer to VIN User's Manual related to VIN registers.

  2. Clear error status of VWER and wake-up counters about VIN0, VIN1 and VIN2

     1.1 VI6_WUP0_IRQ_STA = 32'H 0000 FFF8
     (Clear VWER status of VIN0, VIN1 and VIN2, and keep other VIN wake-up status)
     R. VI6_DL_VIN_WUPCNT0 = 32'H FFFF F000
     (Clear wake-up counter of VIN0, VIN1 and VIN2, and keep other VIN wake-up counter)

  3. Enable interrupt status of VWER of VIN0, VIN1 and VIN2. Because wake-up signals are common between each VSPX and other modules like IMR, wake-up counter of other VIN may increment by the VIN's timing. Therefore, disable interrupt enable of VWER for other VIN channels unrelated to the VSPX.

     3.1 Set 1 to VWER0E, VWER1E and VWER2E in VI6_WUP0_IRQ_ENB.

- Settings for 1-frame processing (sensor0)

  1. Enable waiting wake-up of VIN0, VIN1 and VIN2. Then VSPX waits for wake-up of VIN0, VIN1 and VIN2 before starting one frame processing.

     1.1 VI6_DL_VIN_VIN_WUPEN0 = 32'H 0000 0007

  2. Set 1 to wait_wup in display list header to wait wake-up

- Settings before operation (sensor1)

1. Set wake-up related registers of VIN7. Refer to VIN User's Manual related to VIN registers.

2. Clear error status of VWER and wake-up counters about VIN7

   1.2 VI6_WUP0_IRQ_STA = 32'H 0000 FF7F
   (Clear VWER status of Vin7, and keep other VIN wake-up status)
   s. VI6_DL_VIN_WUPCNT0 = 32'H 0FFF FFFF
   (Clear wake-up counter of VIN7, and keep other VIN wake-up counter)

3. Enable interrupt status of VWER of VIN7. Because wake-up signals are common between each VSPX and other modules like IMR, wake-up counter of other VIN may increment by the VIN's timing. Therefore, disable interrupt enable of VWER for other VIN channels unrelated to the VSPX.

   3.1 Set 1 to VWER7E in VI6_WUP0_IRQ_ENB.

- Settings for 1-frame processing (sensor1)

  1. Enable waiting wake-up of VIN7. Then VSPX waits for wake-up of VIN0, VIN1 and VIN2 before starting one frame processing.

     1.1 VI6_DL_VIN_VIN_WUPEN0 = 32'H 0000 00080

  2. Set 1 to wait_wup in display list header to wait wake-up

- Initialization

  If VSPX is initialized, the wake-up information of all channels (VIN0 to 15) is initialized.

60.3.8.4 Operation of segment processing.

(1) Segment Processing (Vertical)

VIN and VSPX have a function of wake up notification. VIN can notify VSPX of irburstg irburs the specified number of lines by wake up signal without S/W intervention.VSPX waits for the notification from VIN and starts to read the number of lines after the wake up notification. VSPX can read image data output from VIN by shorter latency than one frame by wake up notification as shown in Figure 60.49.

When "Wake up" function is used, it is necessary to process input image data by dividing the image in the vertical direction. The way of dividing in the vertical direction depends on the setting of "Wake Up Line" in VIN register. Hereafter, one area after dividing one frame's image in the vertical directions is called segment. When processing per segment units, display list with header described in section 60.3.3 has to be used.

An example of dividing one frame image into segments is shown in Figure 60.49. Divide one frame in the vertical direction by wake up line set in VIN register like Figure 60.49. Overlapping pixels in adjacent segments may be needed as shown in Figure 60.49. Regarding the number of pixels of overlapping pixels, refer to ISP User's Manual.

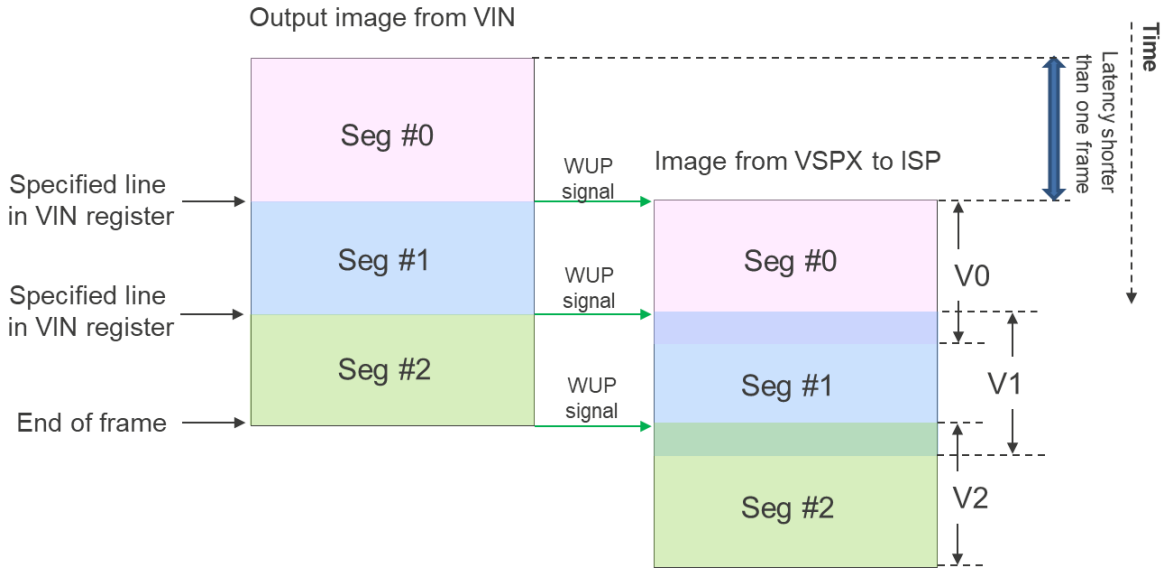

Figure 60.49 Wake up notification and dividing one frame of VSPX input image into segments (Vertical)

The setting method of display list of each vertical segment is shown in Figure 60.50. Vertical segment processing needs the following features as shown in Figure 60.51.

[1] S/W only activate VSPX once per frame

[2] VSPX waits for the wake up notification from VIN before starting data processing

[3] Frame end interrupt asserts only once in one frame

For realizing the features, set registers related to display list as below.

(1) Store all segments' display list in external memory.

(2) In order to get better performance, don't set registers which are not updated per segment in display body from 2nd segment to last segment.

(3) Set 1 to next_frame_auto_start in display list header except last segment. Then S/W has to activate VSPX only once for 1st segment.

(4) Set 1 to current_frame_int_enable in display list header for only last segment. Set H'0000 0002 to VI6_WPF0_IRQ_ENB to enable Display List Frame End (DFE) interrupt and to disable Frame End (FRE) interrupt. Then DFE interrupt occurs after all segments' processing is finished by VSPX-H/W.

(5) Set 1 to wait_wup in display list header. Segment with wait_wup=1 waits for processing to start until wake up signal from VIN asserts.

(6) Set below to VI6_DL_CTRL

- VI6_DL_CTRL.DLE0 = 1 (Use display list)
- VI6_DL_CTRL.NH0 = 0 (Use Header Mode)
- VI6_DL_CTRL.RLM0 = 1 (Display List Header Address <VI6_DL_HDR_ADDR0> is not downloaded into H/W side at segment boundary)

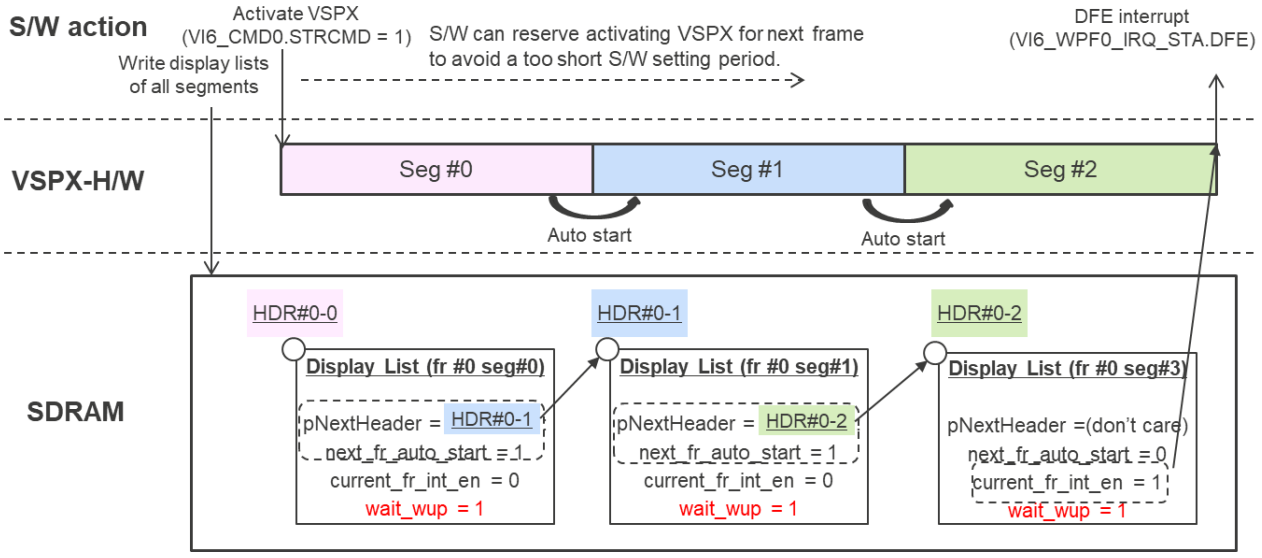

Figure 60.50 Method of Display List for segment (Vertical)

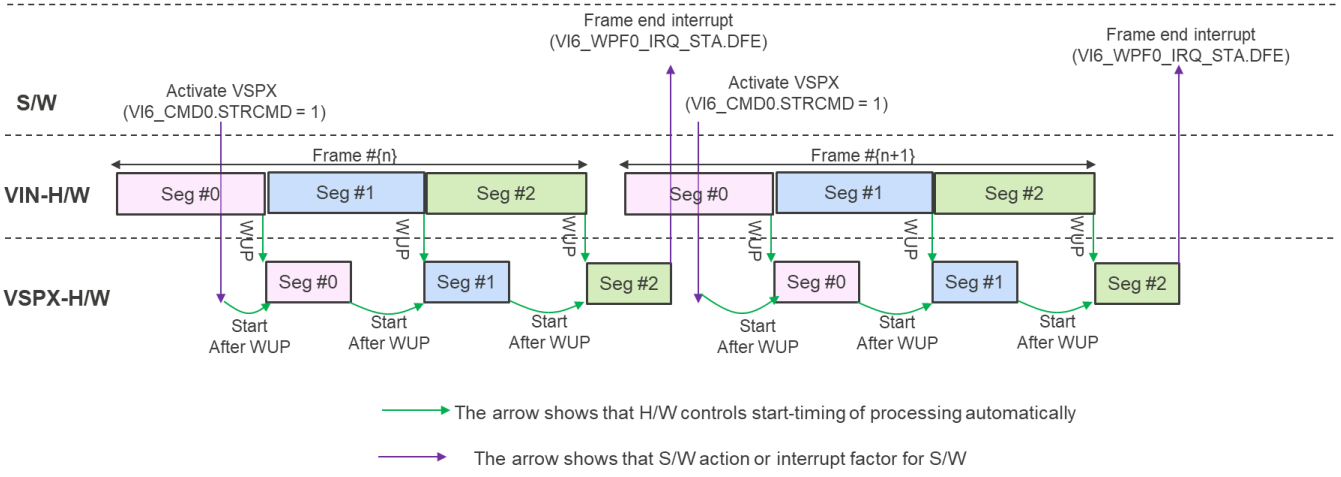

Figure 60.51 Processing flow of segment (Vertical)

(2) Operation flow

Operation Flow in case of segment processing is shown below.

[1] Start procedure

1. Set 0 to relevant bit in VI6_WUP0_IRQ_STA and VI6_DL_VIN_WUPCNT[0-1]. (*1)
2. Activate ISP. Then the ISP waits for VSPX to output first pixel to ISP.
3. Stor all display lists of all segments of one frame in external memory.
4. Read VI6_CMD0.STRCMD. If VI6_CMD0.STRCMD is 0, S/W can activate VSPX by VI6_CMD0.STRCMD.
5. Activate VSPX.
6. Activate VIN by continuous frame capture mode. (*1)

7. Waits for VIN to assert frame end interrupt. (*1) (*2)
8. Repeat step 3 to 5 per one frame.

[2] Stop procedure

1. Stop ISP after receiving VSPX frame end interruption corresponding to last activation of VSPX. Then, the ISP stop the operation.
2. Stop VIN. (*1)

(*1) Take step 1, 6 and 7 of start procedure and step 2 of stop procedure only when wake up notification is used.

(*2) Since step 6 depends on the use case and S/W structure, this procedure can be deleted depending on the use case and S/W structure.

60.3.8.5 Restrcition in Case of VSPX Operation

Software reset (VI6_SRESET.SRST0) cannot be applied to ensure data transfer to ISP.

60.4 Usage Notes

60.4.1 Assignment in Memory Space

Make sure that VSP2 register space shall be mapped to Non-Cache region.

60.4.2 Limitations on Software Reset and Module Standby

Refer to Usage Notes of FCP User's Manual

60.4.3 Input Image Size

Table 60.41 is a list of input size specifications.

Table 60.41 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restrictions on Setting Unit
RPF	1 (horizontal) x 1 (vertical) pixel	8190 (horizontal) x 8190 (vertical) pixels	YcbCr422: 2-pixel units horizontally and 1-pixel units vertically. YcbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. Notes: 1. When the 1-bpp alpha plane[*1] is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. T. These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
UIFn	-	-	Refer to DISCOM section.
ILV	1 (horizontal) x 1 (vertical) pixel	Side by Side Mode 4095 (horizontal) x 8190 (vertical) pixels Line by Line Mode 8190 (horizontal) x 4095 (vertical) pixels Pixel by Pixel Mode 4095 (horizontal) x 8190 (vertical) pixels Doubler Mode 4095 (horizontal) x 4095 (vertical) pixels	1-pixel units both horizontally and vertically.
IIF	128 (horizontal) x 32 (vertical) pixels	5120 (horizontal) x 4096(vertical) pixels	1-pixel units both horizontally and vertically.
BRU	1 (horizontal) x 1 (vertical) pixel	8190 (horizontal) x 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	128 (horizontal) × 96 (vertical)	8190 (horizontal) x 8190 (vertical) pixels	VI6_LIFn_CTRL.CFMT is 1: 2-pixel units horizontally and 1-pixel units vertically. Other formats: 1-pixel units both horizontally and vertically.
SMG	128 (horizontal) × 96 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	VI6_LIFn_CTRL.CFMT is 1: 2-pixel units horizontally and 1-pixel units vertically. Other formats: 1-pixel units both horizontally and vertically.
WPF	1 (horizontal) x 1 (vertical) pixel	8190 (horizontal) x 8190 (vertical) pixels	YcbCr422: 2-pixel units horizontally and 1-pixel units vertically. YcbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically.

			Note 1: This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

The most important restriction shown in Table 60.41 is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in Table 60.41.

60.4.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in Figure 60.1 to Figure 60.2, the data input to the VSP2 is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. Table 60.42 is a list of the processing that changes image size.

Table 60.42 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
WPF	Input size clipping	VI6_WPF0_HSZCLIP VI6_WPF0_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPF0_HSZCLIP.HCL_SIZE setting Vertical output size: VI6_WPF0_VSZCLIP.VCL_SIZE setting
ILV	3D format conversion	VI6_ILV_CTRL	Side by side mode or Pixel by pixel mode Horizontal : Input size× 2, Vertical : Input size Line by line mode Horizontal : Input size, Vertical : Input size x 2 Doubler mode Horizontal : Input size x 2, Vertical : Input size x 2
LIF	Padding line	VI6_LIF0_CTRL	When padding with dummy lines is disabled, output size is same with Input size. When padding with dummy lines is enabled: Horizontal output size: input size Vertical output size: VI6_LIF0_PADLN_SIZE setting

The input image size can be changed only with the modules and functions shown in Table 60.42. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSP2 output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in Table 60.42, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in Table 60.42, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPF0 is determined, this size is the VSP2 output size

Make appropriate register settings in each module so that the VSP2 output image size determined as shown in the figure does not violate the restrictions shown in Table 60.42.

60.4.5 Configuration of VSP2

Table 60.43 show the configuration of each type of VSP2 unit on this LSI.

All the registers and functions listed in [Module] category of Table 60.43 should be treated as un-implemented functions in each VSP2 unit. Do not set any registers related to the un-implemented function without any statement.

For VSPX, refer to 60.3.8.1

Table 60.43 VSPD configuration

Category	Configuration	Restricted contents
Function	RPF/ OSD-CLUT	OSD-CLUT is available only in RPF2. OSD-CLUT is not available in RPF0, RPF1, RPF3 and RPF4. Related registers. VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT1_TBL*,VI6_CLUT3_TBL*, VI6_CLUT4_TBL*

60.4.6 Usage of DISCOM

When DISCOM is used in VSPD, setting registers in DISCOM is needed. See Subsection of this document.

60.4.7 Performance of VSP2

VSPX and VSPD performance is shown in this section. VSP performance shown in below is based on evaluation under the condition that only one IP is operated.

60.4.7.1 Performance of VSPD

In this section, the maximum dot clock frequency is the one VSPD can support regardless of display type. Therefore, it may be higher than the maximum dot clock frequency specified by an particular display type. Please refer to DU User's Manual and Electrical Characteristics to grasp the maximum dot clock frequency.

250 Mpix/s process rate (support up to 300MHz in case of DU display) per 1 set of VSPD.

60.4.7.2 Performance of VSPX

720 Mpix/s process rate per 1 set of VSPX.

To meet the performance, it is required to apply QoS fix-level 4 or QoS fix-level 5 to VSPX. The execution of the VSPX is up to at most 520 frames per second.

60.4.8 Legend of Terms

This section describes the configurations of VSP2 on this LSI. Descriptions in this section show the full-function specifications of the VSP2 IP. Some of the functions described in this section are not available on VSP2 with restrictions written here.

(1) Terminology

This section explains the terminology for VSP2.

Virtual RPF

There is an image compositing sub module named as BRU which can execute image blending or raster operation. The BRU has 5 input ports for compositing multiple images. There must be a RPF module as the start of data processing. Each RPF can be a source of data input to BRU. In addition to these RPF modules, the BRU has a function which generates monochrome color image internally. This functionality is useful because the data access to an external memory is not required. This function is called as virtual RPF.

Refer to section 60.2.7.1, 60.2.9.2, 60.2.9.3 and 60.2.9.4 for virtual RPF.

Target WPF

The VSP2 has five RPFs (RPF 0 to 4) and four WPFs (WPF0 to 1) and execute image processing. One data path consists of more than one RPF, one WPF and other image functional modules if necessary. The WPF which is reached from specific RPF(s) in the data path is called as target WPF for the RPF(s). The number of target WPFs is always one for the data path.

Source RPF

The data source in the data path for the specific WPF is called as source RPF for that WPF. The number of source RPFs is not always one, may be more than one for image blend operation or raster operation.

Layer

In case of image composite operation such as image blending or raster operation for multiple images, there is hierarchical relationship for each image. One layer is assigned to one RPF or one virtual RPF indicating one image in hierarchical relationship.

Master Layer

The master layer is a base layer for image compositing of multiple images, and the size of the master layer equals to that of BRU output. When the image compositing is not applied, there is one layer. This layer is also called as the master layer.

Sub Layer

The Layers except the master layer are called as sub layer.

Alpha

The VSP2 can execute both color data and its transparent data. The alpha is 8-bit data and expresses the transparency of pixel. The value 0xFF represents opaque pixel, and the value 0x00 represents transparent pixel.

Plane

One layer consists of color components such as R/G/B or Y/Cb/Cr, and alpha data representing its transparency of the pixel. The frame which is one of color components and alpha data is called as a plane.

Picture Plane

The picture plane represents color data in one layer.

Alpha Plane

The alpha plane represents transparent data in one layer.

Blending

The image blending means the image composite operation with alpha data. The composite ratio of image blending depends on the relationship of each layer and alpha values.

Raster Operation (ROP)

The bitwise operation such as AND or OR is called as raster operation (ROP).

(2) Definition of Operators and Functions

The following operators, notations are defined for explaining the functions of VSP2.

$\langle x \rangle$

Discard decimal places of value x

rdown (x)

Discard decimal places of value x : Ex, rdown (3.81) = 3

clip0 (x)

Clip to 0 value if x is less than 0. [$x = (x < 0)? 0 : x$]

clip3 (min, max, x)

The value x shall be clipped so that x shall be $min < x < max$. [$x = (x < min)? Min : ((x > max)? Max : x)$]

(3) Unit

The unit is defined here for explaining VSP2's functions.

[bpp]: bits per pixel

VSP2 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8bpp means that its format is RGB and the pixel consists of 8 data bits.

[bpc] : bits per component

VSP2 can handle a number of image formats and bit-depth. The unit [bpc] shows a number of data bits for one component.

[bypp] : bytes per pixel

The unit [bypp] shows a number of data byte for one pixel.

[bypc] : bytes per component

VSP2 can handle 2 types of data size of YUV's component: 1 byte per component (1bypc) when it's 8-bit, and 2 bytes per component (2bypc) when it's more than 8-bit (10/12-bits).

60.5 Safety Mechanism

60.5.1 Watch Dog Timer, Frame Counter and SRAM EDC Error Detection of FCPVX.

60.5.1.1 Ovierview

The VSPX and VSPD has watchdog timer to detect hang-up. VSPX has FCPVX SRAM EDC error status and error injection.

60.5.1.2 Hardware Description

(1) Features

(a) Watch Dog Timer of VSPD

The VSPD has watchdog timer to detect hang-up. Feature is shown below.

- 32 bits watchdog timer (Up to about 8 second)
- Interrupt assertion occurs when timer reaches Time-out cycles set in register
- The interruption is notified to ECM
- Time-out cycle can be set per 2^16 cycles (About 0.12 ms step)
- Min/Max/Step of Time-out cycles is shown below.

  Min : About 0.12 ms (2^16 cycles at 533MHz)

  Max : About 8 sec (2^32 – 1 cycles at 533MHz)

  Step : About 0.12 ms (2^16 cycles at 533MHz)

If the VSP hangs-up due to some H/W fault, initialize the VSP2 by module reset in section .

(b) Watch Dog Timer of VSPX

The VSPX has watchdog timer to detect hang-up. Feature is shown below.

- 32 bits watchdog timer (Up to about 8 second)
- Interrupt assertion occurs when timer reaches Time-out cycles set in register
- The interruption is notified to ECM
- Time-out cycle can be set per 2^16 cycles (About 0.12 ms step)
- Min/Max/Step of Time-out cycles is shown below.

  Min : About 0.08 ms (2^16 cycles at 800MHz)

  Max : About 5.3 sec (2^32 – 1 cycles at 800MHz)

  Step : About 0.08 ms (2^16 cycles at 800MHz)

If the VSP hangs-up due to some H/W fault, initialize the VSP2 by module reset in section 60.2.4.10.

(c) EDC Error Status of FCPV RRSP0BUF SRAM

VSPX has a SRAM EDC status of FCPV.

(d) Error Injection of VSPX ECM Notification

VSPX notifies ECM of WatchdogTimer Error and FCPVX-SRAM-EDC error.VSPX has Error Injection as a function that S/W can set error notification to ECM forcibly.

(2) Register Configurations of General Control Registers

Table 60.44 Register Map

Register Type	Register Name	Address Offset
CTL registers	VI6_WPF0_WDT	H'00C4
	VI6_WPF0_FRCNT	H'00D4
	VI6_ECM0_IRQ_ENB	H'00DC
	VI6_ECM0_IRQ_STA	H'00E0
	VI6_CTL_ERRINJ	H'00E8

(3) Register Descriptions of General Control Registers

(a) WPF0 Watch Dog Timer Registers (VI6_WPF0_WDT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–		–	–	–	–	–	–	–	–	–	–	–	WDTEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIMER_CYC [15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

16	WDTEN	0	R/W	Enable/Disable hung-up timer for WPF0 When this bit is set to 1 and one-frame processing is not finished within the cycles specified in TIMER_CYC [15:0], VI6_ECM0_IRQ_STA.W0ALM is set to 1. 0: Disable timer 1: Enable timer
15 to 0	TIMER_CYC [15:0]	0	R/W	Hung-Up Timer setting for WPF0 These bits specify hung-up timer setting in cycle unit. The number of cycles of watch dog timer can be specified by (TIMER_CYC + 1) x 2 ^ 16 cycles. Example is below. VSPD (533.33 MHz): If D'49999 is set in TIMER_CYC [15:0], timer setting is 6.144 (sec). This value can be obtained by following expression. ((49999+1) x 2^16) / (533.33*1000*1000) = 6.144

(b) WPF0 Frame Count Register (VI6_WPF0_FRCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	FRCNT [11:0]											
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	FRCNT [11:0]	0	R/W	WPF0 Frame Counter These bits are used for counting the number of frames executed by WPF0. The count is automatically incremented at the interrupt timing of the frame end (VI6_WPF0_IRQ_STA.FRE). Set desired value in these bits before activating VSP as initial frame count number.

(c) ECM0 Interrupt Enable Registers (VI6_ECM0_IRQ_ENB)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	W0ALME	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	RRSP0E
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Each bit controls the interrupt enable of the corresponding interrupt source.

0 : Interrupt Disabled

1 : Interrupt Enabled

Bit	Bit Name	Initial Value	R/W	Description
31 to 25, 23 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	W0ALME	0	R/W	Interrupt Enable for WPF0 Watch dog timer alarm.
0	RRSP0E	0	R/W	Interrupt Enable for EDC error of FCPV RRSP0BUF SRAM

Each bit in VI6_ECM0_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_ECM0_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_ECM0_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_ECM0_IRQ_STA is set to 1. This interrupt signal is notified to ECM.

(d) ECM0 Interrupt Status Registers (VI6_ECM0_IRQ_STA)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	W0ALM	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	RRSP0
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0 : No interrupt

1 : Interrupt activated

[Write Access] Interrupt Clear

0 : The interrupt status is cleared to 0

1 : Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
31 to 25, 23 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	W0ALM	0	R/W	Interrupt Status and Clear for WPF0 Watch dog timer alarm. This interrupt source bit is set to 1 when VI6_WPF0_WDT.WDTEN is 1 and VSP2 does not complete one-frame processing within the period specified in VI6_WPF0_WDT register. Refer to VI6_WPF0_WDT register for more detail.
0	RRSP0	0	R/W	Interrupt Status and Clear for EDC error of FCPV RRSP0BUF SRAM This interrupt source bit is set to 1 when EDC Error of RRSP0BUF occurs.

VI6_ECM0_IRQ_STA indicates the state of the interrupt sources generated in the VSP2. Whether to output a VSP2 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_ECM0_IRQ_ENB. While an interrupt is disabled in VI6_ECM0_IRQ_ENB, the VSP2 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

(e) ECM0 Error Injection Registers (VI6_CTL_ERRINJ)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	ERRINJ0
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ERRINJ0	0	R/W	Forced assertion of error notification to ECM 0: Disable error injection to error notification to ECM 1: Enable error injection to error notification to ECM Error injection can assert an error notification signal to the ECM without activating the status in VI6_ECM0_IRQ_STA.

60.5.2 Display Output Compare Unit (DISCOM)

This module is treated as safety mechanism in case of the products supporting functional safety. For details, refer to the functional safety documents. However, this module can be also treated as non-safety-related function.

The DISCOM calculates the CRC of input image plane and checks whether the CRC is equal to an expectation value or not.

The VSPD, which is one of video signal processing module and specified for image blending of output image, has the DISCOM. Usual use case of the DISCOM is calculation CRC of selected input plane show as following figure.

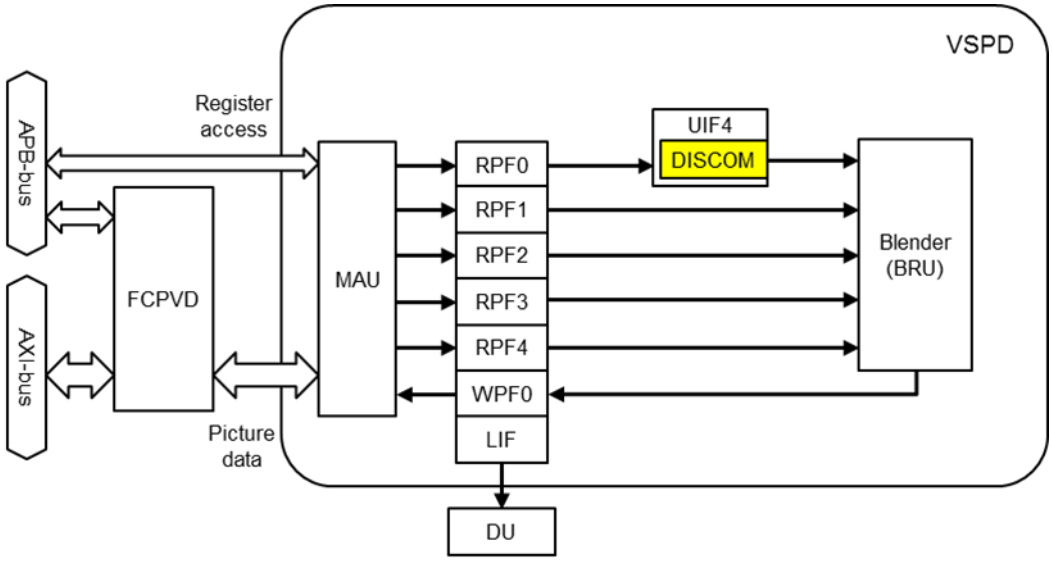

Figure 60.52 Example use case of the DISCOM

60.5.2.1 Overview

Display Output Compare Unit (DISCOM) is used to check the input or blending images of VSPD in VSP2. DISCOM can detect the fault in the VSP2 itself and FCP (Figure 60.53) by comparing the CRC of arbitrary rectangular area of the image with the expected value. For detail, refer to Display Output Compare Unit (DISCOM) section in VSP2 User's Manual.

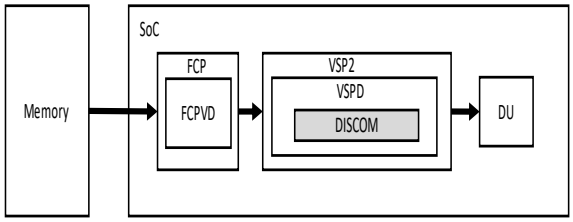

Figure 60.53 Target of Fault Detection by DISCOM (Output Signal Path)

DISCOM can also detect the fault in the Camera sensor on input signal path (Figure 60.54) by comparing the CRC of arbitrary rectangular area of the image with the previous one. It means DISCOM can detect input image frozen when the CRC value is the same as the previous one.

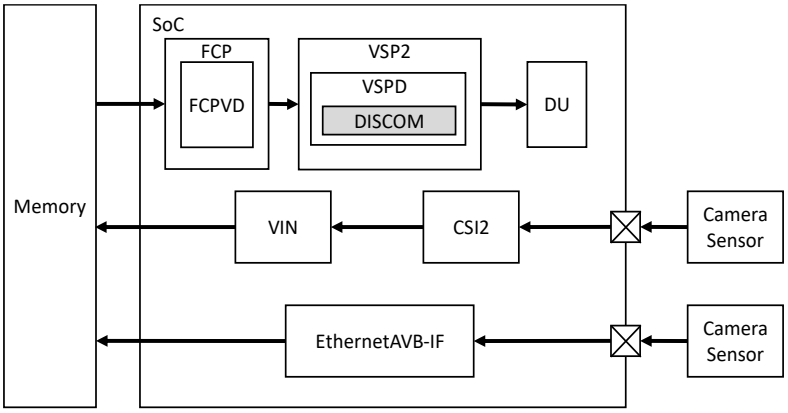

Figure 60.54 Target of Fault Detection by DISCOM (Input Signal Path) or Frozen Image Detection

The DISCOM calculates the CRC of input image plane or blending image and checks whether the CRC is equal to an expectation value or not. It can also check the CRC of input image plane is the same value as the CRC of previous picture. These checking are exclusively.
The VSPD, which is one of video signal processing module and specified for image blending of output image, has the DISCOM. Usual use case of the DISCOM is calculation CRC of selected input plane show as following figure. The DISCOM also can calculate the CRC after blending image.
Figure 60.55 shows a block diagram of DISCOM. The DISCOM.CMPI is an interrupt request for detection of unmatching the expectation CRC value. And the DISCOM.CMPI2 is an interrupt request for detection of image frozen.
When detection of mismatching the expectation CRC value is used for blending image, all the following conditions is required as shown in Figure 60.56 .

- Target image of CMPI detection is blended in the foreground by complete opaque
- Target image of CMPI detection is not moving (still image)

And then set size registers and offset registers of target image.

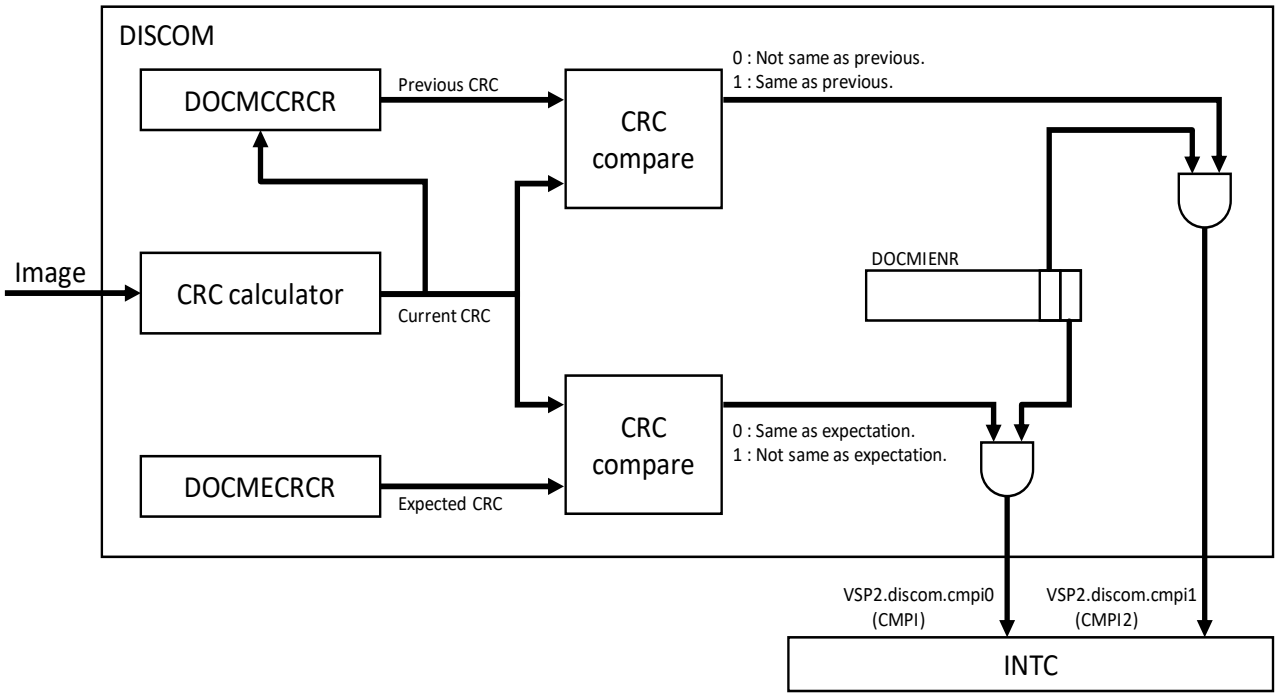

Figure 60.55 Block Diagram of DISCOM

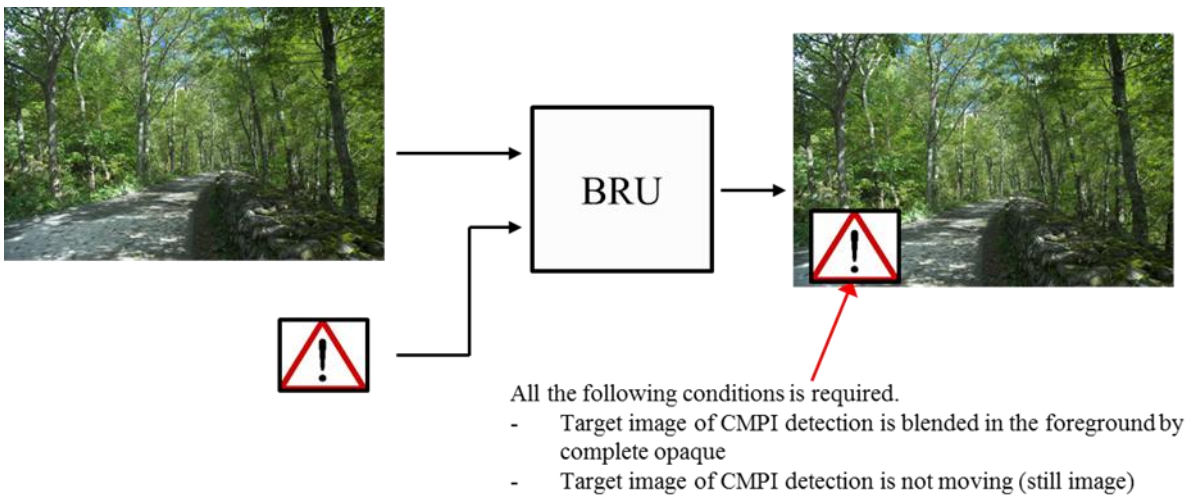

Figure 60.56 Detecting mismatching with expectation CRC value for blending image by DISCOM.CMPI

60.5.2.2 Features

The DISCOM has the CRC checking feature shown in following table.

Table 60.45 Main Function of the DISCOM

Item	Description
Functions	• Calculation the CRC of input image • Comparing the CRC with an expectation value • Comparing the CRC with previous one • CRC calculation area is configurable.
Picture size supported	Minimum: Same as VSPD Maximum: Same as VSPD
Color format	Supported color format: • ARGB8888 • RGB888YcbCr444

60.5.2.3 Block Diagram

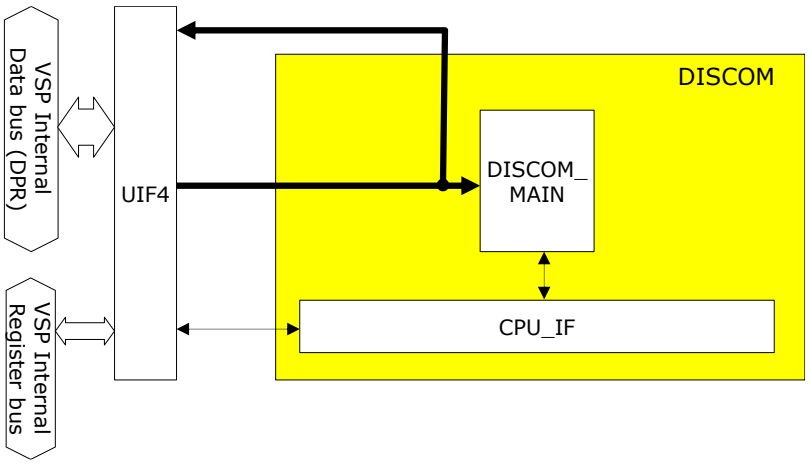

Figure 60.57 Block Diagram of DISCOM

60.5.2.4 Register Configuration

The DISCOM's register can be accessed via VSPD's user logic interface (UIF) register address space 4 and space 5 for VSPD. All parameters should be set in the same manner as the other VSP's register, for example, setting by the display list.

Table 60.46 Register Map

Register Type	Register Name	Address Offset
DISCOM (UIF4) control	VI6_UIF4_DICOM_DOCMCR	0x1C00
	VI6_UIF4_DICOM_DOCMSTR	0x1C04
	VI6_UIF4_DICOM_DOCMCLSTR	0x1C08
	VI6_UIF4_DICOM_DOCMIENR	0x1C0C
	VI6_UIF4_DICOM_DOCMMDR	0x1C10
	VI6_UIF4_DICOM_DOCMPMR	0x1C14
	VI6_UIF4_DICOM_DOCMECRCR	0x1C18
	VI6_UIF4_DICOM_DOCMCCRCR	0x1C1C
	VI6_UIF4_DICOM_DOCMSPXR	0x1C20
	VI6_UIF4_DICOM_DOCMSPYR	0x1C24
	VI6_UIF4_DICOM_DOCMSZXR	0x1C28
	VI6_UIF4_DICOM_DOCMSZYR	0x1C2C
	VI6_UIF4_DICOM_DOCMCRCIR	0x1C30
	Setting forbidden for other UIF4 register space	0x1C00 to 0x1CFC except for above offset
DISCOM (UIF5) control	VI6_UIF5_DICOM_DOCMCR	0x1D00
	VI6_UIF5_DICOM_DOCMSTR	0x1D04
	VI6_UIF5_DICOM_DOCMCLSTR	0x1D08
	VI6_UIF5_DICOM_DOCMIENR	0x1D0C
	VI6_UIF5_DICOM_DOCMMDR	0x1D10
	VI6_UIF5_DICOM_DOCMPMR	0x1D14
	VI6_UIF5_DICOM_DOCMECRCR	0x1D18
	VI6_UIF5_DICOM_DOCMCCRCR	0x1D1C
	VI6_UIF5_DICOM_DOCMSPXR	0x1D20
	VI6_UIF5_DICOM_DOCMSPYR	0x1D24
	VI6_UIF5_DICOM_DOCMSZXR	0x1D28
	VI6_UIF5_DICOM_DOCMSZYR	0x1D2C
	VI6_UIF5_DICOM_DOCMCRCIR	0x1D30
	Setting forbidden for other UIF5 register space	0x1D00 to 0x1DFC except for above offset

60.5.2.5 Connected Module

Table 60.47 shows modules connected to the DISCOM.

Table 60.47 Connected Module

Module	Connected Module	Description
DISCOM (UIF4)	VSPD	VSP for image blending and output
DISCOM (UIF5)	VSPD	VSP for image blending and output

60.5.2.6 Register Description

(1) VI6_UIFn_DICOM_DOCMCR (n=4,5)

DOCMCR controls the DISCOM operation.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	CMPRU
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	CMPR
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
16	CMPRU	0	R	This bit indicates an internal reflected bit of CMPR. The register except for DOCMCR.CMPR, DOCMCLSTR, and DOCMIENR should be updated only when CMPRU is 0. For detail, refer section 60.5.2.7(6) Register Update Timing.
0	CMPR	0	R/W	DISCOM execution enable. This bit is reflected to DISCOM behavior at the timing of frame staring. For detail, refer section (6) Register Update Timing. 0 : Stop DISCOM 1 : Execute DISCOM
31 to 17, 15 to1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(2) VI6_UIFn_DICOM_DOCMSTR (n=4,5)

DOCMSTR indicates the compare result of the CRC code. It is reflected at the end of frame.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	CMPPRE	CMPST
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
1	CMPPRE	0	R	Compare result between the CRC and the previous one. 0: Not same as previous CRC code 1: The CRC has the same code of (VI6_UIFn_DICOM_ DOCMMDR.INTHRH+1) consecutive times.
0	CMPST	0	R	Compare result between the CRC and its expectation 0 : Same as expectation 1 : Not same as expectation
31 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(3) VI6_UIFn_DICOM_DOCMCLSTR (n=4,5)

DOCMCLSTR clear the DOCMSTR. When each bit of DOCMCLSTR is set to 1, the corresponding bit of DOCMSTR is cleared. Note that the clear bit takes the fixed time. Therefore after setting DOCMCLSTR, it is necessary to confirm that DOCMSTR has been cleared.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPPRECLCNT	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPCLPRE	CMPCLST
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
17	CMPPRECLCNT	0	R/W	Clear for frozen counter bit When this bit is set to 1, internal frozen counter is cleared. This bit is always read as 0.
1	CMPCLPRE	0	R/W	Clear for CMPPRE status bit. When this bit is set to 1, DOCMSTR.CMPPRE is cleared. This bit is always read as 0.
0	CMPCLST	0	R/W	Clear for CMPST status bit When this bit is set to 1, DOCMSTR.CMPST is cleared. This bit is always read as 0.

31 to 18, 16 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(4) VI6_UIFn_DICOM_DOCMIENR(n=4,5)

DOCMIENR specifies the enable of the interruption.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EEP_ERR_FWD
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPPREIEN	CMPIEN
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
16	EEP_ERR_FWD	0	R/W	Error forwarding to ECM This bit determines whether DISCOM forwards interrupts to ECM as error signals or to INTC as interrupt signals. 0: Not forward to ECM (Forward interrupts to INTC) 1: Forward to ECM.
1	CMPPREIEN	0	R/W	Interruption enable for CMPI2. This bit specifies the interruption enable if DOCMSTR. CMPPRE becomes 1. 0: Disable CMPI2 interruption. 1: Enable CMPI2 interruption.
0	CMPIEN	0	R/W	Interruption enable for CMPI This bit specifies the interruption enable if DOCMSTR. CMPST becomes 1. 0 : Disable CMPI interruption 1 : Enable CMPI interruption
31 to 17, 15 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(5) VI6_UIFn_DICOM_DOCMMDR (n=4,5)

DOCMMDR specifies the compare mode of the DISCOM.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	INTHRH[7:0]							
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R/W :	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
23 to 16	INTHRH[7:0]	0	R/W	This parameter specified a threshold value for an interruption. If the cause of interruption is continuously occurred more than (INTHRH) frames, the interruption request is generated. Note that the value H'FF is setting prohibited. When the frame rate for output is greater than that for input, the same input frame may be compared. Accordingly, these bits are used to set a limit on the number of matches.
31 to 24, 15 to 0	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(6) VI6_UIFn_DICOM_DOCMPMR (n=4,5)

DOCMPMR specifies the pixel data format.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit :	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPDFF[1:0]		—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit :	CMPDFA[7:0]								CMPDAUF	—	—	—	SEL[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
18 to 17	CMPDFF[1:0]	0	R/W	This parameter should be set to 0. 00 : ARGB8888, RGB888, or YcbCr444 Others : Setting prohibited
15 to 8	CMPDFA[7:0]	0	R/W	This parameter specifies the default alpha value. It is used when CMPDAUF is 1.
7	CMPDAUF	0	R/W	This flag specifies the alpha value which is used for CRC calculation. 0 : Use alpha value with pixel value 1 : Use default alpha value (CMPDFA)

3 to 0	SEL[3:0]	0	R/W	This parameter should be set to 9.
31 to 19, 16, 6 to 4	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(7) VI6_UIFn_DICOM_DOCMECRCR (n=4,5)

DOCMECRCR specifies the expectation value of the CRC code.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPECRC[31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPECRC[15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPECRC[31:0]	0	R/W	This parameter specifies the expectation of the CRC.

(8) VI6_UIFn_DICOM_DOCMCCRCR (n=4,5)

DOCMCCRCR indicates the CRC value of current image. It is reflected at the end of frame.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPCCRC[31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPCCRC[15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPCCRC[31:0]	0	R	This parameter indicates the CRC value of current image.

(9) VI6_UIFn_DICOM_DOCMSPXR (n=4,5)

DOCMSPXR specifies horizontal offset the CRC calculation area in the image.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSPX[12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSPX [12:0]	0	R/W	This parameter specifies horizontal offset of the CRC calculation area. It should be less or equal to horizontal size of input image. Horizontal offset is value of CMPSPX for other products.
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Valid bits for each product is shown below.

(10) VI6_UIFn_DICOM_DOCMSPYR (n=4,5)

DOCMSPYR specifies vertical offset the CRC calculation area in the image.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSPY[12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSPY[12:0]	0	R/W	This parameter specifies vertical offset of the CRC calculation area. It should be less or equal to vertical size of input image.
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Valid bits for each product is shown below.

(11) VI6_UIFn_DICOM_DOCMSZXR (n=4,5)

DOCMSZXR specifies horizontal size of the CRC calculation area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSZX[12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSZX[12:0]	0	R/W	This parameter specifies horizontal size of the CRC calculation area. It should be less or equal to (horizontal size of input image – CMPSPX). Horizontal size is value of CMPSZX for other products.
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Valid bits for each product is shown below.

(12) VI6_UIFn_DICOM_DOCMSZYR (n=4,5)

DOCMSZYR specifies vertical size of the CRC calculation area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSZY[12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

12 to 0	CMPSZY [12:0]	0	R/W	This parameter specifies vertical size of the CRC calculation area. It should be less or equal to (vertical size of input image – CMPSPY).
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Valid bits for each product is shown below.

(13) VI6_UIF4_DICOM_DOCMCRCIR (n=4,5)

DOCMCRCIR specifies the initial value of the CRC.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRCINI[31:16]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRCINI[15:0]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRCINI[31:0]	H'FFFF_FFFF	R/W	This parameter specifies the initial value of the CRC.

60.5.2.7 Operation

(1) Overview of Process

The DISCOM calculates the CRC of arbitrary rectangular area of the input image, and compares with the expectation value.

1. If the CRC code is same as its expectation value, the display output image is as expected. This case the input image is such as graphics data, and the DISCOM is used for checking it is displayed correctly or not.

The DISCOM has the following features.

- The input image of the DISCOM can be selected from five input images of VSPD by using data path routing function of the VSPD.
- Any CRC computation rectangular area can be specified.
- Supported color formats are ARGB8888, RGB888, and YcbCr.
- The interruption (CMPI) is occurred if the CRC value doesn't match with the expectation value.

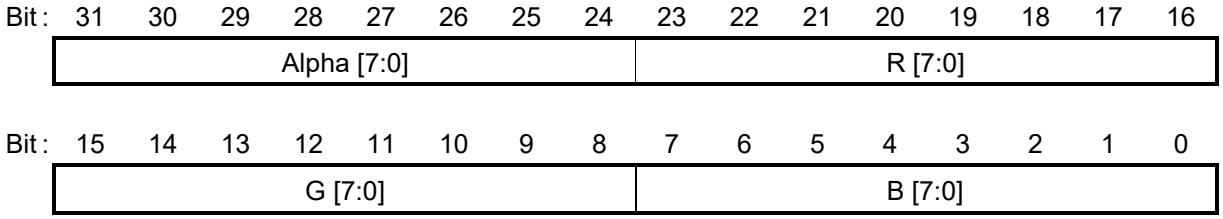
(2) CRC Calculation

The DISCOM uses following equation to calculate the 32-bit CRC value. Each bit of the final CRC result is logically inverted.

$X^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$

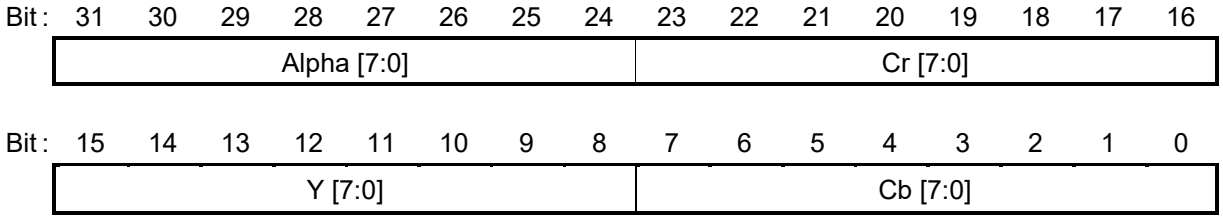
The CRC calculation is operated in pixels and the pixel order of input image is a raster scan order. The pixel data is 32-bit data and processed from LSB to MSB. The format of pixel data is shown as follows:

(a) ARGB8888/RGB888



If DOCMPMR.CMPDAUF is set to 0, the alpha value is from the data path router of the VSPD. Otherwise the alpha value is set as DOCMPMR.CMPDFA.

(b) YcbCr444



If DOCMPMR.CMPDAUF is set to 0, the alpha value is from the data path router of the VSPD. Otherwise the alpha value is set as DOCMPMR.CMPDFA.

(3) Image Format on the External Memory

The read pixel formatter of the VSPD converts the various pixel format shown in Table 60.10 and Table 60.12 to the internal pixel format of the DISCOM (shown in previous section). For the detail, refer section 60.2.6.

(4) Setting Rectangle Region

This section describes how to set the rectangular area to the CRC calculation.

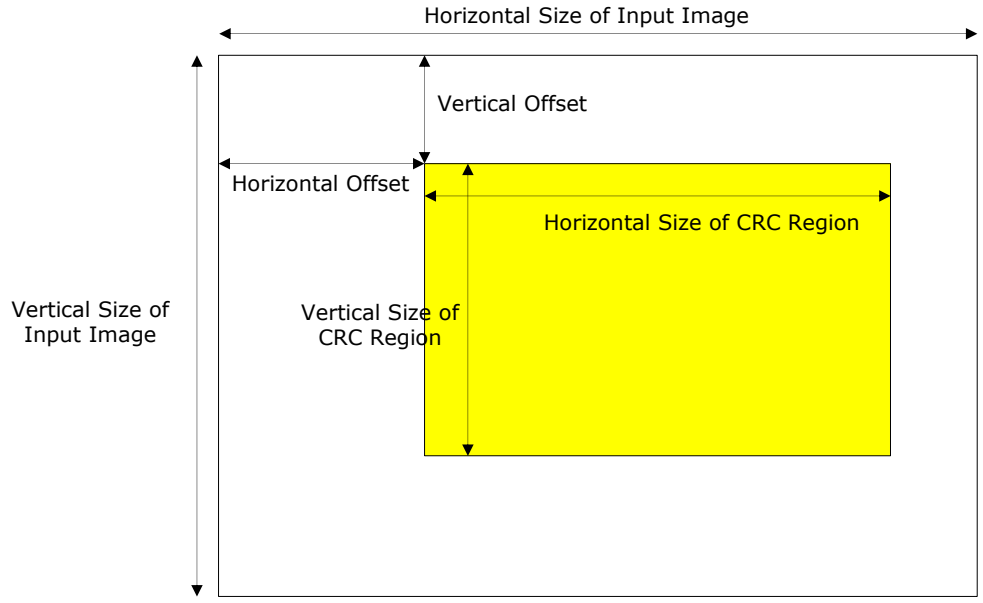


Figure 60.58 Example Case of the CRC Computation Area

Table 60.48 Register Setting for the CRC Computation Area

Word in Figure	Register of DISCOM	Description
Horizontal Size of Input Image		This parameter is horizontal size of input image for the DISCOM. It is set by VSPD's register.
Vertical size of Input Image		This parameter is vertical size of input image for the DISCOM. It is set by VSPD's register.
Horizontal Offset	DOCMSPXR	This parameter specifies horizontal offset position of the CRC calculation area from left border of the input image. The offset value is the pixel unit.
Vertical Offset	DOCMSPYR	This parameter specifies vertical offset position of the CRC calculation area from top border of the input image. The offset value is the line unit.
Horizontal Size of CRC Region	DOCMSZXR	This parameter specifies horizontal size of the CRC calculation area. It should be less or equal to (Horizontal size of input image – Horizontal offset). The size is the pixel unit.
Vertical Size of CRC Region	DOCMSZYR	This parameter specifies vertical size of the CRC calculation area. It should be less or equal to (Vertical size of input image – Vertical offset). The size is the line unit.

(5) Timing Chart of CRC Computation and Comparing

Following figure shows the timing chart example of CRC computation and comparing.

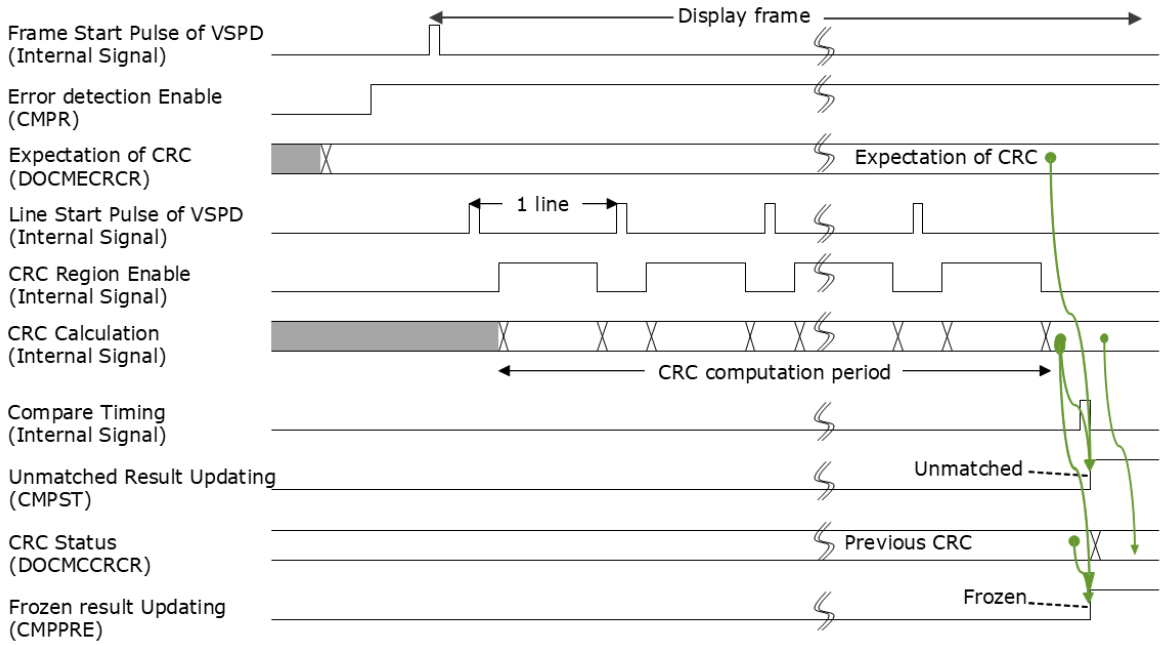

Figure 60.59 Example Timing of CRC Computation and Comparing

1. The DISCOM starts operation from the following frame after setting DOCMCR.CMPR to 1. For register update timing, refer section (6).
2. The CRC code is calculated in the specified rectangular area.
3. The result of the CRC code is compared with the expectation (DOCMECRCR) and the previous value (CMPCCRC).
4. If the CRC code doesn't match with the expectation value, DOCMSTR.CMPST bit is set to 1.
5. If the CRC code matches with the previous value, DOCMSTR.CMPPRE bit is set to 1.

   Note: When VSPD software reset is issued as shown in Figure 60.36, CRC calculation may be halfway finished. CRC calculation is not same with the expectation, and false error occurs as CMPST interrupt in the case. Therefore, disable VI6_UIFn_DICOM_DOCMIENR.CMPIEN before VSPD software reset is issued to restrain false error.

(6) Register Update Timing

(a) Update Timing of Register Setting

All registers except for DOCMCR.CMPR are reflected in the internal register immediately. Therefore, they should be set during DOCMCR.CMPRU is 0.

The DOCMCR.CMPR is reflected in the internal register at the beginning of the frame processing. It can be updated at any time.

(b) Update Timing of Status Register

The DOCMSTR and DOCMCCRCR are updated at the end of the frame processing. The DOCMCR.CMPRU is updated at the beginning of the frame processing.

The following figure shows an example timing of register updating.

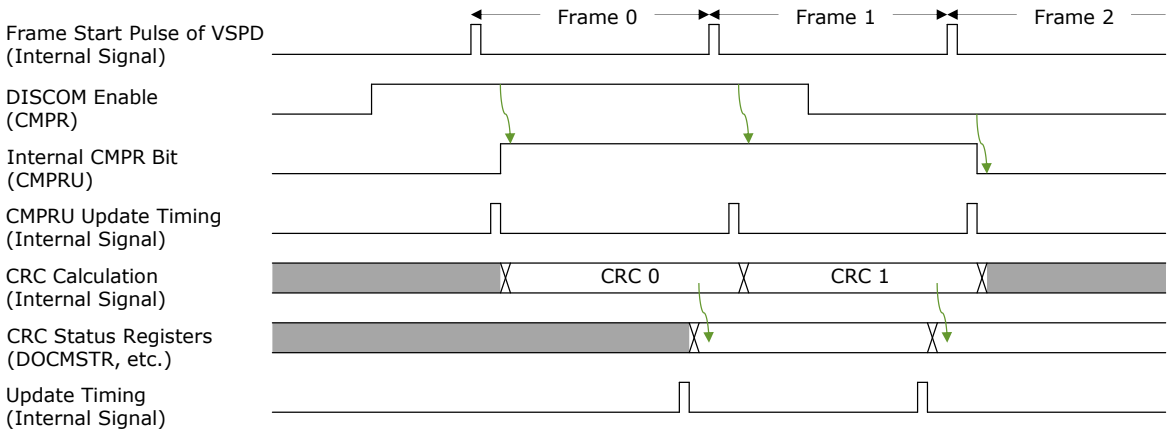

Figure 60.60 Example Timing of Register Updating

(7) Interruption

The DISCOM has two interrupt request, CMPI and CMPI2. The CMPI request is occurred when both DOCMIENR.CMPIEN and DOCMSTR.CMPST are set to 1. CMPI2 is functional safety use only. Refer to functional safety documents for the detail.

60.5.2.8 Usage Notes

Set 9 to VI6_UIFn_DICOM_DOCMPMR.SEL[3:0] (Section 60.5.2.6(6)) before starting VSP2 in case of using UIFn(DISCOM). Otherwise, VSP may not work correctly.

60.5.3 Safety Mechanism Generator (SMG)

60.5.3.1 Ovierview

SMG (Safety Mechanism Generator) is implemented in VSPD to support below safety mechanism of FUSA:

- (1) To send EDC code for each pixel from LIF0 to Display (Pixel protection)
- (2) To send CRC code for each picture from LSI to LSI transmission (End-to-End protection)
- (3) To detect unmatched picture data from External Memory to WPF (Unmatched error notification)
- (4) To detect frozen picture data from External Memory to WPF (Frozen error notification)

To realize safety mechanism (1) SMG calculates EDC code for each pixel and sends EDC code with corresponding pixel data to Display for evaluating (Pixel protection).

To realize safety mechanism (2) SMG calculates CRC code for each frame and sends it with corresponding frame to the other end terminal for evaluating (End-to-End protection).

To realize safety mechanism (3), (4), SMG compare current frame CRC with an expectation or with previous frame CRC result respectively. Result of detection is reflected in registers and notify to ECM for error handling of FUSA

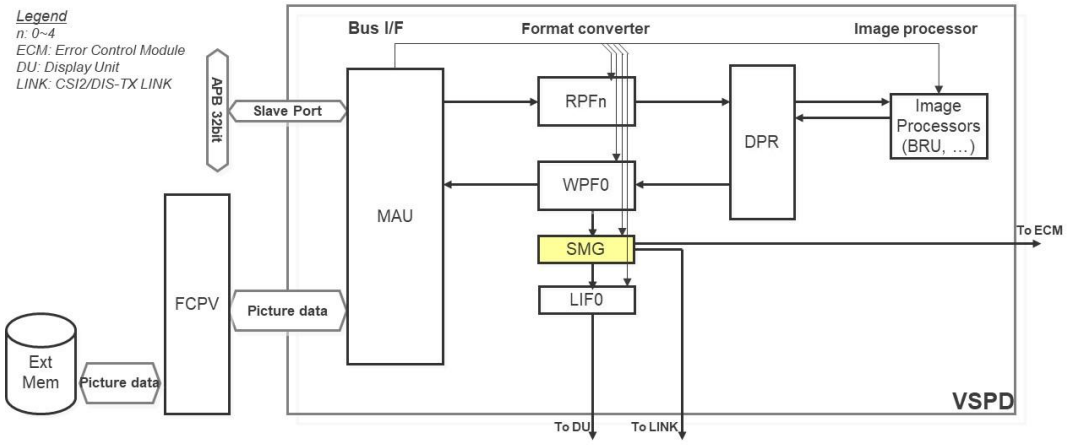

Figure 60.61 Sample use case of SMG

60.5.3.2 Hardware Description

(1) Features

Table 60.49 Main functions of SMG

Item	Description
Functions	• Calculating the EDC code for each output pixels to DUCalculating the CRC for each output frame to TX-LINKComparing the CRC with an expectation value • Comparing the CRC with previous oneCRC calculation area is configurable.
Image size	Minimum: Same as VSPD Maximum: Same as VSPD
Color format	Supported color format for EDC calculation: • RGB888YcbCr422Supported color format for CRC calculation: • RGB888 4bytes (MSB byte is set by register)RGB888YcbCr422

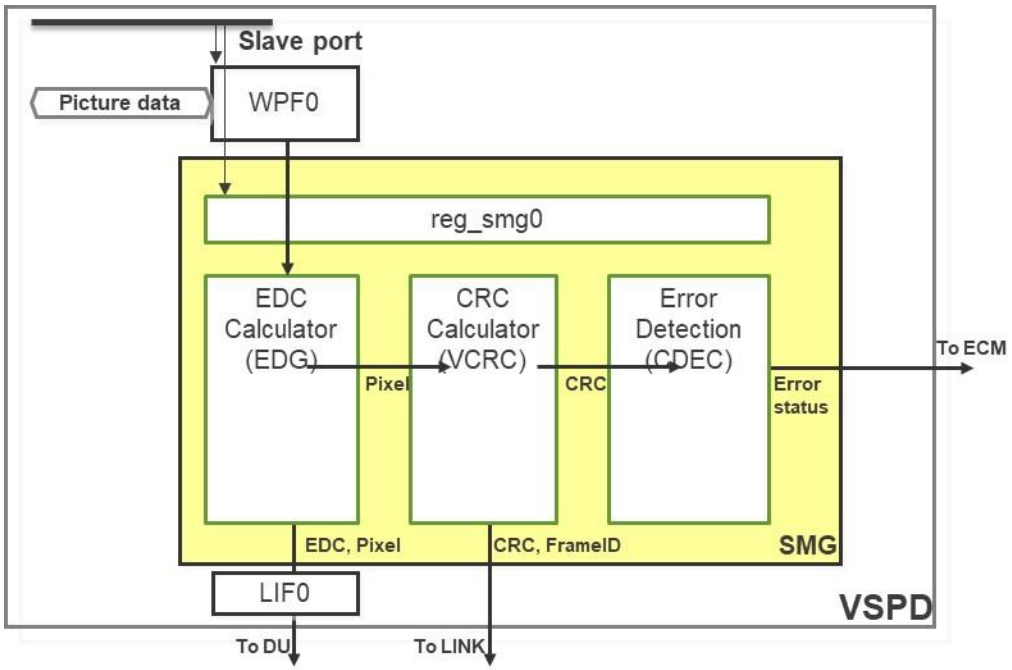

Figure 60.62 Block Diagram of SMG

SMG contains three main blocks:

- ✓ EDC calculator supports calculating EDC code for each output pixels to DU.
- ✓ CRC calculator supports calculating CRC code for both E2E protection and Error detection.
- ✓ Error detection supports either unmatched error or Frozen error notification.

(2) Register Configuration

SMG registers can be accessed via either CPU interface or Display List interface of VSP. SMG registers are allocated as offset in below table.

Table 60.50 Register Configuration

Register Type	Register Name	Address Offset
SMG control	VI6_SMG_MCR	0x1400
	VI6_SMG_MSTR	0x1404
	VI6_SMG_MCLSTR	0x1408
	VI6_SMG_MIENR	0x140C
	VI6_SMG_MMDR	0x1410
	VI6_SMG_MPMR	0x1414
	VI6_SMG_MECRCR	0x1418
	VI6_SMG_MCCRCR	0x141C
	VI6_SMG_MSPXR	0x1420
	VI6_SMG_MSPYR	0x1424
	VI6_SMG_MSZXR	0x1428
	VI6_SMG_MSZYR	0x142C
	VI6_SMG_MCRCIR	0x1430
	VI6_SMG_IODCFG	0x1434
	VI6_SMG_PEQU	0x1438
	VI6_SMG_PSZM1	0x143C
	VI6_SMG_FXOR	0x1440
	VI6_SMG_FRID	0x1444
	VI6_SMG_ERRINJ	0x1448
	VI6_SMG_ECRC	0x1450

(3) Register Description

(a) VI6_SMG_MCR

MCR controls Enable/Stop CRC calculation for error detection feature of SMG

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPRU
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPR
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description

16	CMPRU	0	R	CRC calculation status flag (for error detection) This bit indicates an internal reflected bit of CMPR. The register except for MCR.CMPR, MCLSTR, and MIENR should be updated only when CMPRU is 0.0: There is no CRC calculation (for error detection) 1: CRC calculation for error detection is on-going
0	CMPR	0	R/W	CRC execution enable for error detection. This bit is reflected to SMG behavior at the timing of frame staring. 0: Stop CRC calculation for error detection 1: Start CRC calculation for error detection
31 to 17, 15 to1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(b) VI6_SMG_MSTR

MSTR indicates the compare result of the CRC code. It is reflected at the end of display frame.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPPRE	CMPST
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
1	CMPPRE	0	R	Compare result between the CRC and the previous one. 0: Not same as previous CRC code 1: The CRC has the same code of (VI6_SMG_MMDR.INTHRH1+1) consecutive times.
0	CMPST	0	R	Compare result between the CRC and its expectation 0: Same as expectation 1: The CRC is not same as the expectation (VI6_SMG_MMDR.INTHRH+1) consecutive times.
31 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(c) VI6_SMG_MCLSTR

MCLSTR clear the MSTR. When each bit of MCLSTR is set to 1, the corresponding bit of MSTR is cleared. Note that the clear bit takes the fixed time. Therefore, after setting MCLSTR, it is necessary to confirm that MSTR has been cleared.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPPRECLCNT	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPCLPRE	CMPCLST
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
17	CMPPRECLCNT	0	R/W	Clear for frozen counter bit When this bit is set to 1, internal frozen counter is cleared. This bit is always read as 0.
1	CMPCLPRE	0	R/W	Clear for CMPPRE status bit When this bit is set to 1, MSTR.CMPPRE is cleared. This bit is always read as 0.
0	CMPCLST	0	R/W	Clear for CMPST status bit When this bit is set to 1, MSTR.CMPST is cleared. This bit is always read as 0.
31 to 18, 16 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(d) VI6_SMG_MIENR

MIENR specifies the enable of the error notification to ECM.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UIF5_CMPPREIEN	UIF5_CMPIEN	—	—	UIF4_CMPPREIEN	UIF4_CMPIEN	—	—	CMPPREIEN	CMPIEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
9	UIF5_CMPPREIEN	0	R/W	Enable frozen error notification for DISCOM (UIF5) to ECM This bit specifies the error notification enable if VI6_UIF5_DICOM_DOCMSTR.CMPPRE becomes 1 and VI6_UIF5_DICOM_DOCMIENR.CMPPREIEN = 1 0 : Disable frozen error notification 1 : Enable frozen error notification
8	UIF5_CMPIEN	0	R/W	Enable unmatched error notification for DISCOM (UIF5) to ECM This bit specifies the error notification enable if VI6_UIF5_DICOM_DOCMSTR.CMPST becomes 1 and VI6_UIF5_DICOM_DOCMIENR.CMPIEN = 1 0 : Disable unmatched error notification 1 : Enable unmatched error notification
5	UIF4_CMPPREIEN	0	R/W	Enable frozen error notification for DISCOM (UIF4) to ECM This bit specifies the error notification enable if VI6_UIF4_DICOM_DOCMSTR.CMPPRE becomes 1 and VI6_UIF4_DICOM_DOCMIENR.CMPPREIEN = 1 0 : Disable frozen error notification 1 : Enable frozen error notification
4	UIF4_CMPIEN	0	R/W	Enable unmatched error notification for DISCOM (UIF4) to ECM This bit specifies the error notification enable if VI6_UIF4_DICOM_DOCMSTR.CMPST becomes 1 and VI6_UIF4_DICOM_DOCMIENR.CMPIEN = 1 0 : Disable unmatched error notification 1 : Enable unmatched error notification
1	CMPPREIEN	0	R/W	Enable frozen error notification to ECM This bit specifies the error notification enable if MSTR. CMPPRE becomes 1. 0 : Disable frozen error notification 1 : Enable frozen error notification
0	CMPIEN	0	R/W	Enable unmatched error notification to ECM This bit specifies the error notification enable if MSTR. CMPST becomes 1. 0 : Disable unmatched error notification 1 : Enable unmatched error notification
31 to 10, 7 to 6, 3 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(e) VI6_SMG_MMDR

MMDR specifies the threshold of frozen or unmatched error notification. SMG uses two different error thresholds: INTHRH1 for frozen error notification and INTHRH for unmatched error notification.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTHRH1[7:0]								INTHRH [7:0]							

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTHRH1[7:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	INTHRH1[7:0]	0	R/W	Threshold for frozen error notification This parameter specifies a threshold value for an error notification. If the cause of error notification is continuously occurred more than (INTHRH1) frames, the error request is generated. Note that the value H'FF is setting prohibited.
23 to 16	INTHRH [7:0]	0	R/W	Threshold for unmatched error notification This parameter specified a threshold value for an error notification. If the cause of error is continuously occurred more than (INTHRH) frames, the error request is generated. Note that the value H'FF is setting prohibited.
15 to 0	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(f) VI6_SMG_MPMR

MPMR specifies the pixel data format

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	-	—	—	—	—	—	—		CMPBT
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPDFA[7:0]								CMPDAUF	—	—	—				
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description

16	CMPBT	0	R/W	Invalid bits truncation 0: No truncation (For ARGB8888, RGB888, or YcbCr444, YcbCr422) 1: Apply truncation (For RGB565)
15 to 8	CMPDFA[7:0]	0	R/W	Default alpha value in case of RGB888 (4 bytes format) This parameter specifies the default alpha value. It is used when CMPDAUF is 1.
7	CMPDAUF	0	R/W	This flag specifies the alpha value, which is used for CRC calculation in case of RGB888 (4 bytes format). 0: Use alpha value with pixel value 1: Use default alpha value (CMPDFA)
31 to 17, 6 to 0	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(g) VI6_SMG_MECRCR

MECRCR specifies the expectation value of the CRC code for unmatched error detection.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPECRC [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPECRC [15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPECRC [31:0]	0	R/W	Expected CRC for unmatched error detection This parameter specifies the expectation of the CRC.

(h) VI6_SMG_MCCRCR

MCCRCR indicates the CRC value of current display image. It is reflected at the end of whole frame (V-valid)

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPCCRC [31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPCCRC [15:0]															

Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPCCRC [31:0]	0	R	CRC of current display frame. This parameter indicates the CRC value of current image. These bits are valid when SMG enable error detection features

(i) VI6_SMG_MSPXR

MSPXR specifies horizontal offset the CRC calculation area in the image.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSPX [12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSPX [12:0]	0	R/W	Horizontal offset of the CRC calculation area. This parameter specifies horizontal offset of the CRC calculation area. It should be less or equal to horizontal size of input image (up to 8190) and below condition: VI6_SMG_MSPXR.CMPSPX[12:0] + VI6_SMG_MSZXR.CMPSZX[12:0] <= “WPF output horizontal size to SMG”
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(j) VI6_SMG_MSPYR

MSPYR specifies vertical offset the CRC calculation area in the image.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSPY [12:0]												
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSPY [12:0]	0	R/W	Vertical offset of the CRC calculation area This parameter specifies vertical offset of the CRC calculation area. It should be less or equal to vertical size of input image (up to 8190) and below condition: VI6_SMG_MSPYR.CMPSPY[12:0] + VI6_SMG_MSZYR.CMPSZY[12:0] <= “WPF output vertical size to SMG”
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(k) VI6_SMG_MSZXR

MSZXR specifies horizontal size of the CRC calculation area.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSZX [12:0]												
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSZX [12:0]	0	R/W	Horizontal size of the CRC calculation area. This parameter specifies horizontal size of the CRC calculation area. It should be less or equal to (horizontal size of input image – CMPSPX) (up to 8190) and below condition: VI6_SMG_MSPXR.CMPSPX[12:0] + VI6_SMG_MSZXR.CMPSZX[12:0] <= “WPF output horizontal size to SMG”
31 to 13	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(l) VI6_SMG_MSZYR

MSZYR specifies vertical size of the CRC calculation area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CMPSZY[12:0]												
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	CMPSZY [12:0]	0	R/W	Vertical size of the CRC calculation area. This parameter specifies vertical size of the CRC calculation area. It should be less or equal to (vertical size of input image – CMPSPY) (up to 8190)) and below condition: VI6_SMG_MSPYR.CMPSPY[12:0] + VI6_SMG_MSZYR.CMPSZY[12:0] <= “WPF output vertical size to SMG”
31 to 12	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(m) VI6_SMG_MCRCIR

MCRCIR specifies the initial value of the CRC.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRCINI[31:16]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRCINI[15:0]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

31 to 0	CRCINI[31:0]	H'FFFF_FFFF	R/W	CRC Initial Remainder These bits specify the initial value of reminder. If size of polynomial is smaller than 32-bit, set to LSB side.

(n) VI6_SMG_IODCFG

IODCFG specifies input/output data configuration for CRC calculation. The CRC calculation result is used for both E2E protection feature and Error detection feature.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	REFLECT_REMAINDER	—	—	—	REFLECT_INPUT	—	BYTEORDER_INPUT [2:0]		
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—							—	—	—	—	—	—	DATA_SIZE_M1 [1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
24	REFLECT_REMAINDER	1	R/W	Remainder Output Reflection This bit specifies the reflection flag of remainder output. When this bit is set to 1, the bit order of remainder output data is reversed. 0: No reflection 1: Apply reflection
20	REFLECT_INPUT	1	R/W	Input Data Reflection This bit specifies the reflection flag of input byte data. After applying byte order modification by BYTEORDER_INPUT [2:0] bits, the bit order of each byte of input data is reversed before CRC operation when this bit is set to 1. 0: No reflection 1: Apply reflection
18 to 16	BYTEORDER_INPUT [2:0]	0	R/W	Input Data Byte Order This bit specifies the byte swap setting for input data. H'0: The bit order from MSB is bit 31 to 0 H'1: The bit order from MSB is bit 23 to 16, 31 to 24, 7 to 0, 15 to 8 H'2: The bit order from MSB is bit 15 to 0, 31 to 16 H'3: The bit order from MSB is bit 7to 0, 15 to 8, 23 to 16, 31 to 24 H'4: The bit order from MSB is bit 23 to 0, 31 to 24 H'5: The bit order from MSB is bit 15 to 8, 23 to16, 31 to 24, 7 to 0 H'6: Setting prohibited

				H'7: Setting prohibited
1 to 0	DATA_SIZE_M1 [1:0]	0	R/W	Input Data Byte length These bits specify the value of byte length of input data. 00: 1-byte data (bit 31 to 24) are valid 01: 2-byte data (bit 31 to 16) are valid 10: 3-byte data (bit 31 to 8) are valid 11: 4-byte data (bit 31 to 0) are valid Note: 1. This bit specifies the byte length of modified data by BYTEORDER_INPUT [2:0] and REFLECT_INPUT bits.
31 to 25, 23 to 21, 19, 15 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(o) VI6_SMG_PEQU

PEQU indicates coefficient of polynomial equation. If polynomial is smaller than 32-bit, set it to LSB side.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VCRCPOLYEQU[31:16]															
Initial Value:	0	0	0	0	0	1	0	0	1	1	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCRCPOLYEQU[15:0]															
Initial Value:	0	0	0	1	1	1	0	1	1	0	1	1	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VCRCPOLYEQU[31:0]	H'04C11DB7	R/W	CRC Polynomial Equation Coefficient **These bits specify the** coefficient of CRC polynomial equation. If polynomial is smaller than 32-bit, set to LSB side.

(p) VI6_SMG_PSZM1

PSZM1 indicates bit length of polynomial – 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	—	—	—	—	—	—	—	—	—	—	—	VCRCPOLY_SIZE_M1[4:0]				
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W :	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	VCRCPOLY_ SIZE_M1[4:0]	H'1F	R/W	Polynomial Equation Coefficient Data Bit Length These bits specify the valid bit of coefficient which is specified by the VnCRPEC, VnCRIR, VnCRXRC. H'00: 1-bit data (bit 0) is valid H'01: 2-bit data (bit 1 and 0) are valid H'02: 3-bit data (bit 2 to 0) are valid H'03: 4-bit data (bit 3 to 0) are valid ~ H'0F: 16-bit data (bit 15 to 0) are valid H'10: 17-bit data (bit 16 to 0) are valid ~ H'1E: 31-bit data (bit 30 to 0) are valid **H'1F: 32-bit data (bit 31 to 0) are valid**
31 to 5	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(q) VI6_SMG_FXOR

FXOR indicates final XOR equation's coefficient to remainder. If equation is smaller than 32-bit, set it to LSB side. If no XOR operation is required, set 0 to FXOR.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FINAL_XOR[31:16]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FINAL_XOR[15:0]															
Initial Value :	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W :	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description

31 to 0	FINAL_XOR [31:0]	H'FFFF_FFFF	R/W	CRC Final XOR Coefficient These bits specify the XOR operation coefficient to remainder. If size of polynomial is smaller than 32-bit, set to LSB side. If no XOR operation is applied, set these bits to H'0000 0000.

(r) VI6_SMG_FRID

FRID indicates previous frame-ID for End-to-End (E2E) protection feature. This register is used as backup purpose only and accessed by host CPU.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VALID	UNIQUEID[2:0]			FRAMENUM[11:0]											
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VALID	0	R	CRC valid flag of previous frame This bit indicates previous frame ecrc_valid flag from SMG to LINK. When VALID is 0 , UNIQUEID and FRAMENUM is invalid due to previous frame is error frame (under-run)
30 to 28	UNIQUEID[2:0]	0	R/W	Frame Unique ID for each VSP This parameter indicates a unique-ID for each VSP channels.
27 to 16	FRAMENUM[11:0]	0	R	Frame number of previous frame This parameter indicates frame number of previous frame in continuous order.
15 to 0	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(s) VI6_SMG_ERRINJ

ERRINJ indicates error is forced injecting to each corresponding error notification to ECM.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERR_INJ[1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
1 to 0	ERR_INJ[1:0]	0	R/W	Force error injection to ECM. This bit indicates error is forced injecting to each corresponding error notification to ECM. Bit [0] is for unmatched error notification; Bit [1] is for frozen error notification. For each bits, below setting is can be applied 0: No error is injected to corresponding error notification 1: Error is injected to corresponding error notification
31 to 2	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(t) VI6_SMG_ECRC

ECRC indicates CRC of previous display frame for End-to-End (E2E) protection feature. This register is used as backup purpose only and accessed by host CPU.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECRCDATA[31:16]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECRCDATA[15:0]															
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECRCDATA[31:0]	0	R	CRC of previous display frame

(4) EDC Calculation

EDC calculation is no cycle delay processing. EDC code is generated in the same cycle of input pixel. EDC calculation is carried out as below steps:

SMG receives pixel output from WPF0 in format YCBCR444 or RGB. After EDC calculation, SMG send data to Display through LIF0. In case pixel format send to Display Unit is YCBCR422, set 1 to VI6_LIF0_CTRL.CFMT

Calculate EDC code for each pixel data (24bits) depending on format YCBCR422 or RGB

Output EDC is 6bits and corresponding 24bits pixel data in below figure.

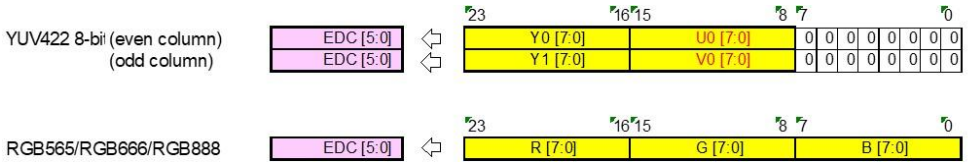

Figure 60.63 EDC calculation for each pixel format

(5) CRC calculation for ECRC (End to End CRC)

VSPD calculates CRC for one frame of output image data and outputs it to DSI/CSI2-TX as 32-bits Frame CRC.

VSPD also outputs following values to DSI/CSI2-TX for Frame CRC packet.

- The value set in VI6_SMG_FRID.UNIQUEID[2:0] as Frame ID.
- The value in VI6_WPF0_FRCNT.FRCNT[31:0] as Frame number value.

Write desirable initial value to VI6_WPF0_FRCNT.FRCNT[31:0]. VI6_WPF0_FRCNT.FRCNT[31:0] is automatically incremented by plus 1 at end of frame.

The operator can calculate CRC of any polynomial by VI6_SMG_PEQU.VCRCPOLYEQU [31:0], VI6_SMG_PSZM1VCRCPOLY_SIZE_M1 [4:0], VI6_SMG_IODCFG.REFLECT_INPUT, VI6_SMG_IODCFG.REFLECT_REMAINDER, VI6_SMG_MCRCIR.CRCINI [31:0] and VI6_SMG_FXOR.FINAL_XOR [31:0].

Following table shows setting examples.

Table 60.51 Setting Examples of CRC

CRC Type	Register	Setting Value
CRC-32 IEEE 802.3	VI6_SMG_PEQU.VCRCPOLYEQU[31:0]	H'04C1 1DB7
	VI6_SMG_PSZM1VCRCPOLY_SIZE_M1[4:0]	31
	VI6_SMG_IODCFG.REFLECT_INPUT	1
	VI6_SMG_IODCFG.REFLECT_REMAINDER	1
	VI6_SMG_MCRCIR.CRCINI	H'FFFF FFFF
	VI6_SMG_FXOR.FINAL_XOR	H'FFFF FFFF
CRC-32 AUTOSAR 4.2.2	VI6_SMG_PEQU.VCRCPOLYEQU[31:0]	H'F4AC FB13
	VI6_SMG_PSZM1VCRCPOLY_SIZE_M1[4:0]	31
	VI6_SMG_IODCFG.REFLECT_INPUT	1

	VI6_SMG_IODCFG.REFLECT_REMAINDER	1
	VI6_SMG_MCRCIR.CRCINI	H'FFFF FFFF
	VI6_SMG_FXOR.FINAL_XOR	H'FFFF FFFF
CRC-16 CCITT-FALSE	VI6_SMG_PEQU.VCRCPOLYEQU[31:0]	H'0000 1021
	VI6_SMG_PSZM1VCRCPOLY_SIZE_M1[4:0]	15
	VI6_SMG_IODCFG.REFLECT_INPUT	0
	VI6_SMG_IODCFG.REFLECT_REMAINDER	0
	VI6_SMG_MCRCIR.CRCINI	H'0000 FFFF
	VI6_SMG_FXOR.FINAL_XOR	H'0000 0000
CRC-8 SAE J1850	VI6_SMG_PEQU.VCRCPOLYEQU[31:0]	H'0000 001D
	VI6_SMG_PSZM1VCRCPOLY_SIZE_M1[4:0]	7
	VI6_SMG_IODCFG.REFLECT_INPUT	0
	VI6_SMG_IODCFG.REFLECT_REMAINDER	0
	VI6_SMG_MCRCIR.CRCINI	H'0000 00FF
	VI6_SMG_FXOR.FINAL_XOR	H'0000 00FF
CRC-21 0x102899	VI6_SMG_PEQU.VCRCPOLYEQU[31:0]	H'0010 2899
	VI6_SMG_PSZM1VCRCPOLY_SIZE_M1[4:0]	20
	VI6_SMG_IODCFG.REFLECT_INPUT	1
	VI6_SMG_IODCFG.REFLECT_REMAINDER	1
	VI6_SMG_MCRCIR.CRCINI	H'001F FFFF
	VI6_SMG_FXOR.FINAL_XOR	H'001F FFFF

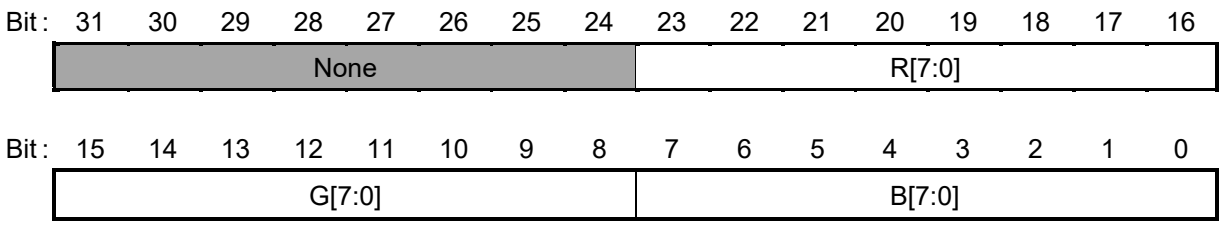
Description below shows the pixel formats and corresponding settings for CRC calculation:

(a) RGB888 (3bytes)

This format is used for CRC calculation 3 bytes per pixel.

- ✓ Set 2 to VI6_SMG_IODCFG.DATA_SIZE_M1
- ✓ Set 4 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 0)

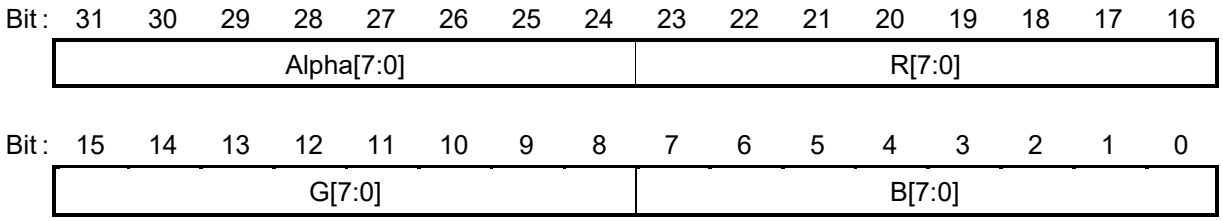
  Set 3 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 1)
- ✓ Set 0 to VI6_LIF0_CTRL.CFMT



(b) ARGB8888 (4bytes)

This format is used for CRC calculation 4 bytes per pixel.

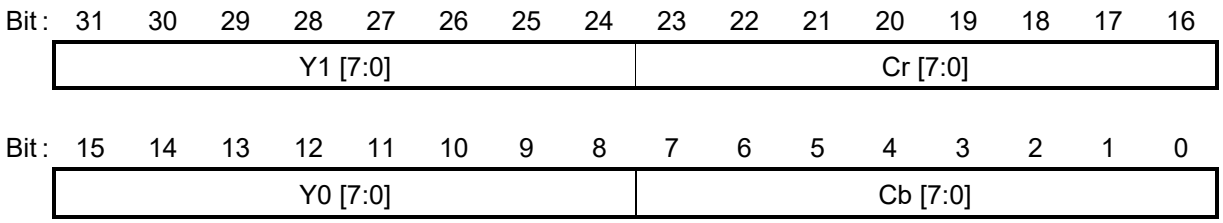
- ✓ Set 1 to VI6_SMG_MPMR.CMPDAUF
- ✓ Set alpha value to VI6_SMG_MPMR.CMPDFA
- ✓ Set 3 to VI6_SMG_IODCFG.DATA_SIZE_M1
- ✓ Set 0 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 0)Set 3 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 1)
- ✓ Set 0 to VI6_LIF0_CTRL.CFMT



(c) YcbCr422

For YcbCr422 format, SMG converts input pixel format YcbCr444 – 8bit to YcbCr422 8bit before CRC calculation. SMG allocates two neighbor pixels as below format for CRC calculation:

- ✓ Set 3 to VI6_SMG_IODCFG.DATA_SIZE_M1
- ✓ Set 0 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 0)Set 3 to VI6_SMG_IODCFG.BYTEORDER_INPUT (In case of VI6_SMG_IODCFG.REFLECT_INPUT= 1)
- ✓ Set 1 to VI6_LIF0_CTRL.CFMT



(6) Setting Rectangle Region

Below figure describes how to set the rectangular area to the CRC calculation.

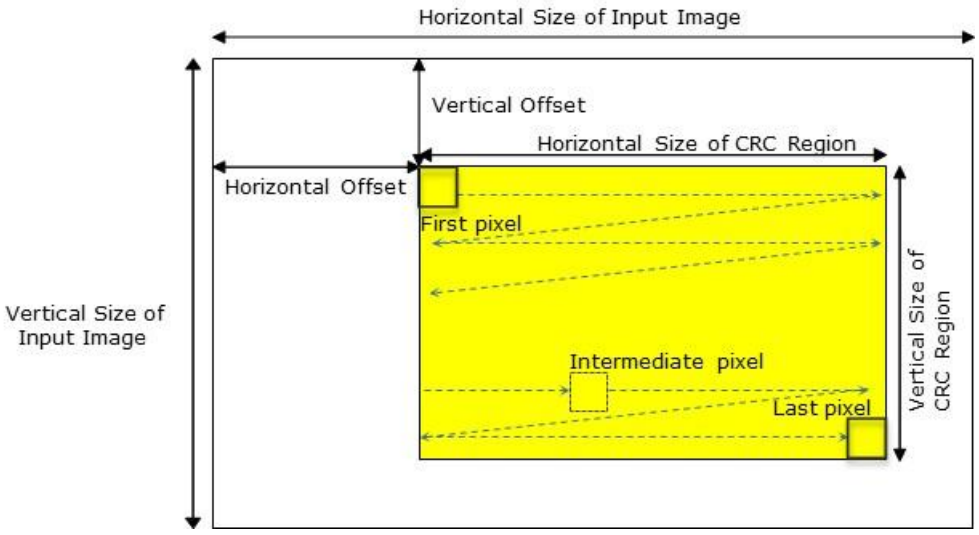


Figure 60.64 Example Case of the CRC computation area

Table 60.52 Register setting for the CRC Computation Area

Word in Figure	Register of SMG	Description
Horizontal Size of Input Image		This parameter is horizontal size of input image for the SMG. It is set by VSPD's register.
Vertical size of Input Image		This parameter is vertical size of input image for the SMG. It is set by VSPD's register.
Horizontal Offset	MSPXR	This parameter specifies horizontal offset position of the CRC calculation area from left border of the input image. The offset value is the pixel unit.
Vertical Offset	MSPYR	This parameter specifies vertical offset position of the CRC calculation area from top border of the input image. The offset value is the line unit.
Horizontal Size of CRC Region	MSZXR	This parameter specifies horizontal size of the CRC calculation area. It should be less or equal to (Horizontal size of input image – Horizontal offset). The size is the pixel unit.
Vertical Size of CRC Region	MSZYR	This parameter specifies vertical size of the CRC calculation area. It should be less or equal to (Vertical size of input image – Vertical offset). The size is the line unit.

(7) Timing Chart of CRC Computation for unmatched/frozen error detection

Following figure shows the timing chart example of CRC computation and comparing for unmatched/frozen error detection.

- ✓ SMG starts error detection operation from the following frame after setting MCR.CMPR to 1.
- ✓ The CRC code is calculated in the specified rectangular area.
- ✓ The result of the CRC code is compared with the expectation (MECRCR) and the previous value (CMPCCRC).
- ✓ If the CRC code doesn't match with the expectation value, MSTR.CMPST bit is set to 1.
- ✓ If the CRC code matches with the previous value, MSTR.CMPPRE bit is set to 1.

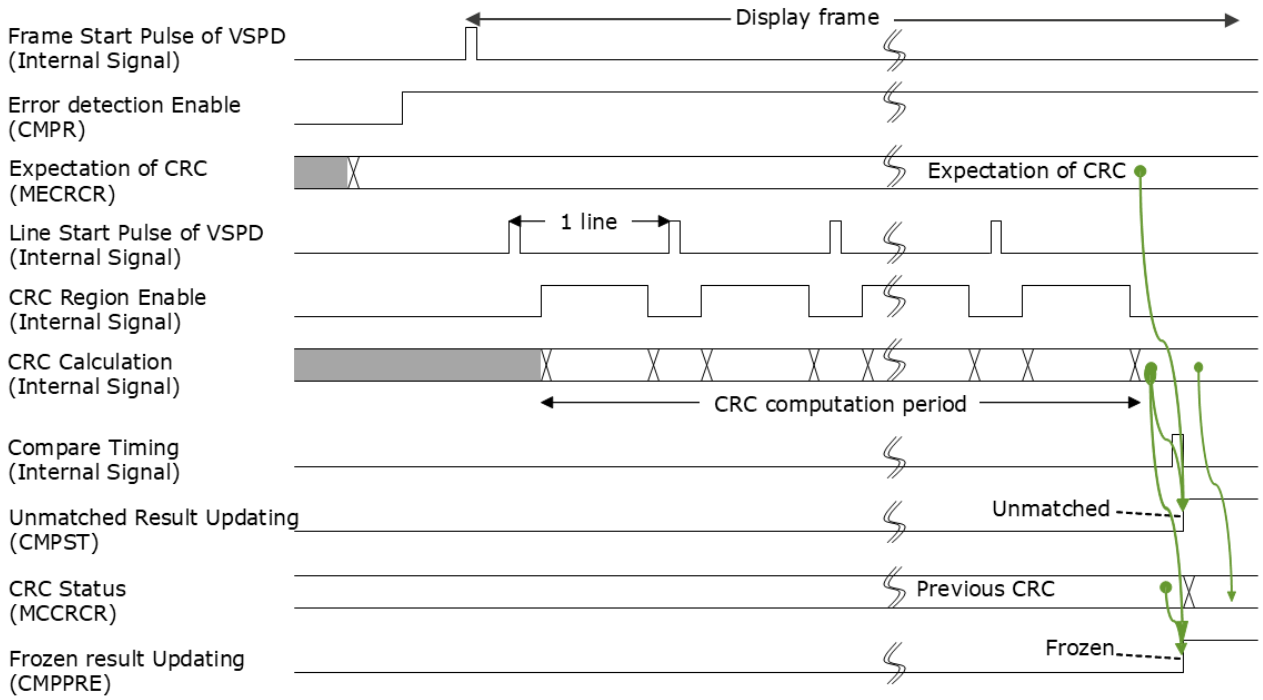

Figure 60.65 Timing of CRC Computation and Comparing for Error Detection

(8) Register Update Timing

(a) Update Timing of Register Setting in Error Detection feature

All registers except for VI6_SMG_MCR.CMPR are reflected in the internal register immediately. Therefore they should be set during VI6_SMG_MCR.CMPRU is 0.

The VI6_SMG_MCR.CMPR is reflected in the internal register at the beginning of the frame processing. It can be updated at any time.

(b) Update Timing of Status Register in Error Detection feature

The VI6_SMG_MSTR and VI6_SMG_MCCRCR are updated at the end of the frame processing. The VI6_SMG_MCR. CMPRU is updated at the beginning of the frame processing.

The following figure shows an example timing of register updating.

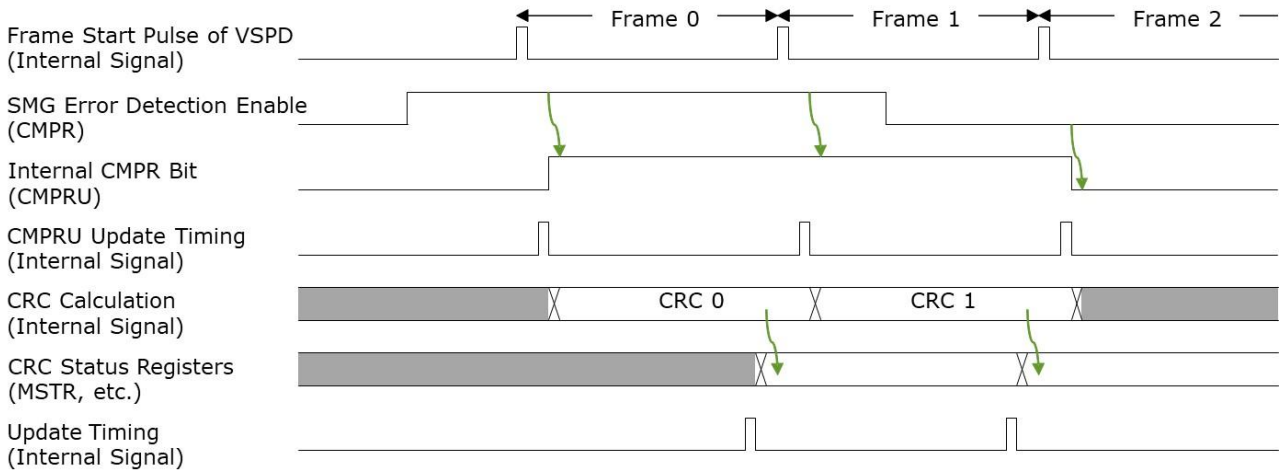

Figure 60.66 Example Timing of Register Updating

62. Frame Compression Processor (FCP)

62.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The FCP is a companion module of a video processing module in R-Car 4th generation. It provides data compression and decompression, data caching, and converting of AXI transaction in order to reduce the memory bandwidth.

62.2 Reserved

62.3 FCP for VSP (FCPV)

The FCPV conducts the bus accesses with 256bit AXI bus for the Renesas video signal processor (VSP). This module is under control of software for the VSP with the control function of the FCPV executed on the host CPU.

There are two configurations of the FCPV. Those are FCPVX and FCPVD.

Table 62.1 Configuration Type of the FCPV

Type	Description
FCPVX	For VSPX
FCPVD	For VSPD

62.3.1 Features

The FCPVD and FCPVX have the following features.

- Support out-of-order for the whole outstanding transactions

Table 62.2 Main Function of the FCPV

Item	Description
Picture size supported	Minimum: 1pixels x 1lines Maximum: 8190pixels x 8190 lines The picture sizes must follow the restriction specified in the section “60. Video Signal Processor (VSP2)” (sections “Usage Notes”, “Input Image Size” and “Output Image Size”).
Color format supported	Support all formats specified in the section “60. Video Signal Processor (VSP2)” (sections “Register Descriptions”, “RPFn Input Format Registers (VI6_RPFn_INFMT)” and “WPF0 Output Format Registers (VI6_WPF0_OUTFMT)”).
AXI transactions	Read access: Access at 256 bytes boundary Support out-of-order for the whole outstanding transactions Support data interleaving Write access: Access at 256 bytes boundary Support out-of-order for the whole outstanding transactions

62.3.2 Block Diagram

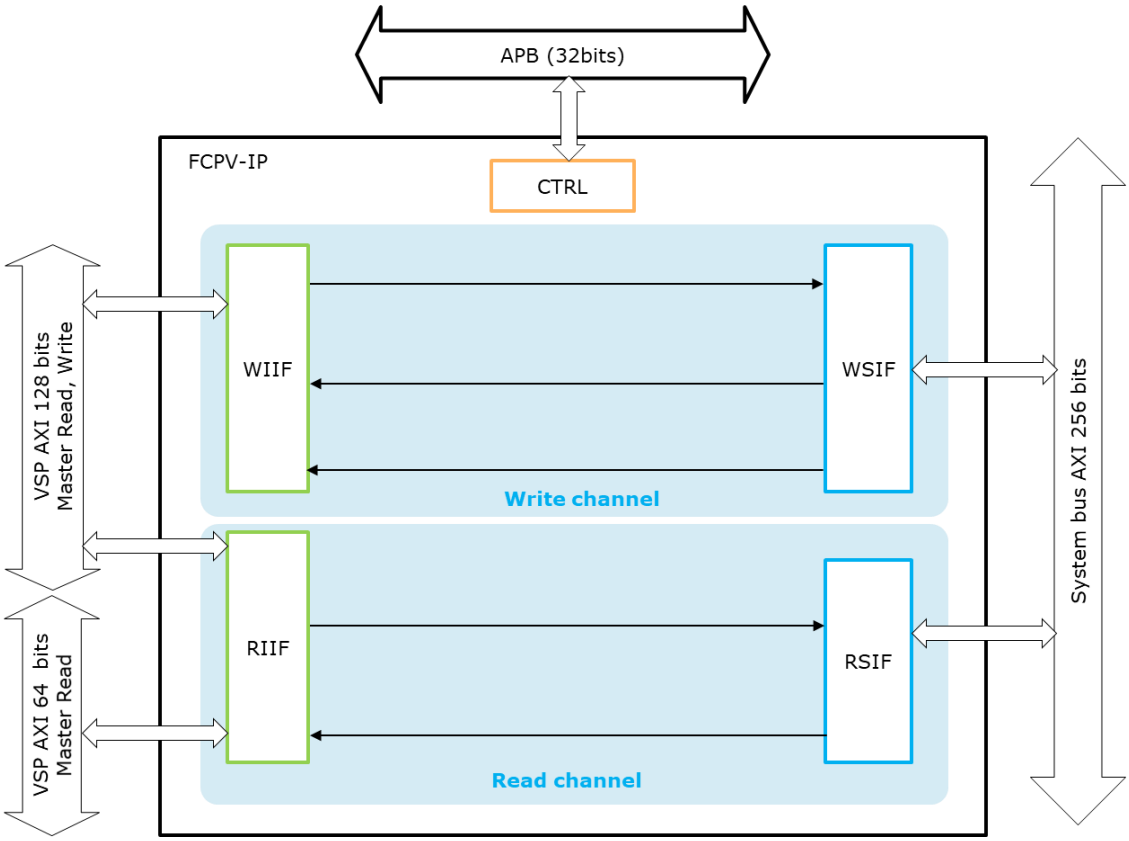

Figure 62.1 Overall Configuration of the FCPV

Table 62.3 Sub-module Description

Abbr.	Description	Abbr.	Description
WIIF	VSP write channel interface	CTRL	FCPV controller
WSIF	System AXI write channel interface	RIIF	VSP read channel interface
-	-	RSIF	System AXI read channel interface

62.3.3 IP Set and Bus Access Functions

FCPV does not work alone but in companion with other IPs (**VSPD/VSPX**) in an IP set. For each IP set the bus access function conducted by FCPV is different.

Table 62.4 Bus access function for each IP set

IP set	Bus access
VSPD + FCPVD	Following functions are conducted by FCPV - Read linear addressing image data - Read display list data - Write image data

VSPX + FCPVX	Following functions are conducted by FCPV - Read linear addressing image data - Read display list data

62.3.4 Register Configuration

The FCPV contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. Never access the registers when the FCPV is in the module standby mode (with the operation clock placed in hold status).

The following are the base addresses of the FCPV channels.

- FCPVD0: H'FEA1 0000
- FCPVX0: H’FEDB 0000

Table 62.5 List of FCPV Register

Name of Register	Abbreviation	R/W	Offset from Base Address	Initial Value	Access size
FCPV version control register	FCP_VCR	R	H’0000	VCR_INIT (*1)	32
			H’0004-H’000C		
FCP reset register	FCP_RST	R/W	H’0010	H’0000 0000	32
			H’0014		
FCP status register	FCP_STA	R	H’0018	H’0000 0000	32
			H’001C-H’01FC		

(*1) VCR_INIT: depend on product generation, refer to section 62.3.6.1 for detail

62.3.5 Connected Module

Following table shows modules connected to the FCPV.

Table 62.6 Connected Module

Module	Connected Module	Description
FCPVX	VSPX	VSP for ISP data transferring
FCPVD	VSPD	VSP for blending and display output

62.3.6 Register Description

62.3.6.1 FCP_VCR: FCPV version Control Register

FCP_VCR is the version control register of the FCPV. The value read is fixed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATEGORY								REVISION							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CATEGORY	H’01	R	FCP use case category. 1: R-Car
7 to 0	REVISION	H’0B	R	Version of LSI product H’0B: FCP revision is R-Car V4M

62.3.6.2 FCP_RST: FCP Reset Register

FCP_RST: FCP Reset Register

FCP_RST controls the FCPV reset operation. The reset operation of the FCPV highly depends on the reset sequence of the connected VSP. For detailed information, refer to the section 62.3.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MODRST	—	—	—	SOFTRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MODRST	0	R/W	FCPV MODule ReSeT This reset stops the FCPV module immediately regardless of the bus transaction state. To operate the FCPV after this reset, reconfigure all FCPV registers. After the active period of MODRST is finished, it is switched back to 0 automatically. 0: NOP 1: Forcibly terminate the FCPV operation. NOTE: Do not set both MODRST and SOFTRST bit to 1.
3 to 1	-	0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SOFTRST	0	R/W	FCPV SOFT ReSeT This reset stops the FCPV module after finishing active bus transaction. To operate the FCPV after this reset, reconfigure all FCPV registers. After the active period of SOFTRST is finished, it is switched back to 0 automatically. 0: NOP 1: Terminates the FCPV operation. NOTE: Do not set both MODRST and SOFTRST bit to 1.

62.3.6.3 FCP_STA: FCP Status Register

FCP_STA indicates the FCPV status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ACT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0 or 1. Do not care about this value. The write value should always be 0.
0	ACT	0	R	FCPV Active Flag 0: Indicates the FCPV is not active. 1: Indicates the FCPV is active.

62.3.7 Operation

FCPV is not invoked directly by register setting. It works if there are bus accesses from the connected IP VSP. This section explains how to control operation for FCPV connected with VSP.

62.3.7.1 Operation Control Setting IP set VSPX+FCPVX

(a) FCPVX initialization

FCPVX must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

(b) To start image process of VSPX + FCPVX

FCPVX registers do not need to be set when starting an image process. Therefore, refer section "60. Video Signal Processor (VSP2)" for the guidance of starting an image process.

(c) To stop image process of VSPX+FCPVX immediately

Do following steps to stop immediately an image process of VSPX + FCPVX

1. Set value 1 to VSPX register VI6_WPF0_IRQ_ENB.FREE so that frame end interruption can be issued.
2. Set value 1 to VSPX register VI6_SRESET.SRST0. VSPX will invoke termination process immediately.
3. Wait frame end interruption from VSPX or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPX has finished its processing.
4. Set value 1 to FCPVX register FCP_RST.SOFTRST. FCPVX will invoke termination process immediately.
5. Wait until ACT bit of the FCP_STA register and become 0. After it occurs, FCPVX has finished its processing.

With this procedure, VSPX can stop its process quickly, but the output frame of the last frame is corrupted.

62.3.7.2 Operation Control Setting for IP set VSPD+FCPVD

(a) FCPVD initialization

FCPVD must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

(b) To start image process of VSPD+FCPVD

FCPVD registers do not need to be set when starting an image process. Therefore, refer the section "60.Video Signal Processor (VSP2)" for the guidance of starting an image process.

(c) To stop image process of VSPD+FCPVD immediately

Do following steps to stop immediately an image process

1. Stop the DU first if it is connected with VSPD (VI6_LIF0_CTRL.LIF_EN = 1). Refer to the section "64. Display Unit (DU)" for the way of stopping the DU.
2. Set value 1 to VSPD register VI6_WPF0 _IRQ_ENB.FREE so that frame end interruption can be issued.
3. Set value 1 to VSPD register VI6_SRESET.SRST0. VSPD will invoke termination process immediately.
4. Wait frame end interruption from VSPD or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPD has finished its processing.
5. Set value 1 to FCPVD register FCP_RST.SOFTRST. FCPVD will invoke termination process immediately. (*1)
6. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPVD has finished its processing. (*1)

NOTE:

With this procedure, VSP can stop its process quickly, but the output frame of the last frame is corrupted.

62.3.7.3 Reset Operation

FCPV reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPV operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPV logic immediately.

(1) Software Reset

1) Activate software reset sequence

   Set FCP_RST.SOFTRST to the value 1.

2) Confirm software reset sequence finished:

   FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

The procedure to stop operation of FCPV and connected IP is descripted at section 62.3.7.1.

(2) Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of FCPV.

62.3.8 Usage Notes

62.3.8.1 Manipulating FCPV+VSP with CPG module stop, software reset

When using Module stop and Software Reset for VSP and FCPV, follow the notes 1) to 2) to prevent FCPV, VSP from the unstable status which may cause hang or wrong operation.

Note 1) Stop sequence of VSP and FCPV.

Take stop process of VSP and FCPV guide in 62.3.7 before applying Software Reset and enabling Module Stop specified in section 9.

Note 2) Start sequence of VSP and FCPV

Take start process of VSP and FCPV guide in section “60. Video Signal Processor (VSP2)” after applying Software Reset and disabling Module Stop

62.3.9 Safety mechanism

62.3.9.1 Safety mechanism of ISP M2M path (include VSPX/FCPVX)

The Runtime region include the whole path from FCPVX to ISP output. However, because the Runtime test does not cover for MBIST the SRAM of FCPVX supports EDC for the safety of SRAM. FCPVX supports EDC for response buffer. The EDC error is sent to VSP to issue error notification (interruption) to ECM.

63. Data Compression Processor (FCPR)

63.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The FCPR is a data compression and decompression module. It provides lossless data compression and decompression to reduce the memory bandwidth.

The FCPR consists of three modules as FCPRC, FCPRS and FCPRM.

The following Figure 63.1 shows an overview of each module.

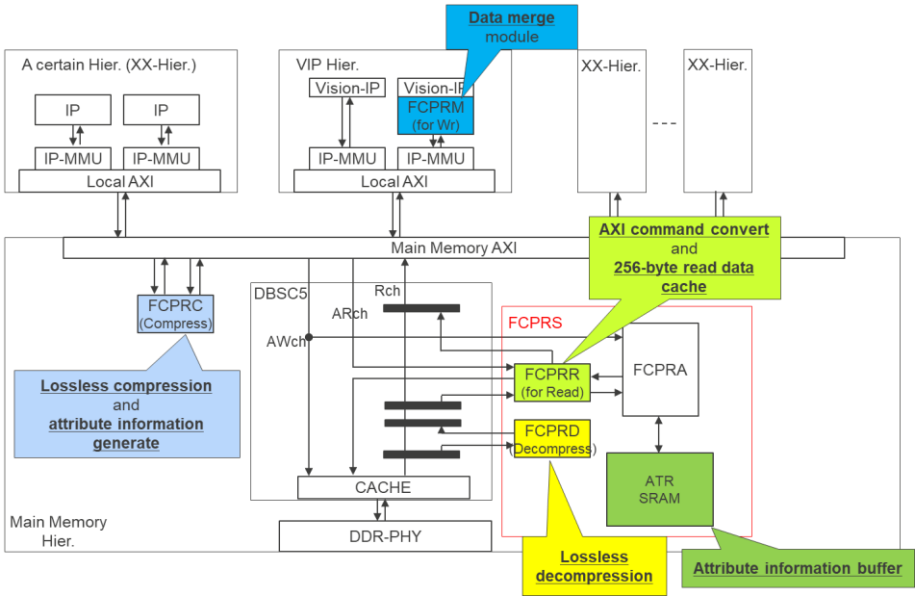

Figure 63.1 LSI System Block Diagram

(1) FCPRC

The FCPRC is connected to AXMM for data compression.

The FCPRC is a lossless compression module to reduce the memory bandwidth. In compression, it also generates attribute information (ATR).

(2) FCPRS

The FCPRS is connected to DBSC for data decompression.

The FCPRS is a lossless decompression module. This module consists of FCPRR, FCPRA and FCPRD.

(3) FCPRM

The FCPRM is a module that merges write data of less than 256 bytes.

(4) FCPRR

The FCPRR is an AXI command converter for lossless decompression. The FCPRR cooperates with FCPRD to decompress data.

(5) FCPRA

The FCPRA manages the SRAM buffer of ATR.

(6) FCPRD

The FCPRD is a decompression core module.

63.1.1 Features

The feature of the FCPR is lossless compression.

Lossless compression ratio is typically 60% (compressed/original). It may not be compressed since lossless compression relies on the statistical nature of the original data.

63.1.2 Register Configuration

The FCPRC and FCPRM contain the registers which the host CPU can read and write directly. The host can access any long word (32-bit) in the registers. All FCPR registers are writable and readable by only 32-bit unit. To write partial bits in 32-bit, read-modify-write is needed.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. In the module standby mode (with the operation clock placed in hold status), FCPR ignores write data. Read data is unstable and meaningless.

Do not access registers of FCPR during CPG soft reset or module stop processing.

Table 63.1 is the base addresses of the FCPR.

Table 63.2, Table 63.3, Table 63.4 and Table 63.5 show list of FCPR register.

Table 63.1 FCPR base address

Bus Domain	Master IP	FCPR	FCPR base address
VIP	DOF	FCPRM_DOF (Expressed as "VIP AXI Bus Register" in Area map)	H'E7AB 1000
MM	-	FCPRC	H'E67A 3000
	AXMM	FCPR	H'E678 5700
	DBSC5	FCPRS	H'E679 0000

Table 63.2 List of FCPRC Register

Name of Register	Abbreviation	R/W	Offset from Base Address	Initial Value	Access size
FCPRC identification information register	FCPRC_VID	R	H'000C	H'0000 144F	32
FCPRC reset register	FCPRC_RST	R/W	H'0010	H'0000 0000	32
FCPRC clock stop control register	FCPRC_CLK_STOP	R/W	H'001C	H'0000 0000	32
FCPRC lossless compression status 0 register	FCPRC_CMP_STA0	R/W	H'0040	H'0000 0000	32
FCPRC lossless compression status 1 register	FCPRC_CMP_STA1	R/W	H'0044	H'0000 0000	32
FCPRC error detection status register	FCPRC_EDC_STS	R/W	H'0074	H'0000 0000	32
FCPRC bus error detection status register	FCPRC_BUSEDC_STS	R/W	H'0080	H'0000 0000	32
FCPRC bus error detection source0 register	FCPRC_BUSEDC_SRC0	R/W	H'0084	H'0000 0000	32
FCPRC bus error detection control register	FCPRC_BUSEDC_CTL	R/W	H'008C	H'0000 0000	32

Table 63.3 List of FCPRM Register

Name of Register	Abbreviation	R/W	Offset from Base Address	Initial Value	Access size
FCPRM identification information register	FCPRM_VID	R	H'000C	H'0000 144F	32
FCPRM reset register	FCPRM_RST	R/W	H'0010	H'0000 0000	32
FCPRM buffer clear register	FCPRM_BRST	R/W	H'0020	H'0000 0000	32
FCPRM buffer flush register	FCPRM_BFLS	R/W	H'0024	H'0000 0000	32
FCPRM data merge control register	FCPRM_MRG_CTRL	R/W	H'0030	H'0000 0000	32
FCPRM error detection status register	FCPRM_EDC_STS	R/W	H'0074	H'0000 0000	32
FCPRM merge enabled area start address 0 register	FCPRM_MRG_STADR0	R/W	H'0084	H'0000 0000	32
FCPRM merge enabled area end address 0 register	FCPRM_MRG_EDADR0	R/W	H'0088	H'0000 0000	32
FCPRM merge enabled area start address 1 register	FCPRM_MRG_STADR1	R/W	H'0094	H'0000 0000	32
FCPRM merge enabled area end address 1 register	FCPRM_MRG_EDADR1	R/W	H'0098	H'0000 0000	32
FCPRM merge enabled area start address 2 register	FCPRM_MRG_STADR2	R/W	H'00A4	H'0000 0000	32
FCPRM merge enabled area end address 2 register	FCPRM_MRG_EDADR2	R/W	H'00A8	H'0000 0000	32

Name of Register	Abbreviation	R/W	Offset from Base Address	Initial Value	Access size
FCPRM merge enabled area start address 3 register	FCPRM_MRG_STADR3	R/W	H'00B4	H'0000 0000	32
FCPRM merge enabled area end address 3 register	FCPRM_MRG_EDADR3	R/W	H'00B8	H'0000 0000	32

FCPRS cache line 5 control register	FCPRS_CL5_CTRL	R/W	H'0618	H'0000 0000	32
FCPRS cache line 6 control register	FCPRS_CL6_CTRL	R/W	H'061C	H'0000 0000	32
FCPRS cache line 7 control register	FCPRS_CL7_CTRL	R/W	H'0620	H'0000 0000	32
FCPRS error detection control register	FCPRS_EDC_CTL	R/W	H'7700	H'0000 0000	32
FCPRS error detection status register	FCPRS_EDC_STA	R	H'7704	H'0000 0000	32
FCPRS error detection status clear register	FCPRS_EDC_STA_CLR	R/W	H'7708	H'0000 0000	32
FCPRS lossless decompression status 0 register	FCPRS_ATR_STA0	R	H'770C	H'0000 0000	32
FCPRS lossless decompression status 0 clear register	FCPRS_ATR_STA0_CLR	R/W	H'7710	H'0000 0000	32
FCPRS lossless decompression status 1 register	FCPRS_ATR_STA1	R	H'7714	H'0000 0000	32
FCPRS lossless decompression status 1 clear register	FCPRS_ATR_STA1_CLR	R/W	H'7718	H'0000 0000	32

63.1.3 Connected Module

Table 63.6, Table 63.7 and Table 63.8 show modules connected to the FCPRC, FCPRS and FCPRM.

Table 63.6 FCPRC Connected Module

Module	Connected Module	Description
FCPRC	CPG	Clock controller
	ECM	Error control module
	Hire ECM	BUS hierarchy error control module
	AXI-BUS	Bus

Table 63.7 FCPRS Connected Module

Module	Connected Module	Description
FCPRS	DBSC5	External Bus Controller for SDRAM
	CPG	Clock controller
	ECM	Error control module

Table 63.8 FCPRM Connected Module

Module	Connected Module	Description
FCPRM	DOF	Optical Flow
	CPG	Clock controller
	ECM	Error control module
	AXI-BUS	Bus

63.2 Register Description

63.2.1 FCPRC Register Description

63.2.1.1 FCPRC Identification Information Register (FCPRC_VID)

FCPRC_VID is identification information register of the FCPRC. The read value is fixed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCID															
Initial value:	0	0	0	1	0	1	0	0	0	1	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
15 to 0	VCID	H’144F	R	Identification number (FCP)

63.2.1.2 FCPRC Reset Register (FCPRC_RST)

FCPRC_RST controls the FCPRC reset operation. For detailed information, refer to the section 63.3.9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FCP RSTF	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
4	FCPRSTF	0	R/W	FCPRC module forced reset. This reset stops the FCPRC module immediately. To operate the FCPRC after this reset, reconfigure all FCPRC registers. After the active period of FCPRSTF is finished, it is switched back to 0 automatically. 0: NOP 1: Stop the FCPRC operation.
3 to 0	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.

63.2.1.3 FCPRC Clock Stop Control Register (FCPRC_CLK_STOP)

FCPRC_CLK_STOP controls the clock stop operation for the FCPRC lossless compression core (COMP).

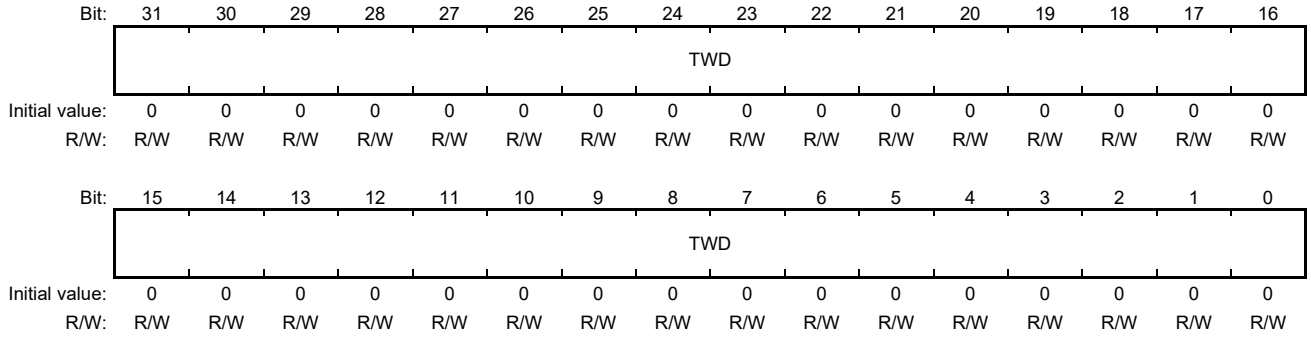
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CC STP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	CCSTP	0	R/W	COMP Clock Supply Setting. Control enabling / disabling of the clock stop operation. 0: Clock supply begins at when the outstanding counter is not 0. When the outstanding counter is 0, the clock supply to it stops. (Initial value) 1: Always supplies the operation clock.

63.2.1.4 FCPRC Lossless Compression Status 0 Register (FCPRC_CMP_STA0)

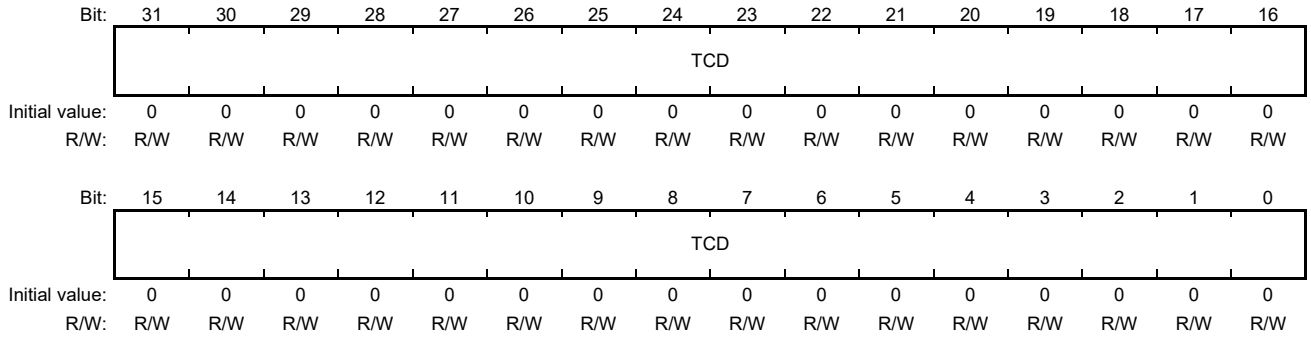
FCPRC_CMP_STA0 indicates the FCPRC lossless compression status.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TWD	0	R/W	Total amount of write data to compression area in 64-byte unit. Data size before compression. To clear it, write 0 to this register. Note that writing not 0 doesn't change it.

63.2.1.5 FCPRC Lossless Compression Status 1 Register (FCPRC_CMP_STA1)

FCPRC_CMP_STA1 indicates the FCPRC lossless compression status.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TCD	0	R/W	Total amount of compressed data in 64-byte unit. Data size after compression. To clear it, write 0 to this register. Note that writing not 0 doesn't change it.

63.2.1.6 FCPRC Error Detection Status Register (FCPRC_EDC_STS)

FCPRC_EDC_STS indicates the FCPRC error detection status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CRC ERR	RAM ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
1	CRCERR	0	R/W	CRC error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it. For details, refer 63.5.6.
0	RAMERR	0	R/W	RAM checksum error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it. For details, refer 63.5.1.

Note: error injection function

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	–	–	W	If this register is set to 0x5361_6c74, FCPRC issue error notification to ECM module. Note that DCLSERR and RAMERR don't change its value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	–	–	W	If this register is set to 0x5361_6c75, Controller module issue error injection pulse to DCLS comparator module. Note that DCLSERR and RAMERR don't change its value.

63.2.1.7 FCPRC Bus Error Detection Status Register (FCPRC_BUSEDC_STS)

FCPRC_BUSEDC_STS indicates the Bus EDC error detection status. For overview of bus safety mechanisms, refer section 18.5.

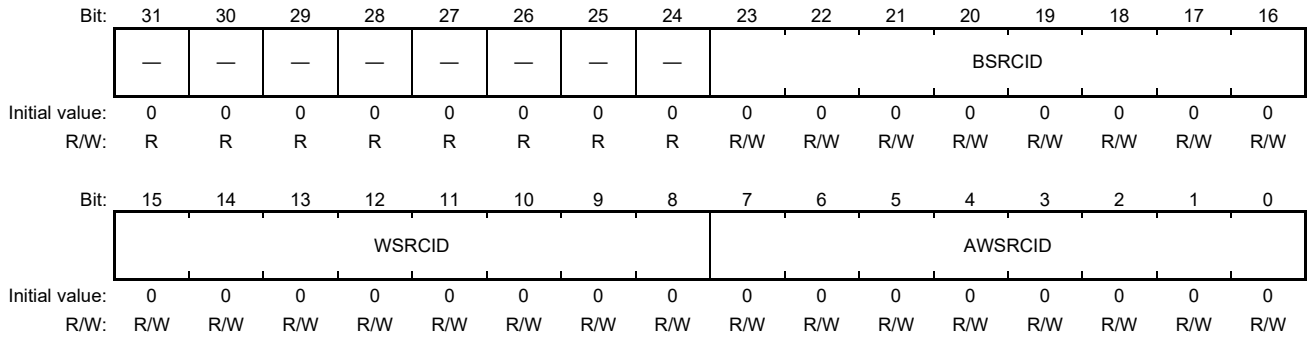
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	WBST ERR	BTID ERR	—	—	—	—	—	BEDC ERR	WEDC ERR	AWED CERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
9	WBSTERR	0	R/W	AXI W channel BstID error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.
8	BTIDERR	0	R/W	AXI B channel TID error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.
7 to 3	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
2	BEDCERR	0	R/W	AXI B channel EDC error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.
1	WEDCERR	0	R/W	AXI W channel EDC error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.
0	AWEDCERR	0	R/W	AXI AW channel EDC error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it.

63.2.1.8 FCPRC Bus Error Detection Source0 Register (FCPRC_BUSEDC_SRC0)

FCPRC_BUSEDC_SRC0 indicates the SrcID of error transaction. For overview of bus safety mechanisms, refer section 18.5.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
23 to 16	BSRCID	0	R/W	SrcID of error transaction at B channel To clear it, write 0 to this register. Note that writing not 0 doesn't change it
15 to 8	WSRCID	0	R/W	SrcID of error transaction at W channel To clear it, write 0 to this register. Note that writing not 0 doesn't change it.
7 to 0	AWSRCID	0	R/W	SrcID of error transaction at AW channel To clear it, write 0 to this register. Note that writing not 0 doesn't change it.

63.2.1.9 FCPRC Bus Error Detection Control Register (FCPRC_BUSEDC_CTL)

FCPRC_BUSEDC_CTL controls the error injection mode for the Bus EDC module. For overview of bus safety mechanisms, refer section 18.5.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BERRINJ	WERRINJ	AWERRINJ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
2	BERRINJ	0	R/W	Error Injection mode enable at B channel Writing 1 to this bit assert error injection to BUS EDC module. When 0 is written, the error injection is deasserted.
1	WERRINJ	0	R/W	Error Injection mode enable at W channel Writing 1 to this bit assert error injection to BUS EDC module. When 0 is written, the error injection is deasserted.
0	AWERRINJ	0	R/W	Error Injection mode enable at AW channel Writing 1 to this bit assert error injection to BUS EDC module. When 0 is written, the error injection is deasserted.

63.2.2 FCPRM Register Description

63.2.2.1 FCPRM Identification Information Register (FCPRM_VID)

FCPRM_VID is identification information register of the FCPRM. The read value is fixed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCID															
Initial value:	0	0	0	1	0	1	0	0	0	1	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
15 to 0	VCID	H’144F	R	Identification number (FCP)

63.2.2.2 FCPRM Reset Register (FCPRM_RST)

FCPRM_RST controls the FCPRM reset operation. For detailed information, refer to the section 63.3.9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FCP RSTF	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
4	FCPRSTF	0	R/W	FCPRM module forced reset. This reset stops the FCPRM module immediately. To operate the FCPRM after this reset, reconfigure all FCPRM registers. After the active period of FCPRSTF is finished, it is switched back to 0 automatically. 0: NOP 1: Stop the FCPRM operation.
3 to 0	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.

63.2.2.3 FCPRM Buffer Clear Register (FCPRM_BRST)

FCPRM_BRST controls reset operation of the buffer of write data. For detailed information, refer to the section 63.3.6.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	BRST ID9	BRST ID8	BRST ID7	BRST ID6	BRST ID5	BRST ID4	BRST ID3	BRST ID2	BRST ID1	BRST ID0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
9	BRSTID9	0	R/W	Reset the buffer of write data of ID9. 0: NOP 1: reset The read value is always 0.
8	BRSTID8	0	R/W	Reset the buffer of write data of ID8. 0: NOP 1: reset The read value is always 0.
7	BRSTID7	0	R/W	Reset the buffer of write data of ID7. 0: NOP 1: reset The read value is always 0.
6	BRSTID6	0	R/W	Reset the buffer of write data of ID6. 0: NOP 1: reset The read value is always 0.
5	BRSTID5	0	R/W	Reset the buffer of write data of ID5. 0: NOP 1: reset The read value is always 0.
4	BRSTID4	0	R/W	Reset the buffer of write data of ID4. 0: NOP 1: reset The read value is always 0.
3	BRSTID3	0	R/W	Reset the buffer of write data of ID3. 0: NOP 1: reset The read value is always 0.
2	BRSTID2	0	R/W	Reset the buffer of write data of ID2. 0: NOP 1: reset The read value is always 0.
1	BRSTID1	0	R/W	Reset the buffer of write data of ID1. 0: NOP 1: reset The read value is always 0.
0	BRSTID0	0	R/W	Reset the buffer of write data of ID0. 0: NOP 1: reset The read value is always 0.

63.2.2.4 FCPRM Buffer Flush Register (FCPRM_BFLS)

FCPRM_BFLS controls flush operation for the buffer of write data. For detailed information, refer to the section 63.3.6.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	BFLS ID9	BFLS ID8	BFLS ID7	BFLS ID6	BFLS ID5	BFLS ID4	BFLS ID3	BFLS ID2	BFLS ID1	BFLS ID0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
9	BFLSID9	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID9 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
8	BFLSID8	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID8 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
7	BFLSID7	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID7 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
6	BFLSID6	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID6 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
5	BFLSID5	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID5 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
4	BFLSID4	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID4 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
3	BFLSID3	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID3 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush

Bit	Bit Name	Initial Value	R/W	Description
2	BFLSID2	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID2 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
1	BFLSID1	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID1 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush
0	BFLSID0	0	R/W	Flush the buffer of write data. The read value indicates FCPRM stays in flush process of ID0 (flush of merging buffer). When flush process is finished, this bit becomes 0 automatically. 0: not flush 1: flush

63.2.2.5 FCPRM Data Merge Control Register (FCPRM_MRG_CTRL)

FCPRM_MRG_CTRL controls the FCPRM data merge operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MRG EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	MRGEN	0	R/W	Data mearge enabled. 0: disabled 1: enabled

63.2.2.6 FCPRM Error Detection Status Register (FCPRM_EDC_STS)

FCPRM_EDC_STS indicates the FCPRM error detection status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RAM ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	RAMERR	0	R/W	RAM checksum error status 0: no error 1: error occurred To clear it, write 0 to this bit. Note that writing 1 doesn't change it. For details, refer 63.5.3.

Note: error injection function

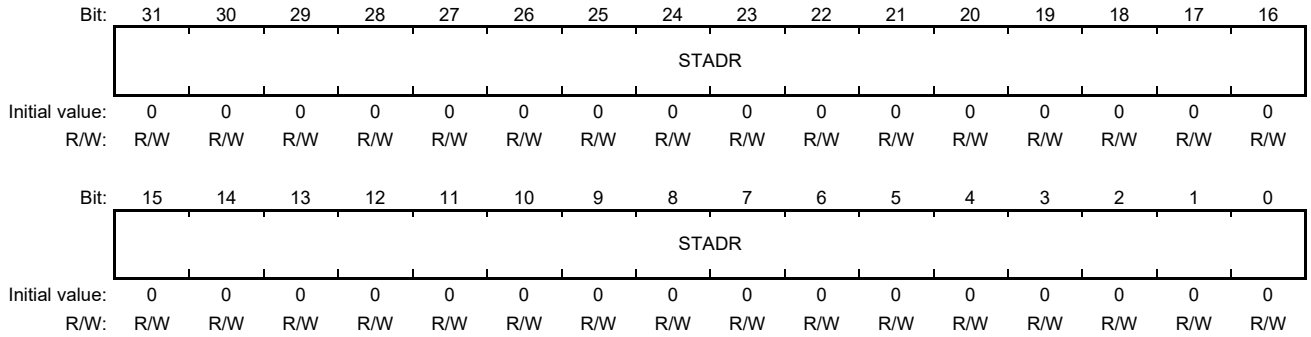
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	–	–	W	By writing 0x5361_6c74, FCPRM issues error notification to ECM module as error injection function. The field bit [31:1] in this register returns always 0 regardless written value. Written value is used for just error injection function. Note that field bit [0] doesn't change its value.

63.2.2.7 FCPRM Merge Enabled Area Start Address Register (FCPRM_MRG_STADRn (n = 0 to 3))

FCPRM_MRG_STADR*n* specifies the start address of merge enabled area *n* (*n* = 0 to 3).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	STADR	0	R/W	Start address of merge enabled area *n* (*n* = 0 to 3) This register is available when data merge is enabled. It shall be 256-byte aligned address.

63.2.2.8 FCPRM Merge Enabled Area End Address Register (FCPRM_MRG_EDADRn (n = 0 to 3))

FCPRM_MRG_EDADR*n* specifies the end address of merge enabled area *n* (*n* = 0 to 3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EDADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDADR	0	R/W	End address of merge enabled area *n* (*n* = 0 to 3) This register is available when data merge is enabled. It shall be (256-byte aligned address + 255).

63.2.2.9 FCPRM ID Setting Register (FCPRM_IDn (n = 0 to 9))

FCPRM_IDn specifies the FCPRM IDn setting (n = 0 to 9). These registers shall be set as shown in Table 63.9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ID VALID	—	—	—	IDPAT

		FCPRM_ID1: H'8001 0007
		FCPRM_ID2: H'8002 0007
		FCPRM_ID3: H'8003 0007
		FCPRM_ID4: H'8004 0007
		Others: H'0000 0000

63.2.3 FCPR Register Description in AXMM

63.2.3.1 FCPR Lossless Compression Control Register (FCPR_CMP_CTRL)

FCPR_CMP_CTRL controls the FCPR lossless compression operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMP EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R/W	Reserved These bits are always read as 0. The write value shall always be 0.
0	CMPEN	0	R/W	Lossless compression enabled. 0: disabled 1: enabled

63.2.3.2 FCPR 4G-byte Space Index Register (FCPR_CMP_SPACE)

FCPR_CMP_SPACE specifies the index of 4G-byte space for FCPR_CMP_STADR/FCPR_CMP_EDADR.

When compression is enabled, all FCPR_CMP_SPACE/FCPR_CMP_STADR/FCPR_CMP_EDADR registers shall be set for compression area.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SPACE							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	–	All 0	R/W	Reserved These bits are always read as 0. The write value shall always be 0.
7 to 0	SPACE	0	R/W	Index of 4G-byte space for FCPR_CMP_STADR/FCPR_CMP_EDADR. It is higher 8-bit of 40-bit address. Use only the lower 6 bits. Ignore the high-order bits 39 and 38 of the address. This register is available when compression is enabled.

63.2.3.3 FCPR Compression Enabled Area Start Address Register (FCPR_CMP_STADR)

FCPR_CMP_STADR specifies the start address of compression enabled area.

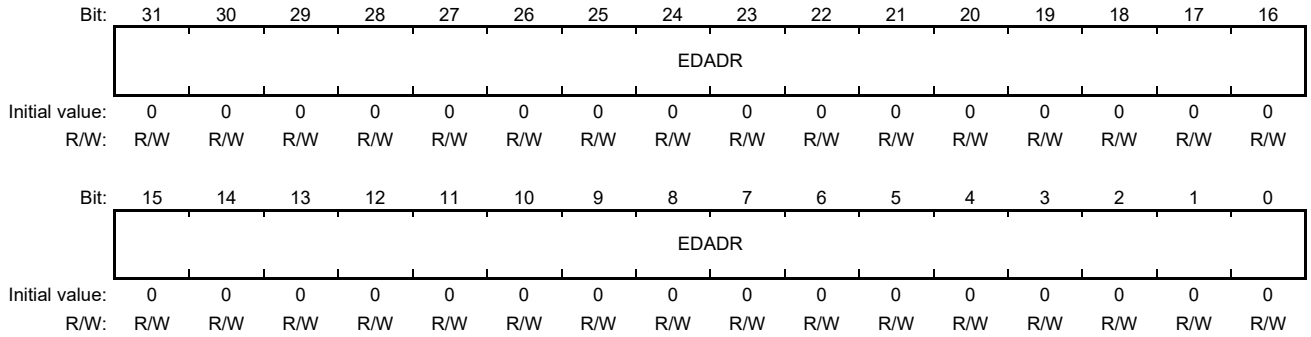
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	STADR	0	R/W	Start address of compression enabled area This register is available when compression is enabled. It shall be 1G-byte aligned address. Lower 30 bits shall be 0.

63.2.3.4 FCPR Compression Enabled Area End Address Register (FCPR_CMP_EDADR)

FCPR_CMP_EDADR specifies the end address of compression enabled area.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDADR	0	R/W	End address of compression enabled area This register is available when compression is enabled. It shall be (256-byte aligned address + 255).

63.2.4 FCPRS Register Description in DBSC5

63.2.4.1 FCPRS Control Register (FCPRS_CTRL)

FCPRS_CTRL controls the FCPRS operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CCDS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	CCDS	0	R/W	Cache disabled. Set 1 to this bit. 0: enabled 1: disabled

63.2.4.2 FCPRS Clock Stop Control Register (FCPRS_CLK_STOP)

FCPRS_CLK_STOP controls the clock stop operation for the FCPRS lossless decompression core (DCMP).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCSTP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	DCSTP	0	R/W	DCMP Clock Supply Setting. Control enabling / disabling of the clock stop operation. 0: Stop the supply of the operating clock. (Initial value) 1: Always supplies the operation clock.

63.2.4.3 FCPRS Cache Line [n] Control Register (n=0-7) (FCPRS_CL[n]_CTRL)

FCPRS_CL[n]_CTRL specifies the cache line n ID setting (n = 0 to 7). FCPRS has an 8-entry simple cache for read data. FCPRS can assign cache lines to dedicated IP by ARID and SrcIDs in ARUSER. An ID that concatenates ARID and SrcID is called Cache_line_ID set by this register.

Transactions matching Cache_line_ID of certain cache lines are restricted to use those only. Transactions not matching any Cache_line_ID use cache lines which have no registration (IDVALID bit is B'0) only. If no cache line is available for a transaction (e.g., in case all cache lines support registration and none is matching), the transaction is transparently passed through. If transactions match multiple Cache_line_ID, a round-robin decision for the used cache line is made.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IDVALID	IDPAT														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	IDMASK														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	IDVALID	0	R/W	Valid of Cache_line_ID 0: Cache_line_ID n is invalid. (No registration) 1: Cache_line_ID n is valid. (Registration)
30 to 16	IDPAT	H'0	R/W	Cache_line_ID pattern bit. These bits are the bit concatenation of ARID*1 and SrcID*2. {ARID[6:0], SrcID[7:0]}
15	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
14 to 0	IDMASK	H'0	R/W	Cache_line_ID mask bit. Setting these bits masks the comparison bit when checking for a transaction ID and IDPAT match. Bits set to 1 are valid. Bits set to 0 are masked (ignored).

*1: The ARIDs that can be set are shown in Table 63.10.

*2: The SrcIDs that can be set are shown in Table 63.11.

Table 63.10 ARID setting

63.2.4.4 FCPRS Error Detection control Register (FCPRS_EDC_CTL)

FCPRS_EDC_CTL controls error checking function and injecting dummy error for testing.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DCLS FEN	EDC FEN	—	—	—	—	CRCE INJ	AXIFE INJ	RAME INJ	DCLS EINJ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
9	DCLSFEN	0	R/W	This bit forces the DCLS error notification signal to be asserted. 0: Does not assert DCLS error notification signal forcibly. 1: Asserts DCLS error notification signal forcibly. For details, refer 63.5.5.
8	EDCFEN	0	R/W	This bit forces the EDC error notification signal to be asserted. 0: Does not assert EDC error notification signal forcibly. 1: Asserts EDC error notification signal forcibly. For details, refer 63.5.2.
7 to 4	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
3	CRCEINJ	0	R/W	This bit inject error to CRC checker. 0: Does not inject error to cheker 1: inject error to checker For details, refer 63.5.7
2	AXIFEINJ	0	R/W	This bit inject error to AXMM I/F EDC checker. 0: Does not inject error to cheker 1: inject error to checker For details, refer 63.5.2.
1	RAMEINJ	0	R/W	This bit inject error to SRAM EDC checker. 0: Does not inject error to cheker 1: inject error to checker For details, refer 63.5.2.

Bit	Bit Name	Initial Value	R/W	Description
0	DCLSEINJ	0	R/W	This bit inject error to DCLS compareter. 0: Does not inject error to compareter 1: inject error to compareter For details, refer 63.5.5.

63.2.4.5 FCPRS Error Detection Status Register (FCPRS_EDC_STA)

FCPRS_EDC_STA indicates the FCPRS error detection status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CRC ERR	AXIF ERR	RAM ERR	DCLS ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
3	CRCERR	0	R	CRC error status 0: no error 1: error occurred For details, refer 63.5.7
2	AXIFERR	0	R	AXMM I/F EDC error status 0: no error 1: error occurred For details, refer 63.5.2.
1	RAMERR	0	R	SRAM EDC error status 0: no error 1: error occurred For details, refer 63.5.2.
0	DCLSERR	0	R	DCLS error status 0: no error 1: error occurred For details, refer 63.5.5.

63.2.4.6 FCPRS Error Detection Status Clear Register (FCPRS_EDC_STA_CLR)

FCPRS_EDC_STA_CLR clear the FCPRS error detection status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CRC ECLR	AXIF ECLR	RAM ECLR	DCLS ECLR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
3	CRCECLR	0	R/W	Clear the CRC error status. It is switched back to 0 automatically. 0: NOP 1: clear the error status For details, refer 63.5.7.
2	AXIFECLR	0	R/W	Clear the AXMM I/F EDC error status. It is switched back to 0 automatically. 0: NOP 1: clear the error status For details, refer 63.5.2.
1	RAMECLR	0	R/W	Clear the SRAM EDC error status. It is switched back to 0 automatically. 0: NOP 1: clear the error status For details, refer 63.5.2.
0	DCLSECLR	0	R/W	Clear the DCLS error status. It is switched back to 0 automatically. 0: NOP 1: clear the error status For details, refer 63.5.5.

63.2.4.7 FCPRS Lossless Decompression Status 0 Register (FCPRS_ATR_STA0)

FCPRS_ATR_STA0 indicates the FCPRS lossless decompression status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TRD															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRD															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TRD	0	R	Total amount of read data from compression area in 64-byte unit. Data size after decompression.

63.2.4.8 FCPRS Lossless Decompression Status 0 Clear Register (FCPRS_ATR_STA0_CLR)

FCPRS_ATR_STA0_CLR clear the FCPRS lossless decompression status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRD CLR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	TRDCLR	0	R/W	Clear the TRD status. It is switched back to 0 automatically. 0: NOP 1: clear the status

63.2.4.9 FCPRS Lossless Decompression Status 1 Register (FCPRS_ATR_STA1)

FCPRS_ATR_STA1 indicates the FCPRS lossless decompression status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TDCD															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDCD															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDCD	0	R	Total amount of compressed data in 64-byte unit. Data size before decompression.

63.2.4.10 FCPRS Lossless Decompression Status 1 Clear Register (FCPRS_ATR_STA1_CLR)

FCPRS_ATR_STA1 clear the FCPRS lossless decompression status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDCD CLR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	–	All 0	R	Reserved These bits are always read as 0. The write value shall always be 0.
0	TDCDCLR	0	R/W	Clear the TDCD status. It is switched back to 0 automatically. 0: NOP 1: clear the status

63.3 Operation

63.3.1 Operation Sequence

The sequence for enabling compression / decompression and activating IP is as follows.

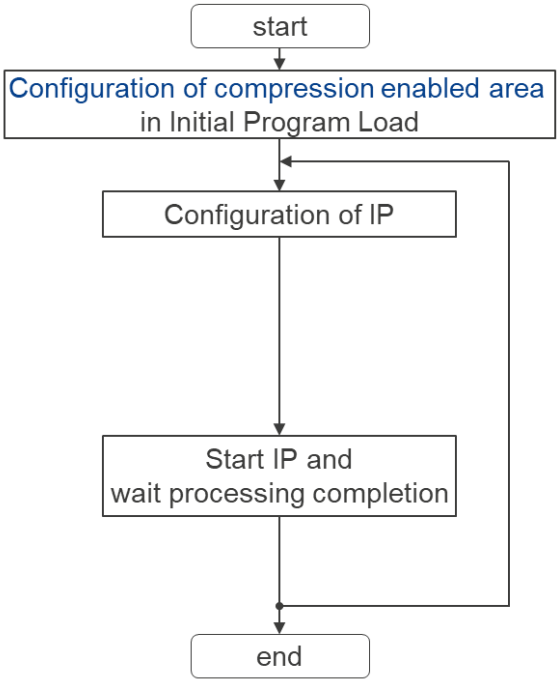

Figure 63.2 Operation Sequence for Enabling Compression / Decompression

In case of DOF, in addition to the above need to set the FCPRM for data merge enable. It is possible to change the configuration order between IP and FCPRM. For details of Clear FCPRM buffer and Flush FCPRM buffer, refer to 63.3.6.

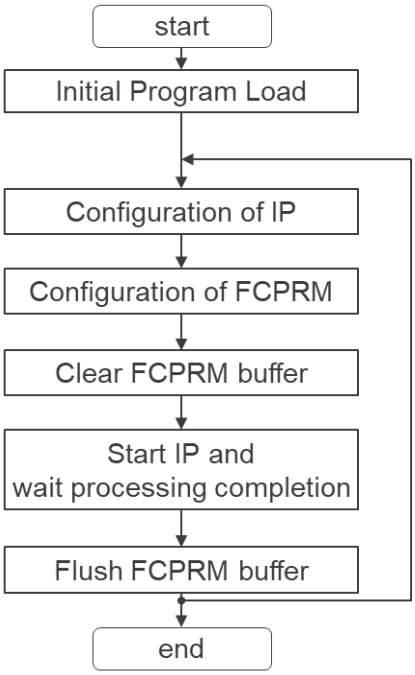

Figure 63.3 Operation Sequence for Enabling Data merge for DOF

63.3.2 Enabling Compression and Decompression

This section shows how to enable compression or decompression function. In order to enable compression or decompression function of FCPR, set FCPR register in AXMM FCPR_CMP_CTRL to 1. If the compression or decompression function is disabled, no data will be transferred to FCPRC/FCPRS.

63.3.3 Setting of Compression Enabled Area

This section shows how to set compression enabled area. Set the start and end address of the area where compressed data is stored in. When IP writes the data to this area, the write data is compressed. When IP reads the data from this area, the compressed data is decompressed. The maximum capacity of the compress enabled area is 1G-byte. The setting registers are following 3 types.

FCPR_CMP_SPACE:

These registers indicate higher 8-bit of 40-bit address setting of FCPR_CMP_STADR/CMP_ EDADR. If IP doesn't support 40-bit address space, it shall be set to 0.

FCPR_CMP_STADR:

Start address of compression enabled area in 1G-byte aligned, Lower 30 bits shall be 0.

FCPR_CMP_EDADR:

End address of compression enabled area. Lower 8-bit shall be 255.

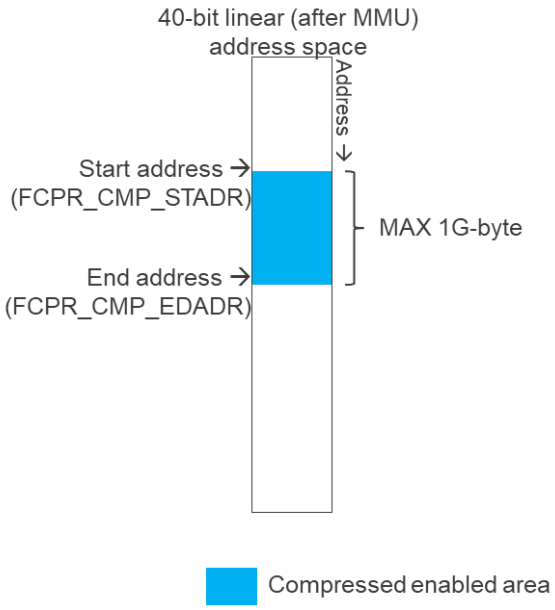

Figure 63.4 Setting of Compression Enabled Area

63.3.4 Enabling Data Merge in FCPRM

This section shows how to enable data merge function. In order to enable data merge function of FCPRM, set FCPRM_MRG_CTRL to 1. If the data merge function is disabled, FCPRM acts simply as a bus bridge.

63.3.5 Setting of Data Merge Enabled Area in FCPRM

This section shows how to set data merge enabled area. Set the start and end address of the area where merged data is stored in. When IP writes the data to this area, the write data is merged. FCPRM can combine contiguous transaction to 256-byte aligned transaction in order to apply compression.

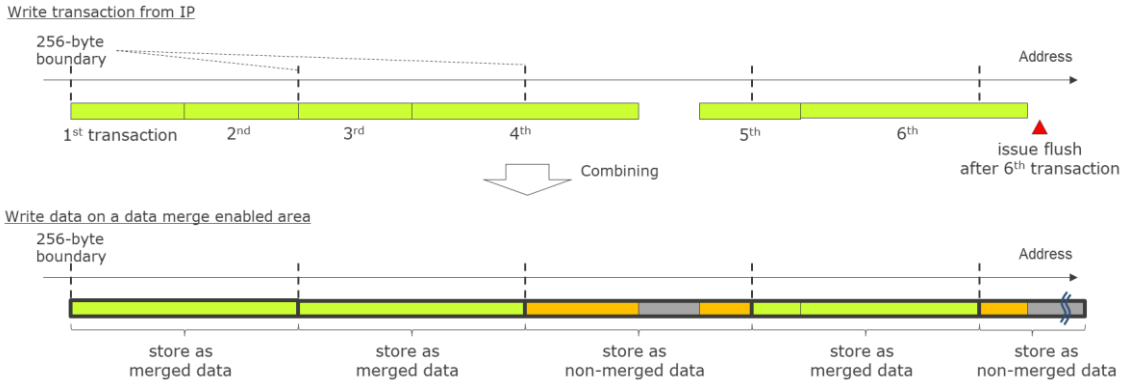

Figure 63.5 Converting to 256-byte aligned write transaction

The maximum number of the area is 4 per FCPRM. Set the area by following 2 registers.

FCPRM_MRG_STADR*n* (*n* = 0 to 3):

Start address of merge enabled area. Lower 8-bit shall be 0.

FCPRM_MRG_EDADR*n* (*n* = 0 to 3):

End address of merge enabled area. Lower 8-bit shall be 255.

63.3.6 Data Consistency in case of using FCPRM

To keep data consistency, there are two operations before/after IP operation. One is clear operation. The other is flush operation.

In write, both clear and flush operation is necessary. Clear operation before IP operation is required to initialize buffer in FCPRM. FCPRM merges some write requests from IP in compression so that FCPRM may hold these requests after IP operation. Flush operation outputs all requests in FCPRM to external memory.

63.3.6.1 Clear and Flush Write Buffer of FCPRM

All IPs connecting with FCPRM have a function to clear and flush the internal buffer of FCPRM.

Table 63.12 Clear and Flush Operation

IP	Clear/Flush Operation
DOF	This IPs have instructions to issue clear and flush. Usually these instructions are listed in the DMA descriptor as below. For detail information, refer to section U25 and IP licensee guide. - Clear buffer - Data transfers for each processing - Flush buffer - Wait completion of flush operation - Assert an end interrupt

63.3.7 Address Management of Compressed Data for using FCPRM

FCPRM of all IPs use an address before Memory Management Unit (MMU) processing (virtual address). So, set virtual address to FCPRM register.

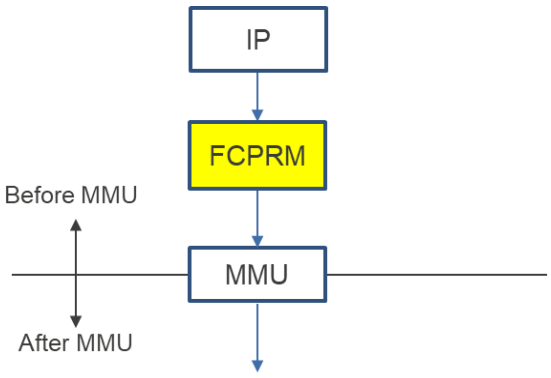

Figure 63.6 FCPRM use an address before MMU processing

63.3.8 Method of Calculating Compression Ratio

The method of calculating compression ratio (compressed/original) is as follows.

Write:

Compression ratio = (FCPRC_CMP_STA1.TCD / FCPRC_CMP_STA0.TWD) * 100

Read:

Compression ratio = (FCPRS_ATR_STA1.TDCD / FCPRS_ATR_STA0.TRD) * 100

63.3.9 Reset Operation

FCPRC and FCPRM has Forced Reset operation controlled by software, which is used to terminate forcibly the whole FCPR immediately upon reset.

The Forced Reset terminates all FCPRC/FCPRM operation immediately even if the bus transaction is being executed. Use this reset in emergency such as the bus sub-system or IP hang.

Set H’0000 0010 to FCPRC_RST/FCPRM_RST register (FCPRSTF bit is set to H’1)

63.4 Usage Notes

63.4.1 Notes of Compression Enabled Area

- The whole compression enabled area must be located in DRAM space.
- The compression enabled area shall be contiguous region.
- Total capacity of the compress enabled area is up to 1G-byte.
- Virtual addresses pointing to the compression enabled area must be translated to physical addresses assigned the compression enabled area by MMUs.
- If Master IP writes outside the compression enabled area, the write data is not compress.
- If Master IP (inclusive FCPRM) writes smaller bursts than 256 bytes or masks data when writing to the compression enabled area, the data will be written uncompressed. The rest of the 256 byte stays untouched and therefore might be invalid.
- If Master IP needs to write smaller bursts than 256 bytes or masks data when writing to the compression enabled area, follow these steps below to perform the read modify write.
  1) Copy the target area (256 byte) to the local buffer.
  2) Modify for copied data.
  3) Write the data back to the original area after Modify.
- If Master IP reads smaller bursts than 256 bytes when reading to the compression enabled area, the effect of bandwidth compression may be reduced. For the convenience of compressing in 256-byte units, if a read of less than 256 bytes is requested from the Master IP, compressed data with a data length exceeding that may be read from the memory.
- The compression enabled area shall be set to either linear or split mapping mode in AXI-bus, and shall not be mixed (see section 18.3).
- Don't read and write at the same time to the same 256 bytes region in compression enabled area (e.g. polling is not allowed in the compression enabled area). The data which requires such access shall be located to compression disabled area.
- Don't use CRC check for compressed regions. When the FCPRS_EDC_STA bit is detected by the ECM, the CRC error shall be cleared according to the procedure below.
  1) Read the FCPRS_EDC_STA.CRCERR bit of FCPRS and check its value.
  2) If the value is 1, ignore this error and write 1 to the FCPRS_EDC_STA_CLR.CRCECLR bit to clear the cause.

  NOTE: This procedure may be skipped for Ver 2.2 or later version.

63.4.2 Exclusive access

In the compression enabled area, exclusive access defined by AXI protocol is prohibited.

63.4.3 Note of software reset for the master IP

In case of FCPRM, after resetting the master IP using its internal register, set FCPRM_BFLS register to H’0000 03FF.

63.4.4 Limitations on Software Reset, Module Standby and power-shutoff

Before executing following operations for the FCPR, confirm that there is no access to the compression enabled area. If there is access to the compression enabled area, wait completion of access.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG
- Enter power-shutoff status (stop power supply) by SYSC

63.5 Safety Mechanism

63.5.1 EDC for FCPRS

63.5.1.1 Overview

EDC protection is applied to internal RAMs in FCPRS.

63.5.1.2 Hardware Description

Figure 63.7 shows the block diagram of EDC protection for FCPRS.

When the EDC error is detected on internal RAMs, the RAMERR bit in the FCPRS_EDC_STA is set to 1.

When the RAMERR bit in the FCPRS_EDC_STA is set to 1, error notification is issued to ECM.

The RAMERR bit is cleared to 0 by FCPRS_EDC_STA_CLR register.

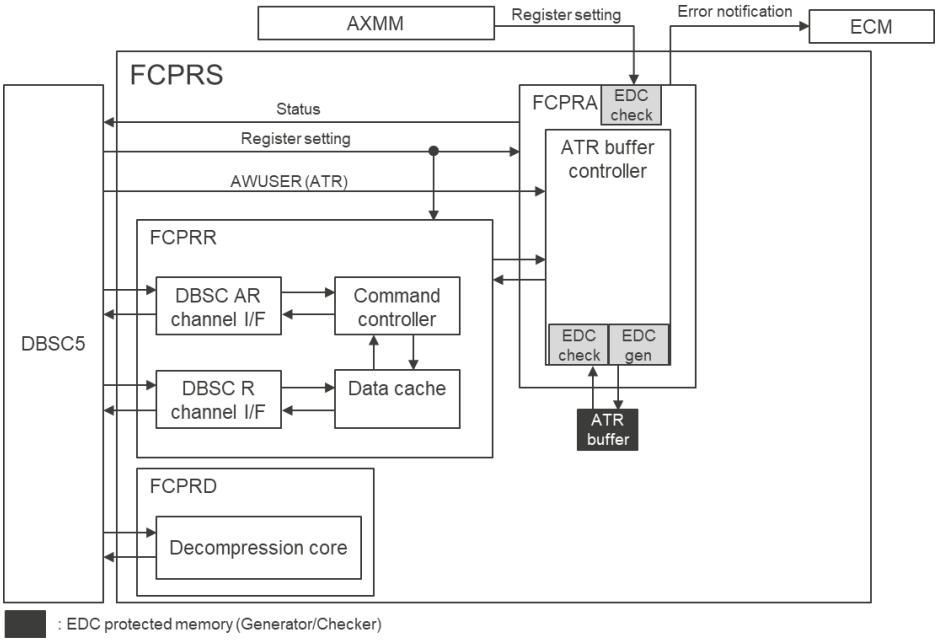

Figure 63.7 EDC protection for FCPRS

63.5.2 EDC for FCPRM

63.5.2.1 Overview

EDC protection is applied to internal RAMs in FCPRM.

63.5.2.2 Hardware Description

Figure 63.8 shows the block diagram of EDC protection for FCPRM.

When the EDC error is detected on internal RAMs, the RAMERR bit in the FCPRM_EDC_STS is set to 1.

When the RAMERR bit in the FCPRM_EDC_STS is set to 1, error notification is issued to ECM.

The RAMERR bit is cleared to 0 by writing 0.

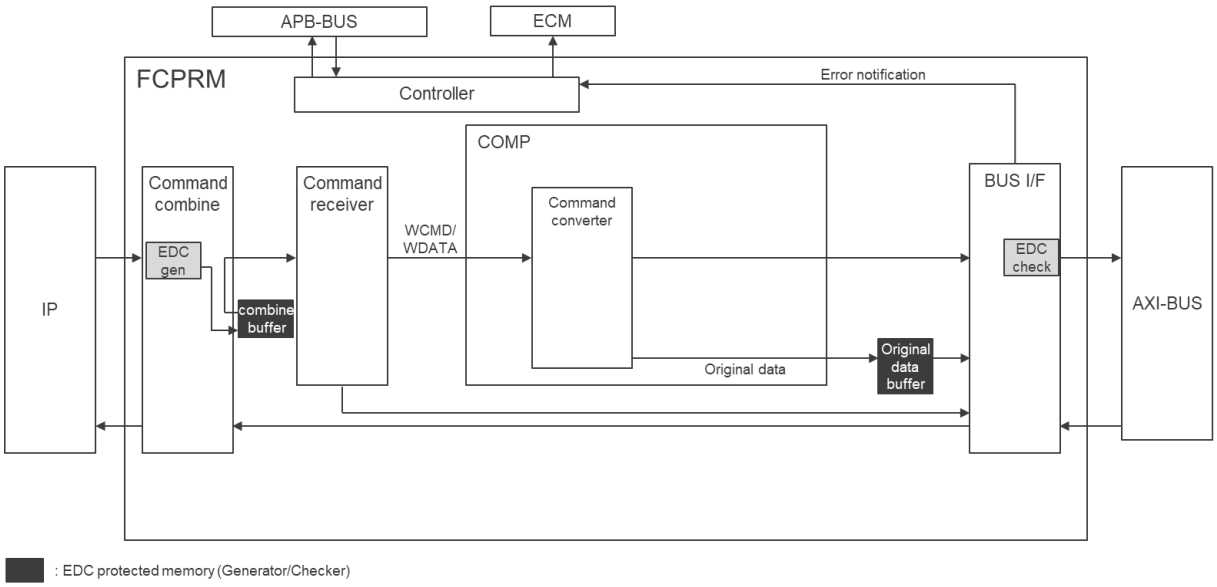

Figure 63.8 EDC protection for FCPRM

63.5.3 Hardware Redundancy for FCPRS

63.5.3.1 Overview

Hardware redundancy is applied to the control logic in FCPRS in order to detect fault of functional logic.

63.5.3.2 Hardware Description

Figure 63.9 shows the block diagram of FCPRS protection for functional safety.
When an error is detected, the DCLSERR bit in the FCPRS_EDC_STA is set to 1.

When the DCLSERR bit in the FCPRS_EDC_STA is set to 1, error notification is issued to ECM.

The DCLSERR bit are cleared to 0 by FCPRS_EDC_STA_CLR register.

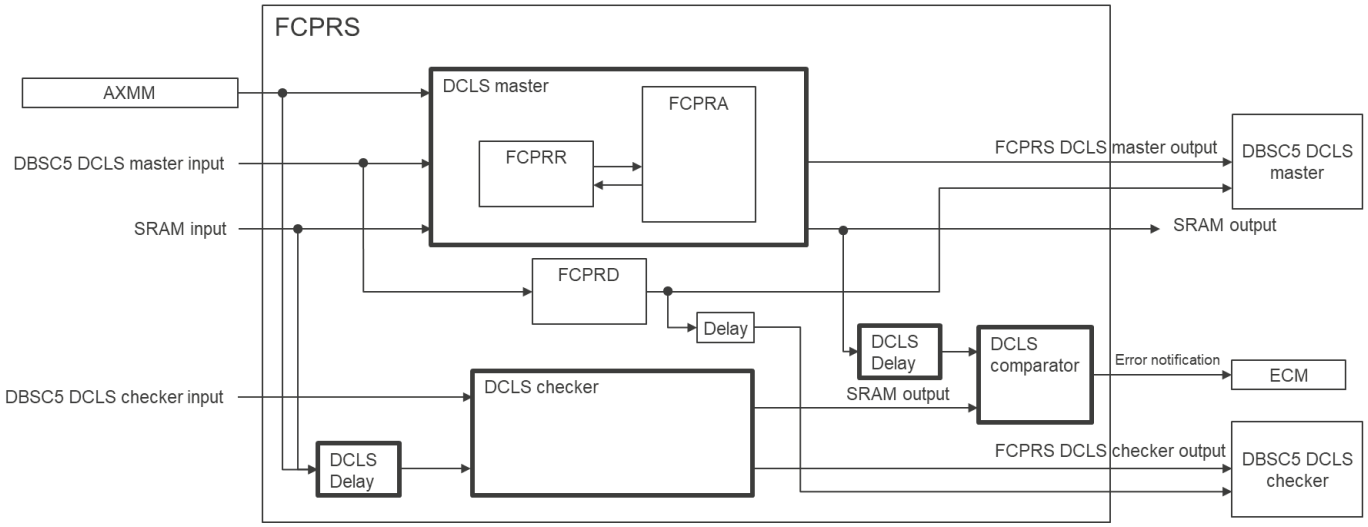

Figure 63.9 Block diagram of hardware redundancy for FCPRS

63.5.4 CRC for FCPRC

63.5.4.1 Overview

CRC protection is applied to FCPRC and compressed data.

63.5.4.2 Hardware Description

Figure 63.10 shows the block diagram of CRC protection for FCPRC.

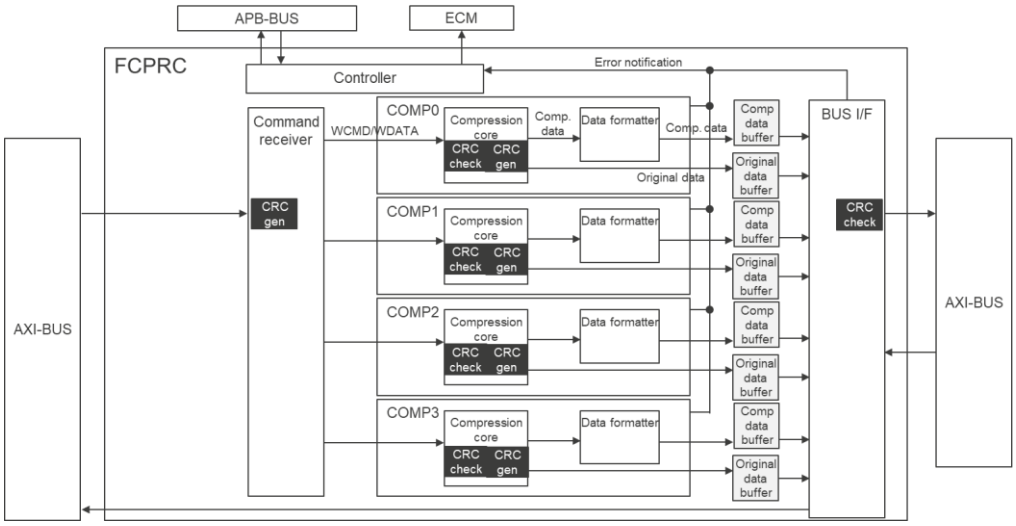

Figure 63.10 CRC protection for FCPRC

63.5.5 CRC for FCPRD in FCPRS

63.5.5.1 Overview

CRC protection is applied to FCPRD in FCPRS and compressed data.

63.5.5.2 Hardware Description

Figure 63.11 shows the block diagram of CRC protection for FCPRD in FCPRS.

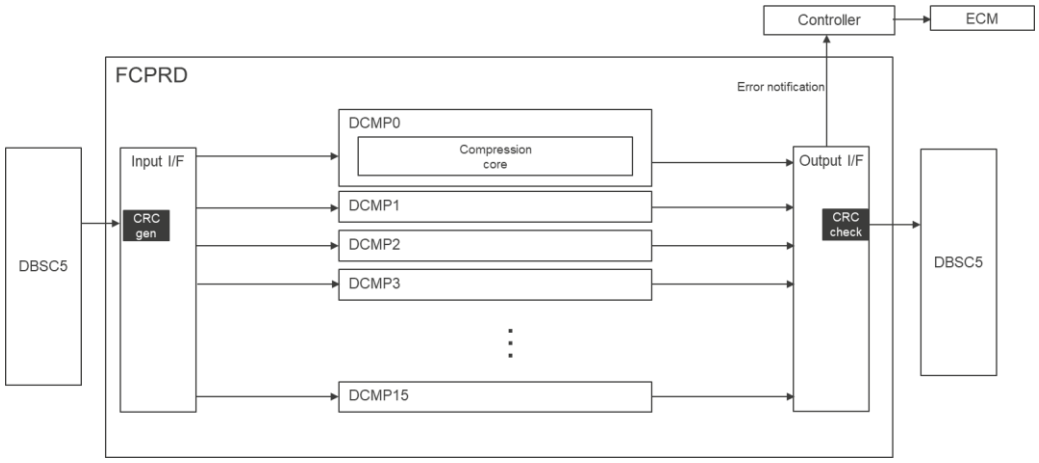

Figure 63.11 CRC protection for FCPRD in FCPRS

64. Display Unit (DU)

64.1 Overview

Display Unit (hereinafter it's called DU) is a module to input an image data from the VSPD and to output the data to the DSI/CSI-2-TX-IF in accordance with optionally settable display timing.

When using display unit, set the desired value in Video Signal Processor for the DU (VSPD) registers.

64.1.1 Features

(1) Plane

The display surfaces configured to display an image on the screen is called plane in this section. The following parameters for plane can be set through the settings of an internal register.

- Display size
- Display position
- Display data format (32-bit/pixel or YC)
- Plane superimposing

(2) Synchronization Method

Internal register settings can be used to select any of three synchronization modes for the display output timing.
Synchronization Method support only master mode (internal sync mode).

(3) CRT Scan Mode (CRT Scan Method)

Internal register settings can be used to select from among three scan modes.
CRT Scan Mode support only non-interlaced mode.

(4) Register Access Control

The module has internal control registers; these are writable/readable by the APB protocol over the APB. The unit of access is fixed to 32 bits.

(5) VSPD Connection

The VSPD output provides RGB or YCbCr444 data format for the DU. The DU is not connected with external memory. For the VSPD connection, refer to Table 64.1.

(6) DOC Connection

Connection with the DOC allows the monitoring of images from the DU and thus allows checking of whether the images are being displayed in accord with the expected values. This also allows checking of the rising edge of the VSYNC signal and the completion of processing by the DU. For the DOC connection, refer to Table 64.1

(7) DSI/CSI-2-TX-IF Connection

Connection with the DSI/CSI-2-TX-IF allows the output of image data via the DSI/CSI-2-TX-IF. Support data format is RGB or YCbCr422. For the DSI/CSI-2-TX-IF connection, refer to Figure 64.1.

Table 64.1 Configuration of channel, plane and connection

Channel	Abbr.	Plane	Connection		
Channel0	DU	Plane	VSPD	DSI/CSI-2-TX-IF	DOC

64.1.2 Block Diagram

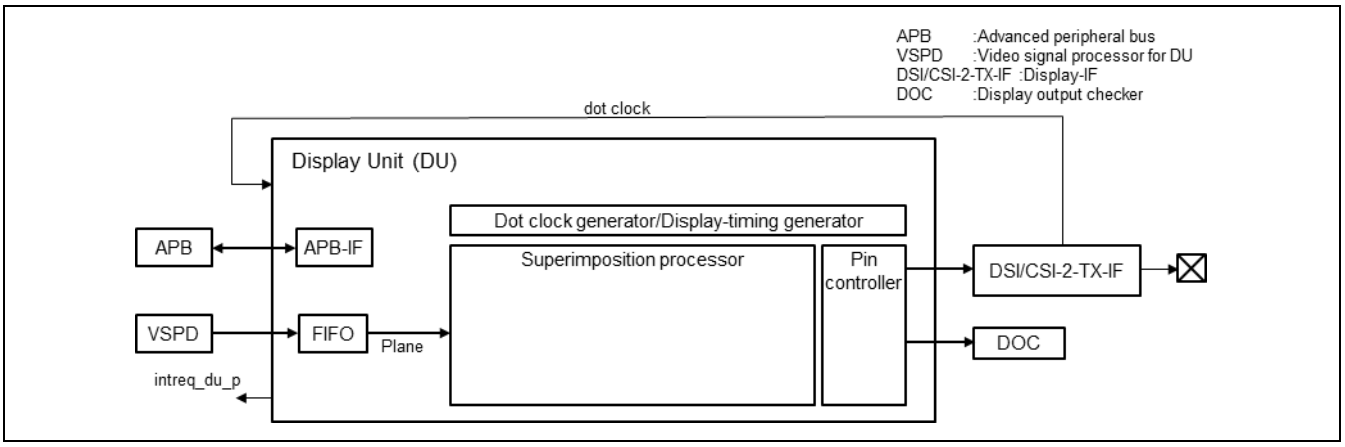

Figure 64.1 Block Diagram of the DU

64.1.3 Register Configuration

For the DU, there are two register update methods, the external update and the internal update. The internal update has two reflection timings. Refer to Table 64.2 for the update methods and the reflecting timings in the DU registers.

Table 64.2 Register update methods

Update Methods	Reflection timings	Definitions of the Internal Updates in the Bit Description Table	Remarks
External Update	After the end of CPU access	Not available	-
Internal Update	When the DRES bit in DSYSR is 1.	DRES	-
	When the DRES bit in DSYSR is 1 and at the beginning of each frame, which is the VSYNC falling edge if the VSL bit in DSMR is 0 and the VSYNC rising edge if the VSL bit in DSMR is 1.	Available	Disabled when the IUPD bit in DSYSR is 1.

(1) External Update

An "external update" is an update which reflects the address-mapped register settings made by the CPU after the end of the CPU access. Registers related to display control (for example, DSYSR) and the settings of which are updated through external updates can be overwritten without display flicker by using bit 11 in DSSR indicating the start position of the vertical blanking interval.

(2) Internal Update

An "internal update" is an update that reflects the address-mapped register settings with the internal update timing of the DU. Hence in the case of a register with an internal update function, even when the CPU overwrites address-mapped registers related to display operation without being aware of the display timing, display flicker can be prevented.

There are two types of internal update timings. One reflects the register value when the DRES bit is set to 1. The other reflects the register value in the following cases: (a) When the DRES bit is set to 1, and (b) when the VSYNC falling edge occurs if the VSL bit in DSMR is 0 and when the VSYNC rising edge occurs if the VSL bit in DSMR is 1. The type of internal update timings is defined by registers and that appears in the bit description table.

Bits which are internally updated in response to setting of the DRES bit in DSYSR are listed in the column headed "Bit with Internal Update Function" in tables on the following pages.

Updates are performed at the falling edge of VSYNC output when the sync method of DSYSR is master mode (bit 7 = 0, bit 6 = 0).

The address-mapped registers with an internal update function are shown in R-CarV4M_UM_064_DU_r0p81.xlsx. The initial settings for these registers should be made during the interval in which the DRES bit in DSYSR is 1.

(3) Register Configurations

Refer to R-CarV4M_UM_064_DU_r0p81.xlsx

64.1.4 Connected Module

Table 64.3 Connected Module

Module name	Connected module name	Function of connected module
	APB	Control to register access
	VSPD	Output image data
	DOC	Input display data and control signals, after that check display data
	DSI/CSI-2-TX-IF	Display-IF
	CPG	Output system clocks and dot clock.
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset

64.2 Register Description

Refer to R-CarV4M_UM_064_DU_r0p81.xlsx

64.3 Operation

64.3.1 Configuration of Output Screen

The DU executes window displays with one window layer. This window is called a "plane". For plane, display can be turned on and off, the display data format (32-bit/pixel, YC), and other settings can be changed independently.

Table 64.4 Display Functions of Plane

	Display On/Off	Display Data Format		interleave	Size
		YC	32-bit/pixel		
Plane	✓	✓	✓	No	X, Y (as desired)
Back-ground color*	—	—	—	—	—

Note: The data format for background color is RGB666.

64.3.2 Display On/Off

All plane display can be turned on and off using the DEN bit in DSYSR. When the DEN bit is 0, the display data set in DOOR is displayed.

When the value of the DPRS bit in DORCR is 0, DPPR is used to turn the display of plane on and off. When the value of the DPRS bit in DORCR is 1, on the other hand, DSPR is used to turn the display of plane on and off. Under the following display conditions, display data set in BPOR is displayed.

1. When the display of plane is turned off
2. In an area with no plane for display, due to the display size and display position
3. When the pixels in a plane for display are all a transparent color

Table 64.5 Turning On and Off the Display of Plane(when the DPRS bit in DORCR is 0)

Display Plane	Display Plane Priority Register (DPPR)
Plane	Plane is selected in one among priority positions 1, and the corresponding enable bit is set to 1

Table 64.6 Turning On and Off the Display of Plane (when the DPRS bit in DORCR is 1)

Display Plane	Display Superimpose Priority Register (DSPR)
Plane	Plane is selected in one among priority positions 1 (setting to select the plane: B'0001)

Notes: Even if display on is set using DPPR and DSPR under the following conditions, the setting is handled as display off, and the corresponding plane is not displayed.

- Plane for which the value set in PDPXR is greater than the screen size (horizontal display end (HDE) - horizontal display start (HDS))
- Plane for which the value set in PDPYR is greater than the screen size (vertical display end (VDE) - vertical display start (VDS))
- Plane for which the value set in PDSXR is 0
- Plane for which the value set in PDSYR is 0

64.3.3 Plane Parameter

For each plane, a display area start position, memory width, display start position, and display size are set using registers.

The followings are the schematic diagram of start positions and sizes related to plane and the registers used for setting start positions and sizes.

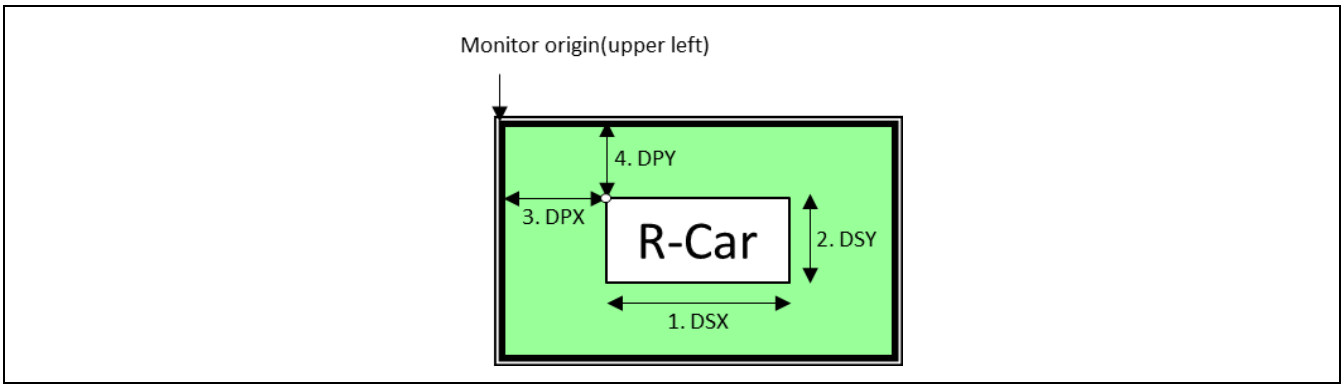

Figure 64.2 Parameters

Table 64.7 Monitor Parameter Setting Registers

No.	Name Used in the Figure	Register	Description
1	DSX (Display size X)	PDSXR	The X-direction display size of plane is set in dot-clock units.
2	DSY (Display size Y)	PDSYR	The Y-direction display size of plane is set in raster line units.
3	DPX (Display position X)	PDPXR	The X-direction distance to the display position is set in dot-clock units, taking the upper-left corner of the monitor as the origin.
4	DPY (Display position Y)	PDPYR	The Y-direction distance to the display position is set in raster line units, taking the upper-left corner of the monitor as the origin.

64.3.4 Data Format for Input

The following format is used for color data used in display. A data configuration is shown in which data is allocated to the unified memory in little endian.

(1) 32-bit/pixel: RGB888

Levels for R, G, and B are represented by 8 bits each (RGB888). "—" Indicates any desired value.

A 32-bit/pixel (RGB888) display should be specified with the PEDF bits in PDDC4R.

32-bit/pixel data (RGB888 data) format

D31 to D0	31 — 24	23 — 16	15 — 8	7 — 0
	—	R	G	B

(2) 32-bit/pixel: RGB666

Levels for R, G, and B are represented by 6 bits each (RGB666). "—" Indicates any desired value.

A 32-bit/pixel (RGB666) display should be specified with the PEDF bits in PDDC4R.

32-bit/pixel data (RGB666 data) format

D31 to D0	31 — 24	23 — 18	17	16	15 — 10	9	8	7 — 2	1	0
	—	R	—	—	G	—	—	B	—	—

(3) YC: YCbCr444

Image data has the format YC (YCbCr) = 4:4:4. "—" Indicates any desired value.

A YC(YCbCr444) display should be specified with the PEDF bits in PDDC4R and value other than B’11 is specified in the PDDF bit in PMR .

YC(YCbCr444) format

D31 to D0	31 — 24	23 — 16	15 — 8	7 — 0
	—	Y0	Cb0	Cr0
	—	Y1	Cb1	Cr1

64.3.5 Data Formats for Output

In the case of digital RGB output from the DU is performed after the display data format has been expanded into the RGB888 format, and then the data are output. The supplementary formats in the case of expansion to RGB888 and output data formats are as indicated in the following table. For YCbCr422 output formats, refer to section 64.3.9 YC Format Display.

Table 64.8 Output Data Format

		Red								Green								Blue							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data	32-bit/pixel (RGB888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB666)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
After superimposing		R (8 bits)								G (8 bits)								B (8 bits)							
Output Data Format		R (8 bits)								G (8 bits)								B (8 bits)							
		Y								Cb								Cr							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							
After superimposing		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							
Output Data Format (YCbCr422)		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							

64.3.6 Superimposing of Plane

Only the specified plane display is supported.

Table 64.9 Superimposing

PSPIM	Superimposing
B'000	Setting prohibited. (Default)
B'001	Setting prohibited.
B'010	Setting prohibited.
B'011	Setting prohibited
B'100	The specified plane is displayed.
B'101	Setting prohibited
B'110	Setting prohibited
B'111	Setting prohibited

64.3.7 Sync Mode

Sync Mode support only master mode (internal sync mode). Selection of master mode is performed using bits 7 and 6 in DSYSR. In master mode (internal sync mode), the position of the falling edge of the vertical sync signal (VSYNC) set by VSPR is detected.The results are then reflected in the bit 11 in DSSR.

Master Mode (Internal Sync Mode): By setting the period and pulse width of the horizontal and vertical sync signals (HSYNC, VSYNC) in the display timing generation registers, the corresponding waveforms are output. Also, display data is output in sync with these signals.

64.3.8 YC Format Display

In addition to RGB format display, YC format can be displayed. YCbCr444 data from the VSPD convert into YCbCr422 format and display as YC format.

RGB format display and YC format display is selected by setting bits 9 and 8 in DEFR. Bits 9 and 8 setting of B'10 selects 16-bit YC format display (non-multiplexed). A setting of B'00 selects RGB format.

Input data format from the VSPD is selected by DEF10R.

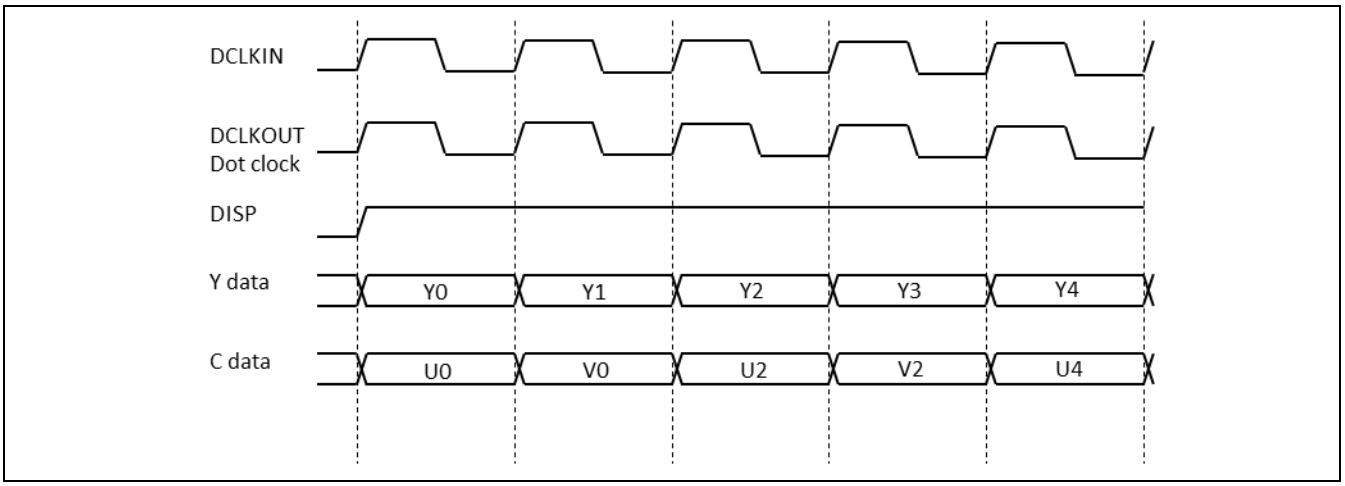

Figure 64.3 YC Non-Multiplexed

64.3.9 Display Timing Generation

In the DU, display timing is generated for the horizontal direction and vertical direction of the display screen. Display timing is set by using display timing generation registers. (Refer to R-CarV4M_UM_064_DU_r0p81.xlsx)

Figure 64.4 shows the display timing in non-interlaced mode. Here, the display screen is defined in terms of the variables of Table 64.10.

Only the Master Mode (Internal Sync Mode) is supported. Therefore, it has no external sync (EXVSYNC/EXHSYNC).

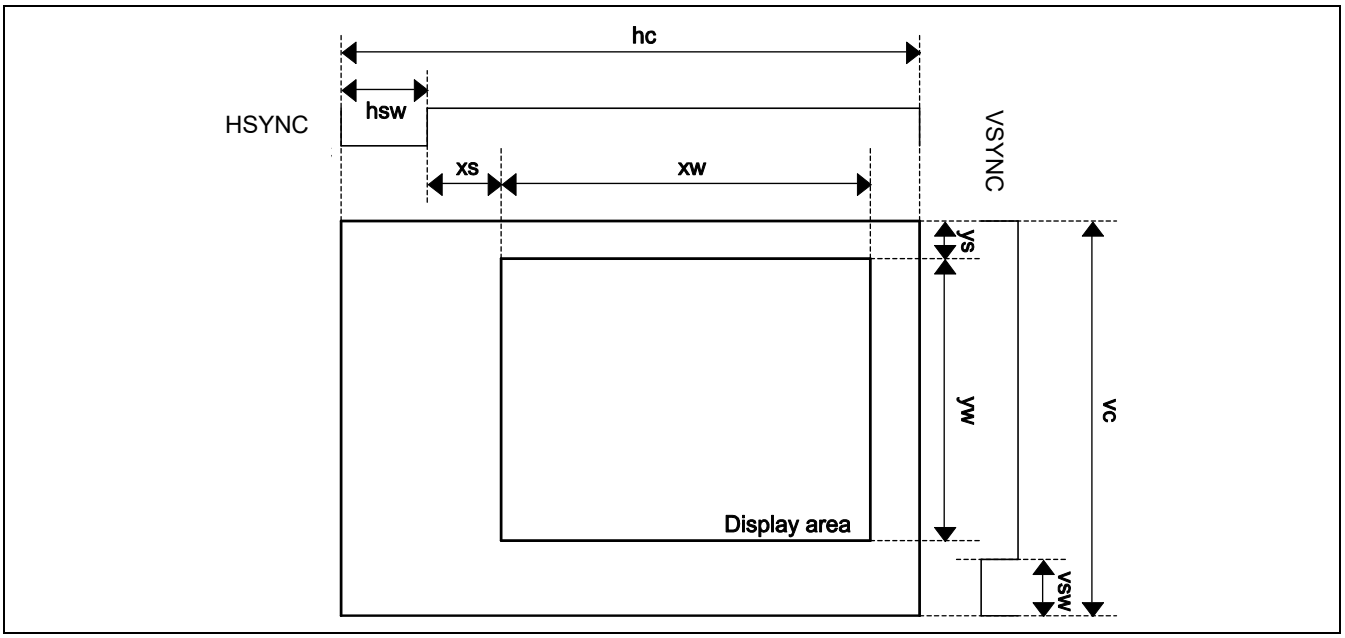

Figure 64.4 Display Timing Generation for Horizontal Direction and Vertical Direction of Display Screen

Table 64.10 Variables Defined in Display Screen

Variables	Contents	Units
hc*1	Horizontal scan period	Dot clock
hsw	Horizontal sync pulse width	Dot clock
xs	From rise of HSYNC to display start position in the horizontal direction of the display screen	Dot clock
xw	Display width per 1 raster of display screen	Dot clock
vc*2	Vertical scan period	Raster line
vsw	Vertical sync pulse width	Raster line
ys	From rise of VSYNC to display start position in the vertical direction of the display screen	Raster line
yw	Vertical display period of display screen	Raster line

Notes: 1. Should be set such that hsw + xs + xw < hc
2. Should be set such that vsw + ys + yw < vc

The display timing generation register settings are different depending on the scan method and synchronization method. Hence the value of the display timing generation registers should be set after performing calculations like those indicated in Table 64.11.

Table 64.11 Correspondence Table of Settings of Display Timing Generation Registers

Register Name	Bit Name	Master Mode
Horizontal display start register (HDSR)	HDS*4	hsw + xs – 19
Horizontal display end register (HDER)	HDE	hsw + xs – 19 + xw
Vertical display start register (VDSR)	VDS	ys – 2
Vertical display end register (VDER)	VDE	ys – 2 + yw
Horizontal synch width register (HSWR)	HSW	hsw – 1
Horizontal cycle register (HCR)	HC*3	hc – 1
Vertical synch point register (VSPR)	VSP	vc – vsw – 1
Vertical cycle register (VCR)	VC	vc – 1

Notes: 1. In all scan modes, VDS, VDE, VSP, VC settings are in single-field units.
2. Reserved.
3. HC should be set so as to satisfy HC > HDE.
4. HDS should be set to 1 or greater.

64.3.10 Scan Method

The scan method is non-interlaced mode only. The mode is selected using bit 5 and bit 4 in DSYSR.

- Non-interlaced mode
  In this scan method, one frame consists of a single field.
- Example of vertical scan period
  Non-interlaced mode: 1/60 second/field, 1/30 second/field
- Display in non-interlaced method
  In this method, all lines are displayed at once without providing intervals between input video signals.
  This input method is for monitors capable of high-resolution display.

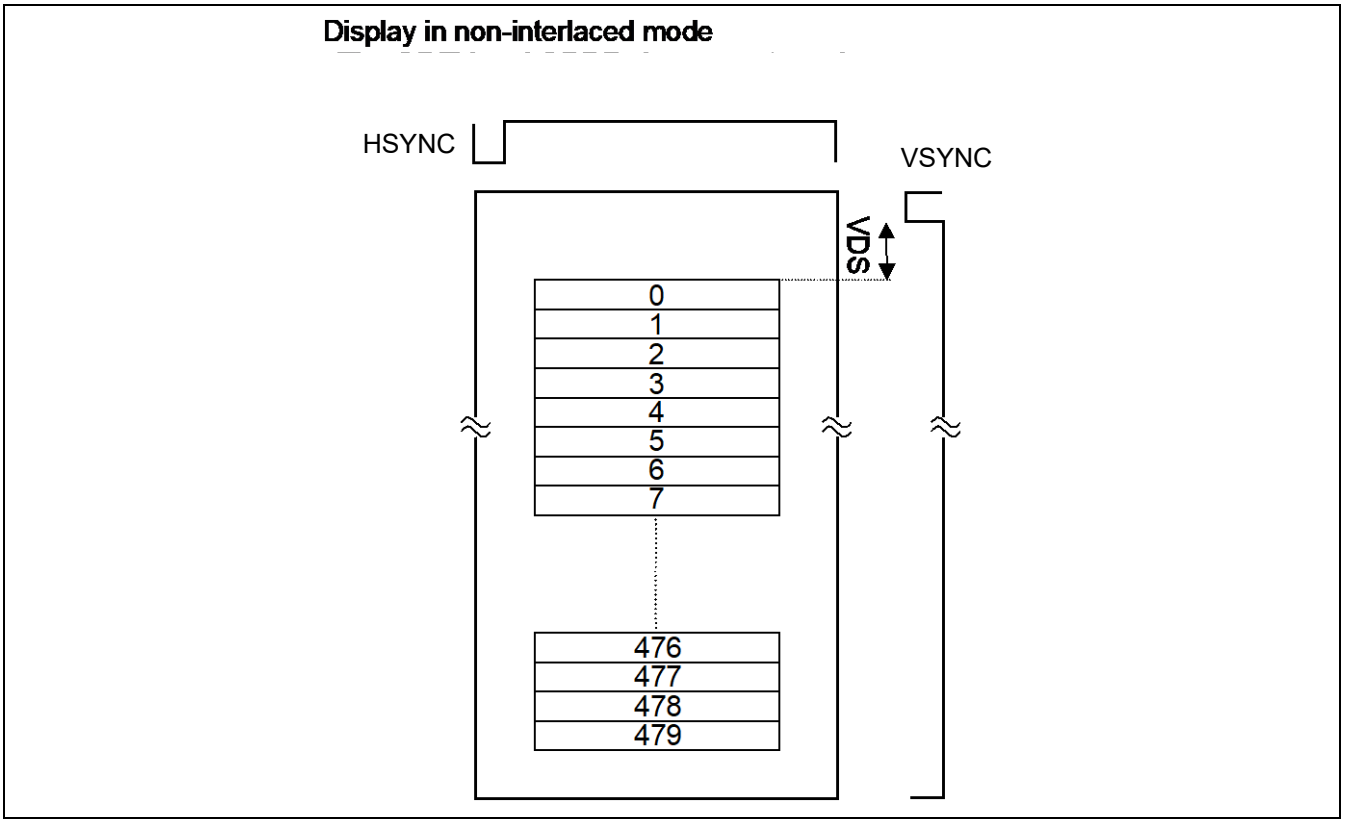

Figure 64.5 Display in Non-Interlaced Method

64.4 Usage Notes

64.4.1 Module Standby Mode

Module Standby mode, in which supply of the clock signal to the DU is stopped, is supported.

Even when the DU enters the standby mode, the register values are retained. Do not access the DU during periods in standby mode.

64.4.2 Transition to Module Standby Mode

1. Set both the DEN and DRES bits in DSYSR to 0 to stop access to the VSPD.
2. Test bit 11 in DSSR to confirm the next VBK flag. The setting made in step 1 becomes effective with the timing of VBK and access to the VSPD is stopped. The value of the display data becomes the value set in DOOR
   When the DU is running, test bit 11 of DSSR.
3. Stop the clock.

64.4.3 Release from Module Standby Mode and Restarting Display

1. Start the clock.
2. Make settings to turn the display on by setting the DEN and DRES bits in DSYSR to 1 and 0 respectively.

64.4.4 Note on Register Settings

At the time of a reset, some registers of the DU have fixed initial values but others do not. The initial values of the latter when the power for the LSI is turned on can be either 0 or 1. From the initial state after power is switched on, be sure to set all of the registers in the DU to the desired values before starting synchronization of the display*[1].

If turning on the display*[2] is attempted while values in registers are unknown, operation may be incorrect due to access by the DU to areas other than those intended (the DU is capable of access to any area).

Notes: 1. Setting (a) or (b) starts synchronization of the display.
   (a) The DRES and DEN bits in DSYSR are B'00.
   (b) The DRES and DEN bits in DSYSR are B'01.
2. Setting (a) or (b) turns the display on.
   (a) When the DPRS bit in DORCR is 0:
   With setting (b) in note 1, setting any of the DPE1 bit in DPPR to 1.
   (b) When the DPRS bit in DORCR is 1:
   With setting (b) in note 1, setting the S0S1 bits in DSPR to B'0001.

64.4.5 Transition to Display operation stop by the DRES bit in DSYSR

(1) Display screen is not disturbed

1. Execute the procedure of 1. and 2. of Chapter 64.4.2.
2. Set the DRES and DEN bits in DSYSR to B’10.

(2) Display screen is disturbed

1. Set the DRES and DEN bits in DSYSR to B’10.
2. Execute software reset to VSPD module.

64.5 Safety Mechanism

There is no safety mechanism in the DU.

65. Display Output Checker (DOC)

65.1 Overview

This module is treated as safety mechanism in case of the products supporting functional safety. However, this module can be also treated as non-safety-related function.

65.1.1 Features

DOC supports one channel of DU.

Table 65.1 DOC's Supported Channels of DU

	Connected channel of DU
DOC	DU (Supports RGB and YCbCr422)

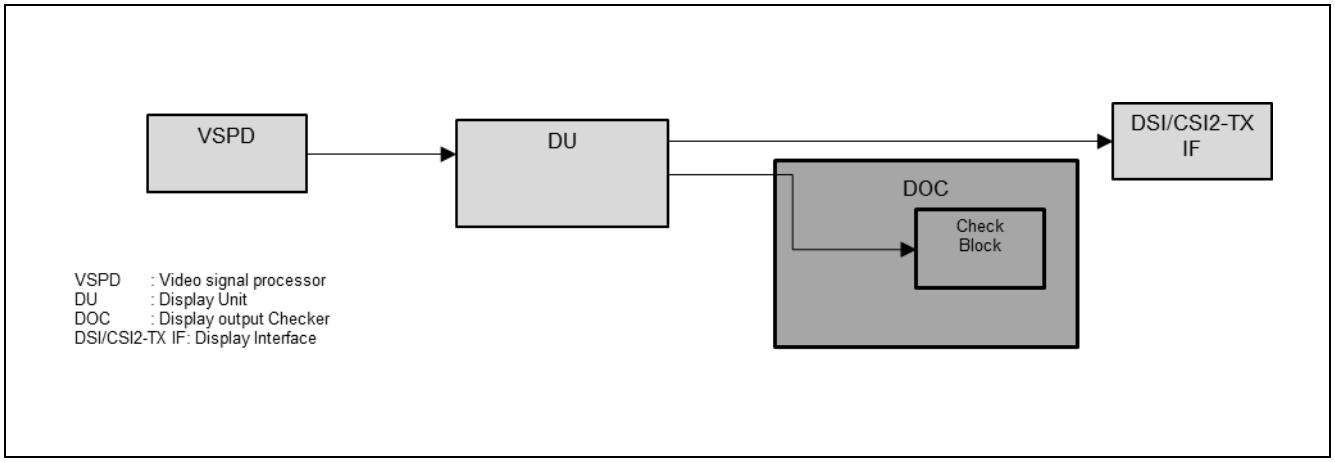

Figure 65.1 Connected modules with DOC

Main function is as the following:

1. **Video Output Check**

   The DOC allows to check whether the display content (warning, light, and so on) is correctly output by the Display Unit (DU). If the content is not correct, interrupts are input to the Interrupt Controller (INTC). Refer to Section 65.3.2.1.

   - Up to 4096x2048 pixel in screen size
   - Total of up to 16 monitor areas
   - Up to 65,536 pixels in total over all monitored areas
   - Four programmable reference color ranges for each monitored area
   - Programmable discriminator threshold for fail/pass decision
   - Interrupt generation upon symbol detection mismatch

2. **Active Monitor**

   The function allows to monitor the failure of VOC (Video Output Checker) implemented in DOC. If the VSYNC interspace is different from the register value set by user, interrupts are input to the Interrupt Controller (INTC). Additionally, the interrupts are also asserted in case that the check completion of VOC is not detected as expected (register values). Refer to Section 65.3.2.2.

65.1.2 Block Diagram

Display output data from DU is checked by "Video Output Checker (VOC)" which is the main component of the DOC. The format of the display output data is either RGB888 (one of RGB color format) or YCbCr422. VOC can support only

RGB format. Hence, the format of YCbCr422 needs to be converted to RGB format before checking the data by VOC if display output data is YUV format. Refer to Section 65.2.14 to 65.2.15 about the format conversion. Additionally, the DOC has internal control registers which are writable / readable by the APB protocol via the APB Bus. The unit of access is fixed to 32 bits. Refer to Section 65.1.4 about the detail register setting.

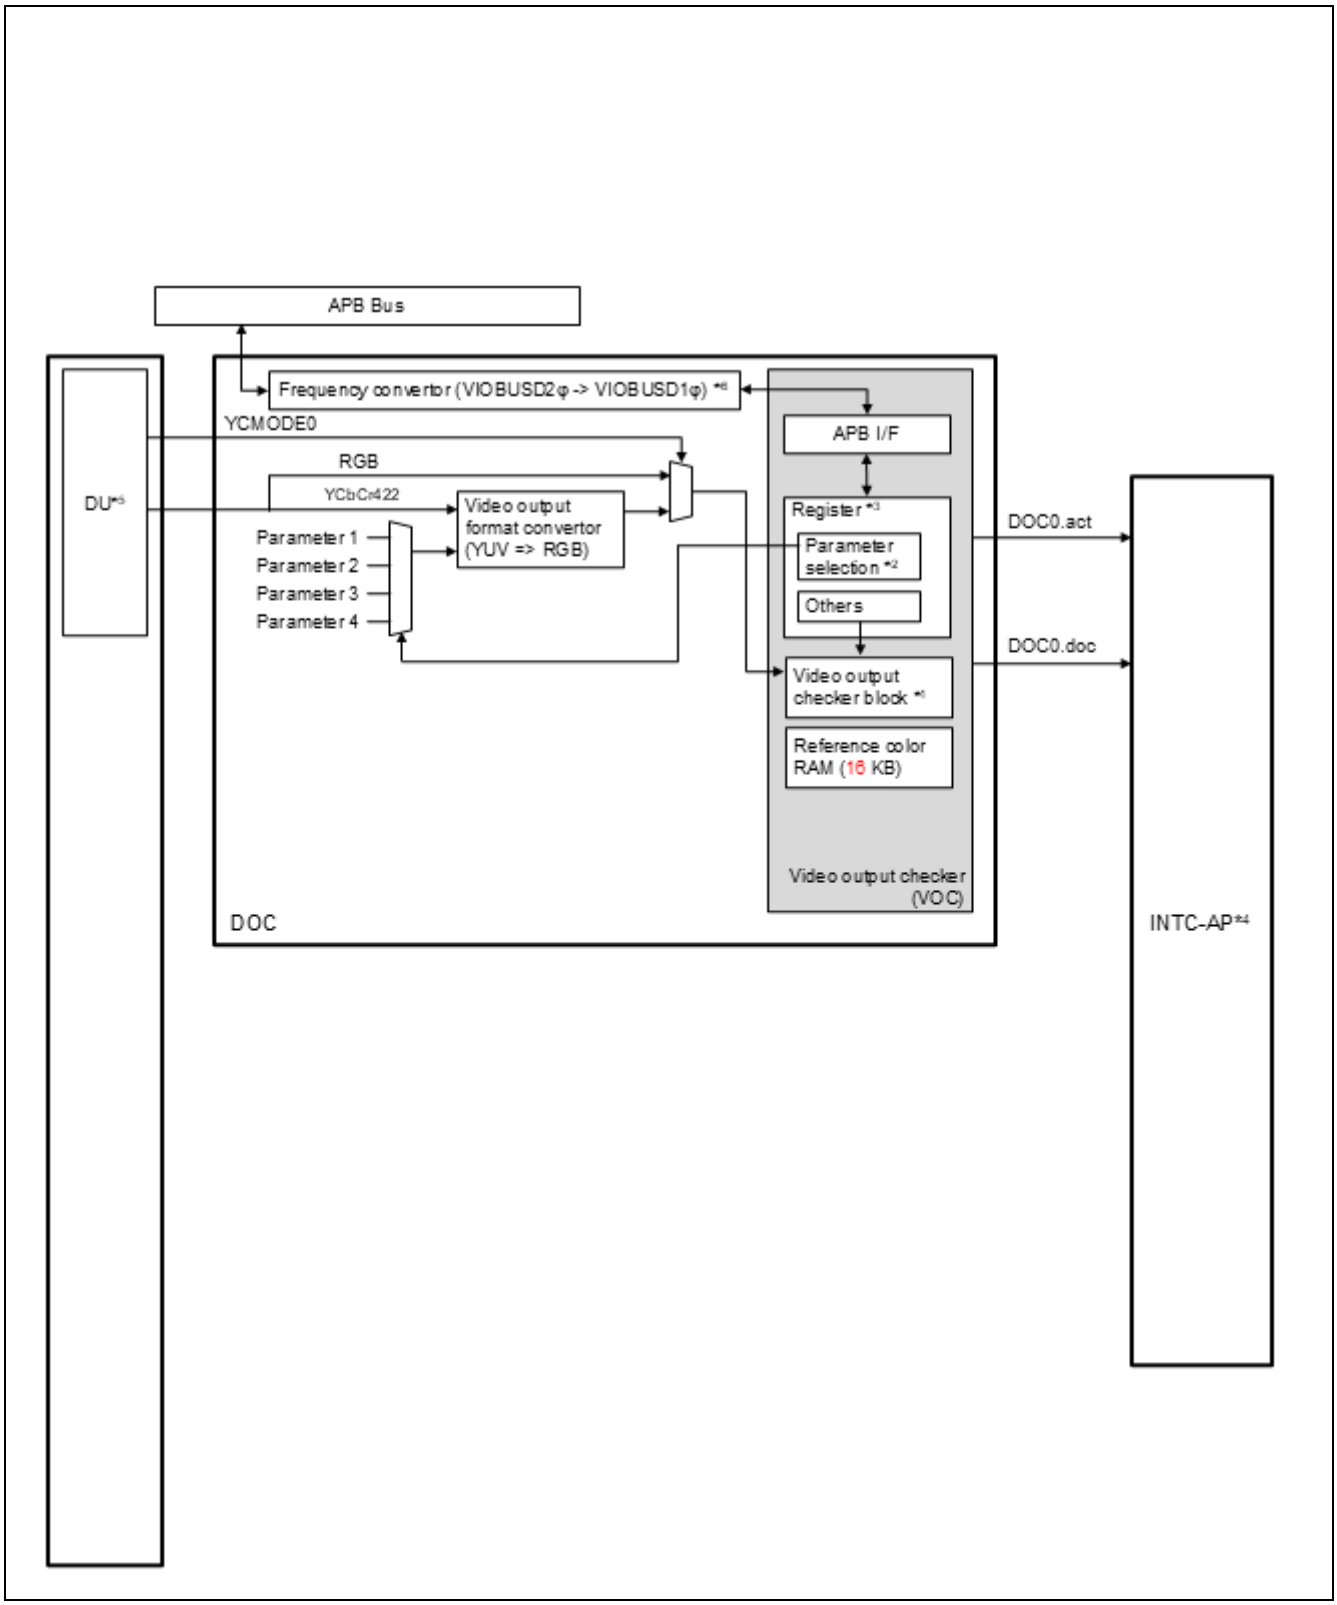

Figure 65.2 DOC Block Diagram

Notes:

1. Refer to Figure 65.3 in detail block diagram.
2. Refer to section 65.3.2.1 and 65.3.2.2 in detail.
3. Refer to section 65.3.2 about register setting.
4. Refer to section 15, Interrupt Controller (INTC-AP).
5. Refer to section 64, Display Unit (DU).
6. VIOBUSD2 ϕ = 266 MHz, VIOBUSD1 ϕ = 533 MHz

65.1.3 External Pins

DOC doesn’t have external pins.

65.1.4 Register Configuration

This section contains a description of all registers of the DOC.

65.1.4.1 DOC registers overview

Table 65.2 shows the register configuration.

Table 65.3 shows the register states in each operating mode. Write/Read access to the address not defined below is not allowed. These registers allow only 32bit access.

Table 65.2 Register Configuration for DOC0 m = 0 to 15

Register Name	Abbreviation	R/W	Address (DOC0_base = H'FEBA 0000)
Status register	DOC0STR	R	<DOC0_base>
Control register	DOC0CTL	R/W	<DOC0_base> + H'0004
Video Output and Activity Monitor enable register	DOC0EN	R/W	<DOC0_base> + H'0008
Activity Monitor detection time register for video channel 0	DOC0TIME0	R/W	<DOC0_base> + H'0010
Back porch offset of video channel 0 screen	DOC0OFFS0	R/W	<DOC0_base> + H'0020
Image size of video channel 0 screen	DOC0DISP0	R/W	<DOC0_base> + H'0028
Video channel 0 selection	DOC0ACT0	R/W	<DOC0_base> + H'0030
Discriminator register	DOC0DIFF	R	<DOC0_base> + H'0040
Format conversion parameter selection for Video channel 0	DOC0YCMODE0	R/W	<DOC0_base> + H'0060
Start point of monitor m registers	DOC0MmCFG0	R/W	<DOC0_base> + H'0100 + m × H'0020
Range of monitor m registers	DOC0MmCFG1	R/W	<DOC0_base> + H'0104 + m × H'0020
Start address of monitor m on expected RAM registers	DOC0MmCFG2	R/W	<DOC0_base> + H'0108 + m × H'0020
Acceptance threshold for sum of pixel of monitor m registers	DOC0MmCFG3	R/W	<DOC0_base> + H'010C + m × H'0020
CLUT0 of monitor m registers	DOC0MmCFG4	R/W	<DOC0_base> + H'0110 + m × H'0020
CLUT1 of monitor m registers	DOC0MmCFG5	R/W	<DOC0_base> + H'0114 + m × H'0020
CLUT2 of monitor m registers	DOC0MmCFG6	R/W	<DOC0_base> + H'0118 + m × H'0020

Note: * For details, refer to section 14, RESET (RST).

65.1.5 Connected Module

Modules which are connected to DOC are:

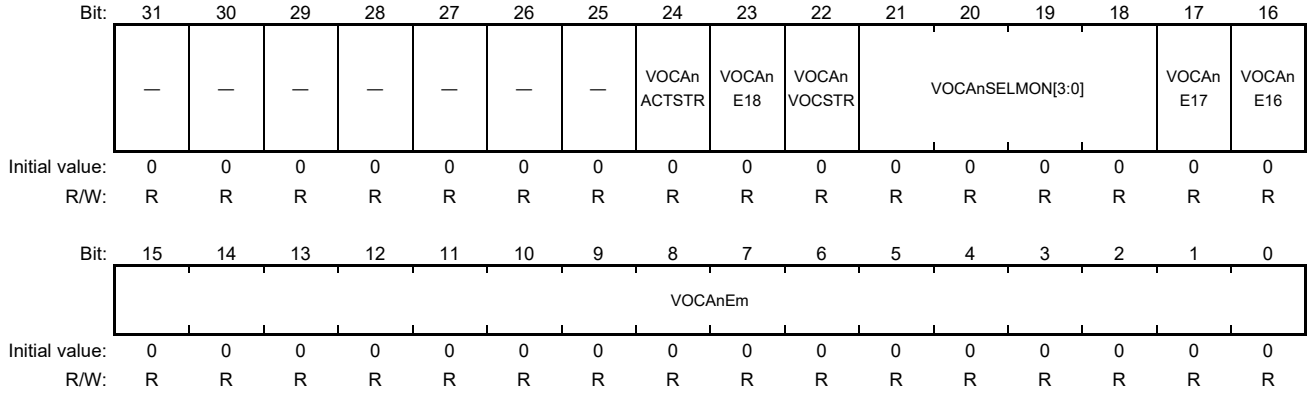
- DU
- INTC-AP

65.2 Register Description

[Legend]
—: Reserved. The write value should always be 0.
Initial value: Register value after a reset.
R/W: Readable/writable. The written value can be read.
R: Read-only. The write value should always be 0.

65.2.1 Status Register (DOC0STR)

This register holds various status and error information.



Bit Position	Bit Name	Initial Value	R/W	Description
24	VOCAnACTSTR	All 0	R	Activity Monitor status 0: not active 1: active
23	VOCAnE18	0	R	Parameter error Area of Video Output Monitor surpasses the size of video channel image If this error occurs, the related Video Output Monitor error (VOCAnEm) flag is also set.
22	VOCAnVOCSTR	0	R	VOC monitor status 0: Video Output Monitor not active in current video channel frame*4 1: Video Output Monitor active in current video channel frame
21 to 18	VOCAnSELMON [3:0]	0	R	Monitor number of the current video channel frame VOCAnSELMON[3:0] = m
17	VOCAnE17	0	R	Activity Monitor of video channel 1 error 0: no error occurred 1: error occurred*1,*2
16	VOCAnE16	0	R	Activity Monitor of video channel 0 error 0: no error occurred 1: error occurred*1,*2
15 to 0	VOCAnEm m = 15 to 0	0	R	Video Output Monitor area m error 0: no error occurred 1: error occurred*1,*3

Note 1. These error flags are cleared via the corresponding clear bits in the control register DOC0CTL.
Note 2. If any Activity Monitor error occurred, the Activity Monitor error interrupt DOC0.act is asserted.
Note 3. If any Video Output Monitor occurred, the Video Output Monitor error interrupt DOC0.doc is asserted.
Note 4. As there is no Video Output Monitor checked during the switching of the video channel, the status of VOCAnVOCSTR will be 0 in this case, even if one (or more) VOC Monitor is enabled (VOCAnENm = 1).

65.2.2 Control Register (DOC0CTL)

This register is used to mask interrupts, apply a software reset and to clear the error flags in the status register DOC0STR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VOCAn MKVOC	VOCAn MKINT	VOCAn SRST	—	—	—	—	—	—	—	—	—	—	VOCAn CL18	VOCAn CL17	VOCAn CL16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnCLm															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Positon	Bit Name	Initial Value	R/W	Description
31	VOCAnMKVOC	0	R/W	Video Output Monitor error detection mode 0: continuous mode: after detection of an area m error the Video Output Monitor continuous monitoring 1: stop mode: after detection of the first area m error the Video Output Monitor stops monitoring of other areas
30	VOCAnMKINT	0	R/W	Interrupt masking 0: DOC0.doc and DOC0.act interrupts are generated upon error detections 1:DOC0.doc and DOC0.act interrupts are not generated upon error detections
29	VOCAnSRST	0	R/W	Software reset Write: 0: no function 1: apply software reset to DOC module Read: 0: software reset released 1: software reset active Refer also to the description (1) Software reset procedure after this table.
18	VOCAnCL18	0	R/W	Parameter error clear 0: sets VOCSnCL18 = 0 1: clear DOC0STR.VOCAnE18
17	VOCAnCL17	0	R/W	Activity Monitor of video channel 1 error flag clear 0: sets VOCSnCL17 = 0 1: clear DOC0STR.VOCAnE17 Clearing the error flag has to be done by a certain procedure. Refer to “Activity Monitors error flag clearing procedure” in Section 65.3.3.2, Activity Monitors error notification for details.
16	VOCAnCL16	0	R/W	Activity Monitor of video channel 0 error flag clear 0: sets VOCSnCL16 = 0 1: clear DOC0STR.VOCAnE16 Clearing the error flag has to be done by a certain procedure. Refer to “Activity Monitors error flag clearing procedure” in Section 65.3.3.2, Activity Monitors error notification for details.
15 to 0	VOCAnCLm m = 15 to 0	0	R/W	Video Output Monitor m error flag clear 0: sets VOCAnCLm = 0 1: clear DOC0STR.VOCAnEm Clearing the error flag has to be done by a certain procedure. Refer to “Video Output Monitor error flag clearing procedure” in Section 65.3.3.1, Video Output Monitor error notification for details.

Note 1. If both Activity Monitor errors are cleared, the Activity Monitor error interrupt DOC0.act is de-asserted.
Note 2. If all Video Output Monitor errors are cleared, the Video Output Monitor error interrupt DOC0.doc is deasserted.

(1) Software Reset Procedure

The following sequence describes the procedure to issue a software reset of the “Video Output Checker” unit.

1. Apply software reset by setting DOC0CTL.VOCAnSRST = 1.
2. Wait until software reset released state reached by polling until DOC0CTL.VOCAnSRST = 0.
3. Wait for occurrence of next Video Data Controller interrupt.

The “Video Output Checker” software reset has been completed. However, this reset is effect only for “Video Output Checker” unit. Hence, the control of reset by CPG is required in case that the whole of DOC is reset.

65.2.3 Video Output and Activity Monitor Enable Register (DOC0EN)

This register is enable/disable each Video Output Monitor.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Initial Value	R/W	Description
16	VOCAnEN16	0	R/W	Enable/disable Activity Monitors 0: Activity Monitors disabled 1: Activity Monitors enabled
15 to 0	VOCAnENm m = 15 to 0	0	R/W	Enable/disable Video Output Monitor m 0: Video Output Monitor m disabled 1: Video Output Monitor m enabled

Enabled or disabling of the Activity Monitors or of a Video Output Monitor m becomes effective with the next frame of the assigned video channel, i.e. with its next VSYNC.

65.2.4 Reserved

65.2.5 Video Channel 0 Activity Monitor Detection Time Register (DOC0TIME0)

These registers specify the upper and lower detection time for Activity Monitor for both video channels. The timing values in this register are specified in units of one cycle time of RCLK. RCLK = 32.768 kHz.

The detection time is given or taken 5 cycles of RCLK. Hence, this deviation should be considered for setting the time.

Bit Position	Bit Name	Initial Value	R/W	Description
0	VOCAnVOUT0	B'1	R/W	Video channel 0 availability selection 0: Video channel 0 is not available 1: Video channel 0 is available

Note: Video channel 0 needs to be selected as available (VOCAnVOUT0 = 1) before it can be used for any monitoring purposes.

65.2.12 Reserved

65.2.13 Video Output Monitor Discriminator Register (DOC0DIFF)

This register shows the calculated discriminator value D for a single Video Output Monitor area. Refer to Section 65.3.2.1, Video Output Monitoring Basic Procedure for details about the discriminator calculation.

This register is to be used only for debugging purposes and in the way shown below (m = 15 to 0):

1. Disable all Video Output Monitor areas m (DOC0EN.VOCAnENm = 0).
2. Enable the single area m to be evaluated (DOC0EN.VOCAnENm = 1).
3. Disable the evaluated single area m (DOC0EN.VOCAnENm = 0).
4. Wait until monitoring becomes inactive, i.e. until DOC0STR.VOCAnVOCSTR = 0.
5. The last calculated discriminator can be read from the VOCAnDIFF register.

65.2.14 Format Conversion Parameter Selection for Video Channel 0 (DOC0YCMODE0)

One from four type of parameter can be selected for image format conversion (YUV to RGB). As described in Section 65.1.2, the format conversion is required if DU output format is YUV. Refer to the conversion formula in the table below. The conversion parameter is effect during YCMODE0/1 from DU asserting to 1'b1

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Initial Value	R/W	Description
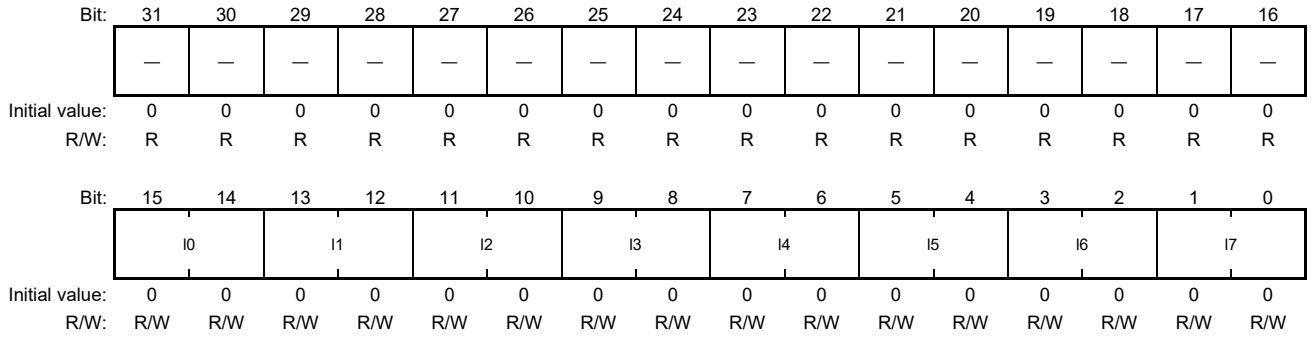
27 to 24	VOCAnMmRUP3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: red upper limit
23 to 20	VOCAnMmGUP3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: green upper limit
19 to 16	VOCAnMmBUP3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: blue upper limit
11 to 8	VOCAnMmRLO3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: red lower limit
7 to 4	VOCAnMmGLO3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: green lower limit
3 to 0	VOCAnMmBLO3 [3:0]	All 0	R/W	Video Output Monitor m reference color 3: blue lower limit

Note: Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. DOC0EN.VOCAnENm = 0.

65.2.24 Video Output Monitor Reference RAM Register-k [k = 0 to 4095] (DOC0EXPDk).

These registers define the 2-bpp CLUT2 indices of the reference colors. For further details refer to Section 65.3.1.3, Reference color.

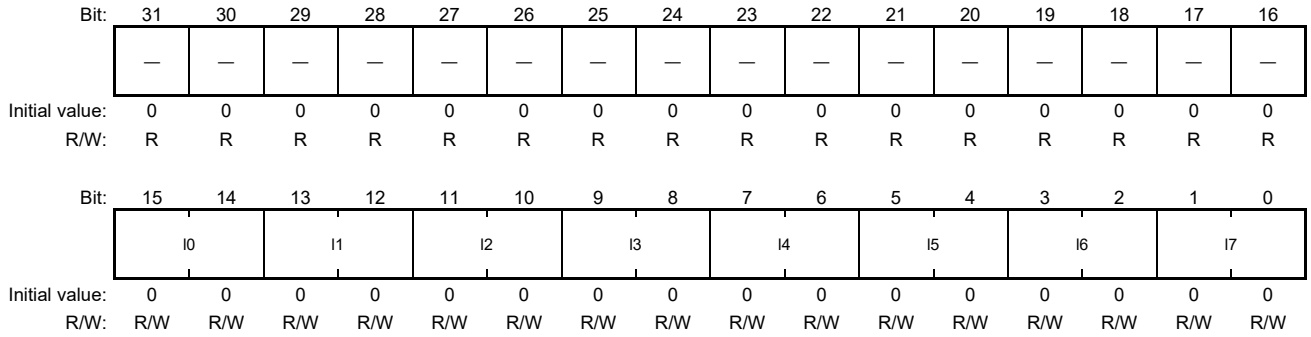


Bit Position	Bit Name	Initial Value	R/W	Description
15 to 14	I0 [1:0]	All 0	R/W	CLUT2 index of pixel x
13 to 12	I1 [1:0]	All 0	R/W	CLUT2 index of pixel x+1
11 to 10	I2 [1:0]	All 0	R/W	CLUT2 index of pixel x+2
9 to 8	I3 [1:0]	All 0	R/W	CLUT2 index of pixel x+3
7 to 6	I4 [1:0]	All 0	R/W	CLUT2 index of pixel x+4
5 to 4	I5 [1:0]	All 0	R/W	CLUT2 index of pixel x+5
3 to 2	I6 [1:0]	All 0	R/W	CLUT2 index of pixel x+6
1 to 0	I7 [1:0]	All 0	R/W	CLUT2 index of pixel x+7

Note: Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. DOC0EN.VOCAnENm = 0.

65.2.25 Video Output Monitor Reference RAM Register-k [k = 4096 to 8191] (DOC0EXPDk).

These registers define the 2-bpp CLUT2 indices of the reference colors. For further details refer to Section 65.3.1.3, Reference color.



Bit Position	Bit Name	Initial Value	R/W	Description
15 to 14	I0 [1:0]	All 0	R/W	CLUT2 index of pixel x
13 to 12	I1 [1:0]	All 0	R/W	CLUT2 index of pixel x+1
11 to 10	I2 [1:0]	All 0	R/W	CLUT2 index of pixel x+2
9 to 8	I3 [1:0]	All 0	R/W	CLUT2 index of pixel x+3
7 to 6	I4 [1:0]	All 0	R/W	CLUT2 index of pixel x+4
5 to 4	I5 [1:0]	All 0	R/W	CLUT2 index of pixel x+5
3 to 2	I6 [1:0]	All 0	R/W	CLUT2 index of pixel x+6
1 to 0	I7 [1:0]	All 0	R/W	CLUT2 index of pixel x+7

Note: Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. DOC0EN.VOCAnENm = 0.

65.3 Operation

65.3.1 Video-Output-Checker block diagram

The figure below shows the building blocks of the Video-Output-Checker (VOC). Further details about the building blocks are described in the following sub-chapters.

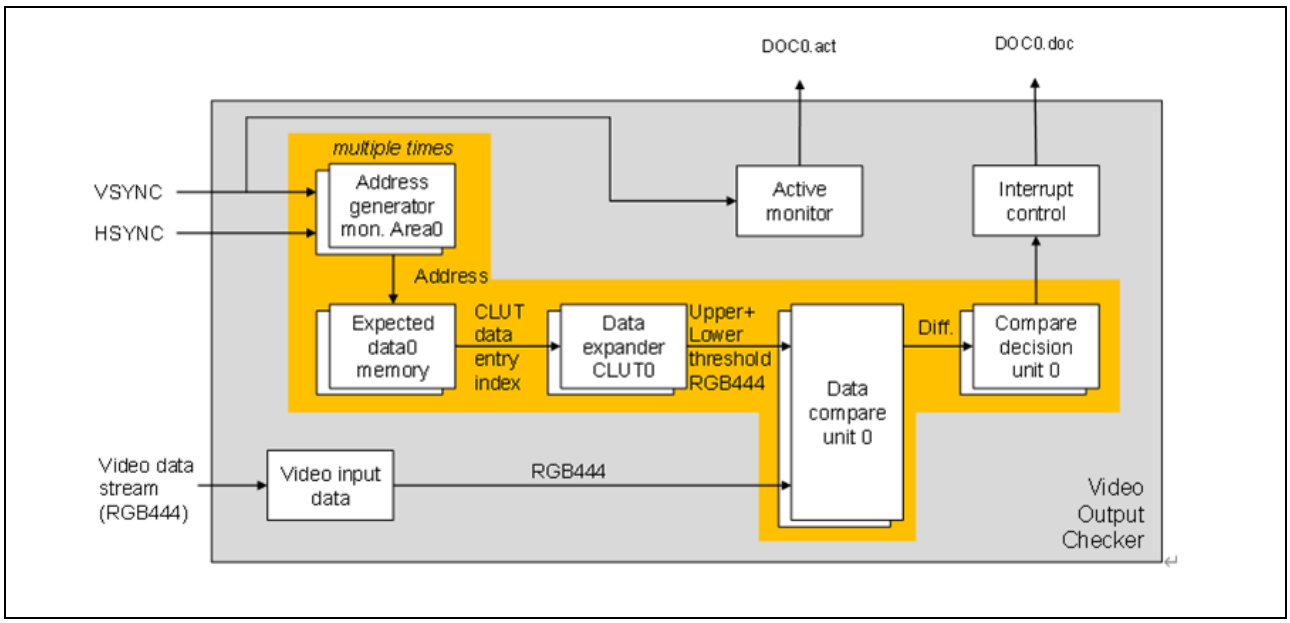


Figure 65.3 Video-Output-Checker (VOC) diagram

65.3.1.1 Address Generator

The address generator specifies a rectangular area out of the full video screen to be monitored. The address generator takes care for time multiplexed monitoring of each (enabled) monitoring area. One monitor area is checked each frame. After all active monitored areas are processed, the monitoring processes are repeated.

- This allows that all the monitored data is just a part of the screen.
- Up to 16 monitored areas can be defined.
- Enable / Disable control of monitored areas by register via APB bus interface.
- The locations of monitored areas are register programmable (during monitored area is disabled).

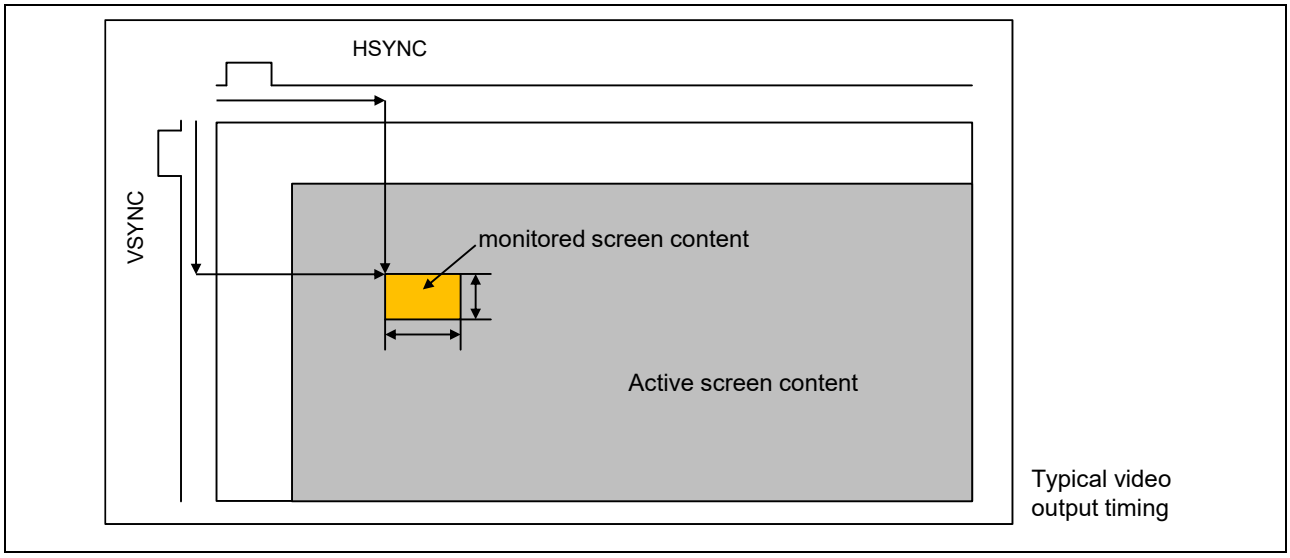

Figure 65.4 Addressing of monitoring area on the screen

65.3.1.2 Expected Data Memory

The expected data memory contains the expected data, which are used to compare against the incoming video data. Per incoming pixel of a monitoring area there is one test data for comparison. To save memory the test data is stored as indexed colors in CLUT2 format. This allows 4 different indexed color values for each monitoring area. The 4 values are set by Video Output Monitor reference register (Section 65.2.20 to Section 65.2.23).

65.3.1.3 Data Expander (CLUT)

For each expected data unit, there is one data expander (CLUT). The unit expands the indexed color to a direct mapped RGB444 color for upper and lower threshold limits per color component. In this unit the indexed color is replaced not by a single direct mapped color but by two values per color component.

- RGB444 upper limit

  1. upper limit red (4bit)
  2. upper limit green (4bit)
  3. upper limit blue (4bit)

- RGB444 lower limit

  1. lower limit red (4bit)
  2. lower limit green (4bit)
  3. lower limit blue (4bit)

This threshold values are register programmable. They describe the acceptable color variation of the 4 indexed colors used for the encoding of the test data (telltale image) in the expected data memory before.

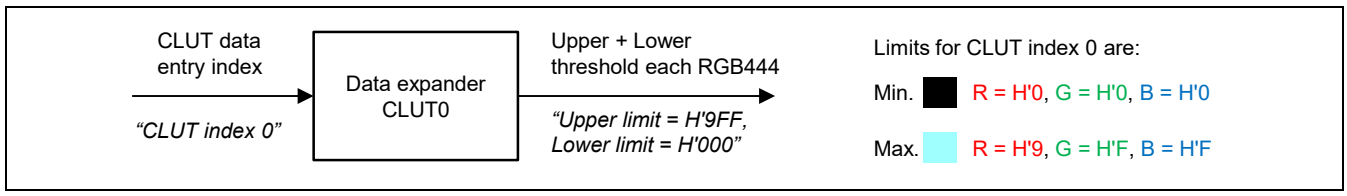

Figure 65.5 Data expander CLUT block (1 out of 16)

65.3.1.4 Data Compare Unit

In the data compare unit the incoming video data is compared pixel- and component-wise with the upper and lower thresholds provided by the data expander unit. An incoming pixel is judged as valid as long as for all color components the value is between lower and upper limit of the test data.

If one incoming pixel is valid, the different value is set to be 0. On the other hand, if one incoming pixel is NOT valid, the difference value is calculated as sum over the deviation of each color component. This difference value is provided for each pixel of the monitoring area to the compare decision unit for further processing.

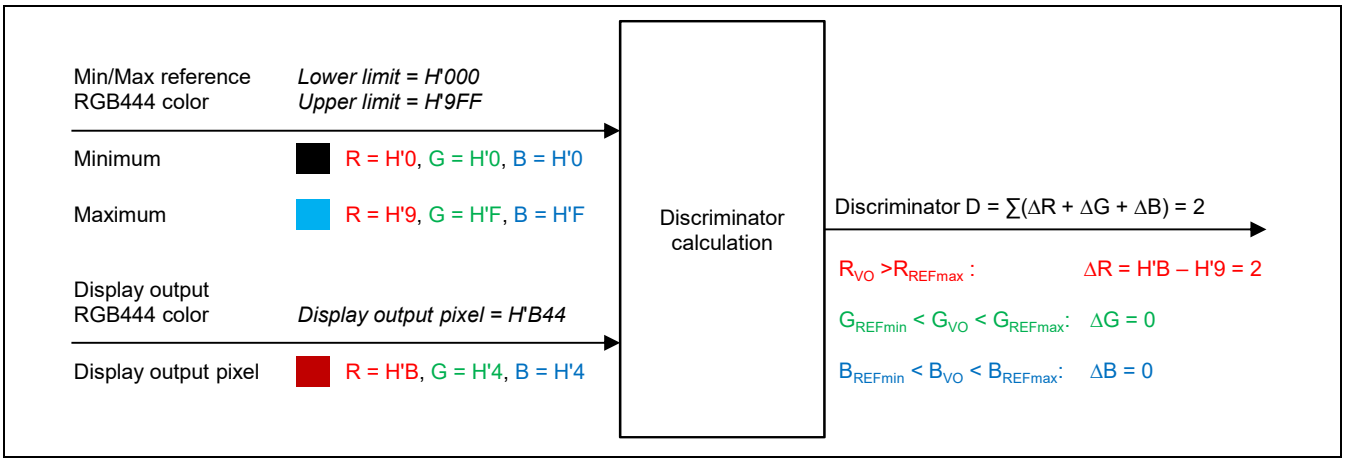

Figure 65.6 Deviation calculation example

65.3.1.5 Compare Decision Unit

The compare decision unit sums up all difference values for one monitoring area. After one monitoring area was completed, this unit decides if an expected image was displayed correctly or not. This is done by comparison of the summed up difference values with a register programmed acceptance threshold value.

If the expected image was not correctly displayed, it raises the Compare status interrupt Signaling “fail” condition. Also the index number of the failed monitoring area is stored in a status register. Depending on this status register the CPU can later detect, which of the monitoring areas did not display the expected image.

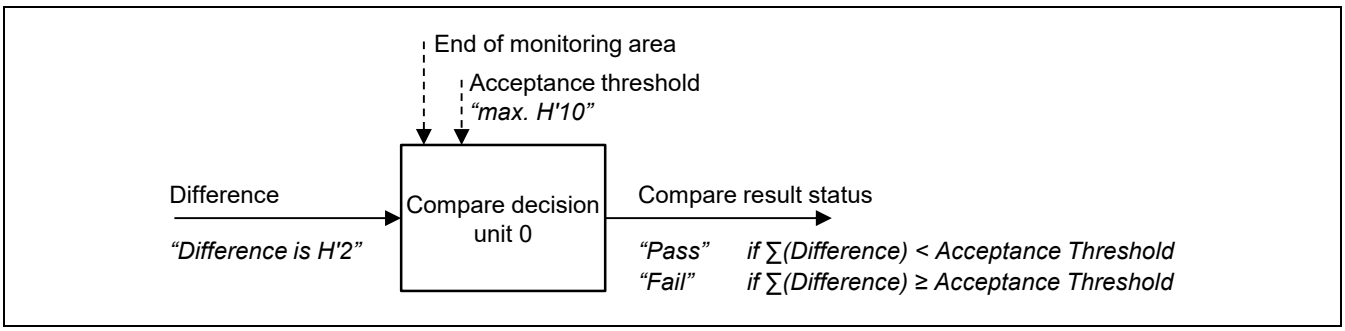

Figure 65.7 Compare decision unit

65.3.1.6 Active Monitor

The Activity Monitor controls whether the Video Output Monitor has completed the check of a monitor area within a certain time window. If the Video Output Monitor does not report completion of the monitor area check within this time window, the Activity Monitor notifies an error.

65.3.2 Procedure of Parameter Setting

This section describes the procedure of the register setting for using the function of DOC. During register setting, Video Output Monitor is disabled. Each monitor can be enabled and disabled separately.

- DOC0EN.VOCAnENm = 0: Monitor m is disabled (Disable Monitor).
- DOC0EN.VOCAnENm = 1: Monitor m is enabled (Enable Monitor).

Further details about Register Setting in Figure 65.8 are described in sub-chapters.

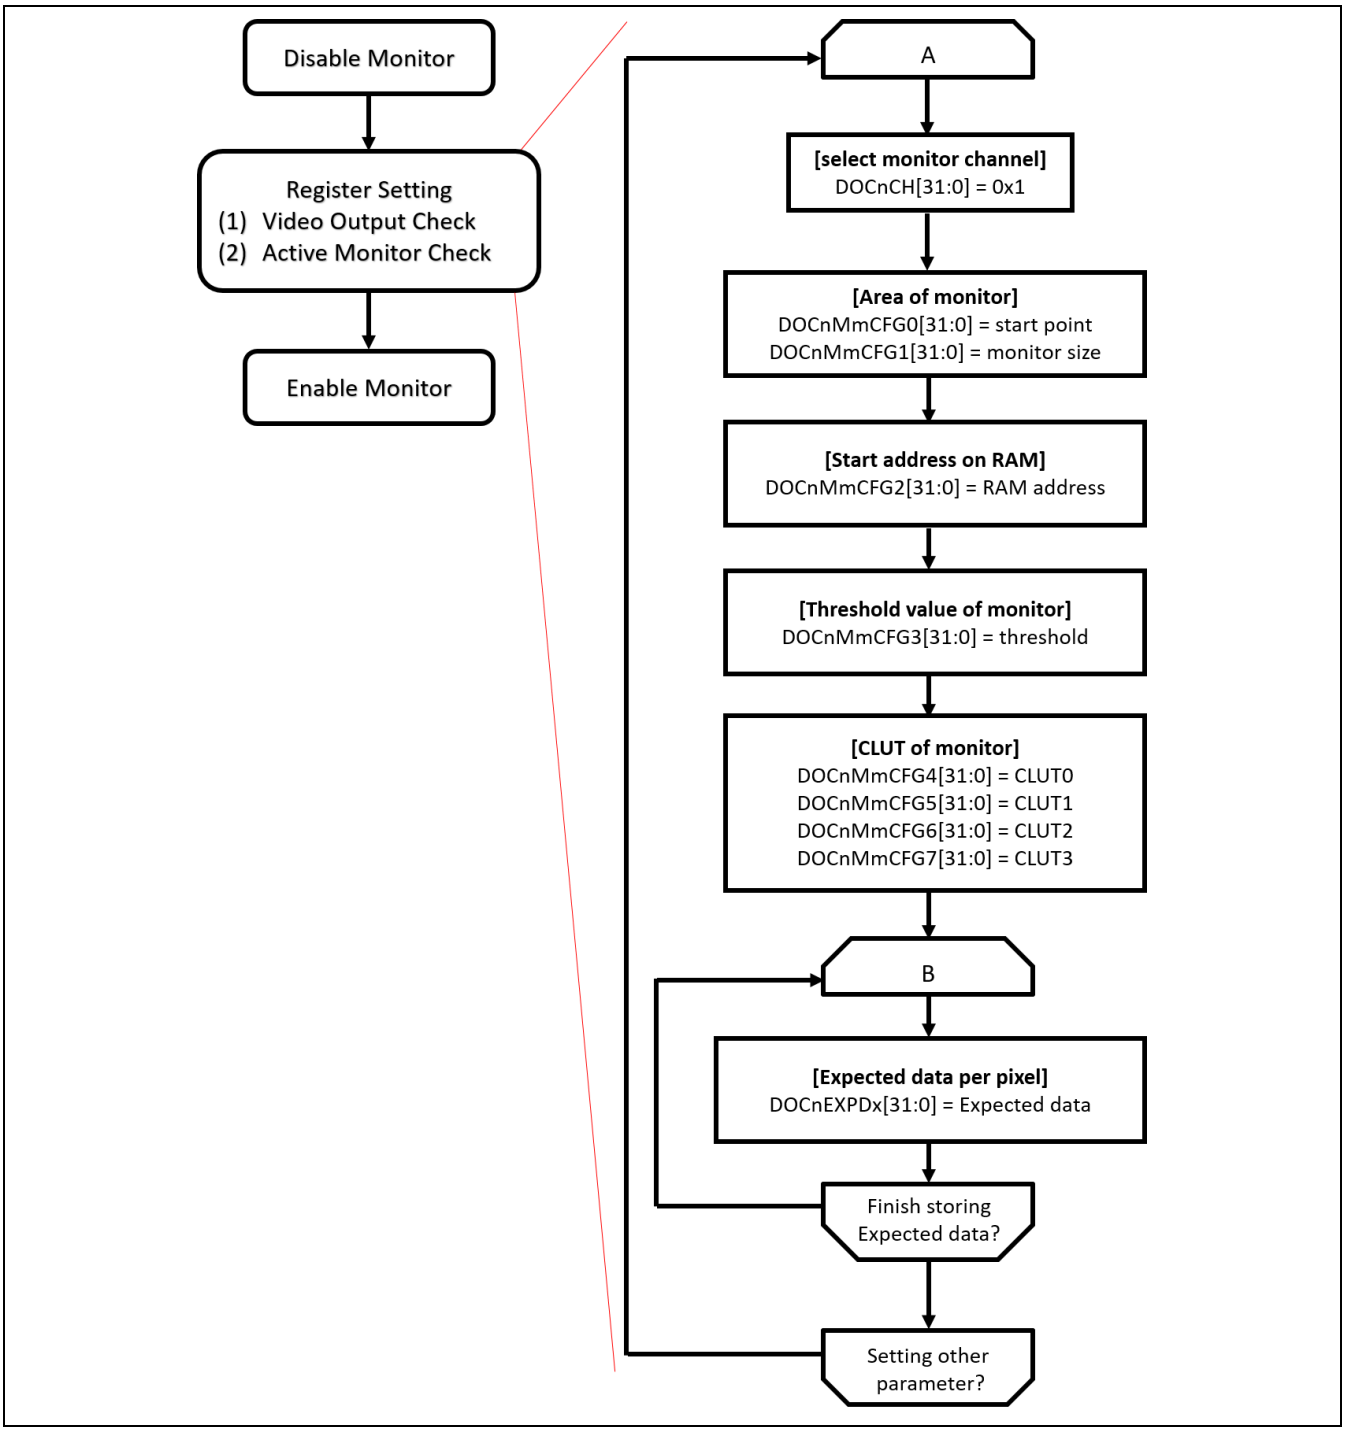

Figure 65.8 Procedure of the register setting (n = 0, 1)

65.3.2.1 Register Setting (1) Video Output Check

(1) Area of Monitor

The area m to be monitored is defined relative to the HSYNC and VSYNC signals of the video output channel j:

- VOCAnHOFFSj and VOCAnVOFFS set by DOC0OFFSj: (Section 65.2.7)

  Start value of the active video output screen in horizontal/vertical direction is shown. The back porch offset values specify the number of pixels between the falling edge of the HSYNC or VSYNC pulse and the beginning of the active screen output. Thus the offset values to specify depend on the polarity of the HSYNC and VSYNC signals:

  - If the SYNC signal is high active (refer to Figure 65.9):

    offset value = back porch (time between the end of the SYNC pulse and the active screen output)

  - If the SYNC signal is low active (refer to Figure 65.10):

    offset value = SYNC pulse width + back porch (time between the beginning of the SYNC pulse and the active screen output)

- VOCAnMmHSTRT and VOCAnMmVSTRT set by DOC0MmCFG0: (Section 65.2.16)

  This value shows horizontal/vertical coordination of the first pixel of the monitor area m

- VOCAnMmHSIZE and VOCAnMmVSIZE set by DOC0MmCFG1: (Section 65.2.17)

  This value shows horizontal/vertical size of the monitor area m

All values in horizontal direction (VOCAnHOFFS, VOCAnMmHSTRT, VOCAnMmHSIZE) are defined in pixel units.
All values in vertical direction (VOCAnVOFFS, VOCAnMmVSTRT, VOCAnMmVSIZE) are defined in line units.

Note

The back and front porch of the video signal must have at least a width of one pixel.

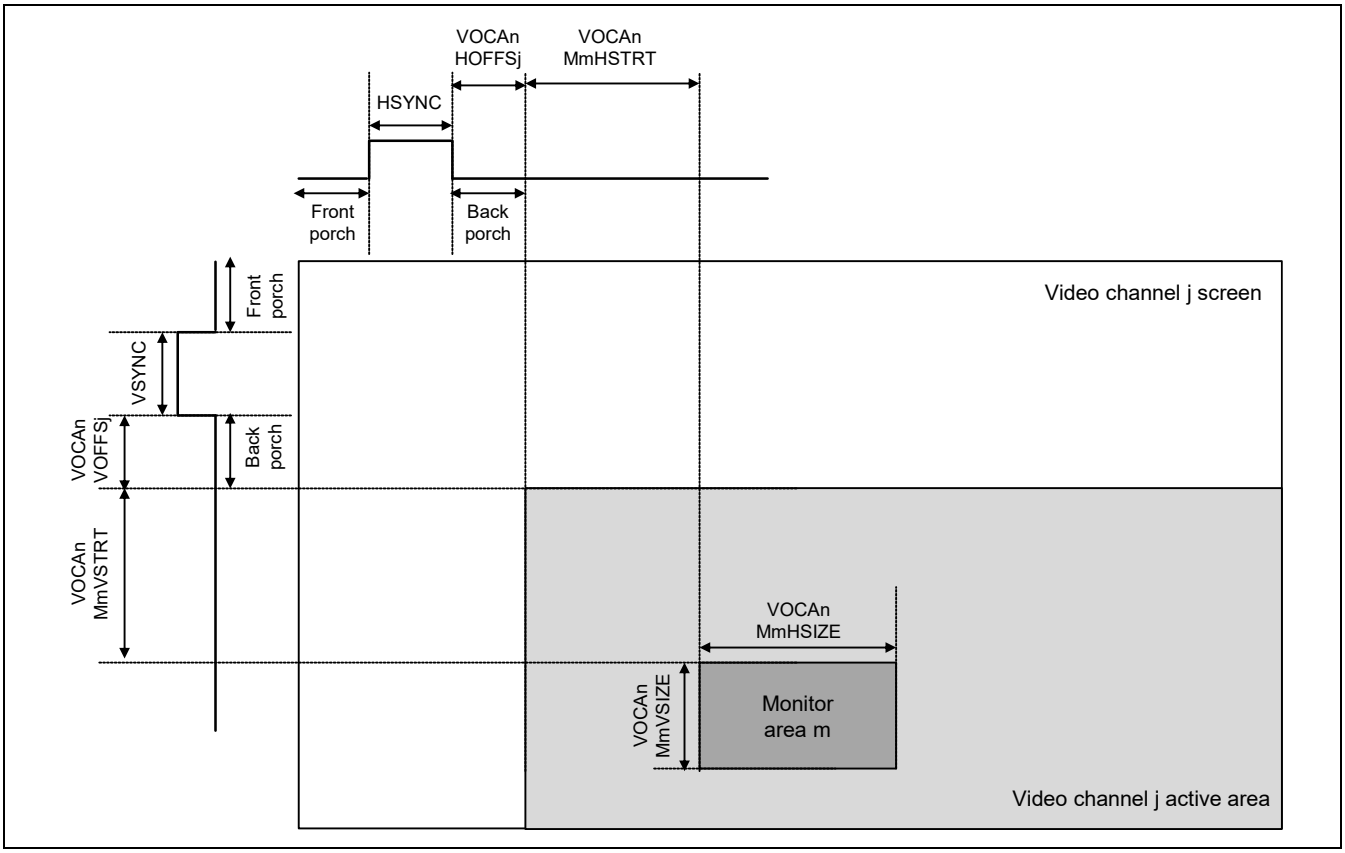

Figure 65.9 Monitor area definition with high active HSYNC and VSYNC

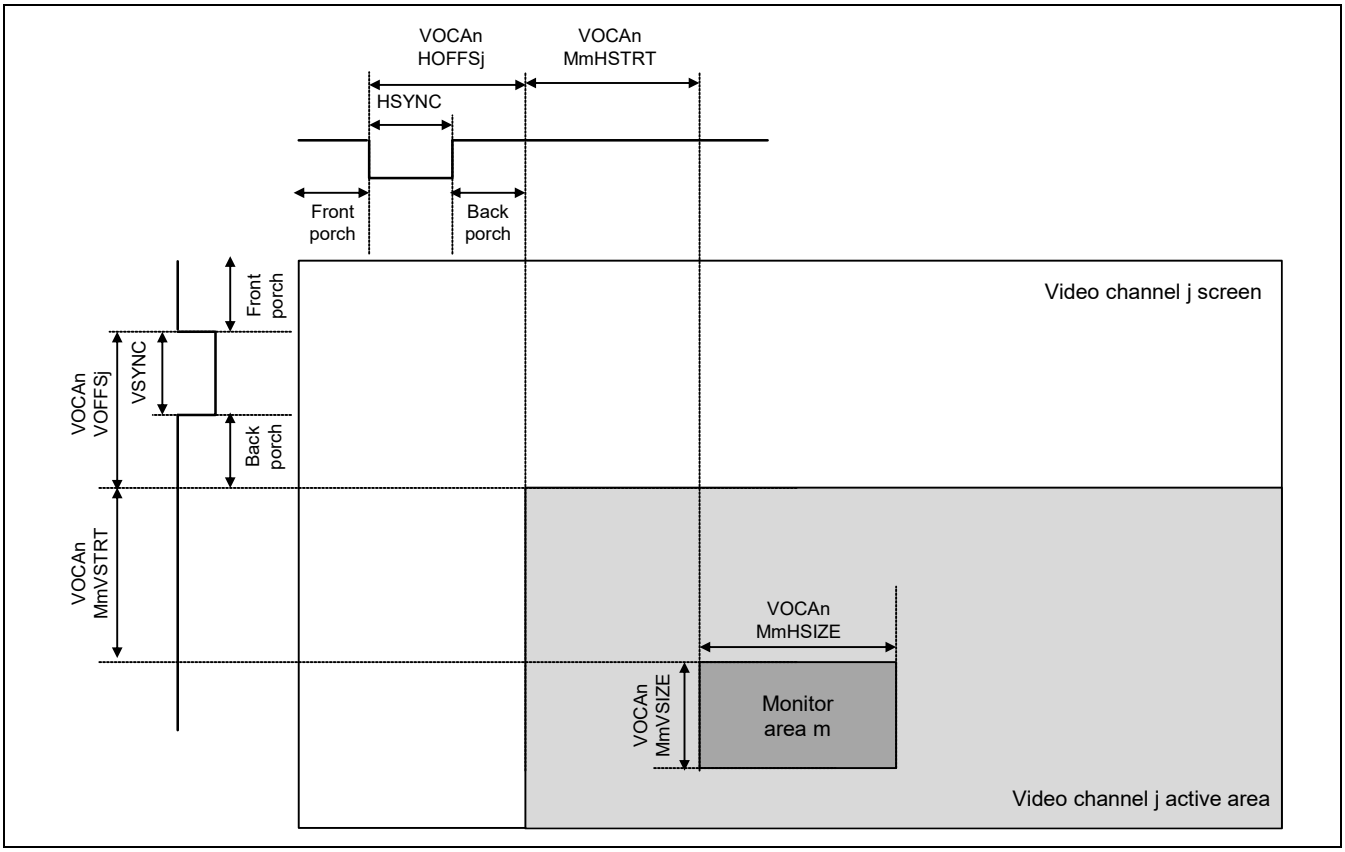

Figure 65.10 Monitor area definition with low active HSYNC and VSYNC

(2) Start Address on RAM

Start address on RAM is set by DOC0MmCFG2 (m = 15 to 0) registers. The register assigns the start address for expected data of each monitor on Expected RAM. It is required to specify the start address for expected data of each monitor before storing the expected data.

New expected data on Expected RAM can be written if there is vacant area on it. Resizing data on new vacant area on Expected RAM if there is not vacant area on it.

(3) Threshold Value of Monitor

Threshold value of monitor is set by DOC0MmCFG3 (m = 15 to 0) registers. The register assigns acceptance threshold in sum of pixel of each monitor. The register size is decided by next equation.

The range of threshold is from 0 to 262143.

- Min. allowed value: 0. Video Check Monitor errors always occur when DOC0MmCFG3.VOCAnMmTHSH=0.
- Max. allowed value: 262143.

(4) CLUT of Monitor

The reference colors for the discriminator calculation are stored as 2-bit CLUT2 indices, that select one out of four 12-bpp RGB444 colors from a color look-up table. CLUT of monitor is set by DOC0MmCFG4/CFG5/CFG6/CFG7 (m = 15 to 0).

(5) Reference Color Definition

Each RGB444 reference color describes an acceptance range by an upper and lower limit for each of the RGB components. The limit values for each of the four reference colors for each monitor area m are defined by the registers DOC0MmCFG4 to DOC0MmCFG7 with following content:

- VOCAnMmRUP[3:0]/RLO[3:0]: upper/lower limit of red component
- VOCAnMmGUP[3:0]/GLO[3:0]: upper/lower limit of green component
- VOCAnMmBUP[3:0]/BLO[3:0]: upper/lower limit of blue component

(6) Reference Color Selection

The 2-bpp CLUT2 indices are stored in the reference color RAM. The RAM is organized as 4096 x 32 bit.

The address of the reference color CLUT2 index of the first pixel of the monitor area m is defined in the Video Output Monitor m reference color RAM address register DOC0MmCFG2.VOCAnMmADDR[12:0] in the range of 0 to 8191, i.e. H’000 to H’FFF.

The 2-bpp CLUT2 indices are stored in the color RAM via the registers DOC0EXPD0000 to DOC0EXPD8191.

The addresses of the monitor areas reference color indices can be freely assigned in the RAM. The Table 65.4 below gives an examples for three monitored areas (m = 0, 2, 10) of different size.

Note

1. The total number of monitored pixel is limited to 65,536 pixels.
2. The RAM areas, assigned to different monitor areas, must not overlap.

Table 65.4 Reference color RAM example

Monitor area	DOC0MmCFG2	RAM address	Bit*1 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
not used		H'000																
		H'001																
		…																
m = 0	VOCAnM0ADDR	H'010	I0		I1		I2		I3		I4		I5		I6		I7	
32 x 32 pixel	VOCAnM0ADDR + 1	H'011	I8		I9		I10		I11		I12		I13		I14		I15	
	…	…	…		…		…		…		…		…		…		…	
	VOCAnM0ADDR + 127	H'08F	I1016		I1017		I1018		I1019		I1020		I1021		I1022		I1023	
m = 10	VOCAnM10ADDR	H'090	I0		I1		I2		I3		I4		I5		I6		I7	
60 x 35 pixel	VOCAnM10ADDR + 1	H'091	I8		I9		I10		I11		I12		I13		I14		I15	
	…	…	…		…		…		…		…		…		…		…	
	VOCAnM10ADDR + 262	H'196	I2096		I2097		I2098		I2099		—		—		—		—	
not used		…																
m = 2	VOCAnM2ADDR	H'800	I0		I1		I2		I3		I4		I5		I6		I7	
128 x 128 pixel	VOCAnM2ADDR+1	H'801	I8		I9		I10		I11		I12		I13		I14		I15	
	…	…	…		…		…		…		…		…		…		…	
	VOCAnM2ADDR + 2047	H'FFF	I16376		I16377		I16378		I16379		I16380		I16381		I16382		I16383	

Note 1. "I" stands for a 2-bpp CLUT2 color index.

(7) Expected Data Per Pixel

Expected data per pixel is set by DOC0EXPD registers. The register is directly mapped to store the Expected data on Expected RAM. The Expected data is stored per 16bit. However, these data need to be aligned per 8pixel (16bit).

(8) Other Setting

When DU (Display Unit) output the image with YUV422, DOC register setting should be done as the following.

(a) YUV422

The following register setting for DU is required. In detail, refer to the register DEF10R of Section 64.2 in DU.

65.3.2.2 Register Setting (2) Active Monitor Check

The Activity Monitor controls whether the Video Output Monitor has completed the check of a monitor area within a certain time window. If the Video Output Monitor does not report completion of the monitor area check within this time window, the Activity Monitor notifies an error.

Note

Since the Activity Monitor requires active Video Output Monitors on the video channel to check activity, at least one Video Output Monitor must be enabled for the respective video channel. That means at least one Video Output Monitor with

- DOC0EN.VOCAnENm = 1 and DOC0CH.VOCAnCHm = 0 (assigned to video channel 0)
- DOC0EN.VOCAnENm = 1 and DOC0CH.VOCAnCHm = 1 (assigned to video channel 1)

must be set up, if the activity of both video channels shall be monitored.

If only the Activity Monitor is to be used, but no Video Output Monitor on a certain video channel, enable a Video Output Monitor for that video channel and set it up in such a way that it does not generate any Video Output Monitor errors. This can be achieved by selecting the range of all reference colors to maximum, i.e.

DOC0MmCFG4 = DOC0MmCFG5 = DOC0MmCFG6 = DOC0MmCFG7 = H'0FFF 0000

(1) Activity Monitors Activation

The Activity Monitors for both video channels can be enabled and disabled all together:

- DOC0EN.VOCAnEN16 = 0: Activity Monitors inactive
- DOC0EN.VOCAnEN16 = 1: Activity Monitors active

(2) Active Monitors Set-up

The time window for valid Video Output Monitor process completion is determined by a counter, that is operated with the clock of the Low Speed (32.768kHz = 0.0305ms per one cycle). The time window's duration and location on the time axis is set up via the timing register DOC0TIMEj for each of both video channels (j = 0, 1):

- DOC0TIMEj.VOCAnMINj: minimum detection time of Activity Monitors for video channel j
- DOC0TIMEj.VOCAnMAXj: maximum detection time of Activity Monitors for video channel j

Note

1. Subject to the Activity Monitor check in a certain video channel frame is always the current monitor area for that frame, i.e. the area m, indicated by DOC0STR.VOCAnSELMON[3:0].

The time window definitions DOC0TIMEj.VOCAnMINj/MAXj are automatically selected for the video channel j, that is assigned to the current monitor area via the Video Output Monitor channel assignment VOCAnCHm.

65.3.3 DOC Behavior

This section describes the behavior of DOC. Error notification algorithm of Video Monitor Check and Active Monitor is summarized.

65.3.3.1 Video Output Monitor Error Notification

An error during check of the Video Output Monitor area m can be detected for two reasons:

(1) Monitor Area-m Content Mismatch Error

Such error is detected, if the content check (with respect to discriminator vs. acceptance threshold) fails. Upon detection of such error

- the monitor m area error bit DOC0STR.VOCAnEm is set
- the Video Output Monitor interrupt DOC0.doc is asserted.

(2) Monitor Area-m Parameter Error

Such error is detected, if the definition of a monitored area m (area m start point in DOC0MmCFG0 and size in DOC0MmCFG1) does not fit to the active screen size of the related video channel. Upon detection of such error

- the parameter error DOC0STR.VOCAnE18 flag is set
- the monitor m area error bit DOC0STR.VOCAnEm is set

Note

1. The error flagsin the status register DOC0STR remain set until they are cleared via the control register DOC0CTL. Refer to “Video Output Monitor error flag clearing procedure” below for details.
2. The DOC0.doc remains asserted as long as any of the VOCAnEm are set.

(3) Video Output Monitor Error Flag Clearing Procedure

In order to clear a Video Output Monitor error flags, that has been set due to a content mismatch or parameter error detection, proceed as follows:

1. Disable all Video Output Monitors by DOC0EN.VOCAnENm = 0.
2. Wait until Video Output Monitors are inactive, i.e. until DOC0STR.VOCAnVOCSTR = 0.
3. Evaluate the error source via the error flags in the status register DOC0STR.
4. Clear all Video Output Monitor error flags by
   - DOC0CTL.VOCAnCLm = 1 for content mismatch errors
   - DOC0CTL.VOCAnCL18 = 1 for parameter error
5. Release all Video Output Monitor error flags clear by
   - DOC0CTL.VOCAnCLm = 0 for content mismatch errors
   - DOC0CTL.VOCAnCL18 = 0 for parameter error
6. Verify that all Video Output Monitor error flags are reset, i.e. that
   - DOC0STR.VOCAnEm = 0: no content mismatch error
   - DOC0STR.VOCAnE18 = 0: no parameter error
7. Enable required Video Output Monitor m by DOC0EN.VOCAnENm = 1.

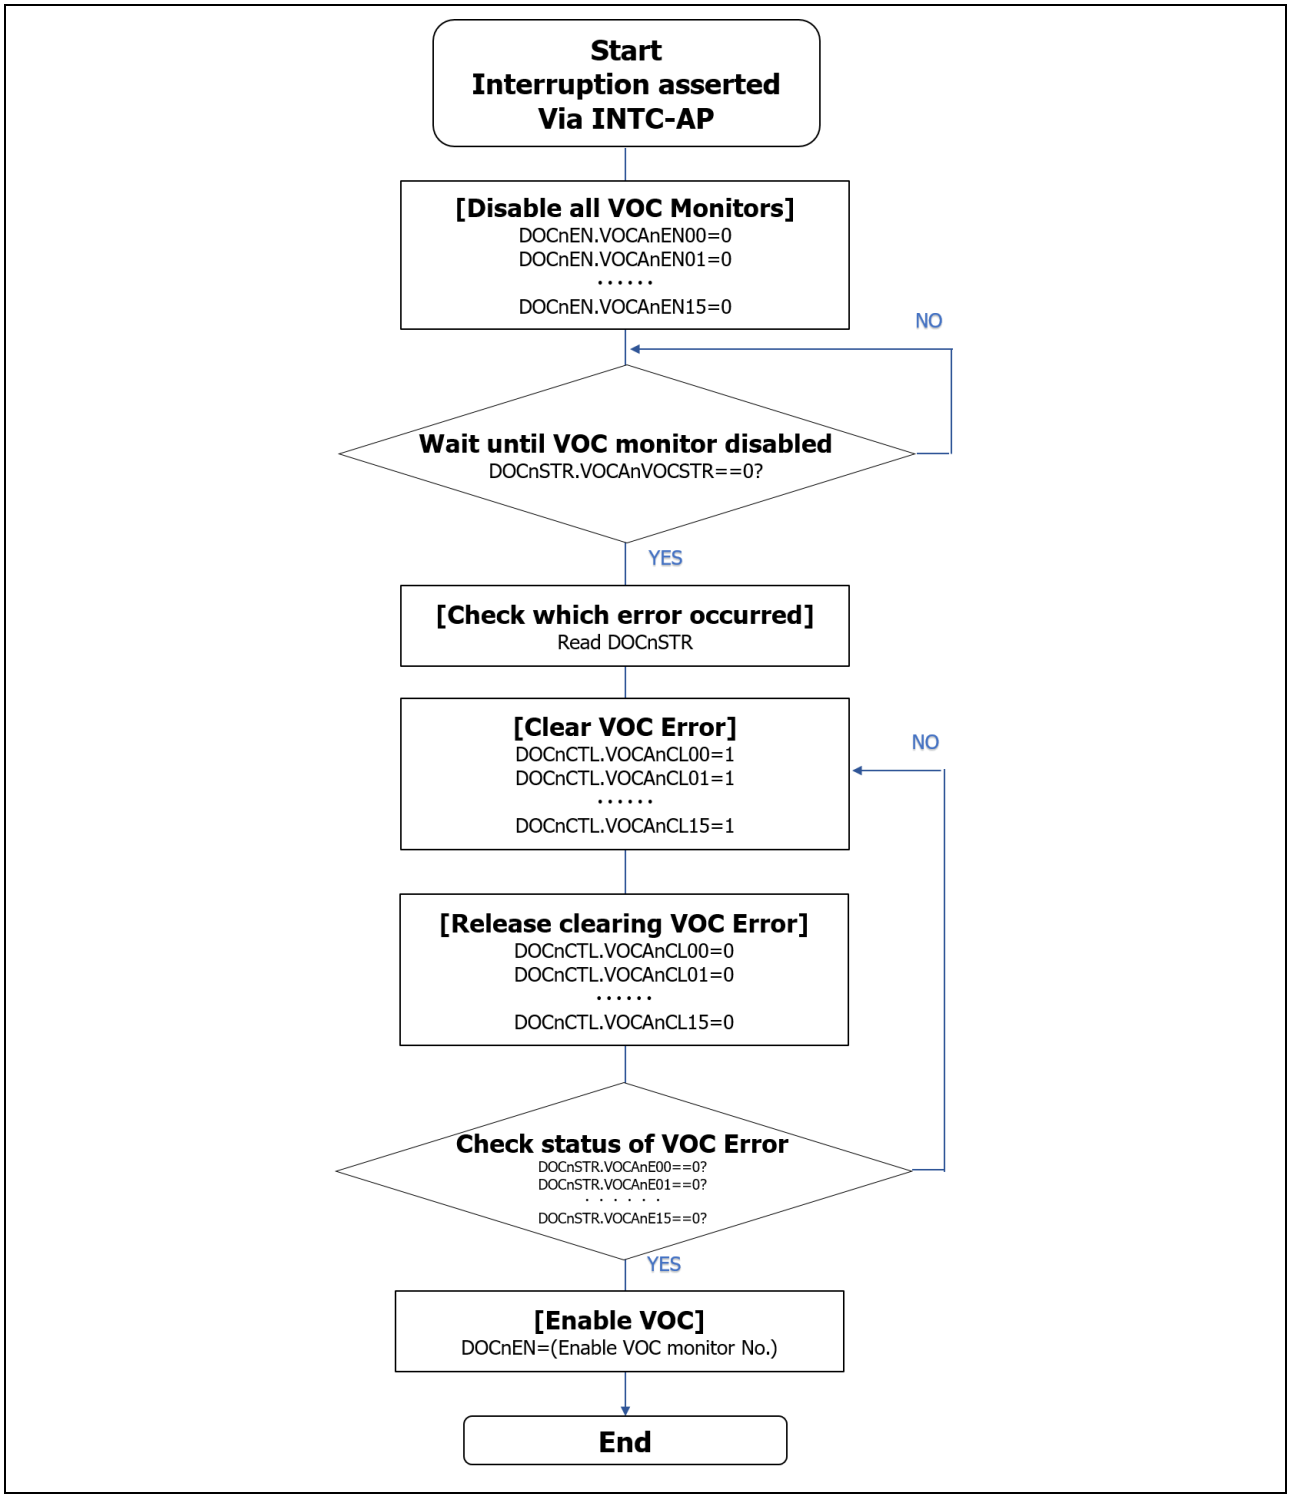

Figure 65.11 Video Output Monitor error flag clearing procedure

(4) Video Output Monitor Behavior After Error Detection

The behaviour of the Video Output Monitor after an error detection can be selected from two different modes:

- DOC0CTL.VOCAnMKVOC = 0:
  Not mask Video Output Monitor
- DOC0CTL.VOCAnMKVOC = 1:

Mask all Video Output Monitor

(5) Interrupt Masking

Assertion of an error interrupt DOC0.doc can be disabled:

- DOC0CTL.VOCAnMKINT = 0:
  DOC0.doc is generated in case of a Video Output Monitor error detection
- DOC0CTL.VOCAnMKINT = 1:
  no DOC0.doc is generated in case of a Video Output Monitor error detection

Note that DOC0CTL.VOCAnMKINT affects also the Activity Monitor interrupt DOC0.act.

(6) Monitoring Sequence

In each video output frame only a single Video Output Monitor area m is examined.

Priority of monitor areas

If several monitor areas are enabled the monitoring order follows a fixed priority:

priority of m = 0 > m = 1 > ... > m = 15

Detection timing

The time for a content mismatch detection depends on the total number of monitored areas. The maximum detection time of an erroneous area is calculated by (number of monitored areas x 2) / framerate.

Note

The maximum detection time of an erroneous frame assumes that the VOC needs to switch between the video channels after each Video Output Monitor frame and that the switching to the other video channel takes one frame for synchronization.

It is recommended to setup the Video Output Monitors in a way, that video channel switching is minimized. I.e. set up Video Output Monitors related to the same video channel consecutively. (example: M0 to M7: video channel 0, M8 to M15: video channel 1) This will shorten the detection time to

(number of monitoring area + 2) / frame rate.

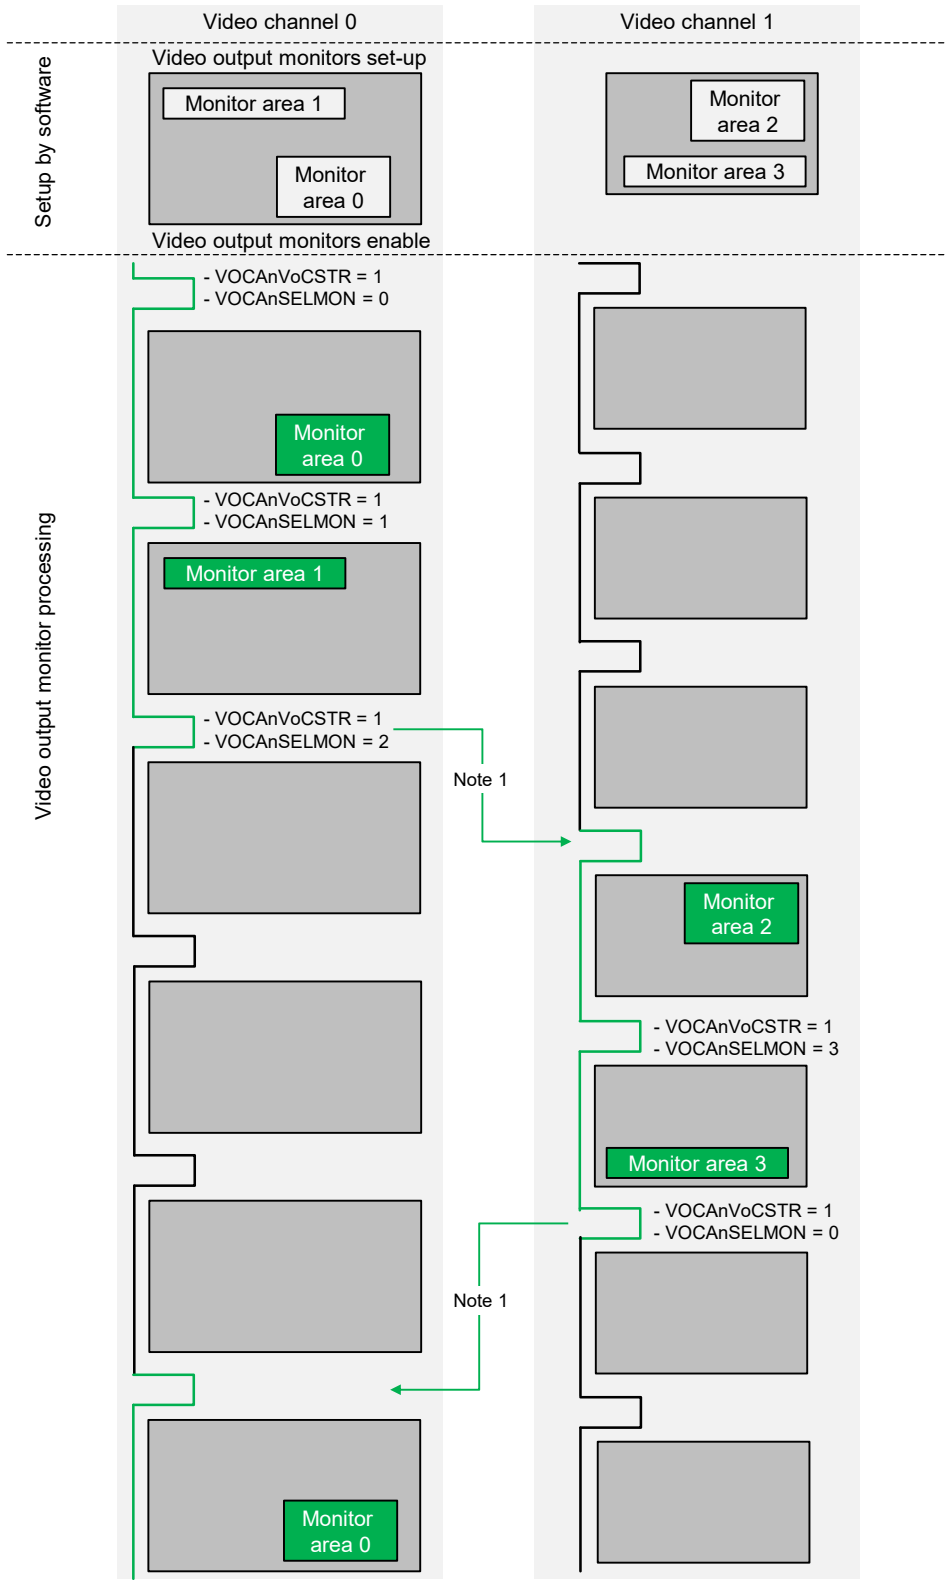
(7) Monitor Process Status

The current Video Output Monitor process status is reflected in two status bits in the status register DOC0STR:

- VOCAnVOCSTR: Video Output Monitor active in the current video channel frame
- VOCAnSELMON[3:0]: monitor number for current video channel frame

These status bits are valid for the current video channel frame.

The following diagram shows an example for sequence, with monitor areas for both video channels.



Note: 1. During switching between the video channels the Video Output Monitor status indicator VOCAnVOCSTR becomes 0 meanwhile.

Figure 65.12 Video Output Monitor processing sequence example

65.3.3.2 Activity Monitors Error Notification

The Activity Monitor notifies an error at the end of the current video channel frame, if the active Video Output Monitor does not complete area m processing within the allowed time window. Upon detection of such error

- the Activity Monitor error bit
  - DOC0STR.VOCAnE16 for video channel 0 error
  - DOC0STR.VOCAnE17 for video channel 1 error is set
- the Activity Monitor error interrupt DOC0.act asserted

Note

1. The error flags in the status register DOC0STR remain set until they are cleared via the control register DOC0CTL. Refer to “Activity Monitors error flag clearing procedure” below for details.
2. The DOC0.act remains asserted as long as any of the Activity Monitor error flags VOCAnE16 and VOCAnE17 are set.

(1) Activity Monitors Error Flag Clearing Procedure

In order to clear an Activity Monitor error flag proceed as follows:

1. Disable the Activity Monitors by DOC0EN.VOCAnEN16 = 0.
2. Wait until Activity Monitors are inactive, i.e. until DOC0STR.VOCAnACTSTR = 0.
3. Evaluate the error source via the error flags in the status register DOC0STR.
4. Clear all Activity Monitor error flags by DOC0CTL.VOCAnCL[17:16] = 1.
5. Release all Activity Monitor error flags clear by DOC0CTL.VOCAnCL[17:16] = 0.
6. Verify that all Activity Monitor error flags are reset, i.e. that DOC0STR.VOCAnE[17:16] = 0. If any of the above error flags are not cleared, return to 5.
7. Enable the Activity Monitors by DOC0EN.VOCAnEN16 = 1.

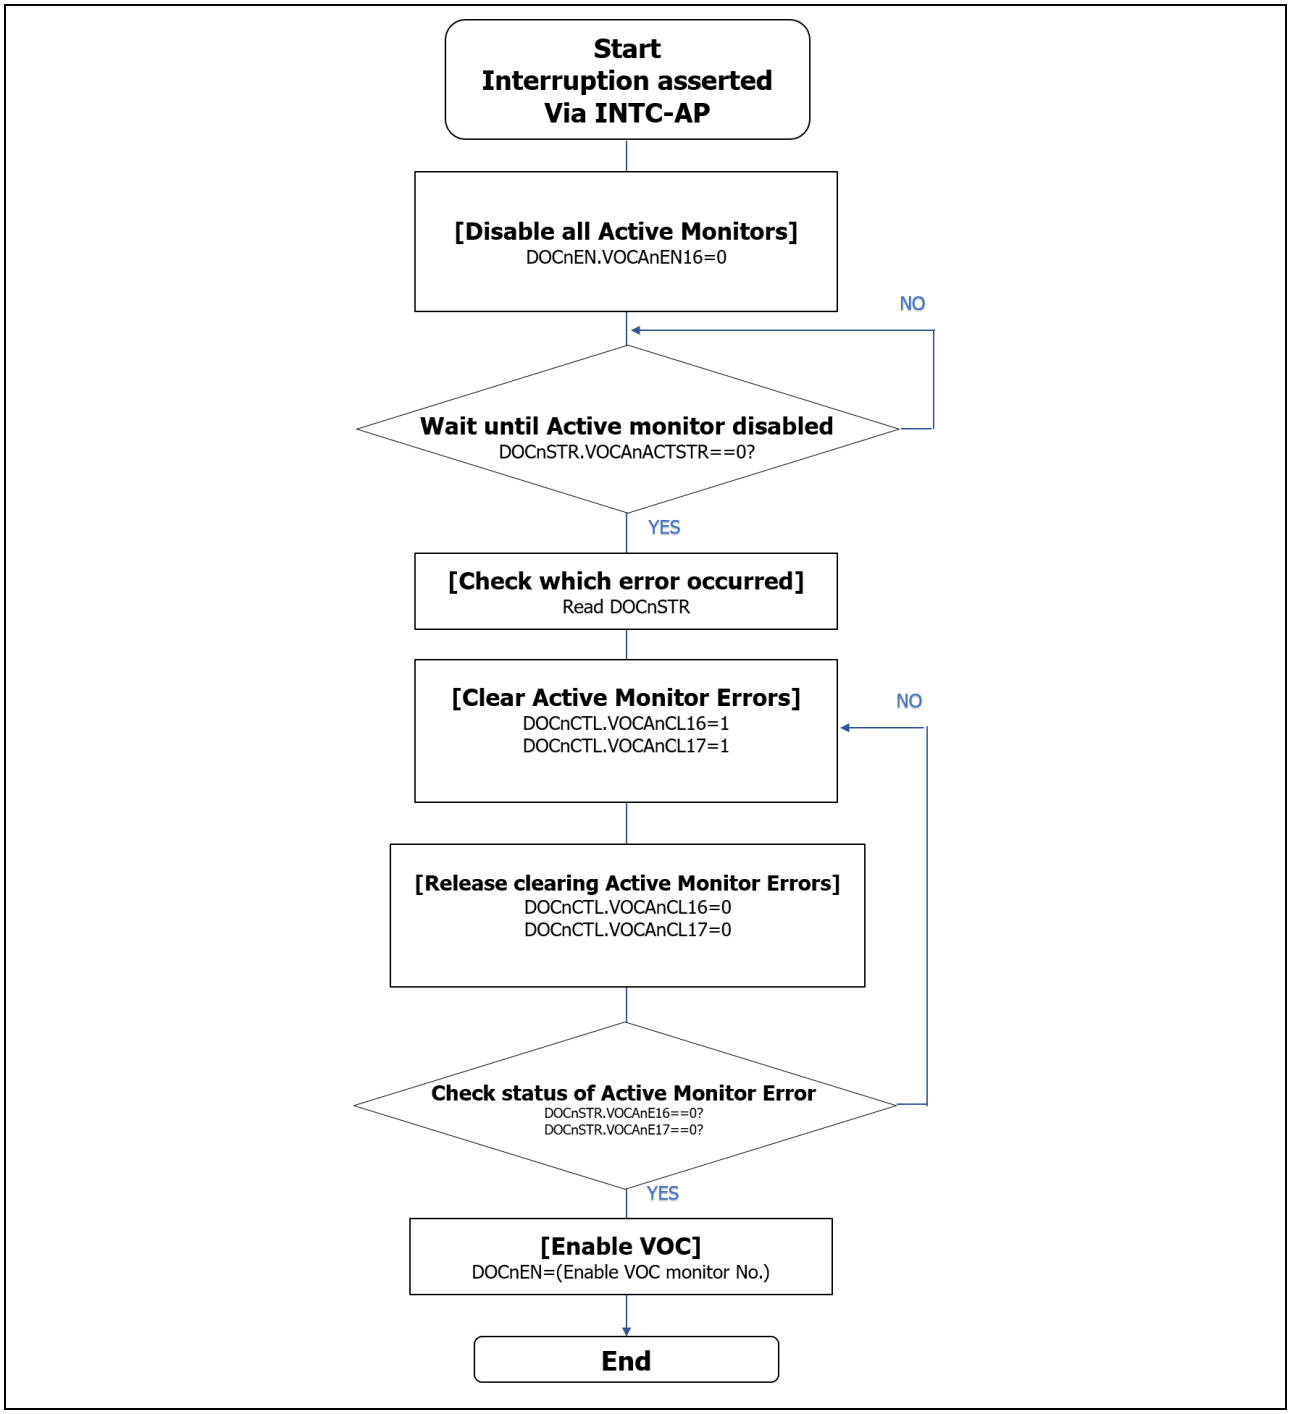


Figure 65.13 Active Monitor error flag clearing procedure

(2) Interrupt Masking

Assertion of an error interrupt DOC0.act can be disabled:

- DOC0CTL.VOCAnMKINT = 0:
  DOC0.act is generated in case of an Activity Monitor error detection
- DOC0CTL.VOCAnMKINT = 1:
  no DOC0.act is generated in case of an Activity Monitor error detection
  Note that DOC0CTL.VOCAnMKINT affects also the Video Output Monitor interrupt DOC0.doc.

Figure 65.14 shows an example with correct detection of the Video Output Monitor completion signal.
Thus no error is reported.

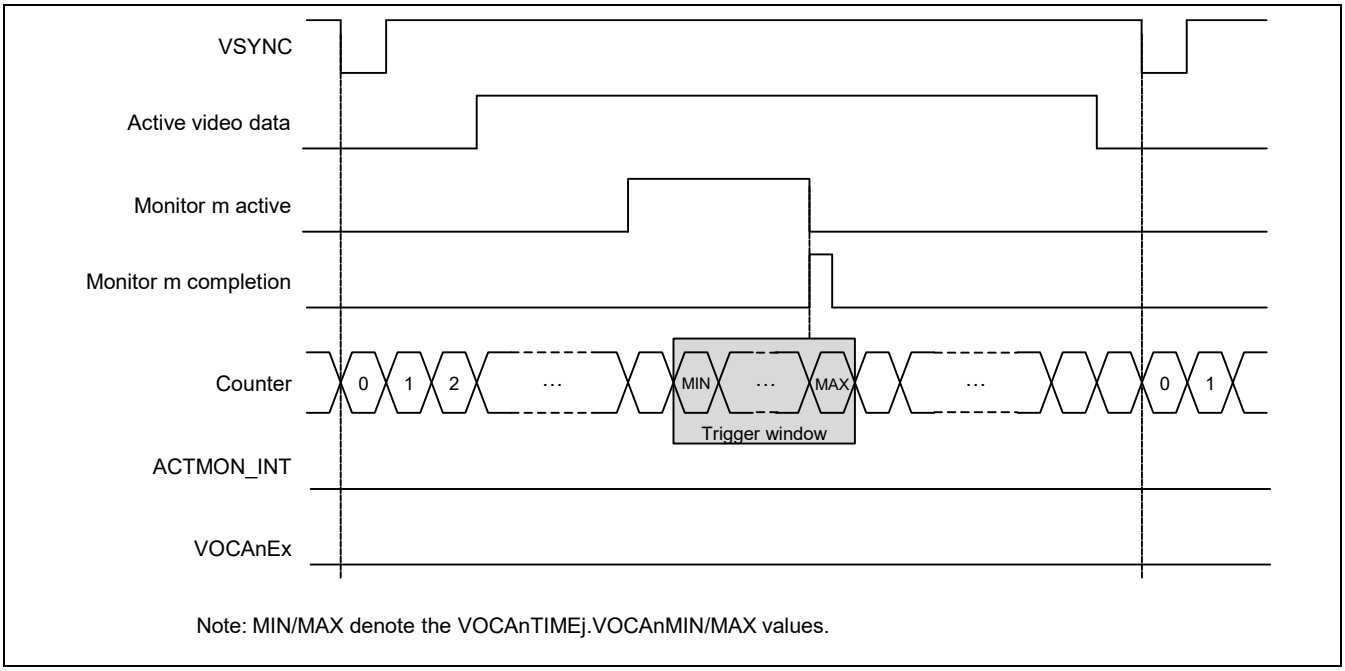

Figure 65.14 Active Monitor process without error detection

Figure 65.15 shows an example with detection of an incorrect Video Output Monitor completion signal. The Activity Monitor error flag VOCAn.VOCAnE16/E17 for video channel 0/1 is set and the DOC0.act interrupt is asserted.

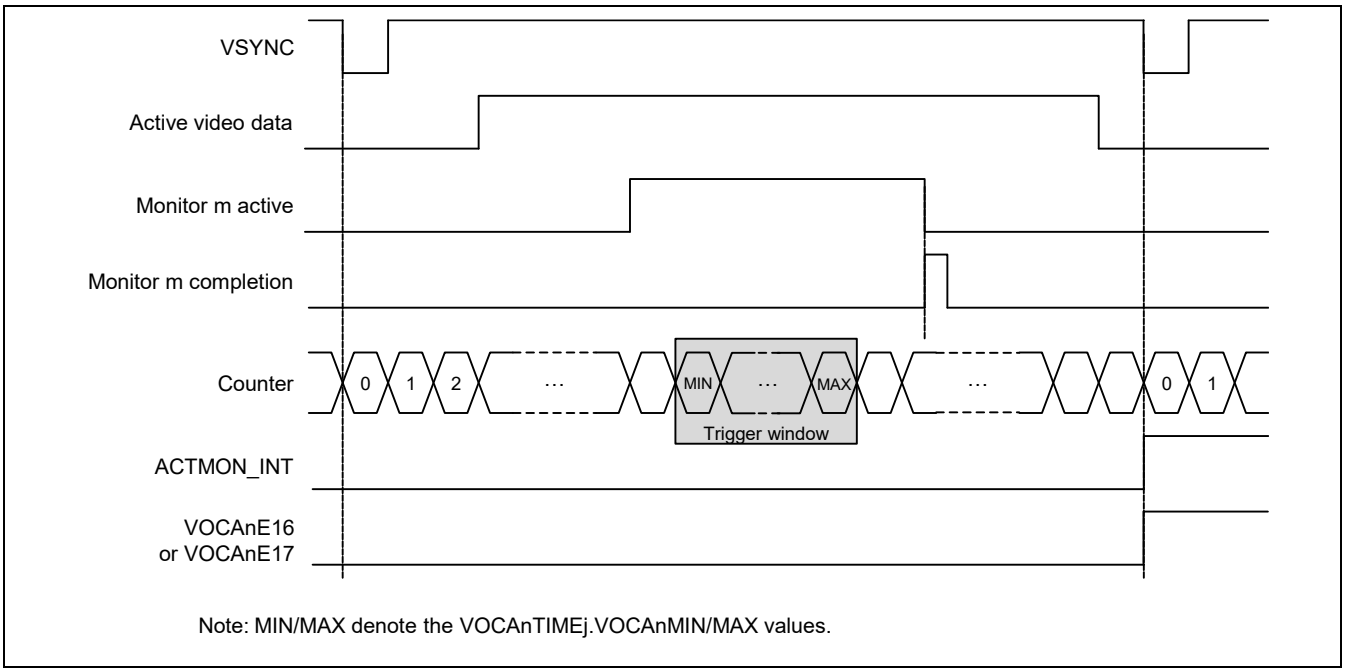

Figure 65.15 Active Monitor process with error detection

(3) Safety Aspects

By use of the Activity Monitor the operation of several video channel functions are indirectly supervised:

- VSYNC/HSYNC signals of the video channel
- video channel pixel clock
- operation of the Video Output Monitor

If any of the above modules operations fail, the Activity Monitor is able to detect such malfunction and issues error notifications.

65.4 Usage Notes

- The DOC has internal control registers which are writable / readable by the APB protocol via the APB Bus. However, accessing the registers is allowed only when the respective Video Monitor m (m = 15 to 1) is disabled (DOC0EN.VOCAnENm = 1’b0).

65.5 Safety Mechanism

No description on this section.

67. DSI/CSI-2 TX

67.1 Overview

This DSI/CSI-2-TX module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The DSI/CSI-2-TX module has a Transmitter function for MIPI Alliance Specification for Display Serial Interface (DSI) and MIPI Alliance Specification for Camera Serial Interface 2 (CSI-2). The DSI/CSI-2-TX module supports MIPI Alliance Specification for Display Serial Interface (DSI) Specification and MIPI Alliance Specification for Camera Serial Interface 2 (CSI-2) Specification, and works with MIPI Alliance Specification for D-PHY Specification. The DSI/CSI-2-TX module provide a solution for transmitting MIPI DSI/CSI-2 compliant digital video and packets.
Normative References are following

Normative References

- MIPI Alliance Specification for Display Serial Interface Version 1.3.1 (Errata01 28-Jun-2017)
- MIPI Alliance Specification for Camera Serial Interface 2 Version 1.3
- MIPI Alliance Specification for D-PHY Version 1.2

Note: the wording about "Host" and "Peripheral" in this document

Mainly, this document is described based on the point of view of a DSI Transmitter.

The meaning of the word "Host" is "a device included DSI Transmitter", and the meaning of the word "Peripheral" is "a device included DSI Receiver (e.g. Display)".

In case of using this Transmitter as CSI-2, the meaning of the word "Host" is "a device included CSI-2 Transmitter (e.g. Camera)", and the meaning of the word "Peripheral" is "a device included CSI-2 Receiver".

67.1.1 Features

The following is Key features of the DSI/CSI-2-TX module.

67.1.1.1 DSI

- Supports MIPI DSI Version 1.3.1
  - Supports MIPI D-PHY 1.5Gbps without de-skew function (for 1.5G)
  - Supports MIPI D-PHY 2.5Gbps with de-skew function (for 2.5G)

- Supports D-PHY specification version 1.2

- Protocol Interface
  - Video mode and Packet Generation from Input Video signal through DU (Display Unit).
    - Supports RGB format (16bpp, 18bpp, 18bpp Loosely and 24bpp)
    - Supports YCbCr 4:2:2 format (16bpp)
    - Not supports YCbCr 4:2:0 format
    - Supports Blanking Packet or LP-11 selection during each of HSA, HBP and HFP Blanking interval

  - Not supports Burst transfer mode
  - Not supports Interlaced Video
  - Not supports 3D control payload
- Supports Command Transfer mode which supports Packet Tx/Rx by Register
- Supports automated insertion of EoTp
- Supports ULPS (TX).
- Not supports ULPS(RX)
- Not supports TE

- Link Layer
  - Supports 1,2,3 and 4 lane configuration
  - Supports unidirectional high-speed mode Tx
  - Supports Bidirectional LP mode Tx/Rx (Only Lane0)
  - Supports ECC/Checksum Generation for Tx Packet
  - Supports ECC/Checksum Verification and ECC Error correction for Rx Packet
  - Supports one Virtual Channel number selected 0,1,2 and 3 (Static and specified by Register, Not supports interleave)
  - Not supports Non-Continuous Clock Mode
  - Supports Detection for PHY Contention Error and Timeout Error

- Supports Interleaving: Line/Column/Side-by-Side. Two videos per one DSI port can be possible to output using DU/VSPD. Refer to the USECASE section

67.1.1.2 CSI-2

- Supports MIPI Alliance Specification for Camera Serial Interface 2 version1.3 Specification
  - Supports MIPI D-PHY 1.5Gbps without de-skew function
  - Supports MIPI D-PHY 2.5Gbps with de-skew function

- Supports D-PHY specification version 1.2

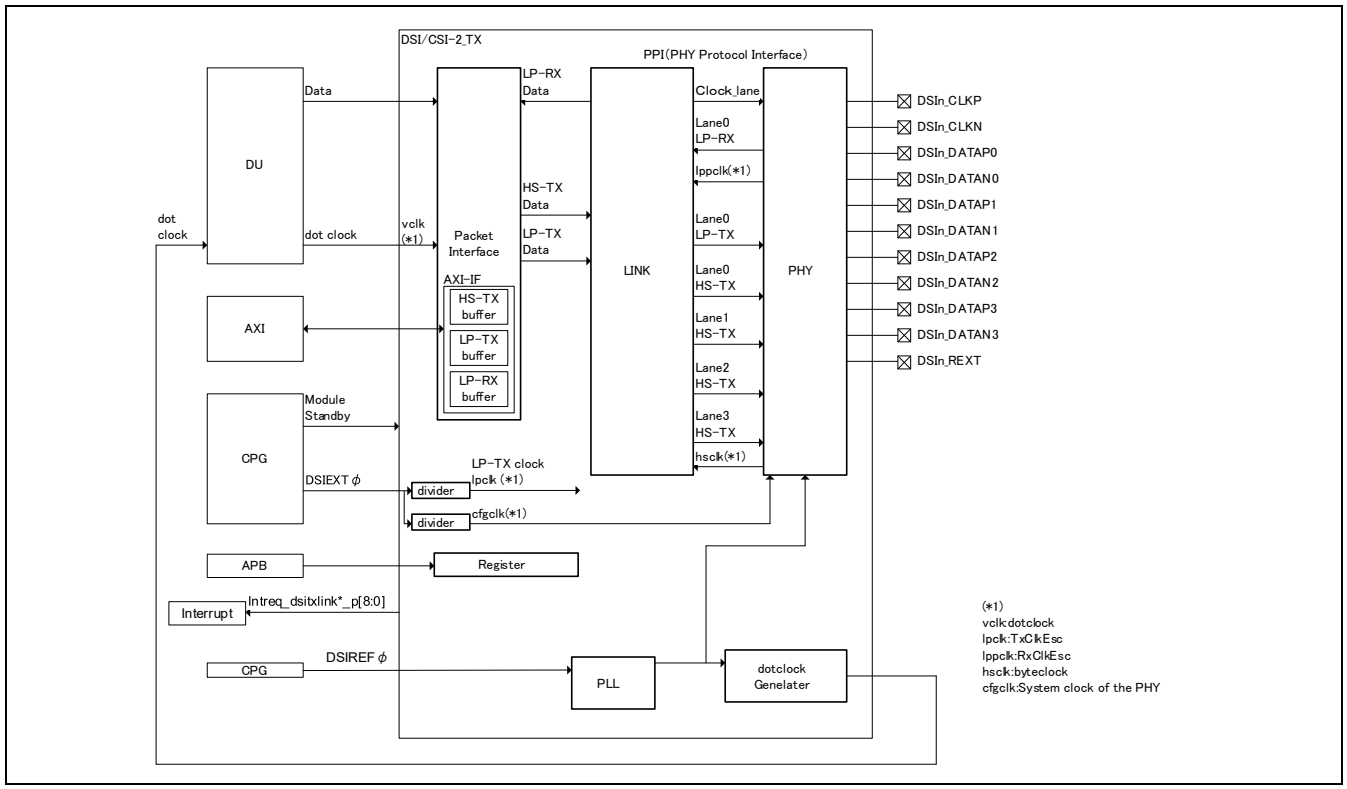
- Protocol Interface
  - Video mode and Packet Generation from Input Video signal through DU (Display Unit).
    - Supports RGB565/666/888
    - Supports YUV422 8bit
    - Not supports YUV420
    - Not supports Interlaced Video
    - Not supports Line Start Packet and Line End Packet
  - Supports Command Transfer mode which supports Packet Tx by Register
  - Supports ULPS

- Link Layer
  - Supports 1,2 and 4 lane configuration
  - Supports unidirectional high-speed mode Tx
  - Supports ECC/Checksum Generation for Tx Packet
  - Supports 4 Virtual Channel number selected from 0,1,2 and 3 (Supports frame level interleave)
  - Not support DT(Data Type) interleave transmission in same VC
  - Not supports Non-Continuous Clock mode

- Supports Interleaving: Line/Column/Side-by-Side. Two videos per one CSI port can be possible to output using DU/VSPD. Refer to the USECASE section.

67.1.2 Block Diagram

Figure 67.1 shows the block diagrams of the DSI/CSI-2-TX module.



Note:DSIEXTϕ and DSIREFϕ from CPG are common in each channel.

Figure 67.1 Block Diagram of DSI/CSI-2-TX module

Figure 67.2 shows Configuration of DSI/CSI-2-TX module.

The transfer of Video stream is only through VSPD/DU.

The transmitter of AXI Bus supports Tx/Rx when only Command Transfer mode.

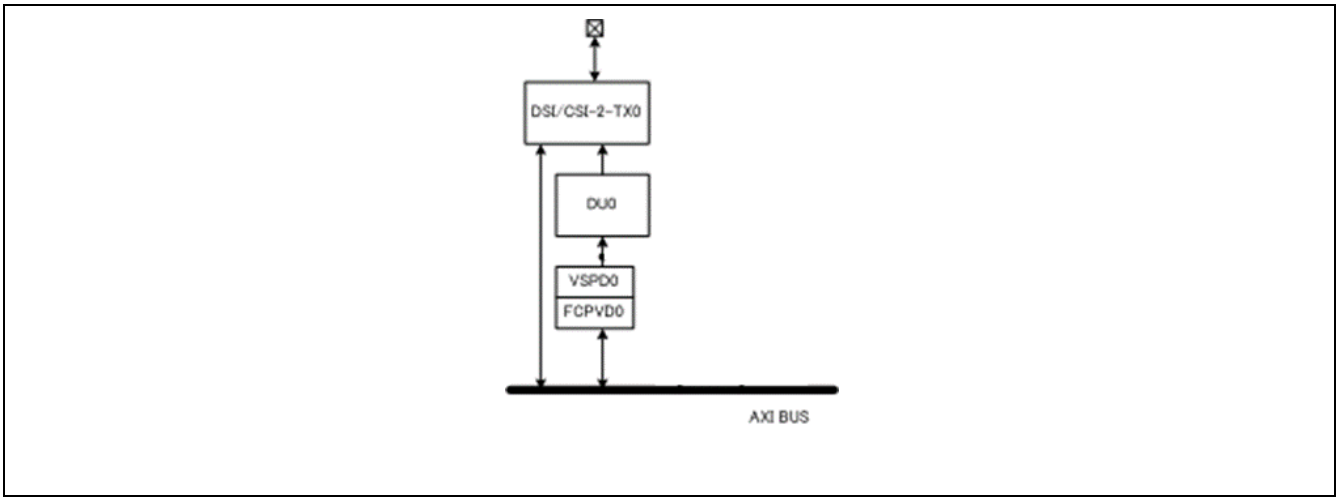


Figure 67.2 Configuration of DSI/CSI-2-TX module

67.1.3 External Pins

Table 67.1 External Pins

Pin Name	Abbreviation	I/O	Function
DSI0 clock lane positive data pin	DSI0_CLKP	output	Positive D-PHY Differential Clock Line
DSI0 clock lane negative data pin	DSI0_CLKN	output	Negative D-PHY Differential Clock Line
DSI0 lane 0 positive data pin	DSI0_DATAP0	I/O	Positive D-PHY Differential Data Line0
DSI0 lane 0 negative data pin	DSI0_DATAN0	I/O	Negative D-PHY Differential Data Line0
DSI0 lane 1 positive data pin	DSI0_DATAP1	output	Positive D-PHY Differential Data Line1
DSI0 lane 1 negative data pin	DSI0_DATAN1	output	Negative D-PHY Differential Data Line1
DSI0 lane 2 positive data pin	DSI0_DATAP2	output	Positive D-PHY Differential Data Line2
DSI0 lane 2 negative data pin	DSI0_DATAN2	output	Negative D-PHY Differential Data Line2
DSI0 lane 3 positive data pin	DSI0_DATAP3	output	Positive D-PHY Differential Data Line3
DSI0 lane 3 negative data pin	DSI0_DATAN3	output	Negative D-PHY Differential Data Line3
DSI0 external resistor connection pin	DSI0_REXT	I/O	200 Ω External Resistor Connection for DSI/CSI-2-TX0

Notes: Immediately after reset assertion, the differential lines of datan/datap and clkn/clkp are high impedance (Hi-Z).

67.1.4 Register Configuration

The following lists the base address of each DSI/CSI-2-TX module.

Module name	Address
DSI0	H'FED8_0000

Table 67.2 shows Registers of the DSI/CSI-2-TX module. These Registers are fixed by 32 bits length. Unaligned access is prohibited.

Table 67.2 Registers

Register Name	Abbr	Offset Address	Initial Value

67.2 Register Description

(include Safety Mechanism related register description)

67.2.1 Register Access

The access propriety of Registers and Fields on each mode is shown on following table.

○: Full Access

△: Limited access. Refer to 67.2.2 Detail of Registers for detail.

×: Not permitted to access. When it needs to write to these registers, write the initial value.

Notes: Other Registers listed above are the Common Register related to PHY configuration.

67.2.2 Detail of Registers

Legend for Register Description

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R0/W: Readable/writable. The read value always is 0.

Note: Do not access locations that appear empty in the address map. Operation is not guaranteed in case of access to change the value at any location other than those of the registers listed.

67.2.2.1 Interrupt Status Register (ISR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SCAL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PPIDL	PPIDL0	PPICL	—	—	—	TO	—	—	—	TA	—	RXP	TXVM	TXCM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
27 to 17	—	All 0	R	Reserved The read value is undefined. The write value should always be 0..
16	SCAL	B'0	R	(for 2.5G) When this value is “1”, an interrupt of Skew Calibration exist. Refer to the description of SCALSR register for more information.
15	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
14	PPIDL	B'0	R	When this value is “1”, an interrupt overall of D-PHY PPI Data Lane exists. Refer to the description of PPIDLSR register for more information.
13	PPIDL0	B'0	R	When this value is “1”, an interrupt of D-PHY PPI Data Lane0 exists. Refer to the description of PPIDL0SR register for more information.
12	PPICL	B'0	R	When this value is “1”, an interrupt of D-PHY PPI Clock Lane exists. Refer to the description of PPICLSR register for more information.
11 to 9	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
8	TO	B'0	R	When this value is “1”, an interrupt of Timeout exists. Refer to the description of TOSR register for more information.
7 to 5	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
4	TA	B'0	R	When this value is “1”, an interrupt of Turn-Around exists. Refer to the description of TASR register for more information
3	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
2	RXP	B'0	R	When this value is “1”, an interrupt of Rx Packet exists. Refer to the description of RXPSR register for more information.
1	TXVM	B'0	R	When this value is “1”, an interrupt of Tx Video mode exists. Refer to the description of TXVMSR register for more information.
0	TXCM	B'0	R	When this value is “1”, an interrupt of Tx Command Transfer mode exists. Refer to the description of TXCMSR register for more information.

67.2.2.2 Link Status Register (LINKSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LPBUSY	HSBUSY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	LPBUSY	B'0	R	When this value is “1”, LP is running. Check this value to confirm to finish of LP behavior.
0	HSBUSY	B'0	R	When this value is “1”, HS is running. Check this value to confirm to finish of HS behavior.

67.2.2.3 Tx Set Register (TXSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SET1				—	—	—	—	SET2			
Initial value:	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EOT PEN	—	—	—	—	—	—	—	—	—	—	LANECNT	
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
27 to 24	SET1	H'F	R/W	Prohibit to change. Keep the Initial Value.
23 to 20	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
19 to 16	SET2	H'F	R/W	Prohibit to change. Keep the Initial Value.
15 to 13	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
12	EOTPEN	B'1	R/W	Enable HS Tx EoTp B'0: Disable Tx EoTp B'1: Enable Tx EoTp Notice, EoTp is always disable in LP Tx.
11 to 2	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	LANECNT	H'3	R/W	Set Lane count. H'0: Lane count is 1 (Use of Lane0) H'1: Lane count is 2 (Use of Lane0 and Lane1) H'2: Lane count is 3 (Use of Lane0, Lane1 and Lane2) H'3: Lane count is 4 (Use of Lane0, Lane1, Lane2 and Lane3) When PPISETR.DLEN=H'1, set to H'0. When PPISETR.DLEN=H'3, set to H'1. When PPISETR.DLEN=H'7, set to H'2. When PPISETR.DLEN=H'F, set to H'3. Notice, prohibit to set to H'2 in CSI-2 mode.

67.2.2.4 Tx Command transfer Mode Set Register (TXCMSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SPD TYP	—	—	—	—	—	—	—	LPP DAC C
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
8	SPDTYP	B'0	R/W	Set the speed type in Command Transfer mode. B'0: High Speed B'1: Low Power
7 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	LPPDACC	B'0	R/W	Set the method to access to Tx long Packet payload data. B'0: Register access(by using TXCMPPD[n]R) B'1: AXI access (by using AXI read access)

67.2.2.5 Tx Command transfer Mode Control Register (TXCMCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BTA TYP	BTA REQ	TXR EQ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
2	BTATYP	B'0	R0/W	Tx Request of Command Transfer mode with Bus Turn-Around (BTA). B'0: Tx Request is Read Command when BTAREQ=1 B'1: Tx Request is Non-Read Command when BTAREQ=1 When BTAREQ=0, any value of this field is No meaning and ignored.
1	BTAREQ	B'0	R0/W	Tx Request of Command Transfer mode with Bus Turn-Around. B'0: No meaning, ignored B'1: Tx Request of Command Transfer mode with Bus Turn-Around.*1

Bit	Bit Name	Initial Value	R/W	Description
0	TXREQ	B'0	R0/W	Tx Request of Command Transfer mode without Bus Turn-Around. B'0: No meaning, ignored B'1: Tx Request of Command Transfer mode without Bus Turn-Around.*1

Note: *1 It is prohibited to set '1' at the same time to TXCMCR.BTAREQ and TXCMCR.TXREQ.

67.2.2.6 Tx Command transfer Mode Status Register (TXCMSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLSNERR	—	AXIERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXREQEND
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
18	CLSNERR	B'0	R	When this value is “1”, Tx Error of HS Command Transfer Packet is occurred by the abnormal transmission. Write “1” to TXCMSCR.CLSNERR register to clear this field.
17	—	B’0	R	Reserved The read value is undefined. The write value should always be 0.
16	AXIERR	B'0	R	When this value is “1”, Tx Error of HS Command Transfer Packet is occurred by the Error of AXI Read. Write “1” to TXCMSCR.AXIERR register to clear this field.
15 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	TXREQEND	B'0	R	When this value is “1”, completion of the request for HS Command Transfer Packet is detected. Write “1” to TXCMSCR.TXREQEND register to clear this field.

67.2.2.7 Tx Command transfer Mode Status Clear Register (TXCMSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLSNERR	—	AXIERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R	R0/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXREQEND
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
18	CLSNERR	B'0	R0/W	Set to "1" to clear the TXCMSR.CLSNERR. B'0: No meaning, ignored B'1: Clear TXCMSR.CLSNERR
17	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
16	AXIERR	B'0	R0/W	Set to "1" to clear the TXCMSR.AXIERR. B'0: No meaning, ignored B'1: Clear TXCMSR.AXIERR
15 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	TXREQEND	B'0	R0/W	Set to "1" to clear the TXCMSR.TXREQEND. B'0: No meaning, ignored B'1: Clear TXCMSR.TXREQEND

67.2.2.8 Tx Command transfer Mode Interrupt Enable Register (TXCMIER)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLSNERR	—	AXIERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXREQEND
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
18	CLSNERR	B'0	R/W	Interrupt enable for TXCMSR.CLSNERR B'0: Disable interrupt of dsi_int_txcm when TXCMSR.CLSNERR=1 B'1: Enable interrupt of dsi_int_txcm when TXCMSR.CLSNERR=1
17	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
16	AXIERR	B'0	R/W	Interrupt enable for TXCMSR.AXIERR B'0: Disable interrupt of dsi_int_txcm when TXCMSR.AXIERR=1 B'1: Enable interrupt of dsi_int_txcm when TXCMSR.AXIERR=1
15 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	TXREQEND	B'0	R/W	Interrupt enable for TXCMSR.TXREQEND B'0: Disable interrupt of dsi_int_txcm when TXCMSR.TXREQEND=1 B'1: Enable interrupt of dsi_int_txcm when TXCMSR.TXREQEND=1

67.2.2.9 Tx Command transfer Mode Address Set 0 Register (TXCMADDRSET0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDRL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDRL													—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	ADDRL	H'0000 0000	R/W	Set the Start Address for Payload Data of Tx Long Packet. Bit[31:3] of the address can be set. Bit[2:0] is always fixed to "0". AXI master can read the payload data by read access when the access of the payload data for Tx Command Transfer mode is used by AXI access (TXCMSET0R.LPPDACC=1) and is a Long Packet for Tx Command Transfer mode (TXCMPHDR.FMT=1).
2 to 0	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.10 Tx Command transfer Mode Header Data Register (TXCMPHDR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FMT	VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA1								DATA0							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
24	FMT	B'0	R/W	Packet format of Tx Packet Header. This field should be set by the data type. B'0: Short Packet B'1: Long Packet
23, 22	VC	H'0	R/W	Identifier of virtual channel of Tx Packet Header. This value is limited to 3 from 0.
21 to 16	DT	H'00	R/W	Data type of Tx Packet Header.
15 to 8	DATA1	H'00	R/W	Data1 of Tx Packet Header.*1 When Tx Packet format is Long Packet, this value is upper 8 bits of the word count.
7 to 0	DATA0	H'00	R/W	Data0 of Tx Packet Header. *1 When Tx Packet format is Long Packet, this value is lower 8 bits of the word count.

Note: *1

・The maximum size for HS Command Transfer mode Long Packet by using AXI is 1024 Byte.
(TXCMSET0R.LPPDACC=1, SPDTYP=0 and TXCMPHDR.FMT=1)

・The maximum size for LP Command Transfer mode Long Packet by using AXI is 128 Byte.
(TXCMSET0R.LPPDACC=1, SPDTYP=1 and TXCMPHDR.FMT=1)

・The maximum size for Command Transfer mode Long Packet by using Register is 16 Byte.
(TXCMSET0R.LPPDACC=0 and TXCMPHDR.FMT=1)

67.2.2.11 Tx Command transfer Mode Packet Payload Data0 Register (TXCMPPD0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	DATA	H'0000 0000	R/W	Payload Data0 for Tx Long Packet. The data is transferred as Payload Data0 when the access of the payload data for Tx Long Packet is used by Register access (TXCMSET0R.LPPDACC=0) and is a Long Packet of Tx Command Transfer mode (TXCMPHDR.FMT=1). Bit[7:0] : Data byte 0 Bit[15:8] : Data byte 1 Bit[23:16]: Data byte 2 Bit[31:24]: Data byte 3

67.2.2.12 Tx Command transfer Mode Packet Payload Data1 Register (TXCMPPD1R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	DATA	H'0000 0000	R/W	Payload Data1 for Tx Long Packet. The data is transferred as Payload Data1 when the access of the payload data for Tx Long Packet is used by Register access (TXCMSET0R.LPPDACC=0) and is a Long Packet of Tx Command Transfer mode (TXCMPHDR.FMT=1). Bit[7:0] : Data byte4 Bit[15:8] : Data byte 5 Bit[23:16]: Data byte 6 Bit[31:24]: Data byte 7

67.2.2.13 Tx Command transfer Mode Packet Payload Data2 Register (TXCMPPD2R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31-0	DATA	H'0000 0000	R/W	Payload Data3 for Tx Long Packet. The data is transferred as Payload Data3 when the access of the payload data for Tx Long Packet is used by Register access (TXCMSET0R.LPPDACC=0) and is a Long Packet of Tx Command Transfer mode (TXCMPHDR.FMT=1). Bit[7:0] : Data byte12 Bit[15:8] : Data byte13 Bit[23:16]: Data byte14 Bit[31:24]: Data byte15

67.2.2.15 Tx Video Mode Set Register (TXVMSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SYNSEQ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VSTPM	—	—	—	—	PIXWDTH			—	—	—	VSEN	—	HFPBPEN	HBPBPEN	HSABPEN
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
16	SYNSEQ	B'0	R/W	Sequence of Tx Video mode. B'0: Sync Pulse mode (Non-Burst Mode with Sync Pulses) B'1: Sync Event mode (Non-Burst Mode with Sync Events)
15	VSTPM	B'0	R/W	Set to B'1
14 to 11	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
10 to 8	PIXWDTH	B’001	R/W	Prohibits to change from Initial Value
7 to 5	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
4	VSEN	B'0	R/W	(for 2.5G) Enable transmission of Skew Calibration at every frame in Tx Video Mode. B'0: Disable B'1: Enable
3	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
2	HFPBPEN	B'0	R/W	Enable transmission of Blanking Packet during the HFP interval. *1 B'0: Disable (LP-11) B'1: Enable (Data Type=H’19) If the period of HFP exceeds (packet maximum length (WC=65535)+4Byte), be sure to set this bit to B’0.
1	HBPBPEN	B'0	R/W	Enable transmission of Blanking Packet during the HBP interval. *1 B'0: Disable (LP-11) B'1: Enable (Data Type=H’19) If the period of HBP exceeds (packet maximum length (WC=65535)+4Byte), be sure to set this bit to B’0.
0	HSABPEN	B'0	R/W	Enable transmission of Blanking Packet during the HSA interval. *1 B'0: Disable (LP-11) B'1: Enable (Data Type=H’19) If the period of HSA exceeds (packet maximum length (WC=65535)+4Byte), be sure to set this bit to B’0.

Note: *1 there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

The host processor should return to LP state once per scanline during the horizontal blanking time.

67.2.2.16 Tx Video Mode Set 2 Register (TXVMSET2R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FNUM															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
15 to 0	FNUM	D'0	R/W	Maximum value of the Frame Number field both of Frame Start Packet and Frame End Packet. D'0: Set to "0" to Frame Number field.: Other: Frame number is 1 at the first frame after starting Video mode. Frame number is incremented automatically by every frame. When the Frame number is same as this FNUM value, the value is set to 1 at the next frame.

67.2.2.17 Tx Video Mode Control Register (TXVMCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VFCLR	—	—	—	—	—	—	—	—	—	—	—	EN
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
12	VFCLR	B'1	R/W	Clear FIFO *1 for Tx Video mode. When write “1”, request Clear FIFO. When write “0”, withdraw the request of Clear FIFO.
11 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	EN	B'0	R/W	When write “1”, enable Video mode Tx. This field should write “1” before starting Video Input. When write “0”, disable Video mode Tx. Refer to Figure 67.13 for the procedure.

Note: *1 This FIFO is a translator of Tx Video Data to hsclk (byteclock) domain from vclk (dotclock) domain.

67.2.2.18 Tx Video Mode Status Register (TXVMSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VBP DET	VSA DET	—	—	—	VFE RR	—	—	—	PDIS	—	—	STP	STR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VFR DY	—	—	—	ACT	—	—	—	—	—	—	—	RDY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
29	VBPDET	B’0	R	"1" is set when the start of the VBP period (0→1 when VSYNC is high polarity and 1→0 for Low polarity) is detected. Write “1” to TXVMSCR.VBPDET register to clear this field.
28	VSADET	B’0	R	"1" is set when the start of the VSA period (0→1 when VSYNC is high polarity and 1→0 for Low polarity) is detected. Write “1” to TXVMSCR.VSADET register to clear this field.
27 to 25	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
24	VFERR	B'0	R	When this value is “1”, Overrun or Underrun of Tx Video mode FIFO is occurred. Write “1” to TXVMSCR.VFERR register to clear this field.
23 to 21	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
20	PDIS	B'0	R	When this value is “1”, the Tx Packet is discarded in Video mode. Write “1” to TXVMSCR.PDIS register to clear this field.
19, 18	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
17	STP	B'0	R	When this value is “1”, the End of Tx is detected in Video mode. Write “1” to TXVMSCR.STP register to clear this field.
16	STR	B'0	R	When this value is “1”, the Start of Tx is detected in Video mode. Write “1” to TXVMSCR.STR register to clear this field.
15 to 13	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
12	VFRDY	B'0	R	Status of Tx Video FIFO. B'0: Not ready B'1: Ready for use
11 to 9	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
8	ACT	B'0	R	Status of Video mode Tx B'0: stopped B'1: running
7 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	RDY	B'0	R	Status of Video mode Tx ready Input Video is permitted to start after the confirmation of this value of “1”. B'0: Not ready of Tx Video mode (Input Video inhibited) B'1: Ready for use of Tx Video mode (Input Video permitted)

67.2.2.19 Tx Video Mode Status Clear Register (TXVMSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	VBP DET	VSA DET	—	—	—	VFE RR	—	—	—	PDIS	—	—	STP	STR

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	B'00	R	Reserved The read value is undefined. The write value should always be 0.
29	VBPDET	B’0	R0/W	Set to "1" to clear the TXVMSR.VBPDET. B'0: No meaning, ignored B'1: Clear TXVMSR.VBPDET
28	VSADET	B’0	R0/W	Set to "1" to clear the TXVMSR.VSADET. B'0: No meaning, ignored B'1: Clear TXVMSR.VSADET
27 to 25	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
24	VFERR	B'0	R0/W	Set to "1" to clear the TXVMSR.VFERR. B'0: No meaning, ignored B'1: Clear TXVMSR.VFERR
23 to 21	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
20	PDIS	B'0	R0/W	Set to "1" to clear the TXVMSR.PDIS. B'0: No meaning, ignored B'1: Clear TXVMSR.PDIS
19, 18	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
17	STP	B'0	R0/W	Set to "1" after detection of the End of Tx in Video mode to detect the next one. B'0: No meaning, ignored B'1: Clear TXVMSR.STP
16	STR	B'0	R0/W	Set to "1" after detection of the Start of Tx in Video mode to detect the next one. B'0: No meaning, ignored B'1: Clear TXVMSR.STR
15 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.20 Tx Video Mode Interrupt Enable Register (TXVMIER)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VBPDET	VSADET	—	—	—	VFERR	—	—	—	PDIS	—	—	STP	STR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	B’00	R	Reserved The read value is undefined. The write value should always be 0.
29	VBPDET	B’0	R/W	Interrupt enable for TXVMSR.VBPDET B'0: Disable interrupt of dsi_int_txvm when TXVMSR.VBPDET=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.VBPDET=1
28	VSADET	B’0	R/W	Interrupt enable for TXVMSR.VFERR B'0: Disable interrupt of dsi_int_txvm when TXVMSR.VSADET=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.VSADET=1
27 to 25	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
24	VFERR	B'0	R/W	Interrupt enable for TXVMSR.VFERR B'0: Disable interrupt of dsi_int_txvm when TXVMSR.VFERR=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.VFERR=1
23 to 21	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
20	PDIS	B'0	R/W	Interrupt enable for TXVMSR.PDIS B'0: Disable interrupt of dsi_int_txvm when TXVMSR.PDIS=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.PDIS=1
19, 18	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
17	STP	B'0	R/W	Interrupt enable for detection of End of Tx in Video mode. B'0: Disable interrupt of dsi_int_txvm when TXVMSR.STP=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.STP=1
16	STR	B'0	R/W	Interrupt enable for detection of Start of Tx in Video mode. B'0: Disable interrupt of dsi_int_txvm when TXVMSR.STR=1 B'1: Enable interrupt of dsi_int_txvm when TXVMSR.STR=1
15 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.21 Tx Video Mode Pixel Stream Packet Header Set Register (TXVMPSPHSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
23, 22	VC	H'0	R/W	Identifier for virtual channel of Tx Video Mode Pixel Stream Packet Header.
21 to 16	DT	H'00	R/W	Data Type of Tx Video Mode Pixel Stream Packet Header. It can be set following values. (for DSI mode) H'0E:Packed Pixel Stream, 16bit RGB H'1E:Packed Pixel Stream, 18bit RGB H'2E:Loosely Packed Pixel Stream, 18bit RGB H'3E:Packed Pixel Stream, 24bit RGB H'2C:Packed Pixel Stream, 16bit YCbCr 4:2:2 (for CSI-2 mode) H'22:RGB565 H'23:RGB666 H'24:RGB888 H'1E:YUV422 8-bit Operation is prohibited to write any value except for listed above.
15 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.22 Tx Video Mode Parameter Set 0 Register (TXVMVPRMSET0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HS POL	VS POL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CSPC		—	BPP		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
17	HSPOL	B'0	R/W	Set polarity of HSYNC signal. B'0: High Active B'1: Low Active.
16	VSPOL	B'0	R/W	Set polarity of VSYNC signal. B'0: High Active B'1: Low Active
15 to 6	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
5 to 4	CSPC	B'00	R/W	Set color space of input video pixel. B'00:RGB B'01:YCbCr(DSI)/YUV(CSI-2) B’10:Reserved B’11:Reserved
3	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	BPP	B'000	R/W	Set VideoColorDepth of input video pixel. B'000:16bpp B'001:18bpp B'010:24bpp*1 Operation is prohibited to write any value except for listed above. Note: *1 Use this value for Loosely Packed Pixel Stream, 18bit RGB.

67.2.2.23 Tx Video Mode Parameter Set 1 Register (TXVMVPRMSET1R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	VACTIVE														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	VSAVW	—	—	VSA											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
30 to 16	VACTIVE	H'0000	R/W	Set Line count of VACTIVE (Vertical Active lines)
15		B'0	R	Reserved The read value is undefined. The write value should always be 0.
14	VSAVW	B'0	R/W	Allows the number of lines in a VSA period to vary. 0b : Not allowed 1b : Allow Do not change the initial value in DSI mode.
13 to 12	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
11 to 0	VSA	H'000	R/W	Set Line count of VSA (Vertical Sync Active)

67.2.2.24 Tx Video Mode Parameter Set 2 Register (TXVMVPRMSET2R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
28	ECCERR1B	B'0	R	When this value is “1”, the Rx ECC Error (1bit) is detected. Write “1” to RXPSCR.ECC1BERR register to clear this field.
27, 26	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
25	UEXTRGERR	B'0	R	When this value is “1”, the Rx Unexpected Trigger is detected. Write “1” to RXPSCR.UEXTRGERR register to clear this field.
24	RESPTOERR	B'0	R	When this value is “1”, the Rx Timeout is detected after changing to Rx mode along with Bus Turn-Around and within the time specified by RESPTOSETR.RESPTOVL. Write “1” to RXPSCR.RESPTOERR register to clear this field.
23	OVRERR	B'0	R	When this value is “1”, the Buffer Overrun Error is detected at Rx Long Packet. Write “1” to RXPSCR.OVRERR register to clear this field.
22	AXIERR	B'0	R	When this value is “1”, the Response except for OKAY is received at AXI write. Write “1” to RXPSCR.AXIERR register to clear this field.
21	CRCERR	B'0	R	When this value is “1”, the Rx CRC Error is detected. Write “1” to RXPSCR.CRCERR register to clear this field.
20	WCERR	B'0	R	When this value is “1”, the Word Count Error of Rx Packet length below word count is detected. Write “1” to RXPSCR.WCERR register to clear this field.
19	UEXDTERR	B'0	R	When this value is “1”, the unexpected Packet Type is received. Write “1” to RXPSCR.UEXDTERR register to clear this field.
18	UEXPKTERR	B'0	R	When this value is “1”, the unexpected Packet is received. Write “1” to RXPSCR.UEXPKTERR register to clear this field.
17	ECCERR	B'0	R	When this value is “1”, the Rx ECC Error (over 1bit) is detected. Write “1” to RXPSCR.ECCERR register to clear this field.
16	MLFERR	B'0	R	When this value is “1”, the Rx Packet under 4bit length is received. Write “1” to RXPSCR.MLFERR register to clear this field.
15	Reserved	B'0	R	This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14	RCVACK	B'0	R	When this value is "1", the ACK trigger is received. When unexpected ACK trigger is received, this value does not set to "1" and UEXTRGERR is set to "1". Refer to Section 67.3.2.10.3.5 for detail. Write "1" to RXPSCR.RCVACK register to clear this field.
13 to 11	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
10	RCVEOT	B'0	R	When this value is “1”, the EoTp Packet is received. When unexpected EoTp Packet is received, this value does not set to "1" and UEXPKTERR is set to "1". Refer to Section 67.3.2.10.3.4 for detail. Write “1” to RXPSCR.RCVEOT register to clear this field.
9	RCVAKE	B'0	R	When this value is “1”, the Acknowledge and Error Report Packet is received. When unexpected Acknowledge and Error Report Packet is received, this value does not set to "1" and UEXPKTERR is set to "1". Refer to Section 67.3.2.10.3.4 for detail. Write “1” to RXPSCR.RCVAKE register to clear this field.
8	RCVRESP	B'0	R	When this value is “1”, the packet except for Acknowledge and Error Report Packet is received. When any packet except for EoTP Packet and Acknowledge and Error Report Packet is received, this value does not set to "1" and UEXPKTERR is set to "1". Refer to Section 67.3.2.10.3.4 for detail. Write “1” to RXPSCR.RCVRESP register to clear this field.
7 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	BTAREQEND	B'0	R	When this value is “1”, the completion of Transmission request include Rx by TXCMCR.BTAREQ Packet is detected. Write “1” to RXPSCR.BTAREQEND register to clear this field.

67.2.2.30 Rx Packet Status Clear Register (RXPSCR)

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
28	ECCERR1B	B'0	R/W	Interrupt enable for RXPSR.ECCERR1B B'0: Disable interrupt of dsi_int_rxp when RXPSR.ECCERR1B=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.ECCERR1B=1
27, 26	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
25	UEXTRGERR	B'0	R/W	Interrupt enable for RXPSR.UEXTRGERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.UEXTRGERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.UEXTRGERR=1
24	RESPTOERR	B'0	R/W	Interrupt enable for RXPSR.RESPTOERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.RESPTOERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.RESPTOERR=1
23	OVRERR	B'0	R/W	Interrupt enable for RXPSR.OVRERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.OVRERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.OVRERR=1
22	AXIERR	B'0	R/W	Interrupt enable for RXPSR.AXIERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.AXIERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.AXIERR=1
21	CRCERR	B'0	R/W	Interrupt enable for RXPSR.CRCERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.CRCERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.CRCERR=1
20	WCERR	B'0	R/W	Interrupt enable for RXPSR.WCERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.WCERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.WCERR=1
19	UEXDTERR	B'0	R/W	Interrupt enable for RXPSR.UEXDTERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.UEXDTERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.UEXDTERR=1
18	UEXPKTERR	B'0	R/W	Interrupt enable for RXPSR.UEXPKTERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.UEXPKTERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.UEXPKTERR=1

Bit	Bit Name	Initial Value	R/W	Description
17	ECCERR	B'0	R/W	Interrupt enable for RXPSR.ECCERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.ECCERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.ECCERR=1
16	MLFERR	B'0	R/W	Interrupt enable for RXPSR.MLFERR B'0: Disable interrupt of dsi_int_rxp when RXPSR.MLFERR=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.MLFERR=1
15	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
14	RCVACK	B'0	R/W	Interrupt enable for RXPSR.RCVACK B'0: Disable interrupt of dsi_int_rxp when RXPSR.RCVACK=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.RCVACK=1
13 to 11	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
10	RCVEOT	B'0	R/W	Interrupt enable for RXPSR.RCVEOT B'0: Disable interrupt of dsi_int_rxp when RXPSR.RCVEOT=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.RCVEOT=1
9	RCVAKE	B'0	R/W	Interrupt enable for RXPSR.RCVAKE B'0: Disable interrupt of dsi_int_rxp when RXPSR.RCVAKE=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.RCVAKE=1
8	RCVRESP	B'0	R/W	Interrupt enable for RXPSR.RCVRESP B'0: Disable interrupt of dsi_int_rxp when RXPSR.RCVRESP=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.RCVRESP=1
7 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	BTAREQEND	B'0	R/W	Interrupt enable for RXPSR.BTAREQEND B'0: Disable interrupt of dsi_int_rxp when RXPSR.BTAREQEND=1 B'1: Enable interrupt of dsi_int_rxp when RXPSR.BTAREQEND=1

67.2.2.32 Rx Packet Address Set 0 Register (RXPADDRSET0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDRL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDRL													—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	ADDRL	H'0000 0000	R/W	Set start address for Payload data of Rx Long Packet. Bit[31:3] of the address can be set. Bit[2:0] is fixed to "0". AXI master can read the payload data by read access when the access of the payload data for Rx Command Transfer mode is used by AXI access (RXPSET0R.LPPDACC=1) and is a Long Packet for Tx Command Transfer mode (RXPHDR.FMT=1).
2 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.33 Rx Packet Size Set Register (RXPSIZESETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SIZE				—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31-7	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
6-3	SIZE	H'0	R/W	Set memory size of AXI by Byte Unit used for payload data of Rx Long Packet. AXI master can write the payload data by write access when the access of the payload data for Rx Command Transfer mode is used by AXI access (RXPSET0R.LPPDACC=1) and is a Long Packet for Tx Command Transfer mode (RXPHDR.FMT=1). The memory size setting is allowed by 8 byte unit because Bit[2:0] of the size is always fixed to "0". The size of Rx Long Packet should be within 128 Byte. The value of 0 Byte and over 129 Byte is prohibited. Without using Rx Long Packet, the Initial Value is permitted to set for this register.
2 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.34 Rx Packet Header Data Register (RXPHDR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FMT	VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA1								DATA0							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
24	FMT	B'0	R	Packet format of Rx Packet Header. B'0: Short Packet B'1: Long Packet
23, 22	VC	H'0	R	Identifier of virtual channel of Rx Packet Header. This value is limited to 3 from 0.
21 to 16	DT	H'00	R	Data type of Rx Packet Header.
15 to 8	DATA1	H'00	R	Data1 of Rx Packet Header. When Rx Packet format is Long Packet, this value is upper 8 bits of the word count.
7 to 0	DATA0	H'00	R	Data0 of Rx Packet Header. When Rx Packet format is Long Packet, this value is lower 8 bits of the word count.

67.2.2.35 Rx Packet Payload Data0 Register (RXPPD0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31-0	DATA	H'0000 0000	R	Payload Data3 for Rx Long Packet. The data is received as Payload Data when the access of the payload data for Rx Long Packet is used by Register access (RXPSETR.LPPDACC=0) and is a Long Packet of Rx Command Transfer mode (RXPHDR.FMT=1). Valid Payload data is identified by word count of Rx Packet Header (RXPHDR.DATA0 and RXPHDR.DATA1). Bit[7:0] : Data byte12 Bit[15:8] : Data byte13 Bit[23:16]: Data byte14 Bit[31:24]: Data byte15

67.2.2.39 Rx Ack and Error Packet parameter Register (AKEPR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VC		DT					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
23, 22	VC	H'0	R	Identifier of virtual channel of Rx Acknowledge and Error Report Packet. This value is limited to 3 from 0.
21 to 16	DT	H'00	R	Data type of Rx Acknowledge and Error Report Packet.
15 to 0	ERRRPT	H'0000	R	Error report of Rx Acknowledge and Error Report Packet.

67.2.2.40 Rx Response Timeout Set Register (RXRESPTOSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RESPTOVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RESPTOVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	RESPTOVL	H'0000 0000	R/W	Set Timeout value to measure the interval between Start of Rx mode and Start of Packet or Trigger Receive along with Bus Turn-Around with TXCMCR.BTAREQ. The limit Time for Timeout is calculated by formula of RESPTOVL * (period of lpclk). Set a value greater than Peripherai provides. If Peripheral offers more than one value, set the highest value. When RXPSR.RESPTOERR is "1", the Timeout is detected. Notice, the Timeout is not detected when RESPTOVL=0.

67.2.2.41 Turn-Around Control Register (TACR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRN REQ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	TRNREQ	B'0	R0/W	Bus Turn-Around request to Rx from Tx. Write "0": No meaning, ignored Write "1": Bus Turn-Around request to Rx from Tx by assertion TurnRequest of PPI Data Lane0.

67.2.2.42 Turn-Around Status Register (TASR)

This register shows Turn-Around Status by TACR.TRNREQ.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	ECC ERR 1B	—	—	—	—	—	—	—	—	UEX DT ERR	UEX PKT ERR	ECC ERR	MLF ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
28	ECCERR1B	B'0	R	When this value is “1”, the Rx ECC Error (1bit) is detected. Write “1” to TASCR.ECC1BERR register to clear this field.
27 to 20	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
19	UEXDTERR	B'0	R	When this value is “1”, the Packet with unexpected Data Type is received. Write “1” to TASCR.UEXDTERR register to clear this field.
18	UEXPKTERR	B'0	R	When this value is “1”, the unexpected Packet is received. Write “1” to TASCR.UEXPKTERR register to clear this field.
17	ECCERR	B'0	R	When this value is “1”, the Rx ECC Error (over 1bit) is detected. Write “1” to TASCR.ECCERR register to clear this field.
16	MLFERR	B'0	R	When this value is “1”, the Packet with under 4 byte length is received. Write “1” to TASCR.MLFERR register to clear this field.
15	—	B'0	R	This bit is always read as 0. The write value should always be 0.
14	RCVACK	B'0	R	When this value is "1", the ACK trigger is received. Write "1" to TASCR.RCVACK register to clear this field.
13 to 11	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
10	RCVEOT	B'0	R	When this value is “1”, the EoTp Packet is detected. When unexpected EoTp Packet is received, this value does not set to "1" and UEXPKTERR is set to "1". Refer to Section 67.3.2.10.3.4 for detail. Write “1” to TASCR.RCVEOT register to clear this field.
9	RCVAKE	B'0	R	When this value is “1”, the Acknowledge and Error Report Packet is detected. When unexpected Acknowledge and Error Report Packet is received, this value does not set to "1" and UEXPKTERR is set to "1".Refer to Section 67.3.2.10.3.4 for detail. Write “1” to TASCR.RCVAKE register to clear this field.
8 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	TRNREQEND	B'0	R	When this value is “1”, the completion of Turn-Around by TACR.TRNREQ and the confirmation of the Direction as "1" (Rx) are detected. Write “1” to TASCR.TRNREQEND register to clear this field.

67.2.2.43 Turn-Around Status Clear Register (TASCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	LRXHTOVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	LRXHTOVL	H'0000 0000	R/W	Set Host LP Rx Timeout value (LRX_H_TO). The limit Time for Timeout is calculated by formula of LRXHTOVL * (period of lpclk). When TOSR.LRXHTO is "1", the Timeout is detected. Notice, the Timeout is not detected when LRXHTOVL=0.

67.2.2.47 Timeout Set 2 Register (TOSET2R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TATOVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TATOVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	TATOVL	H'0000 0000	R/W	Set Turn-Around Timeout value (TA_TO). The limit Time for Timeout is calculated by formula of TATOVL * (period of lpclk). When TOSR.TATO is "1", the Timeout is detected. Notice, the Timeout is not detected when TATOVL=0.

67.2.2.48 Timeout Status Register (TOSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TA TO	LRX HTO	HTX TO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
2	TATO	B'0	R	When this value is "1", the Turn-Around Timeout (TA_TO) is detected. Write "1" to TOSCR.TATO register to clear this field.
1	LRXHTO	B'0	R	When this value is "1", the Host LP Rx Timeout (LRX_H_TO) is detected. Write "1" to TOSCR.LRXHTO register to clear this field.
0	HTXTO	B'0	R	When this value is "1", the Host HS Tx Timeout (HTX_TO) is detected. Write "1" to TOSCR.HTXTO register to clear this field.

67.2.2.49 Timeout Status Clear Register (TOSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
2	TATO	B'0	R0/W	Set to "1" after detection of the Turn-Around Timeout (TA_TO) to detect the next one. B'0: No meaning, ignored B'1: Clear TOSR.TATO
1	LRXHTO	B'0	R0/W	Set to "1" after detection of the Host LP Rx Timeout (LRX_H_TO) to detect the next one. B'0: No meaning, ignored B'1: Clear TOSR.LRXHTO
0	HTXTO	B'0	R0/W	Set to "1" after detection of the Host HS Tx Timeout (HTX_TO) to detect the next one. B'0: No meaning, ignored B'1: Clear TOSR.HTXTO

67.2.2.50 Timeout Interrupt Enable Register (TOIER)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TA TO	LRX HTO	HTX TO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
2	TATO	B'0	R/W	Interrupt enable for Turn-Around Timeout (TA_TO). B'0: Disable interrupt of dsi_int_to when TOSR.TATO=1 B'1: Enable interrupt of dsi_int_to when TOSR.TATO=1
1	LRXHTO	B'0	R/W	Interrupt enable for Host LP Rx Timeout (LRX_H_TO). B'0: Disable interrupt of dsi_int_to when TOSR.LRXHTO=1 B'1: Enable interrupt of dsi_int_to when TOSR.LRXHTO=1
0	HTXTO	B'0	R/W	Interrupt enable for Host HS Tx Timeout (HTX_TO). B'0: Disable interrupt of dsi_int_to when TOSR.HTXTO=1 B'1: Enable interrupt of dsi_int_to when TOSR.HTXTO=1

67.2.2.51 PPI Set Register (PPISETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ULPSWKUP			—	—	—	—	—	—	—	DL0TRNDIS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLEN	—	—	—	—	DLEN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
26 to 24	ULPS WKUP	H'0	R/W	Set Twake-up period of ULPS. This period is specified by count value of lpclk. This period should be more than 1ms. H'0: 20,480 count H'1: 10,240 count H'2: 5,120 count H'3: 2,560 count H'4: 1,280 count H'5: 640 count H'6: 320 count H'7: 160 count
23 to 17	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
16	DL0 TRNDIS	B'0	R/W	Turn-Around is disabled by PPI Data Lane0 TurnDisable. All actions listed below are prohibited when this DL0TRNDIS="1". - Write "1" to TXCMCR.BTAREQ register - Write "1" to TACR.TRNREQ register
15 to 9	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
8	CLEN	B'0	R/W	Clock Lane is enabled by PPI Clock Lane Enable.
7 to 4	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	DLEN	H'0	R/W	Data Lane is enabled by each PPI Data Lane Enable. [0]: Data Lane0 Enable [1]: Data Lane1 Enable [2]: Data Lane2 Enable [3]: Data Lane3 Enable The value for this register is permitted for H'0, H'1, H'3, H'7 and H'F. Others are prohibited

67.2.2.52 PPI Clock Lane Control Register (PPICLCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TX REQ HS	—	—	—	—	—	—	TXUL PSE XT	TXUL PSC LK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
8	TXREQHS	B'0	R/W	Start HS Clock on Clock Lane by PPI Clock Lane TxRequestHS. B'0: No HS transmission (TxRequestHS=0) B'1: Request for HS transmission (TxRequestHS=1)
7 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	TXULPS EXT	B'0	R0/W	When write "1", request to exit from Ultra-low Power State (ULPS) by PPI Clock Lane TxUlpsExit.
0	TXULPS CLK	B'0	R0/W	When write "1", request to transition to Ultra-low Power State (ULPS) by PPI Clock Lane TxUlpsClk.

67.2.2.53 PPI Clock Lane Status Register (PPICLSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HSTOLP	TOHS	FROMULPS	TOULPS	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ULPSACTN	STPST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
27	HSTOLP	B'0	R	When this value is "1", the transition to LP from HS is occurred. Write "1" to PPICLSCR.HSTOLP register to clear this field.
26	TOHS	B'0	R	When this value is "1", the transition to HS is occurred. Write "1" to PPICLSCR.TOHS register to clear this field.
25	FROMULPS	B'0	R	When this value is "1", the Exit from ULSP is detected. Write "1" to PPICLSCR.FROMULPS register to clear this field.
24	TOULPS	B'0	R	When this value is "1", the Enter to ULSP is detected. Write "1" to PPICLSCR.TOULPS register to clear this field.
23 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	ULPSACTN	*1	R	Status of UlpsActiveNot on PPI Clock Lane.
0	STPST	*1	R	Status of Stopstate on PPI Clock Lane.

Note: *1 This Initial Value is depend on ppi_cl_stopstate.

67.2.2.54 PPI Clock Lane Status Clear Register (PPICLSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HSTOLP	TOHS	FROMULPS	TOULPS	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
27	HSTOLP	B'0	R0/W	Set to "1" to clear PPICLSR.HSTOLP. B'0: No meaning, ignored B'1: Clear PPICLSR.HSTOLP。
26	TOHS	B'0	R0/W	Set to "1" to clear PPICLSR.TOHS. B'0: No meaning, ignored B'1: Clear PPICLSR.TOHS
25	FROMULPS	B'0	R0/W	Set to "1" to clear PPICLSR.FROMULPS. B'0: No meaning, ignored B'1: Clear PPICLSR.FROMULPS
24	TOULPS	B'0	R0/W	Set to "1" to clear PPICLSR.TOULPS. B'0: No meaning, ignored B'1: Clear PPICLSR.TOULPS
23 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.55 PPI Clock Lane Interrupt Enable Register (PPICLIER)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HSTOLP	TOHS	FROMULPS	TOULPS	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
27	HSTOLP	B'0	R/W	Interrupt enable for the transition to LP from HS. B'0: Disable interrupt of dsi_int_ppicl when PPICLSR.HSTOLP=1 B'1: Enable interrupt of dsi_int_ppicl when PPICLSR.HSTOLP=1
26	TOHS	B'0	R/W	Interrupt enable for the transition to HS. B'0: Disable interrupt of dsi_int_ppicl when PPICLSR.TOHS=1 B'1: Enable interrupt of dsi_int_ppicl when PPICLSR.TOHS=1
25	FROMULPS	B'0	R/W	Interrupt enable for the transition from ULPS. B'0: Disable interrupt of dsi_int_ppicl when PPICLSR.FROMULPS=1 B'1: Enable interrupt of dsi_int_ppicl when PPICLSR.FROMULPS=1
24	TOULPS	B'0	R/W	Interrupt enable for the transition to ULPS. B'0: Disable interrupt of dsi_int_ppicl when PPICLSR.TOULPS=1 B'1: Enable interrupt of dsi_int_ppicl when PPICLSR.TOULPS=1
23 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.56 PPI Data Lane0 Control Register (PPIDL0CR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TXTRGESC			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R0/W	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	TXTRGESC	H'0	R0/W	Set to "1" to request the Each TxTriggerEsc on PPI Data Lane0. H'0: TxTriggerEsc is not asserted H'1: TxTriggerEsc[0] asserted H'2: TxTriggerEsc[1] asserted H'4: TxTriggerEsc[2] asserted H'8: TxTriggerEsc[3] asserted Others are prohibited.

67.2.2.57 PPI Data Lane0 Status Register (PPIDL0SR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	DIR	TX2RX	RX2TX	ULPSACTN	STPST	RXULPSESC	RXLPDTESC	RXTRGESC			
Initial value:	0	0	0	0	0	0	0	0	1	*1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
20	ERRCLP1	B'0	R	When this value is "1", the Contention Error of LP1 (ErrContentionLP1) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.ERRCLP1 register to clear this field.
19	ERRCLP0	B'0	R	When this value is "1", the Contention Error of LP0 (ErrContentionLP0) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.ERRCLP0 register to clear this field.
18	ERRCTRL	B'0	R	When this value is "1", the Control Error (ErrControl) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.ERRCTRL register to clear this field.
17	ERRSYNESC	B'0	R	When this value is "1", the Sync Error of LPDT (ErrSyncEsc) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.ERRSYNESC register to clear this field.
16	ERRESC	B'0	R	When this value is "1", the Escape mode Entry Error (ErrEsc) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.ERRESC register to clear this field.
15 to 11	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
10	DIR	B'0	R	Direction (Tx or Rx) of PPI Data Lane0
9	TX2RX	B'0	R	When this value is "1", the the transition of Direction from 0 (Tx) to 1(Rx) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.TX2RX register to clear this field.
8	RX2TX	B'0	R	When this value is "1", the the transition of Direction from 1(Rx) to 0 (Tx) is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.RX2TX register to clear this field.
7	ULPSACTN	B'1	R	Status of UlpsActiveNot on PPI Data Lane0.
6	STPST	*1	R	Status of Stopstate on Data Lane0.
5	RXULPSESC	B'0	R	Status of RxULPSEsc on PPI Data Lane0.
4	RXLPDTESC	B'0	R	Status of RxLpdtEsc on Data Lane0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	RXTRGESC	H'0	R	When this value is "1", the Event of Escape mode Rx Trigger is detected on PPI Data Lane0. Write "1" to PPIDL0SCR.RXTRGESC[n] register to clear this field.

Note: *1 This Initial Value is depend on ppi_dl0_stopstate.

67.2.2.58 PPI Data Lane0 Status Clear Register (PPIDL0SCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ERRCLP1	ERRCLP0	ERRCTRL	ERRSYNESC	ERRESC

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	TXULPSEXT	B'0	R0/W	Set to "1" to request the UPLS Exit by TxUlpsExit on all PPI Data Lane. B'0: No meaning, ignored B'1: Request the Exit from UPLS
0	TXULPSESC	B'0	R0/W	Set to "1" to request the transition to ULPS by TxUlpsEsc on all PPI Data Lane. B'0: No meaning, ignored B'1: Request the transition to ULPS

67.2.2.61 PPI Data Lane Status Register (PPIDLSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FROMULPS	TOULPS	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ULPSACTN				STPST			
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	*1	*1	*1	*1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
25	FROMULPS	B'0	R	When this value is "1", the transition to StopState from ULPS by ULPS Exit Request is detected on all PPI Data Lane enabled by PPISETR.DLEN. Write "1" to PPIDLSCR.FROMULPS register to clear this field.
24	TOULPS	B'0	R	When this value is "1", the transition to ULPS by PPIDLCR.TXULPSESC is detected on all PPI Data Lane enabled by PPISETR.DLEN. Write "1" to PPIDLSCR.TOMULPS register to clear this field.
23 to 8	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
7 to 4	ULPSACTN	H'F	R	Status of UlpsActiveNot on PPI Data Lane. [0]: UlpsActiveNot of PPI Data Lane0 [1]: UlpsActiveNot of PPI Data Lane1 [2]: UlpsActiveNot of PPI Data Lane2 [3]: UlpsActiveNot of PPI Data Lane3
3 to 0	STPST	*1	R	Status of Stopstate on PPI Data Lane. [0]: Stopstate of PPI Data Lane0 [1]: Stopstate of PPI Data Lane1 [2]: Stopstate of PPI Data Lane2 [3]: Stopstate of PPI Data Lane3

Note: *1 This Initial Value is depend on the value of ppi_dl0_stopstate, ppi_dl1_stopstate, ppi_dl2_stopstate and ppi_dl3_stopstate in Input Signal.

67.2.2.62 PPI Data Lane Status Clear Register (PPIDLSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FROMULPS	TOULPS	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
25	FROMULPS	B'0	R/W	Interrupt enable for the transition from ULPS on all PPI Data Lane B'0: Disable interrupt of dsi_int_ppidl when PPIDLSR.FROMULPS=1 B'1: Enable interrupt of dsi_int_ppidl when PPIDLSR.FROMULPS=1
24	TOULPS	B'0	R/W	Interrupt enable for the transition to ULPS on all PPI Data Lane B'0: Disable interrupt of dsi_int_ppidl when PPIDLSR.TOULPS=1 B'1: Enable interrupt of dsi_int_ppidl when PPIDLSR.TOULPS=1
23 to 0	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

67.2.2.64 Skew Calibration Control Register (SCALCR)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAL TYP	CAL REQ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	CALTYP	B'0	R0/W	Choice of effective value for the period of TxSkewCalHS. B'0: SCALPSR is effective when CALREQ=1 B'1: SCALPS1R is effective when CALREQ=1 This register is not effective when CALREQ=0.
0	CALREQ	B'0	R0/W	Enable TxSkewCalHS on all Data Lane. B'0: No meaning, ignored B'1: Enable TxSkewCalHS with period based on the value of SCALPSR.PTNSZ or SCALPS1R.PTNSZ.

67.2.2.65 Skew Calibration Status Register (SCALSR)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAL REQ END
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	CALREQEND	B'0	R	When this value is "1", the Completion of Skew Calibration by SCALCR.CALREQ is detected or the Completion of Skew Calibration by TXVMSET(F(i))R.VSEN=1 is detecteded. Write "1" to SCALSCR.CALREQEND register to clear this field.

67.2.2.66 Skew Calibration Status Clear Register (SCALSCR)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAL REQ END
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	CALREQEND	B'0	R0/W	Set to "1" to clear SCALSR.CALREQEND. B'0: No meaning, ignored B'1: Clear SCALSR.CALREQEND

67.2.2.67 Skew Calibration Interrupt Enable Register (SCALIER)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAL REQ END
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
0	CALREQEND	B'0	R/W	Interrupt enable for SCALSR.CALREQEND B'0: Disable interrupt of dsi_int_scal when SCALSR.CALREQEND=1 B'1: Enable interrupt of dsi_int_scal when SCALSR.CALREQEND=1

67.2.2.68 Skew Calibration Pattern Size Register (SCALPSR)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PTNSZ															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PTNSZ															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31-0	PTNSZ	H'0000 0000	R/W	Period for transmission of Skew Calibration Pattern on Skew Calibration. (Unit: hsclk) Asserts TxSkewCalHS for the duration of (field value +1) cycle period. Refer to section 67.3.2.11.1 for detail. This register is used for following. Case 1: Set to "0" to SCALCR.CALTYP with Skew Calibration Request (SCALCR.CALREQ=1) by F/W Case 2: Skew Calibration on Video mode (TXVMSET(F(i))R.VSEN=1) It is inhibited to write "0" to this field at the case described above.

67.2.2.69 Skew Calibration Pattern Size 1 Register (SCALPS1R)

(for 2.5G)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PTNSZ															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PTNSZ															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31-0	PTNSZ	H'0000 0000	R/W	Period for transmission of Skew Calibration Pattern on Skew Calibration. (Unit: hsclk) Asserts TxSkewCalHS for the duration of (field value +1) cycle period. Refer to section 67.3.2.11.1 for detail. This register is used for following. Case 1: Set to "1" to SCALCR.CALTYP with Skew Calibration Request (SCALCR.CALREQ=1) by F/W It is inhibited to write "0" to this field at the case described above.

67.2.2.70 IP Set Register (IPSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
17, 16	FTCUR	H'0	R	Indicates the type of outbound frame you are currently sending while in video mode. 00b: Frame type 0 (set with TXVM*R) 01b: Frame type 1 (set with TXVM*F1R) 10b: Frame type 2 (set with TXVM*F2R) 11b: Frame type 3 (set with TXVM*F3R) This field is updated to the frame boundary (at the start of the VSA period).
15 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	FTNXT	H'0	R/W	During video mode operation, set the frame type to send to the next frame. 00b: Frame type 0 (set with TXVM*R) 01b: Frame type 1 (set with TXVM*F1R) 10b: Frame type 2 (set with TXVM*F2R) 11b: Frame type 3 (set with TXVM*F3R) This field should be set before the currently transmitting frame is completed (at least before 10 usec before the next VSYNC start edge occurs). See Chapter 5.2.4.3 for details.

67.2.2.72 Tx Video Mode Set (Frame Type(i)) Register (TXVMSETF(i)R) (i=1,2,3)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
1	DTTEN	B'0	R/W	Enable Tx Video Packet Inspection Timer B'0: Disable B'1: Enable Refer to section 67.5 for detail.
0	PPITEN	B'0	R/W	Enable Tx PPI Inspection Timer B'0: Disable B'1: Enable Refer to section 67.5 for detail.

67.2.2.82 Fault detection Status Register (FDSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VINERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DTTACT	PPITACT	—	—	—	—	—	—	DTTO	PPITO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
16	VINERR	B'0	R	When this value is “1”, unexpected Video signal input is detected. Write “1” to FDSCR.VINERR register to clear this field. Refer to section 67.5 for detail.
15 to 10	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
9	DTTACT	B'0	R	Status of the Timer for Tx Packet Inspection at the internal of this module B'0: Timer is disabled B'1: Timer is Enabled After the configuration of FDCR.DTTEN register, this Status is updated after some period which is related to the frequency of pclk and hs2clk[*1]/lpclk. Following procedure is needed for re-start of the Timer after stopping. 1. Confirm DTTACT=1 2. Write "0" to FDCR.DTTEN register 3. Wait for DTTACT=0 4. Configure the Timer 5. Write "1" to FDCR.DTTEN register
8	PPITACT	B'0	R	Status of the Timer for Tx Packet Inspection at the PPI end B'0: Timer is disabled B'1: Timer is Enabled After the configuration of FDCR.PPITEN register, this Status is updated after some period which is related to the frequency of pclk and hs2clk[*1]/lpclk. Following procedure is needed for re-start of the Timer after stopping. 1. Confirm PPITACT=1 2. Write "0" to FDCR.PPITEN register 3. Wait for PPITACT=0 4. Configure the Timer 5. Write "1" to FDCR.PPITEN register
7 to 2	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	DTTO	B'0	R	When this value is “1”, the transmission is not executed within the period specified by FDDTTMSETR register. Write “1” to FDSCR.DTTO register to clear this field. Refer to section 67.5 for detail.
0	PPITO	B'0	R	When this value is “1”, the Tx PPI is not executed within the period specified by FDDTTMSETR register. Write “1” to FDSCR.PPITO register to clear this field. Refer to section 67.5 for detail.

Note: *1 hs2clk: hsclk(byteclock)*1/2 (internal clock of Link)

67.2.2.83 Fault detection Status Clear Register (FDSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VINERR

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
29, 28	PPITCSCL	H'0	R/W	Multiplier for Tx PPI Inspection timer B'00: multiplied by 1 B'01: multiplied by 1024 (2^10) B'10: multiplied by 1048576 (2^20) Others described above are prohibited.
27, 26	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
25 to 16	PPITCVL	H'000	R/W	Cycle count value for Tx PPI Inspection timer At the following two cases, the Tx PPI is correct. Case1: At SPDTYP=0, the cycle count per Tx PPI is over the value which is PPITCVL*PPITCSCL by hsclk. Case2: At SPDTYP=1, the cycle count per Tx PPI is over the value which is PPITCVL*PPITCSCL by lpclk. At FDCR.PPITEN=1, it is prohibited to set "0".
15	SPDTYP	B'0	R/W	Transfer speed of the Packet B'0: High Speed B'1: Low Power
14	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	PPITOSCL	H'0	R/W	Multiplier for Timeout period of Tx PPI Inspection timer B'00: multiplied by 1 B'01: multiplied by 1024 (2^10) B'10: multiplied by 1048576 (2^20) Others are prohibited.
11, 10	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
9 to 0	PPITOVL	H'000	R/W	Timeout count for Tx PPI Inspection timer At SPDTYP=0, the timeout count is calculated by PPITOVL*PPITOSCL*(hsclk period). At SPDTYP=1, the timeout count is calculated by PPITOVL*PPITOSCL*(lpclk period). At FDCR.PPITEN=1, it is prohibited to set "0".

67.2.2.86 Fault detection Data Type Timer Set Register (FDDTTMSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPD TYP	—	DTTOSCL		—	—	DTTOVL									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The read value is undefined. The write value should always be 0.
15	SPDTYP	B'0	R/W	Transfer speed of the Packet B'0: High Speed B'1: Low Power
14	—	B'0	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	DTTOSCL	H'0	R/W	Multiplier for Timeout period of Tx Packet Inspection timer B'00: multiplied by 1 B'01: multiplied by 1024 (2^10) B'10: multiplied by 1048576 (2^20) Others are prohibited.
11, 10	—	H'0	R	Reserved The read value is undefined. The write value should always be 0.
9 to 0	DTTOVL	H'000	R/W	Timeout count for Tx Packet Inspection timer. At SPDTYP=0, the timeout count is calculated by DTTOVL*DTTOSCL*(hsclk period). The value at SPDTYP=0 should be an even number, because the timer works by hs2clk*1. At SPDTYP=1, the timeout count is calculated by DTTOVL*DTTOSCL*(lpclk period). At FDCR.DTTEN=1, it is prohibited to set "0".

Note: *1 hs2clk: hsclk(byteclock)*1/2 (internal clock of Link)

67.2.2.87 Fault detection Data Type Timer Enable0 Register (FDDTEN0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

67.3.1 Interrupt

Table 67.3 Interrupt Signals

Interrupt Signal	description	Interrupt Condition	Interrupt source Register
intreq_dsitxlink*_p[8] (called “dsi_int_txcm” in this document)	Interrupt of DSI Tx Command Transfer mode	Completion of Tx Request by TXCMCR.TXREQ	TXCMSR.TXREQEND
		Detection of AXI Error at AXI Read	TXCMSR.AXIERR
		Detection of discarded Command Transfer mode Packet in Video mode	TXCMSR.CLSNERR
intreq_dsitxlink*_p[7] (called “dsi_int_txvm” in this document)	Interrupt of DSI Tx Video mode	Start of HS Video Mode Tx	TXVMSR.STR
		End of HSVideo Mode Tx	TXVMSR.STP
		Detection of Discarded Tx Packet	TXVMSR.PDIS
		Overrun/Underrun Error at Tx Video Mode FIFO	TXVMSR.VFERR
		Detection of VSA period start	TXVMSR.VSADET
		Detection of VBP period start	TXVMSR.VBPDET
intreq_dsitxlink*_p[6] (called “dsi_int_rxp” in this document)	Interrupt of DSI Rx Packet	Completion of request by TXCMCR.BTAREQ	RXPSR.BTAREQEND
		Detection of Packet except for Acknowledge and Error Report Packet and EoTp Packet	RXPSR.RCVRESP
		Received Acknowledge and Error Report Packet	RXPSR.RCVAKE
		Received EoTp Packet	RXPSR.RCVEOT
		Received ACK trigger	RXPSR.RCVACK
		Received Packet with under 4Byte length	RXPSR.MLFERR
		Detection of Rx ECC Error (over 1bit)	RXPSR.ECCERR
		Received unexpected Packet	RXPSR.UEXPKTERR
		Received unexpected Rx DT Packet	RXPSR.UEXDTERR
		WC Error of Rx Long Packet	RXPSR.WCERR
		CRC Error of Rx Long Packet	RXPSR.CRCERR
		Detection of AXI Error at AXI Write	RXPSR.AXIERR
		Overrun in Rx Buffer	RXPSR.OVRERR
		ECC Error (1Bit) of Rx Packet	RXPSR.ECCERR1B
intreq_dsitxlink*_p[5] (called “dsi_int_ta” in this document)	Interrupt of DSI Turn-Around	Completion of BTA request by TACR.TRNREQ	TASR.TRNREQEND
		Received Acknowledge and Error Report Packet	TASR.RCVAKE
		Received EoTp Packet	TASR.RCVEOT
		Received ACK trigger	TASR.RCVACK
		Received Packet with under 4Byte length	TASR.MLFERR
		Detection of Rx ECC Error (over 1bit)	TASR.ECCERR
		Received unexpected Packet	TASR.UEXPKTERR
		Received unexpected Rx DT Packet	TASR.UEXDTERR
		ECC Error (1Bit) of Rx Packet	TASR.ECCERR1B

Interrupt Signal	description	Interrupt Condition	Interrupt source Register
intreq_dsitxlink*_p[4] (called “dsi_int_to” in this document)	Interrupt of DSI Timeout	Host Tx Timeout (HTX_TO)	TOSR.HTXTO
		Host LP Rx Timeout (LRX_H_TO)	TOSR.LRXHTO
		Turn-Around Timeout (TA_TO)	TOSR.TATO
intreq_dsitxlink*_p[3] (called “dsi_int_ppicl” in this document)	Interrupt of DSI D-PHY PPI Clock Lane	PPI Clock Lane Transition to ULPS	PPICLSR.TOULPS
		PPI Clock Lane Transition from ULPS	PPICLSR.FROMULPS
		PPI Clock Lane Transition to HS	PPICLSR.TOHS
		PPI Clock Lane Transition to LP from HS	PPICLSR.HSTOLP
intreq_dsitxlink*_p[2] (called “dsi_int_ppidl0” in this document)	Interrupt of DSI D-PHY PPI Data Lane0	PPI Data Lane0 Escape mode Rx Trigger Event[0] (Reset Trigger)	PPIDL0SR.RXTRGESC[0]
		PPI Data Lane0 Escape mode Rx Trigger Event[1]	PPIDL0SR.RXTRGESC[1]
		PPI Data Lane0 Escape mode Rx Trigger Event[2] (ACK Trigger)	PPIDL0SR.RXTRGESC[2]
		PPI Data Lane0 Escape mode Rx Trigger Event[3]	PPIDL0SR.RXTRGESC[3]
		PPI Data Lane0 Transition to Tx from Rx	PPIDL0SR.RX2TX
		PPI Data Lane0 Transition to Rx from Tx	PPIDL0SR.TX2RX
		PPI Data Lane0 Escape mode Entry Error (ErrEsc)	PPIDL0SR.ERRESC
		PPI Data Lane0 LPDT Sync Error (ErrSyncEsc)	PPIDL0SR.ERRSYNESC
		PPI Data Lane0 Control Error (ErrControl)	PPIDL0SR.ERRCTRL
		PPI Data Lane0 LP0 Contention Error	PPIDL0SR.ERRCLP0
		PPI Data Lane0 LP1 Contention Error	PPIDL0SR.ERRCLP1
intreq_dsitxlink*_p[1] (called “dsi_int_ppidl” in this document)	DSI D-PHY All PPI Data Lane Interrupt	All PPI Data Lane Transition to ULPS	PPIDLSR.TOULPS
		All PPI Data Lane Transition from ULPS	PPIDLSR.FROMULPS
intreq_dsitxlink*_p[0] (called “dsi_int_scal” in this document)	DSI Skew Calibration Interrupt	Skew Calibration Complete	SCALSR.CALREQEND (for 2.5G)

The Interrupt signal consists of combination logic. The Interrupt Signal from a Status Register is enabled by the signal related Interrupt Enable Register. These interrupt signals are bound by OR logic.

67.3.2.1 Software Reset

A software reset can be set by controlling the software reset register 4 (SRCR4) and software reset clear register 4 (SRSTCLR4) of the clock pulse generator (CPG) module. DSI/CSI-2-TX channels DSI/CSI-2-TX0, DSI/CSI-2-TX1 correspond to bits 15 and 16 in the SRCR4 and SRSTCLR4 registers, respectively. To apply a software reset to any of the DSI/CSI-2-TX channels, set the corresponding bit in the SRCR4 register. Enabling the bit initializes all the registers of the corresponding DSI/CSI-2-TX channel. To cancel a software reset of any of the DSI/CSI-2-TX channels, set the corresponding bit in the SRSTCLR4 register.

To apply a software reset to any of the DSI/CSI-2-TX channels, execute the following procedure using the register corresponding to the channel.

1. Set the corresponding bit in the SRCR4 register of the Clock Pulse Generator (CPG) module.

To cancel a software reset of any of the DSI/CSI-2-TX channels and start the channel, execute the following procedure using the register corresponding to the channel.

2. Set the corresponding bit in the SRSTCLR4 register of the Clock Pulse Generator (CPG) module.

This reset is used in Force transition to StopState transition (described in section 67.3.2.9) or Error Handling (described in section 67.3.2.10), Shutdown sequence (described in section 67.3.6).

67.3.2.2 Start/Stop of HS clock

HS Tx Clock Start/Stop sequence is described in this section. HS Tx of PPI Clock Lane is controlled by Software.

Before HS Tx procedure, Start HS Tx Clock.

When write "1" to the PPICLCR.TXREQHS register, to request by TxRequestHS=1 to start the HS Tx of Clock Lane for D-PHY.

When transition to HS from LP of PPI Clock Lane is caused, dsi_int_ppicl interrupt is detected by PPICLSR.TOHS=1.

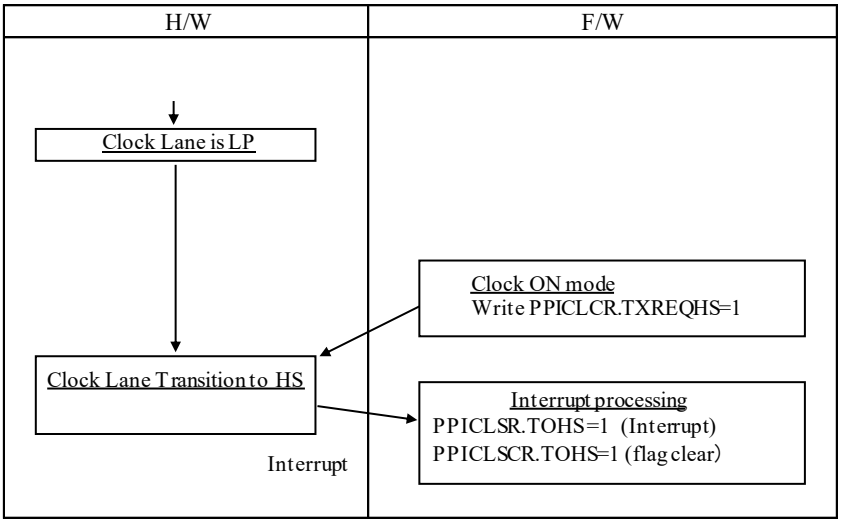

Figure 67.4 Start of HS clock

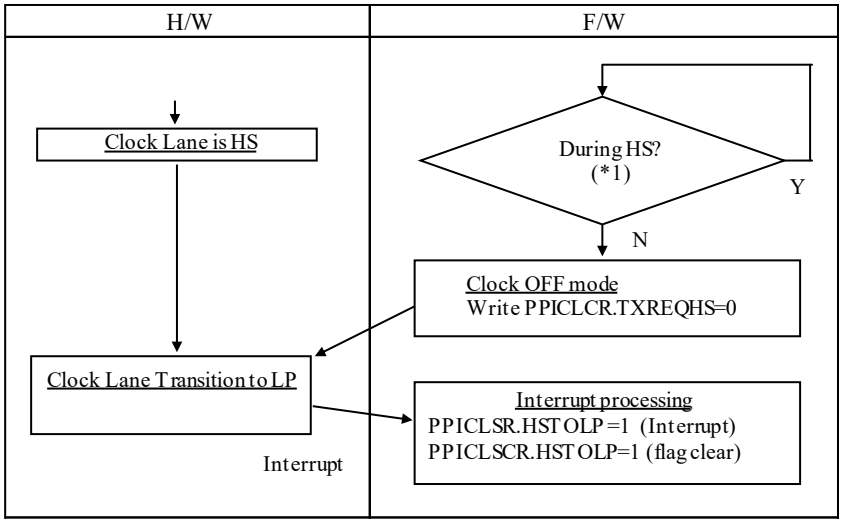
After the confirmation that it is not in HS Tx procedure, write "0" to the PPICLCR.TXREQHS register to request by TxRequestHS=0 to stop the HS Tx of Clock Lane for D-PHY.

When transition to LP from HS of PPI Clock Lane is caused, dsi_int_ppicl interrupt is detected by PPICLSR.HSTOLP=1.



(*1) One of the conditions described below is confirmed as "During HS".
- During processing the Command Transfer mode Packet in HS
- LINKSR.HSBUSY=1
- TXVMSR.ACT=1
- During Transmission of the Skew Calibration pattern

Figure 67.5 Stop of HS clock

67.3.2.3 Command transfer mode

67.3.2.3.1 Tx Short Packet

Tx Short Packet sequence by using Command Transfer mode is described in this section.

As the initial configuration, set the Tx speed to TXCMSETR.SPDTYP register and set "1" to TXCMIER.TXREQEND register.

Then write VC, DT, DATA0 and DATA1 value to TXCMPHDR register as Packet Header. And write "0" to TXCMPHDR.FMT register as Short Packet. After that, write "1" to the TXCMCR.TXREQ register to start Tx Short Packet.

When completion of Tx request by TXCMCR.TXREQ is detected, the dsi_int_txcm interrupt is detected by TXCMSR.TXREQEND=1. This dsi_int_txcm interrupt is indicated to ready for next request.

Before confirmation of this interrupt, it is prohibited to start the other request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the TXCMCR.TXREQ register and is before changing to TXCMSR.TXREQEND=1.

TXCMSETR, TXCMPHDR

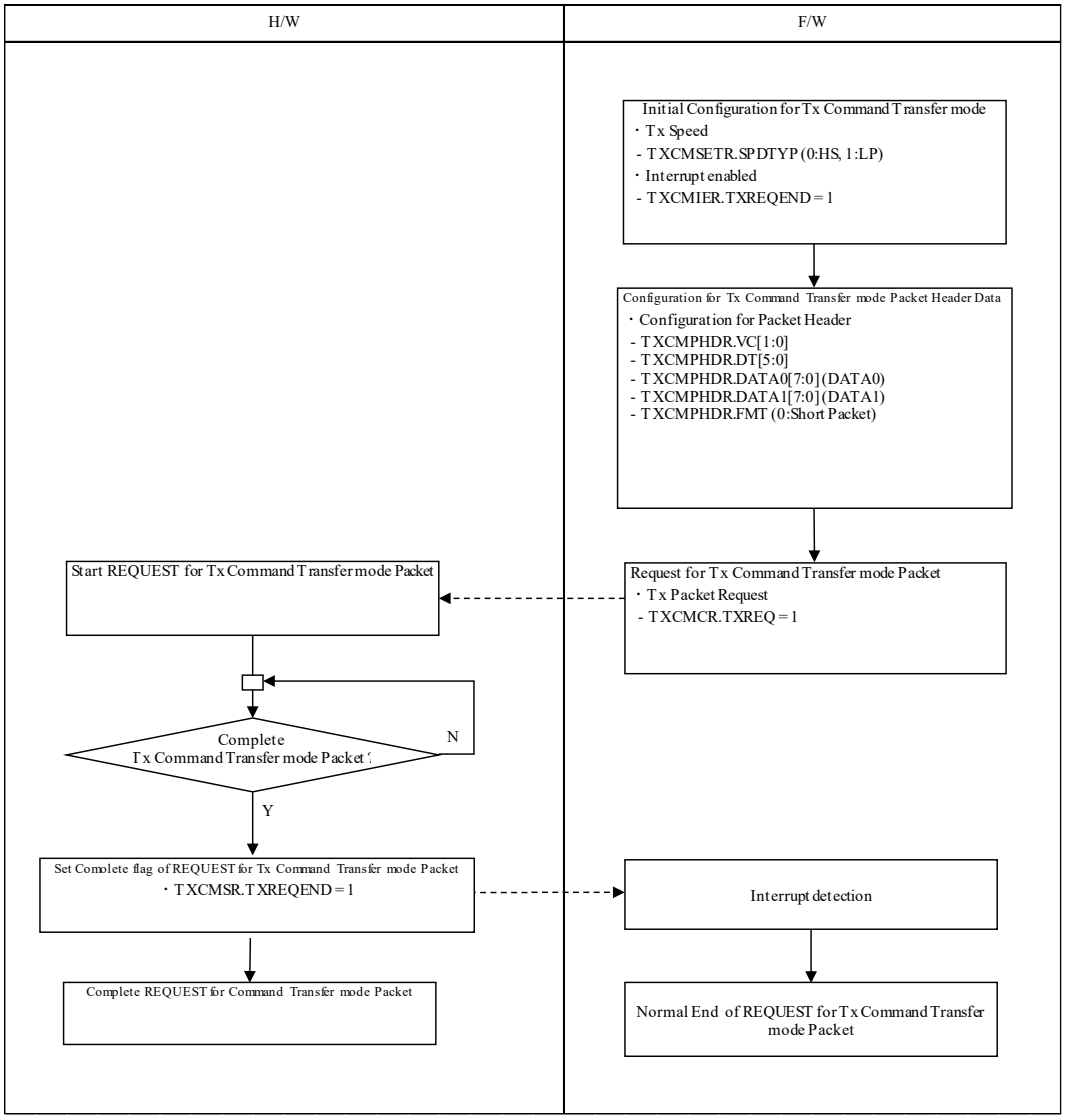


Figure 67.6 Tx Short Packet

67.3.2.3.2 Tx Long Packet

67.3.2.3.2.1 Register Access mode

Long Packet Tx by using Register Access mode supports the Payload Data only to 16 Byte from 0 Byte. Long Packet Tx with over 16 Byte as the Payload Data is supported by AXI Access mode.

Long Packet Tx sequence by using Register Access mode is described in this section.

As initial configuration, set the Tx speed to TXCMSETR.SPDTYP register, set "0" to the TXCMSETR.LPPDACC register as Register Access mode, and set "1" to TXCMIER.TXREQEND register.

Then write VC, DT, DATA0 (WC[7:0]) and DATA1 (WC[15:8]) value to the TXCMPHDR register as Packet Header. Write "1" to the TXCMPHDR.FMT register as Long Packet Tx.

Payload Data is written in the TXCMPPD[n]R(n=0,1,2,3) register with specified Byte size defined by the WC[15:0].

After that, write "1" to the TXCMCR.TXREQ register to start Tx Long Packet.

When completion of Tx request by TXCMCR.TXREQ is detected, dsi_int_txcm interrupt is detected by TXCMSR.TXREQEND=1.

This dsi_int_txcm interrupt is indicated to ready for next request. Before confirmation of this interrupt, it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the TXCMCR.TXREQ register and is before changing to TXCMSR.TXREQEND=1.

TXCMSETR, TXCMPHDR, TXCMPPD0, TXCMPPD1, TXCMPPD2, TXCMPPD3R

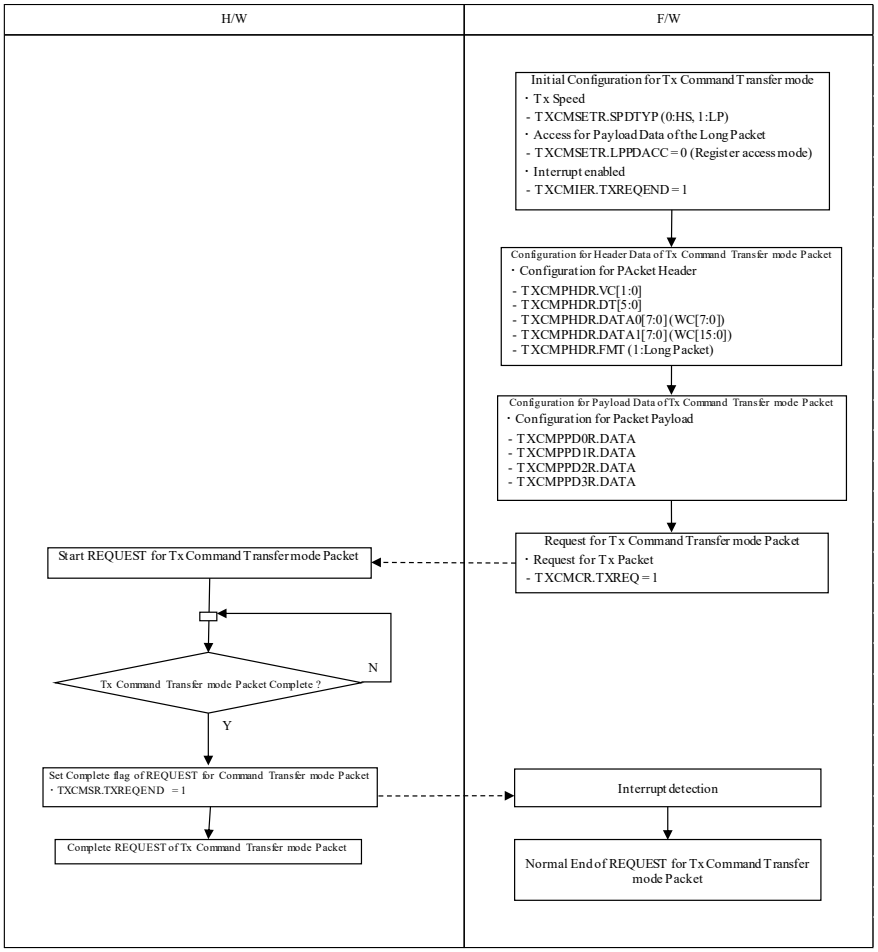

Figure 67.7 Tx Long Packet (Register Access mode)

67.3.2.3.2.2 AXI Access mode

Long Packet Tx by using AXI Access mode supports the Payload Data up to 128 Byte in LP mode and 1024 Byte in HS mode from 0 Byte.

Long Packet Tx sequence by using AXI Access mode is described in this section.
As initial configuration, set the Tx speed to TXCMSETR.SPDTYP register, set "1" to the TXCMSETR.LPPDACC register as AXI Access mode, set the start address for Payload Data Memory to the TXCMADDRSET0R.ADDRL register, and set "1" to TXCMIER.TXREQEND register.

Then write VC, DT, DATA0(WC[7:0]) and DATA1(WC[15:8]) value to the TXCMPHDR register as Packet Header.

Write "1" to the TXCMPHDR.FMT register as Long Packet.

Payload Data is written in the Memory with specified Byte size defined by the WC[15:0]. Refer to Figure 67.8 for the alignment of the Payload Data in the Memory.

After that, write "1" to the TXCMCR.TXREQ register to start Tx Long Packet. When completion of Tx request by TXCMCR.TXREQ is detected, dsi_int_txcm interrupt is detected by TXCMSR.TXREQEND=1. This dsi_int_txcm interrupt is indicated to ready for next request.

After this interrupt, the result of the Tx Request is indicated by the TXCMSR register.

The failure of the Tx Long Packet is indicated by the TXCMSR.AXIERR register, the TXCMSR.UNRERR register or the TXCMSR.CLSNERR register. The Payload Data may re-transmit if needed.

Before confirmation of this interrupt, it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the TXCMCR.TXREQ register and is before changing to TXCMSR.TXREQEND=1.

TXCMSETR, TXCMADDRSET0R, TXCMPHDR

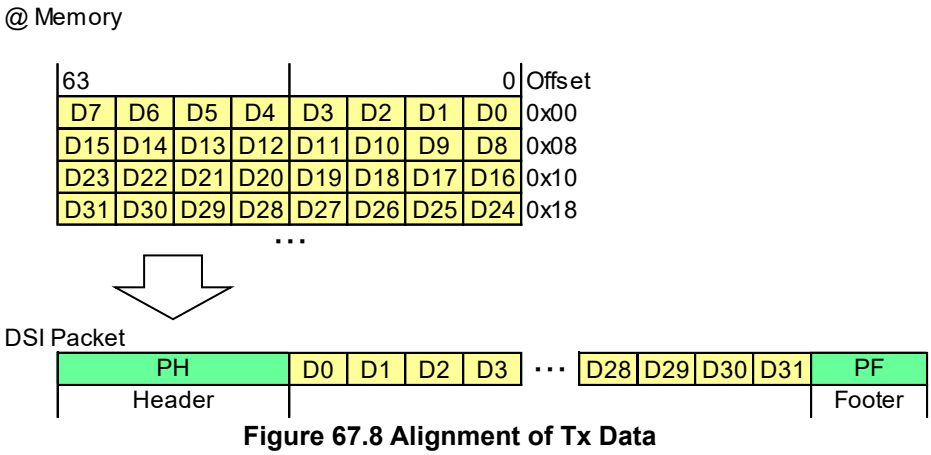

Figure 67.8 Alignment of Tx Data

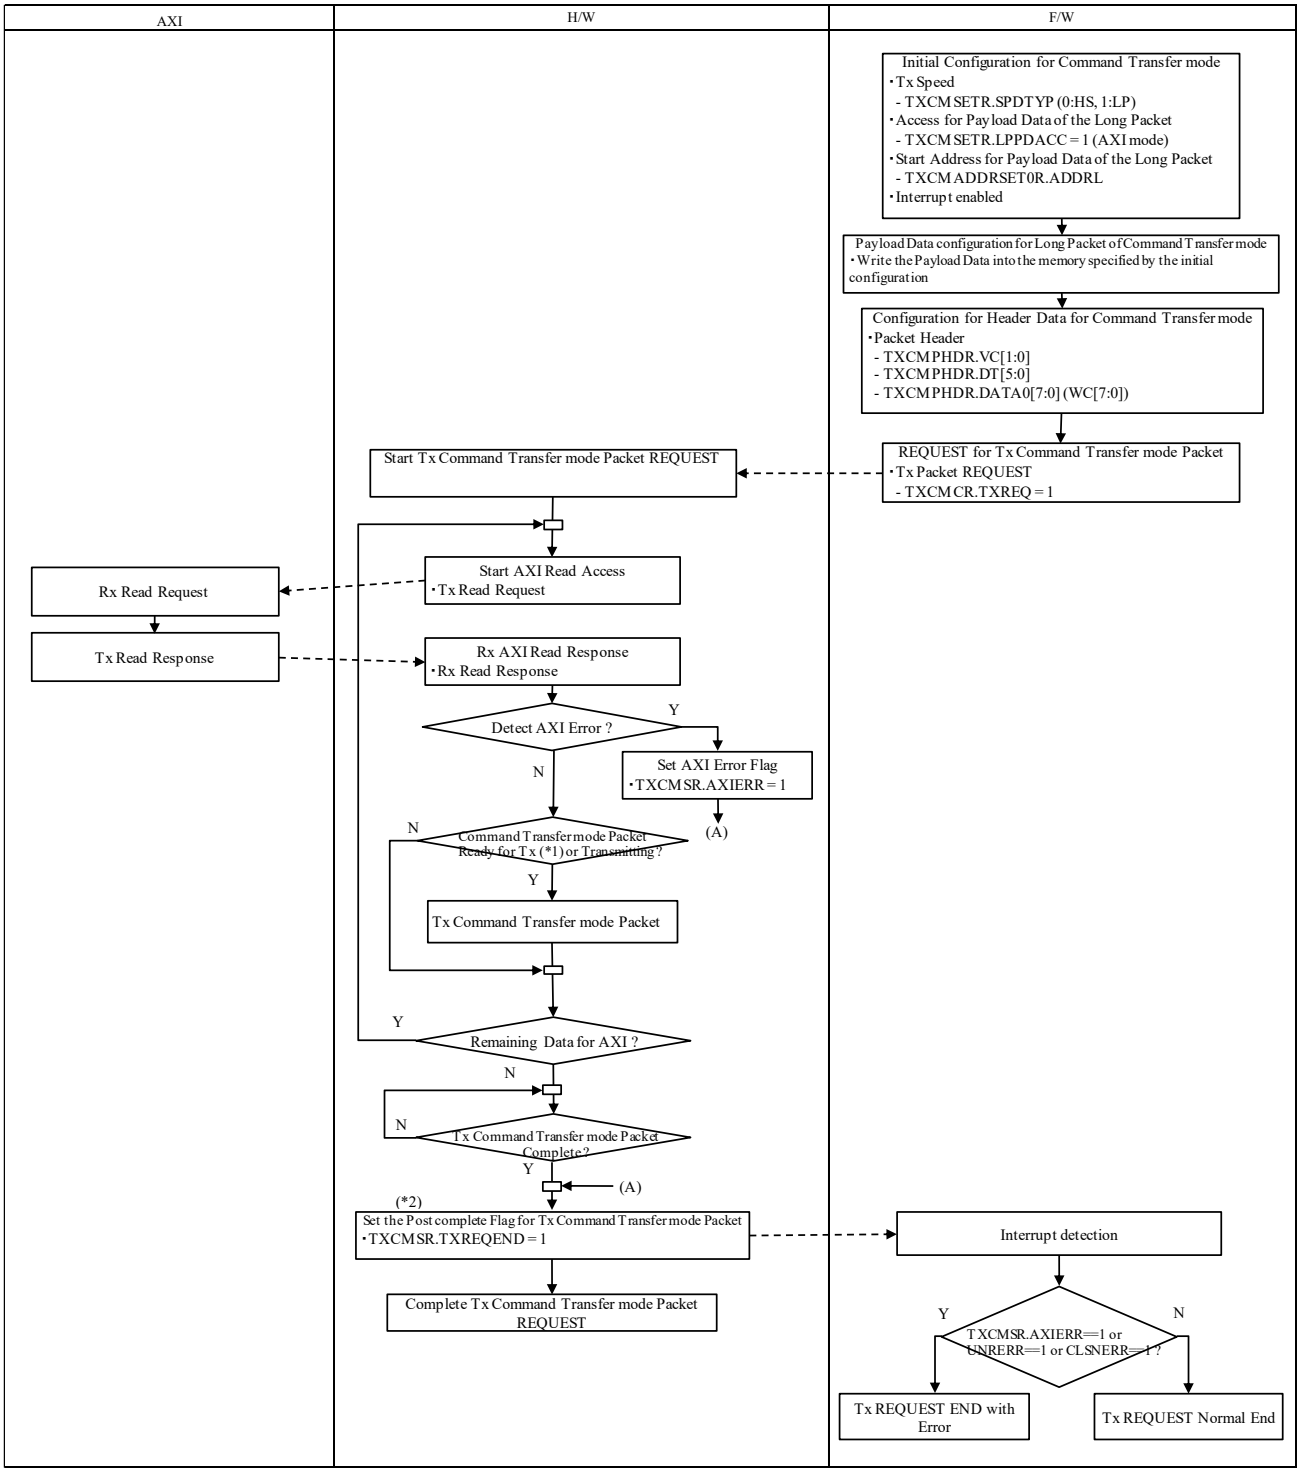


(*1) Tx Command Transfer mode Packet is started by the Data over the WC or the threshold value specified by TXCMPHDR register for HS Tx Buffer.

(*2) The Flag is set after the completion of AXI Read for Outstanding and after the completion of Post for Tx Command Transfer mode Packet .

Figure 67.9 Tx Long Packet (AXI Access mode)

67.3.2.3.3 Command Tx to request some response of Peripheral device (Read Command)

When a Host Processor sends the command to request some response of a peripheral device in Command Transfer mode as Read Command, the Transmitter requests the Bus Turn-Around after the completion of the Read Command and hands over the Bus Control to the peripheral device.

After the Bus handover, the peripheral device sends “Response Packet” or “Acknowledge and Error Report Packet” by using LP mode. After this Packet transfer is completed, the peripheral device requests the Bus Turn-Around to hand over the Bus Control. And the Bus is controlled by the Host Processor.

Command Tx sequence by Host Processor to request some response of Peripheral device is described in this section. Following is needed as initial configuration.

・Set the Tx speed to TXCMSETR.SPDTYP register

・Select the place for received Payload Data to storage by the RXPSETR.LPPDACC register (0: Register, 1: Memory on AXI Bus)

In case of Memory on AXI Bus for received Payload Data:

・Set the Start Address to the RXPADDRSET0R.ADDRL register

・Set the Size of the Memory to the RXPSIZESETR.SIZE register. Maximum value is 128 Bytes.

・Set “1” to the RXPIER.BTAREQEND register and set “1” to the TOIER.TATO register.

In case of Register for received Payload Data by RXPSETR.LPPDACC=0, the Register for the Rx Payload Data supports up to 16 Byte from 0 Byte. If the Rx Payload Data over 16 Bytes is needed, Memory on AXI Bus should be selected by RXPSETR.LPPDACC=1. Memory on AXI Bus for Rx Payload Data supports up to 128 Byte from 0 Byte. The alignment of the Rx Payload Data in the Memory is same as Tx. (Figure 67.8).

Then write VC, DT, DATA0 (WC[7:0]) and DATA1 (WC[15:8]) value to the TXCMPHDR register as Packet Header.

Write "0" to the TXCMPHDR.FMT register as Short Packet. After that, write "1" to the TXCMCR.BTAREQ register with TXCMCR.BTATYP=0 to start the Command Tx using Short Packet to request some response of Peripheral device.

The Transmitter requests the Bus Turn-Around after the completion of the Command Tx and hands over the Bus Control to the peripheral device.

When the Bus Turn-Around request is not completed within the time specified by the TOSET2R.TATOVL register, dsi_int_to interrupt is detected by TOSR.TATO=1. After detection of this interrupt, software should assert Software RESET and should recover the procedure or should re-transmit of the Command Tx.

When the Bus Turn-Around request is completed within the time specified by the TOSET2R.TATOVL register, the Host Processor hands over the Bus Control to the peripheral device. And the Host Processor starts the Rx Response Timer. The Rx Response Timer continues to count until detection of the receipt of Packet.

When "the receipt of Response Packet", “the receipt of Acknowledge and Error Report Packet” or "Timeout of Rx Response Timer" is detected, dsi_int_rxp interrupt is detected by RXPSR.BTAREQEND=1.

After this interrupt, the result of the Rx Packet is indicated by the RXPSR register.

The following sequence is needed to enable next request.

1. When RXPSR.RCVRESP=1 is indicated, Packet Header of Rx Response Packet is correct. The Packet Header is

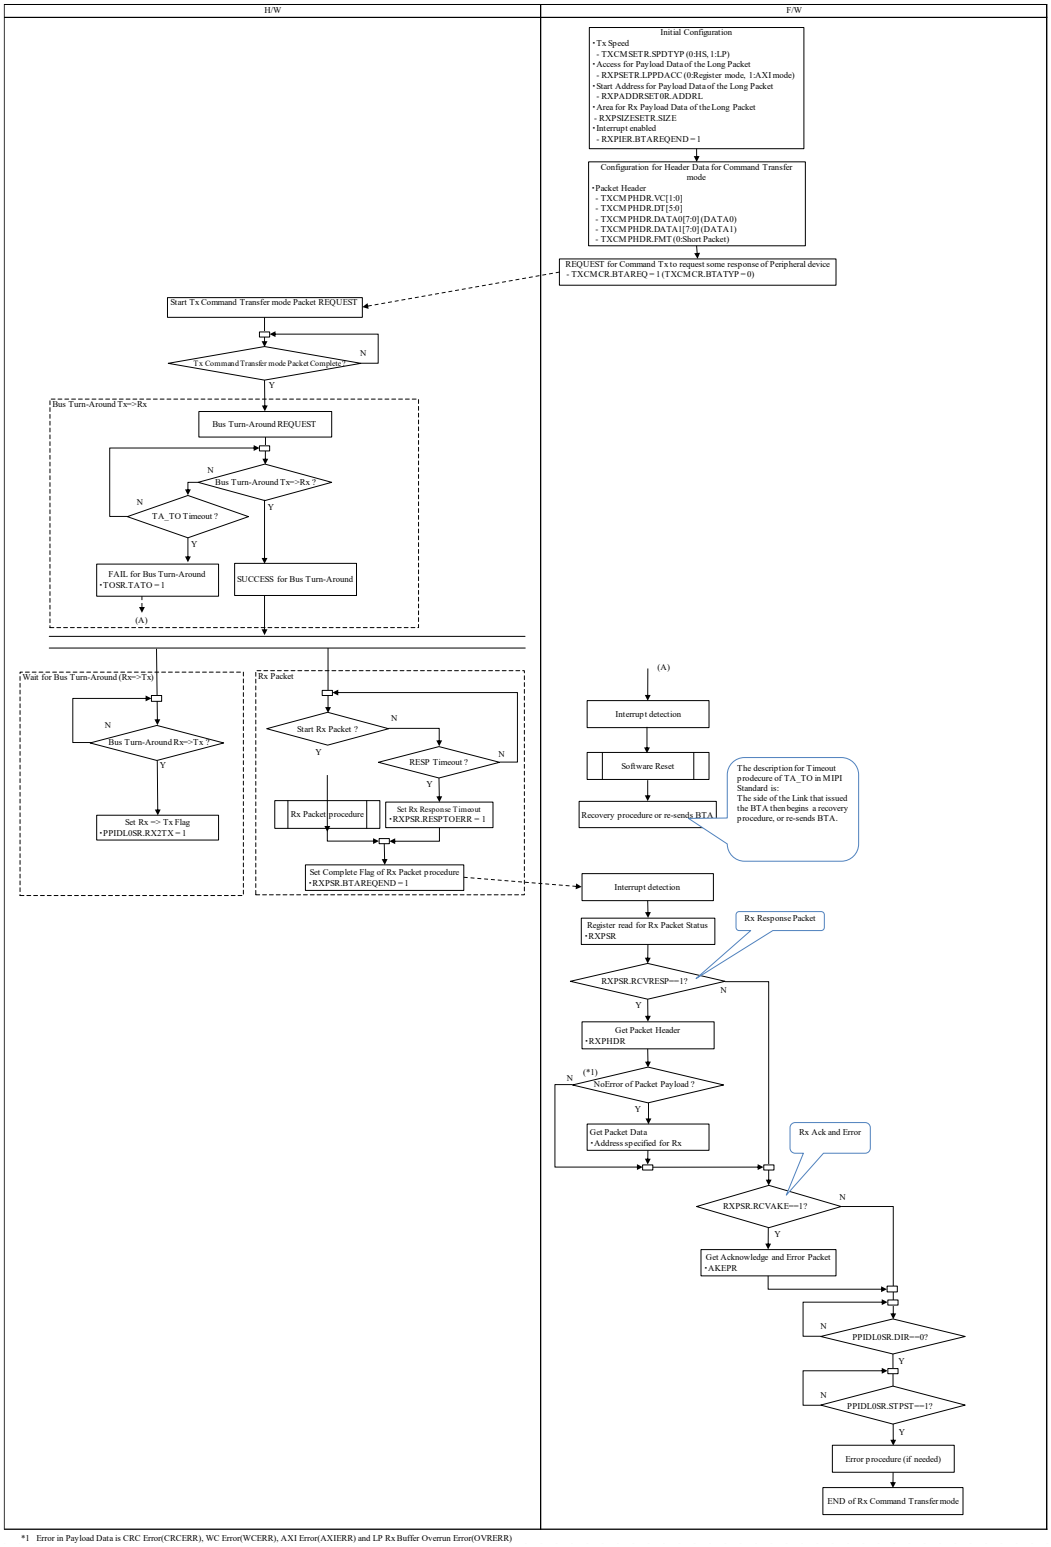
acquired by reading the RXPHDR register.
When all of RXPSR.CRCERR, RXPSR.WCERR, RXPSR.AXIERR and RXPSR.OVRERR are "0", Payload Data is correct. The Payload Data is acquired by reading the storage specified by RXPSETR.LPPDACC register.
When RXPSR.RCVRESP=0 is indicated, Packet Header of Rx Response Packet is not received.

2. When RXPSR.RCVAKE=1 is indicated, the Acknowledge and Error Report is received. The Data is acquired by reading the AKEPR register. When RXPSR.RCVAKE=0 is indicated, the Acknowledge and Error Report is not received.
3. Confirm the Bus handover to the Host Processor by reading PPIDL0SR.DIR register. Wait until finish of the handover procedure to the Host Processor, if that is not yet.
4. Confirm the StopState (LP11) of the Data Lane by reading PPIDL0SR.STPST register.
5. When this Error is detected about the Rx Packet, Error Handling procedure may be needed by referring to section 67.3.2.10 if needed.

Before confirmation of next request to be enabled, it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the TXCMCR.BTAREQ register and is before changing to RXPSR.BTAREQEND=1.

TXCMSETR, TXCMPHDR, RXPSETR, RXPADDRSET0, RXPSIZESETR



*1 Error in Payload Data is CRC Error(CRCERR), WC Error(WCERR), AXI Error(AXIERR) and LP Rx Buffer Overrun Error(OVRERR)

Figure 67.10 Tx Command request with response from peripheral device

67.3.2.3.4 Tx Non-Read Command along with Bus Turn-Around

Until Bus handover along with Bus Turn-Around request, any Error information is stored in the Peripheral device. When the Peripheral device gets the Bus control by handover after some Rx Command (except for the Read Command), the Peripheral device sends ACK Trigger by the reason of no Error and sends Acknowledge and Error Report Packet by the reason of some Error.

When the Peripheral device gets the Bus control after Rx Read Command, the Peripheral device sends Acknowledge and Error Report Packet if some Error is stored in the Peripheral device. Refer to section 67.3.2.3.3 for detail of the Bus Turn-Around by Read Command.

When the Host Processor sends Non-Read Command with Bus Turn-Around in the Command Transfer mode, the Transmitter requests the Bus Turn-Around and hands over the Bus Control to Peripheral device after this Tx Non-Read Command.

After the handover to the Peripheral device, the Peripheral device sends ACK Trigger or Acknowledge and Error Report Packet by LP mode. After these Tx, the Bus Turn-Around is requested by the Peripheral device. The Host Processor gets the Bus Control by the handover.

The Procedure for Non-Read Command Tx with Bus Turn-Around is described in this section.

Following is needed as initial configuration.

- Set Tx Command speed to TXCMSETR.SPDTYP register
- Set "1" to RXPIER.BTAREQEND register and TOIER.TATO register

Refer to section 67.3.2.3.1 for Short Packet Tx, section 67.3.2.3.2.1 for Long Packet Tx by Register Access mode or 67.3.2.3.2.2 for Long Packet Tx by AXI Access mode. Notice, to write “1” to the TXCMCR.BTAREQ register with TXCMCR.BTATYP=1 is needed instead of using the TXCMCR.TXREQ register.

After this Tx, The Transmitter requests Bus Turn-Around as Host Processor, and waits for the handover of Bus Control to the Peripheral device.

When the Bus Turn-Around request is not completed within the time specified by the TOSET2R.TATOVL register, dsi_int_to interrupt is detected by TOSR.TATO=1. After this interrupt, the Recovery procedure or re-transmission of the Command is needed after Software RESET.

When the Bus Turn-Around request is completed within the time specified by the TOSET2R.TATOVL register, the Host Processor hands over the Bus Control to the Peripheral device. And the Host Processor starts the Rx Response Timer.

The Rx Response Timer continues to count until detection of the receipt of Trigger or Packet.

When Rx of "ACK Trigger", Rx of "Acknowledge and Error Report Packet" or "Timeout of the Rx Response Timer" is detected, dsi_int_rxp interrupt is indicated by RXPSR.BTAREQEND=1.

After this interrupt, the result of the Rx Packet is indicated by the RXPSR register.

The following sequence is needed to enable next request.

1. (A) When RXPSR.RCVACK=1 is indicated, the ACK Trigger is received. This means that No Error is detected by the Peripheral device.

(B) When RXPSR.RCVAKE=1 is indicated, the Acknowledge and Error Report Packet is received. Read the AKEPR register to know the Error Information of the Peripheral device.

2. Confirm the Bus handover to the Host Processor by reading PPIDL0SR.DIR register. Wait until finish of the handover procedure to the Host Processor, if that is not yet.
3. Confirm the StopState (LP11) of the Data Lane by reading PPIDL0SR.STPST register.
4. When this Error is detected about the Rx Packet, Error Handling procedure may be needed by referring to section 67.3.2.10 if needed.

Before confirmation of next request to be enabled, it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the TXCMCR.BTAREQ register and is before changing to RXPSR.BTAREQEND=1.

TXCMSETR, TXCMADDRSET0, TXCMPHDR, TXCMPPD0, TXCMPPD1, TXCMPPD2, TXCMPPD3R

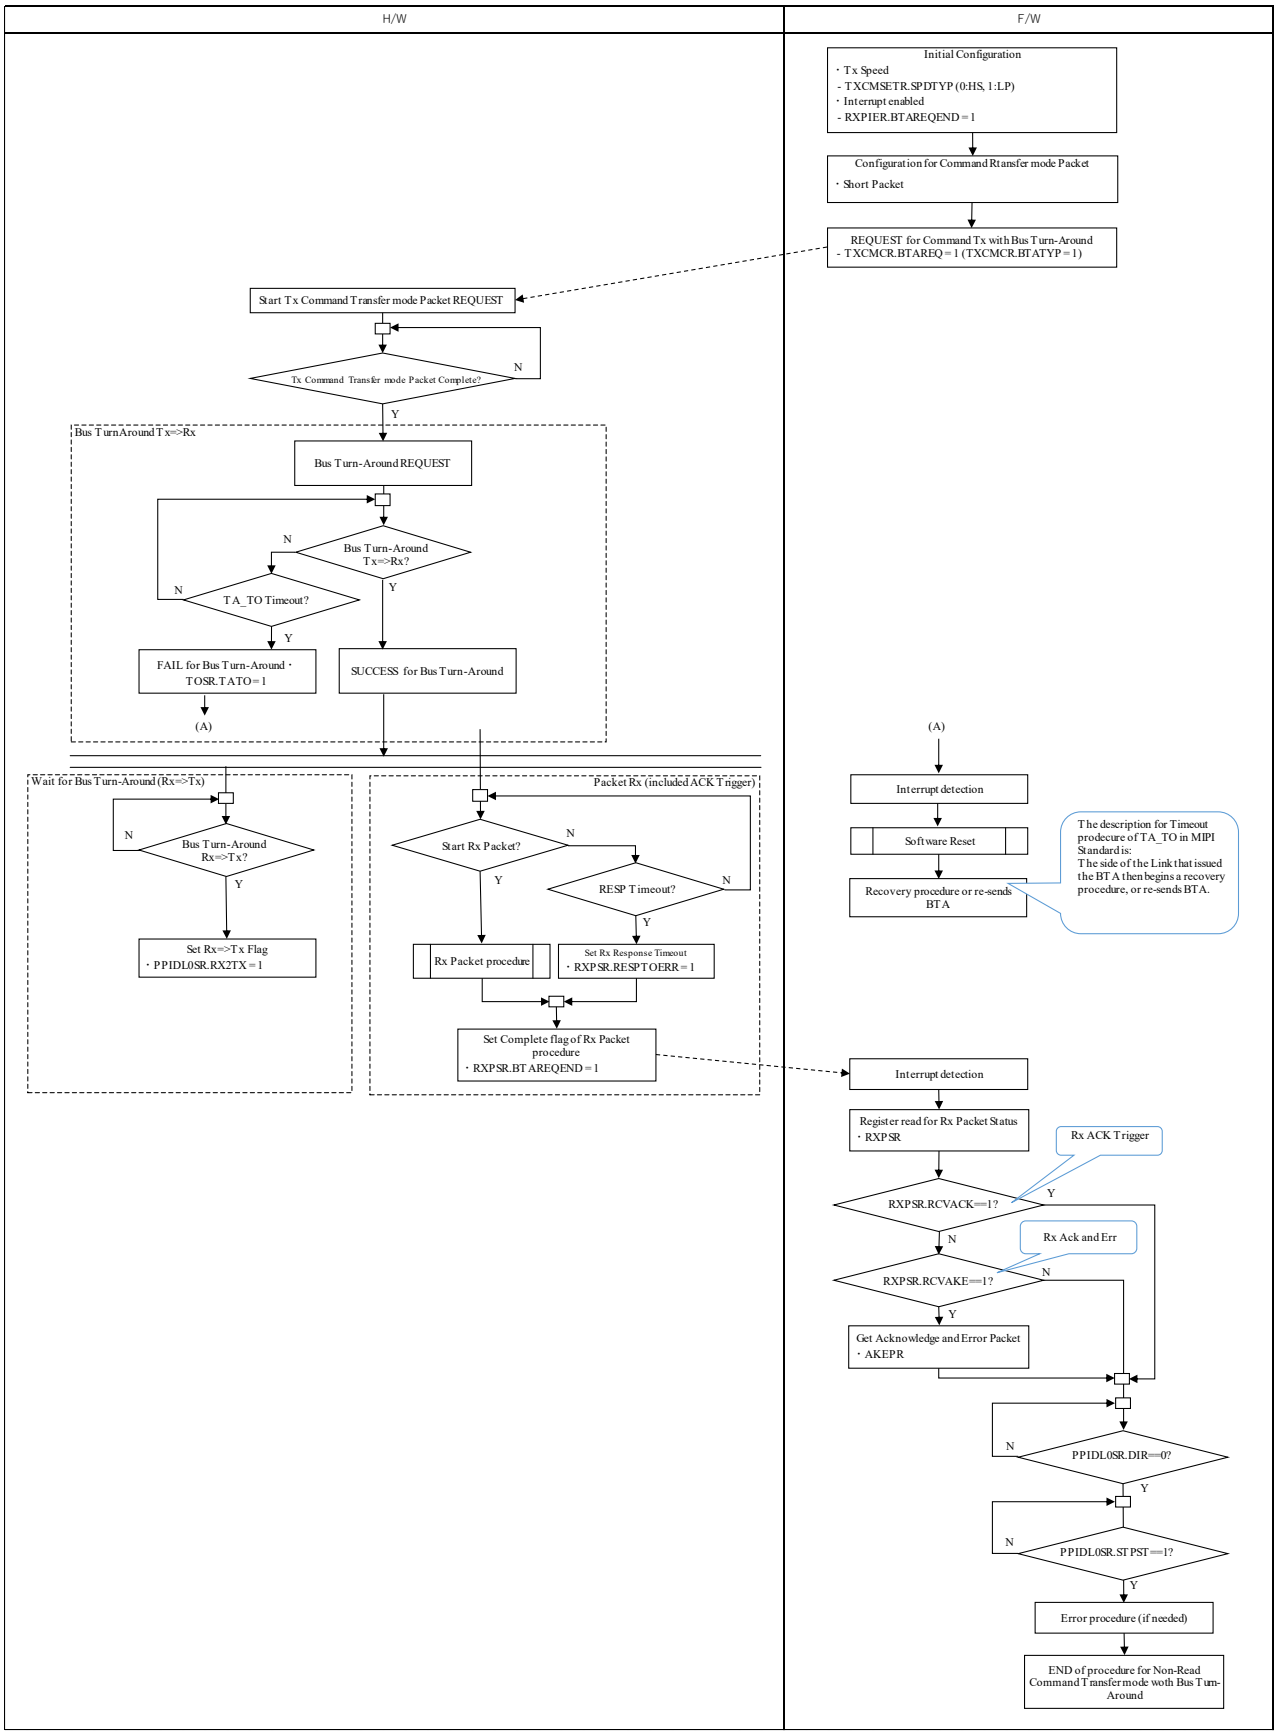


Figure 67.11 Tx Non-Read Command with Bus Turn-Around

67.3.2.4 Video mode

67.3.2.4.1 Start of Video mode

The procedure for Start of Video mode is shown in Figure 67.12. Before start of video mode operation, follow the procedure in Figure 67.4 to set HS clock transmission state.

After the initial configuration of Video mode, confirm that HS/LP operation is not running, and set "0" to TXVMCR.VFCLR register to withdraw the request of Clear FIFO. Wait until TXVMSR.VFRDY=1. Then set "1" to TXVMCR.EN register. Wait until TXVMSR.RDY=1. After that, start the Video signal input. When Video signal input is started, TXVMSR.ACT=1 is indicated.

Confirm the completion of the transaction of Command Transfer mode before start of Video mode. Following is prohibited until the start of Video mode indicated by TXVMSR.ACT=1.

- End of the Video mode
- Start of Command Transfer mode

The registers listed below are prohibited to configure during the period of TXVMCR.VFCLR=0.

TXVMSETR, TXVMSET2R, TXVMPSPHSETR, TXVMVPRMSET0, TXVMVPRMSET1, TXVMVPRMSET2, TXVMVPRMSET3, TXVMVPRMSET4R, TXVMSETF(i)R, TXVMSET2F(i)R, TXVMPSPHSETF(i)R, TXVMVPRMSET0,1,2,3,4F(i)R, SCALPSR, FDSETR

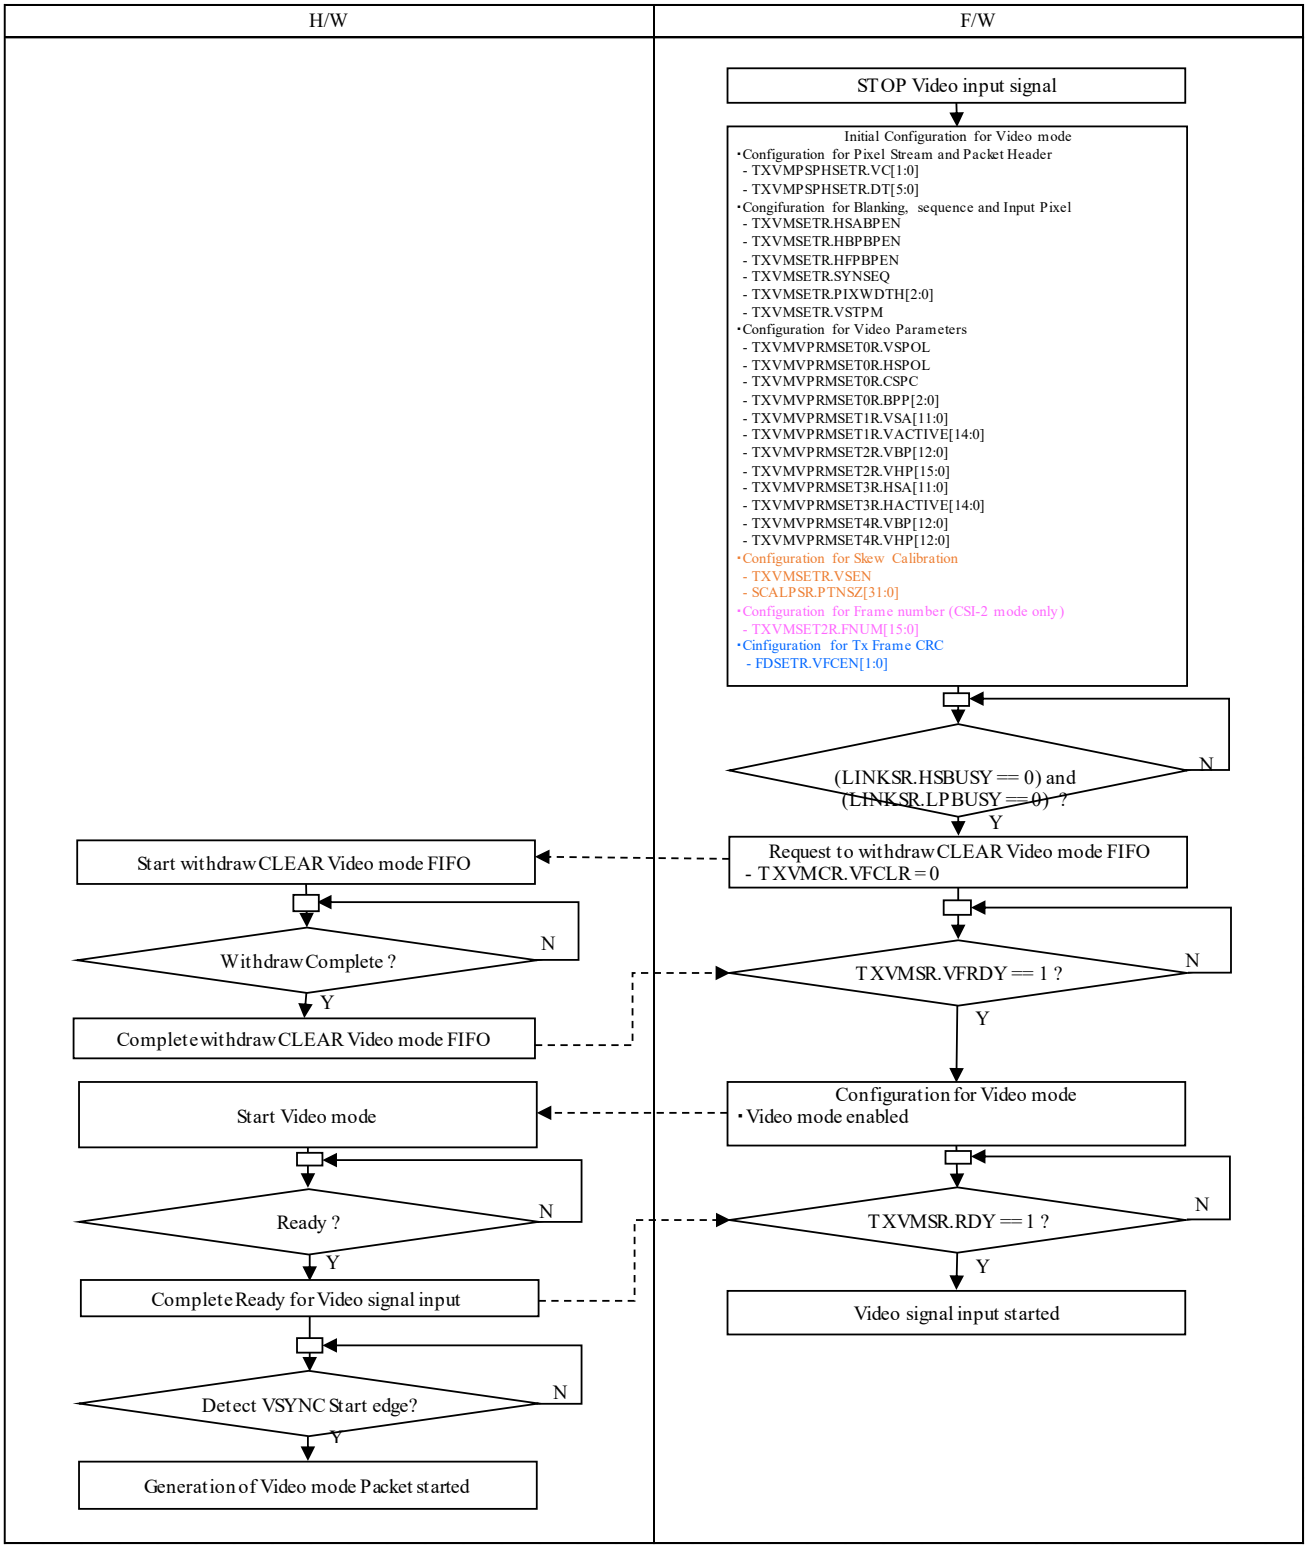

Figure 67.12 Start of Vide mode

67.3.2.4.2 End of Video mode

The procedure for End of Video mode is shown in Figure 67.13.

When both of the start of first Frame (VSYNC assertion) and the disabling Video mode (TXVMCR.EN=0) are detected, the Transmitter stops Tx Packet in Video mode and clears TXVMSR.ACT register to "0".

Stop the Video mode after the confirmation of TXVMSR.ACT=0. After the detection of TXVMSR.ACT=0, the Timing for stopping of Video signal input is free. After the stop of the Video signal input, set "1" to TXVMCR.VFCLR register to request Clear FIFO and wait for TXVMSR.VFRDY=0.

Following is permitted to change the configuration only during the state of TXVMSR.VFRDY=0 described above.

- Change configuration of Video mode
- Change Lane Count

Command mode packets can be sent and received during video mode operation (see Chapters 67.4.1.1.1.1 and 67.4.1.1.2.3).

If you request command mode packet transmission (light 1 to TXCMCR.TXREQ or TXBTAREQ) during video mode operation, perform the video mode operation termination process after confirming that the send completion flag (TXCMSR.TXREQEND) has been set.

It is prohibited to terminate video mode operation during command mode packet requests.

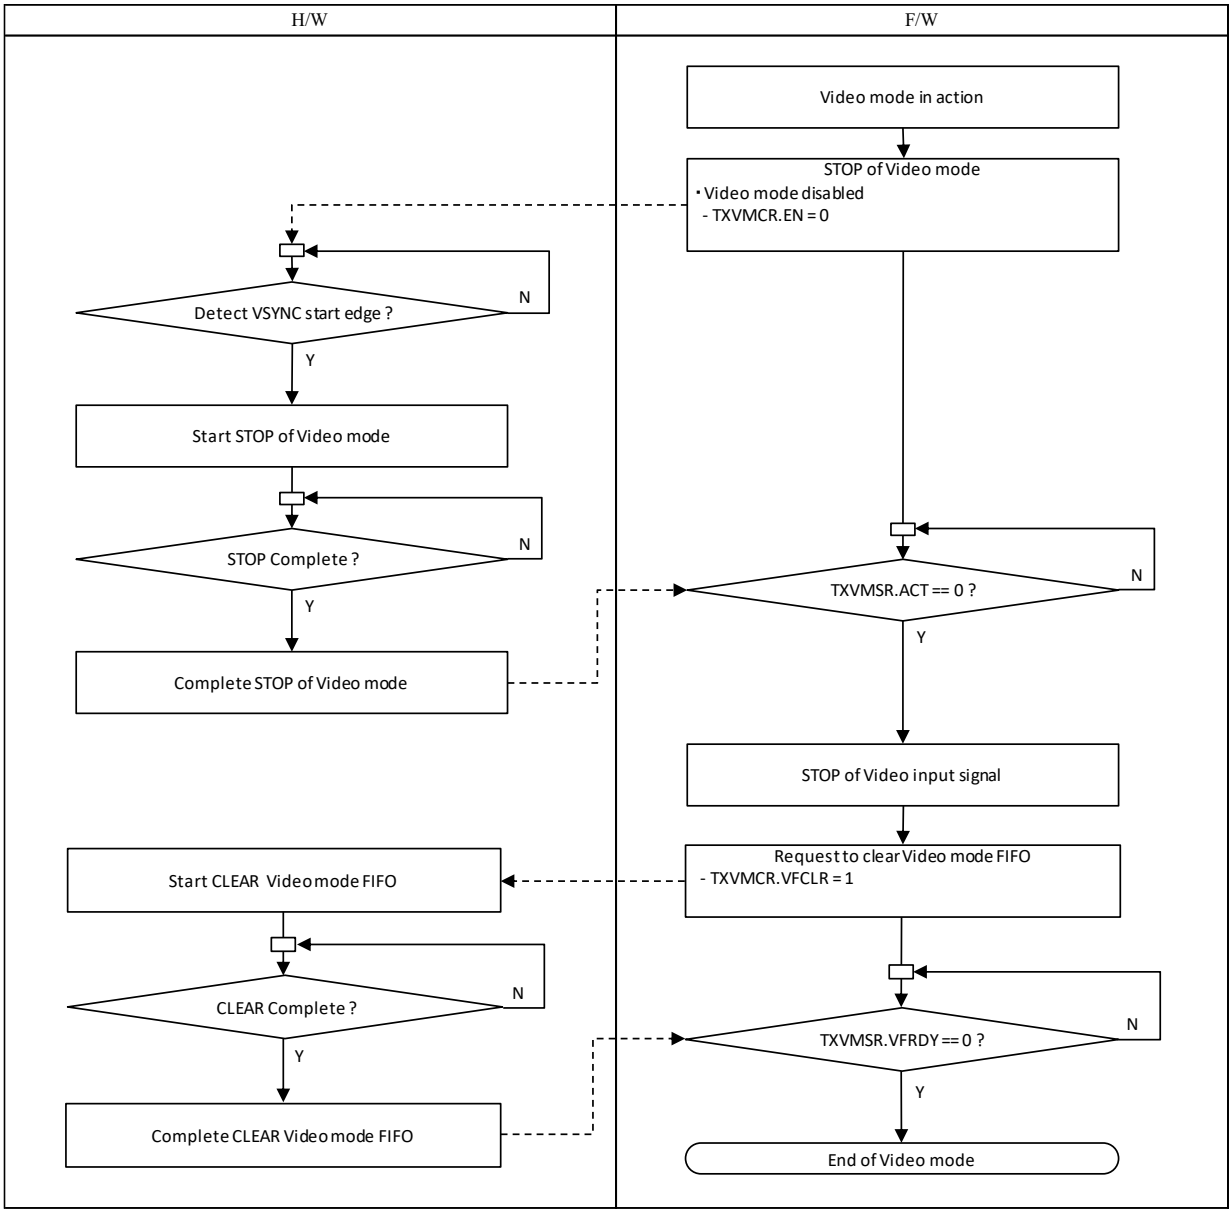

Figure 67.13 End of Video mode (TXVMSETR.VSTPM=1)

67.3.2.4.3 Video data transmission of different types

In CSI-2 mode, different types of video data (up to four types) can be switched and transmitted per frame.

Table 5-3 shows whether video parameters can be switched.

Parameters	Register Name	Switching (*1)
dotclock (vclk)	-	×
Pixel data width	TXVMSETR.PIXWDTH	×
BPP	TXVMVPRMSET0R.BPP	×
Color Space (RGB, YCbCr/YUV	TXVMVPRMSET0R.CSPC	○(*2)
Data Type	TXVMPSPHSETR.DT	○(*2)

Virtual Channel	TXVMPSPHSETR.VC	○
Polarity of VSYNC	TXVMVPRMSET0R.VSPOL	×
VTOTAL	- (Sum of each period)	×
VSA, VACTIVE, VBP, VFP	TXVMVPRMSET1R.VSA TXVMVPRMSET1R.VACTIVE TXVMVPRMSET2R.VBP TXVMVPRMSET2R.VFP	○
Polarity of HSYNC	TXVMVPRMSET0R.HSPOL	×
HTOTAL	- (Sum of each period)	×
HSA, HACTIVE, HBP, HFP	TXVMVPRMSET3R.HSA TXVMVPRMSET3R.HACTIVE TXVMVPRMSET4R.HBP TXVMVPRMSET4R.HFP	○
Periodic Skew Calibration enable	TXVMSETR.VSEN	○
Maximum value of the Frame Number	TXVMSET2R.FNUM	○
FrameCRC packet enabl	FDSETR.VFCEN	○

(*1)「○」support、「×」not support
(*2) Only the same BPP can be mixed

Figure 67.14 shows a different type of video data transmission behavior.
When "Start of Video mode" described in Chapter 67.3.2.4.1, please set the frame type (up to 4 types) to be used in the following registers.
TXVMSETR、TXVMSET2R、TXVMPSPHSETR、TXVMVPRMSET0,1,2,3,4R、TXVMSETF(i)R、TXVMSET2F(i)R、TXVMPSPHSETF(i)R、TXVMVPRMSET0,1,2,3,4F(i)R、FDSETR
In this case, set the frame type from the lower number to the continuous value. For example, if you want to use two frame types, use frame types 0 and 1. Other combinations (e.g. using frame types 0 and 3) are prohibited.
When a video signal is input and the first VSYNC start edge is detected, video data is transmitted according to the frame type parameters specified by TXVMFTCR.FTNXT. When the VSYNC start edge is detected, TXVMSR.VSADET sets 1, so specify the following frame type in TXVMFTCR.FTNXT before the frame transmission is complete (at least until 10usec before the next VSYNC start edge occurrence). Continue to set the TXVMFTCTR.FTNXT frame with TXVMSR.VSADET as the trigger.
※Note※
Setting the next frame type within one frame time is a requirement for S/W. Therefore, the Transmitter module does not detect errors due to the in-time setting.
Figure 67.15 shows a frame-by-frame video data switching image diagram.

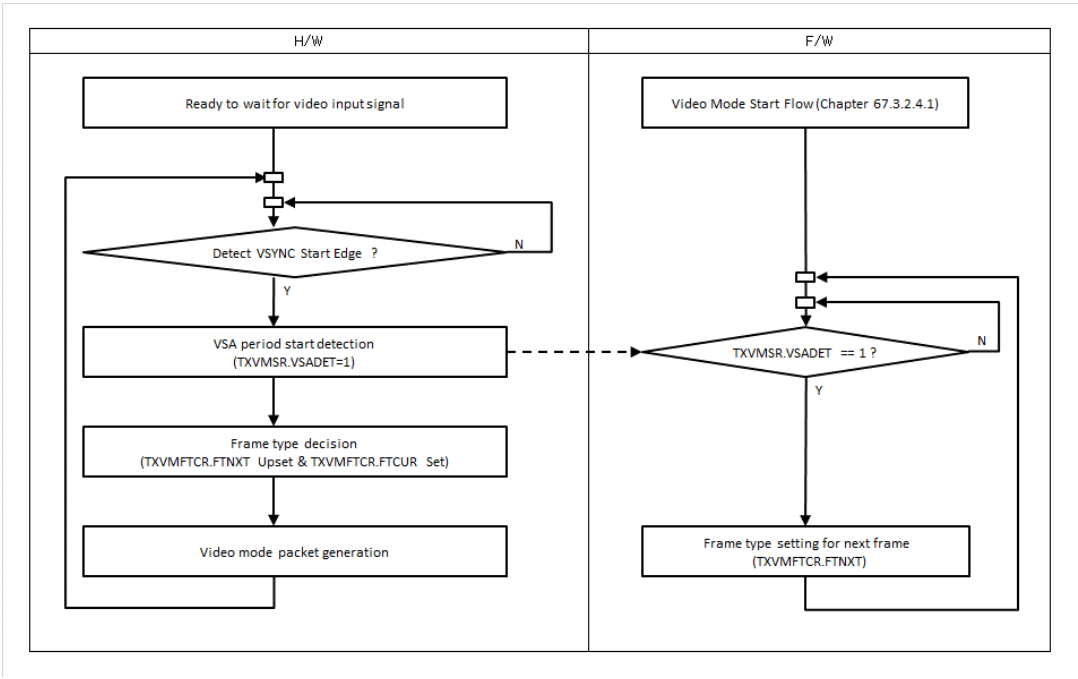

Figure 67.14 video data transmission of different data type

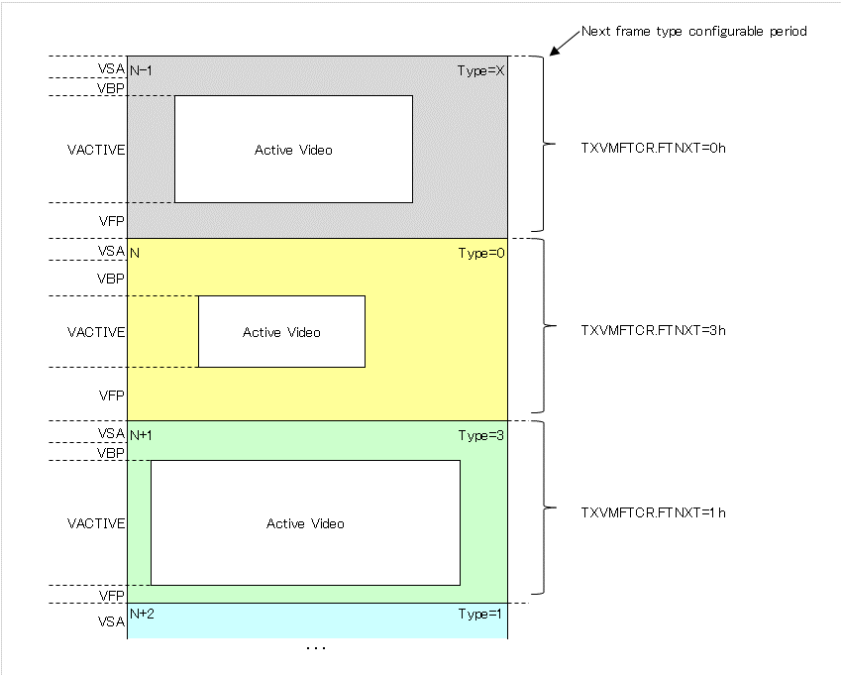

Figure 67.15 switching video data of each frames

67.3.2.4.4 Register Configuration for DSI mode

67.3.2.4.4.1 Configuration for Pixel Stream Packet Header

(1) Virtual Channel

Virtual Channel is configured for all output Packet in Video mode for Sync-Event (VSS, VSE, HSS and HSE), Blanking and Pixel Stream.

(2) Data Type
Configure the Data Type related to Video signal input.

Following Data Type is possible to configure in Video mode.

- RGB 16Bit (Packed Pixel Stream, 16bit RGB (H'0E))
- RGB 18Bit (Packed Pixel Stream, 18bit RGB (H'1E))
- RGB 18Bit Loosely (Loosely Packed Pixel Stream, 18bit RGB (H'2E))
- RGB 24Bit (Packed Pixel Stream 24bit RGB (H'3E))
- YCbCr 4:2:2 16Bit (Packed Pixel Stream 16bit YCbCr 4:2:2 (H'2C))

ColorDepth is related to the Data Type and should be configured by Table 67.6.

67.3.2.4.4.2 Configuration of Blanking and the sequence

(1) Blanking
Blanking Configuration for HSA, HBP and HFP is shown in Table 67.5. LP11 (without Tx Packet) or Blanking Packet (Data Type=H'19) is selective for each Blanking Period of HSA,HBP and HFP. Only LP11 (without Tx Packet) should be used for HBLANK period.

Table 67.5 Blanking Configuration for HSA, HBP and HFP

Blanking Configuration	Description
LP-11	No Packet is transmitted during Blanking period. By this behavior, the Transmitter exits from HS mode, and enters to LP-11.
Blanking Packet (Data Type=H'19)	The HS mode Long Packet (Packet Header Data Type=H'19) is transmitted during Blanking period. By this behavior, the Transmitter continues to be HS mode in Video mode.

(2) Sequence
Configure the Sync-Pulse mode (Non-Burst Mode with Sync Pulses) or Sync-Event mode (Non-Burst Mode with Sync Events).

67.3.2.4.4.3 Video Parameters

(1) Polarity of Vertical and Horizontal Signals (TXVMVPRMSET0R.VSPOL and HSPOL)
Configure the polarity of Vertical Sync (vsync) and Horizontal Sync (hsync) of Video signal input.

(2) Color Space (TXVMVPRMSET0R.CSPC)
Configure the Color Space parameters related to the Video signal input.

(3) ColorDepth (TXVMVPRMSET0R.BPP[2:0])
ColorDepth (TXVMVPRMSET0R.BPP[2:0]) is related to Data Type of Pixel Stream Header (TXVMPSPHSETR.DT[5:0]). Refer to Table 67.6 to determine the configuration of ColorDepth.

Table 67.6 ColorDepth configurations of Pixel Stream Packet Header

Header Data Type of Pixel Stream Packet	ColorDepth	TXVMPSPHSETR.DT[5:0]	TXVMVPRMSETR.BPP[2:0]
Packed Pixel Stream, 16bit RGB	16bpp	H'0E	B'000
Packed Pixel Stream, 18bit RGB	18bpp	H'1E	B'001
Loosely Packed Pixel Stream, 18bit RGB	24bpp *1	H'2E	B'010
Packed Pixel Stream 24bit RGB	24bpp	H'3E	B'010
Packed Pixel Stream 16bit YCbCr 4:2:2	16bpp	H'2C	B'000

Note: *1 24bpp should be selected for RGB 18Bit Loosely.

(4) Vertical Line count of Input Video (TXVMVPRMSET1R and TXVMVPRMSET2R)
Configure the VACTIVE, VSA, VFP and VBP period of Video signal input by the Line count.

(5) Horizontal Pixel count of Input Video (TXVMVPRMSET3R and TXVMVPRMSET4R)
Configure the HACTIVE, HSA, HFP and HBP period of Video signal input by the Pixel count.

67.3.2.4.5 Register Configuration for CSI-2 mode

67.3.2.4.5.1 Configuration for Pixel Stream Packet Header

(1) Virtual Channel

Virtual Channel is configured for all output Packet in Video mode (Frame Start Packet, Frame End Packet and Video Packet). When transmitting different types of video data by switching frame by frame (Chapter 67.3.2.4.3), set all the frame types to be used.

(2) Data Type

Configure the Data Type related to Video signal input. When transmitting different types of video data by switching frame by frame (Chapter 67.3.2.4.3), set all the frame types to be used.

Following Data Types are possible to configure in Video mode.

- RGB565 (H'22)
- RGB666 (H'23)
- RGB888 (H'24)
- YUV422 8-bit (H'1E)

67.3.2.4.5.2 Video Parameters

(1) Polarity of the Vertical Sync and Horizontal Sync (TXVMVPRMSET0R.VSPOL and HSPOL)
Configure the Polarity of Vertical Sync (vsync) and Horizontal Sync (hsync).

(2) Color Space (TXVMVPRMSET0R.CSPC)
Configure the ColorSpace related to the Video signal input. When transmitting different types of video data by switching frame by frame (Chapter 67.3.2.4.3), set all the frame types to be used.

(3) ColorDepth (TXVMVPRMSET0R.BPP[2:0])
ColorDepth (TXVMVPRMSET0R.BPP[2:0]) is related to Data Type of Pixel Stream Header (TXVMPSPHSETR.DT[5:0]). Refer to Table 67.8 to determine the configuration of ColorDepth.

Table 67.8 ColorDepth configurations of Pixel Stream Packet Header

Header Data Type of Pixel Stream Packet	ColorDepth	TXVMPSPHSET(F(i))R.DT[5:0]	TXVMVPRMSETR.BPP[2:0]
RGB 565	16bpp	H'22	B'000
RGB 666	18bpp	H'23	B'001
RGB 888	24bpp	H'24	B'010
YUV422 8-bit	16bpp	H'1E	B'000

(4) Configuration for Horizontal Video Line Count
Configure the VACTIVE, VSA, VFP and VBP period of Video signal input by the Line count. When transmitting different types of video data by switching frame by frame (Chapter 67.3.2.4.3), set all the frame types to be used.

(5) Configuration for Horizontal Video Pixel Count
Configure the HACTIVE, HSA, HFP and HBP period of Video signal input by the Pixel count. When transmitting different types of video data by switching frame by frame (Chapter 67.3.2.4.3), set all the frame types to be used.

67.3.2.5 Tx Reset Trigger

Tx Trigger procedure is described in this section. The Transmitter is enabled to only Tx RESET Trigger because of Host Processor.

After Tx RESET Trigger by Host Processor, the Peripheral device executes the initialization procedure. The access of the peripheral device is prohibited until the elapsed time specified by PR_TO register in the peripheral device after the Tx RESET Trigger. For the detail of the PR_TO register, refer to the related document of the Peripheral device.

The Transmitter does not have a specific counter for the elapsed time specified by the PR_TO. The system timer may be used for this purpose.

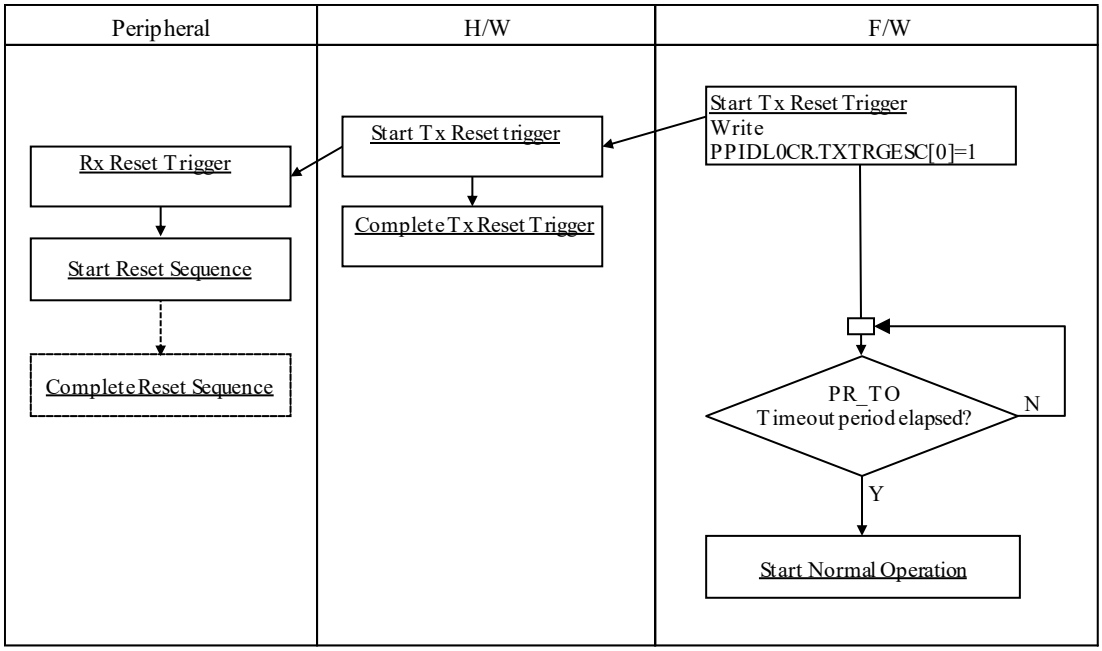

Figure 67.17 Tx Reset Trigger

67.3.2.6 Bus Turn-Around Request

Bus Turn-Around Request is described in this section. Bus Turn-Around Request may use to know the Error information of peripheral device.

Configure the appropriate bit of TAIER register and set "1" to TOIER.TATO register as Initial Configuration.

Write "1" to the TACR.TRNREQ register, then the Host Processor requests the Bus Turn-Around. Wait until the completion of the handover of Bus Control.

When the Bus Turn-Around Request is not completed within the time specified by TOSET2R.TATOVL register, dsi_int_to interrupt is occurred by TOSR.TATO =1. After this interrupt, the Recovery procedure is needed after Software RESET.

When the Bus Turn-Around Request is completed within the time specified by the TOSET2R.TATOVL register and handover of Bus Control to the Peripheral device is completed, dsi_int_ta interrupt is occurred by TASR.TRNREQEND=1.

Before the completion of the handover of the Bus Control to Host Processor (PPIDL0SR.DIR=0) by the Bus Turn-Around Request and the confirmation of the transition of Data Lane to StopState as LP11 (PPIDL0SR.STPST=1), it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Error information of peripheral device (described in section 67.3.2.7), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

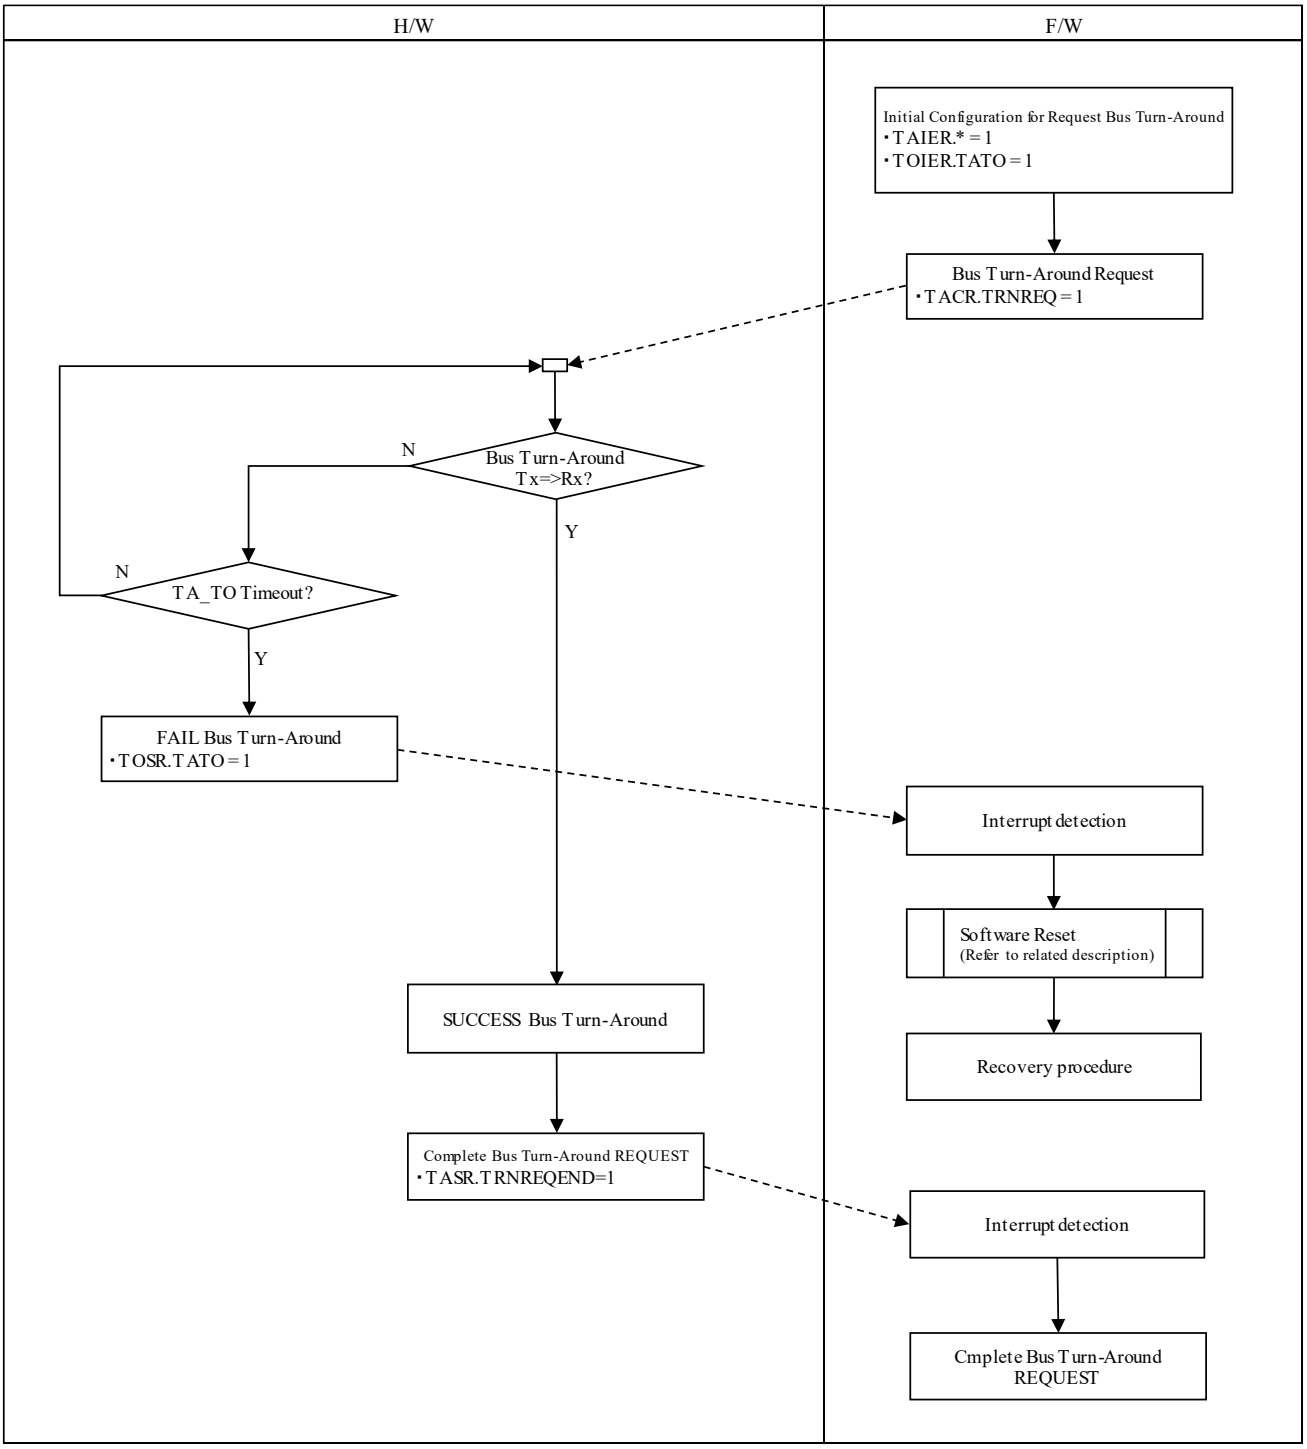

Figure 67.18 Request of Bus Turn-Around

67.3.2.7 Error information of Peripheral device

Error information of Peripheral device is described in this section.

Bus Turn-Around Request to know the Error information of peripheral device is already described in previous section 67.3.2.6. The procedure to receive the Error information is described in next section 67.3.2.7.1.

Note that the Error information of Peripheral device is also enabled to know by Command Transfer with Bus Turn-Around. Refer to section 67.3.2.3.3 (Read Command) and section 67.3.2.3.4 (Non-Read Command) for detail.

Before the completion of the handover of the Bus Control to Host Processor (PPIDL0SR.DIR=0) by the Bus Turn-Around Request and the confirmation of the transition of Data Lane to StopState as LP11 (PPIDL0SR.STPST=1), it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Rx Bus Turn-Around (described in section 67.3.2.6), Transition to ULPS (described in section 67.3.2.8) or Skew Calibration Pattern Tx (described in section 67.3.2.11).

67.3.2.7.1 Rx Error information from Peripheral device

When ACK Trigger is received, dsi_int_ta interrupt is occurred by TASR.RCVACK=1. If Acknowledge and Error Report Packet is received, dsi_int_ta interrupt is also occurred by TASR.RCVAKE=1. To distinguish between these, confirm the cause of the interrupt by reading AKEPR register.

When some Error is detected or the Unexpected Trigger Packet is received, dsi_int_ta is occurred by the appropriate bit of TASR register. The Recovery procedure described in 67.3.2.10.2.4 should be needed.

As very rare case, because of the transmission accident etc., the transition to StopState (LP11) without any interrupt is occurred along with Bus Turn-Around (to Tx from Rx). If any interrupt does not occur within the expected Response time specified by RXRESPTOSETR register, the procedure described in just like section 67.3.2.10.2.4 should be needed.

The procedure if Rx Error information from Peripheral device is shown in Figure 67.19.

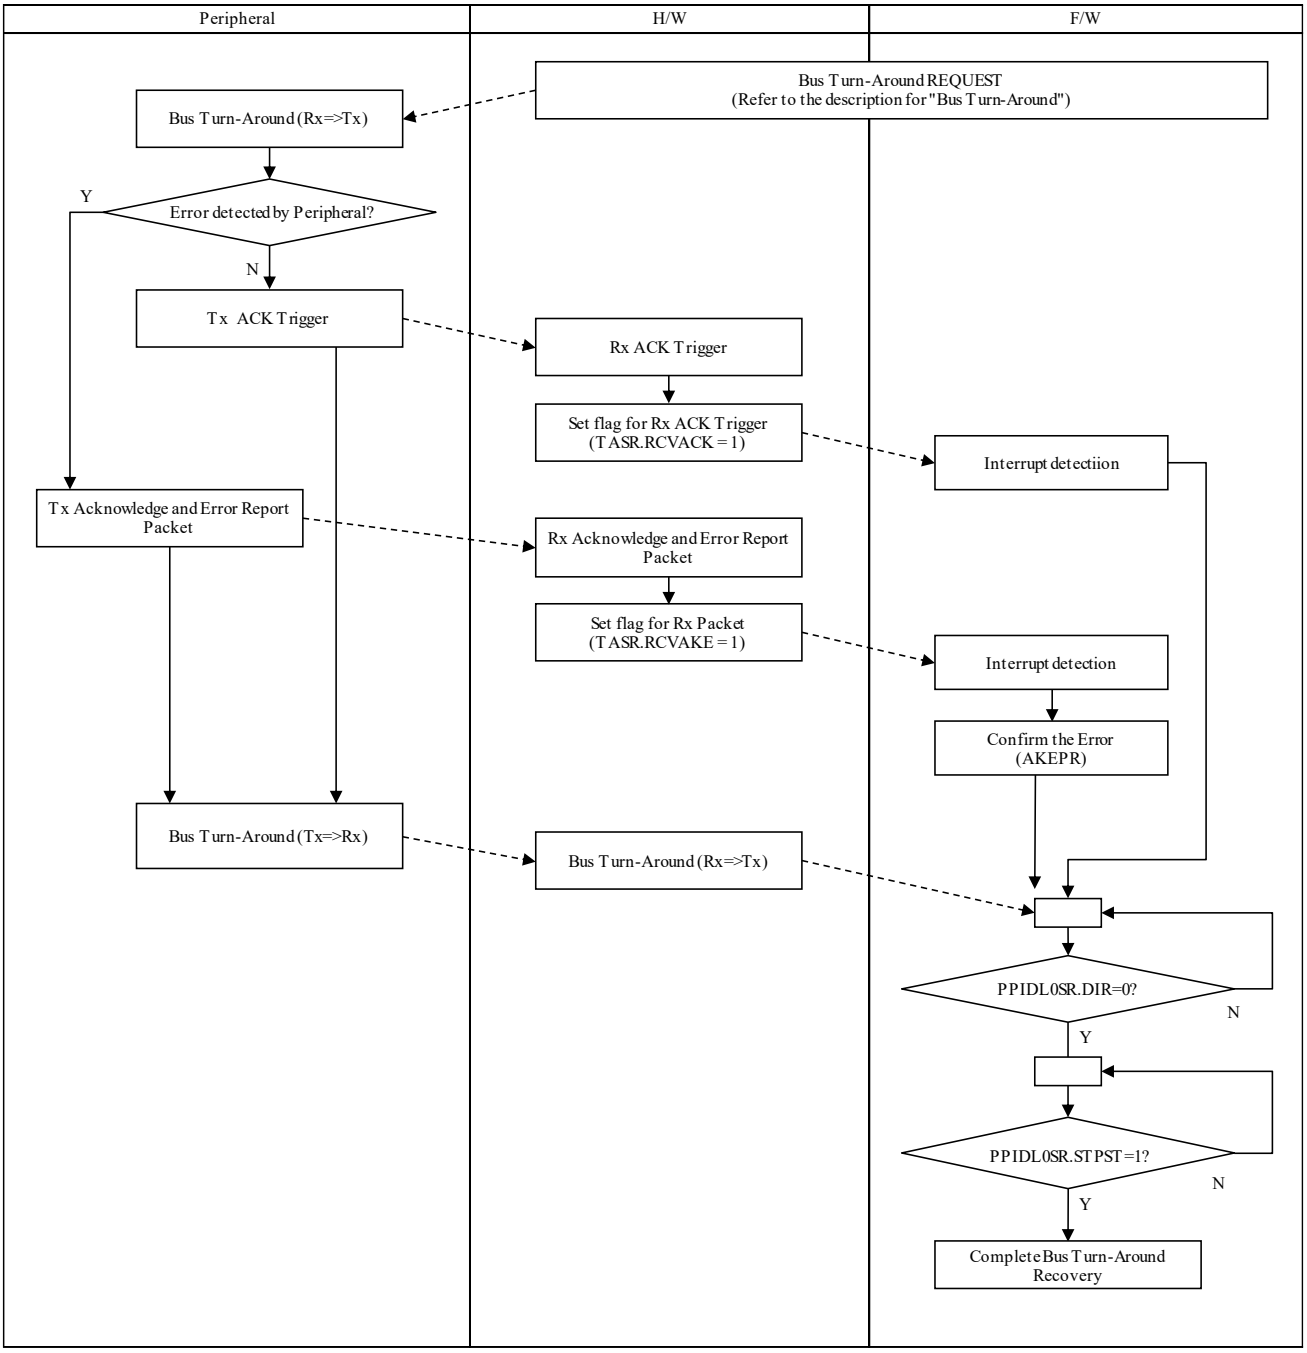

Figure 67.19 Rx Error information from Peripheral device

67.3.2.8 Enter/Exit of ULPS

The procedure for Transition to ULPS and Exit from ULPS are described in this section.

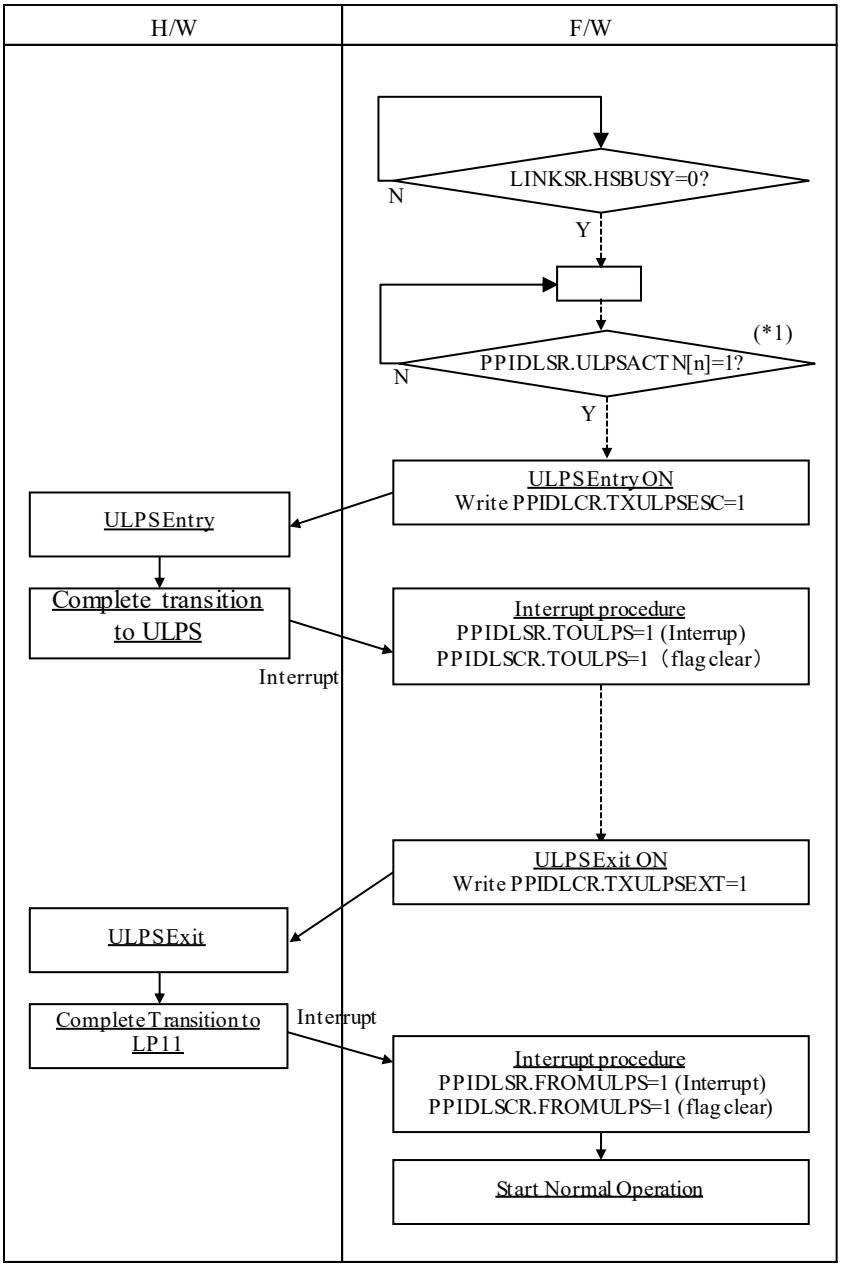
Clock Lane or Data Lane (Lane0, Lane1, Lane2 and Lane3) is enabled to transition to ULPS or to exit from ULPS individually. The Lane which is Enable=0 is disabled to transition to ULPS or to exit from ULPS.

All of Data Lane which is Enable=1 is enabled to transition to ULPS or to exit from ULPS at the same time.

Only the specific Data Lane of these is not possible to transition to ULPS or to exit from ULPS.

When both Clock Lane and Data Lane are enabled to transition to ULPS, at the same time it is necessary to exit from ULPS. (Refer to 67.22)

Once the transition to ULPS occurs and then in ULPS, it is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Video mode (described in section 67.3.2.4), Tx Reset trigger (described in section 67.3.2.5), Bus Turn-Around Request (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7) or Skew Calibration Pattern Tx (described in section 67.3.2.11).



(*1) Confirm the Non-ULPS State of all Lanes specified by PPISETR.DLEN.

Figure 67.20 Enter/Exit of ULPS (Data Lane)

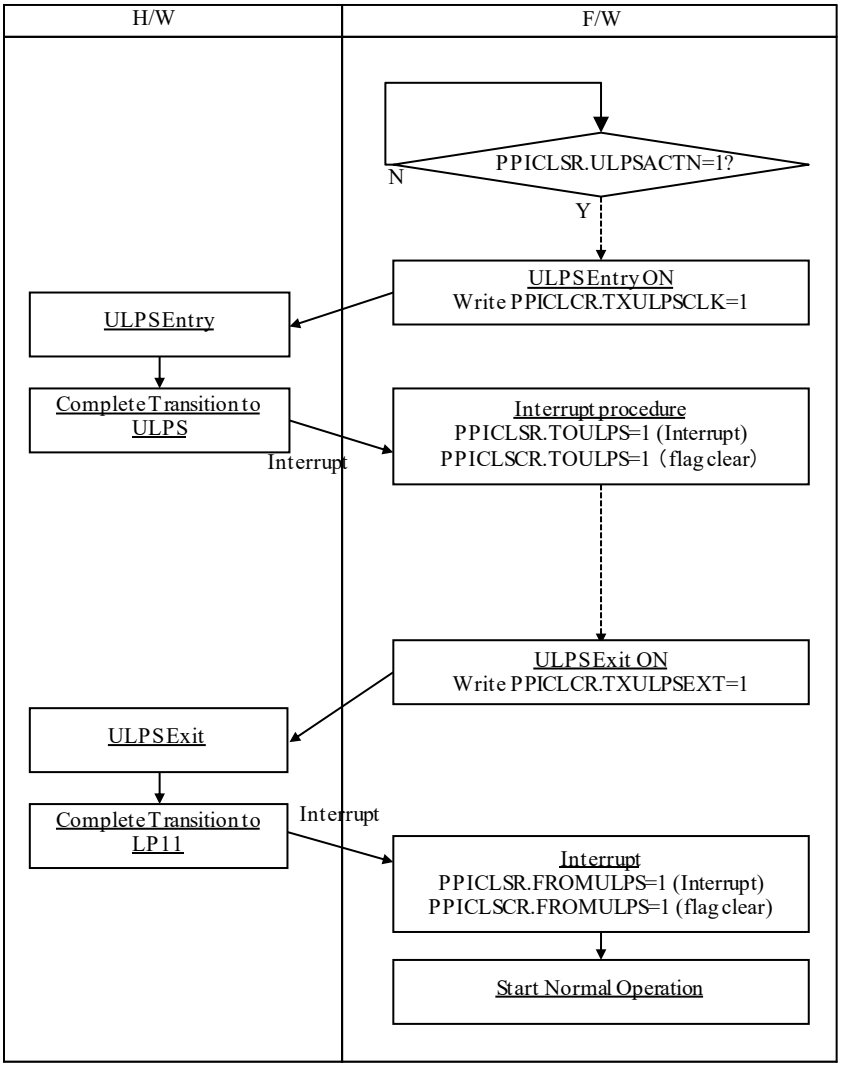


Figure 67.21 Enter/Exit of ULPS (Clock Lane)

67.3.2.9 Force transition to StopState

The procedure of force transition to Stop State is described in this section.

When the D-PHY forces to be transitioned to Stop State (LP11) because of an Error detection, this procedure should be executed startup sequence of section 67.3.5 after the software reset of section 67.3.2.1.

Force transition to StopState sequence
Set the corresponding bit in the SRCR4 register of the Clock Pulse Generator (CPG) module.
Set the corresponding bit in the SRSTCLR4 register of the Clock Pulse Generator (CPG) module.
Startup sequence.(refer to section 67.3.5)

67.3.2.10 Error Handling

67.3.2.10.1 Error detection in D-PHY

When this Error is detected by D-PHY, the Transmitter indicates an interrupt by the Error. These interrupts are shown below. Refer to "Annex A Logical PHY-Protocol Interface Description" on "MIPI Alliance Specification for D-PHY Version 1.2" for detail.

- ErrEsc
- ErrSyncEsc
- ErrControl
- ErrContentionLP0
- ErrContentionLP1

When this Error is detected, Software RESET and Startup sequence (refer to section 67.3.5) should be needed to recover. And Tx Reset Trigger may be necessary by the needs.

The procedure for Recovery of Contention Error is described in Figure 67.23 for example.

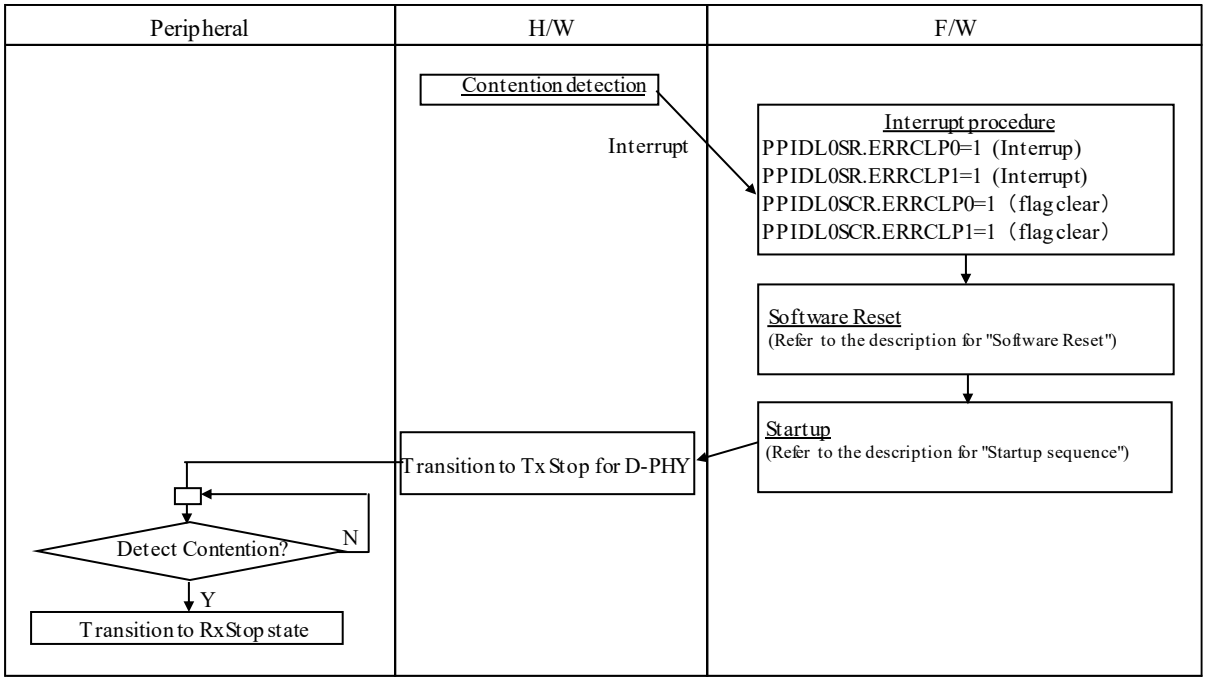

Figure 67.23 Error Handling of D-PHY (e.g. Detect Contention)

67.3.2.10.2 Timeout Error

The Transmitter has two kinds of timers. One is defined by DSI Specification and another is an original timer. Refer to section 7.2.2 "Contention Recovery Using Timers" of the DSI Specification.

・Timers defied in DSI Specification

- Tx HS Timeout Error (HTX_TO)
- Rx LP Timeout Error (LRX_H_TO)
- Turn-Around Timeout Error (TA_TO)

・Original Timers

- Rx Response Timeout Error

67.3.2.10.2.1 Tx HS Timeout Error

When this Error is detected, Software RESET and Startup sequence (refer to section 67.3.5) should be needed to recover. And Tx Reset Trigger may be necessary by the needs.

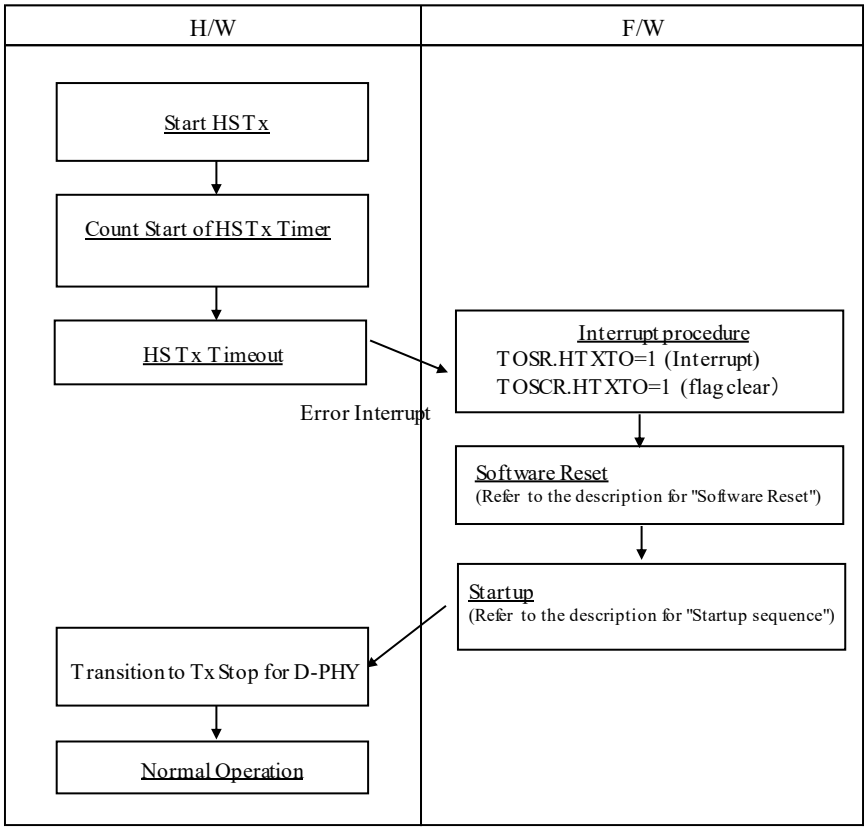

Figure 67.24 Error Handling for Tx HS Timeout

67.3.2.10.2.2 Rx LP Timeout Error

When this Error is detected, Software RESET and Startup sequence (refer to section 67.3.5) should be needed to recover. And Tx Reset Trigger may be necessary by the needs.

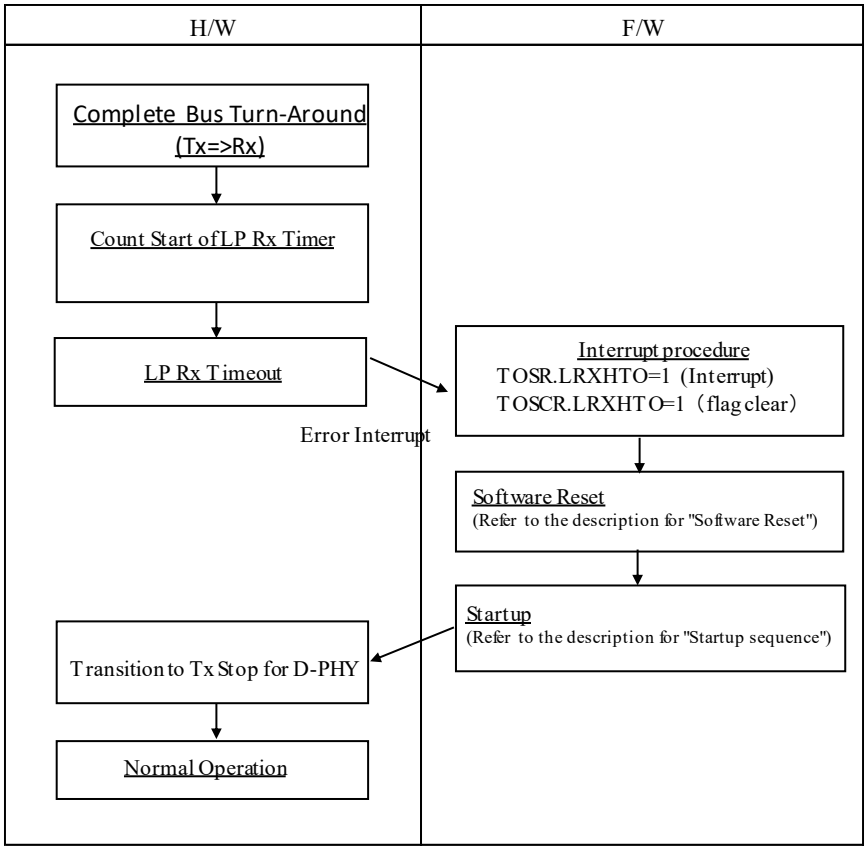

Figure 67.25 Error Handling for Rx LP Timeout

67.3.2.10.2.3 Turn-Around Timeout Error

When this Error is detected, Software RESET and Startup sequence (refer to section 67.3.5) should be needed to recover. And Tx Reset Trigger may be necessary by the needs.

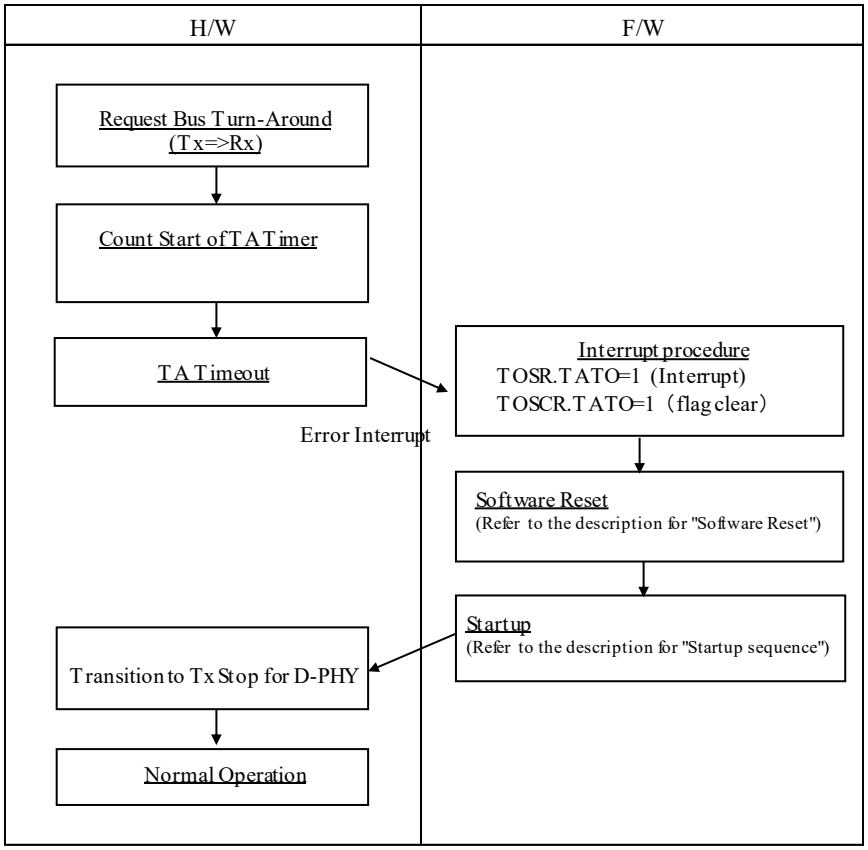

Figure 67.26 Error Handling for Turn-Around Timeout

67.3.2.10.2.4 Rx Response Timeout Error

If Rx Packet is not started within the time specified by RXRESPTOSETRregister after the Bus Turn-Around by TXCMCR.BTAREQ register, then Rx Timeout is indicated by RXPSR.RESPTOERR=1.

Something to recover for this Error should be needed. For example it may be to resend the request, etc.

67.3.2.10.3 Rx Packet Error

Rx Packet Error to be detected by this Transmitter is described in this section.

The Rx Packet Error has two kinds. One is the error which can be classified as a packet and which does not have an influence on other packets. This Error is related to the Packet. e.g. CEC Error or ECC 1bit Error.

The other is the error related to the Rx itself like fatal error.

A fatal error may be reported as only one error because the packet cannot be classified as a packet by the fatal error. A slight error like an ECC error (1bit Error) or CRC error has a possibility to be reported together with other errors. Thus an error report has the priority. The priority of the Errors which can detect by the Transmitter is the order listed below.

Priority order: Malformed Packet Error, ECC Error, Unexpected Data Type Error, Unexpected Packet Error, Unexpected Trigger Error, WC Error, CRC Error

These Errors are described below for detail.

67.3.2.10.3.1 Malformed Packet Error

When the value of RXPSR/TASR.MLFERR is "1", the Error which is the Rx Packet with under 4 byte length is detected. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

67.3.2.10.3.2 ECC Error

Received ECC is enabled by RXSETR.ECCEN=1. If the Peripheral device does not support this ECC function, Received ECC should be disabled by RXSETR.ECCEN=0.

67.3.2.10.3.2.1 ECC 1bit Error

If the ECC 1bit Error is detected by RXPSR/TASR.ECCERR1B=1, the Data of the Rx Packet with ECC Error is corrected automatically. After this automatic Error correction, the Rx Packet is continued.

67.3.2.10.3.2.2 ECC Multi-bit Error

If the ECC Multi-bit Error is detected by RXPSR/TASR.ECCERR=1, the Rx Packet is discarded. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

67.3.2.10.3.3 Unexpected Data Type Error

If the reception of the Packet with "Reserved" Data Type described in Table 22 of DSI Specification is detected by RXPSR/TASR.UEXDTERR=1, the Rx Packet has an Error. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

67.3.2.10.3.4 Unexpected Packet Error

If the Rx Unexpected Packet is detected by RXPSR/TASR.UEXPKTERR=1, the Rx Packet has an Error. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

The expected Rx Packet with Tx Command for requirement of the Response to the Peripheral device (described in section 67.3.2.3.3) is listed below. The Rx Packet except for the Packet listed below is Unexpected Packet.

- Response Packet (1 packet)
- Response Packet (1 packet) + EoTp Packet(1 packet)
- Response Packet (1 packet) + Acknowledge and Error Report Packet (1 packet)
- Response Packet (1 packet) + Acknowledge and Error Report Packet (1 packet) + EoTp Packet(1 packet)
- Acknowledge and Error Report Packet (1 packet)
- Acknowledge and Error Report Packet (1 packet) + EoTp Packet (1 packet)
- EoTp Packet (1 packet)

The expected Rx Packet for Tx Non-Read Command with Bus Turn-Around (described in section 67.3.2.3.4), for Bus Turn-Around Request (described in section 67.3.2.6) and for Error information from Peripheral device (described in section 67.3.2.7) is listed below. The Rx Packet except for the Packet listed below is Unexpected Packet.

- Acknowledge and Error Report Packet (1 packet)
- Acknowledge and Error Report Packet (1 packet) + EoTp Packet (1 packet)
- EoTp Packet (1 packet)

67.3.2.10.3.5 Unexpected Trigger Error

If the Unexpected Rx Trigger is detected by RXPSR.UEXTRGERR=1, the Rx Trigger has an Error. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

When the Command with Response to request to Peripheral device (described in section 67.3.2.3.3) is transmitted, the Unexpected Trigger Error is detected by the Rx Trigger listed below.

- ACK Trigger

67.3.2.10.3.6 WC Error

When the Rx Long Packet with the Payload Data which is not enough for the WC value is detected by RXPSR.WCERR=1, the Payload Data of the Rx Long Packet has an Error. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

67.3.2.10.3.7 CRC Error

CRC check is enabled by RXSETR.CRCEN=1. If the Peripheral device does not support this CRC function, CRC function should be disabled by RXSETR.CRCEN=0. If the CRC Error is detected by RXPSR.CRCERR=1, the Rx Data has an Error. Something to recover for this Error should be needed. For example, Re-transmission of the Command just before may be needed.

67.3.2.10.4 Error of Handling for Rx Data Payload

67.3.2.10.4.1 AXI Error

If the response of Master AXI Write is received except for OKAY, AXI Error is indicated by RXPSR.AXIERR=1. Something to recover for this Error should be needed. For example, the confirmation of the configuration for memory area may be needed.

67.3.2.10.4.2 Rx Buffer Overrun Error

If at least one of the following condition is satisfied, the Rx Buffer Overrun Error is indicated by RXPSR.OVRERR=1.

In case of Register Access mode:

・The Rx Payload Data is over 16Byte length

In case of AXI Access mode:

・The Rx Payload Data is over the length specified by RXPSIZESETR.SIZE register

・RAM Overrun for the LP Rx is detected

The procedure described below should be needed by RXPSR.OVRERR=1.

In case of Register Access mode:

・Change to AXI Access mode

In case of AXI Access mode:

・When WordCount of Rx Packet is over the length specified by RXPSIZESETR.SIZE register, correct the RXPSIZESETR.SIZE register.

・When WordCount of Rx Packet is under the length specified by RXPSIZESETR.SIZE register, something to correct for this Error should be needed. For example, change the response time of AXI Slave faster.

67.3.2.10.5 Error in Tx Command Transfer mode

67.3.2.10.5.1 AXI Error

If the response of Master AXI Read is received except for OKAY, AXI Error is indicated by TXCMSR.AXIERR=1. Something to recover for this Error should be needed. For example, the confirmation of the configuration for memory area may be needed.

67.3.2.10.5.2 Collision Error

If the HS Command Transfer mode Packet is not transmitted correctly in Video mode, the Collision Error is indicated by TXCMSR.CLSNERR=1. Something to correct for this Error should be needed. For example, change the length of Command Transfer mode Packet shorter or, the packet is divided.

67.3.2.10.6 Error in Tx Video mode

67.3.2.10.6.1 Packet Discarded Error

If the Tx Packet is not transmitted correctly in Video mode, the Packet Discarded Error is indicated by =1 TXVMSR.PDIS. For such case, check the Configurations for Video Input interface of Table 67.16 or Table 67.18.

67.3.2.11 Tx Skew Calibration Pattern

The Procedure for Tx Skew Calibration Pattern by Firmware is described in this section. Refer to section 67.4.1.1.1.2 for detail of the Periodic de-skew in Video mode. The switching on/off of the Periodic de-skew is prohibited during Video mode.

67.3.2.11.1 Periodic de-skew

The period for transmission of Skew Calibration Pattern is calculated by the following formula.

SCALPSR.PTNSZ – SKEWCALOFFSET

Refer to Table 67.9 for SKEWCALOFFSET.

Notice, the actual period of Tx Skew Calibration Pattern is depend on the D-PHY of attached Rx. The value of SCALPSR.PTNSZ should be determined by the behavior of the D-PHY of attached Rx with deep consideration. e.g. the actual delay of Tx Pattern from TxSkewCalHS=1, the actual period to stop the Pattern by TxSkewCalHS=0, etc.

For the Periodic de-skew, the Tx Skew Calibration Pattern is needed to continue for the specified period to 10 microseconds from 2^{10} UI (Unit Interval).

After the configuration of the SCALPSR.PTNSZ register, write "1" to the SCALCR.CALREQ register with SCALCR.CALTYP=0 to start the Periodic de-skew. When the next request is enabled by the completion of the Periodic de-skew, the dsi_int_scal interrupt is occurred by SCALSR.CALREQEN=1.

Table 67.9 SKEWCALOFFSET

Bitrate (Mbps)	SKEWCALOFFSET
2500	508
2450	507
2400	507
2350	503
2300	489
2250	481
2200	474
2150	461
2100	452
2050	440
2000	431
1950	419
1900	410
1850	399

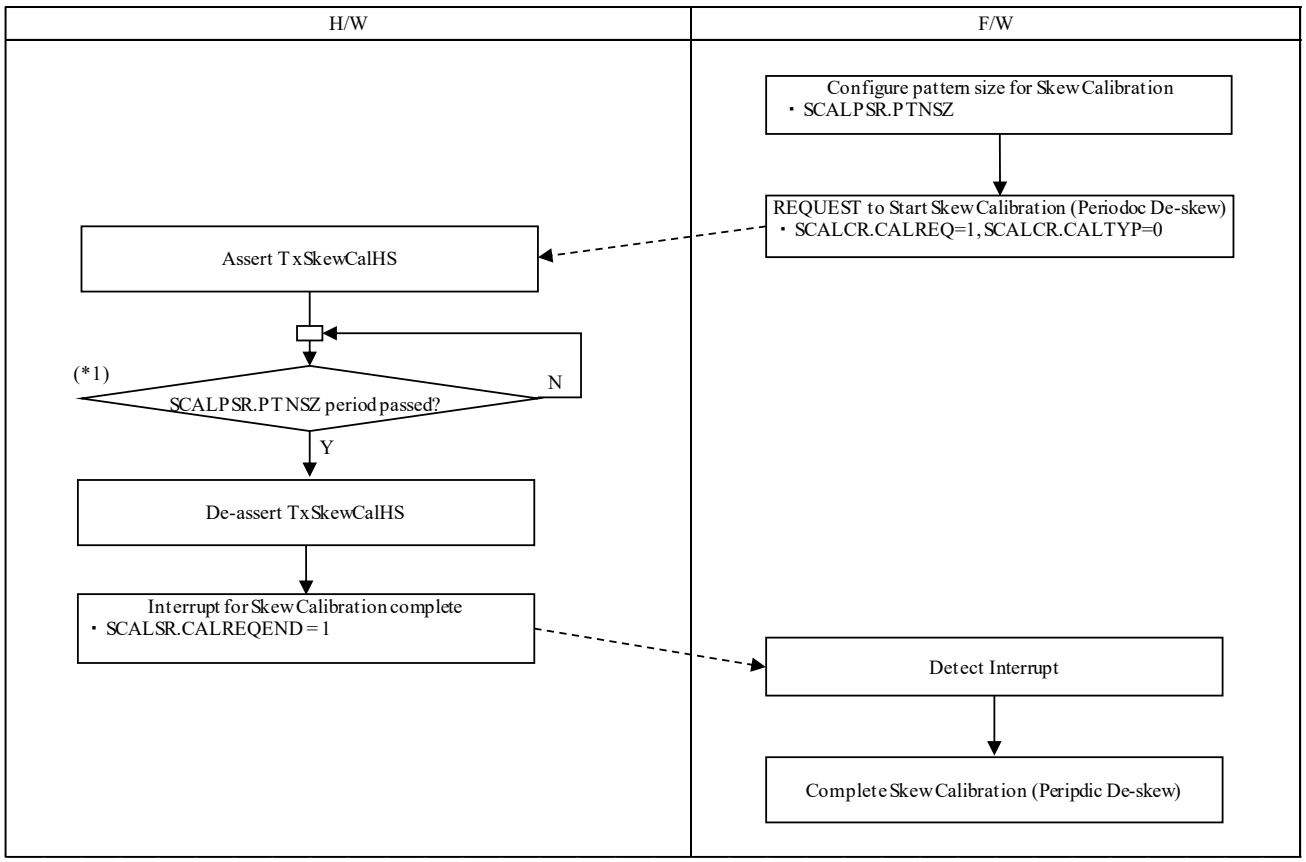
1800	389
1750	377
1700	367
1650	355
1600	346
1550	336
1500	326

Before Periodic de-skew, HS Tx Clock (described in 67.3.2.11.2) must be started.

It is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Bus Turn-Around Request (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7) or Transition to ULPS (described in section 67.3.2.8).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the SCALCR.CALREQ register and is before changing to SCALSR.CALREQEND=1.

SCALPSR



Note: Before Periodic de-skew, HS Tx Clock (described in 67.3.2.11.2) must be started.

Figure 67.27 Skew Calibration (Periodic De-Skew)

67.3.2.11.2 Initial de-skew

When operating above 1.5 Gbps or changing to any rate above 1.5 Gbps, an initial deskew sequence shall be transmitted before HS Tx. When changing states, for example from ULPS to HS, transmission of any deskew sequence is optional,

provided HS operation resumes at a rate for which an initial deskew sequence has previously been transmitted. .

The period for transmission of Skew Calibration Pattern is calculated by the following formula.

SCALPS1R.PTNSZ – SKEWCALOFFSET

Refer to Table 67.9 for SKEWCALOFFSET.

Notice, the actual period of Tx Skew Calibration Pattern is depend on the D-PHY of attached Rx. The value of SCALPS1R.PTNSZ should be determined by the behavior of the D-PHY of attached Rx with deep consideration. e.g. the actual delay of Tx Pattern from TxSkewCalHS=1, the actual period to stop the Pattern by TxSkewCalHS=0, etc.

For the Initial de-skew, the Tx Skew Calibration Pattern is needed to continue for the specified period to 100 microseconds from 2^{15} UI(Unit Interval).

After the configuration of the SCALPS1R.PTNSZ register, write "1" to the SCALCR.CALREQ register with SCALCR.CALTYP=1 to start the Initial de-skew. When the next request is enabled by the completion of the Initial de-skew, the dsi_int_scal interrupt is occurred by SCALSR.CALREQEND=1.

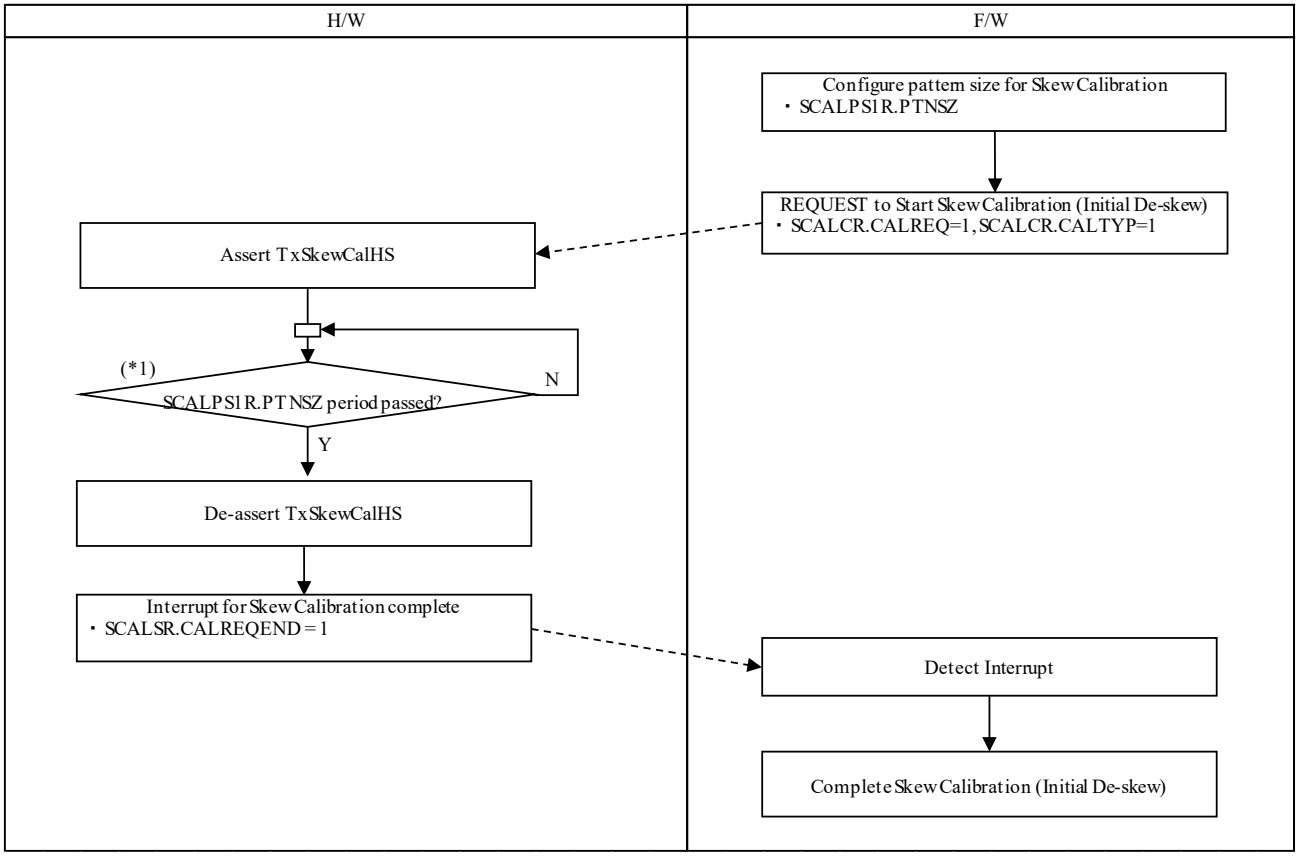
Before Initail de-skew, HS Tx Clock (described in 67.3.2.11.2) must be started.

It is prohibited to start another request which is Command Transfer mode (described in section 67.3.2.3), Tx Reset trigger (described in section 67.3.2.5), Bus Turn-Around Request (described in section 67.3.2.6), Error information of peripheral device (described in section 67.3.2.7) or Transition to ULPS (described in section 67.3.2.8).

The registers listed below are prohibited to configure during the period which is after writing to "1" to the SCALCR.CALREQ register and is before changing to SCALSR.CALREQEND=1.

SCALPS1R

If the D-PHY of attached Rx has an ability of automatically Initial de-skew, the following sequence may not need to execute.



Note: Before Initail de-skew, HS Tx Clock (described in 67.3.2.11.2) must be started.

Figure 67.28 Skew-Calibration (Initial De-Skew)

Note: *1 Although any Data type can be transmitted, using Command Transfer mode in Videomode,

Consider MIPI CSI-2 specification and the document of the Peripheral device.

67.3.4 Clock Configuration

The relationship should be needed for the dotclock and the data rate of DSI/CSI-2-TX. The frequency value can be obtained as follows:

Fout[MHz] = vclk [MHz] * ColorDepth [bpp]/(2*DataLaneCount)

hsclk = Fout/4

Fout: Frequency of clock lane of D-PHY

hsclk: byteclock

vclk: dotclock

The configuration of the clocks is shown on Figure 67.29.

Frequency of Fout is configured by setting of CLOCKSET2.m register and CLOCKSET2.n register. And DU select the dotclock output from the Dotclock Generator module.Refer to DU section for detail.

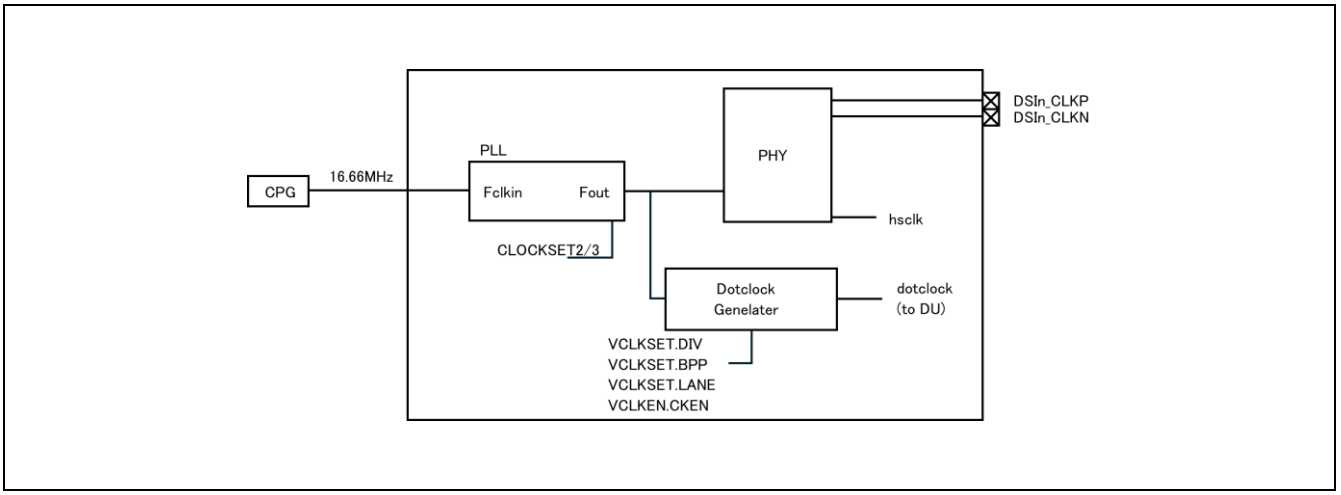

Figure 67.29 Clock Configuration

1250 MHz ≥ Fout ≥ 1000 MHz: Fout =M * Fclkin / (N *2 *2)

Where:

■ M: Feedback Multiplication Ratio M= CLOCKSET2.m

■ N: Input Frequency Division Ratio N= CLOCKSET2.n+1

Fclkin = DSIREFϕ

8 MHz <= Fclkin <= 64MHz

8 MHz <= Fclkin / N <= 24 MHz

2000 MHz <= M * Fclkin / (N * 2) <= 4000 MHz

1 <= N <= 8

167 <= M <= 1000

Output frequencies below 1000MHz are obtained through division (Refer to Table 67.13)

1000 MHz ≥ Fout ≥ 500 MHz: Fout = M * Fclkin / (N *2 *4)

500 MHz ≥ Fout ≥ 250 MHz: Fout = M * Fclkin / (N *2 *8)

250 MHz ≥ Fout ≥ 125 MHz: Fout = M * Fclkin / (N *2 *16)

125 MHz ≥ Fout ≥ 62.5 MHz: Fout = M * Fclkin / (N *2 *32)

62.5 MHz ≥ Fout ≥ 40 MHz: Fout = M * Fclkin / (N *2 *64)

Table 67.12 Parameter Set

2363.125 - 2500	2500	1001001

67.3.6 Shutdown sequence and Standby mode

The DSI/CSI-2-TX module can gate the clock signals to reduce power consumption. Module standby mode can be set by controlling the module stop register 4 (MSTPCR4) of the clock pulse generator (CPG) module. DSI/CSI-2-TX channels DSI/CSI-2-TX0, DSI/CSI-2-TX1 correspond to bits 8 and 9 in the MSTPCR4 registers, respectively. To release any of the DSI/CSI-2-TX channels from standby mode, enable the corresponding the bits in the MSTPCR4 registers. Enabling the bits allows all types of access to the channel.

To set any of the DSI/CSI-2-TX channels to standby mode, execute the following procedure using the register corresponding to the channel.

1.Shutdown sequence (It is the same procedure when Forced termination of execution)
Set the corresponding bit in the SRCR4 register of the Clock Pulse Generator (CPG) module.
2.Stanby mode
Disable the corresponding bits in the MSTPCR4 registers of the Clock Pulse Generator (CPG) module.
Set DSICKCR=9'h100 for disable the DSI clock (DSIEXTϕ)

To set any of the DSI/CSI-2-TX channels to operating mode from standby mode, execute the following procedure using the register corresponding to the channel.

3. Operating mode
Set the corresponding bit in the SRSTCLR4 register of the Clock Pulse Generator (CPG) module.
For the startup sequence, see section 67.3.5

67.4 Usage Notes

67.4.1 Interfaces for Video mode

67.4.1.1 Video Output

67.4.1.1.1 DSI

This section describes the Video input interface on DSI mode (at IPSETR.CSI2M=0b).

Timings and Configurations for Video Output are shown below.

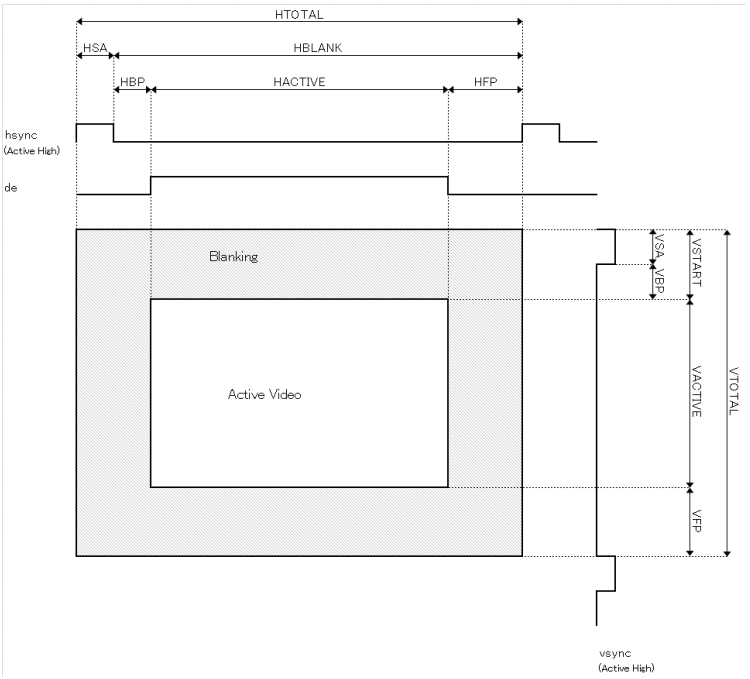

Figure 67.30 Timing for Video Output (DSI)

Table 67.15 Video Output parameters (DSI)

category	Parameter	Description	remarks
The number of horizontal pixels	I	Horizontal sync signal active period pixels	hsync signal assert period number of pixels High active: hsync signal“=””1" period Low active: hsync signal“=””0" period
	HBLANK	Number of pixels for horizontal blending period	hsync negate period pixels for vertical blending period (inactive period)
	HBP	Horizontal back porch period pixels	Number of pixels between the end of the hsync signal assert signal and the start of the de signal assert during the vertical active period
	HACTIVE	Horizontal active period pixels	Number of pixels in de signal assert period de signal“=””1" period

category	Parameter	Description	remarks
	HFP	Horizontal front porch period pixels	Number of pixels in the period from the end of the de-signal assert to the start of the hsync signal assert
	HTOTAL	Total horizontal pixelHSA+HBP+HACTIVEIP (HSA+HBLANK)	
Number of vertical lines	VSA	Number of vertical sync signal active period lines	vsync signal assert period High active: vsync “i”nal = "1" period Low active: vsync “i”nal = "0" period
	VBP	Number of vertical back porch period lines	Number of lines until the start of the vertical sync signal active period
	VACTIVE	Number of vertical active period lines	Number of lines being de-signaled
	VFP	Number of vertical front porch period lines	Number of lines from the end of the vertical active period to the start of the vertical synchronization signal active period
	VSTART	Number of vertical active period start lines	VSA + VBP
	VTOTAL	Total vertical lines	VSA+VBP+VACTIVE+VFP

Table 67.16 Configurations for Video Output interface (DSI)

Common Rules for both Sync-Pulse mode and Sync-Event mode

parameter	description
All	All parameters related to Input Video should be set to the value of not less than 1. Exa“ple for "All p”raIers": HSA, HBP, HACTIVE, HFP, VSA, VBP, VACTIVE, VFP
HACTIVE	**TXVMPSPHSETR.DT** / **TXVMVPRMSET3R.HACTIVE** RGB 16bit / Set 1 to 32767 because 1Pixel consists of 2Byte and the maximum length of the DSI packet is 65535Byte. RGB 18bit / This value should be the multiple of 4. Set 4 to 29124 because the 4pixel consists of 9Byte and the maximum length of the DSI packet is 65535Byte. RGB 24bit RGB 18bit Loosely / Set 1 to 21845 because 1pixel consists of 3Byte and the maximum length of the DSI packet is 65535Byte. YCbCr 4:2:2 16bit / This value should be the multiple of 2. Set 2 to 32766 because the 2pixel consists of 4Byte and the maximum length of the DSI packet is 65535Byte.
HTOTAL	HTOTAL should be the multiple of 4 when TXVMVPRMSET0R.BPP=001I18bpp).
HSA, HBP, HACTIVE, HFP	Each setting should be a multiple of 2 when TXVMSETR.PIXWDT =D’2. Each setting should be a multiple of 4 when TXVMSETR.PIXWDT =D’4.
HACTIVE+HFP	●No use of HFP Blanking Packet (TXVMSETR.HFPBPEN=0) The period which is HACTIVE+HFP should be set to longer than the period which the transmitted time of Pixel Stream Packet and the transition time for HS-LP-HS are added. (HACTIVE+HFP) > (period for the Tx Pixel Stream Packet)+(period for transition time as HS-

parameter	description
	LP-HS) Low power consumption is possible to configure without using HFP Blanking Packet when the formula described above is satisfied.
	●Use of HFP Blanking Packet (TXVMSETR.HFPBPEN=1) Blanking Packet is transmitted at the period to Sync Event Packet from Pixel Stream Packet within the period of HACTIVE+HFP. The period of HACTIVE+HFP should be within the range to maximum value from minimum value of the period which the transmitted time of Pixel Stream Packet and the transmitted time of Blanking Packet are added. So, the period of HACTIVE+HFP should be set to the value within the range described below. Actual period of HACTIVE+HFP = ((HACTIVE+HFP) * ColorDepth) / 8) Transmitted time of Pixel Stream Packet = (6+ RoundUp((HACTIVE * ColorDepth)/8)) (Actual period of HACTIVE+HFP)-(period for the Tx Pixel Stream Packet) >= 6
VFP+VSA+VBP, HTOTAL	When sending Frame CRC packets (FDSETR.VFCEN≠0), set it in the following range. ・ ((VFP+VSA+period of VBP) * HTOTAL * pixel bit depth / 8) > 336 (*)

Additional Rules for Sync Pulse mode

parameter	description
Skew Calibration	When the Skew Calibration is used by TXVMSETR.VSEN=1, the period of HBP+HACTIVE+HFP should be set to longer than the period which the transmitted time of Sync Event Packet, the transition time for HS-LP-HS and period for Skew Calibration are added. (HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet)+(period for transition time as HS-LP-HS)*2+(period for Skew Calibration)
Command Transfer mode Packet	When the Packet transmission of Command Transfer mode is used in the Tx Video mode (TXVMCR.EN=1), the period of HBP+HACTIVE+HFP should be set to the value within the range described below. (HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet)+(period for the Tx Command Transfer Packet)+(Additional Time A) (Additional Time A)=(period for transition time as HS-LP-HS)
HBP+HACTIVE+HFP	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HBP+HACTIVE+HFP should be set to the value within the range described below. (HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet)+(period for transition timeI HS-LP-HS)
HSA	●No use of HSA Blanking Packet (TXVMSETR.HSABPEN=0) Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event PackI the period of HSA should be set to the value within the raI described below. HSA > (period for the Tx Sync Event Packet)+(period for transition time as HS-LP-HS) Low power consumption is possible to Ifigure without using HSA Blanking Packet when the formula described abolis satisfied.
	●Use of HSA Blanking Packet (TXVMSETR.HSABPEN=1) Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next SynIvent Packet, the period of HSA should be set to the value wiIn the range described below.ISA * ColorDepth)/8 >= 10 Notice, HSA should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).
HBP	●No use of HBP Blanking Packet (TXVMSETR.HBPBPEN=0) Transition of HS-LP-HS is caused within the period between current Sync Event Packet andIxt Sync Event Packet, the period of HSA should be set to thIalue within the range described below. HSA > (period for the Tx Sync Event Packet)+(period for transition time as HS-LP-HS)
	●Use of HBP Blanking Packet (TXVMSETR.HBPBPEN=1) Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HPB should be set to the value within the range described below. (HBP * ColorDepth)/8 >= 10 Notice, HPB should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).
Frame CRC Packet	When sending Frame CRC packets (FDSETR.VFCEN(F(i))≠0), set the HBP+HACTIVE+HFP period to be longer than the following sum. (Period for Sync Event Packet transmission) (Period for FrameCRC packet (22Byte) transmission) (Period for transition time as HS-LP-HS)

Additional Rules for Sync-Event mode

parameter	description
Skew Calibration	When the Skew Calibration is Id by TXVMSETR.VSEN=1, the period of HSA+HBP+HACTIVE+HFP should be set to longer than the period which the transmitted time of Sync Event Packet, the transition time for HS-LPI and period for Skew Calibration are added. (HSA+HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet)+(period for transition time as HS-LP-HS)*2+(period for Skew Calibration)
Command Transfer mode Packet	When the Packet transmission of Command Transfer mode is usedI the Tx Video mode (TXVMCR.EN=1), the period of HSA+HBP+HACTIVE+HFP should bIet to the value within the range described below. (HSA+HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet)+(period for the Tx Command Transfer Packet)+(Additional Time A) (Additional Time A)=(period for transition time as HS-LP-HS)
HTOTAL	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HTOTAL should be set to the value within the range described below. HTOTAL > (period for the Tx SyncIent Packet)+(period for transition time as HS-LP-HS)
HSA+HBP	●No use of HBP Blanking Packet (TXVMSETR.HBPBPEN=0) Transition of HS-LP-HS is caused within the period between current Ic Event Packet and next Sync Event Packet, the period of HSA+HBPIould be set to the value within the range described below. (HSA+HBP) > (period for the Tx Pixel Stream Packet)+(period for transition time as HS-LP-HS) Low power consumption is possible at this configuration.
	●Use of HBP Blanking Packet (TXVMSETR.HBPBPEN=1) Transmission of Blanking Packet is caused within the period between cuInt Sync Event Packet and next Sync Event Packet, the period of HSIPB should be set to the value witI the range described below. ((HSA+HBP) * ColorDepth)/8 >= 10 Notice, HSA+HPB should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

67.4.1.1.1.1 Tx/Rx Command Transfer mode in Video mode

The Command Transfer mode Packet Tx is enabled only by HS, and is not supported by LP.

A request of Tx using Command Transfer mode in Video mode should be issued after confirmation of TXVMSR.ACT=1. Command Transfer mode Packet Tx is occurred in the BLLP period of the first Horizontal Line of Video mode Packet by the request of Tx using Command Transfer mode in Video mode. If the request of Tx using Command Transfer mode with requirement of response in Video mode, Bus Turn-Around with Packet Rx is occurred in the BLLP period of the first Horizontal Line of Video mode Packet. Refer to section 67.3.2.3 for detail. After the completion of Tx Command Transfer mode Packet without Bus Turn-Around, the Transmitter transitions to LP11. If the Packet is Tx Command Transfer mode Packet, Bus Turn-Around and Rx Packet are executed during the first Horizontal Line period.

All Command using Command Transfer mode described on Table 67.16" Command Transfer mode Packet" should be issued with limitation described in the Table 67.16.

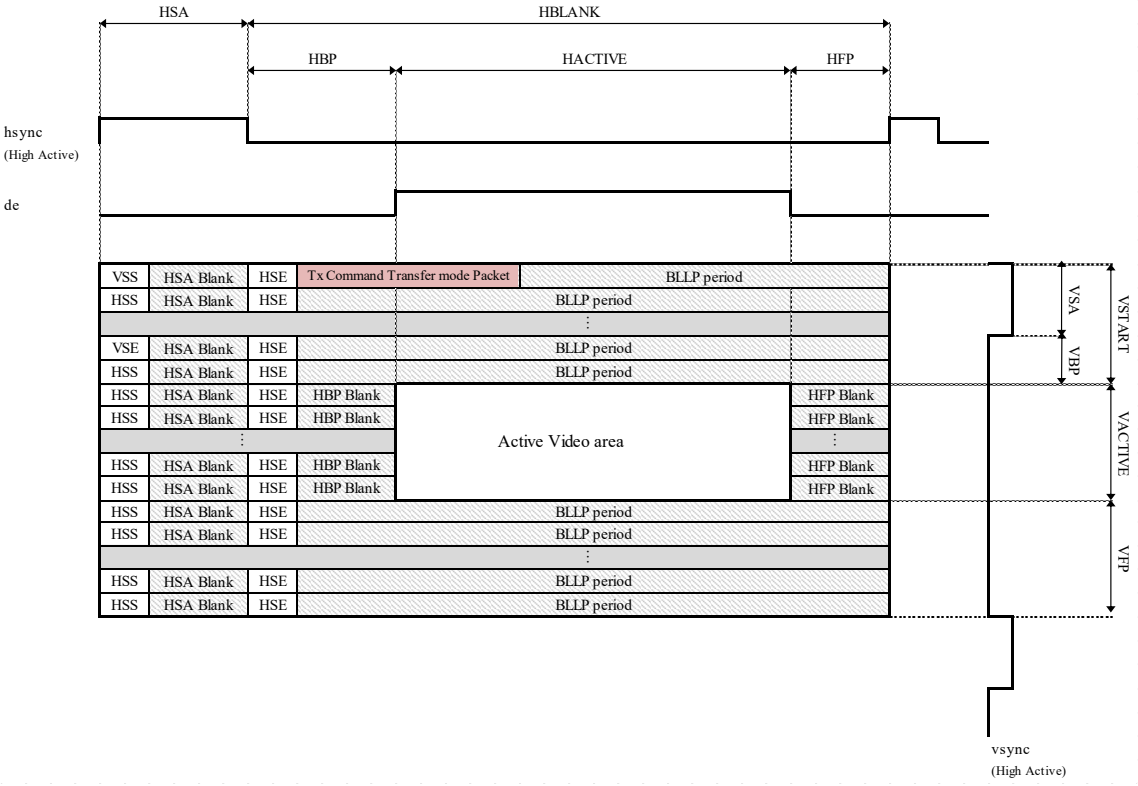

Figure 67.31 Timings for Command Transfer mode in Video mode (Sync-Pulse mode)

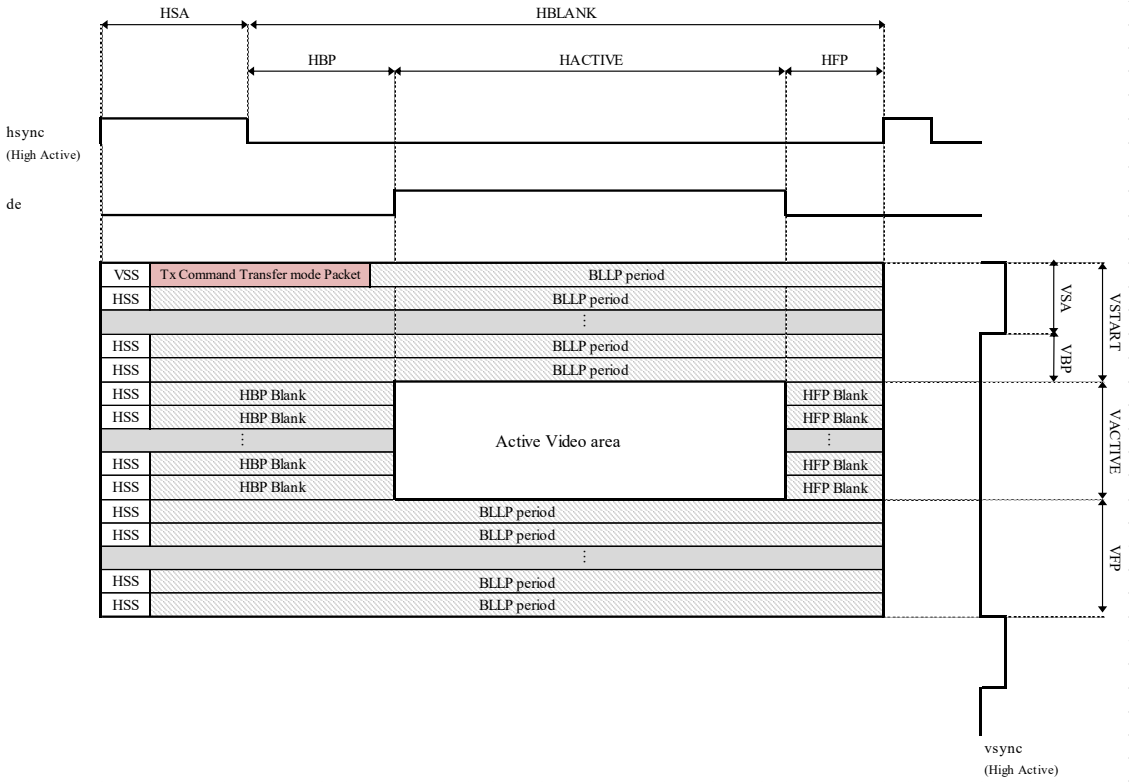

Figure 67.32 Timings for Command Transfer mode in Video mode (Sync-Event mode)

67.4.1.1.1.2 Skew Calibration (Periodic de-skew) in Video mode

In Video mode, the Transmitter supports Skew Calibration at every Video Frame by H/W.

Skew Calibration should be enabled at the initial configuration phase described in 67.3.2.4.1. Skew Calibration is operated in the BLLP period of the Horizontal Line started VBP of Video mode Packet Skew Calibration Pattern is transmitted to connected device during the period specif“e” by SCALPSR.PTNSZ register. When the skew calibration pattern is sent, set "1" to SCALSR.CALLEQEND. The value of SCALPSR.PTNSZ should be within the range described on Table 67.16 ”Skew Calibration”.

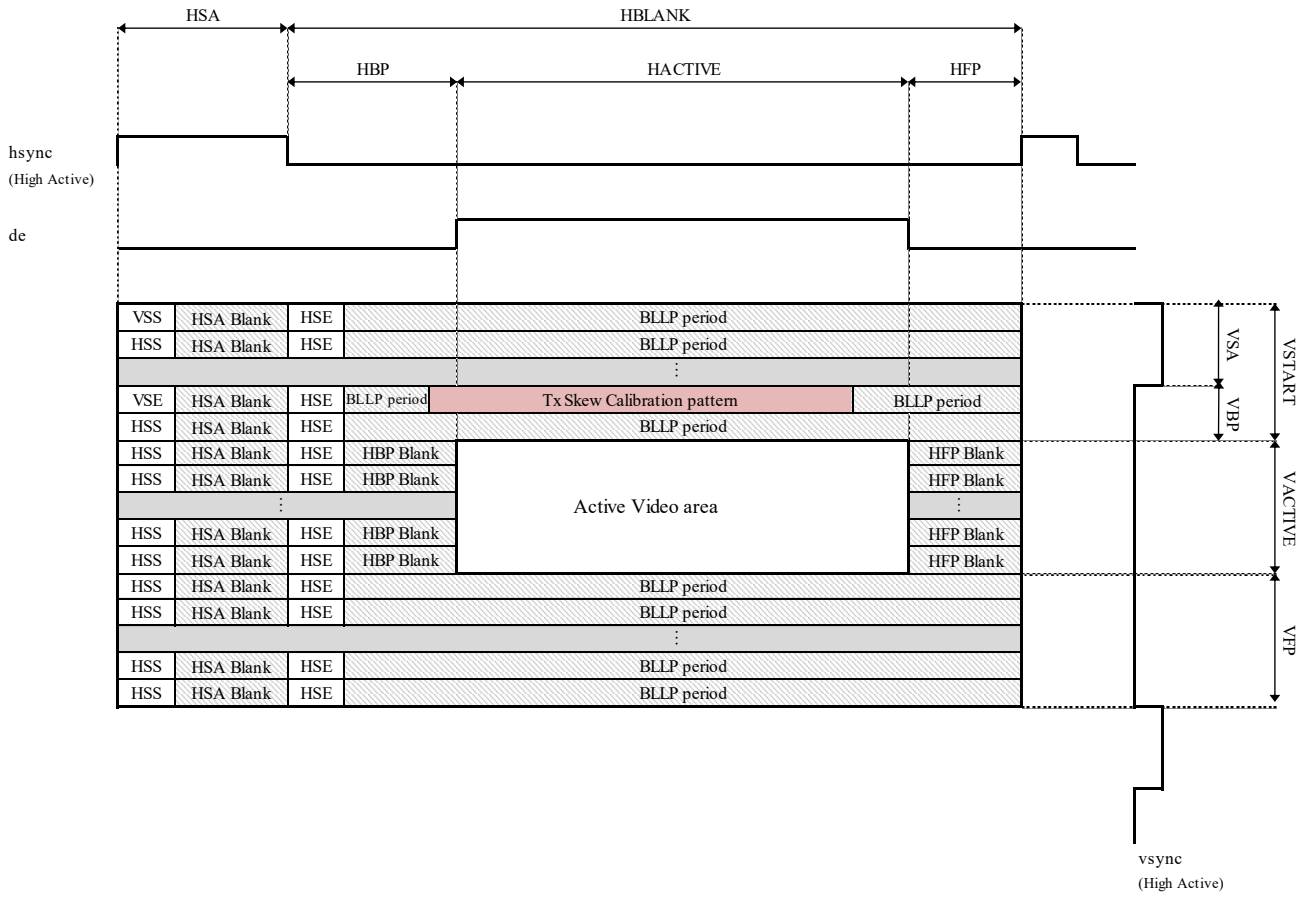

Figure 67.33 Timings for Skew Calibration in Video mode (Sync-Pulse mode)

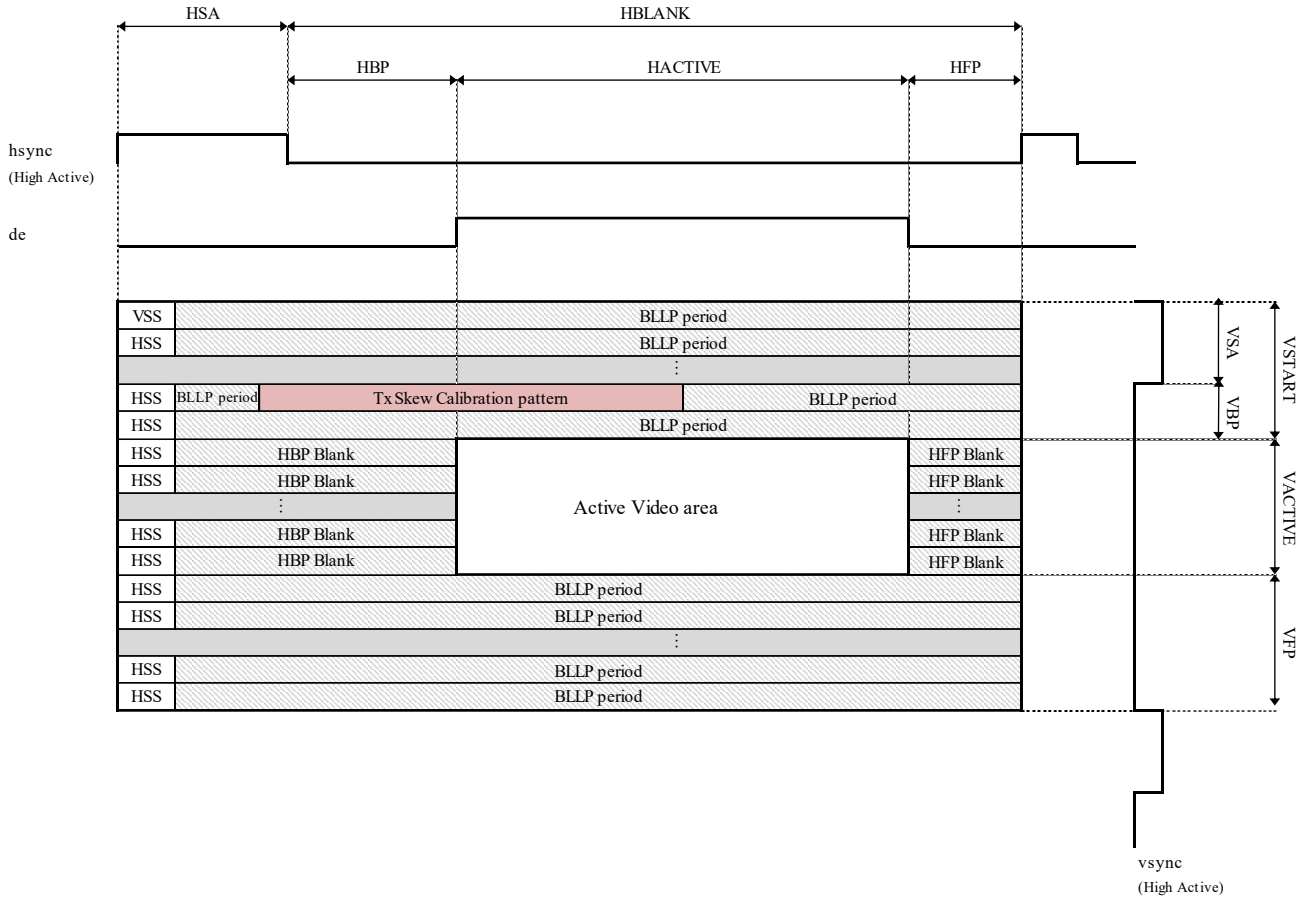

Figure 67.34 Timings for Skew Calibration in Video mode (Sync-Event mode)

67.4.1.1.2 CSI-2

This section describes the Video Output interface on CSI-2 mode (IPSETR.CSI2M=1b).

67.4.1.1.2.1 Timings for Video Output

Timings and Configurations for Video output are shown below.

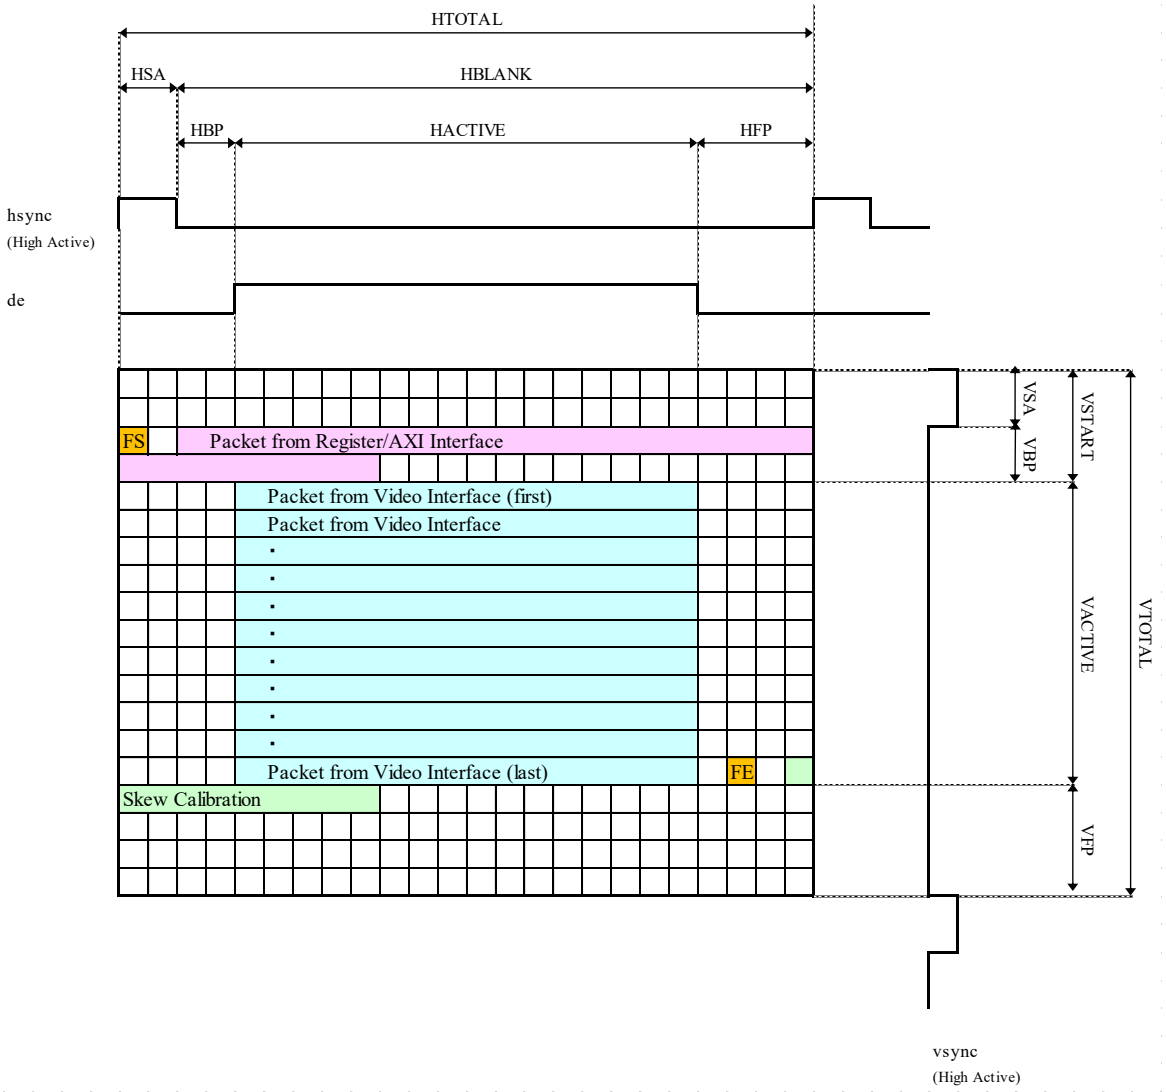

Figure 67.35 Timings for Video Output (CSI-2)

Table 67.17 Video Output parametersISI-2)

category	Parameter	Description	remarks
Number of horizontal pixels	HSA	Horizontal sync signal active perio“ ”ixels	hsync signal assert period nu“b”r of pixels High active: hsync signal = "1" period Low active: hsync signal = "0" period
	HBLANK	Number of pixels for horizontal blending period	hsync negate period pixels for vertical blending period (inactive period)
	HBP	Horizontal back porch period pixels	Number of pixels between the end of the hsync signal assert signal and the start of the de signal assert during the vertical active period
	HACTIVE	Horizon“a” active period pixels	Number of pixels in de signal assert period de signal = "1" period
	HFP	Horizontal front porch period pixels	Number of pixels in the period from the end of the de-signalIsert to the staIof the hsync signal assert
	HTOTAL	Total horizontal pixels	HSA+HBP+HACTIVE+HFP (HSA+HBLANK)
Number of vertical lines	VSA	Number of vertical “y”c signal active period lines	vsync “i”nal assert period High active: vsync signal = "1" period Low active: vsync signal = "0" period
	VBP	Number of vertical back porch period lines	Number of lines until the start of the vertical sync signal active period
	VACTIVE	Number of vertical active period lines	Number of lines being de-signaled
	VFP	Number of vertical front porch period lines	Number of lines from the end of the vertical active period to the start of the vertical synchronization signal active period
	VSTART	Number of vertical active period start lines	VSA + VBP
	VTOTAL	Total vertical lines	VSA+VBP+VACTIVE+VFP

Table 67.18 Configuration for Video Output interface (CSI-2)

Parameter	Description
All	All parame“ers related to”InI Video should be set to the value of not less In 1. Example for "AIIarameters": HSA, HBP, HACTIVE, HFP, VSA, VBP, VACTIVE, VFP
HFP+HSA+HBP	The period of HFP+HSA+HBP should be set to longer than the period of tItransition time for HS-LP-HS of D-PHY.
Frame End Packet Skew Calibration Frame CRC packet	((HSA+HBP+HACTIVE+HFP)× (VFP+VSA) + HFP) period(*1) should be longer than the following sum.

Parameter	Description
	・(period for transition time as HS-LP-HS) ・（period of Frame CRC Packet generation < Frame CRC transmission setting enabled (FDSETR. VFCEN(F(i))≠00b)>） ・（period of Frame CRC Packet transmission period < Frame CRC transmission setting enabled (FDSETR. VFCEN(F(i))≠00b)>） ・(period for transition time as HS-LP-HS <Frame CRC transmission setting enabled (FDSETR. VFCEN(F(i))≠00b)>） ・（period of Frame End Packet generation ） ・(period of Frame End Packet transmission) ・(period for transition time as HS-LP-HS) ・(Send period of skew calibration < when the skew calibration transmission setting is enabled (TXVMSET(F(i))R.VSEN=1>) ・(period for transition time as HS-LP-HS < When skew calibration transmission transmission setting is enabled (TXVMSET(F(i)R.VSEN=1) >) (*1) When transmitting different types of videlata by switching frames, the parameters used for calculating tl period are as follows. HFP+ ((HSA+HBP+HACTIVE+HFP) ×VFP) : Parameter value of the current frame ((HSA+HBP+HACTIVE+HFP) ×VSA) : Parameter values for the next frame
Command Transfer mode Packet	When thelcket transmission of Command Transfer mode is used in the Tx Video mode (TXVMCR.EI), the period of (HSA+HBP+HACTIVE+HFP)*VBP should be set to the value within the range described below. (HSA+HBP+HACTIVE+HFP)*VBP > (period for the Tx Pixel Stream Packet)+(period for transition time as HS-LP-HS) + (period for generation of Command Transfer mode Packet.) +(period for Skew Calibration)+(period for transition time as HS-LP-HS)
HACTIVE	TXVMPSPHSET(F(i))R.DT — TXVMVPRMSET3(F(i))R.HACTIVE RGB565 — Set 1 to 32767 because the 1Pixel consists of 2Byte and the maximum length of the CSI-2 packet is 65535Byte. RGB666 — Set 4 to 29124 because the 4Pixel consists of 9Byte and the maximum length of the CSI-2 packet is 65535Byte. However, the setting value should be a multiple of 4. RGB888 — Set 1 to 21845 because the 1Pixel consists of 3Byte and the maximum length of the CSI-2 packet is 65535Byte. YUV422 8-bit — Set 2 to 32766 because the 2Pixel consists of 4Byte and the maximum length of the CSI-2 packet is 65535Byte. However, the setting value should be a multiple of 2.
VFP+VSA+VBP, HTOTAL	Tx of Frame CRC (FDSETR.VFCEN(F(i))≠0) The values should be within the range by the following. ((VFP+VSA+VBP) * HTOTAL * ColorDepth / 8) > 336 (*) (*) When transmitting different types of video data by switching frames, the parameters used for calculating this period are as follows. (VFP×HTOTAL* Pixel Bit Depth / 8): Parameter value of the current frame (VSA+VBP) * HTOTAL* pixel bit depth / 8): parameter value for the next frame

67.4.1.1.2.2 Packet generation from Input Video

The Transmitter supports Packet Generator for CSI-2 using input signal from Video Input interface. The Frame Start Packet, Frame End Packet and Video Packet are generated automatically by this Packet Generator.

67.4.1.1.2.2.1 Frame Start Packet

Frame Start Packet (FS) is automatically generated and transmitted at the detection of vsync signal.

Figure 67.36 shows the format of Frame Start Packet and Table 67.19 shows parameters for Frame Start Packet.

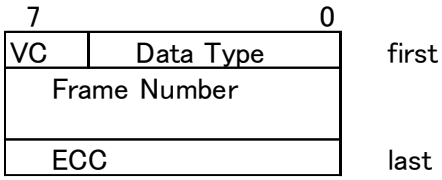

Figure 67.36 Frame Start/Frame End packet format

Table 67.19 Parameters of Frame Start (FS) Packet

Field	Bit count	Description	
VC	2	Value of TXVMPSPHSET(F(i))R.VC	
Data Type	6	Frame Start Code (H'00)	
Frame Number	16	Frame count numbered	
		TXVMSET2(F(i))R.FNUM=0	Set to 0 to Frame Number
		TXVMSET2(F(i))R.FNUM=others	Set to 1 to Frame Number in the Frame Start Packet to be transmitted first. When complete of transmission of the Frame End Packet *1, the Frame Number count is incremented by one internally. The Frame Number resets to 1 after the same value of TXVMSET2(F(i))R.FNUM transmitted. Note: *1 Discarded Frame End Packet is included because of the failed transmission of the Frame End Packet.
ECC	8	This value is automatically calculated by the values of VC, Data Type and Frame Number.	

67.4.1.1.2.2.2 Frame End Packet

Frame End Packet (FE) is automatically transmitted as HS Tx after transmission of Video Packets specified by TXVMVPRMSET1(F(i))R.VACTIVE. Frame End Packet (FE) is automatically transmitted as HS Tx after the Tx Frame CRC Packet is used by FDSETR.VFCEN≠00b.

Frame End Packet is not transmitted when the Frame Start Packet is not transmitted at the Frame.

Figure 67.36 shows the format of Frame End Packet and Table 67.20 shows the parameters for Frame End Packet.

Table 67.20 Parameters of Frame End (FE) Packet

Field	Bit count	Description
VC	2	Value of TXVMPSPHSET(F(i))R.VC
Data Type	6	Frame End Code(H'01)
Frame Number	16	Frame count numbered TXVMSET2(F(i))R.FNUM=0: Set to 0 to Frame Number TXVMSET2(F(i))R.FNUM=others: Set to 1 to Frame Number in the Frame Start Packet to be transmitted first. When complete of transmission of the Frame End Packet *1, the Frame Number count is incremented by one internally. The Frame Number resets to 1 after the same value of TXVMSET2(F(i))R.FNUM transmitted. Note: *1 Discarded Frame End Packet is included because of the failed transmission of the Frame End Packet.
ECC	8	This value is automatically calculated by the values of VC, Data Type and Frame Number.

67.4.1.1.2.2.3 Video Packet

Video Packet transfer is started by both condition of Asserted DE signal and Enabled Pixel Data from the video input interface. Video Packet without FS in the frame is not transferred.

Figure 67.37 shows video packet format and Table 67.21 shows parameters for video packet.

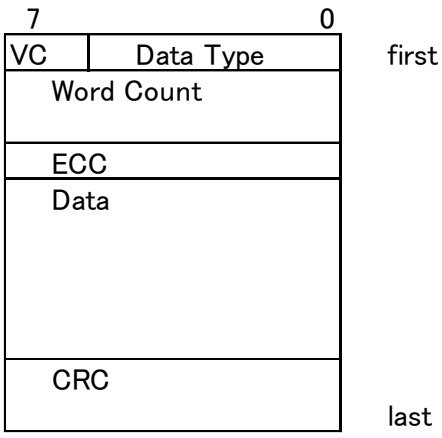

Figure 67.37 Video Packet Format

Table 67.21 Video Packet Parameters

Field name	Bit count	Description for value

VC	2	Value of TXVMPSPHSET(F(i))R.VC
Data Type	6	Value of TXVMPSPHSET(F(i))R.DT The Transmitter module supports RGB565(H'22), RGB666(H'23), RGB888(H'24), YUV422 8-bit(H'1E).
Word Count	16	Value of Word Count which is automatically calculated by value of TXVMVPRMSET0(F(i))R.BPP, TXVMVPRMSET3(F(i))R.HACTIVE and TXVMVPRMSET3(F(i))R.HSBYTE.
ECC	8	Automatically calibrated value from VC, Data Type, and Word Count value.
Data	Word Count *8	Pixel Data from video input interface.
CRC	16	Automatically calculated value from Data value.

67.4.1.1.2.3 Tx Command Transfer mode Packet in Video mode

In Video mode, the Transmitter supports Tx Command Transfer mode Packet. Tx Command Transfer mode Packet should be transmitted after Frame Start Packet by the request of Tx Command Transfer mode Packet described in section 67.3.2.3. The request of Tx Command Transfer mode Packet should be based on the condition described on Table 67.18 "Command Transfer mode Packet". The Command Transfer mode Packet can be transmitted once per Frame in Video mode by the request.

67.4.1.1.2.4 Skew Calibration (Periodic de-skew) in Video mode

In Video mode, the Transmitter supports Skew Calibration at every Video Frame by H/W. Skew Calibration should be enabled at the initial configuration phase described in 67.3.2.4.1. Sen" "kew Calibration Pattern after Frame End packet transmission. When the skew calibration pattern is sent, set "1" to SCALSR.CALLEQEND. Skew Calibration Pattern is transmitted to connected device during the period specified by SCALPSR.PTNSZ register. The value of SCALPSR.PTNSZ should be within the range described on Table 67.18 "Skew Calibration".

67.4.2 USE CASE

67.4.2.1 Inter-Chip Connection Using MIPI CSI-2 I/F

The Data Transfer on the memory is enabled through CSI-2-Tx interface to another R-Car V4M device using CSI-2-Rx.

Refer to Figure 67.44 and Figure 67.45 for example.

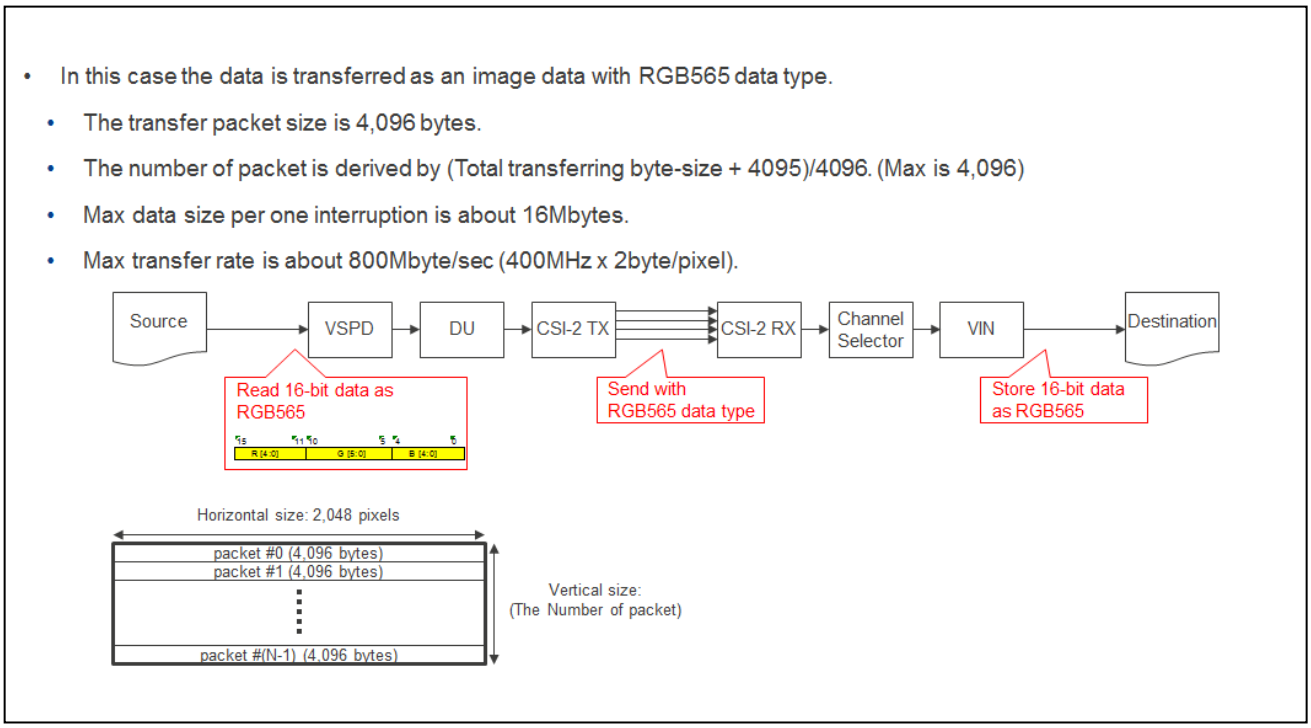

Figure 67.44 transferred as an image data with RGB565 data type

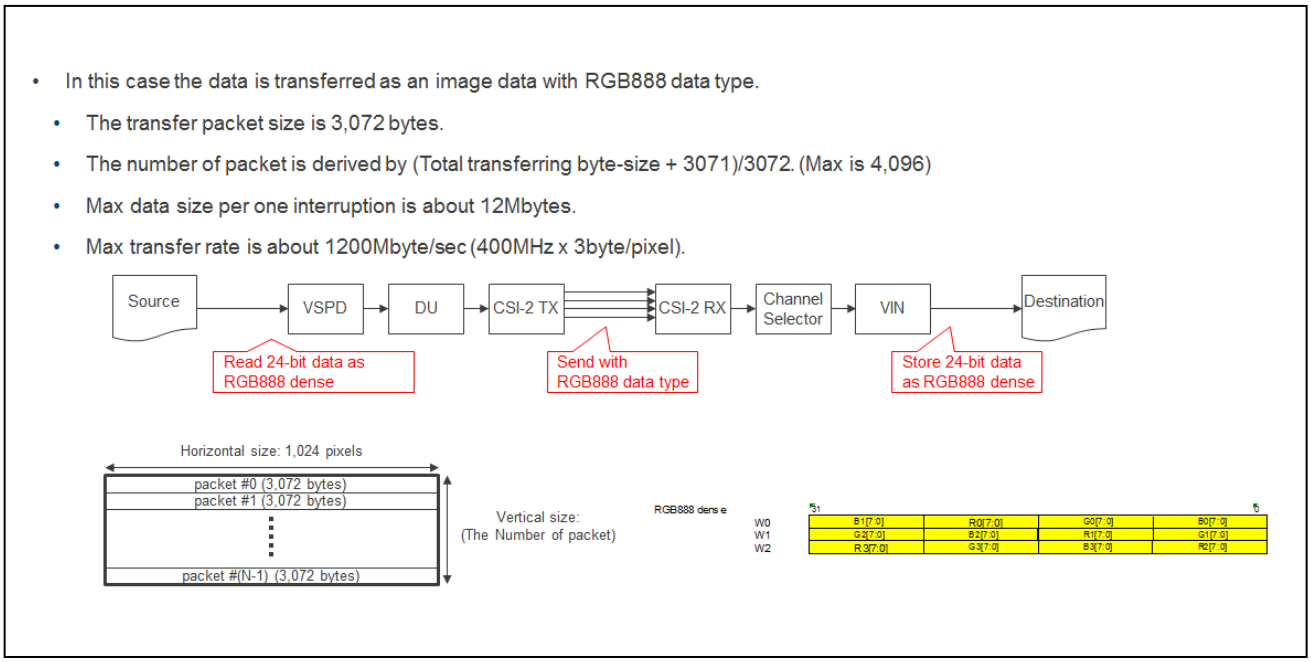

Figure 67.45 transferred as an image data with RGB888 data type

67.4.3 Example Configurations

This section describes the setting of Full-HD video transfer by using video mode as an example.

Format : RGB24bpp (DSI)

Data Lane Count : 4Lane

Over view for this example is following

1: Start the Start-up sequence (described in 67.3.5) with the parameters described on 67.4.3.1.

2: Start HS Tx Clock (described in 67.3.2.11.2) before HS Tx and initial de-skew.

3: Initial de-skew (described in 67.3.2.11.2) is needed for HS Tx over 1.5G before starting HS Tx.

4: Set some parameters to connected Peripheral device by using Command transfer mode. (described in 67.3.2.3)

5: Start the video mode transfer (described in 3.2.4 67.3.2.4 Figure 67.12 67.4.3.2

Periodic de-skew during video mode transfer is optional irrespective of data rate.

67.4.3.1 Clock parameters

Fout = dotclock frequency * ColorDepth / 2 / DataLaneCount

= 148.5 * 24 / 2 / 4

= 445.5 MHz (891 Mbps)

Fclkin = 16.66 MHz

24 MHz ≥ Fclkin / N ≥ 8 MHz

4000 MHz ≥ M * Fclkin / (N * 2) ≥ 2000 MHz : Fout = M * Fclkin / (N * 2 * 8)

67.5 Safety Mechanisms

67.5.1 Safety Mechanism 1

Replace this subsection name to safety mechanism name (e.g. ECC for IP Memory Management Unit (IPMMU). Duplicate this subsection for each safety mechanism.

67.5.1.1 Overview

- Supports EDC Check
- Supports Video input Check (Vsync, Hsync, DE)
- Supports Tx Video Packet Inspection
- Supports Tx PPI Inspection
- Supports Tx Frame CRC (1 CRC per Frame)

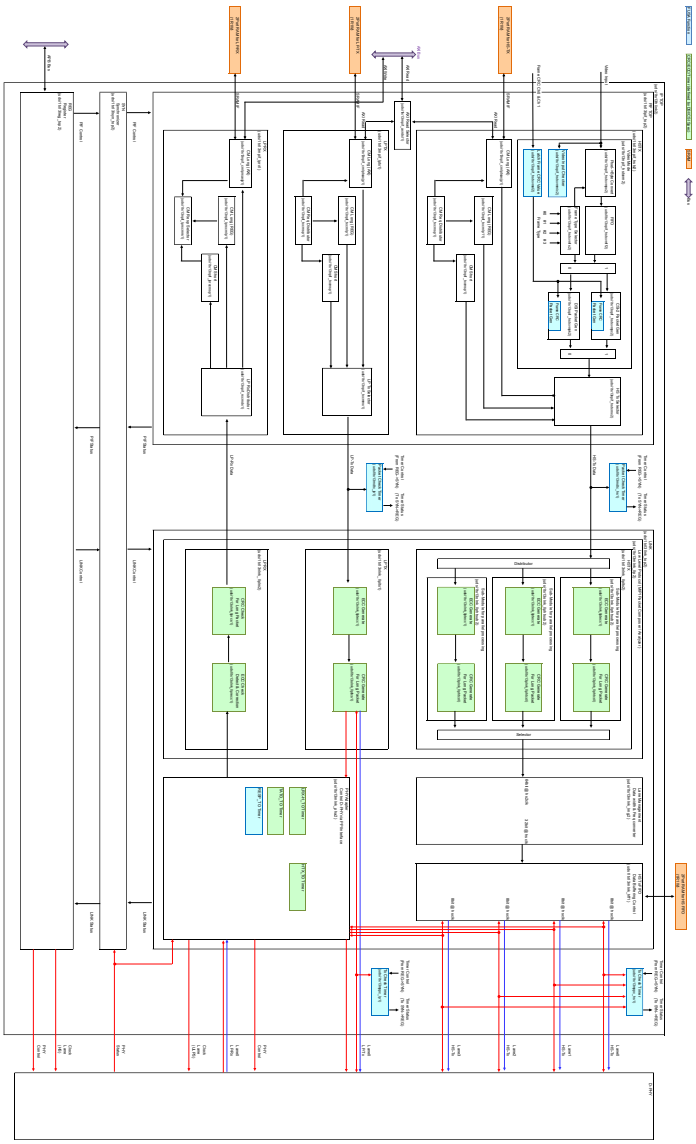

Figure 67.46 Block Diagram of DSI/CSI-2-TX module (with FuSa)

67.5.1.2 Related Registers

Refer to 67.2 Register Description.

67.5.1.3 Hardware Description

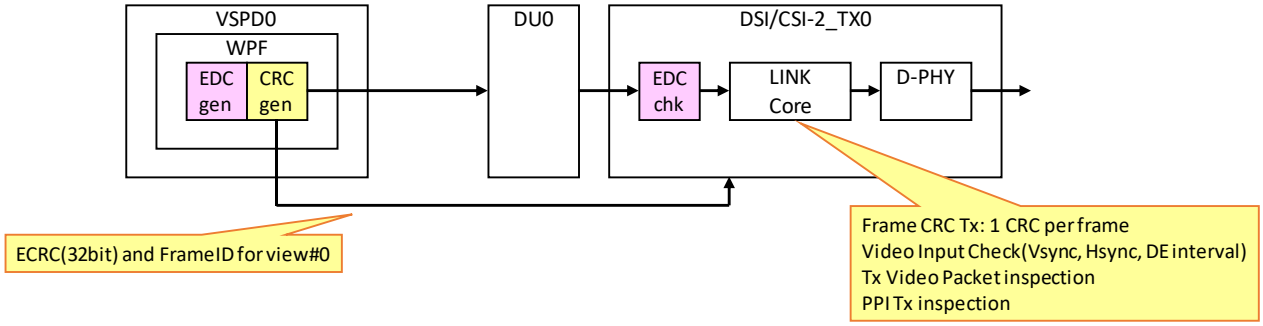

Figure 67.47 Block Diagram (with FuSa)

67.5.1.3.1 Fault detection

67.5.1.3.1.1 Tx Frame CRC (1 CRC per Frame)

When set to FDSETR-VFCEN(F(i))≠0, the CRC value for one frame of pixel data calculated by the upper layer is packetized and transmitted.Peripheral device can detect the presence or absence of fault to pixel data by comparing this CRC value with the CRC value calculated from the received pixel data.

DSI mode (IPSETR.CSI2M=B’0) :

Frame CRC can be transmit during video mode operation. When the video mode initially set in 67.3.2.4.1 is set, frame CRC transmission setting is enabled (FDSETR. VFCEN(F(i))≠00b) transmits the Generic Long Write Packet immediately after the "HSE packet (in sync pulse mode) or HSS packet (in sync event mode) on the VFP start horizontal line".Table 67.23 Generic Long Write packet parameters shows the parameters of the packet.

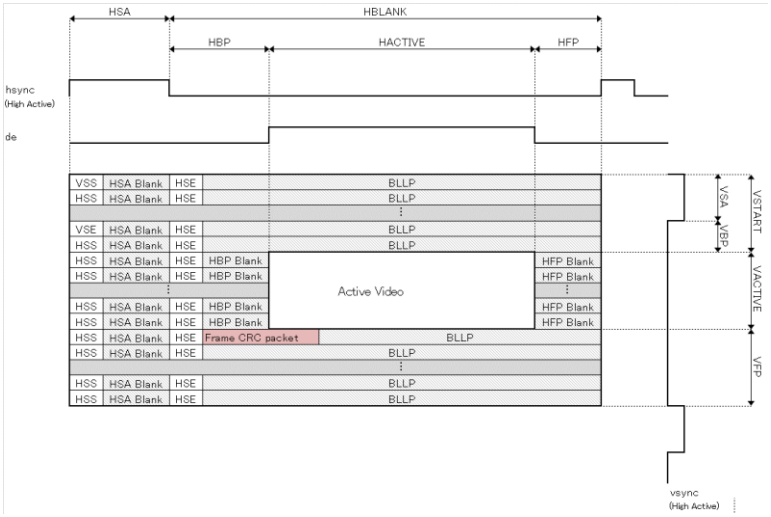

Figure 67.48 Frame CRC transmission operation timing during video mode operation (sync pulse mode)

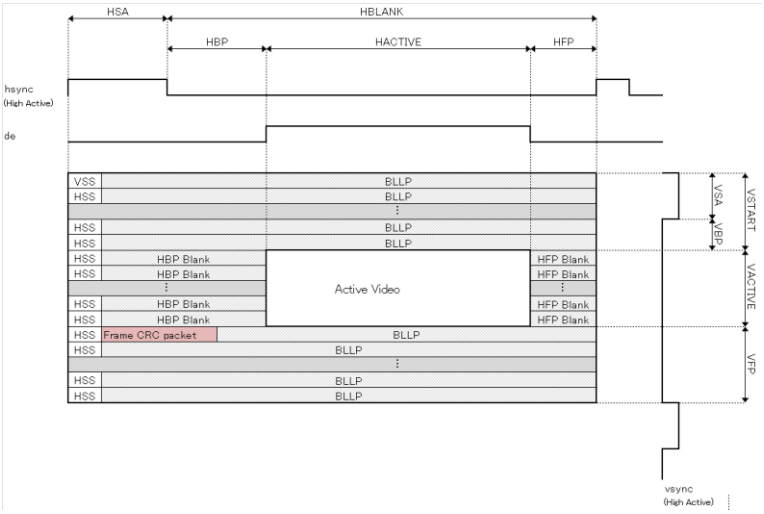

Figure 67.49 Frame CRC transmission operation timing during video mode operation (sync event mode)

Table 67.23 Generic Long Write packet parameters

Field	Number of bits	Setting value	
VC	2	TXVMPSPHSET(F(i))R.VC	
Data Type	6	Generic Long Write Code (H'29)	
Word Count	16	H'10 (16 Byte)	
ECC	8	Calculated from VC, Data Type, Word Count values and automatically granted.	
Data	Word Count ×8	Byte0 : Ch.0 Frame CRC[31:24] Byte1 : Ch.0 Frame CRC[23:16] Byte2 : Ch.0 Frame CRC[15:8] Byte3 : Ch.0 Frame CRC[7:0] Byte4 : Ch.0 {ERR flag, Frame ID[2:0], Frame number value[11:8]} Byte5 : Ch.0 Frame number value[7:0] Byte6 : Reserved (0x00) Byte7 : Reserved (0x00)	Byte8 : Ch.1 Frame CRC[31:24] Byte9 : Ch.1 Frame CRC[23:16] Byte10 : Ch.1 Frame CRC[15:8] Byte11 : Ch.1 Frame CRC[7:0] Byte12 : Ch.1 {ERRflag, Frame ID[2:0], Frame number value[11:8]} Byte13 : Ch.1 Frame number value[7:0] Byte14 : Reserved (0x00) Byte15 : Reserved (0x00)
CRC	16	Calculated from data value and automatically granted.	

CSI-2 mode (IPSETR.CSI2M=B'1) :

Frame CRC can be transmit during video mode operation. When the video mode is initially set as shown in 67.3.2.4.1, the Frame CRC transmission setting is enabled (FDSETR.VFCEN(F(i))≠00b) to send embedded 8-bit non-image Data packets after the last line of video packets are sent.

Figure 67.50 Embedded 8-bit non-image Data packet format shows the format of the packet, and Table 67.24 shows the parameters of the packet.

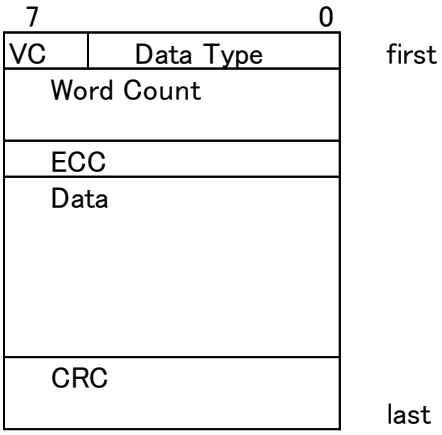

Figure 67.50 Embedded 8-bit non-image Data packet format

Table 67.24 Embedded 8-bit non-image Data packet parameters

Field	Number of bits	Setting value	
VC	2	TXVMPSPHSET(F(i))R.VC	
Data Type	6	Embedded 8-bit non image Data Code (H'12)。	
Word Count	16	H'10 (16 Byte)	
ECC	8	Calculated from VC, Data Type, Word Count values and automatically granted.

		Frame number value[11:8]} Byte5 : Ch.0 Frame number value [7:0] Byte6 : Reserved (0x00) Byte7 : Reserved (0x00)	Frame number value[11:8]} Byte13 : Ch.1 Frame number value [7:0] Byte14 : Reserved (0x00) Byte15 : Reserved (0x00)
CRC	16	Calculated from data value and automatically granted.	

67.5.1.3.1.2 Video input Check (Vsync, Hsync, DE)

Compares the video input (vsync, hsync, de, nvb) with the parameters set to TXVMVPRMSET1,2,3,4(F(i))R, and sets FDSR.VINERR=1 when there is an unexpected input. When transmitting different types of video data by switching frames (Chapter 67.3.2.4.3), the parameters are switched for each frame type for comparison.

Check for the following periods:

・Check start:

Detects VSYNC start edge after TXVMCR.EN=0->1 set.

After DU setting completion, set TXVMCR.EN=1.

・Check end:

TXVMSETR.VSTPM=0: TXVMCR.EN=1->0 clear.

TXVMSETR.VSTPM=1: Detects VSYNC start edge after clearing TXVMCR.EN=1->0.

67.5.1.3.1.3 Tx Video Packet Inspection

When set to FDCR.DTTEN=1, a timer that monitors outbound packets inside the Transmitter module (between the PIF block and the LINK block) is started.

After startup, the timer counts up every cycle (hs2clk for HS, lpclk for LP). When it detects the transmission of a monitored packet, it resets the timer and resumes counting up after the monitored packet transmission is complete.

1 is set to FDDSR.DTTO when the target packet is not sent at the transfer speed set by FDDTTMSETR.SPDTYP for the period set by FDDTTMSETR.DTOVL, DTTOSCL".

The data type of the packet to be monitored should be set to FDDTEN0,1R.

It is prohibited to change the following registers between FDCR-DTTEN=1.

FDDTTMSETR、FDDTEN0R、FDDTEN1R

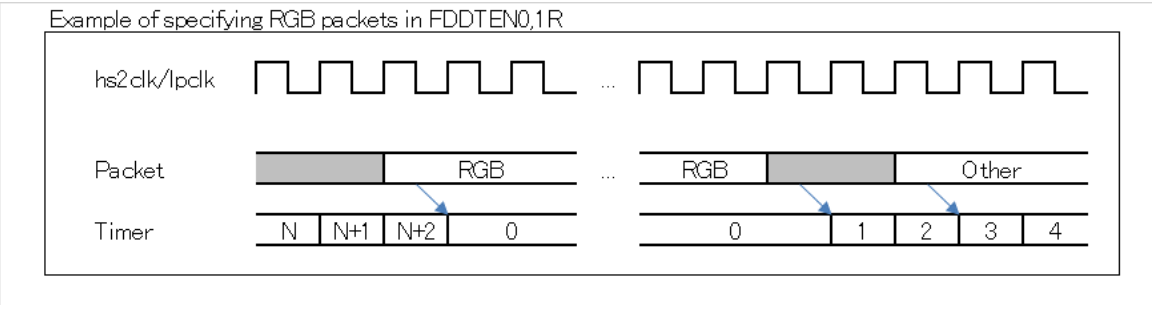

Figure 67.51 Example of timer operation of Tx Video Packet Inspection

67.5.1.3.1.4 Tx PPI Inspection

When set to FDCR.PPITEN=1, a timer that monitors transmissions at the PPI end of the Transmitter module is activated.

The behavior of the timer varies depending on the transfer speed.

- HS (FDPPITMSETR.SPDTYP="0")
  After startup, the timer counts up every cycle (hsclk). When data transmission of the number of cycles set in the register is detected (considered as a single data transmission even if multiple packets are connected), the timer is reset, and the timer count-up is resumed after the data transmission is completed.
  The timer will not be reset unless data is transferred in all effective lanes set in TXSETR.LANECNT. So, for example, if one of the active lanes fails and no data is transferred, the timer will not reset and will eventually time out.

- LP (FDPPITMSETR.SPDTYP="1")
  After startup, the timer counts up every cycle (lplk). When it detects a data transmission of the number of cycles set in the register, it resets the timer and resumes counting up the timer immediately afterwards (without waiting for the data to complete).

During the period set to FDPPITMSETR.PPITOVL, PPITOSCL, FDSR.PPITO sets 1 when no more than the number of cycles set to FDPPITMSETR.PPITCVL, PPCCSCL is performed at the transfer speed set by FDPPITMSETR.SPDTYP.
During FDCR.PPITEN=1, it is prohibited to change the following registers:

FDPPITMSETR

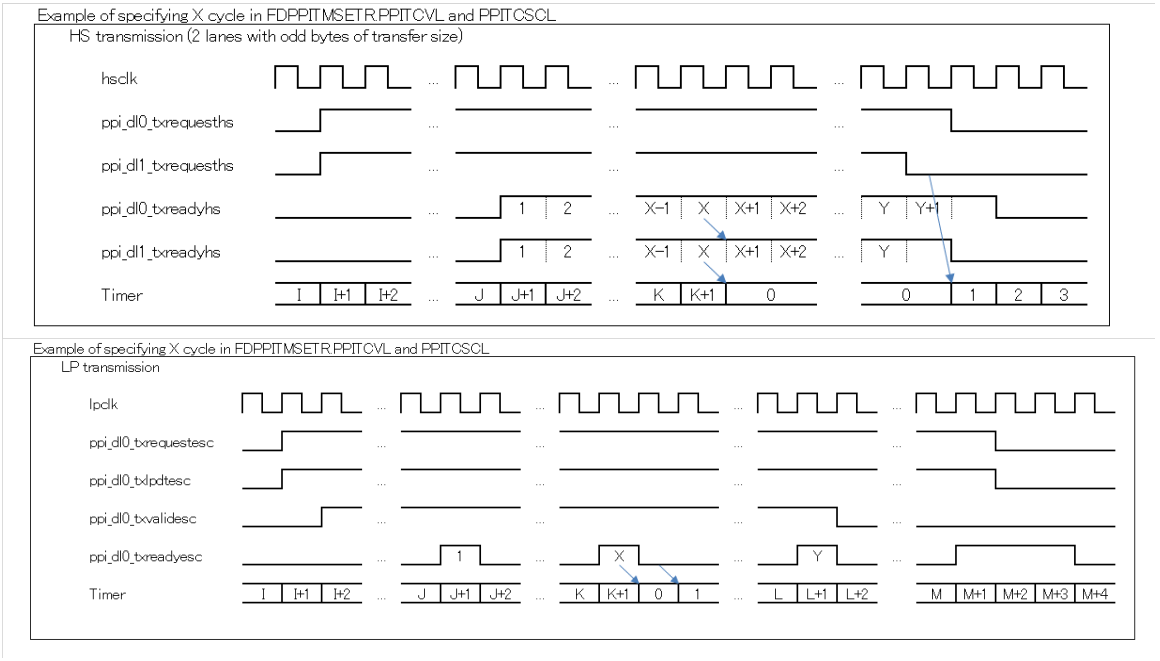

Figure 67.52 Example of PPI monitoring timer operation

81. Serial Sound Interface Unit (SSIU)

81.1 Overview

The SSIU, incorporating a SSI module, allows independent operation of SSI modules, operation of multiple SSI modules sharing the same serial clock, and connection or split of multichannel data. Refer to Section 82 to understand single SSI module in detail.

Note: Configure the system so that connected external devices can operate on the same clock source.

81.1.1 Features

- Incorporates the SSI module.
- Supports 6 channels/1 sound source with the SSI module.
- Supports 8 channels/1 sound source with the SSI module.
- TDM format (Basic Configuration) corresponds to 4, 6 or 8-channel data.
- TDM format corresponds to 16-channel data (TDM-16ch mode).
- Handles 8-channel data on the serial bus and 6-channel data in the SoC (TDM extend mode).
- Handles 6-channel data on the serial bus and 8-channel data in the SoC (TDM extend mode).
- Connects monaural or stereo data to output TDM format data (TDM split mode).
- Splits TDM format input data into monaural or stereo data (TDM split mode).
- Connects stereo or multi data to output TDM format data (TDM ex-split mode).
- Splits TDM format input data into stereo or multi data (TDM ex-split mode).
- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.

81.1.2 Block Diagram

Figure 81.1 show the SSIU block diagrams.

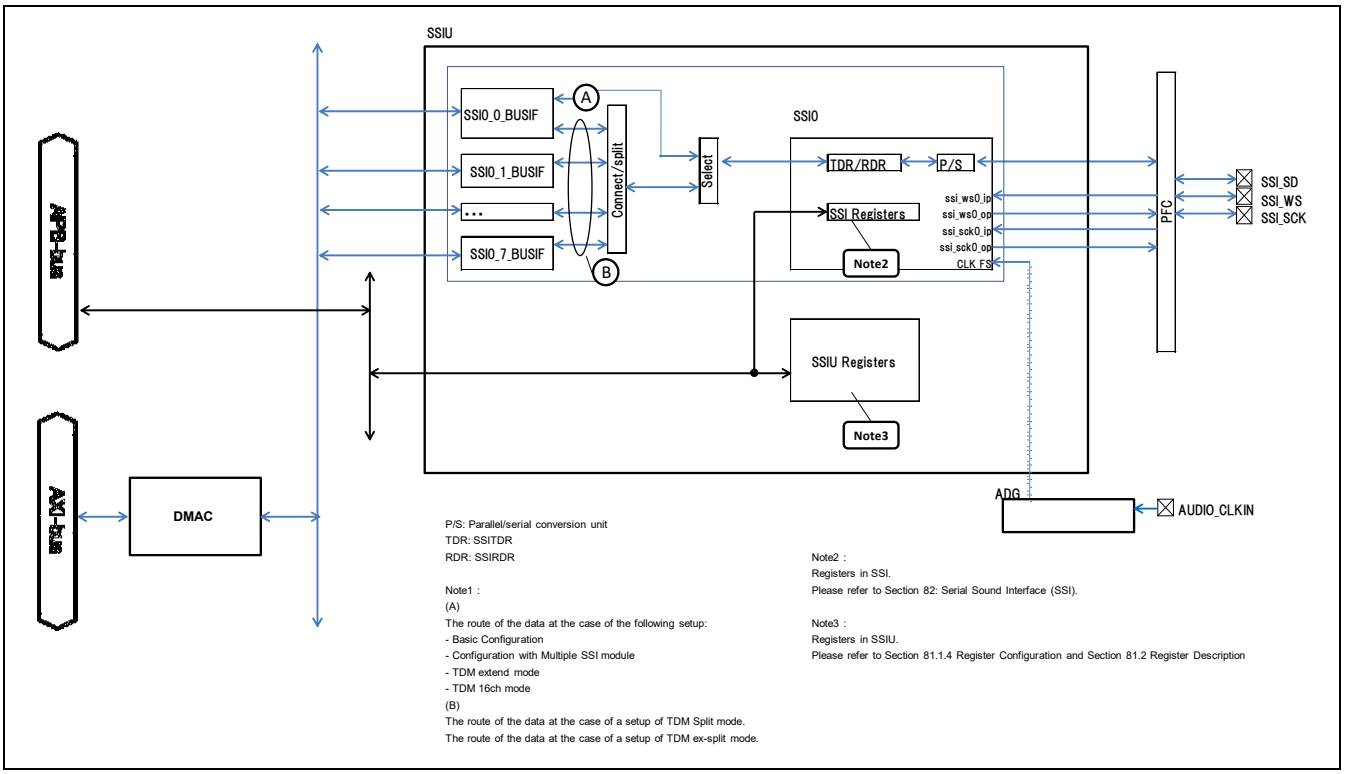

Figure 81.1 Block Diagram of SSIU

81.1.3 External Pins

Table 81.1 shows the pin configuration.

Notes: 1. The write value should always be 0.
2. When use TDM-8ch, B'00111 to B'11111 is reserved.
3. Setting to share place in the stream data with multiple BUSIF channels is prohibited. For example, when x = 0 is 8channel, x = 1 to 3 cannot be used and write value should always be 0.
4. When use TDM-8ch, the write value should always be 0.

81.3 Operation

81.3.1 Module Specifications

Table 81.3 show the correspondences between the modules and functions.

Table 81.3 Function Correspondences

			Format		
		External Interface	Basic Configuration	TDM Extend Mode	TDM Split Mode/ TDM 16Ch Mode/ TDM Ex-Split Mode
1	SSI0	I2S	Supported	Not supported	Not supported
2	SSI0	TDM	Supported	Supported	Supported

81.3.2 Basic Configuration

Data transfer is performed between the SSIU and other audio modules or external memories via BUSIF connected to the audio local bus and the audio DMA bus.

Figure 81.2 shows the data transfer of SSI0. As shown in Figure 81.2, SSI0_1_BUSIF to SSI0_7_BUSIF are not used.

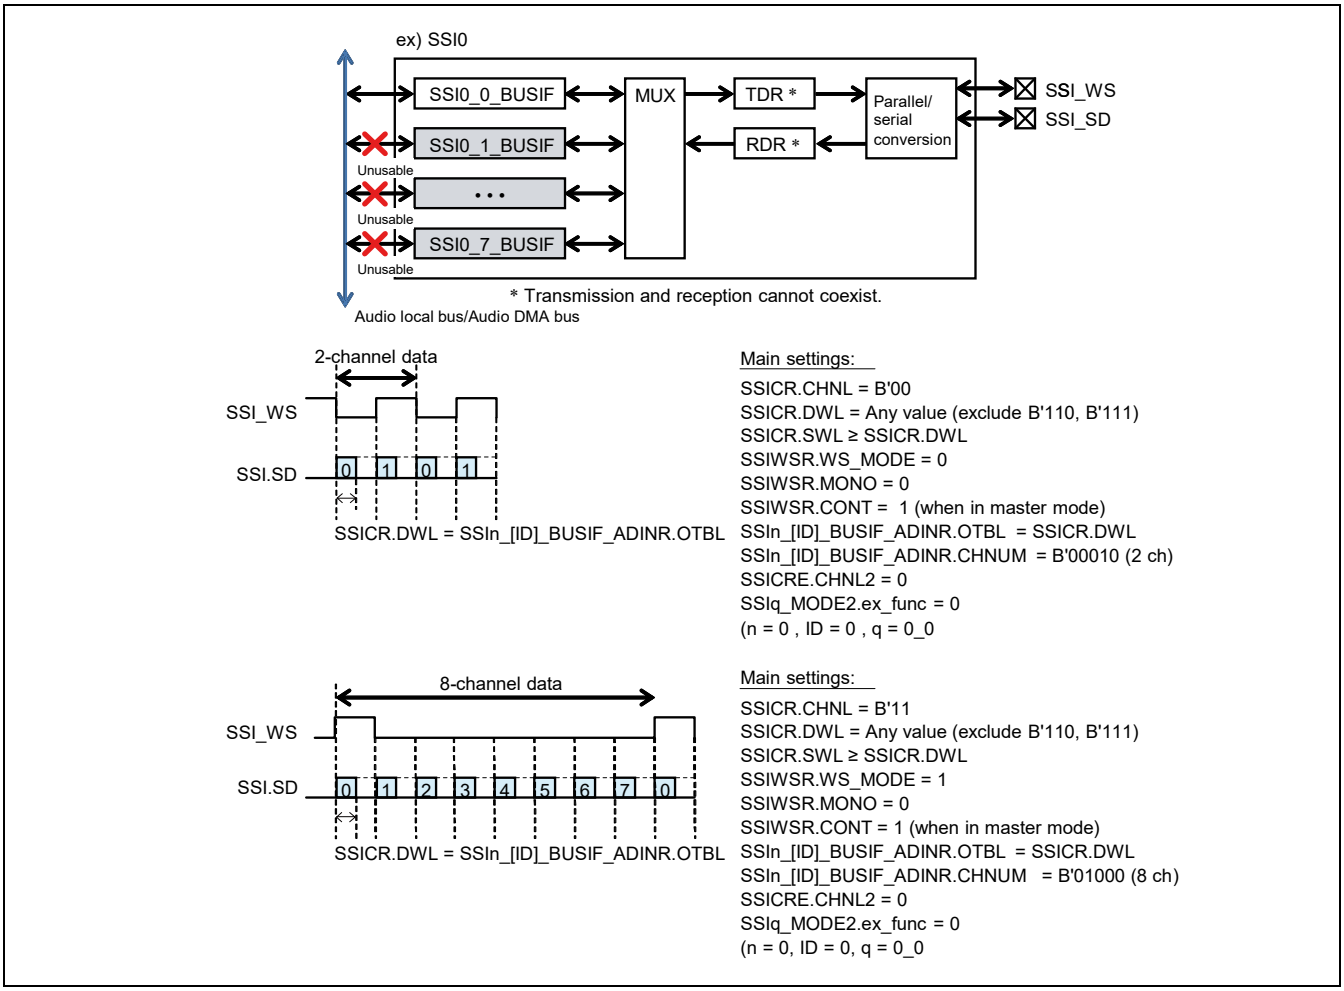

Figure 81.2 Basic Configuration (SSI0)

81.3.3 TDM Format Extension Function (TDM Extend Mode)

The TDM format extension function allows operation with 8-channel data in the serial bus and 6-channel data inside the SoC, or operation with 6-channel data in the serial bus and 8-channel data inside the SoC.

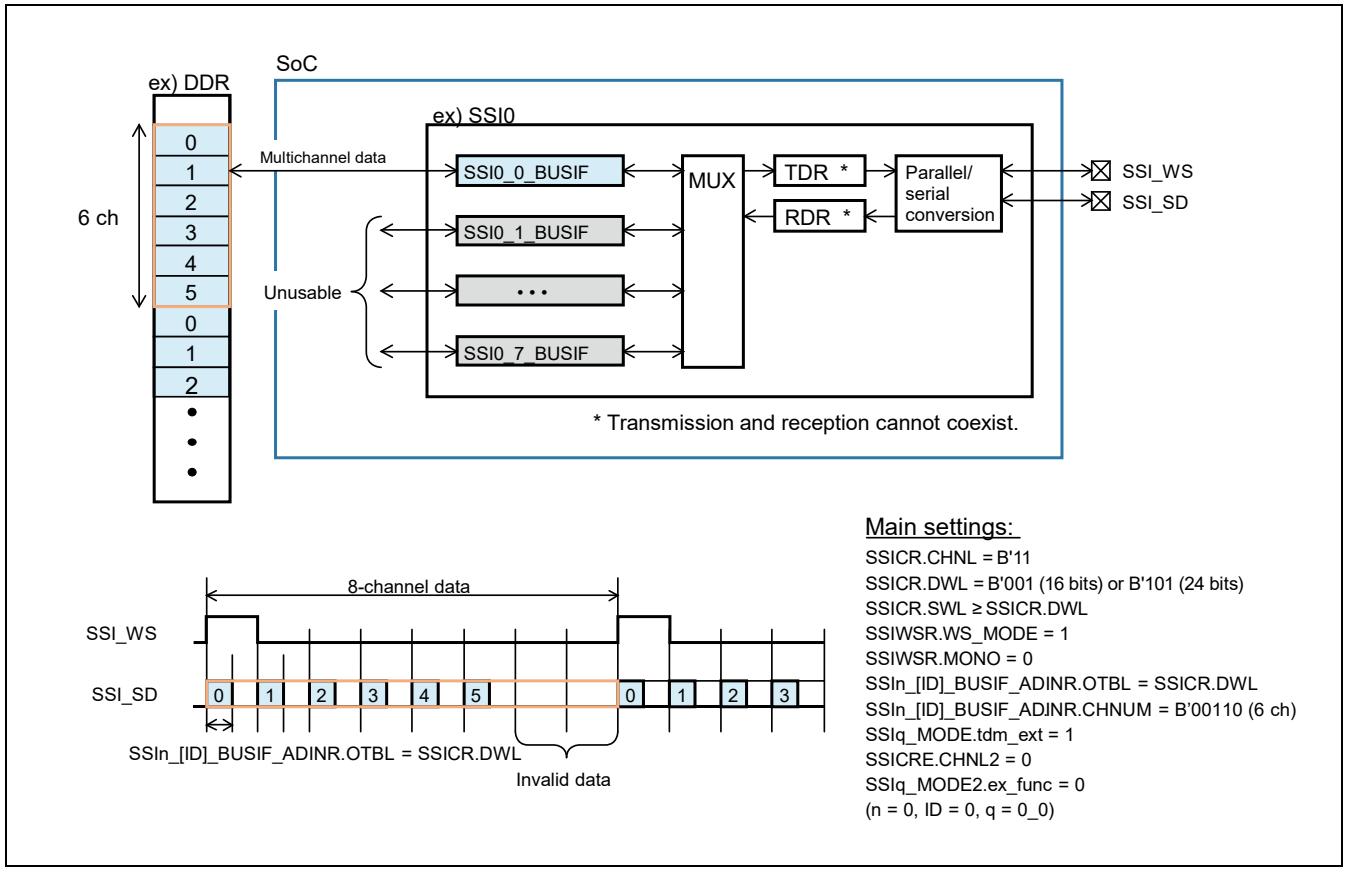

Figure 81.3 TDM Extend Mode Operation with 8-channel Data in Serial Bus and 6-channel Data Inside the SoC (SSI0)

Note: When the above configuration is used, SSI0_1_BUSIF to and SSI0_7_BUSIF cannot be used.

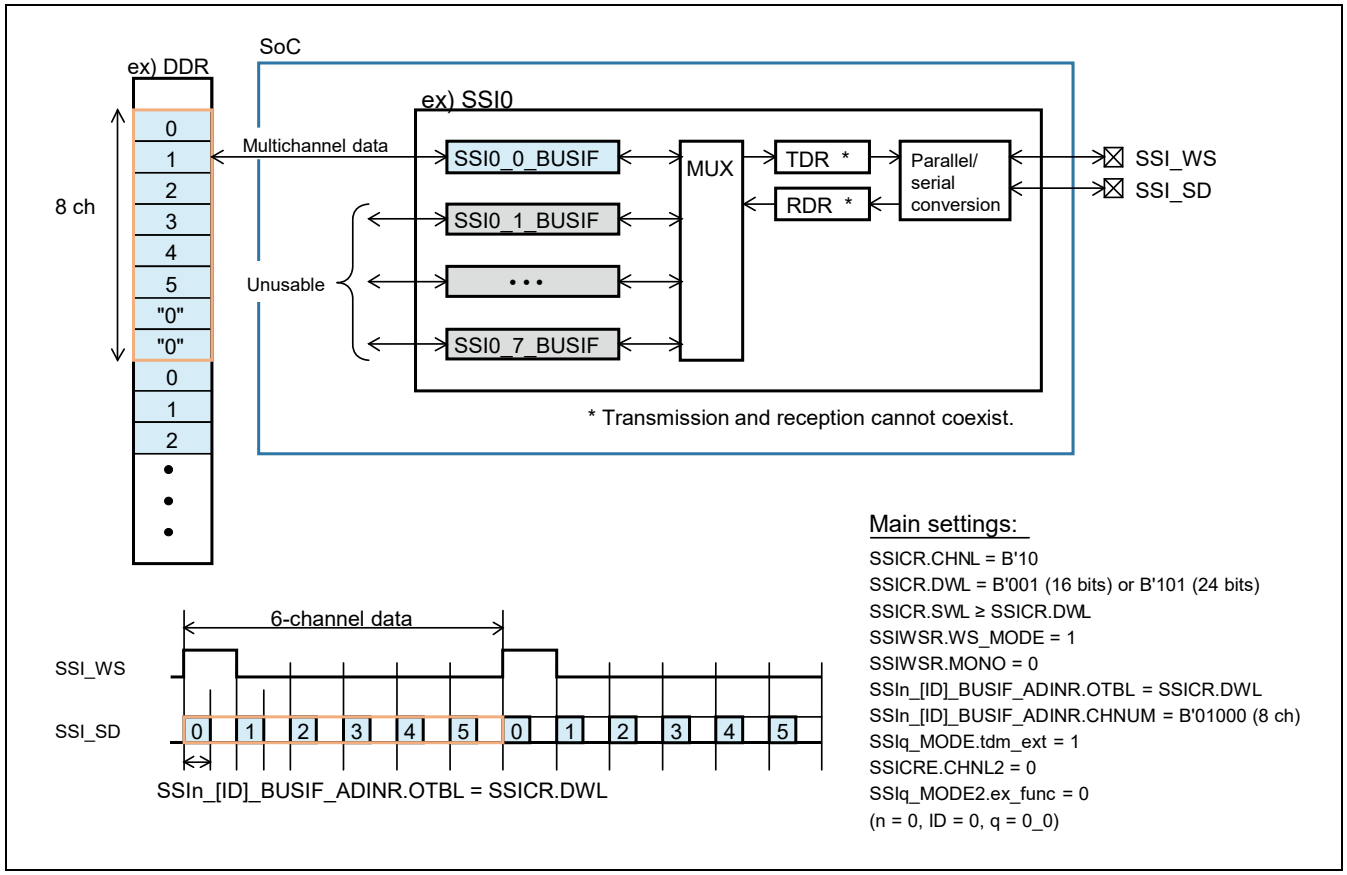

Figure 81.4 TDM Extend Mode Operation with 6-channel Data in Serial Bus and 8-channel Data Inside the SoC (SSI0)

Note: When the above configuration is used, SSI0_1_BUSIF to SSI0_7_BUSIF cannot be used.

81.3.4 TDM Format Split Function (TDM Split Mode)

The TDM format split function (TDM split mode) allows connecting four independent monaural or stereo data inside the SoC and outputting the data in the TDM format, and splitting TDM format input data into four independent monaural or stereo data and distributing the data inside the SoC. This function allows TDM-8ch or TDM-4ch.

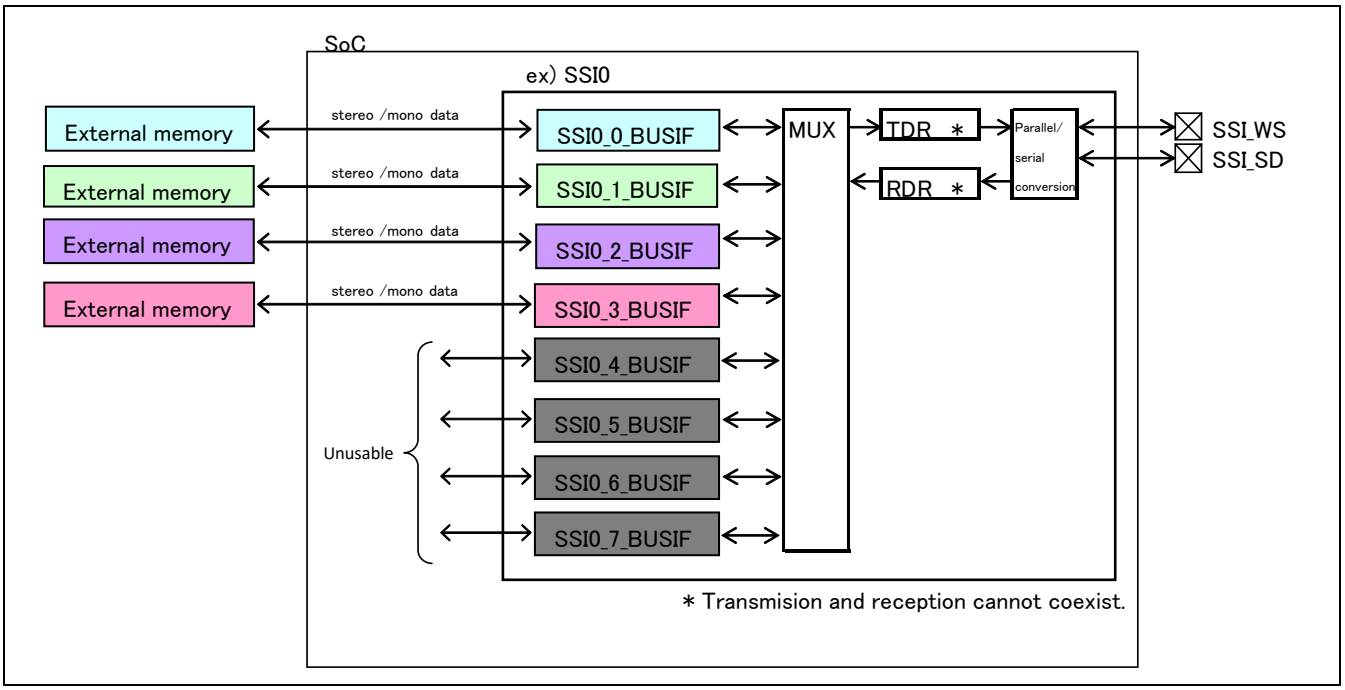

Figure 81.5 TDM Split Mode

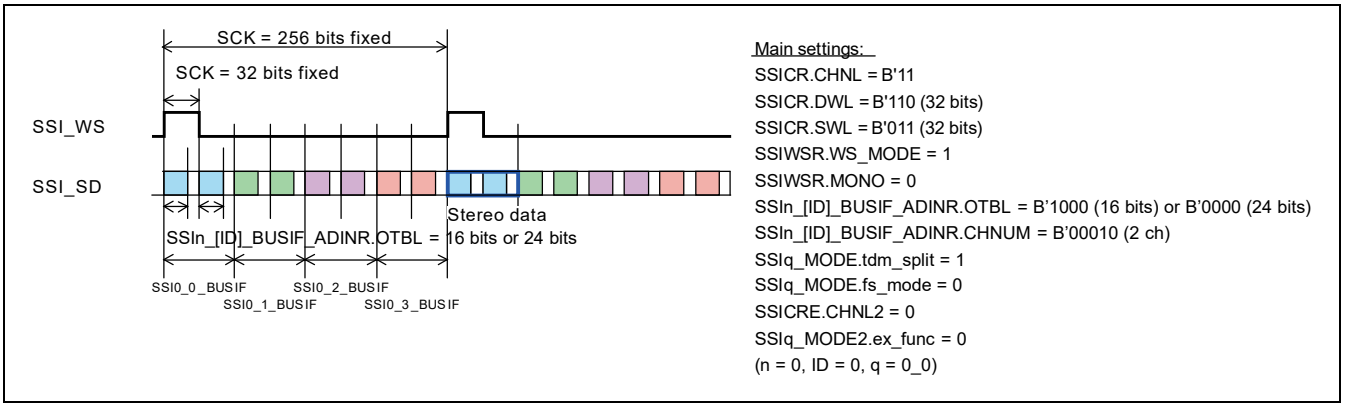

Figure 81.6 TDM Split Mode (Stereo × 4)

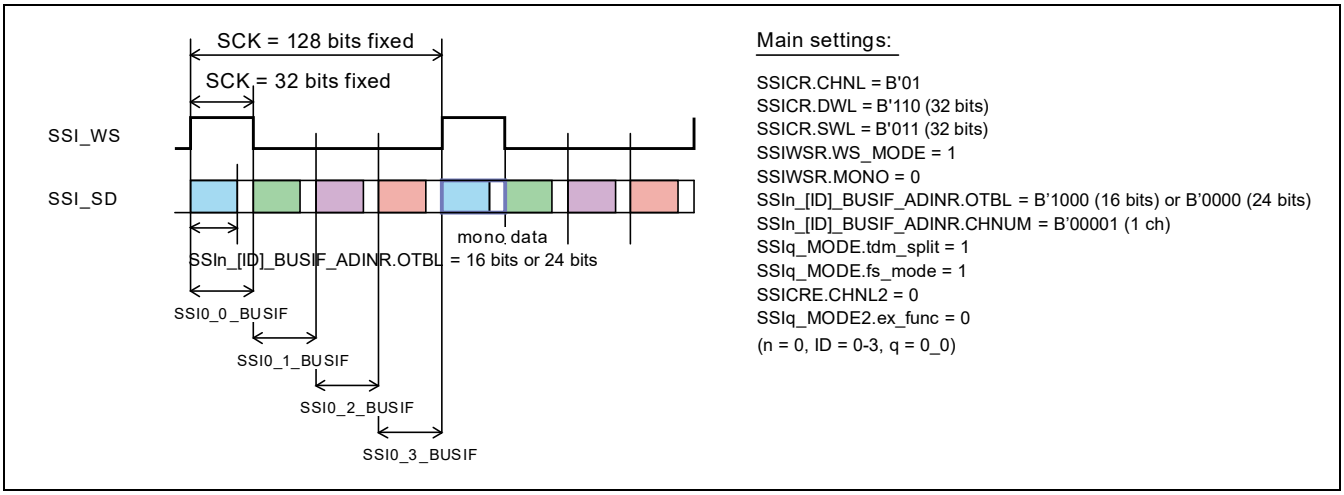

Figure 81.7 TDM Split Mode (Monaural × 4)

Notes: 1. The SWL and DWL bits in SSICR should be fixed at 32-bit setting.
2. Transmission and reception cannot coexist.
3. Data input to SSIn_[ID]_BUSIF (n = 0, ID = 0-3) should be operated synchronously with the SSI sampling frequency (WS signal cycle).
4. Setting of SSIn_[ID]_BUSIF_ADINR.OTBL(n = 0, ID = 0-3) = B'1000 (16bit) and SSIn_[ID]_BUSIF_ADINR.OTBL(n = 0, ID = 0-3) = B'0000 (24bit) cannot coexist within the same SSI.

81.3.5 TDM Format 16ch Function (TDM 16ch Mode)

The TDM format 16ch function (TDM 16ch mode) is similar to basic function. It is correspondence to TDM-16channel.

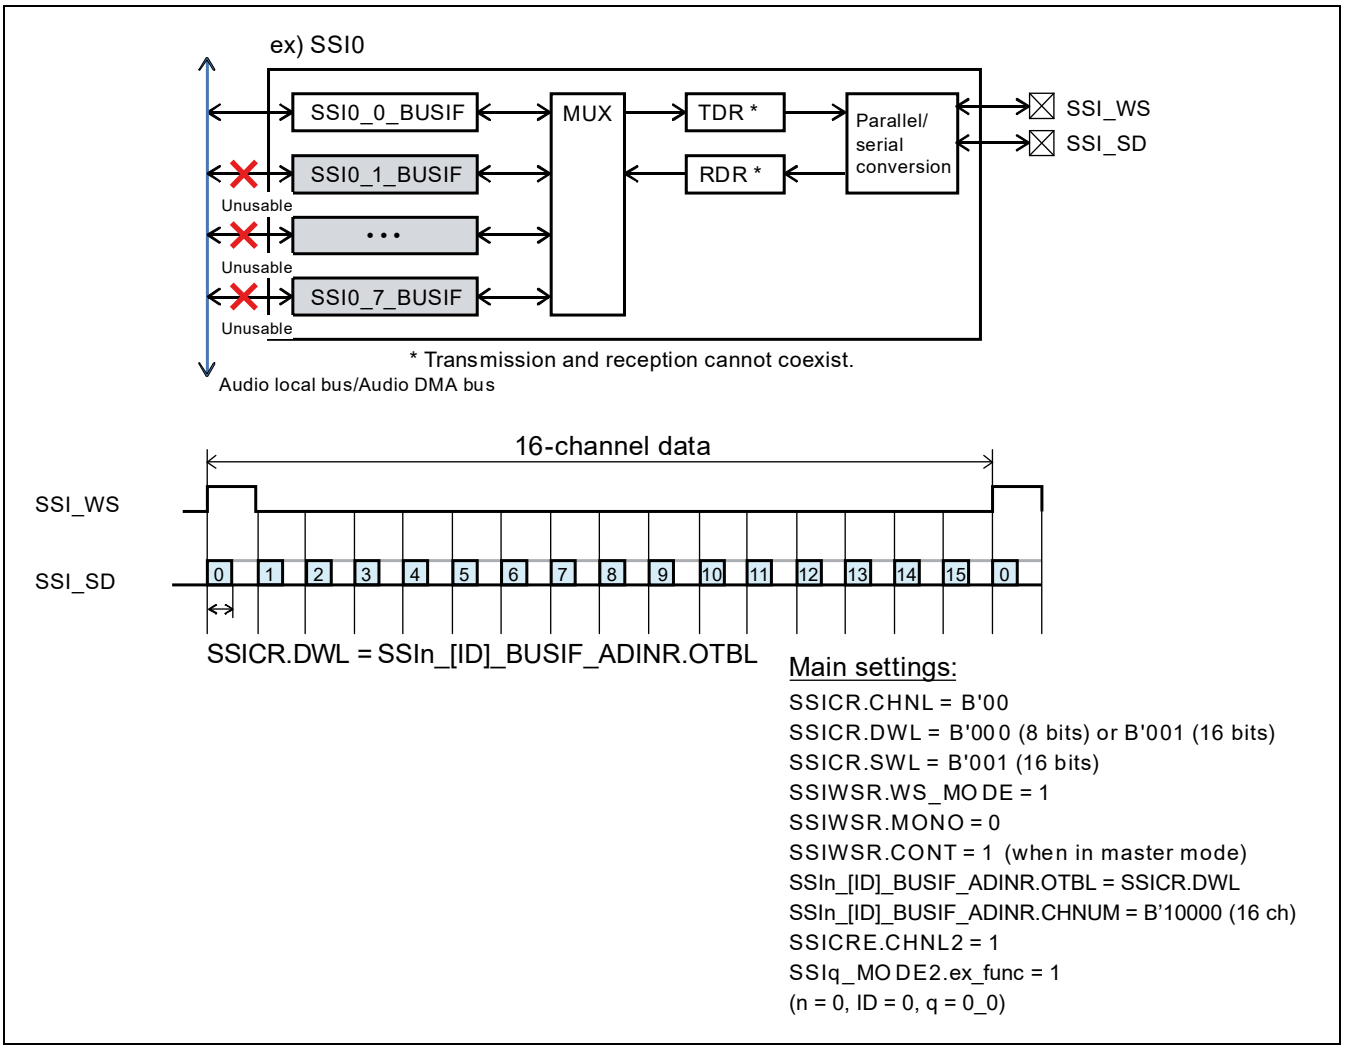

Figure 81.8 TDM 16ch Mode

81.3.6 TDM Format Extend Split Function (TDM Ex-Split Mode)

The TDM format extend split function (TDM ex-split mode) allows connecting eight independent stereo or multi data inside the SoC and outputting the data in the TDM format, and splitting TDM format input data into eight independent stereo or multi data and distributing the data inside the SoC. This function allows TDM-16ch or TDM-8ch (TDM-6ch, 4ch are not supported). Setting to share place in the stream data with multiple BUSIF channels is prohibited. For example, when SSI0_0_BUSIF used as 6channel, SSI0_1_BUSIF and SSI0_2_BUSIF cannot be used.

Notes: 1. Transmission and reception cannot coexist.
2. Data input to SSIn_[ID]_BUSIF (n = 0, ID = 0-7) should be operated synchronously with the SSI sampling frequency (WS signal cycle).
3. Another setting of SSIn_[ID]_BUSIF_ADINR.OTBL(n = 0, ID = 0-7) cannot coexist within the same SSI. (ex. Setting of SSIn_[ID]_BUSIF_ADINR.OTBL(n = 0, ID = 0-7) = B'1000 (16bit) and SSIn_[ID]_BUSIF_ADINR.OTBL(n = 0, ID = 0-7) = B'0000 (24bit) cannot coexist within the same SSI.)

81.3.7 Procedure of SSIU Transfer

Figure 81.12 to Figure 81.15 show the operation flow.

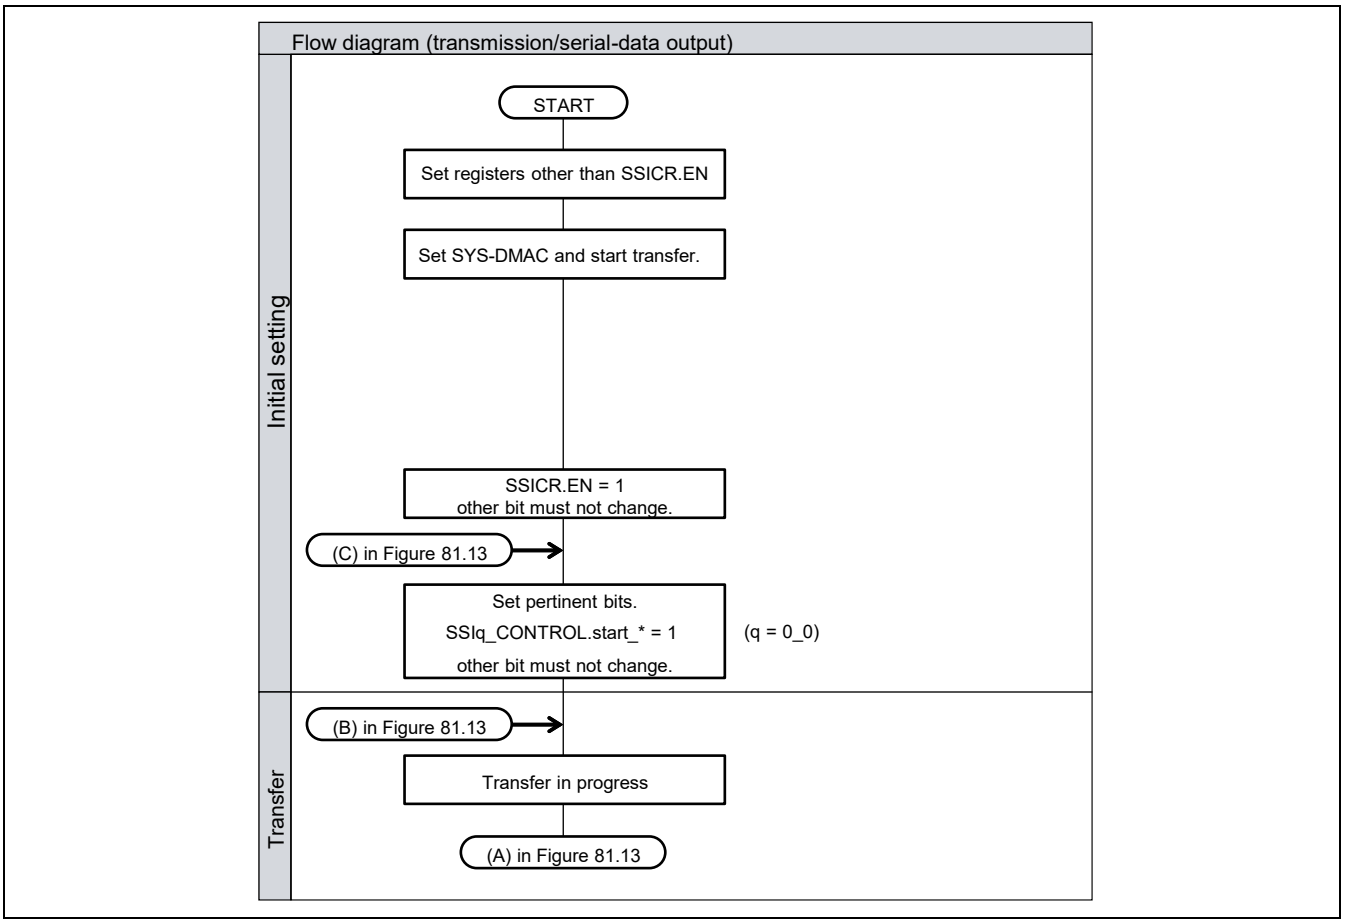

Figure 81.12 Transmission (1)

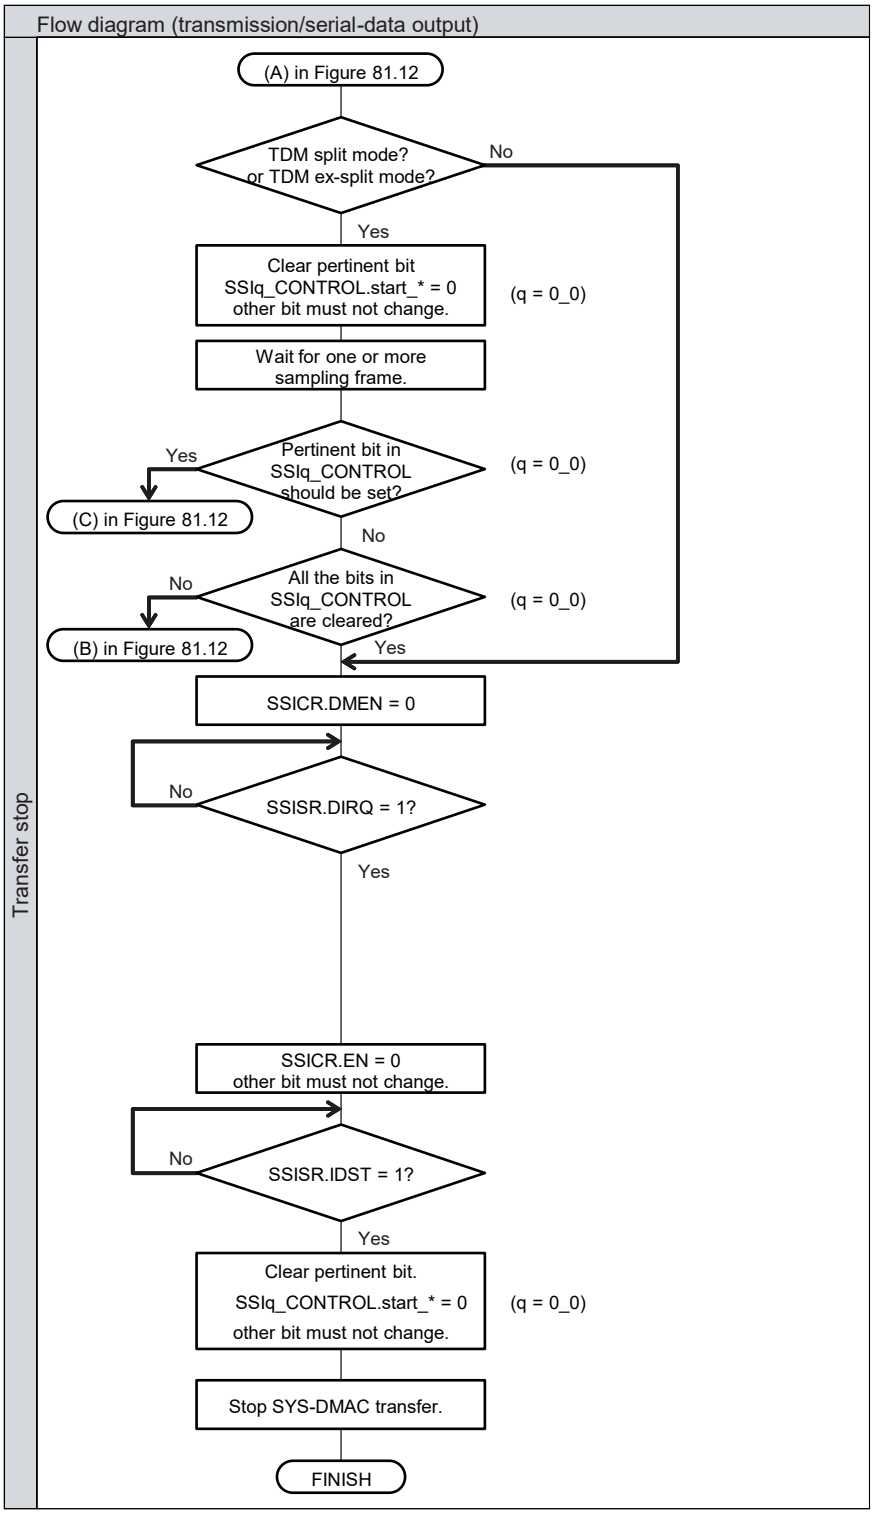

Figure 81.13 Transmission (2)

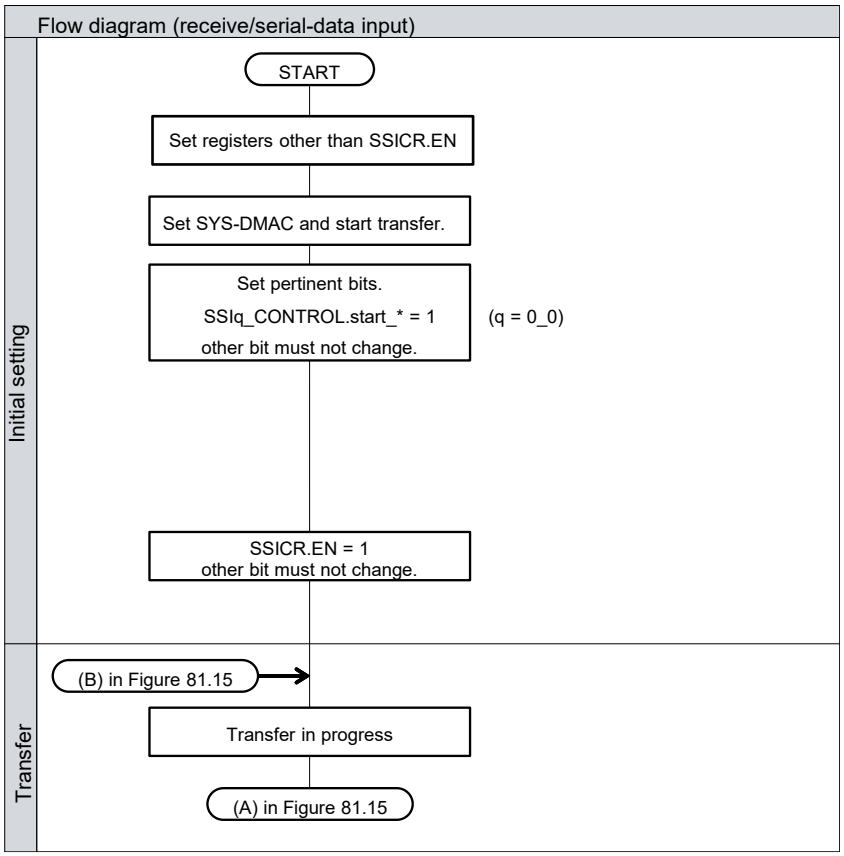

Figure 81.14 Reception (1)

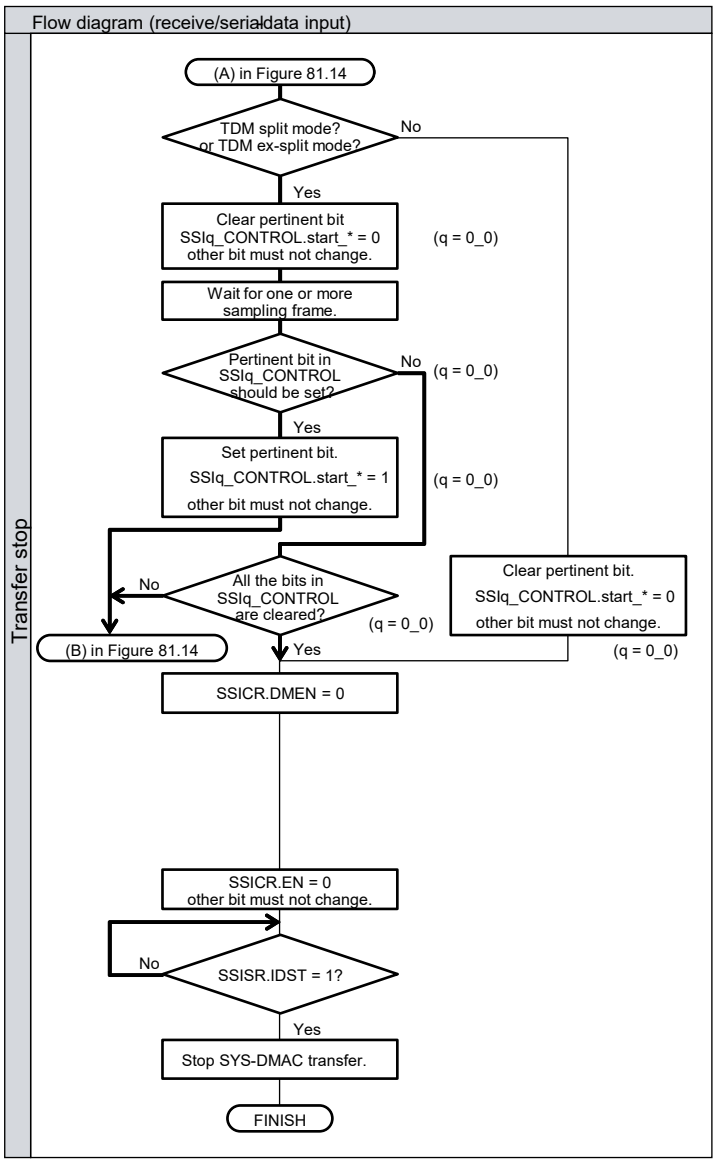

Figure 81.15 Reception (2)

81.3.8 Interrupts of SSI Setting

SSI can output interrupt signals when one of several events happen. Figure 81.16 illustrates how SSI generates interrupt signals and Table 81.4 and Table 81.5 indicate combinations of relevant registers for each SSI to generate interrupt signals (refer to explanations of relevant registers (Section 81.2) and SSI (Section 82))

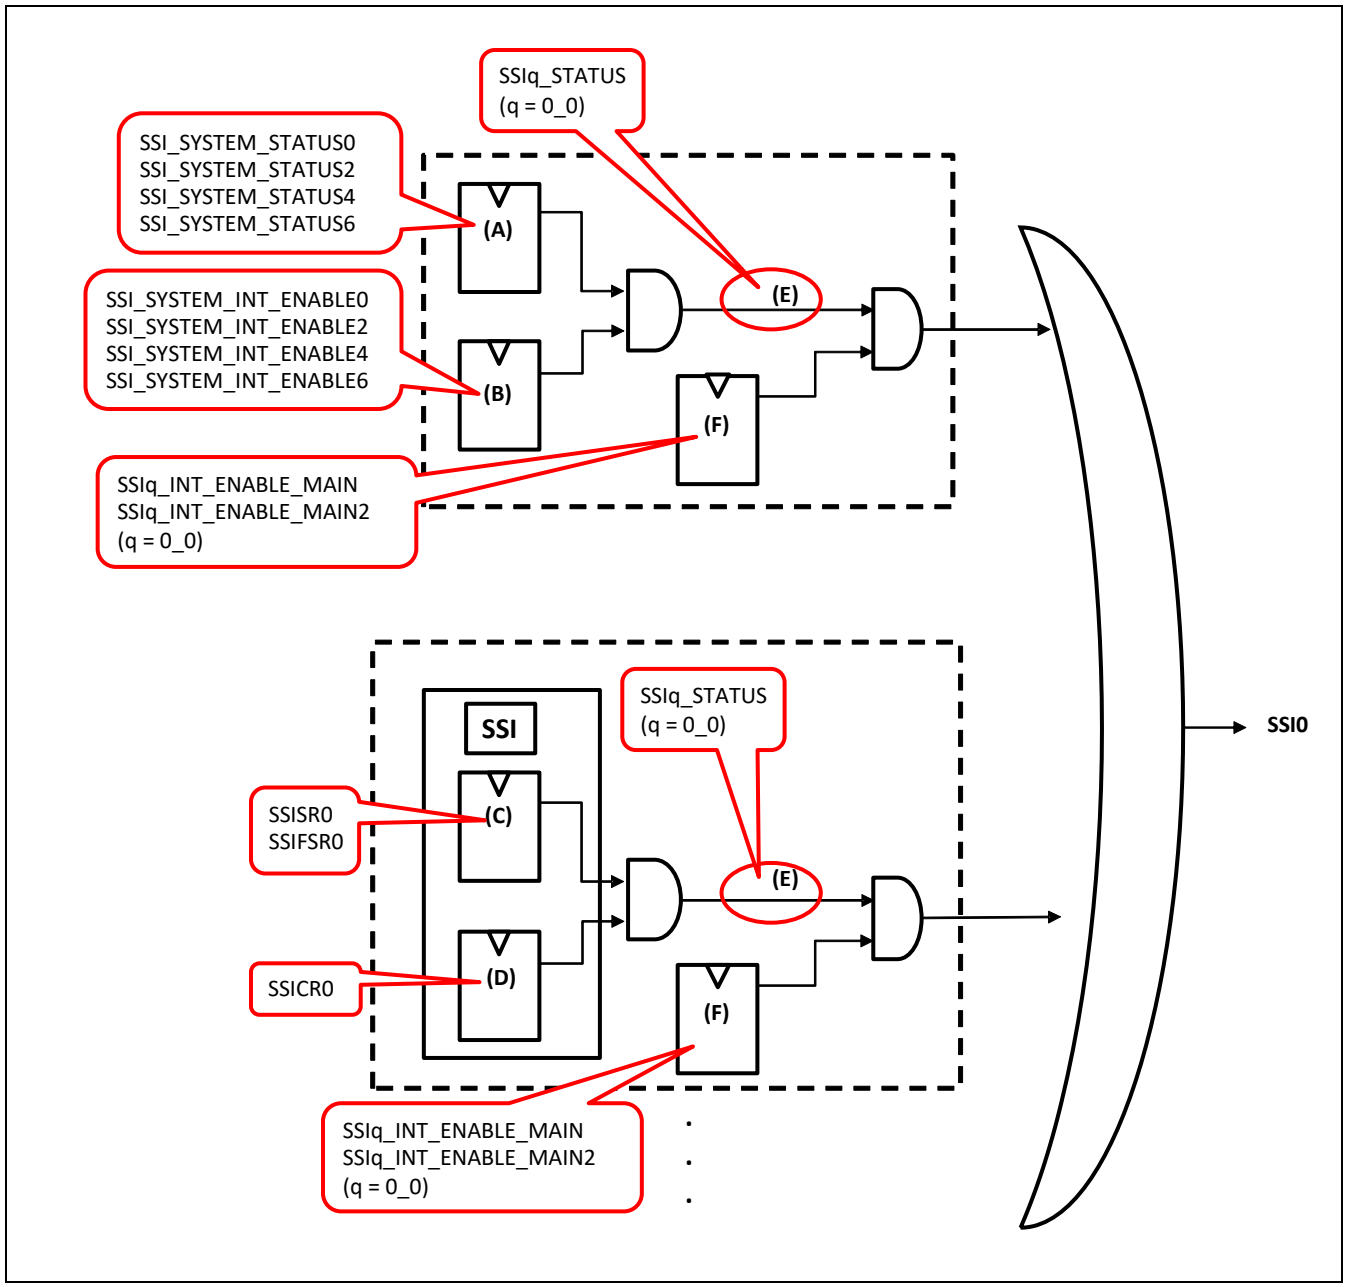

Figure 81.16 Mechanism of generating interrupt signals

Table 81.4 Combinations of relevant registers for each SSI (1)

		(A)	(B)	(E)	(F)
SSI	BUSIF	Register Name (Interrupt Factor)	Register Name (Interrupt Enable)	Register Name (Interrupt Factor)	Register Name (Interrupt Enable)

81.3.9 SYS-DMAC

The SYS-DMAC is used by data transfer between the external memory and SSIU module. The setting values of DMASAR and DMADAR of the SYS-DMAC are shown in Table 81.6.

Table 81.6 Setting Values of DMASAR and DMADAR of SYS-DMAC

Name of Register	DMASAR/DMADAR	
SSI0_0_BUSIF	H'EC40	0000
SSI0_1_BUSIF		8000
SSI0_2_BUSIF	H'EC41	0000
SSI0_3_BUSIF		8000
SSI0_4_BUSIF	H'EC42	0000
SSI0_5_BUSIF		8000
SSI0_6_BUSIF	H'EC43	0000
SSI0_7_BUSIF		8000

81.3.10 Rearranging the Order of Data

Rearranging the order of data is possible in the channel unit. Places of data in each data format are defined as in Table 81.7 to Table 81.10.

Table 81.7 Definition of Data Places in Each Data Format (1)

SSI · Stereo (2 channels)	
SSI · TDM (6 channels)	SSI · TDM (8 channels)	
Table 81.8 Definition of Data Places in Each Data Format (2)

BUSIF · Stereo (2 channels) · 24 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 1 * H'08 Place 0 * H'0C Place 1 * ... ... *
BUSIF · Stereo (2 channels) · 16 bits	External memory image 31 0 H'00 Place 0 Place 1 H'04 Place 0 Place 1 H'08 Place 0 Place 1 H'0C Place 0 Place 1 ... ...
BUSIF · Stereo (2 channels) · 8 bits	External memory image 31 0 H'00 Place 1 Place 0 Place 1 Place 0 H'04 Place 1 Place 0 Place 1 Place 0 ... ...
BUSIF · Monaural (1 channel) · 8/16 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 0 * H'08 Place 0 * H'0C Place 0 * ... ... *
BUSIF · Multichannel (4 channels) · 24 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 1 * H'08 Place 2 * H'0C Place 3 * H'10 Place 0 * H'14 Place 1 * H'18 Place 2 * H'1C Place 3 * ... ... *
BUSIF · Multichannel (4 channels) · 16 bits	External memory image 31 0 H'00 Place 0 Place 1 H'04 Place 2 Place 3 H'08 Place 0 Place 1 H'0C Place 2 Place 3 ... ...

81.3.11 Module Standby Function

For the register settings to make a transition to or from module standby mode, refer to section 9. Module Standby, Software Reset.

(1) Transition to Module Standby Mode

To make a transition to module standby mode by the module standby function, refer to the following transition procedure for each module.

(a) SSIU/SSI

1. Check the following registers' settings.
   [SSIU]
   — All bits in the SSIq control register (SSIq_CONTROL) (q = 0_0) are cleared to 0 (data transfer stopped).
   — All bits in the SSIq interrupt enable register (SSIq_INT_ENABLE_MAIN) (q = 0_0) are cleared to 0 (interrupt disabled).
   [SSI]
   — The DMEN and EN bits in the control register (SSICRn) (n = 0) are cleared to 0 (disabled).
   — The IDST bit in the status register (SSISRn) (n = 0) is set to 1.
   — The CONT bit in the WS mode register (SSIWSRn) (n = 0) is cleared to 0 (disabled).
2. Set the MSTPCR29.26 to MSTPCR29.27 bits in the module stop control register (MSTPCR29)

Note: The above bits should be set while the module operation has been completed and is placed in the idle state in which the module cannot be activated by external pins or other modules.

(b) ADG

1. Set the MSTPCR1.22 bit in the module stop control register (MSTPCR1) to 1.

Note: The above bit is for clock divider(brgclk).
The above bit should be set while the module cannot be activated by other modules

(2) Releasing and Restarting from Module Standby Mode

After the transition to module standby mode, modules can be released from module standby mode by a power-on reset or the appropriate procedure from the list below.

(a) SSIU/SSI

1. Supply the clock signal to SSIU/SSI modules.
2. Clear the MSTPCR29.26 to MSTPCR29.27 bits in the module stop control register (MSTPCR29).

(b) ADG

1. Supply the clock signal to ADG modules.
2. Clear the MSTPCR1.22 bit in the module stop control register (MSTPCR1).

81.4 Usage Notes

81.4.1 Note on Transfer

If an underflow or overflow occurs, stop the transfer and restart it.

Do not stop serial clock (SCK) and word select (WS) signals during data transfer. Confirm that SSISR.IDST = 1 before stopping SCK and WS signals.

In case of transmission at slave mode, it is necessary that WS signal is stable. Data transmission at slave mode should be started after more than two frames period since WS signal is entered and is stable.

In case of multiple SSI modules and case that one SSI works at master mode and the others do at slave mode, data transfer should be started after more than two frames period since registers of SSI at master mode are set.

81.5 Safety Mechanisms

This module has no Mechanism of FuSa.

82. Serial Sound Interface (SSI)

82.1 Overview

The serial sound interface (hereinafter referred to as the "SSI") is a transceiver module designed to send or receive audio data interfacing with a variety of devices offering I2S format. It also supports multi-channel mode in addition to other common formats.

82.1.1 Features

The SSI has the following features:

- Number of channels: Maximum of four (when a multichannel format is specified).
- The SSI module can serve as both a transmitter and a receiver.
- Asynchronous transfer takes place between the data buffer and the shift register.
- Only the MSB first data alignment is supported.
- A value as the dividing ratio for the clock used by the serial bus interface is selectable.
- Controlling of data transmission or reception with DMAC or interrupt requests is possible.
  - SSI does not work on its own. Please use via SSIU.
- TDM format is supported.
- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.
- The WS continue function by which operation can be performed without stopping WS signal is supported.
- Monaural mode (8 bits or 16 bits) is supported.
- In monaural mode, WS signal pulse width can be changed (short or long frame).
- If the sampling clock frequency is switched during transfer, it will be notified of the CPU with interrupts (a function to detect switching frequency).
- Operating mode: non-compressed mode (Not support compressed mode).
- Supports versatile serial audio formats (I2S/left justified/right justified).
- Supports master/slave functions.
- Programmable word clock, bit clock generation functions.

82.1.2 Block Diagram

Figure 82.1 shows a block diagram of a single SSI module.

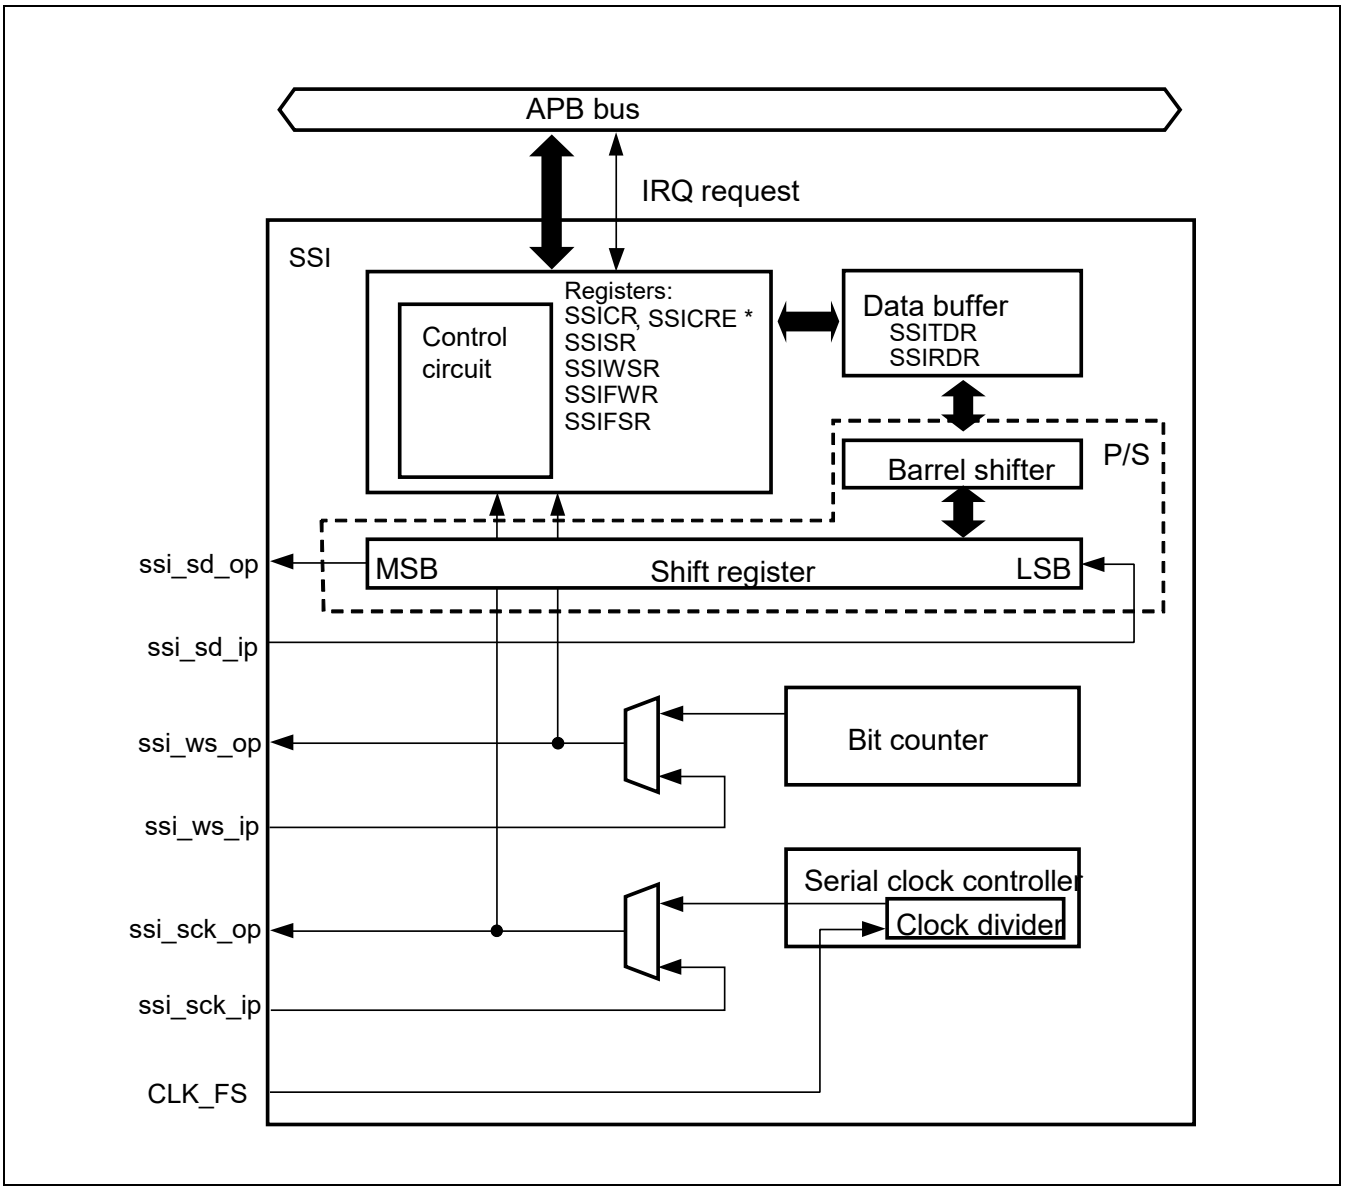

Figure 82.1 Block Diagram of SSI

82.1.3 Register Configuration

The SSI has the following registers. Note that the module numbers are basically omitted from the register names in the text.

Table 82.1 Register Configurations

Module	Register Name	Abbreviation	R/W	Address	Access Size
0	Control Register 0	SSICR0	R/W	H'EC54 1000	32
	Status Register 0	SSISR0	R/W*1	H'EC54 1004	32
	Transmit Data Register 0	SSITDR0	R/W	H'EC54 1008/	32
	Receive Data Register 0	SSIRDR0	R	H'EC54 100C	32
	WS Mode Register 0	SSIWSR0	R/W	H'EC54 1020	32
	FS Mode Register 0	SSIFMR0	R/W	H'EC54 1024	32
	FS Status Register 0	SSIFSR0	R/W*2	H'EC54 1028	32
	Control register extend 0	SSICRE0	R/W	H'EC54 1030	32

Notes: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

1. For this register, bits 26 and 27 are readable/writable bits, although the others are read-only bits. For details, refer to Section 82.2.2 Status Register (SSISRn).
2. For this register, bits 14 and 15 are readable/writable bits, although the others are read-only bits. For details, refer to Section 82.2.7 FS Status Register (SSIFSRn).

82.2 Register Description

[Legend for Register Descriptions]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

82.2.1 Control Register (SSICRn)

Note: n = 0

SSICR is a readable/writable 32-bit register that controls the IRQ, selects the polarity status, and sets operating mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	FORCE	0	R/W	Fixed The bit should always be set to 1.
30	—	0	R	Reserved The read value is 0. The write value should always be 0.
29	FIEN	0	R/W	Frequency Switching Detection Interrupt Enable 0: Frequency switching detection interrupt is disabled. 1: Frequency switching detection interrupt is enabled.
28	DMEN	0	R/W	DMA Enable Enables or disables the DMA request. 0: DMA request is disabled. 1: DMA request is enabled.
27	UIEN	0	R/W	Underflow Interrupt Enable 0: Underflow interrupt is disabled. 1: Underflow Interrupt is enabled.
26	OIEN	0	R/W	Overflow Interrupt Enable 0: Overflow interrupt is disabled. 1: Overflow interrupt is enabled.
25	IIEN	0	R/W	Idle Mode Interrupt Enable 0: Idle mode interrupt is disabled. 1: Idle mode interrupt is enabled.
24	DIEN	0	R/W	Data Interrupt Enable 0: Data interrupt is disabled. 1: Data interrupt is enabled.
23, 22	CHNL[1:0]	00	R/W	Channels These bits set the number of channels in each system word. When the stereo format or multi-channel format is used (WS_MODE = 0, MONO = 0, and WIDTH = B'00000 in the WS Mode Register): 00: A system word has one channel. 01: A system word has two channels. 10: A system word has three channels. 11: A system word has four channels. When the TDM format is used (WS_MODE = 1, MONO = 0, and WIDTH = B'00000 in the WS Mode Register): 00: Setting prohibited * 01: A TDM frame consists of four system words. 10: A TDM frame consists of six system words. 11: A TDM frame consists of eight system words. * In case of CHNL = B'00 and SSICREm.CHNL2 = 1, a TDM frame consists of sixteen system words. When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register): 00: A monaural frame consists of one system word. 01: Setting prohibited 10: Setting prohibited 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
21 to 19	DWL[2:0]	000	R/W	Data Word Length These bits set the number of bits in a data word. When the stereo format or multi-channel format (WS_MODE = 0, MONO = 0, and WIDTH = B'00000 in the WS Mode Register) or TDM format (WS_MODE = 1, MONO = 0, and WIDTH = B'00000 in the WS Mode Register) is used: 000: 8 bits 001: 16 bits 010: 18 bits 011: 20 bits 100: 22 bits 101: 24 bits 110: 32 bits 111: Setting prohibited When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register): 000: 8 bits 001: 16 bits Other than above: Setting prohibited
18 to 16	SWL[2:0]	000	R/W	System Word Length These bits set the number of bits in a system word. When the stereo format or multi-channel format (WS_MODE = 0, MONO = 0, and WIDTH = B'00000 in the WS Mode Register) or TDM format (WS_MODE = 1, MONO = 0, and WIDTH = B'00000 in the WS Mode Register) is used: 000: 8 bits 001: 16 bits 010: 24 bits 011: 32 bits 100: 48 bits 101: 64 bits 110: 128 bits 111: 256 bits When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register): 000: 16 bits 001: 32 bits 010: 48 bits 011: 64 bits 100: 96 bits 101: 128 bits 110: 256 bits 111: 512 bits

Bit	Bit Name	Initial Value	R/W	Description
15	SCKD	0	R/W	Serial Bit Clock Direction 0: Serial bit clock is input, slave mode. 1: Serial bit clock is output, master mode. Note: (SCKD, SWSD) = (0, 0) or (1, 1) can be set. Other settings are prohibited.
14	SWSD	0	R/W	Serial WS Direction 0: Serial word select is input, slave mode. 1: Serial word select is output, master mode. Note: (SCKD, SWSD) = (0, 0) or (1, 1) can be set. Other settings are prohibited.
13	SCKP	0	R/W	Serial Bit Clock Polarity 0: SSI_WS and SSI_SD change at the SSI_SCK falling edge (sampled at the SCK rising edge). 1: SSI_WS and SSI_SD change at the SSI_SCK rising edge (sampled at the SCK falling edge). **SCKP = 0** / **SCKP = 1** SSI_SD input sampling timing at the time of reception (TRMD = 0): SSI_SCK rising edge / SSI_SCK falling edge SSI_SD output change timing at the time of transmission (TRMD = 1): SSI_SCK falling edge / SSI_SCK rising edge SSI_WS input sampling timing at the time of slave mode (SWSD = 0): SSI_SCK rising edge / SSI_SCK falling edge SSI_WS output change timing at the time of master mode (SWSD = 1): SSI_SCK falling edge / SSI_SCK rising edge
12	SWSP	0	R/W	Serial WS Polarity The value of this bit must not be changed when the SSI module enable (EN) bit in this register is set to 1. • When the stereo format or multi-channel format is used (WS_MODE = 0, MONO = 0, and WIDTH = B'00000 in the WS Mode Register): 0: SSI_WS is low for 1st channel, high for 2nd channel. 1: SSI_WS is high for 1st channel, low for 2nd channel. • When the TDM format is used (WS_MODE = 1, MONO = 0, and WIDTH = B'00000 in the WS Mode Register): 0: The SYNC pulse is high over the period of system word 1, and low otherwise. 1: The SYNC pulse is low for over the period of system word 1, and high otherwise. • When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register): 0: WS pulse is high over the period specified with the WIDTH bits in the WS Mode Register, and low otherwise. 1: WS pulse is low over the period specified with the WIDTH bits in the WS Mode Register, and high otherwise.
11	SPDP	0	R/W	Serial Padding Polarity 0: Padding bits are low. 1: Padding bits are high. Padding bits are low when MUEN = 1. (The mute function takes priority.)

Bit	Bit Name	Initial Value	R/W	Description
10	SDTA	0	R/W	Serial Data Alignment This bit should be set to 0 when the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register). 0: Transmitting and receiving in the order of serial data and padding bits. 1: Transmitting and receiving in the order of padding bits and serial data.
9	PDTA	0	R/W	Parallel Data Alignment When the length of data word is 32, 16 or 8 bits, this configuration field has no meaning. This bit should be set to 0 when the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'00001 to B'11111 in the WS Mode Register). This bit applies to SSIRDR in receive mode and SSITDR in transmit mode. 0: Parallel data (SSITDR, SSIRDR) is left-aligned. 1: Parallel data (SSITDR, SSIRDR) is right-aligned. DWL = 000 (with a data word length of 8 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus. Four data words are transmitted or received at each 32-bit access. The first data word is derived from bits 7 to 0, the second from bits 15 to 8, the third from bits 23 to 16 and the last data word is derived from bits 31 to 24. DWL = 001 (with a data word length of 16 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus. Two data words are transmitted or received at each 32-bit access. The first data word is derived from bits 15 to 0 and the second data word is derived from bits 31 to 16. DWL = 010, 011, 100, 101 (with a data word length of 18, 20, 22 or 24 bits), PDTA = 0 (left-aligned) The data bits used in SSIRDR or SSITDR are the following: Bits 31 down to (32 minus the number of bits in the data word length specified by DWL). That is, if DWL = 011, the data word length is 20 bits; therefore, bits 31 to 12 in either SSIRDR or SSITDR are used. All other bits are ignored or reserved. DWL = 010, 011, 100, 101 (with a data word length of 18, 20, 22 or 24 bits), PDTA = 1 (right-aligned) The data bits used in SSIRDR or SSITDR are the following: Bits (the number of bits in the data word length specified by DWL minus 1) to 0 i.e. if DWL = 011, then DWL = 20 and bits 19 to 0 are used in either SSIRDR or SSITDR. All other bits are ignored or reserved. DWL = 110 (with a data word length of 32 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus.
8	DEL	0	R/W	Serial Data Delay 0: One clock cycle delay between SSI_WS and SSI_SD 1: No delay between SSI_WS and SSI_SD

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved The read value is 0. The write value should always be 0.
6 to 4	CKDV[2:0]	000	R/W	Serial Oversampling Clock Division Ratio Set the ratio between oversampling clock, CLK_FS, and the serial bit clock. These bits are ignored if SCKD = 0. The serial bit clock is used in the shift register and is provided on the SSI_SCK module pin. 000: Serial bit clock frequency = oversampling clock frequency/1 001: Serial bit clock frequency = oversampling clock frequency/2 010: Serial bit clock frequency = oversampling clock frequency/4 011: Serial bit clock frequency = oversampling clock frequency/8 100: Serial bit clock frequency = oversampling clock frequency/16 101: Serial bit clock frequency = oversampling clock frequency/6 110: Serial bit clock frequency = oversampling clock frequency/12 111: Setting prohibited CKDV = 000 is invalid when WS_MODE = 1 or CONT = 1 in the WS Mode Register.
3	MUEN	0	R/W	Serial Data Output Disable 0: Module is not muted. 1: Module is muted. Note: This bit can be used to stop output (low output) or to enable output. However, the operation is not synchronized with the change of SSI_WS.
2	—	0	R	Reserved The read value is 0. The write value should always be 0.
1	TRMD	0	R/W	Transmit/Receive Mode Select 0: Module is in receive mode. 1: Module is in transmit mode.
0	EN	0	R/W	SSI Module Enable 0: Module is disabled. 1: Module is enabled. When changing EN bit, do not change other bits.

82.2.2 Status Register (SSISRn)

Note: n = 0

SSISR consists of status flags indicating the operational status of the SSI module and bits indicating the current channel numbers and word numbers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DMRQ	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	1	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	Undefined	R	Reserved The read value is not guaranteed. The write value should always be 0.
28	DMRQ	0	R	DMA Request Status Flag This status flag allows the CPU to recognize the value of the DMA request pin on the SSI module. • TRMD = 0 (receive mode) If DMRQ = 1, the SSIRDR has unread data. If SSIRDR is read, DMRQ = 0 until there is new unread data. • TRMD = 1 (transmit mode) If DMRQ = 1, SSITDR requires data to be written to continue the transmission to the audio serial bus. Once data is written to SSITDR, DMRQ = 0 until it requires further transmit data.
27	UIRQ	0	R/WC0	Underflow Error Interrupt Status Flag This status flag indicates that data was supplied at a lower rate than was required. In either case, this bit is set to 1 regardless of the value of the UIEN bit and can be cleared by writing 0 to this bit. If UIRQ = 1 and UIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) If UIRQ = 1, SSIRDR was read before there was new unread data indicated by the DMRQ or DIRQ bit. This can lead to the same received data being stored twice by the host leading to potential corruption of multi-channel data. • TRMD = 1 (transmit mode) If UIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. This is more serious error than a receive mode underflow as the output SSI data results in error. Note: When underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is filled.
26	OIRQ	0	R/WC0	Overflow Error Interrupt Status Flag This status flag indicates that data was supplied at a higher rate than was required. In either case this bit is set to 1 regardless of the value of the OIEN bit and can be cleared by writing 0 to this bit. If OIRQ = 1 and OIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) If OIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of a data and a potential corruption of multi-channel data. Note: When overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSI interface. • TRMD = 1 (transmit mode) If OIRQ = 1, SSITDR had data written to it before it was transferred to the shift register. This will lead to the loss of a data and a potential corruption of multi-channel data.

Bit	Bit Name	Initial Value	R/W	Description
25	IIRQ	Undefined	R	Idle Mode Interrupt Status Flag This interrupt status flag indicates whether the SSI module is in idle state. This bit is set regardless of the value of the IIEN bit to allow polling. “Idle state” refers to the state where the serial bus has been stopped after activation of the SSI. The interrupt can be masked by clearing IIEN, but cannot be cleared by writing to this bit. If IIRQ = 1 and IIEN = 1, an interrupt occurs. 0: The SSI module is not in idle state. 1: The SSI module is in idle state.
24	DIRQ	0	R	Data Interrupt Status Flag This status flag indicates that the module has data to be read or requires data to be written. In either case this bit is set to 1 regardless of the value of the DIEN bit to allow polling. The interrupt can be masked by clearing DIEN, but cannot be cleared by writing to this bit. If DIRQ = 1 and DIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) 0: No unread data in SSIRDR 1: Unread data in SSIRDR • TRMD = 1 (transmit mode) 0: Transmit buffer is full. 1: Transmit buffer is empty and requires data to be written to SSITDR.
23 to 4	—	Undefined	R	Reserved The read value is not guaranteed. The write value should always be 0.
3, 2	CHNO[1:0]	00	R	Channel Number These bits indicate the current channel number. However, if the length of data words is 8 or 16 bits, the value of these bits is meaningless. 00: 1st channel 01: 2nd channel 10: 3rd channel 11: 4th channel • TRMD = 0 (receive mode) CHNO indicates which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register. • TRMD = 1 (transmit mode) CHNO indicates which channel is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. These bits cannot be used when WS_MODE = 1 or CONT = 1 in the WS Mode Register.

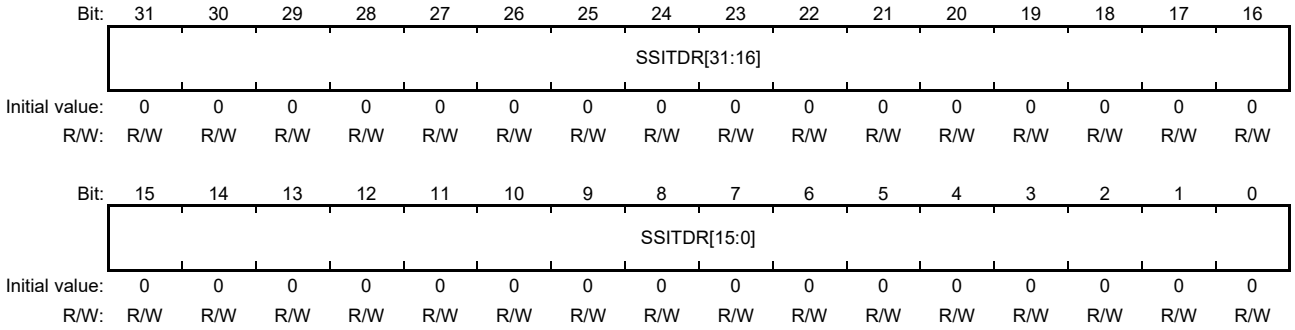
Bit	Bit Name	Initial Value	R/W	Description
1	SWNO	1	R	System Word Number This status bit indicates the current word number. However, if the length of data words is 8 or 16 bits, the value of this bit is meaningless. • TRMD = 0 (receive mode) SWNO indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read. • TRMD = 1 (transmit mode) SWNO indicates which system word is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. This bit cannot be used when WS_MODE = 1 or CONT = 1 in the WS Mode Register.
0	IDST	Undefined	R	Idle Mode Status Flag This status flag indicates that the serial bus activity has stopped. This bit is cleared if EN = 1 and the serial bus are currently active. This bit is automatically set to 1 under the following conditions. • SSI = Master transmitter (SWSD = 1 and TRMD = 1) This bit is set to 1 when the EN bit is cleared and data written in SSITDR has been output from the serial data input/output pin (SSI_SD). • SSI = Master receiver (SWSD = 1 and TRMD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed. • SSI = Slave transmitter/receiver (SWSD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed. Note: If an external device stops the serial bus clock before transfer of the current system word is completed, this bit is not set.

82.2.3 Transmit Data Register (SSITDRn)

Note: n = 0

SSITDR is a 32-bit register that holds data to be transmitted.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR. The data in the buffer can be accessed by reading this register.



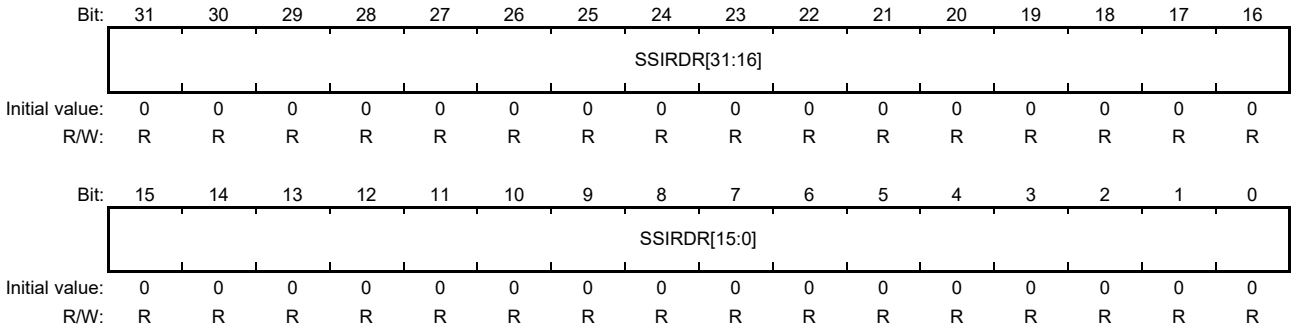
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSITDR[31:0]	All 0	R/W	Transmit Data Data transmitted from SSI.

82.2.4 Receive Data Register (SSIRDRn)

Note: n = 0

SSIRDR is a 32-bit register that stores receive messages.

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSIRDR[31:0]	All 0	R	Receive Data Data received from external pins.

82.2.5 WS Mode Register (SSIWSRn)

Note: n = 0

SSIWSR is a 32-bit readable/writable register that sets the TDM format, monaural format, and WS continue function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	WIDTH[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CONT	—	—	—	—	—	—	MONO	WS_ MODE

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
20 to 16	WIDTH[4:0]	00000	R/W	SYNC Pulse Width Change • When the TDM format is used (WS_MODE = 1 and MONO = 0 in this register): 00000: TDM format Other than 00000: Setting prohibited • When the monaural format is used (WS_MODE = 1 and MONO = 1 in this register): 00000: Setting prohibited 00001: Pulse width is equivalent to one cycle of SCK. 00010: Pulse width is equivalent to two cycles of SCK. ... 11111: Pulse width is equivalent to 31 cycles of SCK. Note that the set value of the system word length bits (SWL) in SSICR should be greater than that of the SYNC pulse width bits (WIDTH) when the monaural format is used.
15 to 9	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
8	CONT	0	R/W	WS Continue Function 0: WS continue function is disabled. 1: WS continue function is enabled. Note: This bit can only be set in master mode (SSICR.SCKD = 1, SSICR.SWSD = 1).
7 to 2	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
1	MONO	0	R/W	TDM Format/Monaural Format Selects the TDM format or monaural format. When the normal stereo format, multi-channel format, this bit should be 0. 0: TDM format 1: Monaural format
0	WS_MODE	0	R/W	WS Mode 0: Stereo format, multi-channel format 1: TDM format, monaural format

82.2.6 FS Mode Register (SSIFMRn)

Note: n = 0

SSIFMR is used to set the frequency switching detection function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	DTCT[5:0]

R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
21 to 16	DTCT[5:0]	000000	R/W	Frequency Switching Detection Range Set 000100: Set the value in the range as 5. Other than above: Setting prohibited.
15 to 6	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
5, 4	CTDV[1:0]	00	R/W	Bus Clock Division Ratio Sets the bus clock division ratio used for the frequency switching detection function. 00: Setting prohibited. 01: Setting prohibited. 10: Setting prohibited. 11: Set the switching detection clock frequency = bus clock frequency/8.
3 to 1	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
0	FSEN	0	R/W	Frequency Switching Detection Function Enable 0: The frequency switching detection function is disabled. 1: The frequency switching detection function is enabled. Note: This bit must be enabled after the desired settings have been made for SWSP in SSICR and WS_MODE in SSIWSR.

82.2.7 FS Status Register (SSIFSRn)

Note: n = 0

SSIFSR is used to read the frequency switching detection status and information on the frequency counter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FCST	DTST	—	—	FCNT[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/WC0	R/WC0	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
15	FCST	0	R/WC0	WS Stopped Status Flag In the frequency switching detection function, this status flag reflects the state that the WS signal is stopped. When FCST = 1, this bit indicates that the WS signal has stopped (the state is detected only when FSEN in SSIFMR = 1). Write 0 if this bit is cleared to 0.
14	DTST	0	R/WC0	Frequency Switching Detection Status Flag In the frequency switching detection function, this status flag reflects the state that frequency switching has been detected. When DTST = 1, this bit indicates that the switching has been detected (the state is detected only when FSEN in SSIFMR = 1). Write 0 if this bit is cleared to 0.
13, 12	—	0	R	Reserved The read value is 0. The write value should always be 0.
11 to 0	FCNT[11:0]	H'000	R	Frequency Count Monitor When the frequency switching detection function is enabled, the count value between WS signal edges is reflected according to the setting of the operating mode and the serial WS polarity (SWSP in SSICR). This value is updated when the frequency is switched and the WS signal has been detected.

82.2.8 Control Register Extend (SSICREm) (m = 0)

CHNL2 is an extension bit of SSICRn.CHNL[1:0]. This bit should be set 0 except SSIq_MODE2.ex_func (q = 0_0) in SSIU is 1 and TDM format is not selected (SSIWSRn.WS_MODE = 1 and SSIWSRn.MONO = 0).

This register should be set up before SSICRn is set up.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHNL2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved The read value is 0. The write value should always be 0.
0	CHNL2	0	R/W	Extension bit of SSICRn.CHNL[1:0] 0: Default value 1: A TDM frame consists of sixteen system words. In this case, SSICRn.CHNL should be set B'00.

82.3 Operation

82.3.1 Bus Format

The SSI module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode.

The bus format can be selected from one of the four major modes shown in Table 82.2.

Table 82.2 Bus Format for SSI Module

	SSICR																	SSIWSR			SSICRE *
	TRMD	SCKD	SWSD	EN	MUEN	DIEN	IIEN	OIEN	UIEN	DEL	PDTA	SDTA	SPDP	SWSP	SCKP	SWL[2:0]	DWL[2:0]	CHNL[1:0]	WS_MODE	MONO	CONT	CHNL2
Slave receiver	0	0	0	Control bits							Configuration bits								WS mode bits			Control bits
Slave transmitter	1	0	0																			
Master receiver	0	1	1																			
Master transmitter	1	1	1																			

(1) Slave receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

(2) Slave transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

(3) Master receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the CLK_FS input clock. The format of these signals is defined in the configuration fields of the SSI module. If the incoming data does not follow the configured format, operation is not guaranteed.

(4) Master transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the CLK_FS input clock. The format of these signals is defined in the configuration fields of the SSI module.

(5) Setting for each format

Table 82.3 shows the setting for each format:

Table 82.3 Setting for Each Format

	SSICR	SSIWSR			SSICRE
Format	**CHNL[1:0]**	**WS_MODE**	**MONO**	**WIDTH[4:0]**	**CHNL2**
Stereo format	B'00	0	0	B'00000	B'0
Multi-channel format	B'01/B'10/B'11	0	0	B'00000	B'0
Monaural format	B'00	1	1	B'00001 to B'11111	B'0
TDM format	B'00/B'01/B'10/B'11 *	1	0	B'00000	B'0/1 *

Note: * SSICR.CHNL[1:0] should be set B'00 to when SSICRE.CHNL2 = 1.

(6) Configuration bits (related to word length)

There are many configurations the SSI module supports, but only some of the combinations are shown below for the I2S, left-aligned, and right-aligned formats.

Figure 82.2 and Figure 82.3 demonstrate the supported I2S format both with and without padding. Padding occurs when the data word length is smaller than the system word length.

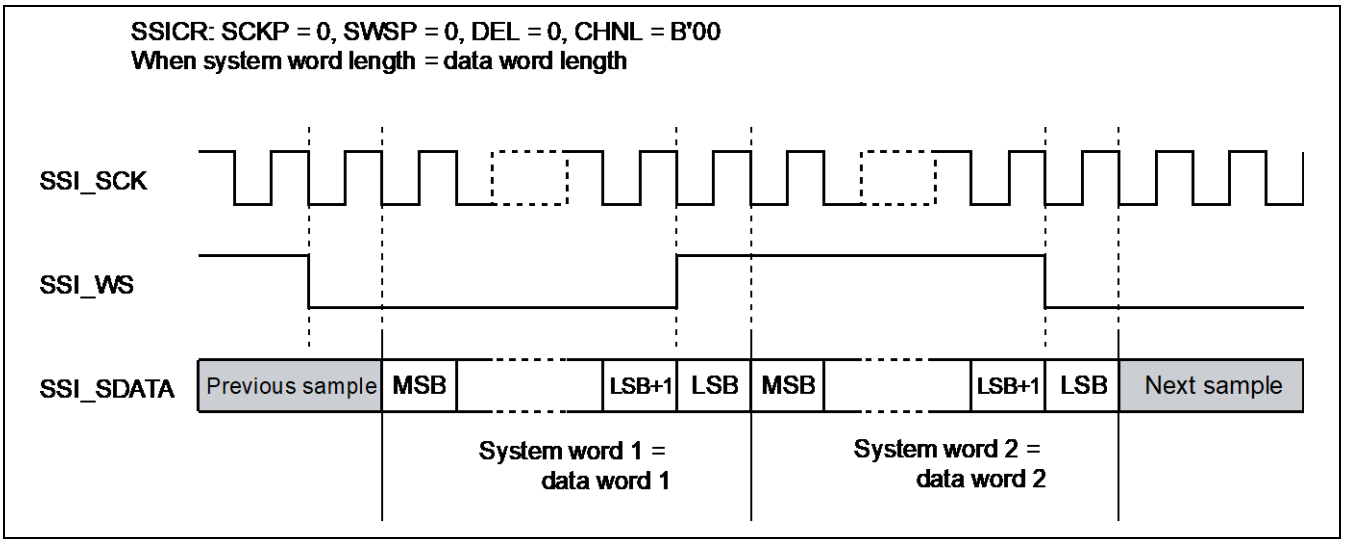

Figure 82.2 I2S Format (without Padding)

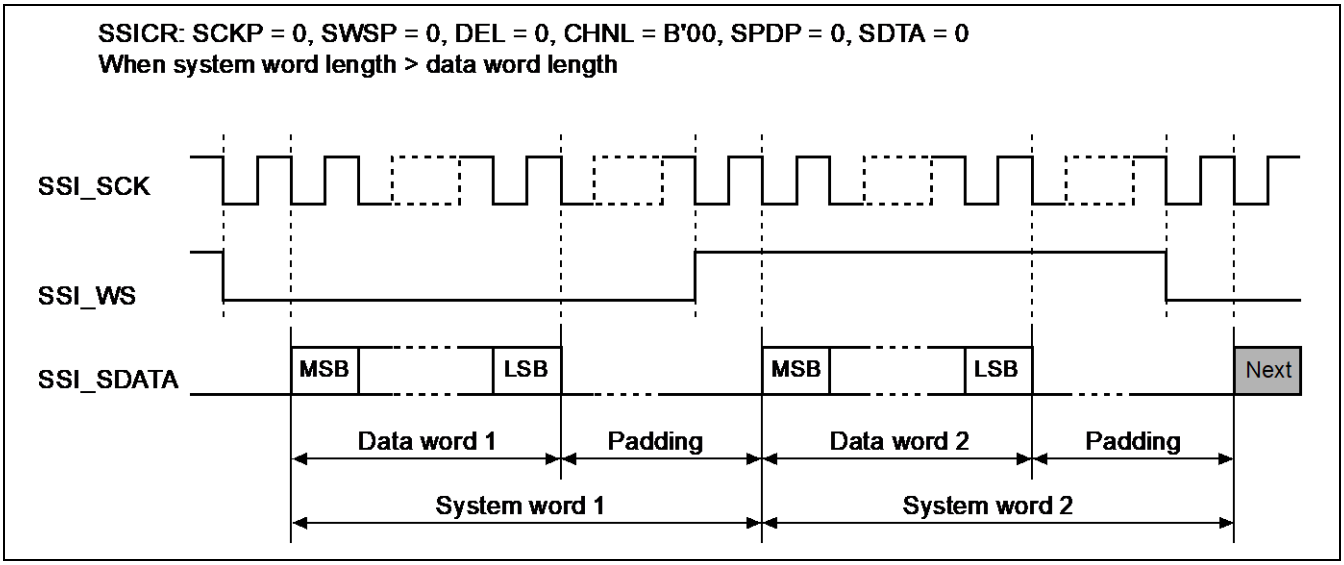

Figure 82.3 I2S Format (with Padding)

Figure 82.4 shows the left-aligned format and Figure 82.5 shows the right-aligned format. Padding is assumed in both cases, but may not be present in a final implementation if the system word length equals the data word length.

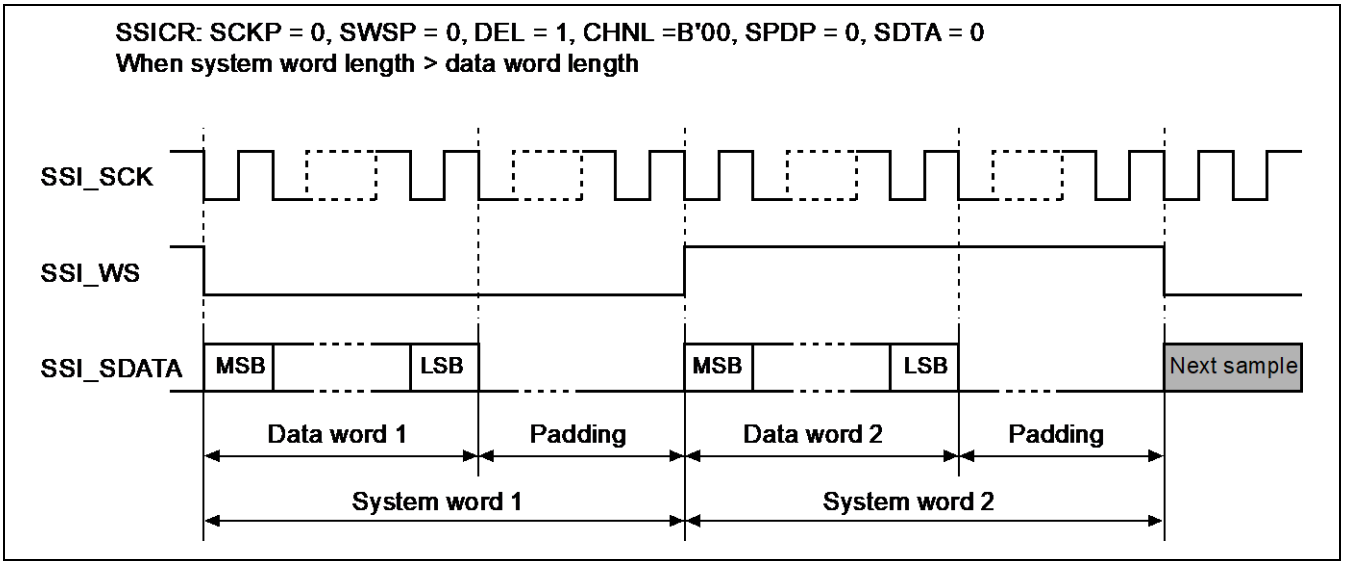

Figure 82.4 Left-Aligned Format
(Transmitting and Receiving in the Order of Serial Data and Padding Bits)

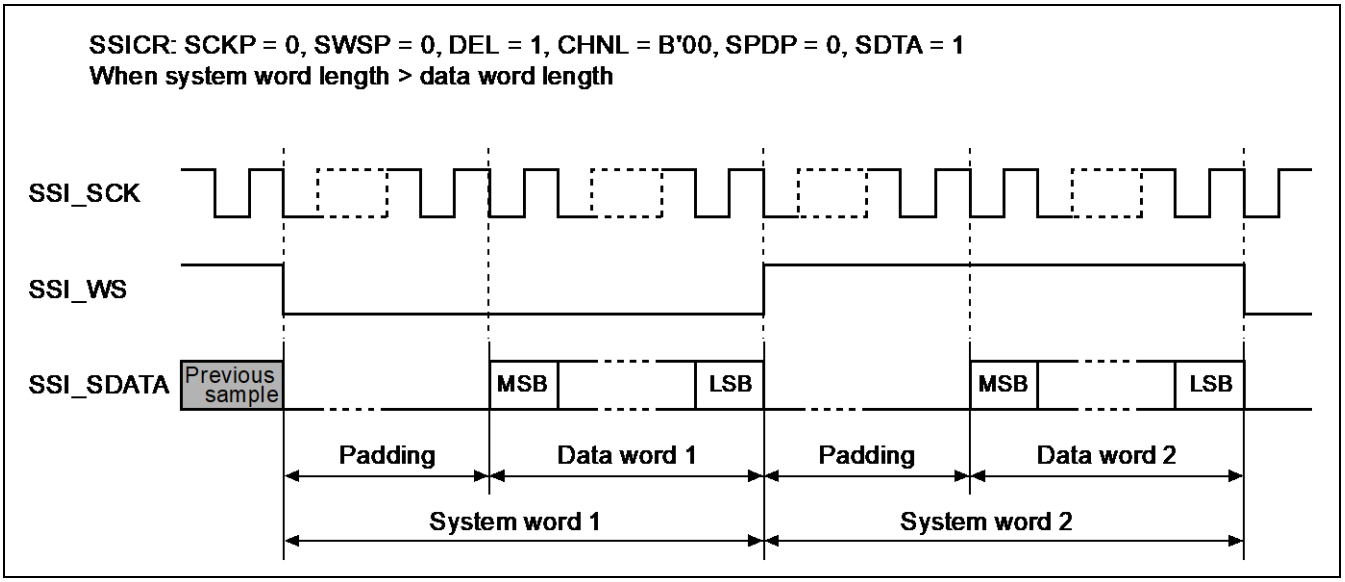

Figure 82.5 Right-Aligned Format
(Transmitting and Receiving in the Order of Padding Bits and Serial Data)

(7) Multi-channel formats

Some devices extend the definition of the I2S format and allow more than two channels to be transferred within two system words.

The SSI module supports the transfer of two, three, and four channels by using the CHNL, SWL and DWL bits only when the system word length (SWL) is greater than or equal to the data word length (DWL) multiplied by channels (CHNL).

Table 82.4 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

Table 82.4 The Number of Padding Bits for Each Valid Setting

Padding Bits Per System Word		DWL[2:0]	B'000	B'001	B'010	B'011	B'100	B'101	B'110
CHNL [1:0]	Decoded Channels per System Word	SWL [2:0]	Decoded Word Length	8	16	18	20	22	24	32
B'00	1	B'000	8	0	—	—	—	—	—	—
		B'001	16	8	0	—	—	—	—	—
		B'010	24	16	8	6	4	2	0	—
		B'011	32	24	16	14	12	10	8	0
		B'100	48	40	32	30	28	26	24	16
		B'101	64	56	48	46	44	42	40	32
		B'110	128	120	112	110	108	106	104	96

		B'110	128	104	80	74	68	62	56	32
		B'111	256	232	208	202	196	190	184	160
B'11	4	B'000	8	—	—	—	—	—	—	—
		B'001	16	—	—	—	—	—	—	—
		B'010	24	—	—	—	—	—	—	—
		B'011	32	0	—	—	—	—	—	—
		B'100	48	16	—	—	—	—	—	—
		B'101	64	32	0	—	—	—	—	—
		B'110	128	96	64	56	48	40	32	0
		B'111	256	224	192	184	176	168	160	128

When the SSI module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When the SSI module acts as a receiver, each word received by the serial audio bus is read in the order received from SSIRDR.

Figure 82.6 to Figure 82.8 show how two, three and four channels are transferred to the serial audio bus. Note that there are no padding bits in the first example, the second example is left-aligned and the third is right-aligned. This selection is arbitrary and is just for demonstration purposes only.

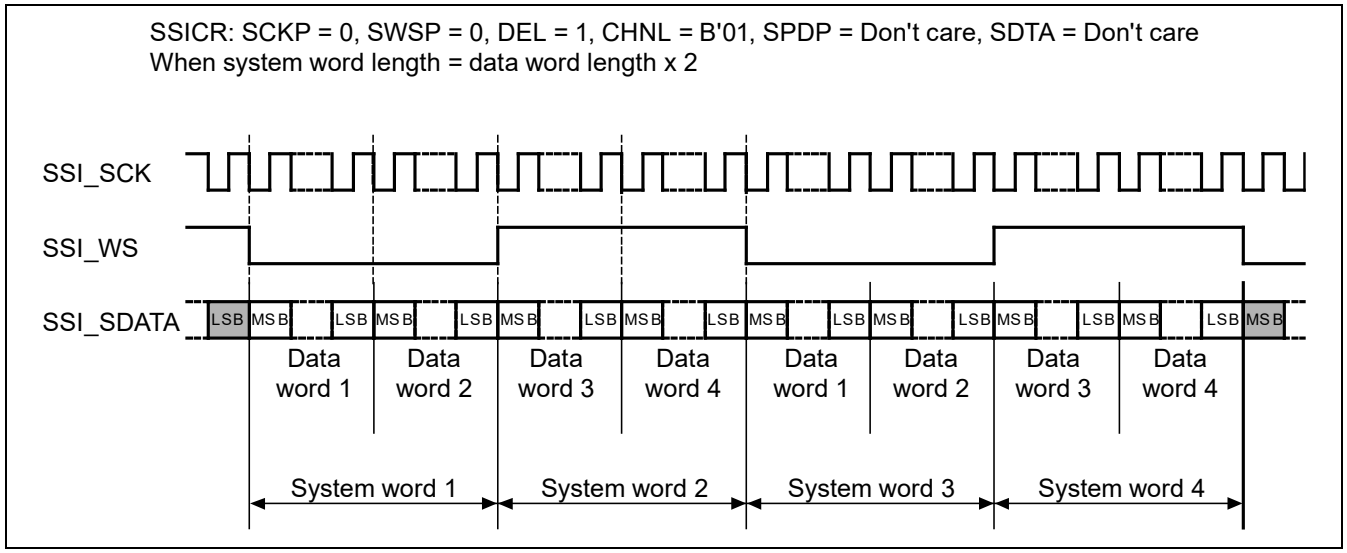

Figure 82.6 Multi-Channel Format (Two Channels without Padding)

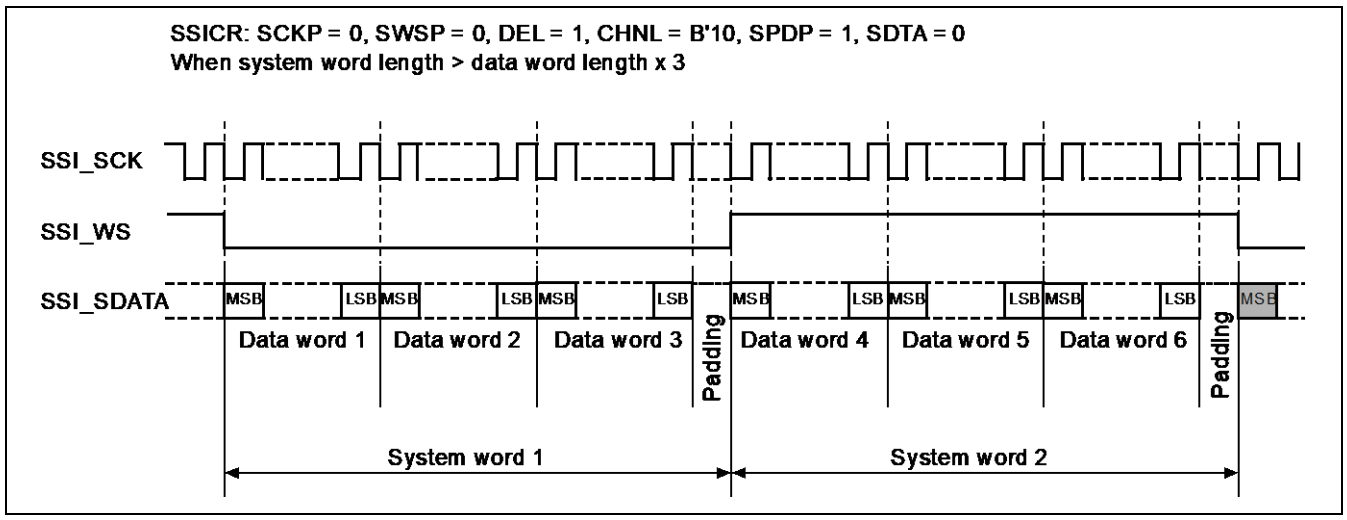

Figure 82.7 Multi-Channel Format (Three Channels with High Padding)

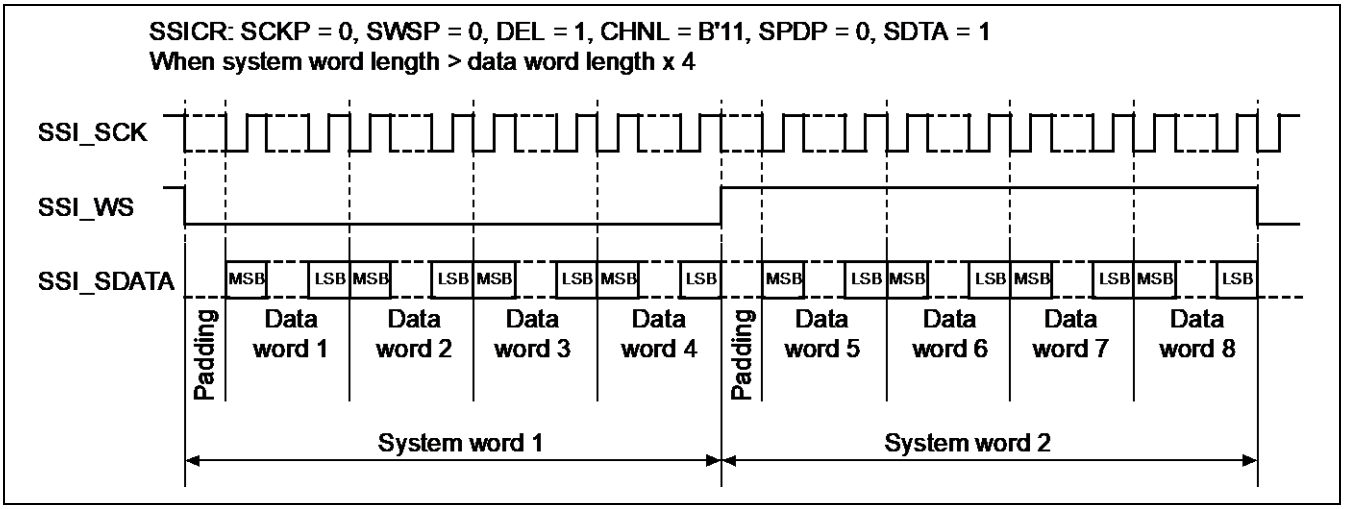

Figure 82.8 Multi-Channel Format
(Four Channels; Transmitting and Receiving in the Order of Padding Bits and Serial Data; with Padding)

(8) TDM formats

The TDM format is used for connecting the SSI with a multi-channel device which supports TDM. The TDM format is set by using the WS_MODE and MONO bits in SSIWSR. When the SWSP bit in SSICR is 0 with the TDM format, SSI_WS is driven high over the period of system word 1, and pulled low otherwise. When the SWSP bit is 1, SSI_WS is pulled low over the period of system word 1, and driven high otherwise. The pulses generated on the SSI_WS signal are referred to as SYNC pulses.

Figure 82.9 and Figure 82.10 show the TDM formats without padding and with padding.

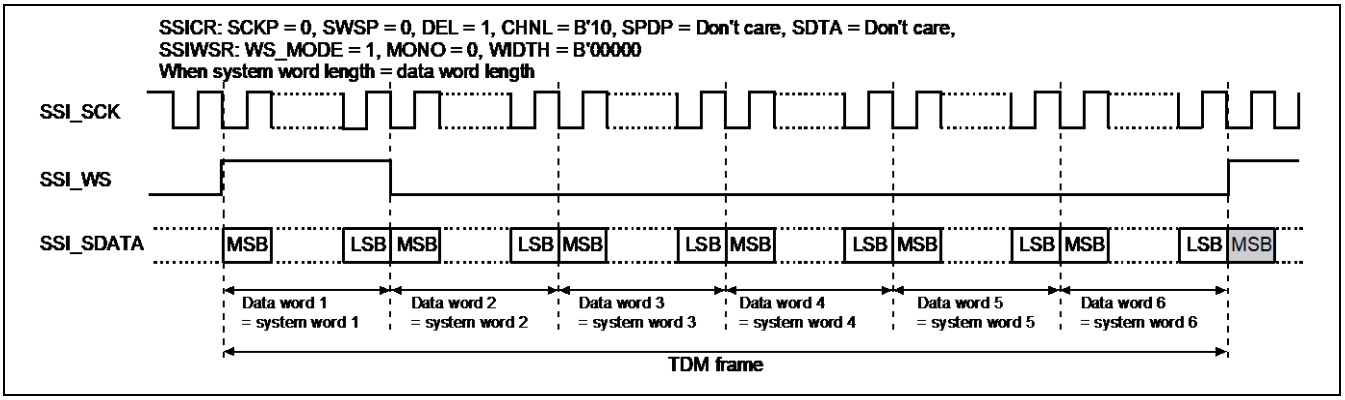

Figure 82.9 TDM Format (Six System Words, without Padding)

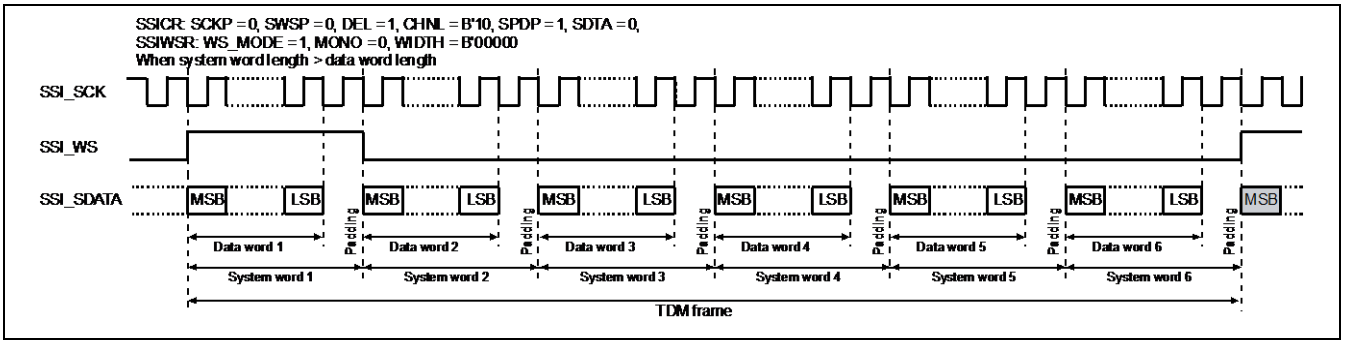

Figure 82.10 TDM Format (Six System Words, with Padding)

The following describes operation in each mode:

(a) Master transmitter

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for the SYNC pulses cannot be determined. Therefore, stop and reconfigure the transfer.

(b) Master receiver

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data register should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

The receive data should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

(c) Slave transmitter

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for SYNC pulses cannot be determined. Therefore, stop and re-set the transfer.

Transfers cannot be performed if the SCK signal and SYNC pulses are not provided to the SSI module during transfer.

(d) Slave receiver

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

The receive data register should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

Transfer cannot proceed if the SCK signal and SYNC pulses are not being provided to the SSI module during transfer.

(9) Monaural format

The monaural format is set by using the WS_MODE and MONO bits in SSIWSR. The available data lengths are 8 bits and 16 bits. When the SWSP bit in SSICR is 0 and the monaural format is selected, SSI_WS is driven high over the period from bit 1 to bit 31, and pulled low otherwise. When the SWSP bit is 1, SSI_WS is pulled low over the period from bit 1 to bit 31, and driven high otherwise. The pulses generated as the SSI_WS signal are referred to as SYNC pulses. The width of the SYNC pulses can be set to a value in bits between 1 and 31 by using the WIDTH bits in SSIWSR. The setting must be smaller than the system word length (SSICR.SWL). In the monaural format, the system word length is equal to one monaural frame period.

Figure 82.11 shows the left-aligned monaural format and Figure 82.12 shows the monaural format with a delay of one bit-period.

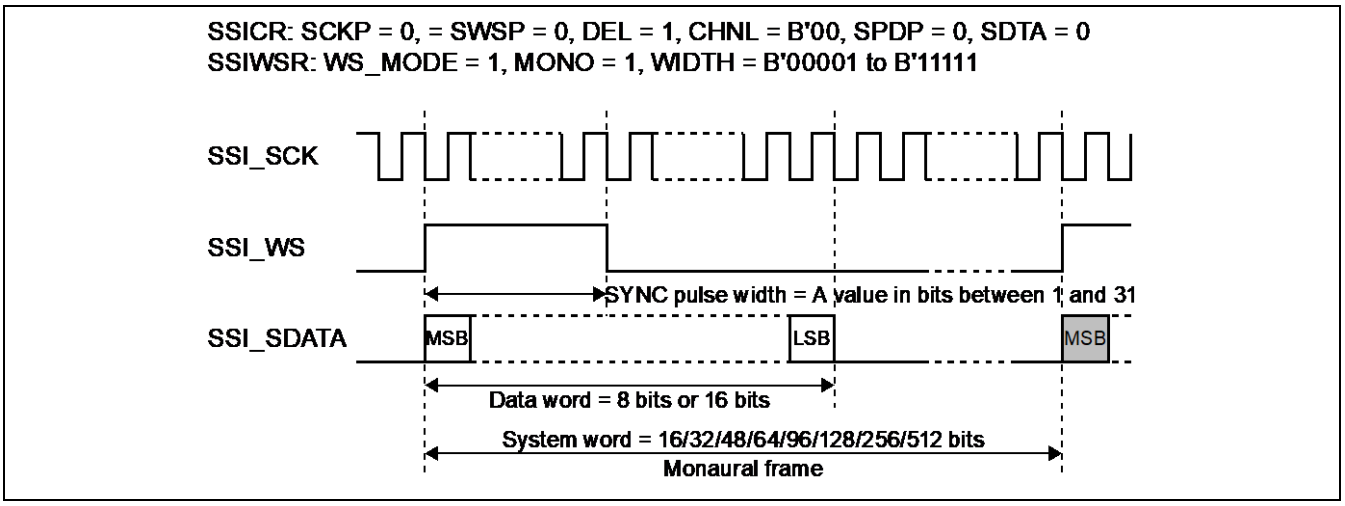

Figure 82.11 Monaural Format (Left-Aligned)

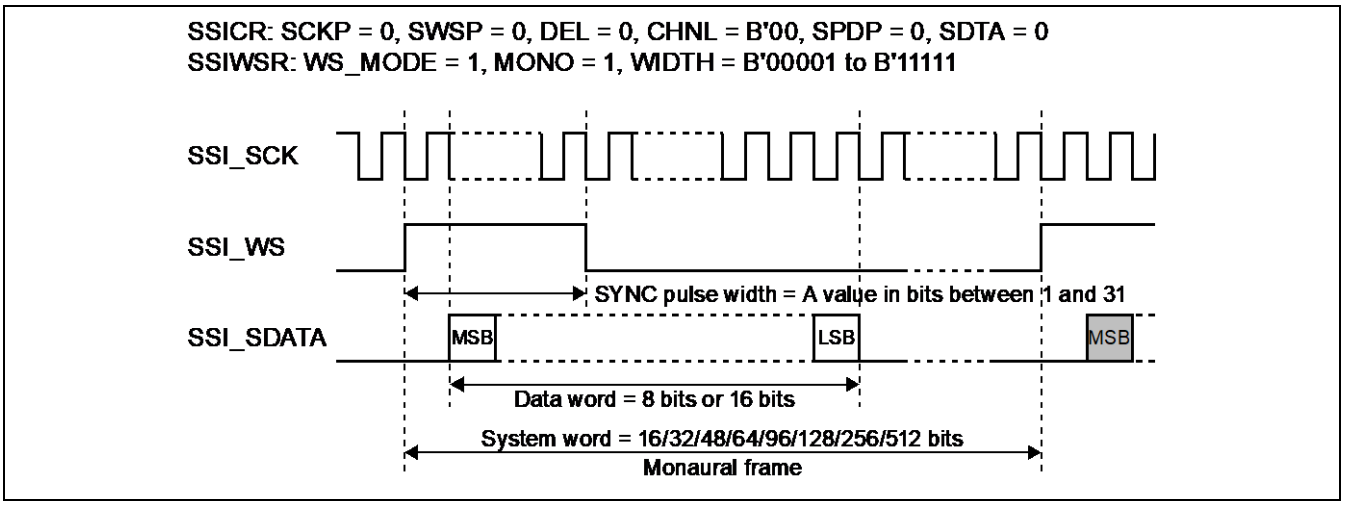

Figure 82.12 Monaural Format (with 1-bit Delay)

(10) Configuration bits

Several more configuration bits are shown below. These bits are not mutually exclusive, but some combinations may not be useful for any other device.

These configuration bits are described below with reference to Figure 82.13, Basic Sample Format.

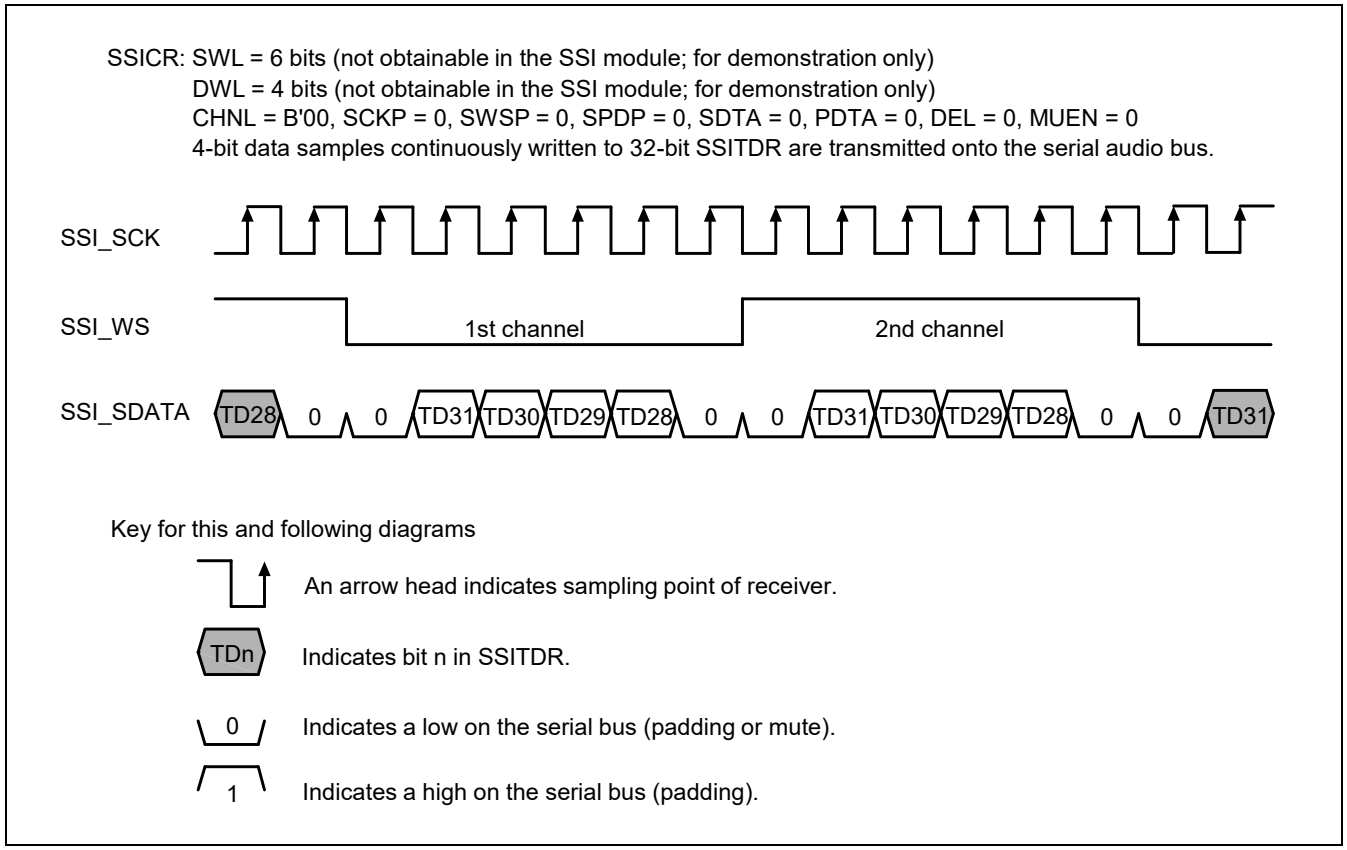

Figure 82.13 Basic Sample Format
(Transmit Mode with Example System/Data Word Length)

Figure 82.13 uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with the SSI module but are used only for clarification of the other configuration bits.

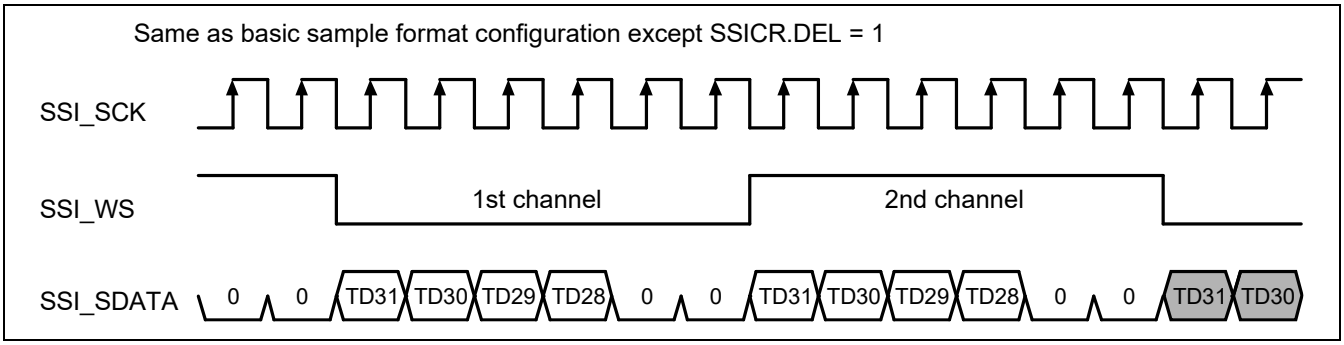

Figure 82.19 Transmitting and Receiving in the Order of Serial Data and Padding Bits; without Delay

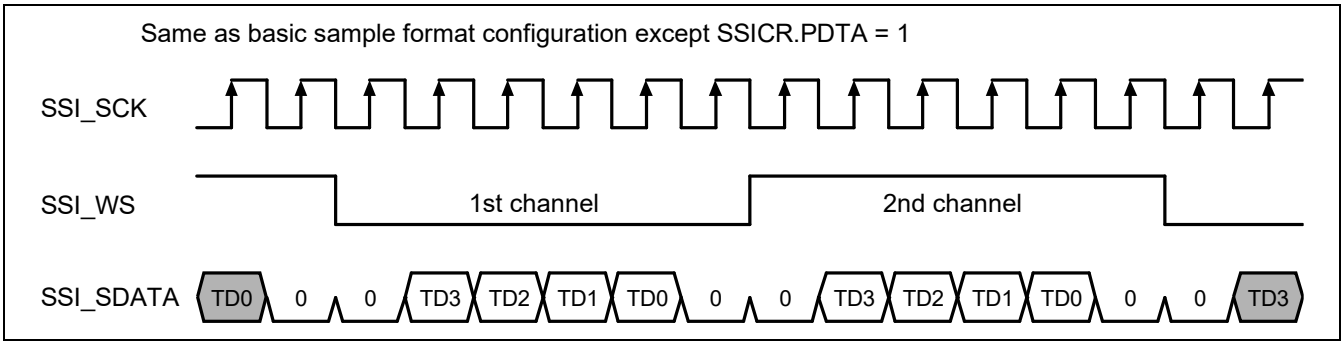

Figure 82.20 Parallel Right-Aligned with Delay

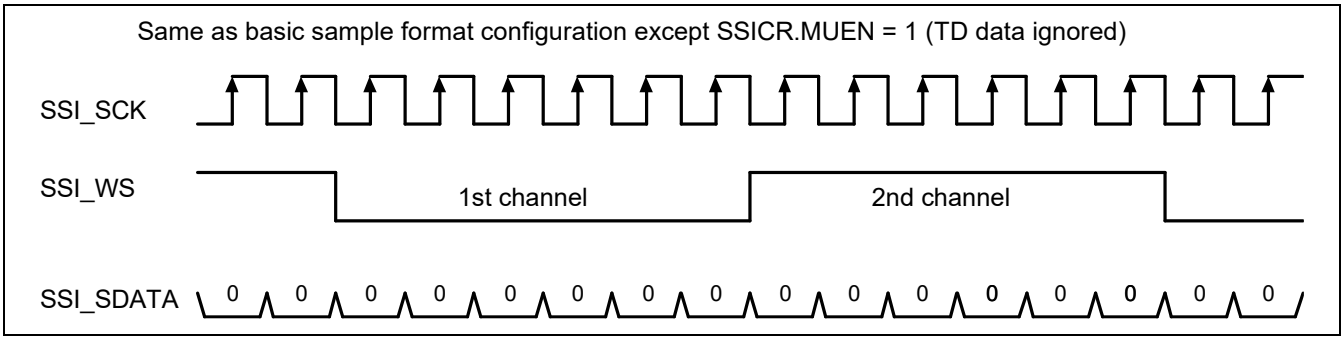

Figure 82.21 Mute Enabled

(11) WS continue function

The WS continue function is used to output SSI_WS signal continuously regardless of whether data transfer is enabled or disabled. The WS continue function can be set by using the CONT bit in SSIWSR. This function can be combined with master mode only. When this function is enabled, the SSI_WS signal continues to operate even if the EN bit in SSICR is cleared to 0 (stopping a transfer). When this function is disabled, the SSI_WS signal operates synchronously with the EN bit.

Figure 82.22 and Figure 82.23 show operations when the WS continue function is enabled and disabled, respectively.

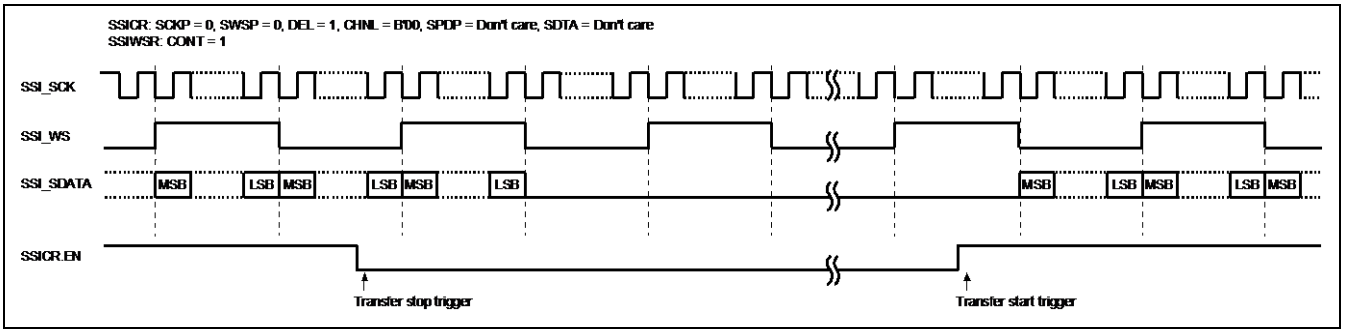

Figure 82.22 WS Continue Function Operation (When the Function is Enabled)

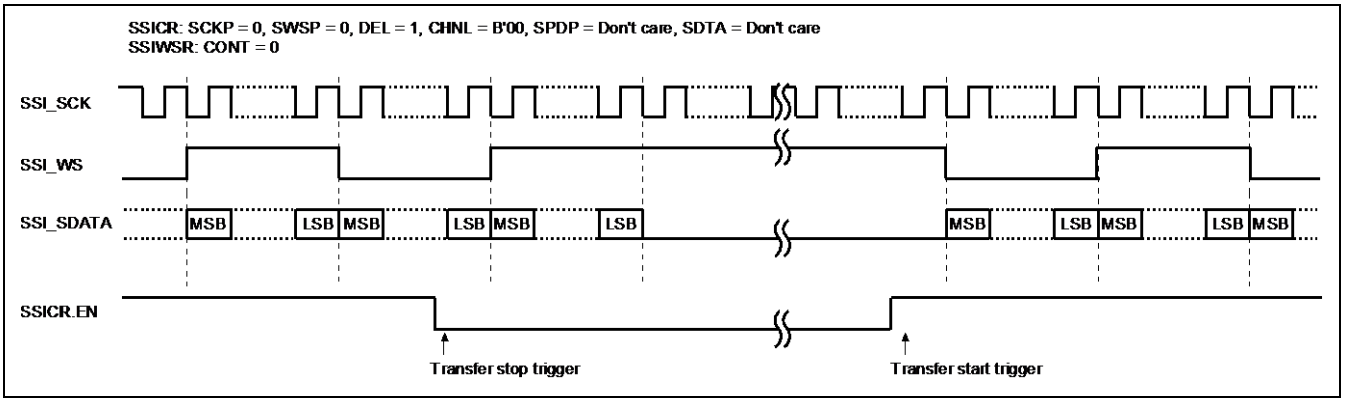

Figure 82.23 WS Continue Function Operation (When the Function is Disabled)

(12) Bit alignment in transferred data

Figure 82.24 to Figure 82.36 show the bit alignment in transmit or receive data. Only the MSB first alignment is available. The waveforms in Figure 82.24 to Figure 82.36 are setting examples without delay (SSICR.DEL is set to 1, the number of bits specified with SSICR.DWL is the same as that specified with SSICR.SWL).

82.3.2 Operating Modes

There are three modes of operation: configuration, module enabled and module disabled. Figure 82.37 shows how the module enters each of these modes.

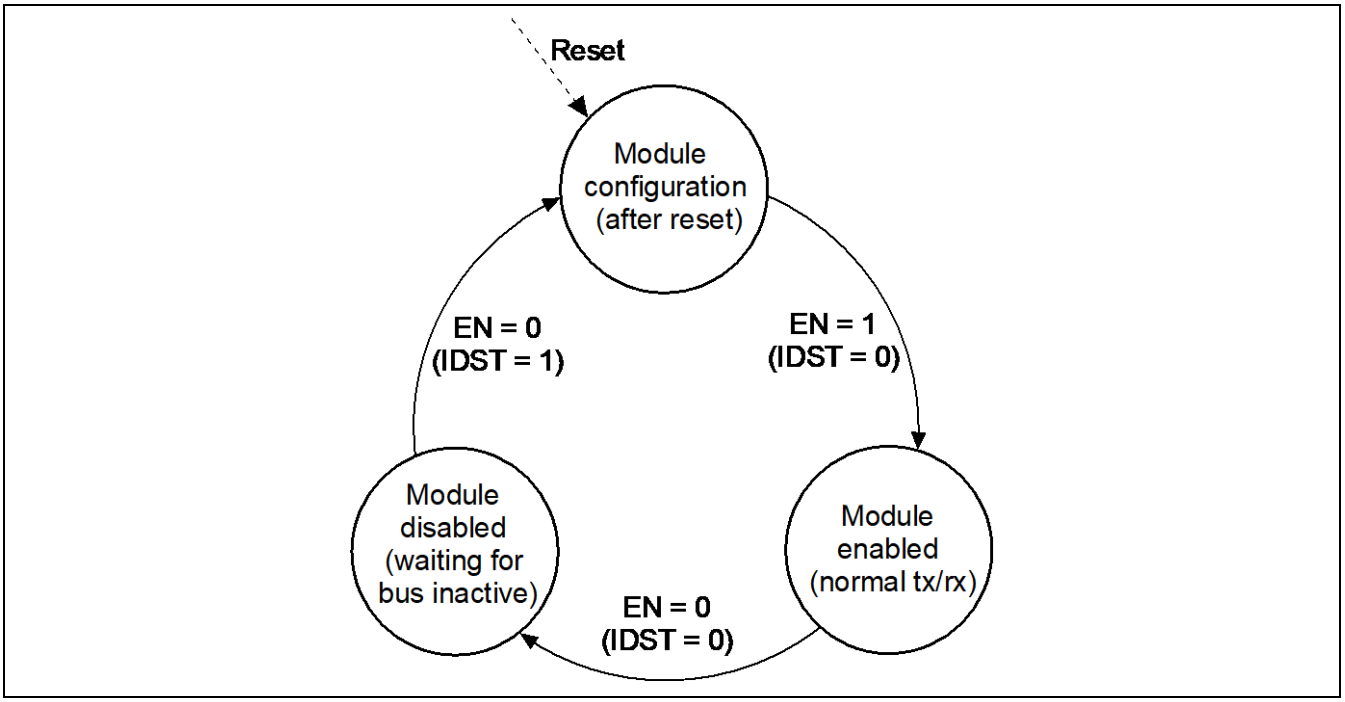

Figure 82.37 Operating Modes

(1) Configuration mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before the SSI module is enabled by setting the EN bit.

Setting the EN bit causes the module to enter the module enabled mode.

(2) Module enabled mode

Operation of the module in this mode is dependent on the operating mode selected. For details, refer to Section 82.3.3 Transmit Operation and Section 82.3.4 Receive Operation.

82.3.3 Transmit Operation

Transmission can be controlled either by DMA or interrupt.

DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or the DMAC has finished its transfer.

The alternative method is using the interrupts that the SSI module generates to supply data as required. This mode has a higher interrupt load as the module is only double buffered and will require data to be written at least every system word period.

When disabling the module, the SSI clock* must remain present until the SSI module is in idle state, indicated by the SSISR.IIRQ bit.

Figure 82.38 shows the transmit operation in DMA control mode, and Figure 82.39 shows the transmit operation in interrupt control mode.

Note: * Input clock from the SSI_SCK pin when SCKD = 0.
Input clock from the CLK_FS pin when SCKD = 1.

(1) Transmission using DMA controller

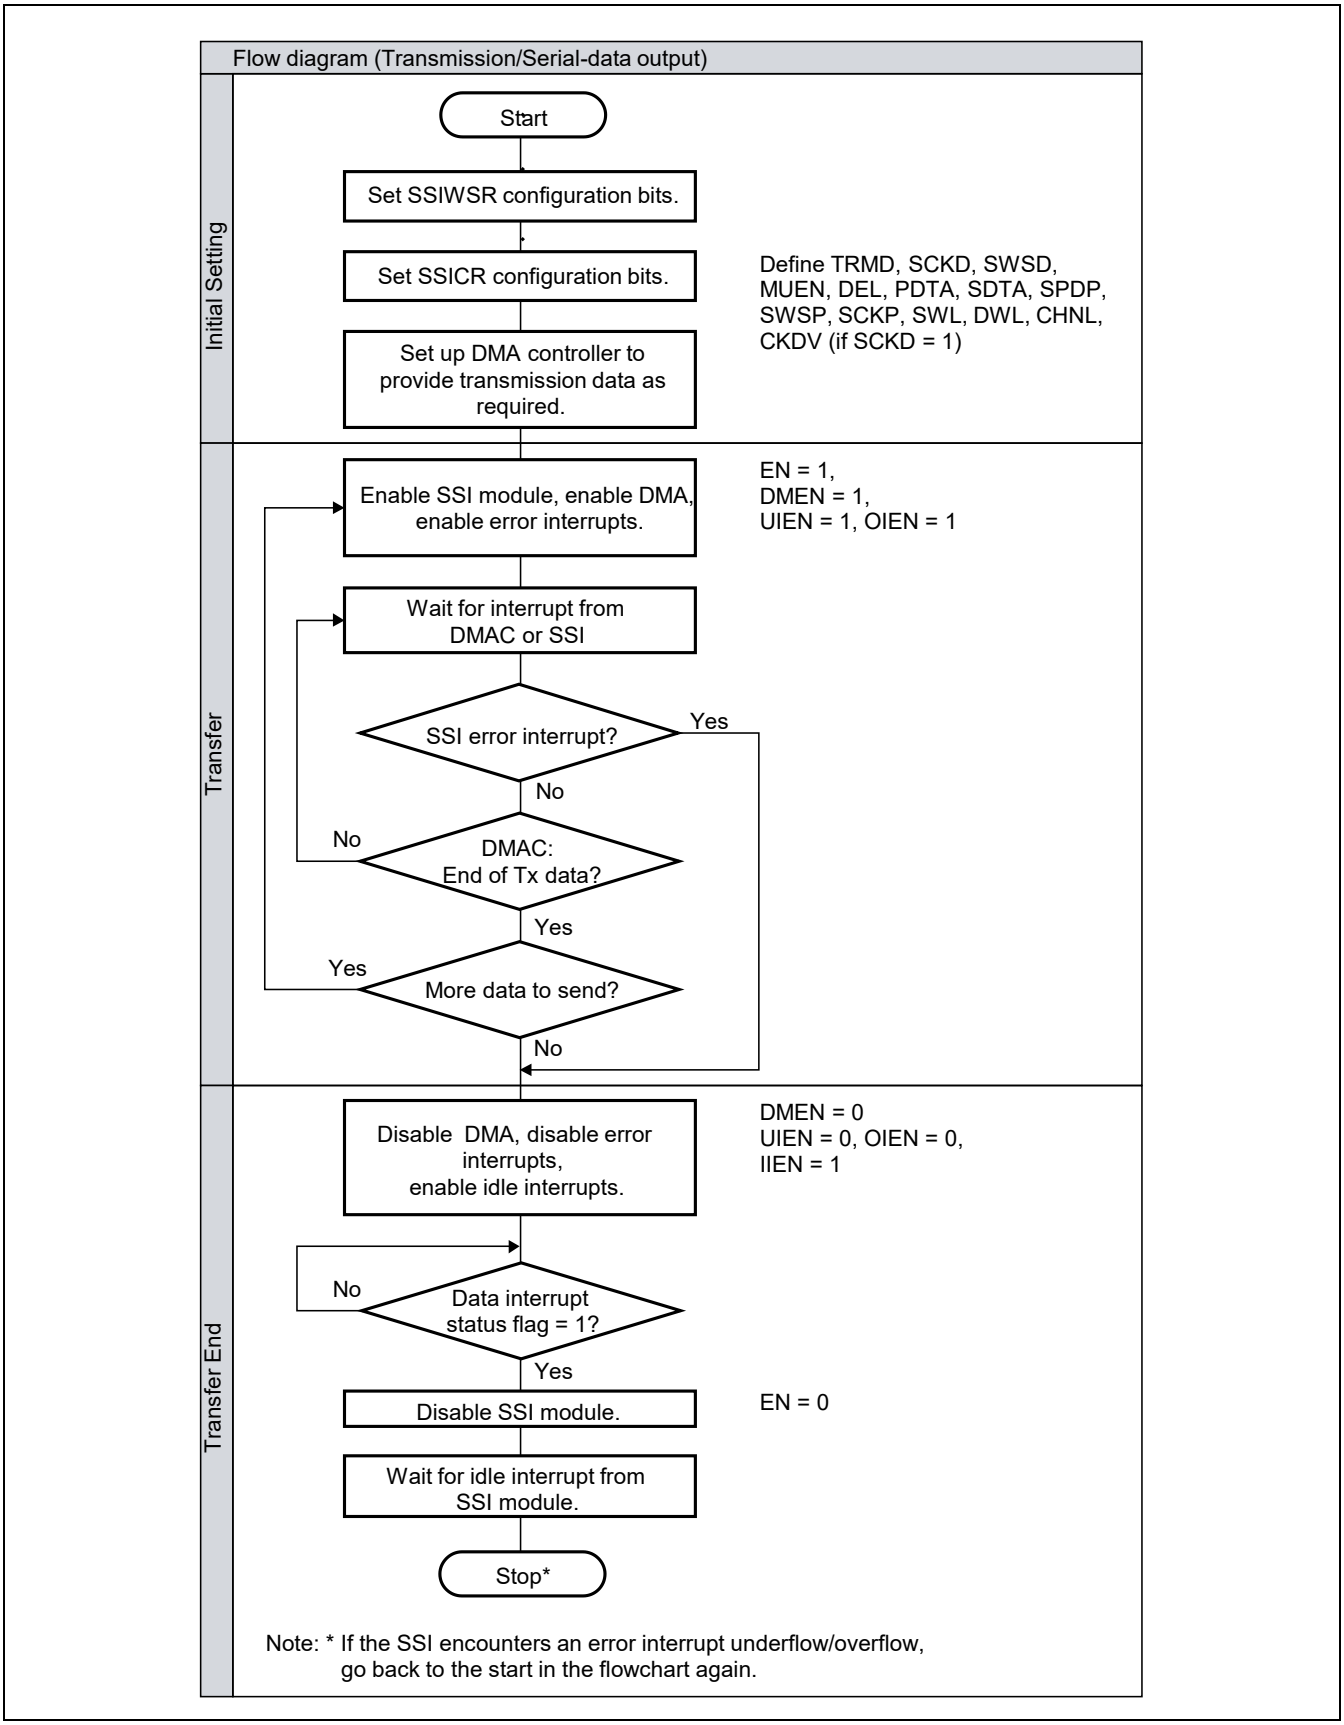

Figure 82.38 Transmission Using DMA Controller

(2) Transmission using interrupt data flow control

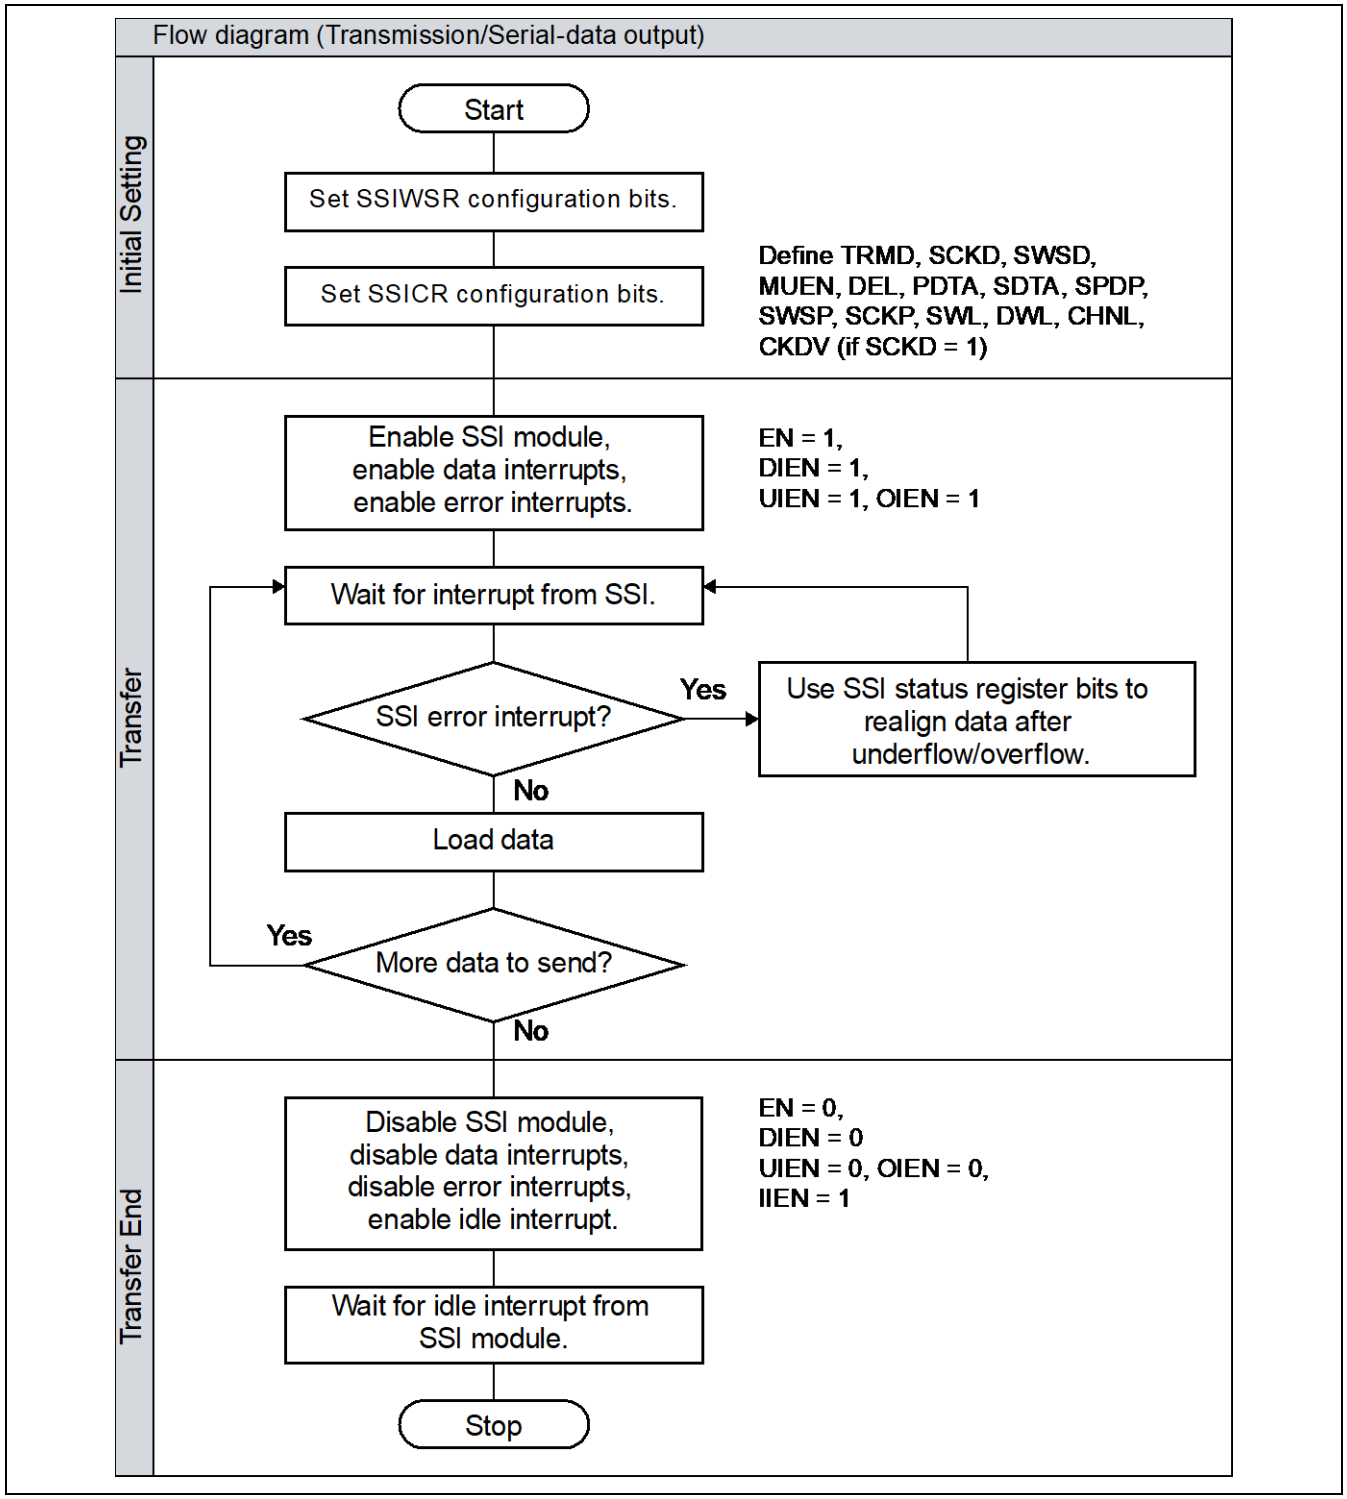

Figure 82.39 Transmission Using Interrupt Data Flow Control

82.3.4 Receive Operation

Like transmission, reception can be controlled either by DMA or interrupt.

Figure 82.40 and Figure 82.41 show the flow of operation.

When disabling the SSI module, the SSI clock* must be kept supplied until the SSISR.IIRQ bit is in idle state.

Note: * Input clock from the SSI_SCK pin when SCKD = 0.
Input clock from the CLK_FS pin when SCKD = 1.

(1) Reception using DMA controller

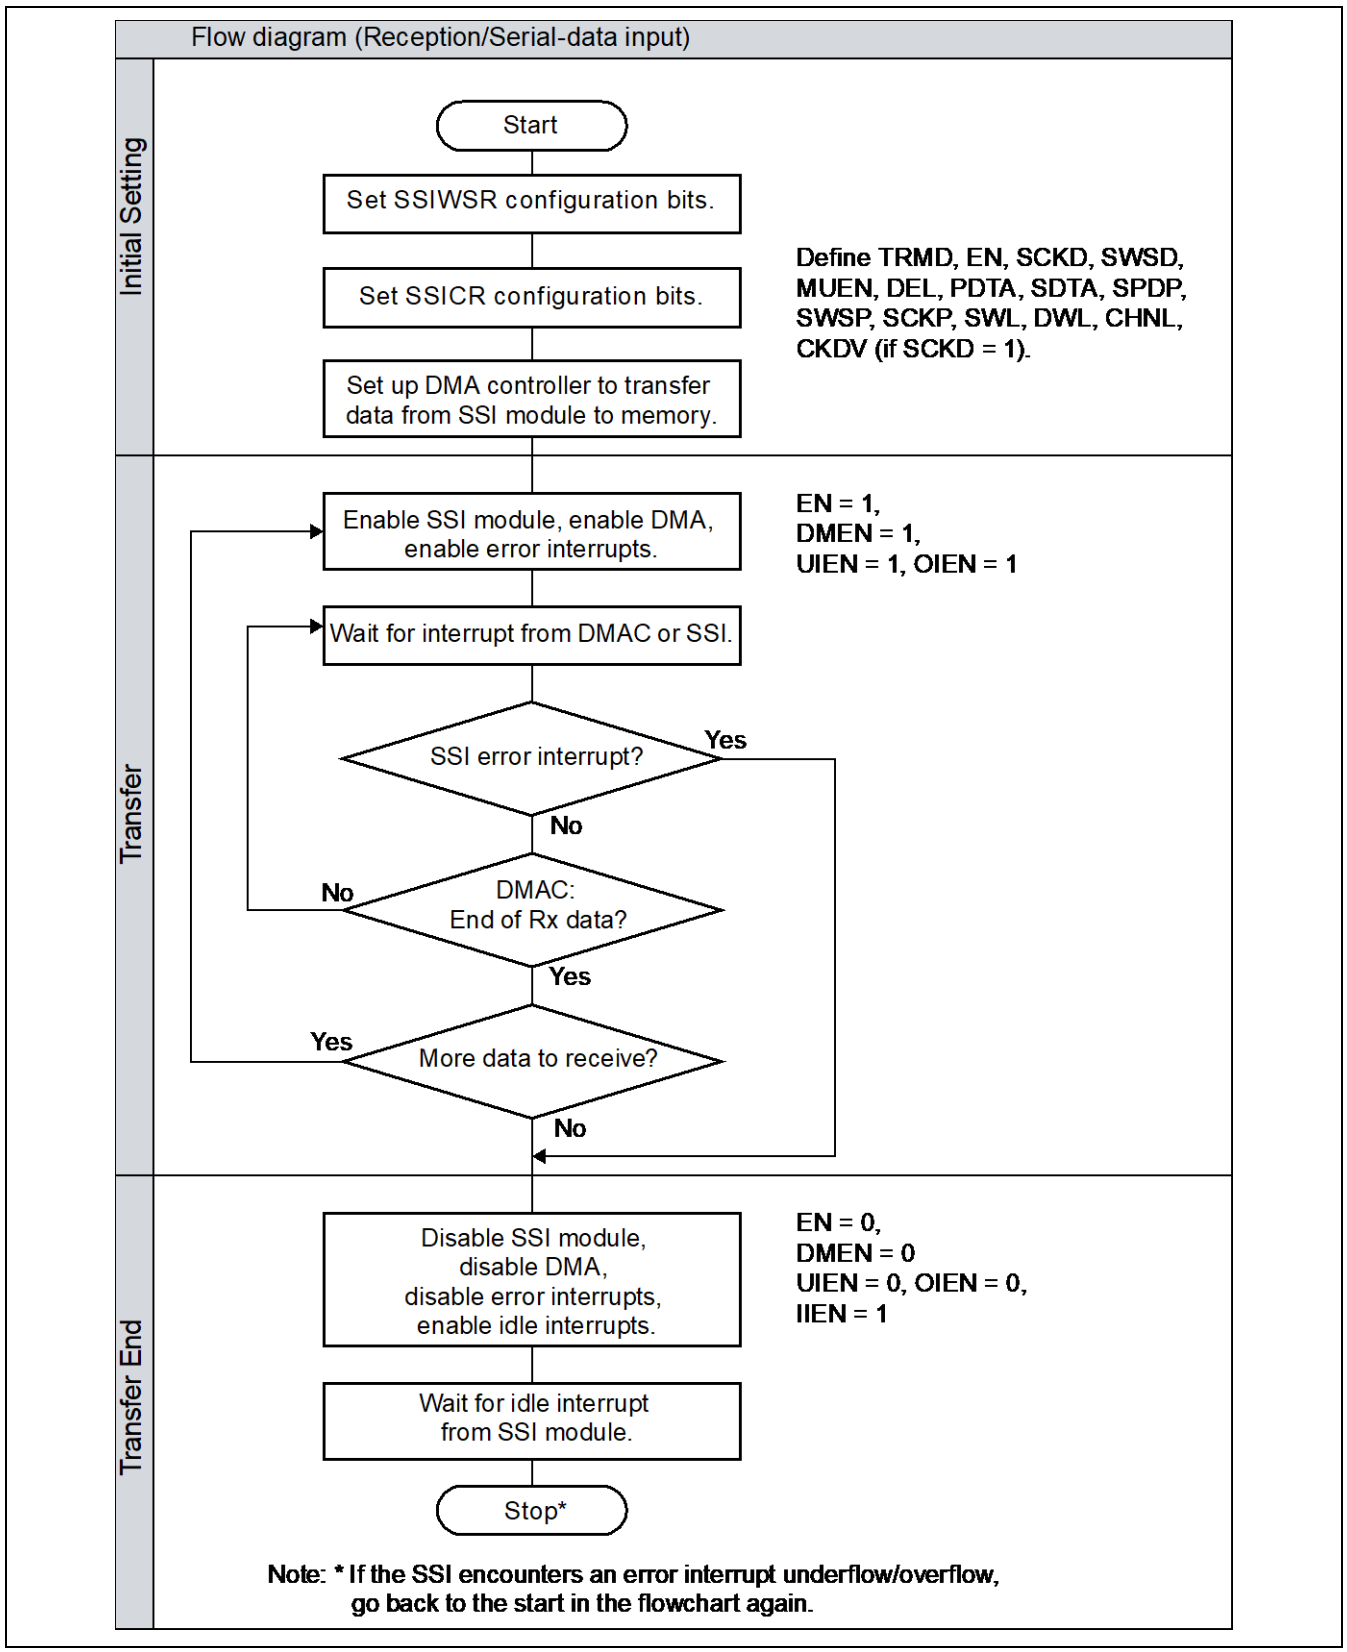

Figure 82.40 Reception Using DMA Controller

(2) Reception using interrupt data flow control

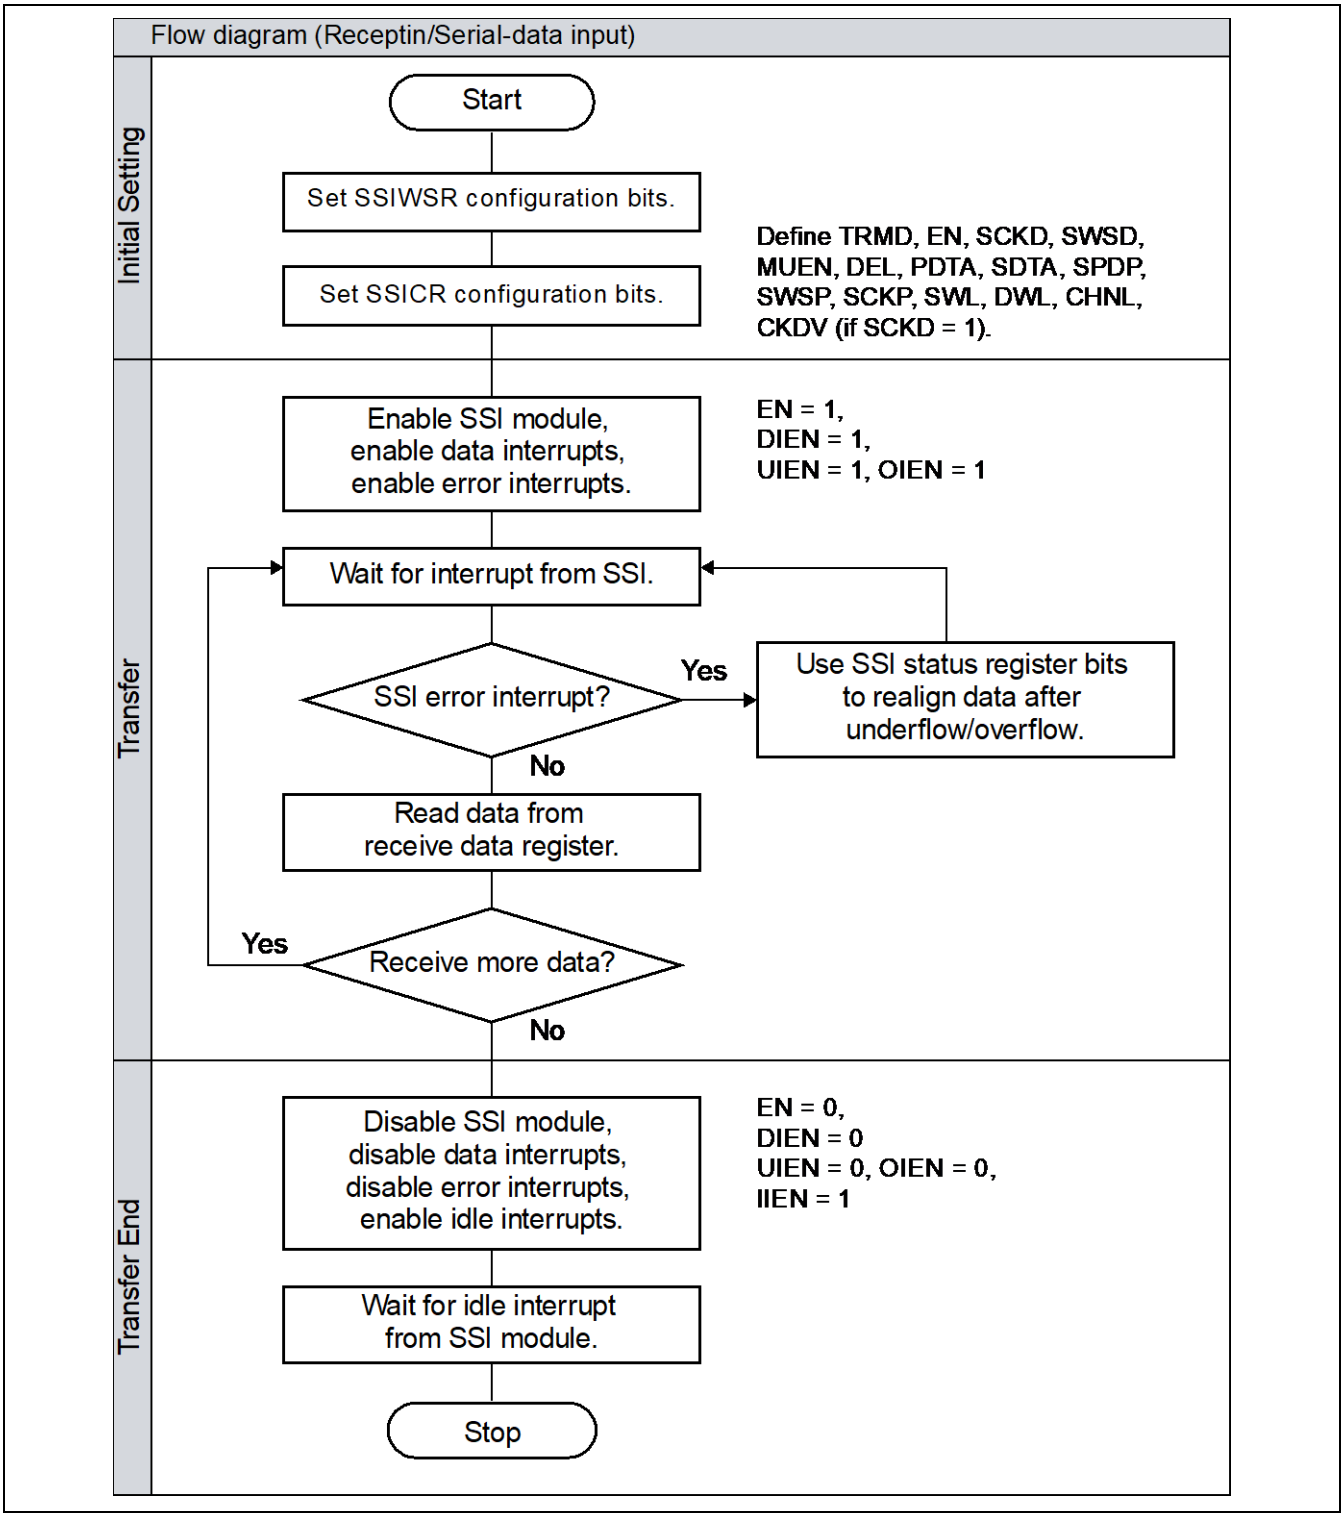

Figure 82.41 Reception Using Interrupt Data Flow Control

82.3.5 Serial Bit Clock Control

This function is used to control and select which clock is used for the serial bus interface.

If the serial clock direction is set to input (SSICR.SCKD = 0), the SSI module is in clock slave mode and the shift register uses the bit clock that was input to the SSI_SCK pin.

If the serial clock direction is set to output (SSICR.SCKD = 1), the SSI module is in clock master mode, and the shift register uses the bit clock that is input from the CLK_FS pin or the bit clock that is obtained by dividing the input from the CLK_FS pin. In the latter case, the clock input from the CLK_FS pin is divided by the ratio in the serial oversampling clock divide ratio (CKDV) in SSICR and used as the bit clock in the shift register.

In either case, the SSI_SCK pin output is the same as the bit clock.

82.4 Usage Notes

82.4.1 Limitations from Overflow during Receive DMA Operation

If an overflow occurs while the receive DMA is in operation, the module should be restarted. The receive buffer in the SSI consists of 32-bit registers that share the L and R channels. Therefore, data to be received at the L channel may sometimes be received at the R channel if an overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL).

If an overflow is confirmed with the overflow error interrupt or overflow error status flag (SSISR. OIRQ), write 0 to the EN and DMEN bits in SSICR to disable DMA in the SSI module, thus stopping the operation (In this case, the controller setting should also be stopped). After this, write 0 to the OIRQ bit in SSISR to clear the overflow status, set DMA again and restart the transfer.

82.4.2 Limitations on Slave Mode Operation

When this LSI is used in slave mode, in ending a data transfer process, data transfer on this LSI should be stopped (SSICR.EN = 0) before the input word selection signal (SSI_WS) is stopped.

In slave mode, data transfer is stopped by clearing the EN bit in SSICR (setting to stop transfer) and detecting the falling edge of the word selection signal (SSI_WS). If the input word selection signal is stopped first, the falling edge of the word selection signal cannot be detected and data transfer cannot be ended successfully.

In case of transmission at slave mode, it is necessary that WS signal is stable. Data transmission at slave mode should be started after more than two frames period since WS signal is entered and is stable.

In case of multiple SSI modules and case that one SSI works at master mode and the others do at slave mode, data transfer should be started after more than two frames period since registers of SSI at master mode are set.

82.4.3 Limitations on Changes to Settings

The SSI_SCK and SSI_WS signals are not guaranteed immediately after changes of the WS mode bit in the WS Mode Register (SSIWSR) and configuration bits in the control register (SSICR). Settings must not be changed dynamically if this would affect any connected device.

82.4.4 Stopping or Resuming Transmission

Follow the procedure below to stop or resume transmission.

(1) Stopping transmission:

1. Set the DMEN bit in SSICR to 0 for stopping transmission.
2. Wait for SSISR.DIRQ = 1 by using polling or interrupts.
3. Set the EN bit in SSICR to 0 to stop transmission.
4. Check that SSISR.IDST is 1.

(2) Resuming transmission:

Set DMEN and EN bits in SSICR to 1 for resuming transmission (The DMEN bit should be set to 1 at the same time of or before setting the EN bit).

82.4.5 Stable period of SCK and WS

The period during which SCK signal and WS signal stabilizes is shown below. It is assumed that the clock supplied from ADG is stable.

SCK signal (when SSI is used in the master mode)

1. Set the SSICR (exclude EN bit) register.
2. Wait count end to setting value of SSICR.CKDV (counted by CLK_FS).
3. SCK signal is stable.

WS signal (when SSI is used in the master mode)

1. Set the SSIWSR and SSICR (exclude EN bit) register.
2. Wait 2 frames.
3. WS signal is stable.

82.4.6 About CLK_FS input clock

For details on generation and selection of master clock signal, see section 83. Audio Clock Generator (ADG).

82.5 Safety Mechanisms

This module has no Mechanism of FuSa.

83. Audio Clock Generator (ADG)

83.1 Overview

The audio clock generator (ADG) selects and supplies the necessary clock for the SSIU module. It also divides the frequency of the selected clock and sends it outside the chip.

83.1.1 Features

- The clock signal from the AUDIO_CLKIN pin supplies it to the SSIU module.
- The frequency of the clock signals from the AUDIO_CLKIN pins can be divided before use.
- The divided clock can be output through the AUDIO_CLKOUT pin.

Note: The presence or absence of pins depends on the product. For details, see Table 83.1.

Audio Clock Select Register 0	AUDIO_CLK_SEL0	R/W	H'00C	H'0000 0000	32

Note: * Some restrictions apply.

83.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit.

All registers are accessed in longword units.

83.2.1 BRGA Baud Rate Setting Register (BRRA)

Function: BRRA is a 32-bit readable/writable register that specifies the baud rate for ACLK_A (see Table 83.3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

9, 8	CKS[1:0]	H'0	R/W	These bits specify the clock source for the on-chip baud rate generator. B'00: ACLK_B B'01: ACLK_B/4 B'10: ACLK_B/16 B'11: ACLK_B/64
7 to 0	BRRB[7:0]	H'FF	R/W	These bits specify the division ratio. For details, see Table 83.4.

Table 83.4 Division Ratio for BRGB

BRGB Operating Clock (CKS[1], CKS[0])	Division Ratio BRRB (N = 0 to 255)	Calculating Formula
ACLK_B	1/2, 1/4, 1/6, ..., 1/512	1 / (2(N + 1))
ACLK_B/4	1/8, 1/16, 1/24, ..., 1/2048	1 / (8(N + 1))
ACLK_B/16	1/32, 1/64, 1/96, ..., 1/8192	1 / (32(N + 1))
ACLK_B/64	1/128, 1/256, 1/384, ..., 1/32768	1 / (128(N + 1))

Note: Use the output of BRGB in less than 25 MHz.

83.2.3 BRG Clock Select Register (BRGCKR)

Function: BRGCKR selects the clocks input to and output from the ADG.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BRGCKR_31	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	1	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	BRGCKR_31	B'0	R/W	This bit selects the clock signal output to the AUDIO_CLKOUT or external pin. 0: BRGA output clock 1: BRGB output clock
30 to 23	—	H'46	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
22 to 0	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.

83.2.4 Audio Clock Select Register 0 (AUDIO_CLK_SEL0)

Function: AUDIO_CLK_SEL0 selects the clocks for the SSIU (for SSI0).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—		—		—		—		—		—		—		—	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—		—		—		—		DIVSEL_SSI0 [1:0]		ACLK_SEL_ SSI0[1:0]		DIVSEL2 _SSI0	DIVCLK_SEL_SSI0 [2:0]

R/W:	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
7, 6	DIVSEL_SSI0[1:0]	H'0	R/W	SSI0 Frequency Divider Select [3], [7:6]: ACLK_SEL_SSI0[1:0] = B'00 B'000: Not divided B'001: Divided by 2 B'010: Divided by 4 B'011: Divided by 8 B'100: Divided by 16 B'101: Divided by 32 B'110, B'111: Fixed at 0
5, 4	ACLK_SEL_SSI0[1:0]	H'0	R/W	SSI0 Clock Select B'00: DIVCLK B'01: BRGA output clock B'10: BRGB output clock Others: Setting Prohibited
3	DIVSEL2_SSI0	B'0	R/W	See Bit Description of DIVSEL_SSI0[1:0]
2 to 0	DIVCLK_SEL_SSI0 [2:0]	H'0	R/W	SSI0 Clock Select B'000: Fixed at 0 B'001: AUDIO_CLKIN Others: Setting Prohibited

83.3 Operation

The following sections give examples of setting the ADG registers .

83.3.1 Supplying SSI with Audio Clock

The following procedure can be used to divide the external clock (AUDIO_CLKIN: 25 MHz) by d'2 and supply the resulting BRGB clock (12.500 MHz) to SSI0.

If the procedure is applied before starting SSI0, steps 1 to 4 can be executed in any order.

1. Set BRRB so that the frequency division ratio should be d'2.
2. Select external clock (AUDIO_CLKIN) as the clock to be input to BRGB using BRGCKR.
3. Select the BRGB output clock as SSI0 clock using AUDIO_CLK_SEL0.
4. Release SSI0 from the module standby state using MSTPCR29 of the CPG module.

Table 83.5 Setting Example 1

Register Name	Address	Setting Value	Description
BRRB	H'EC5A 0004	H'0000 0000	Divided by d'2
BRGCKR	H'EC5A 0008	H'2300 0000	Selects AUDIO_CLKIN as the clock to be input to BRGB.
AUDIO_CLK_SEL0	H'EC5A 000C	H'0000 0020	Selects the BRGB output clock as the clock to be output to SSI0.
MSTPCR29	H'E615 2D74	Set bits 27, 26.	Releases the SSI0 from the module standby state.

Note: * CPG register is enabled by writing the inverse of the value to CPGWPR register.

83.4 Usage Notes

83.4.1 Note on using AUDIO_CLKIN and Input/Output timing signal in stable condition

AUDIO_CLKIN and Input/Output timing signal should be in a stable state before starting transfer of related audio modules. When Input/Output timing signal counts the number of divider register setting, it becomes stable.

83.5 Safety Mechanisms

This module has no Mechanism of FuSa.

100. Ethernet（EtherAVB-IF, gPTP, RGMII）

Timer Unit module is a module composed of EtherAVB-IF, gPTP, and RGMII.

Refer to following section for the detailed function.

- EtherAVB-IF :100.1 EtherAVB-IF
- gPTP :100.2 gPTP
- RGMII:100.3 RGMII

100.1 EthernetAVB-IF

100.1.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The EthernetAVB-IF includes an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB-IF has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the User RAM(URAM) at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

In this section, URAM refers to the local RAM and external memory for the SoC.

100.1.1.1 Features

Table 100.1 lists the specifications of the EthernetAVB-IF module.

Table 100.1 Specifications (Common Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 100 and 1000 Mbps
Mode	Full-duplex mode
Interface	Supports the RGMII (Reduced Gigabit Media Independent Interface), MII Interface
Summary of the EthernetAVB-IF function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: IEEE 802.1AS (time synchronization protocol) IEEE 802.1Qav (real-time transfer) IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. Descriptor management system Identification and sorting of frame data, and extraction and gathering of valid data Controllable interrupt frequency (reducing the load on the CPU)
Transmit/Receive FIFO	For transmission : 16Kbytes For reception : 8Kbytes
Max frame size	For transmission : 2047bytes For reception : 4092bytes

Item	Description
Magic Packet™	Detection of Magic Packets™* and output of a detected signal

Note: * Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

Table 100.4 Pin Configuration

Name	I/O	Function
AVBn_TD[3:0]	O	Transmit data signal
AVBn_TX_CTL	O	Transmit control signal
AVBn_RD[3:0]	I	Receive data signal
AVBn_RX_CTL	I	Receive control signal
AVBn_RXC	I	Receive clock signal
AVBn_TXC	O	transmit clock signal
AVBn_TXCREFCLK	I	reference clock signal
AVBn_MDC	O	Management information transfer clock signal
AVBn_MDIO	I/O	Management information transmit/receive data
AVBn_LINK	I	Link status signal
AVBn_MAGIC	O	Magic packet signal
AVBn_PHY_INT	I	PHY interrupt signal
AVBn_AVTP_CAPTURE	I	AVTP capture signal
AVBn_AVTP_MATCH	O	AVTP match signal
AVBn_AVTP_PPS	O	AVTP Pulse-per-second signal
AVBn_MII_TXC	I	25MHz transmit clock
AVBn_MII_RXC	I	25MHz receive clock
AVBn_MII_TX_EN	O	Transmit enable
AVBn_MII_TD[3:0]	O	Transmit data
AVBn_MII_TX_ER	O	Transmit coding error
AVBn_MII_RX_DV	I	Receive data valid
AVBn_MII_RD[3:0]	I	Receive data
AVBn_MII_RX_ER	I	Receive error
AVBn_MII_CRS	I	Carrier sense
AVBn_MII_COL	I	Collision detected

100.1.1.4 Register Configuration

Table 100.6 and Table 100.7 lists the EthernetAVB-IF related registers and their configurations.

Table 100.5 Base address of EthernetAVB-IF- Registers

Ch	Base Address
AVB0	H'E680 0000
AVB1	H'E681 0000
AVB2	H'E682 0000

Table 100.6 Configurations of AVB-DMAC-related Registers

Name	Abbreviation*1	R/W	Offset Address	Initial Value	Access Size
AVB-DMAC mode register	AVBnCCC	R/W	H'0000	H'0000 0000	32
Descriptor base address table register	AVBnDBAT	R/W	H'0004	H'0000 0000	32
Descriptor base address load request register	AVBnDLR	R/W	H'0008	H'003F FFFF	32
AVB-DMAC status register	AVBnCSR	R	H'000C	H'0000 0001	32
Current descriptor address register q (q = 0 to 21)	AVBnCDARq	R	H'0010 + q × 4	H'0000 0000	32
Error status register	AVBnESR	R	H'0088	H'0000 0000	32
AVB-DMAC Product Specific Register	AVBnAPSR	R/W	H'008C	H'0000 0000	32
Receive configuration register	AVBnRCR	R/W	H'0090	H'1800 0000	32
Receive queue configuration register i (i = 0 to 4)	AVBnRQCi	R/W	H'0094 + i × 4	H'0000 0000	32
Receive padding configuration register	AVBnRPC	R/W	H'00B0	H'0000 0100	32
Reception Truncation Configuration register	AVBnRTC	R/W	H'00B4	H'0FFC 0FFC	32
Unread frame counter warning level register	AVBnUFCW	R/W	H'00BC	H'0000 0000	32
Unread frame counter stop level register	AVBnUFCS	R/W	H'00C0	H'0000 0000	32
Unread frame counter register i (i = 0 to 4)	AVBnUFCVi	R	H'00C4 + i × 4	H'0000 0000	32
Unread frame counter decrement register i (i = 0 to 4)	AVBnUFCDi	R/W	H'00E0 + i × 4	H'0000 0000	32
Separation filter offset register	AVBnSFO	R/W	H'00FC	H'0000 0000	32
Separation filter pattern register i (i = 0 to 31)	AVBnSFPi	R/W	H'0100 + i × 4	H'0000 0000	32
Separation Filter Value register i (i = 0 to 1)	AVBnSFVi	R/W	H'01B8 + i × 4	H'0000 0000	32
Separation filter mask register i (i = 0, 1)	AVBnSFMi	R/W	H'01C0 + i × 4	H'0000 0000	32
Separation Filter Load register	AVBnSFL	R/W	H'01C8	H'0000 001F	32

Name	Abbreviation*1	R/W	Offset Address	Initial Value	Access Size
Payload CRC register	AVBnPCRC	R/W	H'01CC	H'0000 0000	32
Current Incremental Address Register r (r = 0 to 17)	AVBnCIARr	R	H'0200 + r × 4	H'0000 0000	32
Last Incremental Address Register r (r=0 to 17)	AVBnLIARr	R	H'0280 + r × 4	H'0000 0000	32
Transmit configuration register	AVBnTGC	R/W	H'0300	H'0022 2200	32
Transmit configuration control register	AVBnTCCR	R/W	H'0304	H'0000 0000	32
Transmit status register	AVBnTSR	R	H'0308	H'0000 0000	32
E-MAC status FIFO Access register	AVBnMFA	R	H'030C	H'0000 0000	32
Time stamp FIFO access register 0	AVBnTFA0	R	H'0310	H'0000 0000	32

100.1.1.5 Connected Module

Table 100.9 Connected module

Module name	Connected module name	Function of connected module
EthernetAVB-IF	AP-System Core	Access the Registers
	CPG	Output clocks
	PFC	Select the External pins
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-SYS, INTC-RT	Control to interrupt
	DU	Output capture signal

100.1.2 Register Description

100.1.2.1 AVB-DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FCE	LBME	—	—	—	—	—	—	CSEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

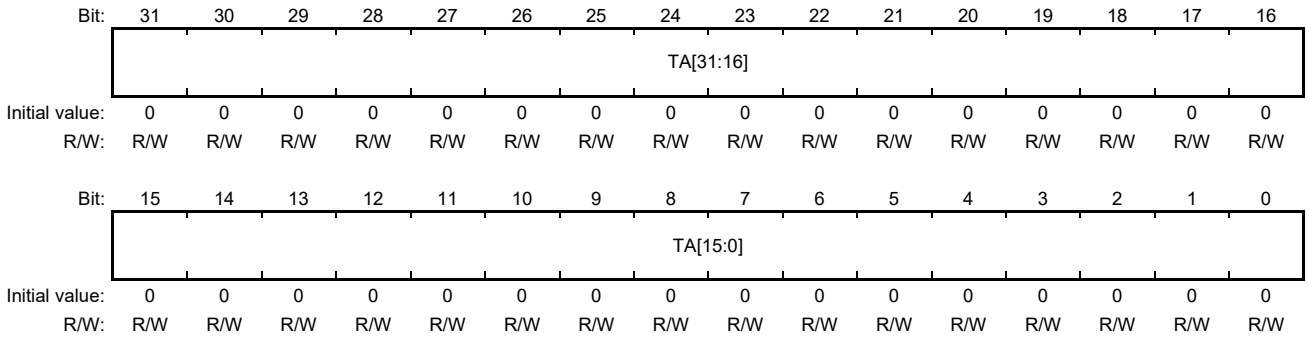
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTSR	GAC	—	—	—	—	—	OPC[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
25	FCE	0	R/W	Flow Control Enable This bit enables the flow control support of E-MAC. When flow control is enabled, the E-MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached **RCR.RFCL**). 0: Flow control disabled 1: Flow control enabled
24	LBME	0	R/W	Loopback Mode Enable This bit enables loopback mode. In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the RGMII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Normal operation 1: Loopback mode is enabled. Note: Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data.
23 to 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17, 16	CSEL[1:0]	00	R/W	gPTP Clock Select These bits select the clock source for the gPTP timer. Writing to these bits is only possible when the current operating mode is configuration mode and CCC.GAC is 0b. Writing to these bits is only possible when the current operating mode is Reset mode when writing CCC.GAC to 1b and CCC.OPC to 01b by same write access. 00: gPTP is disabled 01: High-speed peripheral bus clock 10 and 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8	DTSR	0	R/W	Data Transmission Suspend Request This bit can suspend access to the URAM. The access is suspended on completion of the transfer of the AXI transaction currently being transferred. This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity. Note that the transmission and reception queues are not processed while access is suspended. Change neither the AVB-DMAC settings nor the mode while access is suspended. 0: Normal operation 1: Requests suspension
7	GAC	0	R/W	Gptp Active in Config This bit enables the gPTP support of EthernetAVB-IF in CONFIG mode. Function of gPTP support in OPERATION and STANDBY is not influenced by this bit. When gPTP support is active in CONFIG, **CCC.CSEL** defines the timer clock source. The CPU can only write 1b to this bit if **CSR.OPS** is RESET when writing **CCC.OPC** to 01b by same write access. 0: Normal operation 1: gPTP support active in CONFIG mode
6 to 2	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
1, 0	OPC[1:0]	00	R/W	Operating Mode Configuration These bits specify the operating mode. For the operating modes, see section 100.1.3.1(1) Operating Modes. Writing to these bits is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request. When **CCC.GAC** is 1b CPU should not write 11b to these bits. [Changing condition] These bits are set to 00b when RESET mode is entered due to 'enter power off' request. 00: Reset mode 01: Configuration mode 10: Operation mode 11: standby mode

100.1.2.2 Descriptor Base Address Table Register (DBAT)

The DBAT register specifies the base address of the descriptor table in the URAM. For the structure of this table, see section 100.1.3.3 Descriptors. Writing to this bit is only possible when the current operating mode is configuration mode.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TA[31:0]	H'0000 0000	R/W	Descriptor Base Table Address Base address of the descriptor table in the URAM Note: The setting of this bit must be a multiple of four (i.e. bit 0 and bit 1 must be set to 0).

100.1.2.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q. If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	LBA21	LBA20	LBA19	LBA18	LBA17	LBA16
Initial value:	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBA15	LBA14	LBA13	LBA12	LBA11	LBA10	LBA9	LBA8	LBA7	LBA6	LBA5	LBA4	LBA3	LBA2	LBA1	LBA0
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21	LBA21	1	R/W	Base Address Load Request (Rx17: Stream 15) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
20	LBA20	1	R/W	Base Address Load Request (Rx16: Stream 14) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
19	LBA19	1	R/W	Base Address Load Request (Rx15: Stream 13) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
18	LBA18	1	R/W	Base Address Load Request (Rx14: Stream 12) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Bit	Bit Name	Initial Value	R/W	Description
17	LBA17	1	R/W	Base Address Load Request (Rx13: Stream 11) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
16	LBA16	1	R/W	Base Address Load Request (Rx12: Stream 10) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
15	LBA15	1	R/W	Base Address Load Request (Rx11: Stream 9) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
14	LBA14	1	R/W	Base Address Load Request (Rx10: Stream 8) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
13	LBA13	1	R/W	Base Address Load Request (Rx9: Stream 7) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
12	LBA12	1	R/W	Base Address Load Request (Rx8: Stream 6) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
11	LBA11	1	R/W	Base Address Load Request (Rx7: Stream 5) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
10	LBA10	1	R/W	Base Address Load Request (Rx6: Stream 4) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
9	LBA9	1	R/W	Base Address Load Request (Rx5: Stream 3) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
8	LBA8	1	R/W	Base Address Load Request (Rx4: Stream 2) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Bit	Bit Name	Initial Value	R/W	Description
7	LBA7	1	R/W	Base Address Load Request (Rx3: Stream 1) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
6	LBA6	1	R/W	Base Address Load Request (Rx2: Stream 0) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
5	LBA5	1	R/W	Base Address Load Request (Rx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
4	LBA4	1	R/W	Base Address Load Request (Rx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
3	LBA3	1	R/W	Base Address Load Request (Tx3: Stream Class A) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
2	LBA2	1	R/W	Base Address Load Request (Tx2: Stream Class B) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
1	LBA1	1	R/W	Base Address Load Request (Tx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
0	LBA0	1	R/W	Base Address Load Request (Tx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

100.1.2.4 AVB-DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TDUO	RPO	TPO3	TPO2	TPO1	TPO0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTS	—	—	—	—	OPS[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are read as 0.
21	TDUO	0	R	Transmission Descriptor Update On-going This bit indicates that there is pending descriptor update for one or more transmit queues. When this bit is 1b, there are descriptors of already or currently processed transmit storage elements not updated in URAM. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when all transmit queue related storage elements processed. This bit is set to 1b when descriptor related status update procedure starts (descriptor update and register flagging). 0: No pending descriptor update 1: Pending descriptor update in URAM
20	RPO	0	R	Receive Process Status This bit indicates whether a reception queue contains an unread received frame. This bit being set to 1 indicates that a received frame is yet to be stored in the URAM. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Received frames in the reception FIFO all being stored in the URAM. 1: Reception is in progress. [Setting condition] — A received frame being stored in the reception FIFO (but not yet in the URAM).

Bit	Bit Name	Initial Value	R/W	Description
19	TPO3	0	R	Transmit Process Status 3 (Stream Class A) This bit indicates whether a class A stream is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ3 is 0. 1: Transmission is in progress. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3)).
18	TPO2	0	R	Transmit Process Status 2 (Stream Class B) This bit indicates whether a class B stream is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ2 is 0. 1: Transmission is in progress. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2)).
17	TPO1	0	R	Transmit Process Status 1 (Network Control) This bit indicates whether a network control is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ1 is 0. 1: Transmission is in progress. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1)).

Bit	Bit Name	Initial Value	R/W	Description
16	TPO0	0	R	Transmit Process Status 0 (Best Effort) This bit indicates whether a best effort is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ0 is 0. 1: Transmission is in progress. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0)).
15 to 9	—	All 0	R	Reserved These bits are read as 0.
8	DTS	0	R	Data Transmission Suspended Status This bit indicates whether access to the URAM is enabled. 0: Normal operation [Clearing conditions] — The data transmission suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0. 1: Transmission is in progress. [Setting condition] — Access to the URAM not proceeding while the data transmission suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).
7 to 4	—	All 0	R	Reserved These bits are read as 0.
3 to 0	OPS[3:0]	0001	R	Operating Mode Status These bits indicate the current operating mode. For the operating modes, see section 100.1.3.1(1) Operating Modes. 0001: Reset mode 0010: Configuration mode 0100: Operation mode 1000: standby mode Other settings are reserved.

100.1.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

The CDARq register indicates the current descriptor address.

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the descriptor base address table register (DBAT) are set in to the corresponding CDAR registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	CDA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDA[31:0]	H'0000 0000	R	Current Descriptor Address The address of the current descriptors for the transmission queues. Conditions for updating: • These bits are set to 0 when the operating mode is not operation mode. This register is updated in response to processing of the descriptor for a queue.

100.1.2.6 Error Status Register (ESR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

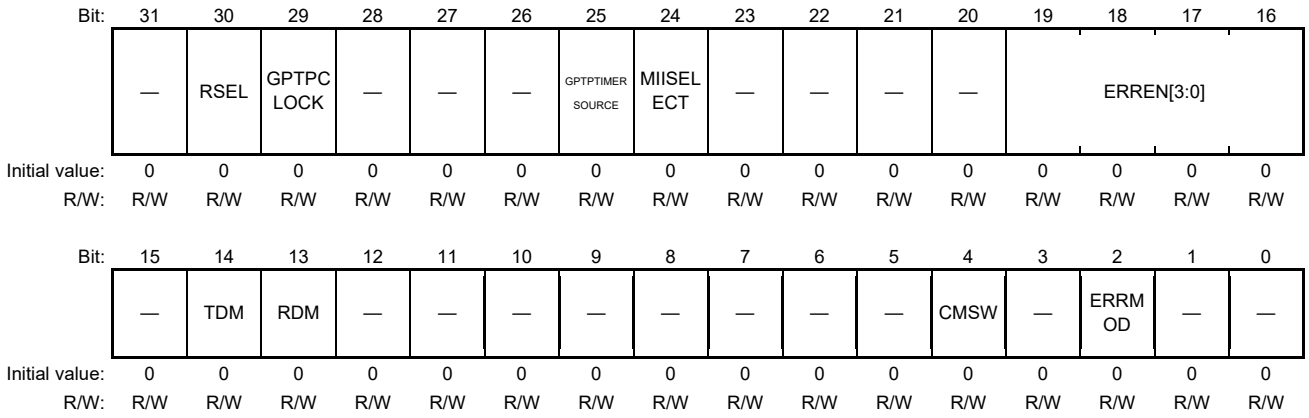
Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as 0.
12	EIL	0	R	Error Information Lost This bit indicates that error information detect by EthernetAVB-IF is lost, because the previous reported error has not been processed by CPU. [Changing conditions] — This bit is set to 0 when leaving operation mode. — This bit is set to 0 when CPU writes 0 to EIS.QEF. — This bit is set to 1 when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1. 0: No loss of error information 1: Lost of error information detected

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	ET[3:0]	0000	R	Error Type These bits indicate details about the transfer stage which was handled when EthernetAVB-IF has detected an error. When the fault is related to the read descriptor (ESR.ET = B'0000 or B'0010), CPU needs to correct the faulty descriptor before the related queue can continue processing. Because the queue halts at the faulty descriptor CDARq.CDA (q = ESR.EQN) is identifying the faulty descriptor directly. When the fault is related to descriptor writing (ESR.ET = B'0001), CPU needs to recognize the not-updated or incorrectly updated descriptor in queue ESR.EQN. The write problem is not influencing how EthernetAVB-IF processes the descriptor chain. When the fault is related to the Tx-buffer (ESR.ET = B'0011), CPU needs to clean-up the Tx-buffer to correct the buffer control structures. All other errors are transient in nature and may be corrected by continuation of hardware or software operation; so there is no strong demand on CPU interaction. Refer to section 100.1.3.2(2) Checking Integrity for details of error handling. The CPU should only evaluate these bits when the EIS.QEF bit is 1. [Changing condition] — These bits are updated when the set condition of the EIS.QEF bit is fulfilled and the EIS.QEF bit is 0. 0000: Read descriptor from URAM 0001: Write descriptor to URAM 0010: Interpret data descriptor 0011: Tx-buffer is corrupted 0100: Read data from URAM 0101: Write data or timestamp to URAM 0110: Reading from Rx-FIFO 0111: Rx-FIFO is corrupted 1000: Frame size error during reception detected 1001: Frame size error during transmission detected 1010: Tx-buffer overflow 1011: AVTP FIFO error
7 to 5	—	All 0	R	Reserved These bits are read as 0.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	EQN[4:0]	00000	R	Error Queue Number These bits indicate the queue number which was handled when EthernetAVB-IF has detected an error. A fault reported for ESR.EQN = 0 to 3 is related to transmit queue t (t = 0 to 3). From ESR.EQN = 4, the fault is related to receive queue r (r = ESR.EQN – 4). The CPU should only evaluate these bits when the EIS.QEF bit is 1. The CPU should not evaluate these bits when the ESR.ET bit is B'0011, B'0111 or B'1011. [Changing condition] — These bits are updated when the set condition of the EIS.QEF bit is fulfilled and the EIS.QEF bit is 0.

100.1.2.7 AVB-DMAC Product Specific Register (APSR)

Writing to this bit is only possible when the current operating mode is configuration mode.

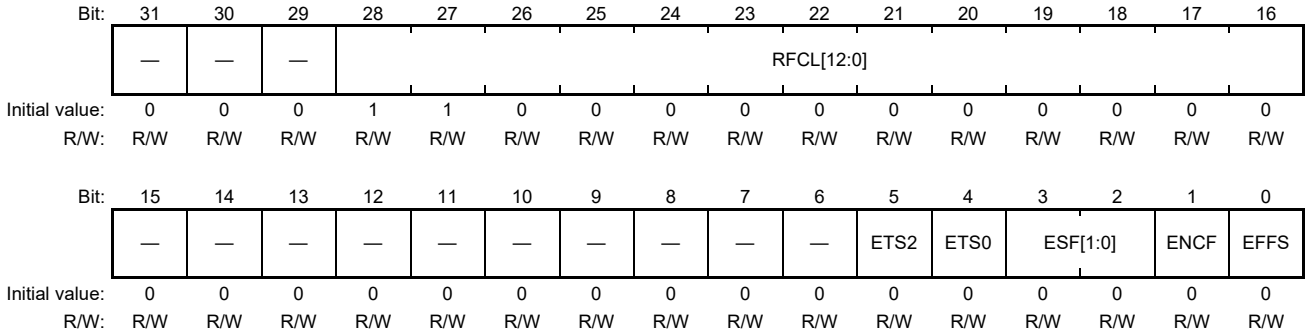


Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R/W	Reserved These bits are read as 0.
30	RSEL	0	R/W	Reference Clock Selection for Transmission 0: Use AVBn_TXCREFCLK (n = own channel number) 1: Use AVB0_TXCREFCLK
29	GPTPCLOCK	0	R/W	Select clock source for GPTP synchronization 0: Original clock source 1: S0D4_HSC This bit should be set to 1 when APSR.GPTPTIMERSOURCE is 1
28 to 26	—	All 0	R/W	Reserved These bits are read as 0.
25	GPTPTIMERSOURCE	0	R/W	Select gptp_timer[77:0] source for GPTP synchronization 0: Original gptp_timer source 1: gptp_timer source from GPTP module This bit should be set 1.
24	MIISELECT	0	R/W	MII clock selection 0: RGMII clock 1: MII clock *This functional is used AVB0 and AVB1 only. Not support AVB2.
23 to 20	—	All 0	R/W	Reserved These bits are read as 0.
19 to 16	ERREN[3:0]	All 0	R/W	Dummy Error Setting This bit is functional safety use only. Keep initial value.
15	—	0	R/W	Reserved These bits are read as 0.
14	TDM	0	R/W	Tx clock internal Delay Mode This bit can add internal Tx clock delay typ 2.0ns*. 0: normal mode 1: delayed mode *Refer to Electrical Characteristics for details.

Bit	Bit Name	Initial Value	R/W	Description
13	RDM	0	R/W	Rx clock internal Delay Mode This bit can add internal Rx clock delay typ 1.8ns*. 0: normal mode 1: delayed mode *Refer to Electrical Characteristics for details.
12	—	0	R/W	Reserved These bits are read as 0.
11 to 6	—	All 0	R/W	Reserved These bits are read as 0.
4	CMSW	0	R/W	select width of internal compare match signal 0: 1clock period pulse 1: 4clock period pulse
3	—	0	R/W	Reserved These bits are read as 0.
2	ERRMOD	0	R/W	Error injection mode 0: ERREN[3:0] invalid 1: ERREN[3:0] valid
1	—	0	R/W	Reserved These bits are read as 0.
0	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.8 Receive Configuration Register (RCR)

The RCR register is used to make settings related to reception for the AVB-DMAC.



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
28 to 16	RFCL[12:0]	H'1800	R/W	Receive FIFO Caution Level These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission. If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending. If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending. Writing to this bit is only possible when the current operating mode is configuration mode. Recommended value: H'1800 Notes: • The setting of this bit must be a multiple of four (i.e. set RFCL[1:0] = B'00). • In the case of this LSI chip, set these bits to H'1800.
15 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5	ETS2	0	R/W	Time Stamp Enable (Stream) Enables the inclusion of time-stamp information in reception queues 2 to 17. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0

Bit	Bit Name	Initial Value	R/W	Description
4	ETS0	0	R/W	Time Stamp Enable (Best Effort) Enables the inclusion of time-stamp information in reception queue 0. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0
3, 2	ESF[1:0]	00	R/W	Stream Filtering Select Settings for reception queues 2 to 17. These bits select separation filtering for reception queues 2 to 17. The queue-dependent separation filter can be used in combination with the identification of AVB stream frames. When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort). When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort). When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded. When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort). For separation filtering, see section 100.1.3.4(1)(a) Separation Filtering. Writing to this bit is only possible when the current operating mode is configuration mode. 00: Filtering is disabled. Frames are processed in queue 0 (best effort). 01: The filter for both AVB stream frames and non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). 10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. 11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort). Recommended value: B'10 or B'11
1	ENCF	0	R/W	Network Control Filtering Enable Setting for reception queue 1 (network control) Enables the AVB network control frame for reception queue 1. When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort). Writing to this bit is only possible when the current operating mode is configuration mode. 0: Network control is disabled. 1: Network control is enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	EFFS	0	R/W	Error Frame Enable Enables or disables the reception of frames that have been classified as error frames by the E-MAC. Received error frames are stored in reception queue 0 (best effort). An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS). Writing to this bit is only possible when the current operating mode is configuration mode. 0: Error frames are disabled. 1: Error frames are enabled. Recommended value: 0

100.1.2.9 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	PIA1	UFCC1[1:0]		TSEL1[1:0]		RSM1[1:0]		—	PIA0	UFCC0[1:0]		TSEL0[1:0]		RSM0[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
30	PIA3	0	R/W	Packed Incremental data Area (Receive Queue 3+i×4) This bit defines how addresses inside the incremental data area of queue 3+i×4 are handled. When this bit is 0b, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1b, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if **CSR.OPS** is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
29, 28	UFCC3[1:0]	00	R/W	Unread Frame Counter Configuration (Receive Queue 3+i×4) These bits set the unread frame counter used in reception queue 3+i×4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 3 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
27, 26	TSEL3	00	R/W	Truncation SELection (Receive Queue 3+i×4) This bit defines a maximum number of bytes for storing frames in receive queue 3+i×4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by **RTCi.MFLj**. 00: Maximum frame length defined by **RTC0.MFL0** 01: Maximum frame length defined by **RTC0.MFL1** Other configurations are Invalid The CPU can only write to these bits if **CSR.OPS** is CONFIG.
25, 24	RSM3[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 3+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 100.1.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back 01: Keep DT mode (no update of DT field at descriptor write back) 10: No write-back (no descriptor write back) 11: Invalid
23	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
22	PIA2	0	R/W	Packed Incremental data Area (Receive Queue 2+i×4) This bit defines how addresses inside the incremental data area of queue 2+i×4 are handled. When this bit is 0b, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1b, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if **CSR.OPS** is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
21, 20	UFCC2[1:0]	00	R/W	Unread Frame Counter Configuration (Receive Queue 2+i×4) These bits set the unread frame counter used in reception queue 2+i×4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 2 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	TSEL2	00	R/W	Truncation SELection (Receive Queue 2+i×4) This bit defines a maximum number of bytes for storing frames in receive queue 2+i×4. Frames longer than the selected maximum are truncated. EthernetAVB provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by **RTCi.MFLj**. 00: Maximum frame length defined by **RTC0.MFL0** 01: Maximum frame length defined by **RTC0.MFL1** Other configurations are Invalid The CPU can only write to these bits if **CSR.OPS** is CONFIG.
17, 16	RSM2[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 2+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 100.1.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back 01: Keep DT mode (no update of DT field at descriptor write back) 10: No write-back (no descriptor write back) 11: Invalid
15	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
14	PIA1	0	R/W	Packed Incremental data Area (Receive Queue 1+i×4) This bit defines how addresses inside the incremental data area of queue 1+i×4 are handled. When this bit is 0b, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1b, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if **CSR.OPS** is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
13, 12	UFCC1[1:0]	00	R/W	Unread Frame Counter Configuration (Receive Queue 1+i×4) These bits set the unread frame counter used in reception queue 1+i×4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 1 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

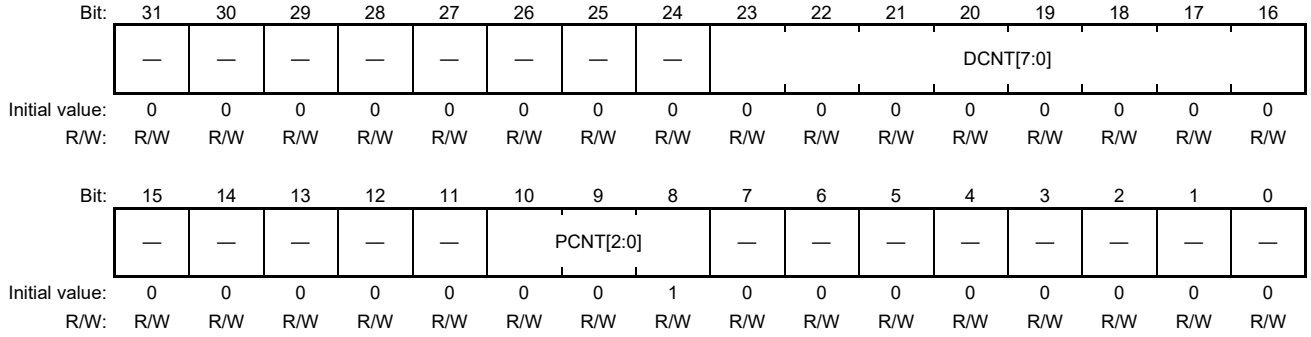
Bit	Bit Name	Initial Value	R/W	Description
11, 10	TSEL1	00	R/W	Truncation SELection (Receive Queue 1+i×4) This bit defines a maximum number of bytes for storing frames in receive queue 1+i×4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by **RTCi.MFLj**. 00: Maximum frame length defined by **RTC0.MFL0** 01: Maximum frame length defined by **RTC0.MFL1** Other configurations are Invalid The CPU can only write to these bits if **CSR.OPS** is CONFIG.
9, 8	RSM1[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 1+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 100.1.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back 01: Keep DT mode (no update of DT field at descriptor write back) 10: No write-back (no descriptor write back) 11: Invalid
7	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
6	PIA0	0	R/W	Packed Incremental data Area (Receive Queue 0+i×4) This bit defines how addresses inside the incremental data area of queue 0+i×4 are handled. When this bit is 0b, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1b, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if **CSR.OPS** is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
5, 4	UFCC0[1:0]	00	R/W	Unread Frame Counter Configuration (Receive Queue 0+i×4) These bits set the unread frame counter used in reception queue 0+i×4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 0 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	TSEL0	00	R/W	Truncation SELection (Receive Queue 0+i×4) This bit defines a maximum number of bytes for storing frames in receive queue 0+i×4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by **RTCi.MFLj**. 00: Maximum frame length defined by **RTC0.MFL0** 01: Maximum frame length defined by **RTC0.MFL1** Other configurations are Invalid The CPU can only write to these bits if **CSR.OPS** is CONFIG.
1, 0	RSM0[1:0]	00	R/W	Receive Synchronous Mode (Receive Queue 0+i×4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 100.1.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. 00: Mode with write-back 01: Keep DT mode (no update of DT field at descriptor write back) 10: No write-back (no descriptor write back) 11: Invalid

100.1.2.10 Receive Padding Configuration Register (RPC)

The RPC register is used to set padding for received frames.

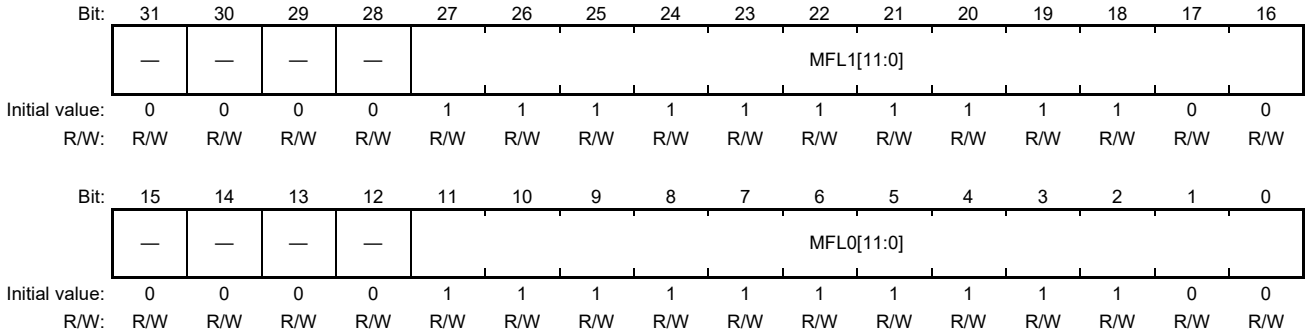
Note: Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23 to 16	DCNT[7:0]	H'00	R/W	Stored Data Counter These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes). When these bits are 0, all received data have been stored following the initial padding. Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 100.1.3.4(3)(b) Incremental Data Areas.
15 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10 to 8	PCNT[2:0]	001	R/W	Stored Padding Counter These bits specify the amount of padding to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes). Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 100.1.3.4(3)(b) Incremental Data Areas. The CPU should not write 0 to these bits.
7 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.11 Reception Truncation Configuration register (RTC)

The RTC register is used to set Maximum Number of bytes stored per received frame.



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	MFL1[11:0]											
Initial value:	0	0	0	0	1	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFL0[11:0]											
Initial value:	0	0	0	0	1	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
27to 16	MFL1[11:0]	H'FFC	R/W	Maximum Frame Length 1 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 1 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by **EIS.QEF** and frame size error (**ESR.ET** is 1000b). Additionally the **DESCR.TI** in the updated descriptor is set to 1b. The CPU can only write to these bits if **CSR.OPS** is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then **SFO.FBP** + 8 to these bits when **RCR.ESF** is not equal to 00b.
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11to 0	MFL0[11:0]	H'FFC	R/W	Maximum Frame Length 0 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 0 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by **EIS.QEF** and frame size error (**ESR.ET** is 1000b). Additionally the **DESCR.TI** in the updated descriptor is set to 1b. The CPU can only write to these bits if **CSR.OPS** is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then **SFO.FBP** + 8 to these bits when **RCR.ESF** is not equal to 00b.

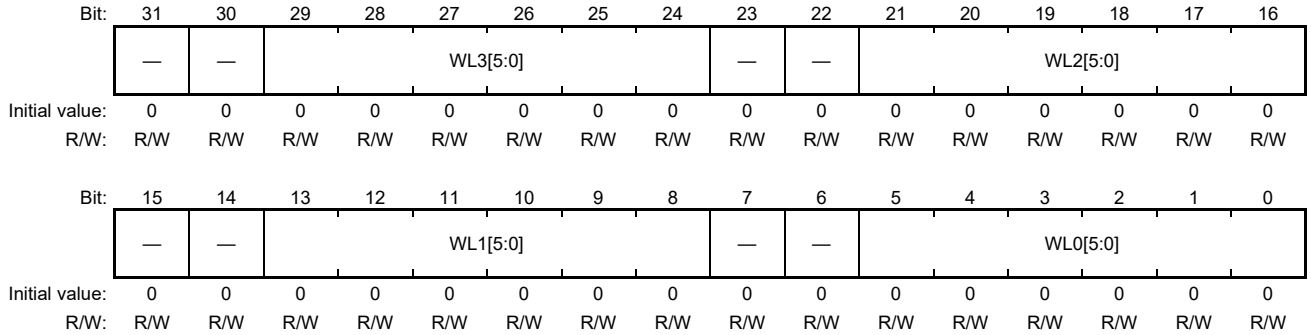
100.1.2.12 Unread frame counter warning level register (UFCW)

The UFCW register sets the warning levels for the number of unread frames.

One of the four warning levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

The CPU should not write 63 to these bits.



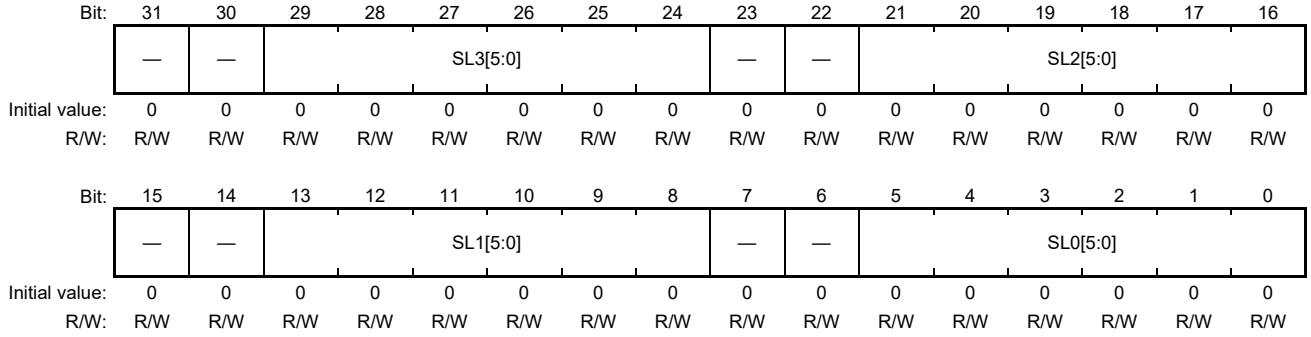
Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
29 to 24	WL3[5:0]	000000	R/W	Warning Level 3 Unread frame count warning level 3
23, 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21 to 16	WL2[5:0]	000000	R/W	Warning Level 2 Unread frame count warning level 2
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13 to 8	WL1[5:0]	000000	R/W	Warning Level 1 Unread frame count warning level 1
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	WL0[5:0]	000000	R/W	Warning Level 0 Unread frame count warning level 0

100.1.2.13 Unread frame counter stop level register (UFCS)

The UFCS register sets the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
29 to 24	SL3[5:0]	000000	R/W	Stop Level 3 Unread frame count stop level 3
23, 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21 to 16	SL2[5:0]	000000	R/W	Stop Level 2 Unread frame count stop level 2
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13 to 8	SL1[5:0]	000000	R/W	Stop Level 1 Unread frame count stop level 1
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	SL0[5:0]	000000	R/W	Stop Level 0 Unread frame count stop level 0 The CPU can only write 0

100.1.2.14 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

For a description of how to use unread frames, refer to section 100.1.3.4(4) Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The number is incremented when data received in reception queue r are stored normally. The maximum increment is H'3F. If the value exceeds H'3F, incrementation will not proceed.)

The number is decremented by the value written to the unread frame counter decrement register i (UFCDi).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31, 30	—	All 0	R	Reserved These bits are read as 0.
29 to 24	CV3[5:0]	000000	R	Unread Frame Count 3+4×i Number of unread frames in reception queue 3+4×i
23, 22	—	All 0	R	Reserved These bits are read as 0.
21 to 16	CV2[5:0]	000000	R	Unread Frame Count 2+4×i Number of unread frames in reception queue 2+4×i
15, 14	—	All 0	R	Reserved These bits are read as 0.
13 to 8	CV1[5:0]	000000	R	Unread Frame Count 1+4×i Number of unread frames in reception queue 1+4×i
7, 6	—	All 0	R	Reserved These bits are read as 0.
5 to 0	CV0[5:0]	000000	R	Unread Frame Count 0+4×i Number of unread frames in reception queue 0+4×i

100.1.2.15 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Write H'3F to these bits to reset the unread counters in reception queue r (r = 0 to 17). These bits are always read as 0.

100.1.2.16 Separation Filter Offset Register (SFO)

The SFO register sets an offset into frames for use by the separation filter.

Note: Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	FBP[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	FBP[5:0]	000000	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **SFVi.LV**[5:0] when **SFL.LC** changes from 30 (Load SFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.4(1)(a) Separation Filtering.

100.1.2.17 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

A pair of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17 (for streams 0 to 15).

Each queue shares a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (SFMi), data from received frames match the value defined in these bits.

SFPi.FP[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FP[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of **SFVi.LV**[63:0] when **SFL.LC** changes from s (Load SFPi.FPs) to 31 while **CSR.OPS** is OPERATION.

For separation filtering, see section 100.1.3.4(1)(a) Separation Filtering.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FP[31:16]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FP[31:0]	H'0000 0000	R/W	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

100.1.2.18 Separation Filter Value register i (SFVi) (i = 0 to 1)

These bits define the 64 bit value to be loaded for separation filtering.

When loading the first by position (**SFO.FBP**), **SFVi.LV**[63:6] are ignored.

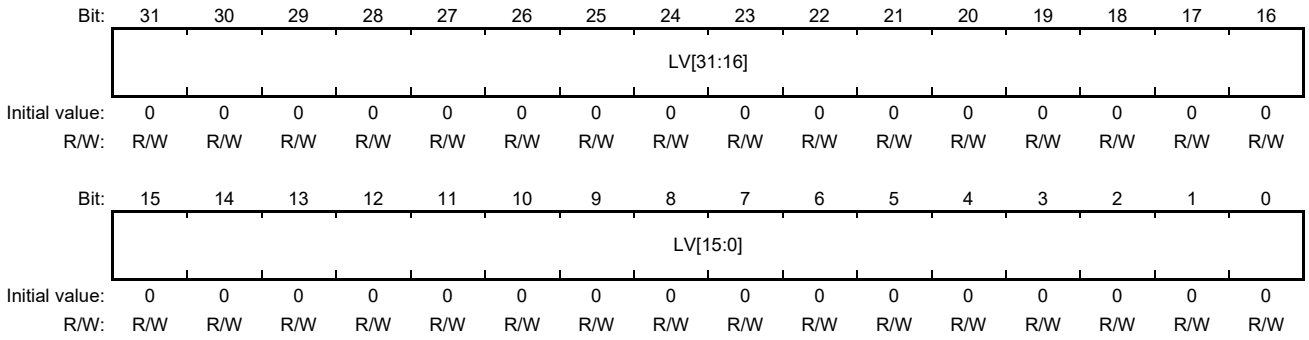
The CPU can only write to these bits if **CSR.OPS** is OPERATION.

The CPU can only write to these bits if **SFL.LC** is 31.

[Changing condition]

These bits are set to 0 when leaving OPERATION mode.

For separation filtering, see section 100.1.3.4(1)(a) Separation Filtering.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.19 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern-matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of **SFVi.LV**[63:0] when **SFL.LC** changes from 29 (Load SFMi.CFM) to 31 while **CSR.OPS** is OPERATION.

For separation filtering, see section 100.1.3.4(1)(a) Separation Filtering.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFM[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.20 Separation Filter Load register (SFL)

The SFL register is used to separation filter load.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	LC[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
4 to 0	LC[4:0]	H'1F	R/W	Load Command These bits control update of separation filter configuration in OPERATION mode. By writing 30 to these bits CPU triggers an update of First Byte Position (**SFO.FBP**) value. By writing 29 to these bits CPU triggers an update of Common Filter Mask (**SFMi.CFM**) value. By writing number between 0 and 15 to these bits CPU triggers an update of Filter Pattern s (**SFPi.FPs**) value. The number written to **SFL.LC** defines the index s of the updated Filter Pattern. The CPU can only write to these bits if **CSR.OPS** is OPERATION. The CPU can only write to these bits if **SFL.LC** is 31. [Changing condition] These bits are set to 31 when leaving OPERATION mode. These bits are set to 31 when the requested update has been processed. 0-15: Load of SFPi.FPs with s = SFL.LC 16-28: Invalid 29: Load of SFMi.CFM 30: Load of SFO.FBP 31: No pending load request

100.1.2.21 Payload CRC register (PCRC)

The PCRC register is used to set the number of the first data byte in received frame to check a potential payload CRC.

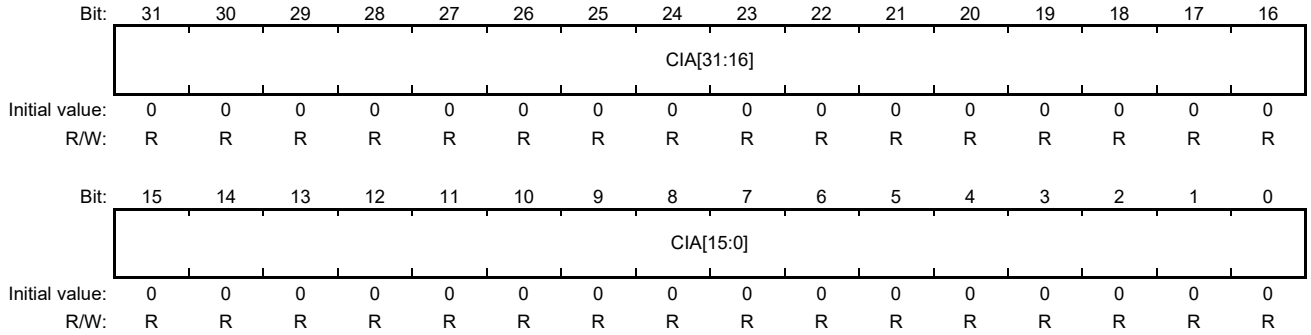
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CAS[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

This register is functional safety use only. Keep initial value.

100.1.2.22 Current Incremental Address Register r (CIARr) (r = 0 to 17)

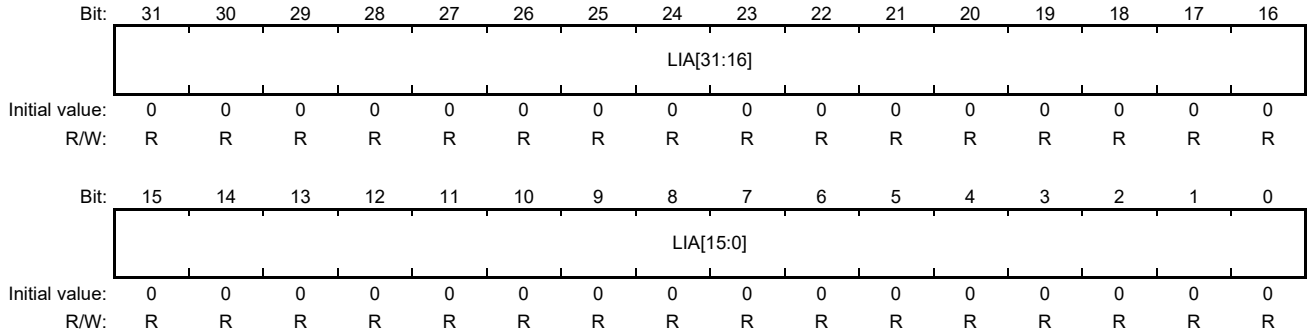
The CIARr register is used to check queue address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIA[31:0]	H'0000 0000	R	Current incremental address used by receive queue These bits indicate the incremental address of receive queue r, where currently frame data is stored or where frame data will be stored when queue r gets active. Refer to section 100.1.3.4(3)(b) Incremental Data Areas. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are updated to next address in incremental data area when processing a FEMPTY_IS or FEMPTY_IC descriptor.

100.1.2.23 Last Incremental Address Register r (LIARr) (r = 0 to 17)

The LIARr register is used to check queue address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LIA[31:0]	H'0000 0000	R	Last incremental address used by receive queue These bits indicate the current incremental address of receive queue r (**CIARr.CIA**) before its address was updated due to processing a FEMPTY_IS descriptor. So it describes the first not used address inside the incremental data area of receive queue r. Refer to section 100.1.3.4(3)(b) Incremental Data Areas. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to **CIARr.CIA** when processing a FEMPTY_IS descriptor.

100.1.2.24 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TBD3[1:0]		—	—	TBD2[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TBD1[1:0]		—	—	TBD0[1:0]		—	—	TQP	ECBS	TSM3	TSM2	TSM1	TSM0
Initial value:	0	0	1	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
21, 20	TBD3[1:0]	10	R/W	Transmit FIFO Size (Stream Class A) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 3 (for stream class A). Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to B'10.
19, 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17, 16	TBD2[1:0]	10	R/W	Transmit FIFO Size (Stream Class B) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 2 (for stream class B). Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to B'10.
15, 14	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
13, 12	TBD1[1:0]	10	R/W	Transmit FIFO Size (Network Control) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 1 (for network control). Writing to these bits is only possible when the current operating mode is configuration mode.
11, 10	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
9, 8	TBD0[1:0]	10	R/W	Transmit FIFO Size (Best Effort) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 0 (for best effort). Writing to these bits is only possible when the current operating mode is configuration mode.
7, 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	TQP	0	R/W	Transmission Queues Priority This bit defines how EtherAVB-IF prioritises between transmit queues when scheduling transmission. For fetching always the queue with highest priority is selected, for transmission the queue with highest priority where data is available in Tx-Buffer. Transmission priority of queue 2 and 3 can be influenced by the credit based shaping algorithm. The priority of the transmit queues is given from high to low. 0: Default priority: Q3(CBS), Q2(CBS), Q1, Q0 1: Alternate priority: Q1, Q3(CBS), Q2(CBS), Q0 For the credit-based shaping (CBS) algorithm, see section 100.1.3.6 CBS (Credit-Based Shaping). Writing to the bits is only possible when the current operating mode is configuration mode.
4	ECBS	0	R/W	Enable Credit Based Shaping This bit defines if CBS algorithm is used for transmit queue 2 and 3 to prioritise between transmit queues when scheduling transmission. When CBS is enabled, the shaping bases on queue specific configuration in CIVRc, CDVRc, CULc and CLLc. 0: CBS globally disabled 1: CBS enabled based on queue specific configuration For the credit-based shaping (CBS) algorithm, see section 100.1.3.6 CBS (Credit-Based Shaping). Writing to the bits is only possible when the current operating mode is configuration mode.
3	TSM3	0	R/W	Transmit Synchronous Mode (Stream Class A) Set these bits to 0. 0: With write-back 1: Setting prohibited Writing to the bits is only possible when the current operating mode is configuration mode.
2	TSM2	0	R/W	Transmit Synchronous Mode (Stream Class B) Set these bits to 0. 0: With write-back 1: Setting prohibited Writing to the bits is only possible when the current operating mode is configuration mode.
1	TSM1	0	R/W	Transmit Synchronous Mode (Network Control) Set these bits to 0. 0: With write-back 1: Setting prohibited Writing to the bits is only possible when the current operating mode is configuration mode.
0	TSM0	0	R/W	Transmit Synchronous Mode (Best Effort) Set these bits to 0. 0: With write-back 1: Setting prohibited Writing to the bits is only possible when the current operating mode is configuration mode.

100.1.2.25 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MFR	MFEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TFR	TFEN	—	—	—	—	TSRQ3	TSRQ2	TSRQ1	TSRQ0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	MFR	0	R/W	E-MAC status FIFO Release This bit releases the oldest entry of the E-MAC status FIFO. When 1b is written to this bit, EthernetAVB-IF gets informed that CPU has processed the oldest E-MAC status FIFO entry as visible in **MFA** register. The oldest entry is removed from E-MAC status FIFO. This bit is always read as 0b. 0: No request to E-MAC status FIFO 1: Release oldest entry of E-MAC status FIFO
16	MFEN	0	R/W	E-MAC status FIFO ENable This bit enables the storage of transmission status information (the MAC flags for frame transmission) in the E-MAC status FIFO. Additionally CPU can control the status storage for each frame provided for transmission using **DESCR.MSR**. When this bit is set to 0b all pending FIFO entries are removed. 0: Disabled 1: Enabled
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	TFR	0	R/W	Time Stamp FIFO Release This bit releases the oldest entry in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 100.1.3.5(4) Time Stamping in Transmission. 0: (Not operating) 1: Releases the oldest entry in the time-stamp FIFO.

Bit	Bit Name	Initial Value	R/W	Description
8	TFEN	0	R/W	Time Stamp FIFO Enable This bit enables storage in the time-stamp FIFO. When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 100.1.3.5(2)(b) Configuration of Transmission Frame Data Descriptors. When 0 is set in this bit, no entries are made in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 100.1.3.5(4) Time Stamping in Transmission. 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	TSRQ3	0	R/W	Transmit Start Request (Queue 3 (Stream Class A)) This bit issues a request to start transmission for transmission queue 3. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 100.1.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
2	TSRQ2	0	R/W	Transmit Start Request (Queue 2 (Stream Class B)) This bit issues a request to start transmission for transmission queue 2. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 100.1.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.

Bit	Bit Name	Initial Value	R/W	Description
1	TSRQ1	0	R/W	Transmit Start Request (Queue 1 (Network Control)) This bit issues a request to start transmission for transmission queue 1. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 100.1.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
0	TSRQ0	0	R/W	Transmit Start Request (Queue 0 (Best Effort)) This bit issues a request to start transmission for transmission queue 0. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 100.1.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.

100.1.2.26 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MFFL[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TFFL[2:0]			—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	MFFL[4:0]	H'00	R	Number of entries stored in the E-MAC status FIFO E-MAC status FIFO Fill Level These bits indicate the number of entries available in the MAC status FIFO. If this value is 0, the FIFO is empty. If this value is 16, the FIFO is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when **TCCR.MFEN** is 0b. This value is incremented when frame with **DESCR.MSR** has been transmitted by E-MAC, **TCCR.MFEN** is 1b and **TSR.MFFL** is not 16. This value is incremented when E-MAC detects an error during transmission, **TCCR.MFEN** is 1b and **TSR.MFFL** is not 16. This value is decremented when 1b is written to **TCCR.MFR** and **TSR.MFFL** is not 0.
15 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	TFFL[2:0]	00	R	Time Stamp FIFO Count These bits indicate the number of time stamps in the time-stamp FIFO. The values 0 and 3 indicate that the time-stamp FIFO is empty and full, respectively (values 4 to 7 are reserved). Conditions for updating: • The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0. • When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 3, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see section 100.1.3.5(2)(b) Configuration of Transmission Frame Data Descriptors. • The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).
7 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3, 2	CCS1[1:0]	00	R	CBS Counter Status 1 (Class A) These bits indicate the CBS (credit-based shaping) state of stream data transmission queue 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS. Conditions for updating: • The bits are set to B'00 when the operating mode is not operation mode. The bits are set to B'00 when the CBS is inside the condition limits. • The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc). • The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc). 00: The current credit value is within the limit. 01: The current credit value is less than or equal to the lower limit. 10: The current credit value is greater than or equal to the upper limit. 11: (Reserved)

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CCS0[1:0]	00	R	CBS Counter Status 0 (Class B) These bits indicate the CBS (credit-based shaping) state of stream data transmission queue 0. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS. Conditions for updating: • The bits are set to B'00 when the operating mode is not operation mode. The bits are set to B'00 when the CBS is inside the condition limits. • The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc). • The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc). 00: The current credit value is within the limit. 01: The current credit value is less than or equal to the lower limit. 10: The current credit value is greater than or equal to the upper limit. 11: (Reserved)

100.1.2.27 E-MAC status FIFO Access register (MFA)

The MFA register indicates the state of MAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	MST[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

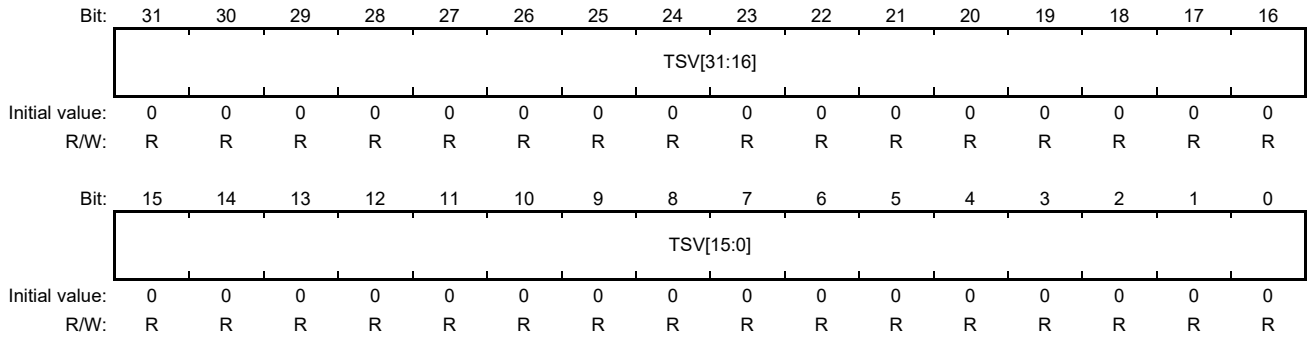
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MSV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
25 to 16	MST[9:0]	H'000	R	Tag number from descriptor identifying the frame E-MAC status relation E-MAC Status Tag These bits represent the **DESCR.TAG** bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the E-MAC status available in the FIFO (**MFA.MSV**). The CPU should not read these bits when **TSR.MFFL** is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (**TSR.MFFL** changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to **TCCR.MFR**). These bits are updated when the FIFO is overwritten (a frame with **DESCR.MSR** in descriptor has been transmitted by MAC, **TCCR.MFEN** is 1b and **TSR.MFFL** is 16). These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and **TSR.MFFL** is 16). ***Note for verification: These bits are set to 0 when leaving OPERATION mode.***
15 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	MSV[3:0]	H'0	R	E-MAC Status Value These bits represent the E-MAC status bits as stored in the oldest E-MAC status FIFO entry. ***MSV**[3] Reserved* ***MSV**[2] Carrier lost during frame transmission* ***MSV**[1] Delay collision* ***MSV**[0] Transmission time out* The CPU should not read these bits when **TSR.MFFL** is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (**TSR.MFFL** changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to **TCCR.MFR**). These bits are updated when the FIFO overwritten (a frame with **DESCR.MSR** in descriptor has been transmitted by E-MAC, **TCCR.MFEN** is 1b and **TSR.MFFL** is 16). These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and **TSR.MFFL** is 16). ***Note for verification: These bits are set to 0 when leaving OPERATION mode.***

100.1.2.28 Time Stamp FIFO Access Register 0 (TFA0)

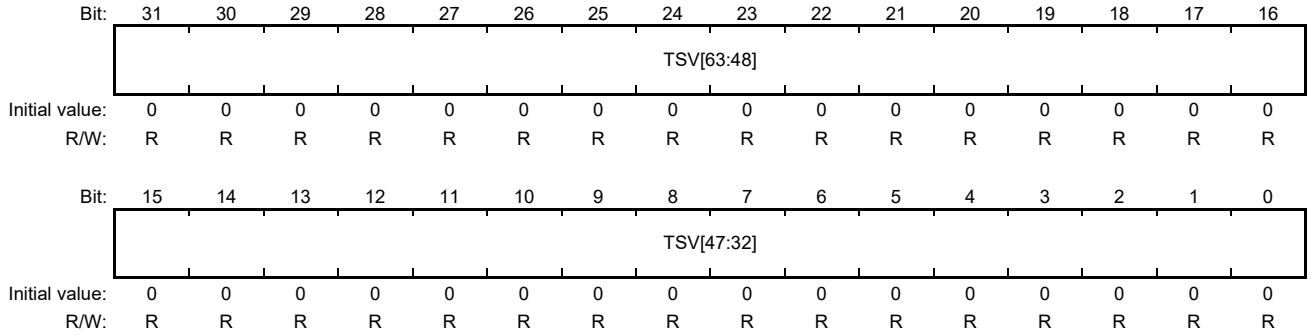
TFA0 indicates the nano seconds portion of the timestamp value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[31:0]	H'0000 0000	R	Time Stamp Value These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO. Once the time-stamp FIFO is full, no further time-stamp values are stored. Conditions for updating: • The bits are set to H'0000 0000 when the operating mode is not operation mode. • The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). • The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

100.1.2.29 Time Stamp FIFO Access Register 1 (TFA1)

The TFA1 register indicates the lower seconds portion of the timestamp value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[63:32]	H'0000 0000	R	Time Stamp Value For details, see section 100.1.2.28 Time Stamp FIFO Access Register 0 (TFA0).

100.1.2.30 Time Stamp FIFO Access Register 2 (TFA2)

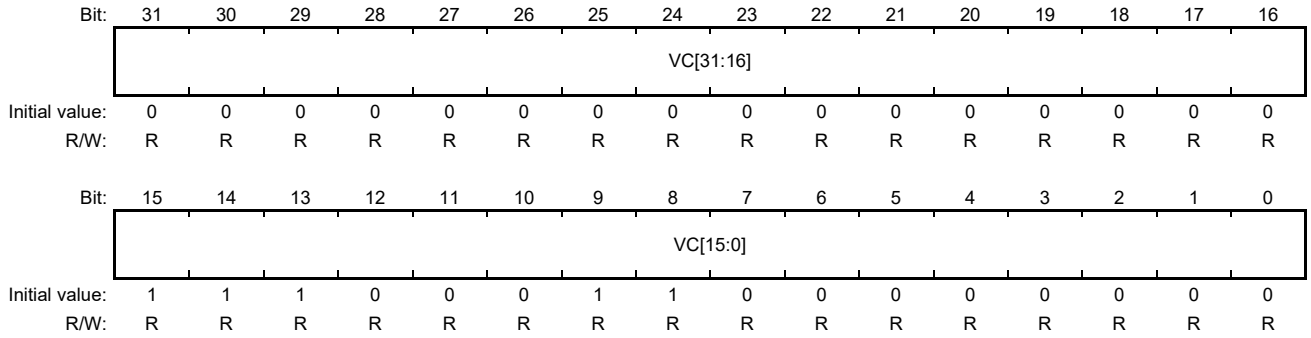
The TFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	TST[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[79:64]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are read as 0.
25 to 16	TST[9:0]	H'000	R	Time Stamp Tag These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi)) which can be placed in the FIFO. For the tagging of frames in transmission, see section 100.1.3.5(4) Time Stamping in Transmission. Conditions for updating: • The bits are set to 000H when the operating mode is not operation mode. • Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). • Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).
15 to 0	TSV[79:64]	H'0000	R	Time Stamp Value For details, see section 100.1.2.28 Time Stamp FIFO Access Register 0 (TFA0).

100.1.2.31 Version and Release Register (VRR)

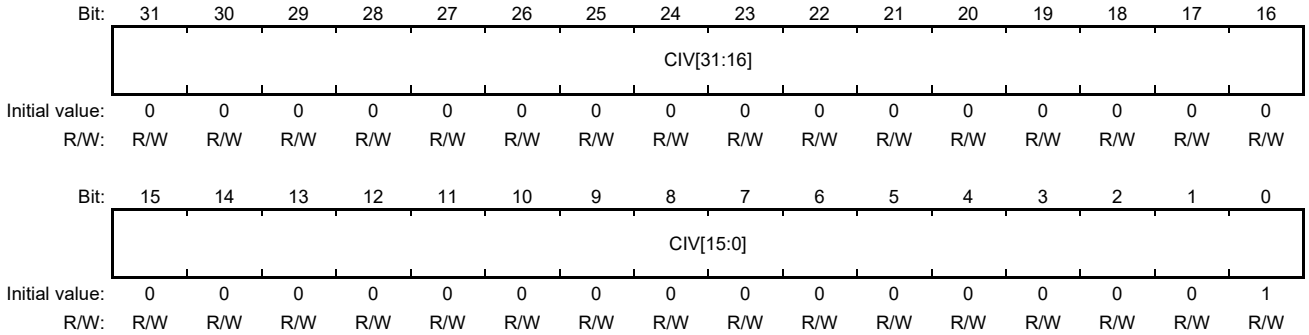


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VC[31:0]	H'0000 E300	R	Version Code These bits identify the version of used EtherAVB-IF. 0000 E300 : RAVBES3

100.1.2.32 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

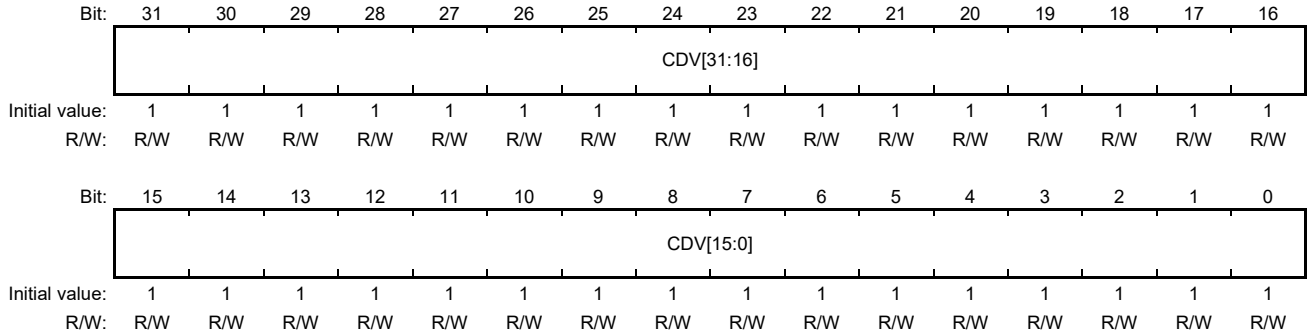


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIV[31:0]	H'0000 0001	R/W	CBS Increment Value CBS increment value (1 to H'FFFF) These bits define the increment value related to idleSlope for the CBS algorithm. Set a value in the range from H'0000 0001 to H'0000 FFFF. The value to be written to these bits depends on the Ethernet bit rate and HPϕ (high-speed peripheral clock). For details, see section 100.1.3.6 CBS (Credit-Based Shaping).

100.1.2.33 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

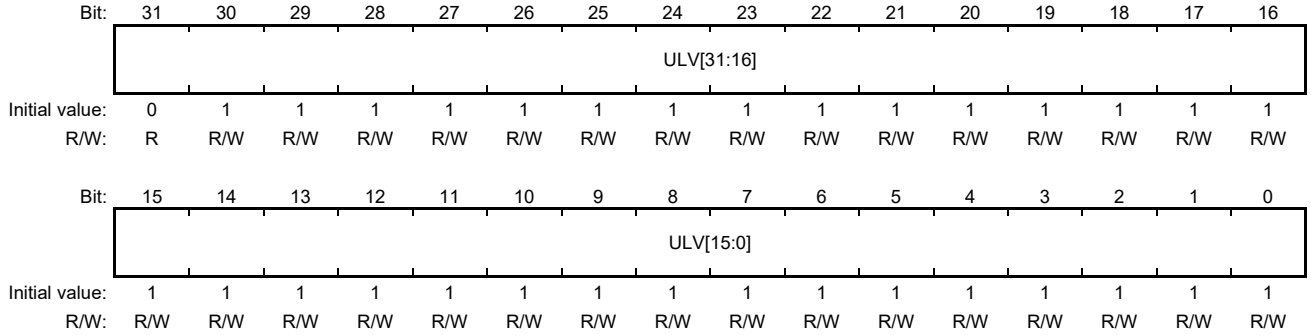


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDV[31:0]	H'FFFF FFFF	R/W	CBS Decrement Value Setting value: –1 to –65536 (H'FFFF FFFF to H'FFFF 0000) These bits set the decrement for the CBS algorithm. These bits define the decrement value related to sendSlope for CBS algorithm. The value to be written to these bits depends on the Ethernet bit rate and HPϕ (high-speed peripheral clock). For details, see section 100.1.3.6 CBS (Credit-Based Shaping).

100.1.2.34 CBS Upper Limit Register c (CULc) (c = 0 or 1)

The CUL0 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).



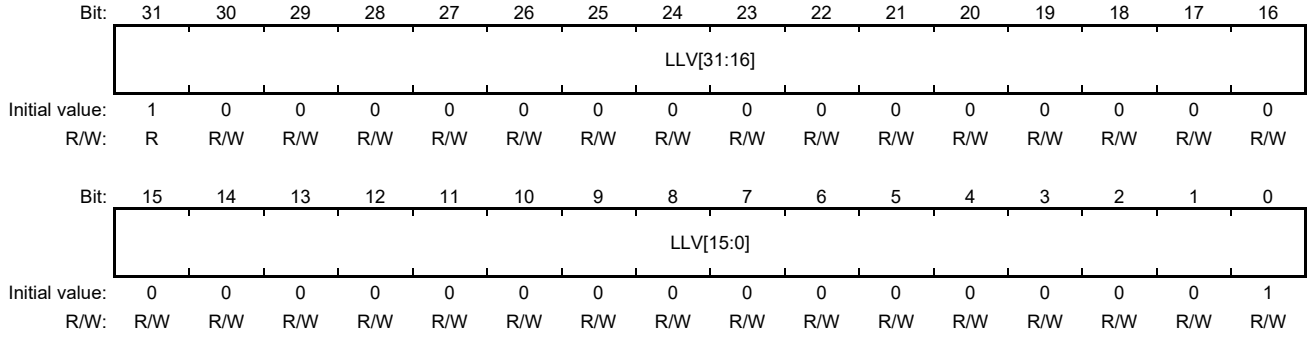
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ULV[31:0]	H'7FFF FFFF	R/W*	CBS Upper Limit These bits set the upper limit for credit values calculated by using the CBS algorithm. The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a positive value to these bits. For details, see section 100.1.3.6 CBS (Credit-Based Shaping).

Note* : Bit 31 is read only.

100.1.2.35 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

The CUL0 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LLV[31:0]	H'8000 0001	R/W*	CBS Lower Limit These bits set the lower limit for credit values calculated by using the CBS algorithm. The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a negative value to these bits. For details, see section 100.1.3.6 CBS (Credit-Based Shaping).

Note* : Bit 31 is read only.

100.1.2.36 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

When an interrupt source flag is set (a bit from DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0b when writing 1b to **DID.DPDi**.

This bit is set to 1b when writing 1b to **DIE.DPSi**.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPF15	0	R/W	Descriptor Interrupt Status15 0: The interrupt is not pending. 1: The interrupt is pending.
14	DPF14	0	R/W	Descriptor Interrupt Status14 0: The interrupt is not pending. 1: The interrupt is pending.
13	DPF13	0	R/W	Descriptor Interrupt Status13 0: The interrupt is not pending. 1: The interrupt is pending.
12	DPF12	0	R/W	Descriptor Interrupt Status12 0: The interrupt is not pending. 1: The interrupt is pending.
11	DPF11	0	R/W	Descriptor Interrupt Status11 0: The interrupt is not pending. 1: The interrupt is pending.
10	DPF10	0	R/W	Descriptor Interrupt Status10 0: The interrupt is not pending. 1: The interrupt is pending.
9	DPF9	0	R/W	Descriptor Interrupt Status9 0: The interrupt is not pending. 1: The interrupt is pending.
8	DPF8	0	R/W	Descriptor Interrupt Status8 0: The interrupt is not pending. 1: The interrupt is pending.
7	DPF7	0	R/W	Descriptor Interrupt Status7 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
6	DPF6	0	R/W	Descriptor Interrupt Status6 0: The interrupt is not pending. 1: The interrupt is pending.
5	DPF5	0	R/W	Descriptor Interrupt Status5 0: The interrupt is not pending. 1: The interrupt is pending.
4	DPF4	0	R/W	Descriptor Interrupt Status4 0: The interrupt is not pending. 1: The interrupt is pending.
3	DPF3	0	R/W	Descriptor Interrupt Status3 0: The interrupt is not pending. 1: The interrupt is pending.
2	DPF2	0	R/W	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
1	DPF1	0	R/W	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
0	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits:

When DESCR.DIE is 1 to 15, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated.

When DESCR.DIE is 0001b, in addition a queue specific descriptor interrupt is generated.

Only 0 can be written to these bits.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 is processed.

100.1.2.38 Error Interrupt Control Register (EIC)

The EIC register controls the AVB-DMAC-related error interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	TBFE	0	R/W	Tx-Buffer Full interrupt Enable While this bit is 1b an interrupt will be generated when **EIS.TBFF** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **EID.TBFD**. This bit is set to 1b when writing 1b to **EIE.TBFS**. 0: Disabled 1: Enabled
9	MFFE	0	R/W	E-MAC status FIFO Full interrupt Enable While this bit is 1b an interrupt will be generated when **EIS.MFFF** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **EID.MFFD**. This bit is set to 1b when writing 1b to **EIE.MFFS**. 0: Disabled 1: Enabled
8	TFFE	0	R/W	Time Stamp FIFO Full-Error Interrupt Enable When the time stamp FIFO is full (TFFF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **EID.TFFD**. This bit is set to 1b when writing 1b to **EIE.TFFS**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
7	CULE1	0	R/W	CBS Upper Limit Error Interrupt Enable (Class A) When the Class A CBS reaches its upper limit (CULF1 in the error interrupt status register (EIS) = 1), the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **EID.CULD1**. This bit is set to 1b when writing 1b to **EIE.CULS1**. 0: Disabled 1: Enabled
6	CULE0	0	R/W	CBS Upper Limit Error Interrupt Enable (Class B) When the Class B CBS reaches its upper limit (CULF0 in the error interrupt status register (EIS) = 1), the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **EID.CULD0**. This bit is set to 1b when writing 1b to **EIE.CULS0**. 0: Disabled 1: Enabled
5	CLLE1	0	R/W	CBS Lower Limit Error Interrupt Enable (Class A) When the Class A CBS reaches its lower limit (CLLF1 in the error interrupt status register (EIS) = 1), the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **EID.CLLD1**. This bit is set to 1b when writing 1b to **EIE.CLLS1**. 0: Disabled 1: Enabled
4	CLLE0	0	R/W	CBS Lower Limit Error Interrupt Enable (Class B) When the Class B CBS reaches its lower limit (CLLF0 in the error interrupt status register (EIS) = 1), the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **EID.CLLD0**. This bit is set to 1b when writing 1b to **EIE.CLLS0**. 0: Disabled 1: Enabled
3	SEE	0	R/W	Separation Error Interrupt Enable While this bit is 1, an interrupt will be generated when the EIS.SEF bit is 1. [Changing condition] This bit is set to 0b when writing 1b to **EID.SED**. This bit is set to 1b when writing 1b to **EIE.SES**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
2	QEE	0	R/W	Queue Error Interrupt Enable While this bit is 1, an interrupt will be generated when the EIS.QEF bit is 1. [Changing condition] This bit is set to 0b when writing 1b to **EID.QED**. This bit is set to 1b when writing 1b to **EIE.QES**. 0: Disabled 1: Enabled
1	MTEE	0	R/W	E-MAC Transmission Error Interrupt Enable While this bit is 1, an interrupt will be generated when the EIS.MTEF bit is 1. [Changing condition] This bit is set to 0b when writing 1b to **EID.MTED**. This bit is set to 1b when writing 1b to **EIE.MTES**. 0: Disabled 1: Enabled
0	MREE	0	R/W	E-MAC Reception Error Interrupt Enable While this bit is 1, an interrupt will be generated when the EIS.MREF bit is 1. [Changing condition] This bit is set to 0b when writing 1b to **EID.MRED**. This bit is set to 1b when writing 1b to **EIE.MRES**. 0: Disabled 1: Enabled

100.1.2.39 Error Interrupt Status Register (EIS)

The EIS register indicates the states of AVB-DMAC-related error interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TBFF	MFFF	TFFF	CULF1	CULF0	CLLF1	CLLF0	SEF	QEF	MTEF	MREF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	QFS	0	R	Queue Full Error Interrupt Status With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1). [Conditions for Changing] — If the receive queue r full interrupt status bit (RIS2.QFFr) and/or the receive queue r full interrupt enable bit in the - receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated. — If the receive FIFO full interrupt status bit (RIS2.RFFF) and/or the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated. 0: The interrupt is not pending. 1: The interrupt is pending.
15 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10	TBFF	0	R/W	Tx-Buffer Full Flag This bit indicates that fetching transmit data was delayed because the Tx-Buffer has no sufficient storage available to store fetched frame. It depends on configuration of **TGC.TBDt** (refer to section 100.1.3.5(1)) if a full Tx-Buffer is expected during normal operation. No frame gets lost but transmission priority may be influenced. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when frame data has been fetched from URAM but there is no storage available in Tx-Buffer. 0: No interrupt pending 1: Tx-Buffer full condition detected

Bit	Bit Name	Initial Value	R/W	Description
9	MFFF	0	R/W	E-MAC status FIFO Full Flag This bit indicates that a transmission E-MAC status is overwritten because the E-MAC status FIFO is full (overwrite condition). The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame with **DESCR.MSR** has been transmitted by E-MAC, **TCCR.MFEN** is 1b and **TSR.MFFL** is 16. This bit is set to 1b when E-MAC detects an error during transmission and **TSR.MFFL** is 16. 0: No interrupt pending 1: E-MAC status FIFO full, oldest E-MAC status lost
8	TFFF	0	R/W	Time Stamp FIFO Full Error Interrupt Status This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 3. 0: The interrupt is not pending. 1: The interrupt is pending.
7	CULF1	0	R/W	CBS Upper Limit Error Interrupt Status (Class A) This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)). Only 0 can be written to the bit. [Conditions for Changing] — This bit is set to 0 when the operating mode is not operation mode. — This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
6	CULF0	0	R/W	CBS Upper Limit Error Interrupt Status (Class B) This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). 0: The interrupt is not pending. 1: The interrupt is pending.
5	CLLF1	0	R/W	CBS Lower Limit Error Interrupt Status (Class A) This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV in CBS lower limit register c (CLLc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit). 0: The interrupt is not pending. 1: The interrupt is pending.
4	CLLF0	0	R/W	CBS Lower Limit Error Interrupt Status (Class B) This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV in the CBS lower limit register c (CLLc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit). 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
3	SEF	0	R/W	Separation Error Flag This bit indicates that a received frame was discarded because it has not matched any configurated separation filter for AVB stream data frames. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operation mode. — This bit is set to 1 when a valid AVB stream data frame was received by E-MAC but discarded because the RCR.ESF bits are B'10 and no separation filter has matched. 0: No interrupt pending. 1: AVB stream data frame has discarded.
2	QEF	0	R/W	Queue Error Flag This bit indicates that an error has been detected while processing reception or transmit queue or while processing AVTP FIFO entries. Details about the detected error is indicated by ESR. Section 100.1.3.2(2) gives an overview of detail error conditions and the required interaction. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when an error condition is detected. 0: No interrupt pending. 1: Interrupt pending.
1	MTEF	0	R/W	E-MAC Transmission Error Flag This bit indicates that the E-MAC has detected a fault during transmission. For detail, the E-MAC registers have to be checked. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when E-MAC detects an error during frame transmission. 0: No interrupt pending. 1: E-MAC has reported an error during transmission.

Bit	Bit Name	Initial Value	R/W	Description
0	MREF	0	R/W	E-MAC Reception Error Flag This bit indicates that the E-MAC has detected a fault during reception. For detail, the E-MAC registers have to be checked. Note: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information, CPU can identify corrupted frames in URAM. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when E-MAC detects an error during frame reception. 0: No interrupt pending. 1: E-MAC has reported an error during reception.

100.1.2.40 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the AVB-DMAC receive interrupts.

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRF0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0b when writing 1b to **RID0.FRDr**.

This bit is set to 1b when writing 1b to **RIE0.FRSr**.

4	FRF4	0	R/W	Receive Frame Interrupt Status 4 (Stream) 0: The interrupt is not pending. 1: The interrupt is pending.
3	FRF3	0	R/W	Receive Frame Interrupt Status 3 (Stream) 0: The interrupt is not pending. 1: The interrupt is pending.
2	FRF2	0	R/W	Receive Frame Interrupt Status 2 (Stream) 0: The interrupt is not pending. 1: The interrupt is pending.
1	FRF1	0	R/W	Receive Frame Interrupt Status 1 (Network Control) 0: The interrupt is not pending. 1: The interrupt is pending.
0	FRF0	0	R/W	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17:

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (UFCVi) (i = 0 to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

100.1.2.42 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RFWE	0	R/W	Receive FIFO Warning Interrupt Enable If the reception FIFO reaches the caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)) with the corresponding interrupt enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RFWD**. This bit is set to 1b when writing 1b to **RIE1.RFWS**. 0: Disabled 1: Enabled
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWE17	0	R/W	Reception Warning interrupt Enable 17 While this bit is 1b an interrupt will be generated when **RIS1.RWF17** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD17**. This bit is set to 1b when writing 1b to **RIE1.RWS17**. 0: Disabled 1: Enabled
16	RWE16	0	R/W	Reception Warning interrupt Enable 16 While this bit is 1b an interrupt will be generated when **RIS1.RWF16** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD16**. This bit is set to 1b when writing 1b to **RIE1.RWS16**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
15	RWE15	0	R/W	Reception Warning interrupt Enable 15 While this bit is 1b an interrupt will be generated when **RIS1.RWF15** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD15**. This bit is set to 1b when writing 1b to **RIE1.RWS15**. 0: Disabled 1: Enabled
14	RWE14	0	R/W	Reception Warning interrupt Enable 14 While this bit is 1b an interrupt will be generated when **RIS1.RWF14** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD14**. This bit is set to 1b when writing 1b to **RIE1.RWS14**. 0: Disabled 1: Enabled
13	RWE13	0	R/W	Reception Warning interrupt Enable 13 While this bit is 1b an interrupt will be generated when **RIS1.RWF13** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD13**. This bit is set to 1b when writing 1b to **RIE1.RWS13**. 0: Disabled 1: Enabled
12	RWE12	0	R/W	Reception Warning interrupt Enable 12 While this bit is 1b an interrupt will be generated when **RIS1.RWF12** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD12**. This bit is set to 1b when writing 1b to **RIE1.RWS12**. 0: Disabled 1: Enabled
11	RWE11	0	R/W	Reception Warning interrupt Enable 11 While this bit is 1b an interrupt will be generated when **RIS1.RWF11** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD11**. This bit is set to 1b when writing 1b to **RIE1.RWS11**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
10	RWE10	0	R/W	Reception Warning interrupt Enable 10 While this bit is 1b an interrupt will be generated when **RIS1.RWF10** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD10**. This bit is set to 1b when writing 1b to **RIE1.RWS10**. 0: Disabled 1: Enabled
9	RWE9	0	R/W	Reception Warning interrupt Enable 9 While this bit is 1b an interrupt will be generated when **RIS1.RWF9** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD9**. This bit is set to 1b when writing 1b to **RIE1.RWS9**. 0: Disabled 1: Enabled
8	RWE8	0	R/W	Reception Warning interrupt Enable 8 While this bit is 1b an interrupt will be generated when **RIS1.RWF8** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD18**. This bit is set to 1b when writing 1b to **RIE1.RWS18**. 0: Disabled 1: Enabled
7	RWE7	0	R/W	Reception Warning interrupt Enable 7 While this bit is 1b an interrupt will be generated when **RIS1.RWF7** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD7**. This bit is set to 1b when writing 1b to **RIE1.RWS7**. 0: Disabled 1: Enabled
6	RWE6	0	R/W	Reception Warning interrupt Enable 6 While this bit is 1b an interrupt will be generated when **RIS1.RWF6** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD6**. This bit is set to 1b when writing 1b to **RIE1.RWS6**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
5	RWE5	0	R/W	Reception Warning interrupt Enable 5 While this bit is 1b an interrupt will be generated when **RIS1.RWF5** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD5**. This bit is set to 1b when writing 1b to **RIE1.RWS5**. 0: Disabled 1: Enabled
4	RWE4	0	R/W	Reception Warning interrupt Enable 4 While this bit is 1b an interrupt will be generated when **RIS1.RWF4** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD4**. This bit is set to 1b when writing 1b to **RIE1.RWS4**. 0: Disabled 1: Enabled
3	RWE3	0	R/W	Reception Warning interrupt Enable 3 While this bit is 1b an interrupt will be generated when **RIS1.RWF3** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD3**. This bit is set to 1b when writing 1b to **RIE1.RWS3**. 0: Disabled 1: Enabled
2	RWE2	0	R/W	Reception Warning interrupt Enable 2 While this bit is 1b an interrupt will be generated when **RIS1.RWF2** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD2**. This bit is set to 1b when writing 1b to **RIE1.RWS2**. 0: Disabled 1: Enabled
1	RWE1	0	R/W	Reception Warning interrupt Enable 1 While this bit is 1b an interrupt will be generated when **RIS1.RWF1** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD1**. This bit is set to 1b when writing 1b to **RIE1.RWS1**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
0	RWE0	0	R/W	Reception Warning interrupt Enable 0 While this bit is 1b an interrupt will be generated when **RIS1.RWF0** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID1.RWD0**. This bit is set to 1b when writing 1b to **RIE1.RWS0**. 0: Disabled 1: Enabled

100.1.2.43 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the AVB-DMAC receive interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWF	—	—	—	—	—	—	—	—	—	—	—	—	—	RWF17	RWF16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RWF15	RWF14	RWF13	RWF12	RWF11	RWF10	RWF9	RWF8	RWF7	RWF6	RWF5	RWF4	RWF3	RWF2	RWF1	RWF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFWF	0	R/W	Receive FIFO Warning Interrupt Status This bit indicates that the reception FIFO has exceeded the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the reception FIFO exceeded the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)). 0: The interrupt is not pending. 1: The interrupt is pending.
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWF17	0	R/W	Reception Warning Flag 17 This bit indicates that the unread frame counter of receive queue 17 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA21** is 1b). This bit is set to 0b when CPU writes to **UFCD4.DV1** and **UFCV4.CV1** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV4.CV1** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
16	RWF16	0	R/W	Reception Warning Flag 16 This bit indicates that the unread frame counter of receive queue 16 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA20** is 1b). This bit is set to 0b when CPU writes to **UFCD4.DV0** and **UFCV4.CV0** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV4.CV0** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
15	RWF15	0	R/W	Reception Warning Flag 15 This bit indicates that the unread frame counter of receive queue 15 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA19** is 1b). This bit is set to 0b when CPU writes to **UFCD3.DV3** and **UFCV3.CV3** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV3.CV3** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
14	RWF14	0	R/W	Reception Warning Flag 14 This bit indicates that the unread frame counter of receive queue 14 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA18** is 1b). This bit is set to 0b when CPU writes to **UFCD3.DV2** and **UFCV3.CV2** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV3.CV2** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
13	RWF13	0	R/W	Reception Warning Flag 13 This bit indicates that the unread frame counter of receive queue 13 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA17** is 1b). This bit is set to 0b when CPU writes to **UFCD3.DV1** and **UFCV3.CV1** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV3.CV1** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
12	RWF12	0	R/W	Reception Warning Flag 12 This bit indicates that the unread frame counter of receive queue 12 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA16** is 1b). This bit is set to 0b when CPU writes to **UFCD3.DV0** and **UFCV3.CV0** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV3.CV0** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
11	RWF11	0	R/W	Reception Warning Flag 11 This bit indicates that the unread frame counter of receive queue 11 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA15** is 1b). This bit is set to 0b when CPU writes to **UFCD2.DV3** and **UFCV2.CV3** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV2.CV3** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
10	RWF10	0	R/W	Reception Warning Flag 10 This bit indicates that the unread frame counter of receive queue 10 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA14** is 1b). This bit is set to 0b when CPU writes to **UFCD2.DV2** and **UFCV2.CV2** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV2.CV2** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
9	RWF9	0	R/W	Reception Warning Flag 9 This bit indicates that the unread frame counter of receive queue 9 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA13** is 1b). This bit is set to 0b when CPU writes to **UFCD2.DV1** and **UFCV2.CV1** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV2.CV1** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
8	RWF8	0	R/W	Reception Warning Flag 8 This bit indicates that the unread frame counter of receive queue 8 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA12** is 1b). This bit is set to 0b when CPU writes to **UFCD2.DV0** and **UFCV2.CV0** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV2.CV0** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
7	RWF7	0	R/W	Reception Warning Flag 7 This bit indicates that the unread frame counter of receive queue 7 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA11** is 1b). This bit is set to 0b when CPU writes to **UFCD1.DV3** and **UFCV1.CV3** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV1.CV3** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
6	RWF6	0	R/W	Reception Warning Flag 6 This bit indicates that the unread frame counter of receive queue 6 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA10** is 1b). This bit is set to 0b when CPU writes to **UFCD1.DV2** and **UFCV1.CV2** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV1.CV2** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
5	RWF5	0	R/W	Reception Warning Flag 5 This bit indicates that the unread frame counter of receive queue 5 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA9** is 1b). This bit is set to 0b when CPU writes to **UFCD1.DV1** and **UFCV1.CV1** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV1.CV1** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
4	RWF4	0	R/W	Reception Warning Flag 4 This bit indicates that the unread frame counter of receive queue 4 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA8** is 1b). This bit is set to 0b when CPU writes to **UFCD1.DV0** and **UFCV1.CV0** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV1.CV0** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
3	RWF3	0	R/W	Reception Warning Flag 3 This bit indicates that the unread frame counter of receive queue 3 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA7** is 1b). This bit is set to 0b when CPU writes to **UFCD0.DV3** and **UFCV0.CV3** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV0.CV3** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
2	RWF2	0	R/W	Reception Warning Flag 2 This bit indicates that the unread frame counter of receive queue 2 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA6** is 1b). This bit is set to 0b when CPU writes to **UFCD0.DV2** and **UFCV0.CV2** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV0.CV2** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
1	RWF1	0	R/W	Reception Warning Flag 1 This bit indicates that the unread frame counter of receive queue 1 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA5** is 1b). This bit is set to 0b when CPU writes to **UFCD0.DV1** and **UFCV0.CV1** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV0.CV1** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached
0	RWF0	0	R/W	Reception Warning Flag 0 This bit indicates that the unread frame counter of receive queue 0 has reached the configured warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU request a reload of the base address (**DLR.LBA4** is 1b). This bit is set to 0b when CPU writes to **UFCD0.DV0** and **UFCV0.CV0** is decremented to a value less than the selected warning level **UFCW.WLj**. This bit is set to 1b when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (**UFCV0.CV0** + 1 == **UFCW.WLj**). 0: No interrupt pending 1: Unread frame counter warning level reached

100.1.2.44 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the AVB-DMAC receive interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RFFE	0	R/W	Receive FIFO Full Interrupt Enable When the reception FIFO is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.RFFD**. This bit is set to 1b when writing 1b to **RIE2.RFFS**. 0: Disabled 1: Enabled
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFE17	0	R/W	Receive Queue 17 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD17**. This bit is set to 1b when writing 1b to **RIE2.QFS17**. 0: Disabled 1: Enabled
16	QFE16	0	R/W	Receive Queue 16 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD16**. This bit is set to 1b when writing 1b to **RIE2.QFS16**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
15	QFE15	0	R/W	Receive Queue 15 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD15**. This bit is set to 1b when writing 1b to **RIE2.QFS15**. 0: Disabled 1: Enabled
14	QFE14	0	R/W	Receive Queue 14 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD14**. This bit is set to 1b when writing 1b to **RIE2.QFS14**. 0: Disabled 1: Enabled
13	QFE13	0	R/W	Receive Queue 13 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD13**. This bit is set to 1b when writing 1b to **RIE2.QFS13**. 0: Disabled 1: Enabled
12	QFE12	0	R/W	Receive Queue 12 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD12**. This bit is set to 1b when writing 1b to **RIE2.QFS12**. 0: Disabled 1: Enabled
11	QFE11	0	R/W	Receive Queue 11 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD11**. This bit is set to 1b when writing 1b to **RIE2.QFS11**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
10	QFE10	0	R/W	Receive Queue 10 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD10**. This bit is set to 1b when writing 1b to **RIE2.QFS10**. 0: Disabled 1: Enabled
9	QFE9	0	R/W	Receive Queue 9 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD9**. This bit is set to 1b when writing 1b to **RIE2.QFS9**. 0: Disabled 1: Enabled
8	QFE8	0	R/W	Receive Queue 8 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD8**. This bit is set to 1b when writing 1b to **RIE2.QFS8**. 0: Disabled 1: Enabled
7	QFE7	0	R/W	Receive Queue 7 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD7**. This bit is set to 1b when writing 1b to **RIE2.QFS7**. 0: Disabled 1: Enabled
6	QFE6	0	R/W	Receive Queue 6 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD6**. This bit is set to 1b when writing 1b to **RIE2.QFS6**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
5	QFE5	0	R/W	Receive Queue 5 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD5**. This bit is set to 1b when writing 1b to **RIE2.QFS5**. 0: Disabled 1: Enabled
4	QFE4	0	R/W	Receive Queue 4 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD4**. This bit is set to 1b when writing 1b to **RIE2.QFS4**. 0: Disabled 1: Enabled
3	QFE3	0	R/W	Receive Queue 3 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD3**. This bit is set to 1b when writing 1b to **RIE2.QFS3**. 0: Disabled 1: Enabled
2	QFE2	0	R/W	Receive Queue 2 (Stream) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD2**. This bit is set to 1b when writing 1b to **RIE2.QFS2**. 0: Disabled 1: Enabled
1	QFE1	0	R/W	Receive Queue 1 (Network Control) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD1**. This bit is set to 1b when writing 1b to **RIE2.QFS1**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
0	QFE0	0	R/W	Receive Queue 0 (Best Effort) Full Interrupt Enable When a reception queue is full and the interrupt is enabled, the interrupt is issued. [Changing condition] This bit is set to 0b when writing 1b to **RID2.QFD0**. This bit is set to 1b when writing 1b to **RIE2.QFS0**. 0: Disabled 1: Enabled

100.1.2.45 Receive Interrupt Status Register 2 (RIS2)

The RIS2 register indicates the states of the AVB-DMAC receive interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFF	—	—	—	—	—	—	—	—	—	—	—	—	—	QFF17	QFF16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QFF15	QFF14	QFF13	QFF12	QFF11	QFF10	QFF9	QFF8	QFF7	QFF6	QFF5	QFF4	QFF3	QFF2	QFF1	QFF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFF	0	R/W	Receive FIFO Full Interrupt Status This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full. When receiving a frame is not possible, the frame will be discarded. Other information regarding discarded frames is not retained. Even if the frame is discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when frame data provided by the E-MAC cannot be stored in the reception FIFO. 0: The interrupt is not pending. 1: The interrupt is pending
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFF17	0	R/W	Receive Queue 17 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
16	QFF16	0	R/W	Receive Queue 16 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
15	QFF15	0	R/W	Receive Queue 15 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
14	QFF14	0	R/W	Receive Queue 14 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
13	QFF13	0	R/W	Receive Queue 13 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
12	QFF12	0	R/W	Receive Queue 12 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
11	QFF11	0	R/W	Receive Queue 11 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
10	QFF10	0	R/W	Receive Queue 10 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
9	QFF9	0	R/W	Receive Queue 9 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
8	QFF8	0	R/W	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	QFF7	0	R/W	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
6	QFF6	0	R/W	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
5	QFF5	0	R/W	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
4	QFF4	0	R/W	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
3	QFF3	0	R/W	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
2	QFF2	0	R/W	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
1	QFF1	0	R/W	Receive Queue 1 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
0	QFF0	0	R/W	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits:

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

Note: If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 100.1.3.4(3)(a) Storing Frame Data in the Descriptor Data Area, for storing a frame as a divided frame), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue r has no space available for storage.
- A bit is set to 1 when a SW defined stop point (EOS descriptor) reached within a split frame.
- A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

100.1.2.46 Transmit Interrupt Control Register (TIC)

The TIC register controls the AVB-DMAC transmit interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPE3	0	R/W	Transmit Descriptor Processed interrupt Enable 3 While this bit is 1b an interrupt will be generated when **TIS.TDPF3** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.TDPD3**. This bit is set to 1b when writing 1b to **TIE.TDPS3**. 0: Disabled 1: Enabled
18	TDPE2	0	R/W	Transmit Descriptor Processed interrupt Enable 2 While this bit is 1b an interrupt will be generated when **TIS.TDPF2** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.TDPD2**. This bit is set to 1b when writing 1b to **TIE.TDPS2**. 0: Disabled 1: Enabled
17	TDPE1	0	R/W	Transmit Descriptor Processed interrupt Enable 1 While this bit is 1b an interrupt will be generated when **TIS.TDPF1** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.TDPD1**. This bit is set to 1b when writing 1b to **TIE.TDPS1**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
16	TDPE0	0	R/W	Transmit Descriptor Processed interrupt Enable 0 While this bit is 1b an interrupt will be generated when **TIS.TDPF0** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.TDPD0**. This bit is set to 1b when writing 1b to **TIE.TDPS0**. 0: Disabled 1: Enabled
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWE	0	R/W	MAC status FIFO Warning interrupt Enable While this bit is 1b an interrupt will be generated when **TIS.MFWF** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.MFWD**. This bit is set to 1b when writing 1b to **TIE.MFWS**. 0: Disabled 1: Enabled
10	MFUE	0	R/W	MAC status FIFO Updated interrupt Enable While this bit is 1b an interrupt will be generated when **TIS.MFUF** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.MFUD**. This bit is set to 1b when writing 1b to **TIE.MFUS**. 0: Disabled 1: Enabled
9	TFWE	0	R/W	Time Stamp FIFO Warning Interrupt Enable When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued. 0: Disabled 1: Enabled
8	TFUE	0	R/W	Time Stamp FIFO Update Interrupt Enable When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued. 0: Disabled 1: Enabled
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTE3	0	R/W	Frame Transmitted interrupt Enable 3 While this bit is 1b an interrupt will be generated when **TIS.FTF3** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.FTD3**. This bit is set to 1b when writing 1b to **TIE.FTS3**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
2	FTE2	0	R/W	Frame Transmitted interrupt Enable 2 While this bit is 1b an interrupt will be generated when **TIS.FTF2** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.FTD2**. This bit is set to 1b when writing 1b to **TIE.FTS2**. 0: Disabled 1: Enabled
1	FTE1	0	R/W	Frame Transmitted interrupt Enable 1 While this bit is 1b an interrupt will be generated when **TIS.FTF1** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.FTD1**. This bit is set to 1b when writing 1b to **TIE.FTS1**. 0: Disabled 1: Enabled
0	FTE0	0	R/W	Frame Transmitted interrupt Enable 0 While this bit is 1b an interrupt will be generated when **TIS.FTF0** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **TID.FTD0**. This bit is set to 1b when writing 1b to **TIE.FTS0**. 0: Disabled 1: Enabled

100.1.2.47 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TDPF3	TDPF2	TDPF1	TDPF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFWF	MFUF	TFWF	TFUF	—	—	—	—	FTF3	FTF2	FTF1	FTF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPF3	0	R/W	Transmit Descriptor Processed Flag 3 This bit indicates that a descriptor in transmit queue 3 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue 3 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
18	TDPF2	0	R/W	Transmit Descriptor Processed Flag 2 This bit indicates that a descriptor in transmit queue 2 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue 2 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
17	TDPF1	0	R/W	Transmit Descriptor Processed Flag 1 This bit indicates that a descriptor in transmit queue 1 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue 1 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
16	TDPF0	0	R/W	Transmit Descriptor Processed Flag 0 This bit indicates that a descriptor in transmit queue 0 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue 0 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWF	0	R/W	E-MAC status FIFO Warning Flag This bit indicates that the warning level of the E-MAC status FIFO (12 out of 16 entries) has been reached. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when **TCCR.MFEN** is 0b. This bit is set to 0b when writing 1b to **TCCR.MFR**. This bit is set to 1b when a frame with **DESCR.MSR** has been transmitted by E-MAC and the E-MAC Status FIFO contains already 11 entries (**TSR.MFFL** is 11). This bit is set to 1b when E-MAC detects an error during transmission and the E-MAC Status FIFO contains already 11 entries (**TSR.MFFL** is 11). 0: No interrupt pending 1: Tx Status FIFO warning level has been reached

Bit	Bit Name	Initial Value	R/W	Description
10	MFUF	0	R/W	E-MAC status FIFO Updated Flag This bit indicates that the E-MAC status FIFO has been updated after the E-MAC has transmitted a frame. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when **TCCR.MFEN** is 0b. This bit is set to 0b when writing 1b to **TCCR.MFR**. This bit is set to 1b when a frame with **DESCR.MSR** has been transmitted by E-MAC and **TCCR.MFEN** is 1b. This bit is set to 1b when E-MAC detects an error during transmission and **TCCR.MFEN** is 1b. 0: No interrupt pending 1: Tx Status FIFO has been updated
9	TFWF	0	R/W	Time Stamp FIFO Warning Interrupt Status This bit indicates that the transmission time-stamp FIFO has reached the warning level. Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0. — The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO. 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
8	TFUF	0	R/W	Time Stamp FIFO Update Interrupt Status This bit indicates that the transmission time-stamp FIFO has been updated. Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode, when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0, and when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR). — The bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted. 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
3	FTF3	0	R/W	Frame Transmitted Flag 3 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (**DIS.DPFi**) refers to the end of processing storage element. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue 3 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC
2	FTF2	0	R/W	Frame Transmitted Flag 2 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (**DIS.DPFi**) refers to the end of processing storage element. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue 2 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC
1	FTF1	0	R/W	Frame Transmitted Flag 1 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (**DIS.DPFi**) refers to the end of processing storage element. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue 1 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC

Bit	Bit Name	Initial Value	R/W	Description
0	FTF0	0	R/W	Frame Transmitted Flag 0 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (**DIS.DPFi**) refers to the end of processing storage element. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue 0 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC

100.1.2.48 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPM15	DPM14	DPM13	DPM12	DPM11	DPM10	DPM9	DPM8	DPM7	DPM6	DPM5	DPM4	DPM3	DPM2	DPM1	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DPM15	0	R	Descriptor Interrupt 15 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE15) and descriptor interrupt status flag (DIS.DPF15) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
30	DPM14	0	R	Descriptor Interrupt 14 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE14) and descriptor interrupt status flag (DIS.DPF14) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
29	DPM13	0	R	Descriptor Interrupt 13 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE13) and descriptor interrupt status flag (DIS.DPF13) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
28	DPM12	0	R	Descriptor Interrupt 12 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE12) and descriptor interrupt status flag (DIS.DPF12) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
27	DPM11	0	R	Descriptor Interrupt 11 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE11) and descriptor interrupt status flag (DIS.DPF11) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
26	DPM10	0	R	Descriptor Interrupt 10 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE10) and descriptor interrupt status flag (DIS.DPF10) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
25	DPM9	0	R	Descriptor Interrupt 9 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE9) and descriptor interrupt status flag (DIS.DPF9) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
24	DPM8	0	R	Descriptor Interrupt 8 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE8) and descriptor interrupt status flag (DIS.DPF8) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
23	DPM7	0	R	Descriptor Interrupt 7 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE7) and descriptor interrupt status flag (DIS.DPF7) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
22	DPM6	0	R	Descriptor Interrupt 6 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE6) and descriptor interrupt status flag (DIS.DPF6) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
21	DPM5	0	R	Descriptor Interrupt 5 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE5) and descriptor interrupt status flag (DIS.DPF5) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
20	DPM4	0	R	Descriptor Interrupt 4 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE4) and descriptor interrupt status flag (DIS.DPF4) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
19	DPM3	0	R	Descriptor Interrupt 3 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE3) and descriptor interrupt status flag (DIS.DPF3) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
18	DPM2	0	R	Descriptor Interrupt 2 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE2) and descriptor interrupt status flag (DIS.DPF2) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
17	DPM1	0	R	Descriptor Interrupt 1 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE1) and descriptor interrupt status flag (DIS.DPF1) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
16 to 14	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
13	—	0	R	Reserved These bits are read as 0. The write value should be 0.
12	RFWM	0	R	Receive FIFO Warning Interrupt Mirror This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
11	MFWM	0	R	E-MAC status FIFO Warning Mirror This bit indicates that **TIS.MFWF** is 1b and **TIC.MFWE** is 1b. [Changing condition] This bit is updated when **TIS.MFWF** or **TIC.MFWE** changes. 0: No interrupt pending 1: E-MAC status FIFO warning interrupt pending
10	MFUM	0	R	E-MAC status FIFO Updated Mirror This bit indicates that **TIS.MFUF** is 1b and **TIC.MFUE** is 1b. [Changing condition] This bit is updated when **TIS.MFUF** or **TIC.MFUE** changes. 0: No interrupt pending 1: E-MAC status FIFO updated interrupt pending
9	TFWM	0	R	Time Stamp FIFO Warning Interrupt Mirror This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
8	TFUM	0	R	Time Stamp FIFO Update Mirror This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
7	MM	0	R	E-MAC Interrupt Mirror This bit is set to 1 when an E-MAC interrupt is issued. 0: The interrupt is not pending. 1: The interrupt is pending.
6	EM	0	R	Error Interrupt Mirror This bit is set to 1 when an error interrupt is issued (both of a bit in EIS and corresponding to the bit in EIC are 1). 0: The interrupt is not pending. 1: The interrupt is pending.
5 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	FTM	0	R	Frame Transmitted Mirror [Changing condition] This bit is set when any matching pair of **TIC.FTEt** enable and **TIS.FTFt** flag are both 1b. This bit is set when any matching pair of **TIC.TDPEt** enable and **TIS.TDPFt** flag are both 1b. 0: No interrupt pending 1: Frame transmitted interrupt pending
1	RWM	0	R	Reception Warning Mirror [Changing condition] This bit is set when any matching pair of **RIC1.RWEr** enable and **RIS1.RWFr** flag are both 1b. 0: No interrupt pending 1: Frame transmitted interrupt pending
0	FRM	0	R	Frame Received Mirror [Changing condition] This bit is set when any matching pair of **RIC0.FREr** enable and **RIS0.FRFr** flag are both 1b. This bit is set when any matching pair of **RIC3.RDPEr** enable and **RIS3.RDPFr** flag are both 1b. 0: No interrupt pending 1: Frame received interrupt pending

100.1.2.49 Common Interrupt Enable register (CIE)

The CIE register is used to control the Common Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	RFFL	RFWL	CL0M	RQFM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTIE	—	—	—	—	—	—	—	CRIE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	RFFL	0	R/W	Rx-FIFO Full interrupt Line select This bit selects the interrupt line of notification flagged by **RIS2.RFFF**. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
18	RFWL	0	R/W	Rx-FIFO Warning interrupt Line select This bit selects the interrupt line of notification flagged by **RIS1.RFWF**. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
17	CL0M	0	R/W	Common Line 0 Mode This bit controls if all data related interrupts using a common interrupt line or if queue specific interrupt lines for data related interrupts are used. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. **ISS**). To prevent interrupt notifications on different lines, it is recommended to set all **CIE.CTIE**, **CIE.CRIE**, and **DIL.DPLi** (i=2 to 15) to 0b when this bit is 1b. 0: Use common interrupt line 0 1: Use queue specific interrupt line 0
16	RQFM	0	R/W	Reception Queue Full Mode This bit controls if queue full notification is mapped to error interrupt line or to queue data interrupt line. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. **ISS**). 0: Use for error interrupt line 1: Use for queue specific interrupt line
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	CTIE	0	R/W	Common Transmit Interrupt Enable This bit controls transmit related interrupt line outputs of EthernetAVB-IF. It has no influence to internal flagging in EthernetAVB-IF register (e.g. **ISS**). These lines are controlled by this bit: **line0_Tx**[3:0] -- individual transmit queue interrupts Transmission interrupts mapped on other lines are not influenced. 0: Disabled 1: Enabled
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	CRIE	0	R/W	Common Receive Interrupt enable This bit controls receive related interrupt line outputs of EthernetAVB-IF. It has no influence to internal flagging in EthernetAVB-IF register (e.g. **ISS**). These lines are controlled by this bit: **line0_Rx**[17:0] -- individual receive queue interrupts Receive interrupts mapped on other lines are not influenced. 0: Disabled 1: Enabled

100.1.2.50 Reception Interrupt Control register 3 (RIC3)

The RIC3 register controls the AVB-DMAC receive descriptor interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPE17	RDPE16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPE17	0	R/W	Receive Descriptor Processed interrupt Enable 17 While this bit is 1b an interrupt will be generated when **RIS3.RDPF17** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD17**. This bit is set to 1b when writing 1b to **RIE3.RDPS17**. 0: Disabled 1: Enabled
16	RDPE16	0	R/W	Receive Descriptor Processed interrupt Enable 16 While this bit is 1b an interrupt will be generated when **RIS3.RDPF16** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD16**. This bit is set to 1b when writing 1b to **RIE3.RDPS16**. 0: Disabled 1: Enabled
15	RDPE15	0	R/W	Receive Descriptor Processed interrupt Enable 15 While this bit is 1b an interrupt will be generated when **RIS3.RDPF15** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD15**. This bit is set to 1b when writing 1b to **RIE3.RDPS15**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
14	RDPE14	0	R/W	Receive Descriptor Processed interrupt Enable 14 While this bit is 1b an interrupt will be generated when **RIS3.RDPF14** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD14**. This bit is set to 1b when writing 1b to **RIE3.RDPS14**. 0: Disabled 1: Enabled
13	RDPE13	0	R/W	Receive Descriptor Processed interrupt Enable 13 While this bit is 1b an interrupt will be generated when **RIS3.RDPF13** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD13**. This bit is set to 1b when writing 1b to **RIE3.RDPS13**. 0: Disabled 1: Enabled
12	RDPE12	0	R/W	Receive Descriptor Processed interrupt Enable 12 While this bit is 1b an interrupt will be generated when **RIS3.RDPF12** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD12**. This bit is set to 1b when writing 1b to **RIE3.RDPS12**. 0: Disabled 1: Enabled
11	RDPE11	0	R/W	Receive Descriptor Processed interrupt Enable 11 While this bit is 1b an interrupt will be generated when **RIS3.RDPF11** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD11**. This bit is set to 1b when writing 1b to **RIE3.RDPS11**. 0: Disabled 1: Enabled
10	RDPE10	0	R/W	Receive Descriptor Processed interrupt Enable 10 While this bit is 1b an interrupt will be generated when **RIS3.RDPF10** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD10**. This bit is set to 1b when writing 1b to **RIE3.RDPS10**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
9	RDPE9	0	R/W	Receive Descriptor Processed interrupt Enable 9 While this bit is 1b an interrupt will be generated when **RIS3.RDPF9** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD9**. This bit is set to 1b when writing 1b to **RIE3.RDPS9**. 0: Disabled 1: Enabled
8	RDPE8	0	R/W	Receive Descriptor Processed interrupt Enable 8 While this bit is 1b an interrupt will be generated when **RIS3.RDPF8** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD8**. This bit is set to 1b when writing 1b to **RIE3.RDPS8**. 0: Disabled 1: Enabled
7	RDPE7	0	R/W	Receive Descriptor Processed interrupt Enable 7 While this bit is 1b an interrupt will be generated when **RIS3.RDPF7** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD7**. This bit is set to 1b when writing 1b to **RIE3.RDPS7**. 0: Disabled 1: Enabled
6	RDPE6	0	R/W	Receive Descriptor Processed interrupt Enable 6 While this bit is 1b an interrupt will be generated when **RIS3.RDPF6** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD6**. This bit is set to 1b when writing 1b to **RIE3.RDPS6**. 0b Disabled 1b Enabled
5	RDPE5	0	R/W	Receive Descriptor Processed interrupt Enable 5 While this bit is 1b an interrupt will be generated when **RIS3.RDPF5** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD5**. This bit is set to 1b when writing 1b to **RIE3.RDPS5**. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
4	RDPE4	0	R/W	Receive Descriptor Processed interrupt Enable 4 While this bit is 1b an interrupt will be generated when **RIS3.RDPF4** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD4**. This bit is set to 1b when writing 1b to **RIE3.RDPS4**. 0: Disabled 1: Enabled
3	RDPE3	0	R/W	Receive Descriptor Processed interrupt Enable 3 While this bit is 1b an interrupt will be generated when **RIS3.RDPF3** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD3**. This bit is set to 1b when writing 1b to **RIE3.RDPS3**. 0: Disabled 1: Enabled
2	RDPE2	0	R/W	Receive Descriptor Processed interrupt Enable 2 While this bit is 1b an interrupt will be generated when **RIS3.RDPF2** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD2**. This bit is set to 1b when writing 1b to **RIE3.RDPS2**. 0: Disabled 1: Enabled
1	RDPE1	0	R/W	Receive Descriptor Processed interrupt Enable 1 While this bit is 1b an interrupt will be generated when **RIS3.RDPF1** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD1**. This bit is set to 1b when writing 1b to **RIE3.RDPS1**. 0: Disabled 1: Enabled
0	RDPE0	0	R/W	Receive Descriptor Processed interrupt Enable 0 While this bit is 1b an interrupt will be generated when **RIS3.RDPF0** is 1b. [Changing condition] This bit is set to 0b when writing 1b to **RID3.RDPD0**. This bit is set to 1b when writing 1b to **RIE3.RDPS0**. 0: Disabled 1: Enabled

100.1.2.51 Reception Interrupt Status register 3 (RIS3)

The RIS3 register indicates the states of the AVB-DMAC receive descriptor interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPF17	RDPF16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDPF15	RDPF14	RDPF13	RDPF12	RDPF11	RDPF10	RDPF9	RDPF8	RDPF7	RDPF6	RDPF5	RDPF4	RDPF3	RDPF2	RDPF1	RDPF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPF17	0	R/W	Receive Descriptor Processed Flag 17 This bit indicates that a descriptor in reception queue 17 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 17 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
16	RDPF16	0	R/W	Receive Descriptor Processed Flag 16 This bit indicates that a descriptor in reception queue 16 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 16 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
15	RDPF15	0	R/W	Receive Descriptor Processed Flag 15 This bit indicates that a descriptor in reception queue 15 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 15 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
14	RDPF14	0	R/W	Receive Descriptor Processed Flag 14 This bit indicates that a descriptor in reception queue 14 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 14 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
13	RDPF13	0	R/W	Receive Descriptor Processed Flag 13 This bit indicates that a descriptor in reception queue 13 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 13 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
12	RDPF12	0	R/W	Receive Descriptor Processed Flag 12 This bit indicates that a descriptor in reception queue 12 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 12 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
11	RDPF11	0	R/W	Receive Descriptor Processed Flag 11 This bit indicates that a descriptor in reception queue 11 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 11 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
10	RDPF10	0	R/W	Receive Descriptor Processed Flag 10 This bit indicates that a descriptor in reception queue 10 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 10 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
9	RDPF9	0	R/W	Receive Descriptor Processed Flag 9 This bit indicates that a descriptor in reception queue 9 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 9 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
8	RDPF8	0	R/W	Receive Descriptor Processed Flag 8 This bit indicates that a descriptor in reception queue 8 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 8 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
7	RDPF7	0	R/W	Receive Descriptor Processed Flag 7 This bit indicates that a descriptor in reception queue 7 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 7 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
6	RDPF6	0	R/W	Receive Descriptor Processed Flag 6 This bit indicates that a descriptor in reception queue 6 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 6 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
5	RDPF5	0	R/W	Receive Descriptor Processed Flag 5 This bit indicates that a descriptor in reception queue 5 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 5 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
4	RDPF4	0	R/W	Receive Descriptor Processed Flag 4 This bit indicates that a descriptor in reception queue 4 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 4 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
3	RDPF3	0	R/W	Receive Descriptor Processed Flag 3 This bit indicates that a descriptor in reception queue 3 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 3 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
2	RDPF2	0	R/W	Receive Descriptor Processed Flag 2 This bit indicates that a descriptor in reception queue 2 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 2 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
1	RDPF1	0	R/W	Receive Descriptor Processed Flag 1 This bit indicates that a descriptor in reception queue 1 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 1 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending
0	RDPF0	0	R/W	Receive Descriptor Processed Flag 0 This bit indicates that a descriptor in reception queue 0 has been processed where **DESCR.DIE** is 0001b. Note: The descriptor with **DESCR.DIE** is 1, which sets this bit, sets in addition the universal descriptor interrupt **DIS.DPF1**. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue 0 has been processed where **DESCR.DIE** is 1. 0: No interrupt pending 1: Descriptor interrupt pending

100.1.2.52 Descriptor Interrupt Line selection register (DIL)

The DIL register is used to control the Descriptor Interrupt line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DPL15	DPL14	DPL13	DPL12	DPL11	DPL10	DPL9	DPL8	DPL7	DPL6	DPL5	DPL4	DPL3	DPL2	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPL15	0	R/W	Descriptor Processed interrupt Line select 15 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
14	DPL14	0	R/W	Descriptor Processed interrupt Line select 14 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
13	DPL13	0	R/W	Descriptor Processed interrupt Line select 13 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
12	DPL12	0	R/W	Descriptor Processed interrupt Line select 12 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
11	DPL11	0	R/W	Descriptor Processed interrupt Line select 11 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
10	DPL10	0	R/W	Descriptor Processed interrupt Line select 10 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
9	DPL9	0	R/W	Descriptor Processed interrupt Line select 9 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
8	DPL8	0	R/W	Descriptor Processed interrupt Line select 8 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
7	DPL7	0	R/W	Descriptor Processed interrupt Line select 7 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
6	DPL6	0	R/W	Descriptor Processed interrupt Line select 6 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
5	DPL5	0	R/W	Descriptor Processed interrupt Line select 5 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
4	DPL4	0	R/W	Descriptor Processed interrupt Line select 4 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
3	DPL3	0	R/W	Descriptor Processed interrupt Line select 3 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
2	DPL2	0	R/W	Descriptor Processed interrupt Line select 2 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
1 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.53 Error Interrupt Line selection register (EIL)

The EIL register is used to control the Error Interrupt line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TBFL	MFFL	TFFL	CULL1	CULL0	CLLL1	CLLL0	SEL	QEL	MTEL	MREL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10	TBFL	0	R/W	Tx-Buffer Full interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
9	MFFL	0	R/W	E-MAC status FIFO Full interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
8	TFFL	0	R/W	Timestamp FIFO Full interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
7	CULL1	0	R/W	CBS Upper Limit reached interrupt Line select 1 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
6	CULL0	0	R/W	CBS Upper Limit reached interrupt Line select 0 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
5	CLLL1	0	R/W	CBS Lower Limit reached interrupt Line select 1 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
4	CLLL0	0	R/W	CBS Lower Limit reached interrupt Line select 0 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
3	SEL	0	R/W	Separation Error interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
2	QEL	0	R/W	Queue Error interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
1	MTEL	0	R/W	E-MAC Transmission Error interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
0	MREL	0	R/W	E-MAC Reception Error interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

100.1.2.54 Transmission Interrupt Line selection register (TIL)

The TIL register is used to control the Transmission Interrupt line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFWL	MFUL	TFWL	TFUL	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWL	0	R/W	E-MAC status FIFO Warning interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
10	MFUL	0	R/W	E-MAC status FIFO Updated interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
9	TFWL	0	R/W	Timestamp FIFO Warning interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
8	TFUL	0	R/W	Timestamp FIFO Updated interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
7 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.55 Descriptor Interrupt Enable register (DIE)

The DIE register is used to control the Descriptor Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPS15	0	R/W	Descriptor Processed interrupt Set 15 This bit supports interrupt enable. It controls set of **DIC.DPE15**. This bit is always read as 0b. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 1b
14	DPS14	0	R/W	Descriptor Processed interrupt Set 14 This bit supports interrupt enable. It controls set of **DIC.DPE14**. This bit is always read as 0b. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 1b
13	DPS13	0	R/W	Descriptor Processed interrupt Set 13 This bit supports interrupt enable. It controls set of **DIC.DPE13**. This bit is always read as 0b. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 1b
12	DPS12	0	R/W	Descriptor Processed interrupt Set 12 This bit supports interrupt enable. It controls set of **DIC.DPE12**. This bit is always read as 0b. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 1b
11	DPS11	0	R/W	Descriptor Processed interrupt Set 11 This bit supports interrupt enable. It controls set of **DIC.DPE11**. This bit is always read as 0b. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 1b

Bit	Bit Name	Initial Value	R/W	Description
10	DPS10	0	R/W	Descriptor Processed interrupt Set 10 This bit supports interrupt enable. It controls set of **DIC.DPE10**. This bit is always read as 0b. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 1b
9	DPS9	0	R/W	Descriptor Processed interrupt Set 9 This bit supports interrupt enable. It controls set of **DIC.DPE9**. This bit is always read as 0b. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 1b
8	DPS8	0	R/W	Descriptor Processed interrupt Set 8 This bit supports interrupt enable. It controls set of **DIC.DPE8**. This bit is always read as 0b. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 1b
7	DPS7	0	R/W	Descriptor Processed interrupt Set 7 This bit supports interrupt enable. It controls set of **DIC.DPE7**. This bit is always read as 0b. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 1b
6	DPS6	0	R/W	Descriptor Processed interrupt Set 6 This bit supports interrupt enable. It controls set of **DIC.DPE6**. This bit is always read as 0b. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 1b
5	DPS5	0	R/W	Descriptor Processed interrupt Set 5 This bit supports interrupt enable. It controls set of **DIC.DPE5**. This bit is always read as 0b. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 1b
4	DPS4	0	R/W	Descriptor Processed interrupt Set 4 This bit supports interrupt enable. It controls set of **DIC.DPE4**. This bit is always read as 0b. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 1b
3	DPS3	0	R/W	Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of **DIC.DPE3**. This bit is always read as 0b. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 1b
2	DPS2	0	R/W	Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of **DIC.DPE2**. This bit is always read as 0b. 0: No change of DIC.DPE2 1:Set DIC.DPEi to 1b

Bit	Bit Name	Initial Value	R/W	Description
1	DPS1	0	R/W	Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of **DIC.DPE1**. This bit is always read as 0b. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 1b
0	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.56 Descriptor Interrupt Disable register (DID)

The DID register is used to control the Descriptor Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPD15	0	R/W	Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of **DIC.DPE15**. This bit is always read as 0b. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 0b
14	DPD14	0	R/W	Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of **DIC.DPE14**. This bit is always read as 0b. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 0b
13	DPD13	0	R/W	Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of **DIC.DPE13**. This bit is always read as 0b. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 0b
12	DPD12	0	R/W	Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of **DIC.DPE12**. This bit is always read as 0b. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 0b
11	DPD11	0	R/W	Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of **DIC.DPE11**. This bit is always read as 0b. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 0b

Bit	Bit Name	Initial Value	R/W	Description
10	DPD10	0	R/W	Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of **DIC.DPE10**. This bit is always read as 0b. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 0b
9	DPD9	0	R/W	Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of **DIC.DPE9**. This bit is always read as 0b. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 0b
8	DPD8	0	R/W	Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of **DIC.DPE8**. This bit is always read as 0b. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 0b
7	DPD7	0	R/W	Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of **DIC.DPE7**. This bit is always read as 0b. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 0b
6	DPD6	0	R/W	Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of **DIC.DPE6**. This bit is always read as 0b. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 0b
5	DPD5	0	R/W	Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of **DIC.DPE5**. This bit is always read as 0b. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 0b
4	DPD4	0	R/W	Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of **DIC.DPE4**. This bit is always read as 0b. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 0b
3	DPD3	0	R/W	Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of **DIC.DPE3**. This bit is always read as 0b. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 0b
2	DPD2	0	R/W	Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of **DIC.DPE2**. This bit is always read as 0b. 0: No change of DIC.DPE2 1: Set DIC.DPE2 to 0b

Bit	Bit Name	Initial Value	R/W	Description
1	DPD1	0	R/W	Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of **DIC.DPE1**. This bit is always read as 0b. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 0b
0	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.57 Error Interrupt Enable register (EIE)

The EIE register is used to control the Error Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TBFS	MFFS	TFFS	CULS 1	CULS 0	CLLS1	CLLS0	SES	QES	MTES	MRES
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10	TBFS	0	R/W	Tx-Buffer Full interrupt Set This bit supports interrupt enable. It controls set of **EIC.TBFE**. This bit is always read as 0b. 0: No change of EIC.TBFE 1: Set EIC.TBFE to 1b
9	MFFS	0	R/W	E-MAC status FIFO Full interrupt Set This bit supports interrupt enable. It controls set of **EIC.MFFE**. This bit is always read as 0b. 0: No change of EIC.MFFE 1: Set EIC.MFFE to 1b
8	TFFS	0	R/W	Timestamp FIFO Full interrupt Set This bit supports interrupt enable. It controls set of **EIC.TFFE**. This bit is always read as 0b. 0: No change of EIC.TFFE 1: Set EIC.TFFE to 1b
7	CULS1	0	R/W	CBS Upper Limit reached interrupt Set 1 This bit supports interrupt enable. It controls set of **EIC.CULE1**. This bit is always read as 0b. 0: No change of EIC.CULE1 1: Set EIC.CULE1 to 1b
6	CULS0	0	R/W	CBS Upper Limit reached interrupt Set 0 This bit supports interrupt enable. It controls set of **EIC.CULE0**. This bit is always read as 0b. 0: No change of EIC.CULE0 1: Set EIC.CULE0 to 1b

Bit	Bit Name	Initial Value	R/W	Description
5	CLLS1	0	R/W	CBS Lower Limit reached interrupt Set 1 This bit supports interrupt enable. It controls set of **EIC.CLLE1**. This bit is always read as 0b. 0: No change of EIC.CLLE1 1: Set EIC.CLLE1 to 1b
4	CLLS0	0	R/W	CBS Lower Limit reached interrupt Set 0 This bit supports interrupt enable. It controls set of **EIC.CLLE0**. This bit is always read as 0b. 0: No change of EIC.CLLE0 1: Set EIC.CLLE0 to 1b
3	SES	0	R/W	Separation Error interrupt Set This bit supports interrupt enable. It controls set of **EIC.SEE**. This bit is always read as 0b. 0: No change of EIC.SEE 1: Set EIC.QEE to 1b
2	QES	0	R/W	Queue Error interrupt Set This bit supports interrupt enable. It controls set of **EIC.QEE**. This bit is always read as 0b. 0: No change of EIC.QEE 1: Set EIC.QEE to 1b
1	MTES	0	R/W	E-MAC Transmission Error interrupt Set This bit supports interrupt enable. It controls set of **EIC.MTEE**. This bit is always read as 0b. 0: No change of EIC.MTEE 1: Set EIC.MTEE to 1b
0	MRES	0	R/W	E-MAC Reception Error interrupt Set This bit supports interrupt enable. It controls set of **EIC.MREE**. This bit is always read as 0b. 0: No change of EIC.MREE 1: Set EIC.MREE to 1b

100.1.2.58 Error Interrupt Disable register (EID)

The EID register is used to control the Error Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TBFD	MFFD	TFFD	CULD 1	CULD 0	CLLD1	CLLD0	SED	QED	MTED	MRED
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10	TBFD	0	R/W	Tx-Buffer Full interrupt Disable This bit supports interrupt enable. It controls set of **EIC.TBFE**. This bit is always read as 0b. 0: No change of EIC.TBFE 1: Set EIC.TBFE to 0b
9	MFFD	0	R/W	E-MAC status FIFO Full interrupt Disable This bit supports interrupt enable. It controls set of **EIC.MFFE**. This bit is always read as 0b. 0: No change of EIC.MFFE 1: Set EIC.MFFE to 0b
8	TFFD	0	R/W	Timestamp FIFO Full interrupt Disable This bit supports interrupt enable. It controls set of **EIC.TFFE**. This bit is always read as 0b. 0: No change of EIC.TFFE 1: Set EIC.TFFE to 0b
7	CULD1	0	R/W	CBS Upper Limit reached interrupt Disable 1 This bit supports interrupt enable. It controls set of **EIC.CULE1**. This bit is always read as 0b. 0: No change of EIC.CULE1 1: Set EIC.CULE1 to 0b
6	CULD0	0	R/W	CBS Upper Limit reached interrupt Disable 0 This bit supports interrupt enable. It controls set of **EIC.CULE0**. This bit is always read as 0b. 0: No change of EIC.CULE0 1: Set EIC.CULE0 to 0b

Bit	Bit Name	Initial Value	R/W	Description
5	CLLD1	0	R/W	CBS Lower Limit reached interrupt Disable 1 This bit supports interrupt enable. It controls set of **EIC.CLLE1**. This bit is always read as 0b. 0: No change of EIC.CLLE1 1: Set EIC.CLLE1 to 0b
4	CLLD0	0	R/W	CBS Lower Limit reached interrupt Disable 0 This bit supports interrupt enable. It controls set of **EIC.CLLE0**. This bit is always read as 0b. 0: No change of EIC.CLLE0 1: Set EIC.CLLE0 to 0b
3	SED	0	R/W	Separation Error interrupt Disable This bit supports interrupt enable. It controls set of **EIC.SEE**. This bit is always read as 0b. 0: No change of EIC.SEE 1: Set EIC.SEE to 0b
2	QED	0	R/W	Queue Error interrupt Disable This bit supports interrupt enable. It controls set of **EIC.QEE**. This bit is always read as 0b. 0: No change of EIC.QEE 1: Set EIC.QEE to 0b
1	MTED	0	R/W	E-MAC Transmission Error interrupt Disable This bit supports interrupt enable. It controls set of **EIC.MTEE**. This bit is always read as 0b. 0: No change of EIC.MTEE 1: Set EIC.MTEE to 0b
0	MRED	0	R/W	E-MAC Reception Error interrupt Disable This bit supports interrupt enable. It controls set of **EIC.MREE**. This bit is always read as 0b. 0: No change of EIC.MREE 1: Set EIC.MREE to 0b

100.1.2.59 Reception Interrupt Enable register 0 (RIE0)

The RIE0 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRS17	FRS16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	FRS17	0	R/W	Frame Received interrupt Set 17 This bit supports interrupt enable. It controls set of **RIC0.FRE17**. This bit is always read as 0b. 0: No change of RIC0.FRE17 1: Set RIC0.FRE17 to 1b
16	FRS16	0	R/W	Frame Received interrupt Set 16 This bit supports interrupt enable. It controls set of **RIC0.FRE16**. This bit is always read as 0b. 0: No change of RIC0.FRE16 1: Set RIC0.FRE16 to 1b
15	FRS15	0	R/W	Frame Received interrupt Set 15 This bit supports interrupt enable. It controls set of **RIC0.FRE15**. This bit is always read as 0b. 0: No change of RIC0.FRE15 1: Set RIC0.FRE15 to 1b
14	FRS14	0	R/W	Frame Received interrupt Set 14 This bit supports interrupt enable. It controls set of **RIC0.FRE14**. This bit is always read as 0b. 0: No change of RIC0.FRE14 1: Set RIC0.FRE14 to 1b
13	FRS13	0	R/W	Frame Received interrupt Set 13 This bit supports interrupt enable. It controls set of **RIC0.FRE13**. This bit is always read as 0b. 0: No change of RIC0.FRE13 1: Set RIC0.FRE13 to 1b

Bit	Bit Name	Initial Value	R/W	Description
12	FRS12	0	R/W	Frame Received interrupt Set 12 This bit supports interrupt enable. It controls set of **RIC0.FRE12**. This bit is always read as 0b. 0: No change of RIC0.FRE12 1: Set RIC0.FRE12 to 1b
11	FRS11	0	R/W	Frame Received interrupt Set 11 This bit supports interrupt enable. It controls set of **RIC0.FRE11**. This bit is always read as 0b. 0: No change of RIC0.FRE11 1: Set RIC0.FRE11 to 1b
10	FRS10	0	R/W	Frame Received interrupt Set 10 This bit supports interrupt enable. It controls set of **RIC0.FRE10**. This bit is always read as 0b. 0: No change of RIC0.FRE10 1: Set RIC0.FRE10 to 1b
9	FRS9	0	R/W	Frame Received interrupt Set 9 This bit supports interrupt enable. It controls set of **RIC0.FRE9**. This bit is always read as 0b. 0: No change of RIC0.FRE9 1: Set RIC0.FRE9 to 1b
8	FRS8	0	R/W	Frame Received interrupt Set 8 This bit supports interrupt enable. It controls set of **RIC0.FRE8**. This bit is always read as 0b. 0: No change of RIC0.FRE8 1: Set RIC0.FRE8 to 1b
7	FRS7	0	R/W	Frame Received interrupt Set 7 This bit supports interrupt enable. It controls set of **RIC0.FRE7**. This bit is always read as 0b. 0: No change of RIC0.FRE7 1: Set RIC0.FRE7 to 1b
6	FRS6	0	R/W	Frame Received interrupt Set 6 This bit supports interrupt enable. It controls set of **RIC0.FRE6**. This bit is always read as 0b. 0: No change of RIC0.FRE6 1: Set RIC0.FRE6 to 1b
5	FRS5	0	R/W	Frame Received interrupt Set 5 This bit supports interrupt enable. It controls set of **RIC0.FRE5**. This bit is always read as 0b. 0: No change of RIC0.FRE5 1: Set RIC0.FRE5 to 1b
4	FRS4	0	R/W	Frame Received interrupt Set 4 This bit supports interrupt enable. It controls set of **RIC0.FRE4**. This bit is always read as 0b. 0: No change of RIC0.FRE4 1: Set RIC0.FRE4 to 1b

Bit	Bit Name	Initial Value	R/W	Description
3	FRS3	0	R/W	Frame Received interrupt Set 3 This bit supports interrupt enable. It controls set of **RIC0.FRE3**. This bit is always read as 0b. 0: No change of RIC0.FRE3 1: Set RIC0.FRE3 to 1b
2	FRS2	0	R/W	Frame Received interrupt Set 2 This bit supports interrupt enable. It controls set of **RIC0.FRE2**. This bit is always read as 0b. 0: No change of RIC0.FRE2 1: Set RIC0.FRE2 to 1b
1	FRS1	0	R/W	Frame Received interrupt Set 1 This bit supports interrupt enable. It controls set of **RIC0.FRE1**. This bit is always read as 0b. 0: No change of RIC0.FRE1 1: Set RIC0.FRE1 to 1b
0	FRS0	0	R/W	Frame Received interrupt Set 0 This bit supports interrupt enable. It controls set of **RIC0.FRE0**. This bit is always read as 0b. 0: No change of RIC0.FRE0 1: Set RIC0.FRE0 to 1b

100.1.2.60 Reception Interrupt Disable register 0 (RID0)

The RID0 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	FRD17	0	R/W	Frame Received interrupt Disable 17 This bit supports interrupt enable. It controls set of **RIC0.FRE17**. This bit is always read as 0b. 0: No change of RIC0.FRE17 1: Set RIC0.FRE17 to 0b
16	FRD16	0	R/W	Frame Received interrupt Disable 16 This bit supports interrupt enable. It controls set of **RIC0.FRE16**. This bit is always read as 0b. 0: No change of RIC0.FRE16 1: Set RIC0.FRE16 to 0b
15	FRD15	0	R/W	Frame Received interrupt Disable 15 This bit supports interrupt enable. It controls set of **RIC0.FRE15**. This bit is always read as 0b. 0: No change of RIC0.FRE15 1: Set RIC0.FRE15 to 0b
14	FRD14	0	R/W	Frame Received interrupt Disable 14 This bit supports interrupt enable. It controls set of **RIC0.FRE14**. This bit is always read as 0b. 0: No change of RIC0.FRE14 1: Set RIC0.FRE14 to 0b
13	FRD13	0	R/W	Frame Received interrupt Disable 13 This bit supports interrupt enable. It controls set of **RIC0.FRE13**. This bit is always read as 0b. 0: No change of RIC0.FRE13 1: Set RIC0.FRE13 to 0b

Bit	Bit Name	Initial Value	R/W	Description
12	FRD12	0	R/W	Frame Received interrupt Disable 12 This bit supports interrupt enable. It controls set of **RIC0.FRE12**. This bit is always read as 0b. 0: No change of RIC0.FRE12 1: Set RIC0.FRE12 to 0b
11	FRD11	0	R/W	Frame Received interrupt Disable 11 This bit supports interrupt enable. It controls set of **RIC0.FRE11**. This bit is always read as 0b. 0: No change of RIC0.FRE11 1: Set RIC0.FRE11 to 0b
10	FRD10	0	R/W	Frame Received interrupt Disable 10 This bit supports interrupt enable. It controls set of **RIC0.FRE10**. This bit is always read as 0b. 0: No change of RIC0.FRE10 1: Set RIC0.FRE10 to 0b
9	FRD9	0	R/W	Frame Received interrupt Disable 9 This bit supports interrupt enable. It controls set of **RIC0.FRE9**. This bit is always read as 0b. 0: No change of RIC0.FRE9 1: Set RIC0.FRE9 to 0b
8	FRD8	0	R/W	Frame Received interrupt Disable 8 This bit supports interrupt enable. It controls set of **RIC0.FRE8**. This bit is always read as 0b. 0: No change of RIC0.FRE8 1: Set RIC0.FRE8 to 0b
7	FRD7	0	R/W	Frame Received interrupt Disable 7 This bit supports interrupt enable. It controls set of **RIC0.FRE7**. This bit is always read as 0b. 0: No change of RIC0.FRE7 1: Set RIC0.FRE7 to 0b
6	FRD6	0	R/W	Frame Received interrupt Disable 6 This bit supports interrupt enable. It controls set of **RIC0.FRE6**. This bit is always read as 0b. 0: No change of RIC0.FRE6 1: Set RIC0.FRE6 to 0b
5	FRD5	0	R/W	Frame Received interrupt Disable 5 This bit supports interrupt enable. It controls set of **RIC0.FRE5**. This bit is always read as 0b. 0: No change of RIC0.FRE5 1: Set RIC0.FRE5 to 0b
4	FRD4	0	R/W	Frame Received interrupt Disable 4 This bit supports interrupt enable. It controls set of **RIC0.FRE4**. This bit is always read as 0b. 0: No change of RIC0.FRE4 1: Set RIC0.FRE4 to 0b

Bit	Bit Name	Initial Value	R/W	Description
3	FRD3	0	R/W	Frame Received interrupt Disable 3 This bit supports interrupt enable. It controls set of **RIC0.FRE3**. This bit is always read as 0b. 0: No change of RIC0.FRE3 1: Set RIC0.FRE3 to 0b
2	FRD2	0	R/W	Frame Received interrupt Disable 2 This bit supports interrupt enable. It controls set of **RIC0.FRE2**. This bit is always read as 0b. 0: No change of RIC0.FRE2 1: Set RIC0.FRE2 to 0b
1	FRD1	0	R/W	Frame Received interrupt Disable 1 This bit supports interrupt enable. It controls set of **RIC0.FRE1**. This bit is always read as 0b. 0: No change of RIC0.FRE1 1: Set RIC0.FRE1 to 0b
0	FRD0	0	R/W	Frame Received interrupt Disable 0 This bit supports interrupt enable. It controls set of **RIC0.FRE0**. This bit is always read as 0b. 0: No change of RIC0.FRE0 1: Set RIC0.FRE0 to 0b

100.1.2.61 Reception Interrupt Enable register 1 (RIE1)

The RIE1 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RFWS	0	R/W	Rx-FIFO Warning interrupt Set This bit supports interrupt enable. It controls set of **RIC1.RFWE**. This bit is always read as 0b. 0: No change of RIC1.RFWE 1: Set RIC1.RFWE to 1b
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWS17	0	R/W	Reception Warning interrupt Set 17 This bit supports interrupt enable. It controls set of **RIC1.RWE17**. This bit is always read as 0b. 0: No change of RIC1.RWE17 1: Set RIC1.RWE17 to 1b
16	RWS16	0	R/W	Reception Warning interrupt Set 16 This bit supports interrupt enable. It controls set of **RIC1.RWE16**. This bit is always read as 0b. 0: No change of RIC1.RWE16 1: Set RIC1.RWE16 to 1b
15	RWS15	0	R/W	Reception Warning interrupt Set 15 This bit supports interrupt enable. It controls set of **RIC1.RWE15**. This bit is always read as 0b. 0: No change of RIC1.RWE15 1: Set RIC1.RWE15 to 1b
14	RWS14	0	R/W	Reception Warning interrupt Set 14 This bit supports interrupt enable. It controls set of **RIC1.RWE14**. This bit is always read as 0b. 0: No change of RIC1.RWE14 1: Set RIC1.RWE14 to 1b

Bit	Bit Name	Initial Value	R/W	Description
13	RWS13	0	R/W	Reception Warning interrupt Set 13 This bit supports interrupt enable. It controls set of **RIC1.RWE13**. This bit is always read as 0b. 0: No change of RIC1.RWE13 1: Set RIC1.RWE13 to 1b
12	RWS12	0	R/W	Reception Warning interrupt Set 12 This bit supports interrupt enable. It controls set of **RIC1.RWE12**. This bit is always read as 0b. 0: No change of RIC1.RWE12 1: Set RIC1.RWE12 to 1b
11	RWS11	0	R/W	Reception Warning interrupt Set 11 This bit supports interrupt enable. It controls set of **RIC1.RWE11**. This bit is always read as 0b. 0: No change of RIC1.RWE11 1: Set RIC1.RWE11 to 1b
10	RWS10	0	R/W	Reception Warning interrupt Set 10 This bit supports interrupt enable. It controls set of **RIC1.RWE10**. This bit is always read as 0b. 0: No change of RIC1.RWE10 1: Set RIC1.RWE10 to 1b
9	RWS9	0	R/W	Reception Warning interrupt Set 9 This bit supports interrupt enable. It controls set of **RIC1.RWE9**. This bit is always read as 0b. 0: No change of RIC1.RWE9 1: Set RIC1.RWE9 to 1b
8	RWS8	0	R/W	Reception Warning interrupt Set 8 This bit supports interrupt enable. It controls set of **RIC1.RWE8**. This bit is always read as 0b. 0: No change of RIC1.RWE8 1: Set RIC1.RWE8 to 1b
7	RWS7	0	R/W	Reception Warning interrupt Set 7 This bit supports interrupt enable. It controls set of **RIC1.RWE7**. This bit is always read as 0b. 0: No change of RIC1.RWE7 1: Set RIC1.RWE7 to 1b
6	RWS6	0	R/W	Reception Warning interrupt Set 6 This bit supports interrupt enable. It controls set of **RIC1.RWE6**. This bit is always read as 0b. 0: No change of RIC1.RWE6 1: Set RIC1.RWE6 to 1b
5	RWS5	0	R/W	Reception Warning interrupt Set 5 This bit supports interrupt enable. It controls set of **RIC1.RWE5**. This bit is always read as 0b. 0: No change of RIC1.RWE5 1: Set RIC1.RWE5 to 1b

Bit	Bit Name	Initial Value	R/W	Description
4	RWS4	0	R/W	Reception Warning interrupt Set 4 This bit supports interrupt enable. It controls set of **RIC1.RWE4**. This bit is always read as 0b. 0: No change of RIC1.RWE4 1: Set RIC1.RWE4 to 1b
3	RWS3	0	R/W	Reception Warning interrupt Set 3 This bit supports interrupt enable. It controls set of **RIC1.RWE3**. This bit is always read as 0b. 0: No change of RIC1.RWE3 1: Set RIC1.RWE3 to 1b
2	RWS2	0	R/W	Reception Warning interrupt Set 2 This bit supports interrupt enable. It controls set of **RIC1.RWE2**. This bit is always read as 0b. 0: No change of RIC1.RWE2 1: Set RIC1.RWE2 to 1b
1	RWS1	0	R/W	Reception Warning interrupt Set 1 This bit supports interrupt enable. It controls set of **RIC1.RWE1**. This bit is always read as 0b. 0: No change of RIC1.RWE1 1: Set RIC1.RWE1 to 1b
0	RWS0	0	R/W	Reception Warning interrupt Set 0 This bit supports interrupt enable. It controls set of **RIC1.RWE0**. This bit is always read as 0b. 0: No change of RIC1.RWE0 1: Set RIC1.RWE0 to 1b

100.1.2.62 Reception Interrupt Disable register 1 (RID1)

The RID1 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RFWD	0	R/W	Rx-FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of **RIC1.RFWE**. This bit is always read as 0b. 0: No change of RIC1.RFWE 1: Set RIC1.RFWE to 0b
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWD17	0	R/W	Reception Warning interrupt Disable 17 This bit supports interrupt enable. It controls set of **RIC1.RWE17**. This bit is always read as 0b. 0: No change of RIC1.RWE17 1: Set RIC1.RWE17 to 0b
16	RWD16	0	R/W	Reception Warning interrupt Disable 16 This bit supports interrupt enable. It controls set of **RIC1.RWE16**. This bit is always read as 0b. 0: No change of RIC1.RWE16 1: Set RIC1.RWE16 to 0b
15	RWD15	0	R/W	Reception Warning interrupt Disable 15 This bit supports interrupt enable. It controls set of **RIC1.RWE15**. This bit is always read as 0b. 0: No change of RIC1.RWE15 1: Set RIC1.RWE15 to 0b
14	RWD14	0	R/W	Reception Warning interrupt Disable 14 This bit supports interrupt enable. It controls set of **RIC1.RWE14**. This bit is always read as 0b. 0: No change of RIC1.RWE14 1: Set RIC1.RWE14 to 0b

Bit	Bit Name	Initial Value	R/W	Description
13	RWD13	0	R/W	Reception Warning interrupt Disable 13 This bit supports interrupt enable. It controls set of **RIC1.RWE13**. This bit is always read as 0b. 0: No change of RIC1.RWE13 1: Set RIC1.RWE13 to 0b
12	RWD12	0	R/W	Reception Warning interrupt Disable 12 This bit supports interrupt enable. It controls set of **RIC1.RWE12**. This bit is always read as 0b. 0: No change of RIC1.RWE12 1: Set RIC1.RWE12 to 0b
11	RWD11	0	R/W	Reception Warning interrupt Disable 11 This bit supports interrupt enable. It controls set of **RIC1.RWE11**. This bit is always read as 0b. 0: No change of RIC1.RWE11 1: Set RIC1.RWE11 to 0b
10	RWD10	0	R/W	Reception Warning interrupt Disable 10 This bit supports interrupt enable. It controls set of **RIC1.RWE10**. This bit is always read as 0b. 0: No change of RIC1.RWE10 1: Set RIC1.RWE10 to 0b
9	RWD9	0	R/W	Reception Warning interrupt Disable 9 This bit supports interrupt enable. It controls set of **RIC1.RWE9**. This bit is always read as 0b. 0: No change of RIC1.RWE9 1: Set RIC1.RWE9 to 0b
8	RWD8	0	R/W	Reception Warning interrupt Disable 8 This bit supports interrupt enable. It controls set of **RIC1.RWE8**. This bit is always read as 0b. 0: No change of RIC1.RWE8 1: Set RIC1.RWE8 to 0b
7	RWD7	0	R/W	Reception Warning interrupt Disable 7 This bit supports interrupt enable. It controls set of **RIC1.RWE7**. This bit is always read as 0b. 0: No change of RIC1.RWE7 1: Set RIC1.RWE7 to 0b
6	RWD6	0	R/W	Reception Warning interrupt Disable 6 This bit supports interrupt enable. It controls set of **RIC1.RWE6**. This bit is always read as 0b. 0: No change of RIC1.RWE6 1: Set RIC1.RWE6 to 0b
5	RWD5	0	R/W	Reception Warning interrupt Disable 5 This bit supports interrupt enable. It controls set of **RIC1.RWE5**. This bit is always read as 0b. 0: No change of RIC1.RWE5 1: Set RIC1.RWE5 to 0b

Bit	Bit Name	Initial Value	R/W	Description
4	RWD4	0	R/W	Reception Warning interrupt Disable 4 This bit supports interrupt enable. It controls set of **RIC1.RWE4**. This bit is always read as 0b. 0: No change of RIC1.RWE4 1: Set RIC1.RWE4 to 0b
3	RWD3	0	R/W	Reception Warning interrupt Disable 3 This bit supports interrupt enable. It controls set of **RIC1.RWE3**. This bit is always read as 0b. 0: No change of RIC1.RWE3 1: Set RIC1.RWE3 to 0b
2	RWD2	0	R/W	Reception Warning interrupt Disable 2 This bit supports interrupt enable. It controls set of **RIC1.RWE2**. This bit is always read as 0b. 0: No change of RIC1.RWE2 1: Set RIC1.RWE2 to 0b
1	RWD1	0	R/W	Reception Warning interrupt Disable 1 This bit supports interrupt enable. It controls set of **RIC1.RWE1**. This bit is always read as 0b. 0: No change of RIC1.RWE1 1: Set RIC1.RWE1 to 0b
0	RWD0	0	R/W	Reception Warning interrupt Disable 0 This bit supports interrupt enable. It controls set of **RIC1.RWE0**. This bit is always read as 0b. 0: No change of RIC1.RWE0 1: Set RIC1.RWE0 to 0b

100.1.2.63 Reception Interrupt Enable register 2 (RIE2)

The RIE2 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFS	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS17	QFS16

Bit	Bit Name	Initial Value	R/W	Description
31	RFFS	0	R/W	Rx-FIFO Full interrupt Set This bit supports interrupt enable. It controls set of **RIC2.RFFE**. This bit is always read as 0b. 0: No change of RIC2.RFFE 1: Set RIC2.RFFE to 1b
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFS17	0	R/W	Queue Full interrupt Set 17 This bit supports interrupt enable. It controls set of **RIC2.QFE17**. This bit is always read as 0b. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 1b
16	QFS16	0	R/W	Queue Full interrupt Set 16 This bit supports interrupt enable. It controls set of **RIC2.QFE16**. This bit is always read as 0b. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 1b
15	QFS15	0	R/W	Queue Full interrupt Set 15 This bit supports interrupt enable. It controls set of **RIC2.QFE15**. This bit is always read as 0b. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 1b
14	QFS14	0	R/W	Queue Full interrupt Set 14 This bit supports interrupt enable. It controls set of **RIC2.QFE14**. This bit is always read as 0b. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 1b

Bit	Bit Name	Initial Value	R/W	Description
13	QFS13	0	R/W	Queue Full interrupt Set 13 This bit supports interrupt enable. It controls set of **RIC2.QFE13**. This bit is always read as 0b. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 1b
12	QFS12	0	R/W	Queue Full interrupt Set 12 This bit supports interrupt enable. It controls set of **RIC2.QFE12**. This bit is always read as 0b. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 1b
11	QFS11	0	R/W	Queue Full interrupt Set 11 This bit supports interrupt enable. It controls set of **RIC2.QFE11**. This bit is always read as 0b. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 1b
10	QFS10	0	R/W	Queue Full interrupt Set 10 This bit supports interrupt enable. It controls set of **RIC2.QFE10**. This bit is always read as 0b. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 1b
9	QFS9	0	R/W	Queue Full interrupt Set 9 This bit supports interrupt enable. It controls set of **RIC2.QFE9**. This bit is always read as 0b. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 1b
8	QFS8	0	R/W	Queue Full interrupt Set 8 This bit supports interrupt enable. It controls set of **RIC2.QFE8**. This bit is always read as 0b. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 1b
7	QFS7	0	R/W	Queue Full interrupt Set 7 This bit supports interrupt enable. It controls set of **RIC2.QFE7**. This bit is always read as 0b. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 1b
6	QFS6	0	R/W	Queue Full interrupt Set 6 This bit supports interrupt enable. It controls set of **RIC2.QFE6**. This bit is always read as 0b. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 1b
5	QFS5	0	R/W	Queue Full interrupt Set 5 This bit supports interrupt enable. It controls set of **RIC2.QFE5**. This bit is always read as 0b. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 1b

Bit	Bit Name	Initial Value	R/W	Description
4	QFS4	0	R/W	Queue Full interrupt Set 4 This bit supports interrupt enable. It controls set of **RIC2.QFE4**. This bit is always read as 0b. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 1b
3	QFS3	0	R/W	Queue Full interrupt Set 3 This bit supports interrupt enable. It controls set of **RIC2.QFE3**. This bit is always read as 0b. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 1b
2	QFS2	0	R/W	Queue Full interrupt Set 2 This bit supports interrupt enable. It controls set of **RIC2.QFE2**. This bit is always read as 0b. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 1b
1	QFS1	0	R/W	Queue Full interrupt Set 1 This bit supports interrupt enable. It controls set of **RIC2.QFE1**. This bit is always read as 0b. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 1b
0	QFS0	0	R/W	Queue Full interrupt Set 0 This bit supports interrupt enable. It controls set of **RIC2.QFE0**. This bit is always read as 0b. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 1b

100.1.2.64 Reception Interrupt Disable register 2 (RID2)

The RID2 register is used to control the Reception Interrupt.

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFD	0	R/W	Rx-FIFO Full interrupt Disable This bit supports interrupt enable. It controls set of **RIC2.RFFE**. This bit is always read as 0b. 0: No change of RIC2.RFFE 1: Set RIC2.RFFE to 0b
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFD17	0	R/W	Queue Full interrupt Disable 17 This bit supports interrupt enable. It controls set of **RIC2.QFE17**. This bit is always read as 0b. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 0b
16	QFD16	0	R/W	Queue Full interrupt Disable 16 This bit supports interrupt enable. It controls set of **RIC2.QFE16**. This bit is always read as 0b. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 0b
15	QFD15	0	R/W	Queue Full interrupt Disable 15 This bit supports interrupt enable. It controls set of **RIC2.QFE15**. This bit is always read as 0b. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 0b
14	QFD14	0	R/W	Queue Full interrupt Disable 14 This bit supports interrupt enable. It controls set of **RIC2.QFE14**. This bit is always read as 0b. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 0b

Bit	Bit Name	Initial Value	R/W	Description
13	QFD13	0	R/W	Queue Full interrupt Disable 13 This bit supports interrupt enable. It controls set of **RIC2.QFE13**. This bit is always read as 0b. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 0b
12	QFD12	0	R/W	Queue Full interrupt Disable 12 This bit supports interrupt enable. It controls set of **RIC2.QFE12**. This bit is always read as 0b. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 0b
11	QFD11	0	R/W	Queue Full interrupt Disable 11 This bit supports interrupt enable. It controls set of **RIC2.QFE11**. This bit is always read as 0b. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 0b
10	QFD10	0	R/W	Queue Full interrupt Disable 10 This bit supports interrupt enable. It controls set of **RIC2.QFE10**. This bit is always read as 0b. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 0b
9	QFD9	0	R/W	Queue Full interrupt Disable 9 This bit supports interrupt enable. It controls set of **RIC2.QFE9**. This bit is always read as 0b. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 0b
8	QFD8	0	R/W	Queue Full interrupt Disable 8 This bit supports interrupt enable. It controls set of **RIC2.QFE8**. This bit is always read as 0b. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 0b
7	QFD7	0	R/W	Queue Full interrupt Disable 7 This bit supports interrupt enable. It controls set of **RIC2.QFE7**. This bit is always read as 0b. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 0b
6	QFD6	0	R/W	Queue Full interrupt Disable 6 This bit supports interrupt enable. It controls set of **RIC2.QFE6**. This bit is always read as 0b. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 0b
5	QFD5	0	R/W	Queue Full interrupt Disable 5 This bit supports interrupt enable. It controls set of **RIC2.QFE5**. This bit is always read as 0b. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 0b

Bit	Bit Name	Initial Value	R/W	Description
4	QFD4	0	R/W	Queue Full interrupt Disable 4 This bit supports interrupt enable. It controls set of **RIC2.QFE4**. This bit is always read as 0b. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 0b
3	QFD3	0	R/W	Queue Full interrupt Disable 3 This bit supports interrupt enable. It controls set of **RIC2.QFE3**. This bit is always read as 0b. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 0b
2	QFD2	0	R/W	Queue Full interrupt Disable 2 This bit supports interrupt enable. It controls set of **RIC2.QFE2**. This bit is always read as 0b. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 0b
1	QFD1	0	R/W	Queue Full interrupt Disable 1 This bit supports interrupt enable. It controls set of **RIC2.QFE1**. This bit is always read as 0b. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 0b
0	QFD0	0	R/W	Queue Full interrupt Disable 0 This bit supports interrupt enable. It controls set of **RIC2.QFE0**. This bit is always read as 0b. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 0b

100.1.2.65 Transmission Interrupt Enable register (TIE)

The TIE register is used to control the Transmission Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TDPS3	TDPS2	TDPS1	TDPS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFWS	MFUS	TFWS	TFUS	—	—	—	—	FTS3	FTS2	FTS1	FTS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPS3	0	R/W	Transmit Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of **TIC.TDPE3**. This bit is always read as 0b. 0: No change of TIC.TDPE3 1: Set TIC.TDPE3 to 1b
18	TDPS2	0	R/W	Transmit Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of **TIC.TDPE2**. This bit is always read as 0b. 0: No change of TIC.TDPE2 1: Set TIC.TDPE2 to 1b
17	TDPS1	0	R/W	Transmit Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of **TIC.TDPE1**. This bit is always read as 0b. 0: No change of TIC.TDPE1 1: Set TIC.TDPE1 to 1b
16	TDPS0	0	R/W	Transmit Descriptor Processed interrupt Set 0 This bit supports interrupt enable. It controls set of **TIC.TDPE0**. This bit is always read as 0b. 0: No change of TIC.TDPE0 1: Set TIC.TDPE0 to 1b
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWS	0	R/W	E-MAC status FIFO Warning interrupt Set This bit supports interrupt enable. It controls set of **TIC.MFWE**. This bit is always read as 0b. 0: No change of TIC.MFWE 1: Set TIC.MFWE to 1b

Bit	Bit Name	Initial Value	R/W	Description
10	MFUS	0	R/W	E-MAC status FIFO Updated interrupt Set This bit supports interrupt enable. It controls set of **TIC.MFUE**. This bit is always read as 0b. 0: No change of TIC.MFUE 1: Set TIC.MFUE to 1b
9	TFWS	0	R/W	Timestamp FIFO Warning interrupt Set This bit supports interrupt enable. It controls set of **TIC.TFWE**. This bit is always read as 0b. 0: No change of TIC.TFWE 1: Set TIC.TFWE to 1b
8	TFUS	0	R/W	Timestamp FIFO Updated interrupt Set This bit supports interrupt enable. It controls set of **TIC.TFUE**. This bit is always read as 0b. 0: No change of TIC.TFUE 1: Set TIC.TFUE to 1b
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTS3	0	R/W	Frame Transmitted interrupt Set 3 This bit supports interrupt enable. It controls set of **TIC.FTE3**. This bit is always read as 0b. 0: No change of TIC.FTE3 1: Set TIC.FTE3 to 1b
2	FTS2	0	R/W	Frame Transmitted interrupt Set 2 This bit supports interrupt enable. It controls set of **TIC.FTE2**. This bit is always read as 0b. 0: No change of TIC.FTE2 1: Set TIC.FTE2 to 1b
1	FTS1	0	R/W	Frame Transmitted interrupt Set 1 This bit supports interrupt enable. It controls set of **TIC.FTE1**. This bit is always read as 0b. 0: No change of TIC.FTE1 1: Set TIC.FTE1 to 1b
0	FTS0	0	R/W	Frame Transmitted interrupt Set 0 This bit supports interrupt enable. It controls set of **TIC.FTE0**. This bit is always read as 0b. 0: No change of TIC.FTE0 1: Set TIC.FTE0 to 1b

100.1.2.66 Transmission Interrupt Disable register (TID)

The TID register is used to control the Transmission Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TDPD3	TDPD2	TDPD1	TDPD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFWD	MFUD	TFWD	TFUD	—	—	—	—	FTD3	FTD2	FTD1	FTD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPD3	All 0	R/W	Transmit Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of **TIC.TDPE3**. This bit is always read as 0b. 0: No change of TIC.TDPE3 1: Set TIC.TDPE3 to 0b
18	TDPD2	All 0	R/W	Transmit Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of **TIC.TDPE2**. This bit is always read as 0b. 0: No change of TIC.TDPE2 1: Set TIC.TDPE2 to 0b
17	TDPD1	All 0	R/W	Transmit Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of **TIC.TDPE1**. This bit is always read as 0b. 0: No change of TIC.TDPE1 1: Set TIC.TDPE1 to 0b
16	TDPD0	All 0	R/W	Transmit Descriptor Processed interrupt Disable 0 This bit supports interrupt enable. It controls set of **TIC.TDPE0**. This bit is always read as 0b. 0: No change of TIC.TDPE0 1: Set TIC.TDPE0 to 0b
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWD	0	R/W	E-MAC status FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of **TIC.MFWE**. This bit is always read as 0b. 0: No change of TIC.MFWE 1: Set TIC.MFWE to 0b

Bit	Bit Name	Initial Value	R/W	Description
10	MFUD	0	R/W	E-MAC status FIFO Updated interrupt Disable This bit supports interrupt enable. It controls set of **TIC.MFUE**. This bit is always read as 0b. 0: No change of TIC.MFUE 1: Set TIC.MFUE to 0b
9	TFWD	0	R/W	Timestamp FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of **TIC.TFWE**. This bit is always read as 0b. 0: No change of TIC.TFWE 1: Set TIC.TFWE to 0b
8	TFUD	0	R/W	Timestamp FIFO Updated interrupt Disable This bit supports interrupt enable. It controls set of **TIC.TFUE**. This bit is always read as 0b. 0: No change of TIC.TFUE 1: Set TIC.TFUE to 0b
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTD3	0	R/W	Frame Transmitted interrupt Disable 3 This bit supports interrupt enable. It controls set of **TIC.FTE3**. This bit is always read as 0b. 0: No change of TIC.FTE3 1: Set TIC.FTE3 to 0b
2	FTD2	0	R/W	Frame Transmitted interrupt Disable 2 This bit supports interrupt enable. It controls set of **TIC.FTE2**. This bit is always read as 0b. 0: No change of TIC.FTE2 1: Set TIC.FTE2 to 0b
1	FTD1	0	R/W	Frame Transmitted interrupt Disable 1 This bit supports interrupt enable. It controls set of **TIC.FTE1**. This bit is always read as 0b. 0: No change of TIC.FTE1 1: Set TIC.FTE1 to 0b
0	FTD0	0	R/W	Frame Transmitted interrupt Disable 0 This bit supports interrupt enable. It controls set of **TIC.FTE0**. This bit is always read as 0b. 0: No change of TIC.FTE0 1: Set TIC.FTE0 to 0b

100.1.2.67 Reception Interrupt Enable register 3 (RIE3)

The RIE3 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPS17	RDPS16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDPS15	RDPS14	RDPS13	RDPS12	RDPS11	RDPS10	RDPS9	RDPS8	RDPS7	RDPS6	RDPS5	RDPS4	RDPS3	RDPS2	RDPS1	RDPS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPS17	0	R/W	Receive Descriptor Processed interrupt Set 17 This bit supports interrupt enable. It controls set of **RIC3.RDPE17**. This bit is always read as 0b. 0: No change of RIC3.RDPE17 1: Set RIC3.RDPE17 to 1b
16	RDPS16	0	R/W	Receive Descriptor Processed interrupt Set 16 This bit supports interrupt enable. It controls set of **RIC3.RDPE16**. This bit is always read as 0b. 0: No change of RIC3.RDPE16 1: Set RIC3.RDPE16 to 1b
15	RDPS15	0	R/W	Receive Descriptor Processed interrupt Set 15 This bit supports interrupt enable. It controls set of **RIC3.RDPE15**. This bit is always read as 0b. 0: No change of RIC3.RDPE15 1: Set RIC3.RDPE15 to 1b
14	RDPS14	0	R/W	Receive Descriptor Processed interrupt Set 14 This bit supports interrupt enable. It controls set of **RIC3.RDPE14**. This bit is always read as 0b. 0: No change of RIC3.RDPE14 1: Set RIC3.RDPE14 to 1b
13	RDPS13	0	R/W	Receive Descriptor Processed interrupt Set 13 This bit supports interrupt enable. It controls set of **RIC3.RDPE13**. This bit is always read as 0b. 0: No change of RIC3.RDPE13 1: Set RIC3.RDPE13 to 1b

Bit	Bit Name	Initial Value	R/W	Description
12	RDPS12	0	R/W	Receive Descriptor Processed interrupt Set 12 This bit supports interrupt enable. It controls set of **RIC3.RDPE12**. This bit is always read as 0b. 0: No change of RIC3.RDPE12 1: Set RIC3.RDPE12 to 1b
11	RDPS11	0	R/W	Receive Descriptor Processed interrupt Set 11 This bit supports interrupt enable. It controls set of **RIC3.RDPE11**. This bit is always read as 0b. 0: No change of RIC3.RDPE11 1: Set RIC3.RDPE11 to 1b
10	RDPS10	0	R/W	Receive Descriptor Processed interrupt Set 10 This bit supports interrupt enable. It controls set of **RIC3.RDPE10**. This bit is always read as 0b. 0: No change of RIC3.RDPE10 1: Set RIC3.RDPE10 to 1b
9	RDPS9	0	R/W	Receive Descriptor Processed interrupt Set 9 This bit supports interrupt enable. It controls set of **RIC3.RDPE9**. This bit is always read as 0b. 0: No change of RIC3.RDPE9 1: Set RIC3.RDPE9 to 1b
8	RDPS8	0	R/W	Receive Descriptor Processed interrupt Set 8 This bit supports interrupt enable. It controls set of **RIC3.RDPE8**. This bit is always read as 0b. 0: No change of RIC3.RDPE8 1: Set RIC3.RDPE8 to 1b
7	RDPS7	0	R/W	Receive Descriptor Processed interrupt Set 7 This bit supports interrupt enable. It controls set of **RIC3.RDPE7**. This bit is always read as 0b. 0: No change of RIC3.RDPE7 1: Set RIC3.RDPE7 to 1b
6	RDPS6	0	R/W	Receive Descriptor Processed interrupt Set 6 This bit supports interrupt enable. It controls set of **RIC3.RDPE6**. This bit is always read as 0b. 0: No change of RIC3.RDPE6 1: Set RIC3.RDPE6 to 1b
5	RDPS5	0	R/W	Receive Descriptor Processed interrupt Set 5 This bit supports interrupt enable. It controls set of **RIC3.RDPE5**. This bit is always read as 0b. 0: No change of RIC3.RDPE5 1: Set RIC3.RDPE5 to 1b
4	RDPS4	0	R/W	Receive Descriptor Processed interrupt Set 4 This bit supports interrupt enable. It controls set of **RIC3.RDPE4**. This bit is always read as 0b. 0: No change of RIC3.RDPE4 1: Set RIC3.RDPE4 to 1b

Bit	Bit Name	Initial Value	R/W	Description
3	RDPS3	0	R/W	Receive Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of **RIC3.RDPE3**. This bit is always read as 0b. 0: No change of RIC3.RDPE3 1: Set RIC3.RDPE3 to 1b
2	RDPS2	0	R/W	Receive Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of **RIC3.RDPE2**. This bit is always read as 0b. 0: No change of RIC3.RDPE2 1: Set RIC3.RDPE2 to 1b
1	RDPS1	0	R/W	Receive Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of **RIC3.RDPE1**. This bit is always read as 0b. 0: No change of RIC3.RDPE1 1: Set RIC3.RDPE1 to 1b
0	RDPS0	0	R/W	Receive Descriptor Processed interrupt Set 0 This bit supports interrupt enable. It controls set of **RIC3.RDPE0**. This bit is always read as 0b. 0: No change of RIC3.RDPE0 1: Set RIC3.RDPE0 to 1b

100.1.2.68 Reception Interrupt Disable register 3 (RID3)

The RID3 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPD17	RDPD16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDPD15	RDPD14	RDPD13	RDPD12	RDPD11	RDPD10	RDPD9	RDPD8	RDPD7	RDPD6	RDPD5	RDPD4	RDPD3	RDPD2	RDPD1	RDPD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPD17	0	R/W	Receive Descriptor Processed interrupt Disable 17 This bit supports interrupt enable. It controls set of **RIC3.RDPE17**. This bit is always read as 0b. 0: No change of RIC3.RDPE17 1: Set RIC3.RDPE17 to 0b
16	RDPD16	0	R/W	Receive Descriptor Processed interrupt Disable 16 This bit supports interrupt enable. It controls set of **RIC3.RDPE16**. This bit is always read as 0b. 0: No change of RIC3.RDPE16 1: Set RIC3.RDPE16 to 0b
15	RDPD15	0	R/W	Receive Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of **RIC3.RDPE15**. This bit is always read as 0b. 0: No change of RIC3.RDPE15 1: Set RIC3.RDPE15 to 0b
14	RDPD14	0	R/W	Receive Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of **RIC3.RDPE14**. This bit is always read as 0b. 0: No change of RIC3.RDPE14 1: Set RIC3.RDPE14 to 0b
13	RDPD13	0	R/W	Receive Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of **RIC3.RDPE13**. This bit is always read as 0b. 0: No change of RIC3.RDPE13 1: Set RIC3.RDPE13 to 0b

Bit	Bit Name	Initial Value	R/W	Description
12	RDPD12	0	R/W	Receive Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of **RIC3.RDPE12**. This bit is always read as 0b. 0: No change of RIC3.RDPE12 1: Set RIC3.RDPE12 to 0b
11	RDPD11	0	R/W	Receive Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of **RIC3.RDPE11**. This bit is always read as 0b. 0: No change of RIC3.RDPE11 1: Set RIC3.RDPE11 to 0b
10	RDPD10	0	R/W	Receive Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of **RIC3.RDPE10**. This bit is always read as 0b. 0: No change of RIC3.RDPE10 1: Set RIC3.RDPE10 to 0b
9	RDPD9	0	R/W	Receive Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of **RIC3.RDPE9**. This bit is always read as 0b. 0: No change of RIC3.RDPE9 1: Set RIC3.RDPE9 to 0b
8	RDPD8	0	R/W	Receive Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of **RIC3.RDPE8**. This bit is always read as 0b. 0: No change of RIC3.RDPE8 1: Set RIC3.RDPE8 to 0b
7	RDPD7	0	R/W	Receive Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of **RIC3.RDPE7**. This bit is always read as 0b. 0: No change of RIC3.RDPE7 1: Set RIC3.RDPE7 to 0b
6	RDPD6	0	R/W	Receive Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of **RIC3.RDPE6**. This bit is always read as 0b. 0: No change of RIC3.RDPE6 1: Set RIC3.RDPE6 to 0b
5	RDPD5	0	R/W	Receive Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of **RIC3.RDPE5**. This bit is always read as 0b. 0: No change of RIC3.RDPE5 1: Set RIC3.RDPE5 to 0b
4	RDPD4	0	R/W	Receive Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of **RIC3.RDPE4**. This bit is always read as 0b. 0: No change of RIC3.RDPE4 1: Set RIC3.RDPE4 to 0b

Bit	Bit Name	Initial Value	R/W	Description
3	RDPD3	0	R/W	Receive Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of **RIC3.RDPE3**. This bit is always read as 0b. 0: No change of RIC3.RDPE3 1: Set RIC3.RDPE3 to 0b
2	RDPD2	0	R/W	Receive Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of **RIC3.RDPE2**. This bit is always read as 0b. 0: No change of RIC3.RDPE2 1: Set RIC3.RDPE2 to 0b
1	RDPD1	0	R/W	Receive Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of **RIC3.RDPE1**. This bit is always read as 0b. 0: No change of RIC3.RDPE1 1: Set RIC3.RDPE1 to 0b
0	RDPD0	0	R/W	Receive Descriptor Processed interrupt Disable 0 This bit supports interrupt enable. It controls set of **RIC3.RDPE0**. This bit is always read as 0b. 0: No change of RIC3.RDPE0 1: Set RIC3.RDPE0 to 0b

100.1.2.69 E-MAC Mode Register (ECMR)

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	TZPF	PFR	RXF	TXF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MPDE	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

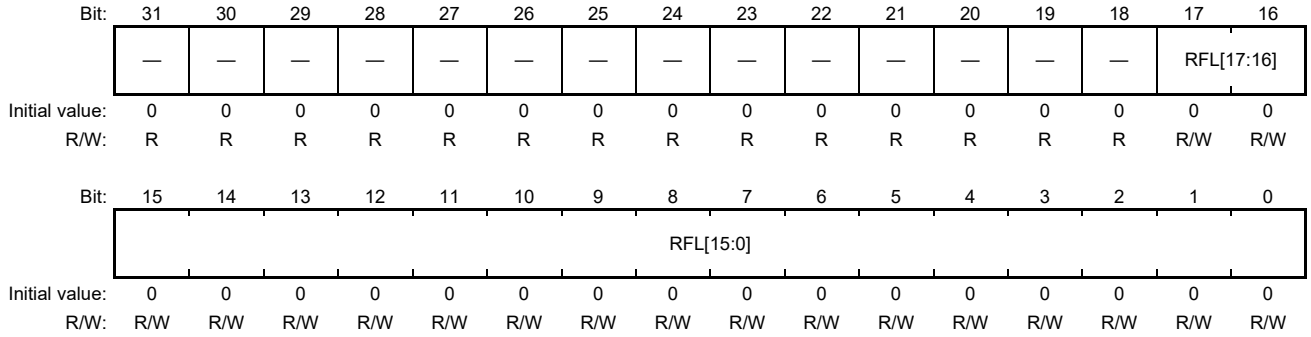
Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
26	TRCCM	0	R/W	Counter Clear Mode This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers. 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
25, 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23	RCSC	0	R/W	Checksum Calculation Setting this bit to 1 enables automatic calculation of checksums for data in received frames. Only the data field of an Ethernet frame without a VLAN field is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion. 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
22	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
21	DPAD	0	R/W	Data Padding This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted. When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission. 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
20	RZPF	0	R/W	PAUSE Frame Reception with Time = 0 When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded. When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0. 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
19	TZPF	0	R/W	Transmit Zero PAUSE Frame When setting CCC.FCE=1, and Rx FIFO become Warning Level. 0: Not transmit the PAUSE frame of TIME parameter value 0. 1: Transmit the PAUSE frame of TIME parameter value 0.
18	PFR	0	R/W	PAUSE Frame Receive Mode This bit specifies whether PAUSE frames are transferred to the AVB-DMAC. 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
17	RXF	0	R/W	Operating Mode for Flow Control in Reception When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 100.1.2.95 PAUSE Frame Receive Counter (PFRCR). Setting this bit to 0 disables PAUSE frame detection. 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.
16	TXF	0	R/W	Transmit Flow control mode 0: Flow control for the transmitting port is disabled. 1: Flow control for the transmitting port is enabled.
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	MPDE	0	R/W	Magic Packet™ Detection Enable The MPDE bit enables or disables Magic Packet™ detection by hardware to allow activation via the Ethernet connection. 0: Magic Packet™ detection is not enabled. 1: Magic Packet™ detection is enabled.

Bit	Bit Name	Initial Value	R/W	Description
8, 7	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
6	RE	0	R/W	Reception Enable If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of the frame is completed. 0: Reception is disabled. 1: Reception is enabled.
5	TE	0	R/W	Transmission Enable If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed. 0: Transmission is disabled. 1: Transmission is enabled.
4 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
1	DM	0	R/W	Duplex Mode This bit should always be set to 1. The value after reset is 0. 0: Value after reset 1: Full-duplex operation This bit should always be set to 1.
0	PRM	0	R/W	Promiscuous Mode Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames mean all receivable frames, irrespective of differences of destination address (exclude PAUSE frame). 0: Normal operation 1: Promiscuous mode operation

100.1.2.70 Receive Frame Length Register (RFLR)

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (ECMR) is 1).



Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17 to 0	RFL[17:0]	H'0 0000	R/W	Receive Frame Length Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value and more 8 byte length is discarded. CAUTION: The prepared descriptor data size is just the specified value (RFLR.RFL). Therefore descriptor data size must be more than RFLR.RFL + 8 if you will receive such the long frame. H'0 0000 to H'0 05EE: 1,518 bytes H'0 05EF: 1,519 bytes H'0 05F0: 1,520 bytes : : H'0 07FF: 2,047 bytes H'0 0800: 2,048 bytes : : H'0 1000: 4,096 bytes : : H'1 0000: 65,535 bytes : : H'2 0000 to H'3 FFFF: 131,072 bytes

100.1.2.71 E-MAC Status Register (ECSR)

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 100.1.2.88.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFRI	PHYI	LCHNG	MPD	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
4	PFRI	0	R/W	PAUSE Frame Retry Interrupt This bit indicate that reached to the number of PAUSE frame retransmission for register PFTTLR setting. Procedure for 0-clear to this bit is follows. 0: Read the PFTTCR register to clear the PFTTCR register. 1: Write to this bit 1.
3	PHYI	0	R	PHY interrupt terminal state bit This bit indicates the state of input to the PHY interrupt pin (AVB_PHY_INT) from the PHY-LSI. 0: PHY interrupt terminal (AVB_PHY_INT) is not asserted. 1: PHY interrupt terminal (AVB_PHY_INT) is asserted.
2	LCHNG	0	R/W	Link signal change bit This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high. However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected. To check the current link state, refer to the link status pin state bit in the PHY status register (PSR.LMON). 0: The change of Link status signal (AVB_LINK) is not detected. 1: The change of Link status signal (AVB_LINK) is detected.
1	MPD	0	R/W	Magic Packet™ Detection This bit indicates that a Magic Packet™ has been detected on the line. Writing 1 to this bit clears it to 0. 0: A Magic Packet™ has not been detected. 1: A Magic Packet™ has been detected.

Bit	Bit Name	Initial Value	R/W	Description
0	ICD	0	R/W	Illegal Carrier Detection This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. Writing 1 to this bit clears it to 0. 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

100.1.2.72 E-MAC Interrupt Permission Register (ECSIPR)

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
4	PFRIM	0	R/W	PAUSE Frame Retry Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PAUSE Frame Retry Interrupt bit (ECSR. PFRI) in the E-MAC status register to 1. 0: Interrupts on setting of the PFRI bit is disabled. 1: Interrupts on setting of the PFRI bit is enabled.
3	PHYIM	0	R/W	PHY Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PHY interrupt terminal state bit (ECSR. PHYI) in the E-MAC status register to 1. 0: Interrupts on setting of the PHYI bit is disabled. 1: Interrupts on setting of the PHYI bit is enabled.
2	LINKIM	0	R/W	LINK Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the Link signal change bit (ECSR. LCHNG) in the E-MAC status register to 1. 0: Interrupts on setting of the LCHNG bit is disabled. 1: Interrupts on setting of the LCHNG bit is enabled.
1	MPDIP	0	R/W	Magic Packet™ Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the Magic PacketTM detection bit (ECSR.MPD) in the E-MAC status register to 1. 0: Interrupts on setting of the MPD bit is disabled. 1: Interrupts on setting of the MPD bit is enabled.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1. 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled. Not support for 1000Mbps mode.

100.1.2.73 PHY Interface Register (PIR)

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3	MDI	—	R	MII Management Data-In This bit indicates the level of the AVB_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out This bit holds data for output from the AVB_MDIO pin. The AVB_MDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).
1	MMD	0	R/W	MII Management Mode This bit specifies the direction for data through MDIO (reading or writing). 0: Read direction is specified. 1: Write direction is specified.
0	MDC	0	R/W	MII Management Data Clock Values set in this bit are output on the AVB_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 100.1.3.13 Connection to PHY-LSI.

100.1.2.74 PHY Status Register (PSR)

The PSR register is a read-only register that can read interface signals from the PHY-LSI.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LMON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0.
0	LMON	0	R	Link Status Pin State The Link state can be read by connecting the Link signal output from the PHY-LSI to the link status pin (AVB_LNK) pin. For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: The link status signal (AVB_LNK) is at the low level. 1: The link status signal (AVB_LNK) is at the high level.

100.1.2.75 PHY_INT Polarity Register (PIPR)

The PIPR register is used to set the active sense of the AVB_PHY-INT pin.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

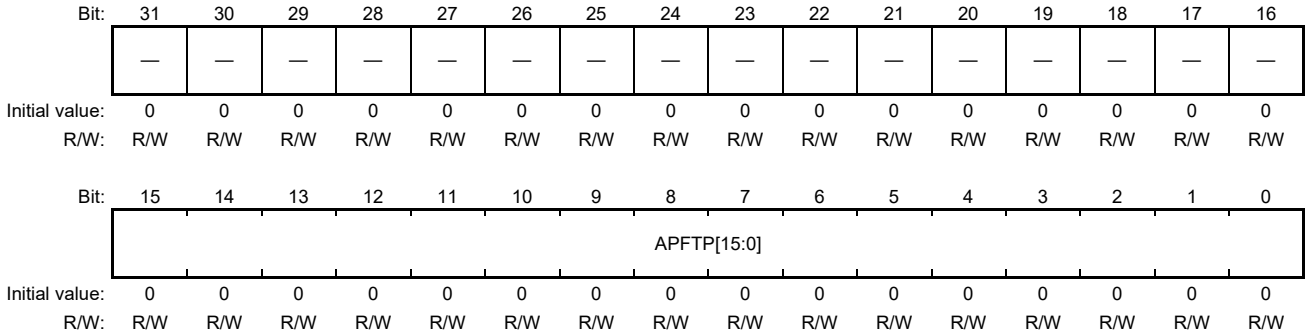
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PHYIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	PHYIP	0	R/W	PHY Interrupt Input Pin Polarity This bit sets the active sense of the PHY interrupt pin (AVB_PHY-INT). For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: PHY interrupt pin (AVB_PHY-INT) is active low (the low level triggers the interrupt state) 1: PHY interrupt pin (AVB_PHY-INT) is active high (the high level triggers the interrupt state)

100.1.2.76 Automatic PAUSE frame register (APR)

The APR register is used to set the value for the TIME parameter of auto generated PAUSE frames.

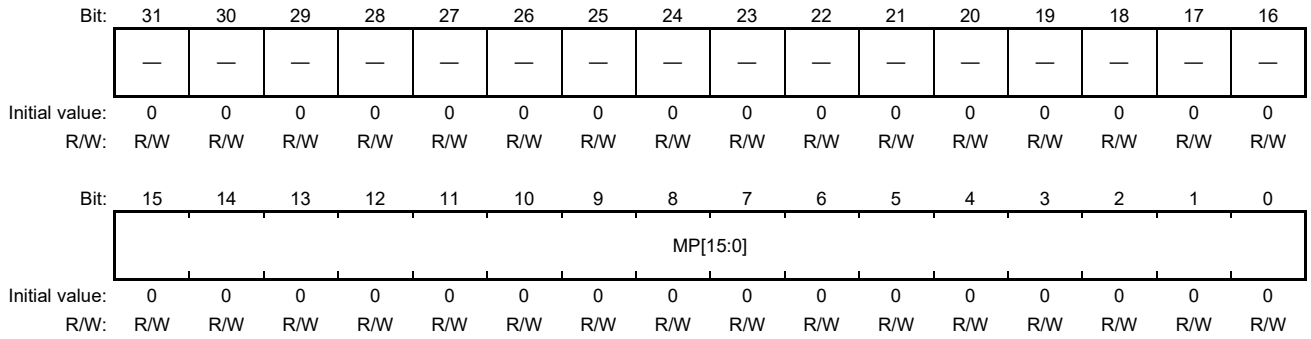
When ECMR.TXF=b'1, the value shouldn’t set all 0 in this register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	APFTP[15:0]	H'0000	R/W	Auto Pause Frame Time Parameter When a PAUSE frame is auto transmitted, the value set in this register is used as its TIME parameter. H'0000: — H'0001: 1 × 512 bit time H'0002: 2 × 512 bit time : : H'FFFF: 65535 × 512 bit time A bit time changes relative to the transfer speed as follows. 1000 Mbps:1 bit time = 1 ns 100 Mbps: 1 bit time = 10 ns

100.1.2.77 Manual PAUSE Frame Register (MPR)

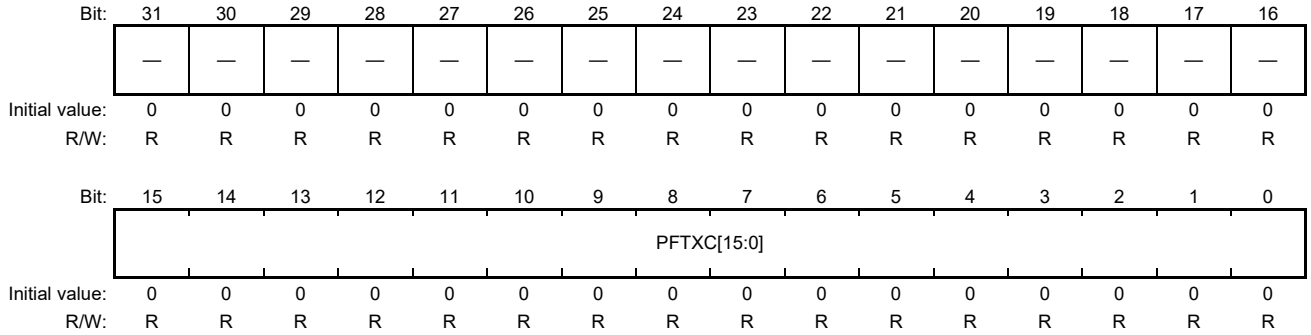
The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MP[15:0]	H'0000	R/W	Manual PAUSE These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit time. These bits set the TIME parameter value of a manual PAUSE frame. H'0000: — H'0001: 1 × 512 bit time H'0002: 2 × 512 bit time : : H'FFFF: 65535 × 512 bit time A bit time changes relative to the transfer speed as follows. 1000 Mbps:1 bit time = 1 ns 100 Mbps: 1 bit time = 10 ns

100.1.2.78 PAUSE Frame Transmit Counter (PFTCR)

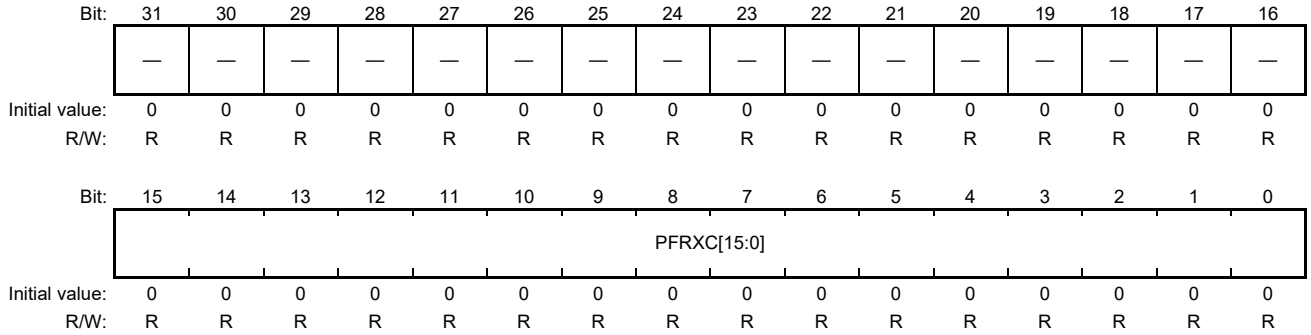
The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFTXC[15:0]	H'0000	R	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames The bits are cleared to 0 when they are read. If counting up and clearing of the counter coincide, clearing the counter takes priority.

100.1.2.79 PAUSE Frame Receive Counter (PFRCR)

The PFRCR register is a counter that indicates the number of times PAUSE frames have been received.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRXC[15:0]	H'0000	R	PAUSE Frame Receive Counter These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1). The bits are cleared to 0 when they are read. If counting up and clearing the counter coincide, clearing the counter takes priority.

100.1.2.80 Automatic PAUSE frame retransmit count register (TPAUSER)

The TPAUSER register is used to set the value for upper limit number of auto generated PAUSE frames.

The setting in this register must not be changed while transmission is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

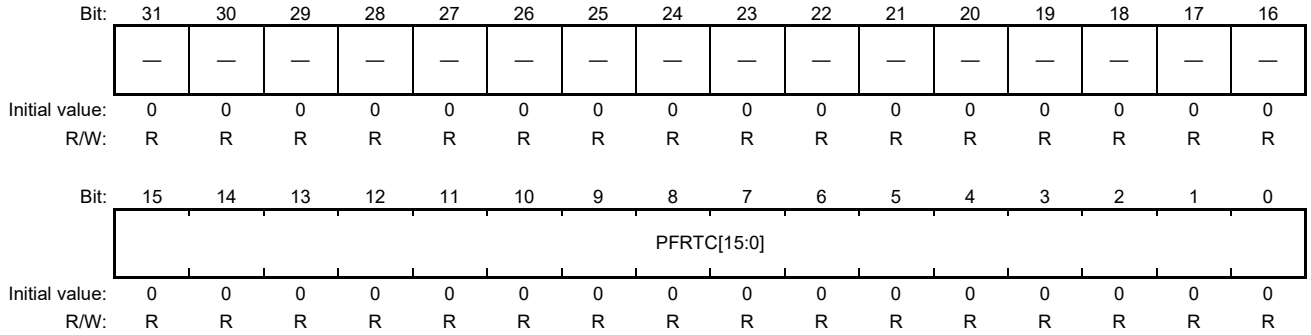
	PFRTULMT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRTULMT[15:0]	H'0000	R/W	Pause Frame Retry Upper LiMiT These bit's set the value for upper limit time of auto generated PAUSE frames while Receive FIFO caution. H'0000: unlimited H'0001: 1 time H'0002: 2 times : : H'FFFF: 65535 times

100.1.2.81 PAUSE frame transmit times counter (PFTTCR)

The PFTTCR register is a counter that indicates the number of times auto PAUSE frames have been transmit.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRTC[15:0]	H'0000	R	Pause Frame Retry Counter These bits indicate the number of auto PAUSE frames that have been transmit while Receive FIFO caution. The bits are cleared to 0 when they are read and Receive FIFO caution start.

100.1.2.82 E-MAC Mode Register 2 (GECMR)

The GECMR register specifies the operating mode for the E-MAC.

The setting in the GECMR register must not be changed while transmission or reception is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

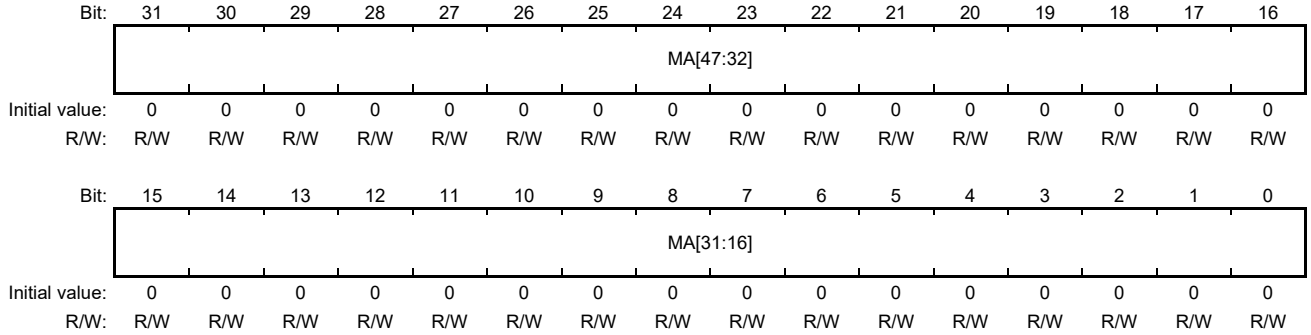
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEED
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	SPEED	0	R/W	Transfer Speed Setting This bit sets the transfer rate. 0: Transfer is at 100 Mbps. 1: Transfer is at 1000 Mbps.

100.1.2.83 E-MAC Address High Register (MAHR)

The MAHR register specifies the 32 higher-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

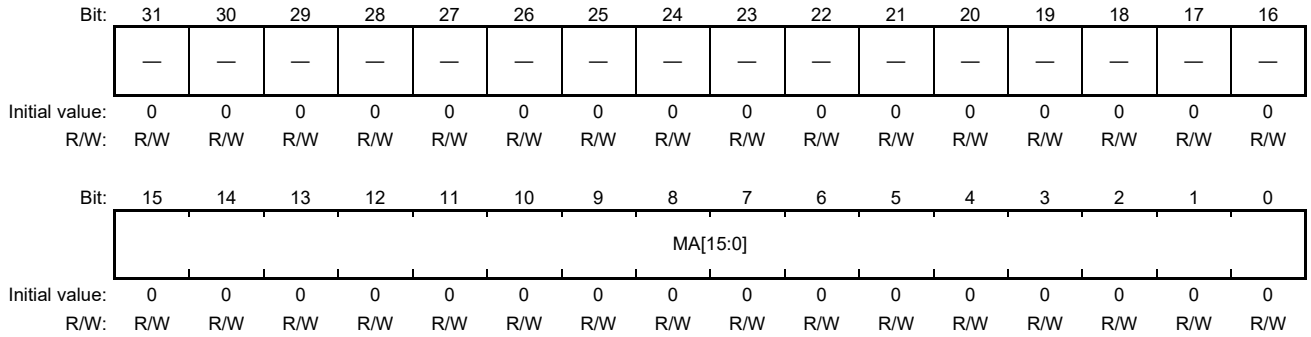


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	H'0000 0000	R/W	E-MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

100.1.2.84 E-MAC Address Low Register (MALR)

The MALR register specifies the 16 lower-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

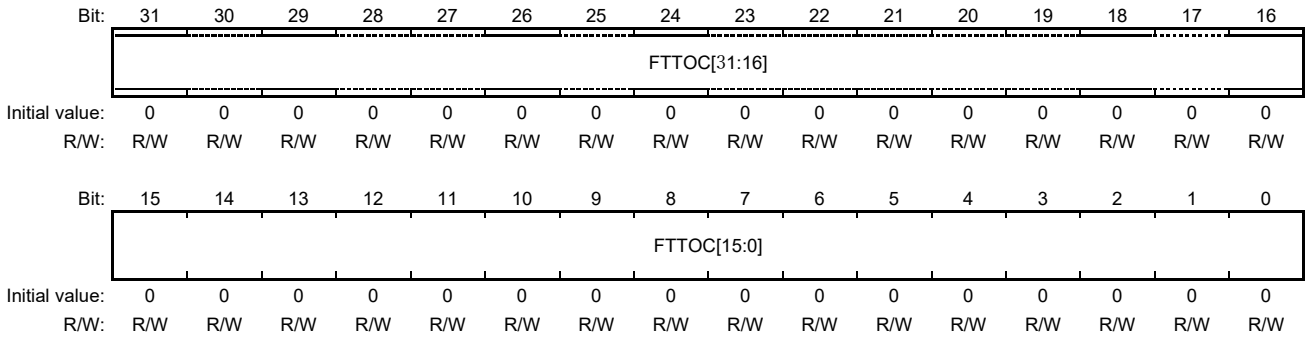
The settings in this register must not be changed while transmission or reception is enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MA[15:0]	H'0000	R/W	E-MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

100.1.2.85 Transmit retry over counter register (TROCR)

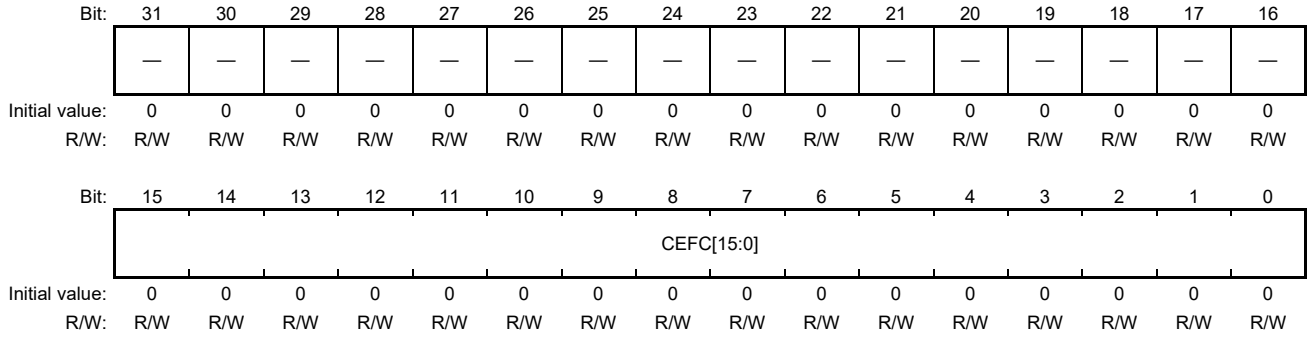
The TROCR register is a counter that indicates the number of times frames with time-out were transmit. Counting up stops when the value in this register reaches H'FFFF FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FTTOC [31:0]	H'0000 0000	R/W	Frame transmit time-out counter These bits indicate the number of transmit frames having time-out. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.86 CRC Error Frame Receive Counter Register (CEFCR)

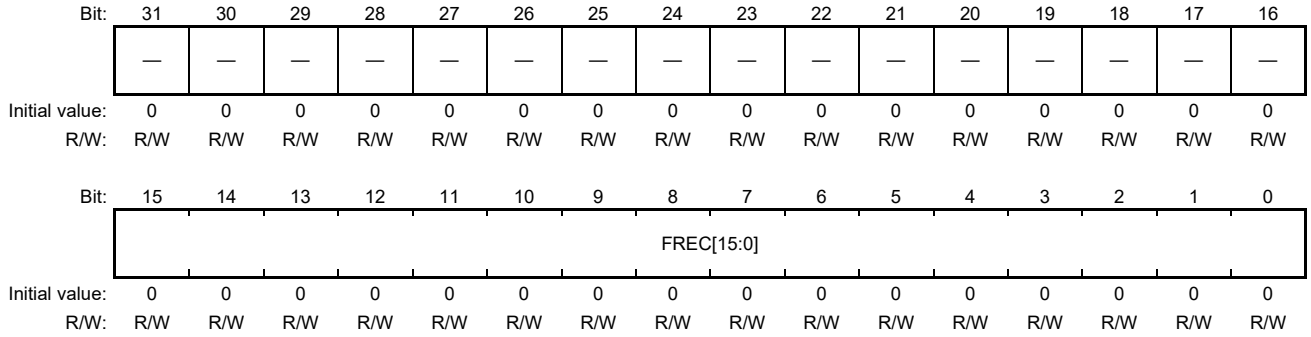
The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	CEFC[15:0]	H'0000	R/W	CRC Error Frame Counter These bits indicate the number of received frames having CRC errors. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.87 Frame Receive Error Counter Register (FRECR)

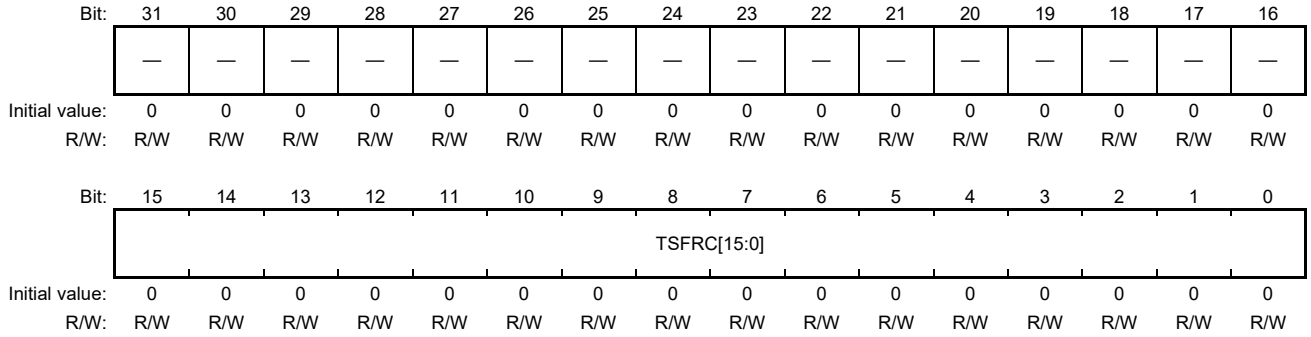
The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the RX_ER from the PHY-LSI. Counting up stops when the value in this register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	FREC[15:0]	H'0000	R/W	Frame Receive Error Counter These bits indicate the number of errors during frame reception. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.88 Too-Short Frame Receive Counter Register (TSFRCR)

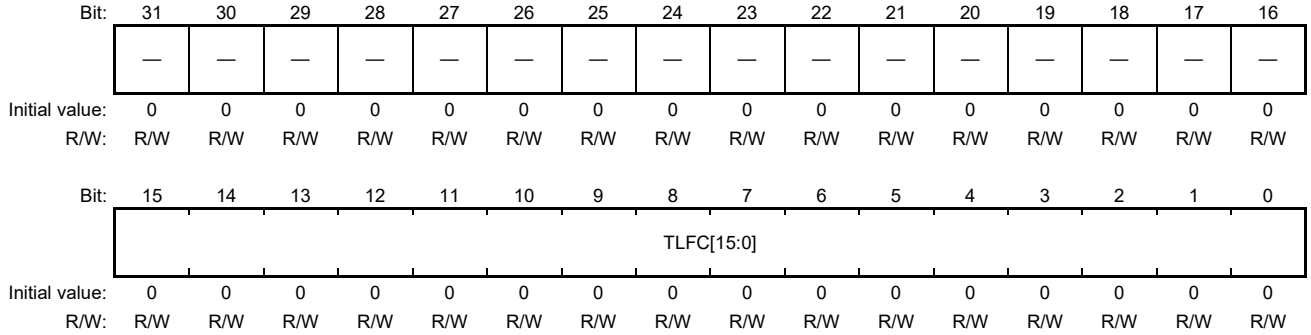
The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TSFRC[15:0]	H'0000	R/W	Too-Short Frame Receive Counter These bits indicate the number of received frames that were fewer than 64 bytes in length. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.89 Too-Long Frame Receive Counter Register (TLFRCR)

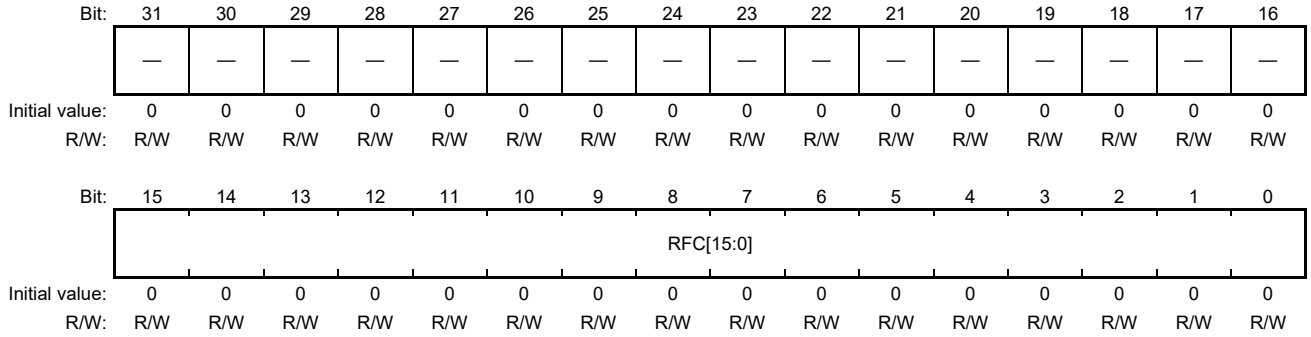
The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TLFC[15:0]	H'0000	R/W	Too-Long Frame Receive Counter These bits indicate the number of received frames that were longer than the value in RFLR. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.90 Residual-Bit Frame Receive Counter Register (RFCR)

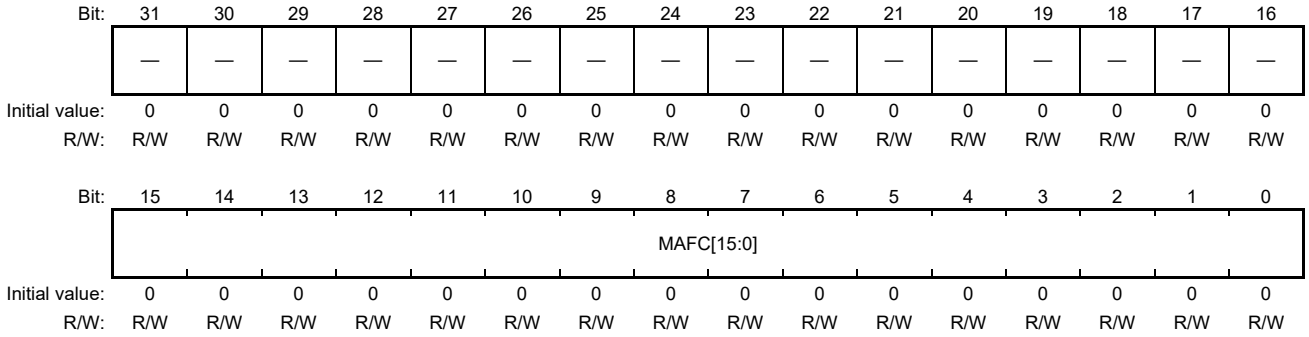
The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	RFC[15:0]	H'0000	R/W	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.91 Multicast Address Frame Receive Counter Register (MAFCR)

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'0000 FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MAFC[15:0]	H'0000	R/W	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

100.1.2.92 Checksum Operating Mode Register (CSR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	H'0000 0200	R/W	Reserved These bits are read as H'0000 0200. The write value should be H'0000 0200.

100.1.2.93 Rx Frame Checksum Enable Register (CSR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.94 Unsupported Rx Frame Counter Register (CSR30)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.95 Rx IPv4 Header checksum Error Counter Register (CSR31)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

100.1.2.96 Rx TCP/UDP/ICMP checksum Error Counter register (CSR32)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

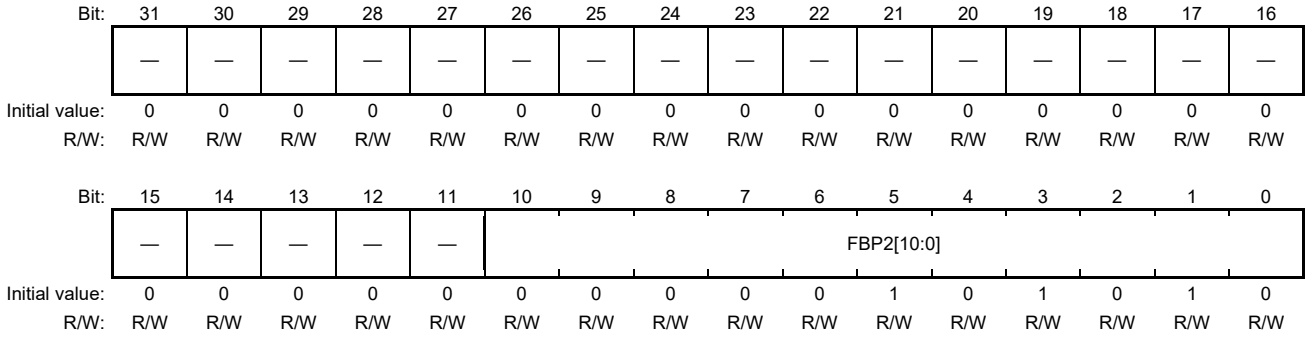
100.1.2.97 UDP/IP Support Mode Register (USMR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	EI6F	EI4F	EMOM	EEOM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

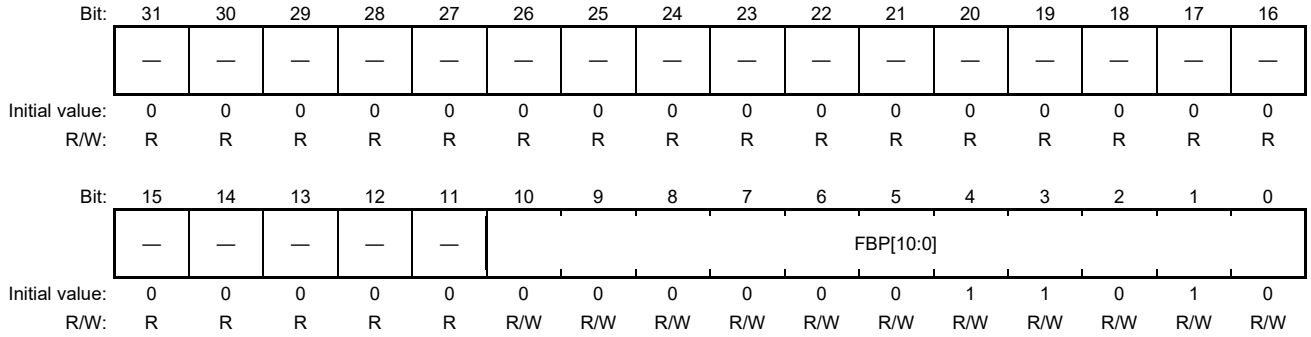
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	EI6F	0	R/W	Enable UDP/IPv6 Filtering 0: UDP/IPv6 Filtering disabled 1: UDP/IPv6 Filtering enabled
2	EI4F	0	R/W	Enable UDP/IPv4 Filtering 0: UDP/IPv4 Filtering disabled 1: UDP/IPv4 Filtering enabled
1	EMOM	0	R/W	Enable Manual Offset Mode 0: Manual Offset Mode disabled 1: Manual Offset Mode enabled When this bit is 0, These bits set the position in Ethernet frames of the first byte of the bytes(see section 100.1.3.15(1)(d) Disable Manual Offset Mode) to be used by the separation filter. When this bit is 1, These bits set the position in Ethernet frames of the first byte of the bytes**(I4SFO.FBP, I4DFO.FBP, I6SFO.FBP, I6DFO.FBP and UPFO.FBP)** to be used by the separation filter.
0	EEOM	0	R/W	Enable Extended Offset Mode 0: Extended Offset Mode disabled 1: Extended Offset Mode enabled When this bit is 0, enables the position in Ethernet frames of the first byte of the bytes(SFO.FBP) to be used by the separation filter. When this bit is 1, enables the position in Ethernet frames of the first byte of the bytes(SFO2.FBP2) to be used by the separation filter.

100.1.2.98 Separation Filter Offset Register 2 (SFO2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP2[10:0]	H'02A	R/W	First Byte Position2 These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **SFV2.LV**[11:0] when **SFL2.LC** changes from 30 (Load SFO2.FBP2) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

100.1.2.99 IPv4 Source Address Filter Offset Register (I4SFO)



Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP[10:0]	H'01A	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **I4SFVR.LV**[11:0] when **I4SFLR.LC** changes from 30 (Load I4SFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

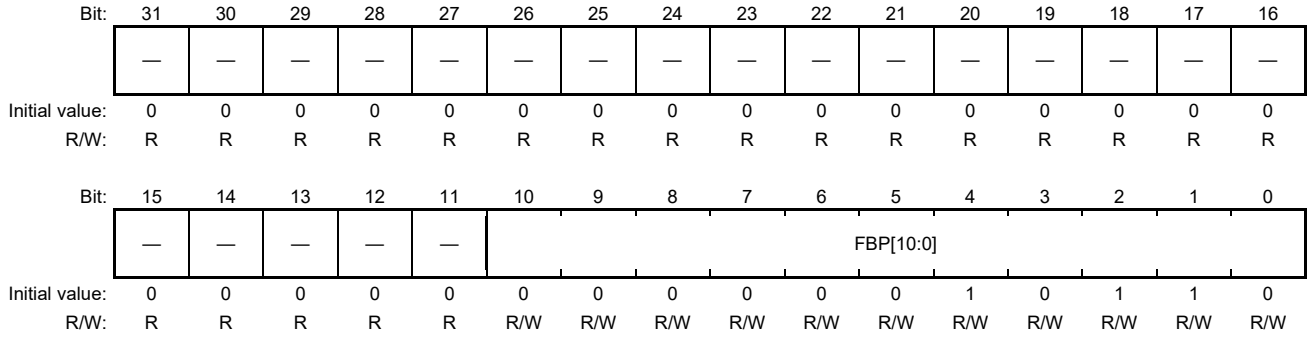
100.1.2.100 IPv4 Destination Address Filter Offset Register (I4DFO)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	FBP[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP[10:0]	H'01E	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **I4DFVR.LV**[11:0] when **I4DFLR.LC** changes from 30 (Load I4DFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

100.1.2.101 IPv6 Source Address Filter Offset Register (I6SFO)

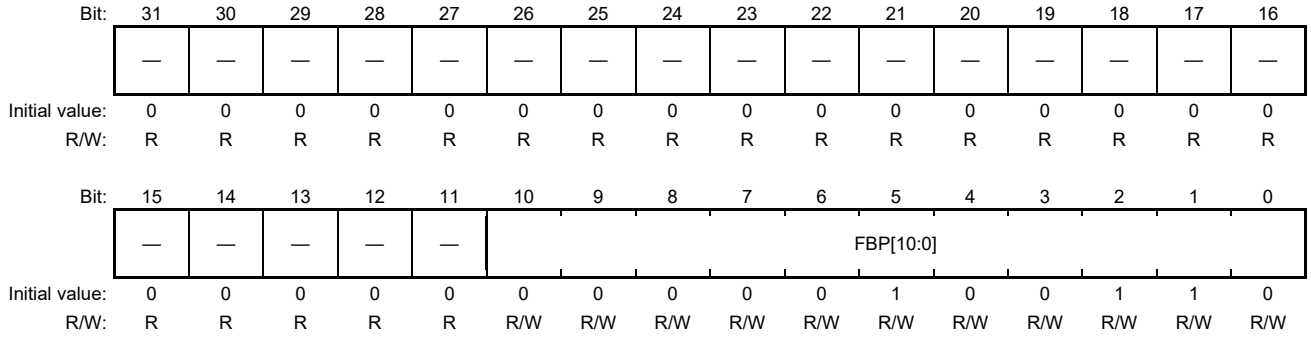


Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	FBP[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP[10:0]	H'016	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **I6SFVR.LV**[11:0] when **I6SFLR.LC** changes from 30 (Load I6SFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

100.1.2.102 IPv6 Destination Address Filter Offset Register (I6DFO)



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	FBP[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP[10:0]	H'026	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **I6DFVR.LV**[11:0] when **I6DFLR.LC** changes from 30 (Load I6DFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

100.1.2.103 UDP Port Number Filter Offset Register (UPFO)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

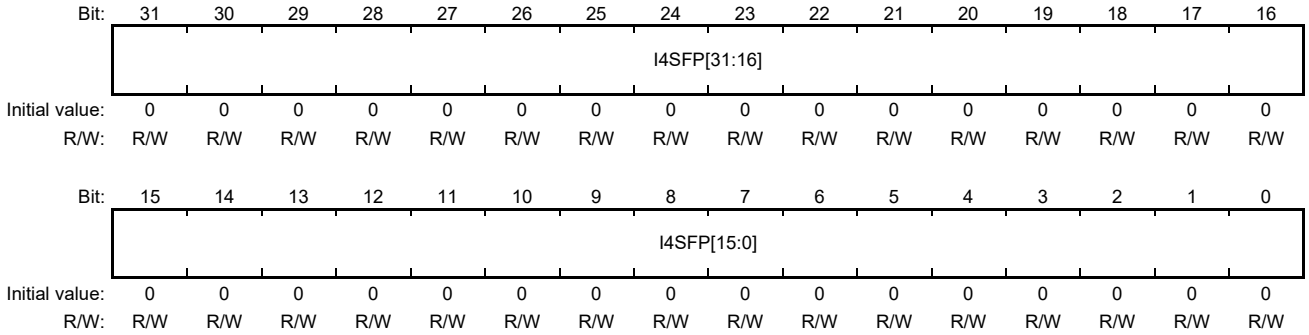
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

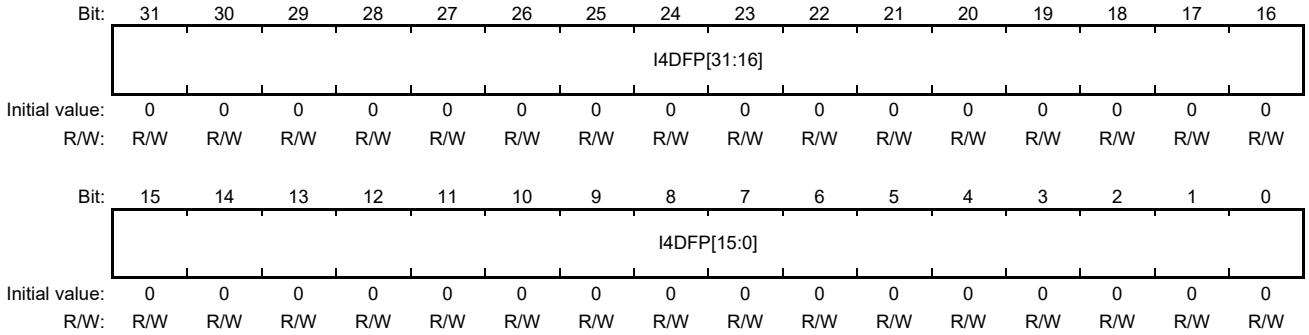
Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
10 to 0	FBP[10:0]	H'022	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 100.1.3.1.1 Operating Mode of AVB-DMAC, in section 100.1.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of **UPFVR.LV**[5:0] when **UPFLR.LC** changes from 30 (Load UPFO.FBP) to 31 while **CSR.OPS** is OPERATION. For separation filtering, see section 100.1.3.15(1)(a) Separation Filtering.

100.1.2.104 IPv4 Source Address Filter Pattern Register i (I4SFPRi) (i = 0 to 15)



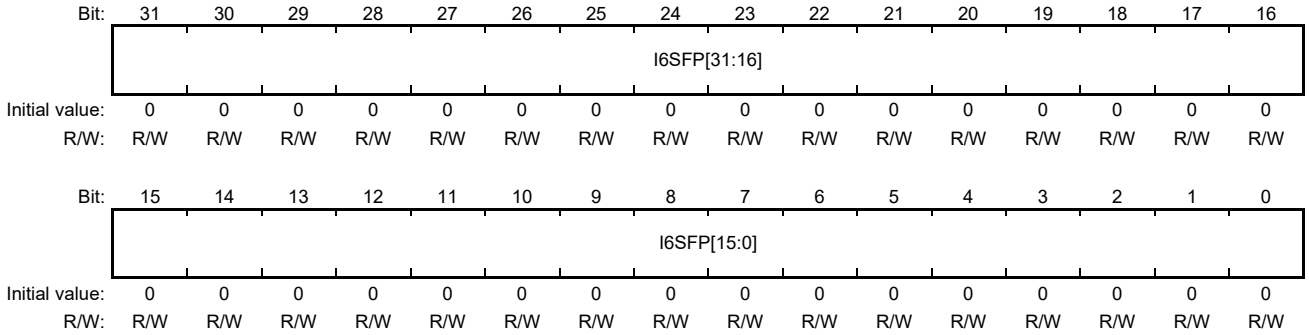
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	I4SFP[31:0]	H'0000 0000	R/W	IP v4 Source Address Filter Pattern These bits set the pattern of the address filter. The 32-bit filter pattern is set for each queue.

100.1.2.105 IPv4 Destination Address Filter Pattern Register i (I4DFPRi) (i = 0 to 15)



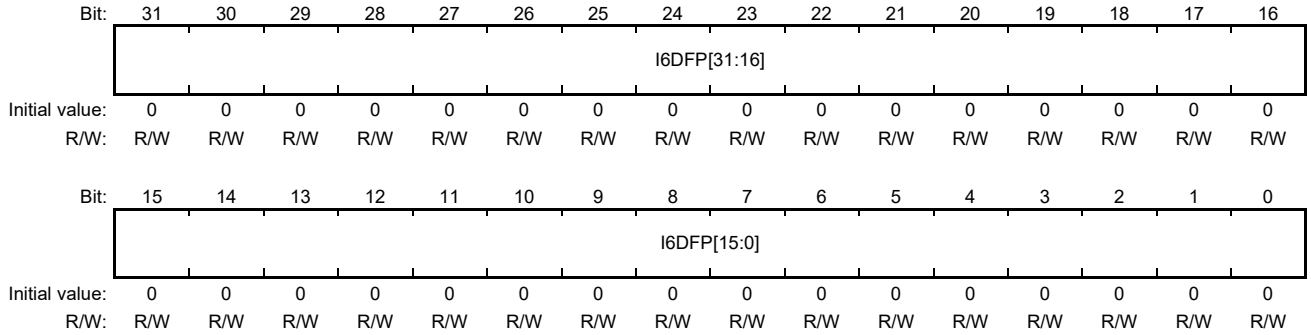
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	I4DFP[31:0]	H'0000 0000	R/W	IP v4 Destination Address Filter Pattern These bits set the pattern of the address filter. The 32-bit filter pattern is set for each queue.

100.1.2.106 IPv6 Source Address Filter Pattern Register i (I6SFPRi) (i = 0 to 63)



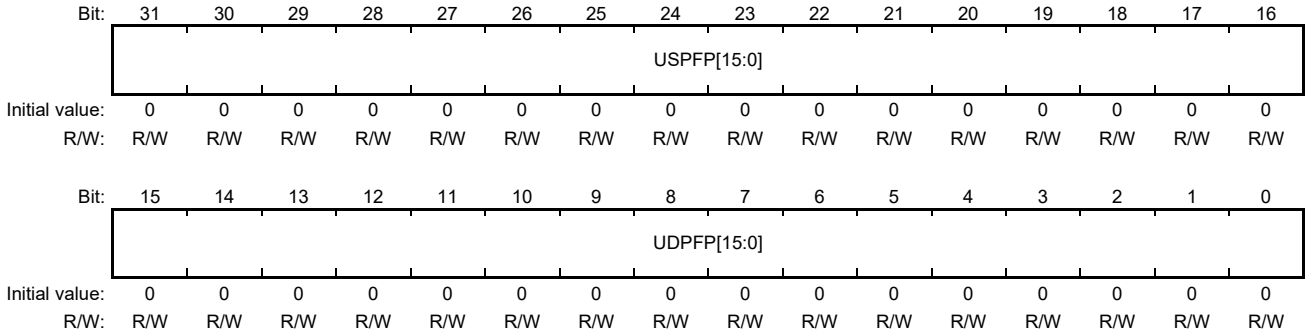
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	I6SFP[31:0]	H'0000 0000	R/W	IPv6 Source Address Filter Pattern These bits set the pattern of the address filter. The 128-bit filter pattern is set for each queue.

100.1.2.107 IPv6 Destination Address Filter Pattern Register i (I6DFPRi) (i = 0 to 63)



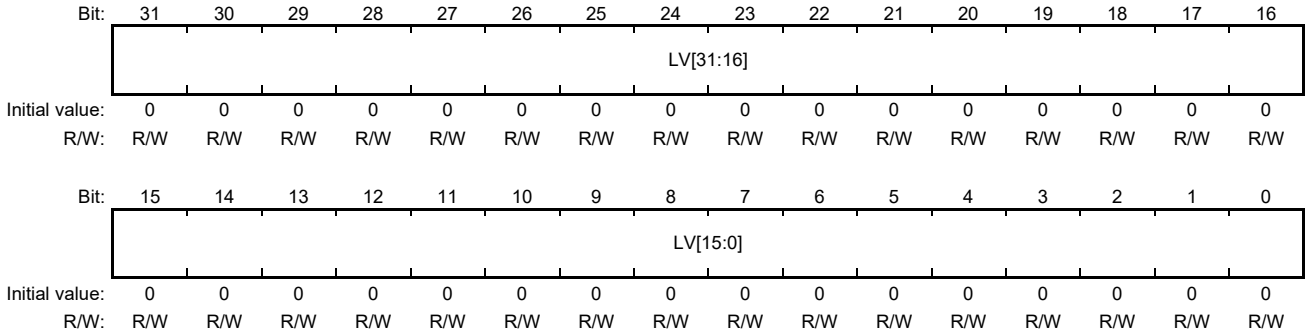
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	I6DFP[31:0]	H'0000 0000	R/W	IPv6 Destination Address Filter Pattern These bits set the pattern of the address filter. The 128-bit filter pattern is set for each queue.

100.1.2.108 UDP Port Number Filter Pattern Register i (UPFPRi) (i = 0 to 15)



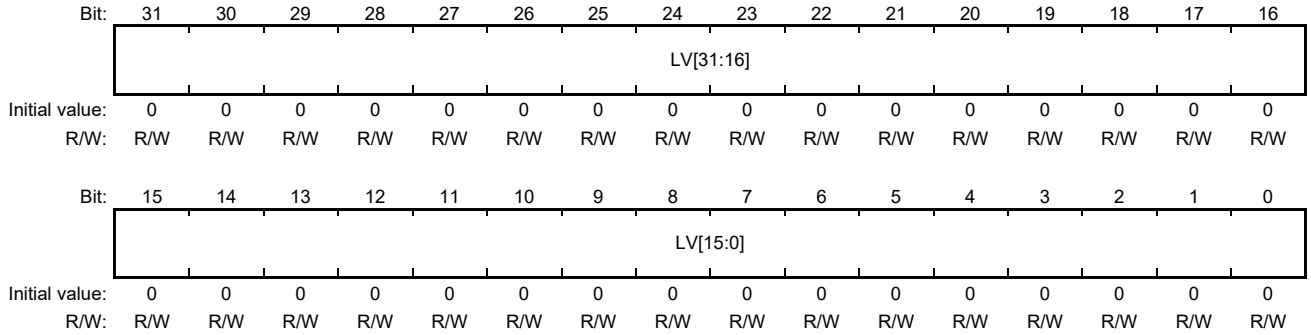
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	USPFP[15:0]	H'0000	R/W	UDP Source Port Number Filter Pattern These bits set the pattern of the port filter. The 16-bit filter pattern is set for each queue.
15 to 0	UDPFP[15:0]	H'0000	R/W	UDP Destination Port Number Filter Pattern These bits set the pattern of the port filter. The 16-bit filter pattern is set for each queue.

100.1.2.109 Separation Filter Value Register 2 (SFV2)



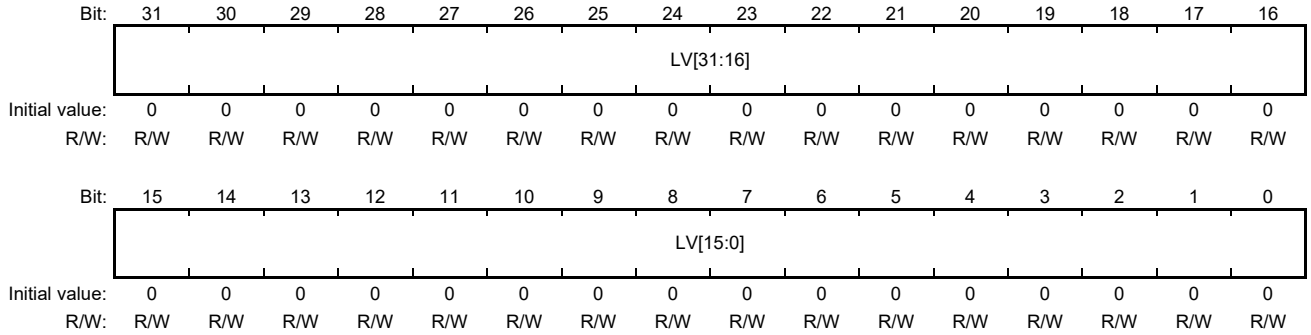
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.110 IPv4 Source Address Filter Value Register (I4SFVR)



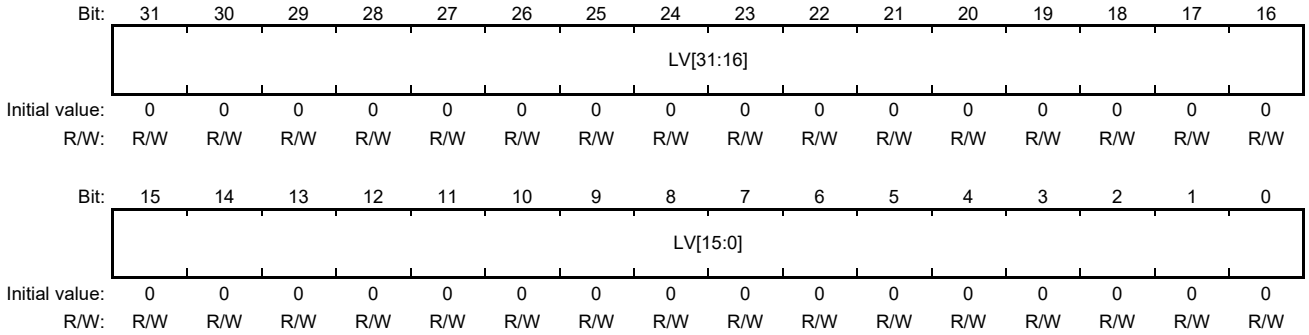
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.111 IPv4 Destination Address Filter Value Register (I4DFVR)



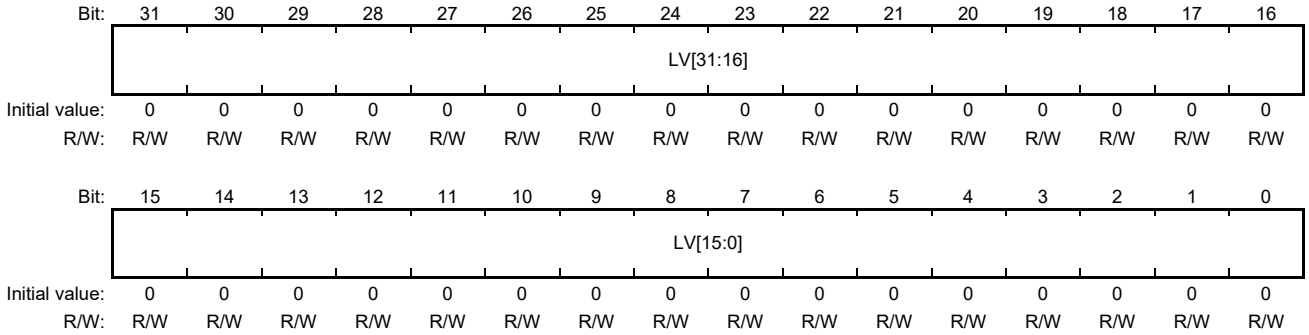
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.112 IPv6 Source Address Filter Value Register i (I6SFVRi) (i = 0 to 3)



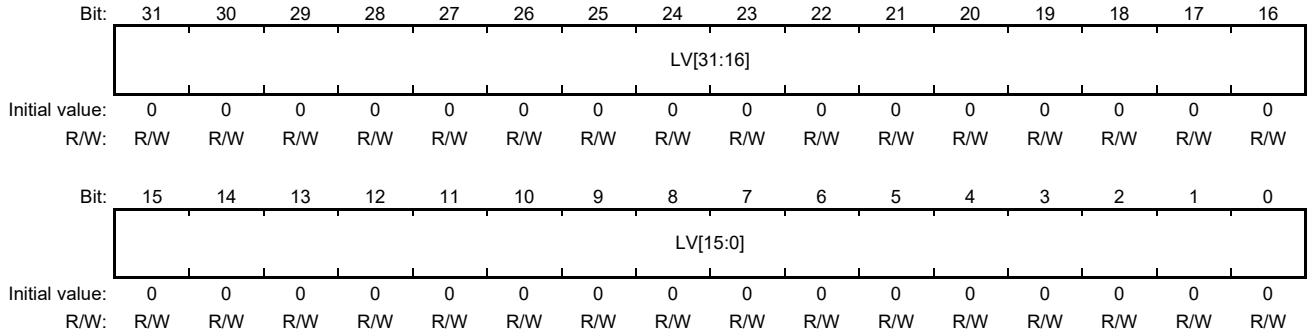
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.113 IPv6 Destination Address Filter Value Register i (I6DFVRi) (i = 0 to 3)



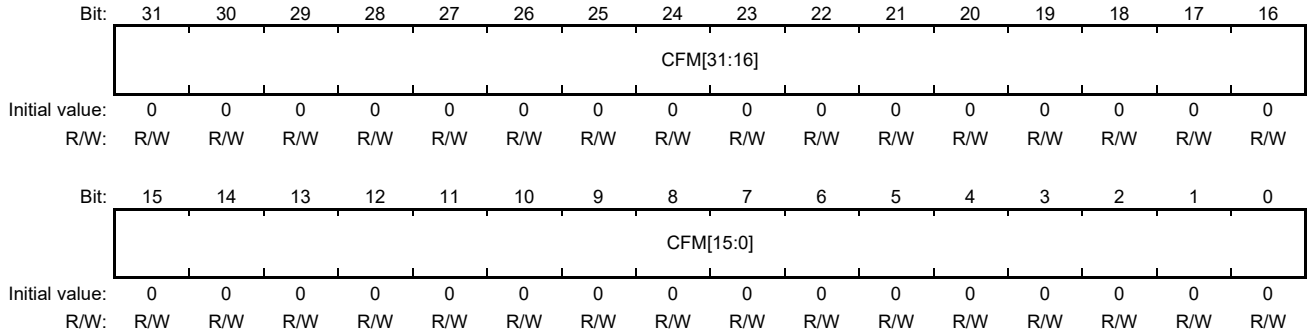
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.114 UDP Port Number Filter Value Register (UPFVR)



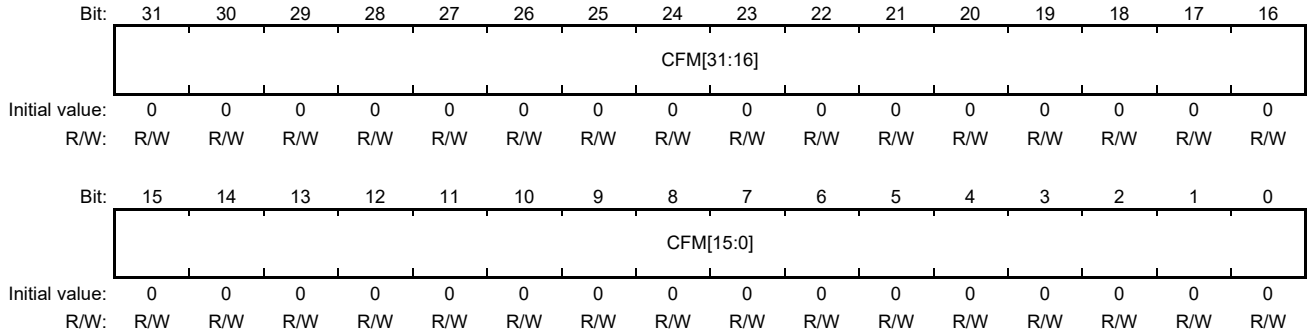
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000 0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

100.1.2.115 IPv4 Source Address Filter Mask Register (I4SFMR)



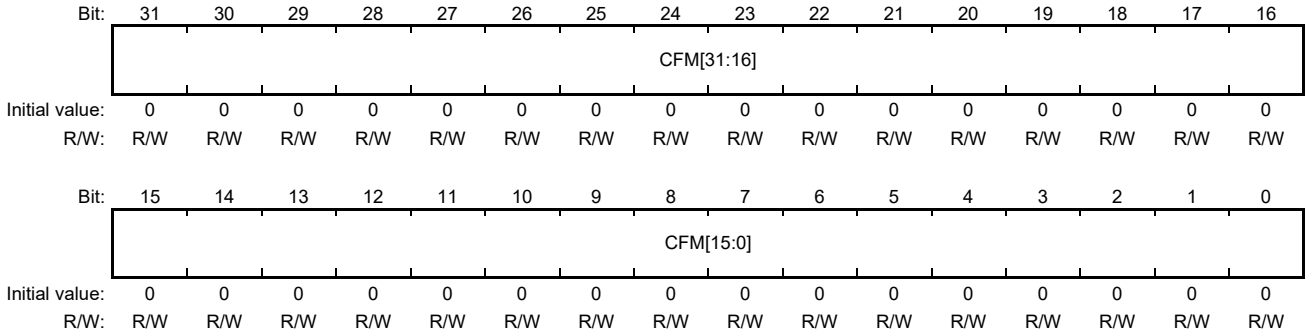
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.116 IPv4 Destination Address Filter Mask Register (I4DFMR)



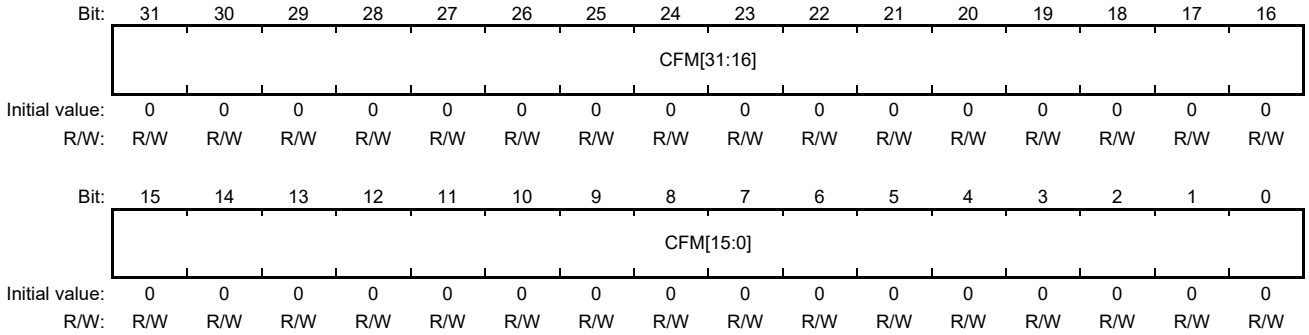
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.117 IPv6 Source Address Filter Mask Register i (I6SFMRi) (i = 0 or 3)



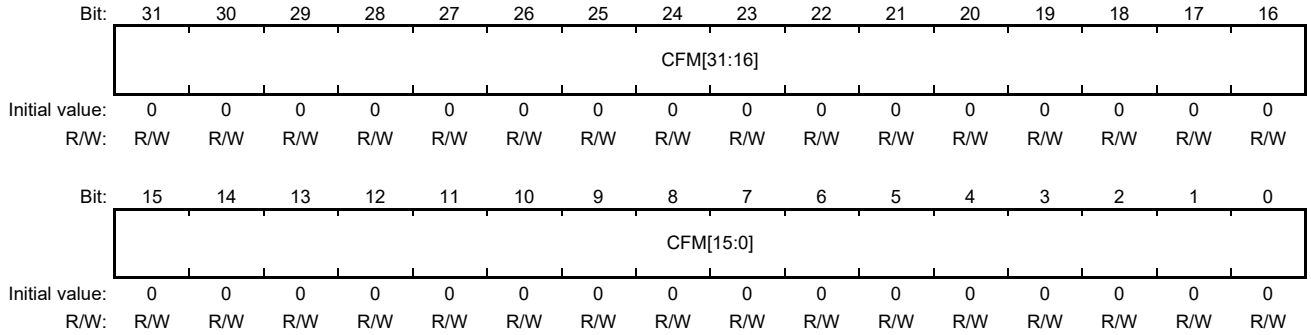
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.118 IPv6 Destination Address Filter Mask Register i (I6DFMRi) (i = 0 or 3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.119 UDP Port Number Filter Mask Register (UPFMR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CFM[31:0]	H'0000 0000	R/W	Separation Filter Mask These bits set the mask value for the separation filter.

100.1.2.120 Separation Filter Load Register 2 (SFL2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
4 to 0	LC[4:0]	H'1F	R/W	Load Command These bits control update of separation filter configuration in OPERATION mode. By writing 30 to these bits CPU triggers an update of First Byte Position (**UPFO.FBP**) value. By writing 29 to these bits CPU triggers an update of Common Filter Mask (**UPFMR.CFM**) value. By writing number between 0 and 15 to these bits CPU triggers an update of Filter Pattern s (**UPFPRi.USPFP and UPFPRi.UDPFP**) value. The number written to **UPFLR.LC** defines the index s of the updated Filter Pattern. The CPU can only write to these bits if **CSR.OPS** is OPERATION. The CPU can only write to these bits if **UPFLR.LC** is 31. [Changing condition] These bits are set to 31 when leaving OPERATION mode. These bits are set to 31 when the requested update has been processed. 0-15: Load of UPFPRi.USPFP and UPFPRi.UDPFP with s = UPFLR.LC 16-28: Invalid 29: Load of UPFMR.CFM 30: Load of UPFO.FBP 31: No pending load request

100.1.3 Operation

The EthernetAVB-IF consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the RGMII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a RGMII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the RGMII. It also performs CRC checking of Ethernet frames received from the RGMII and writes the frames to the reception FIFO.

100.1.3.1 AVB-DMAC Operating Modes

Figure 100.1.3.1.1 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset and power-down mode)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be confirmed by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

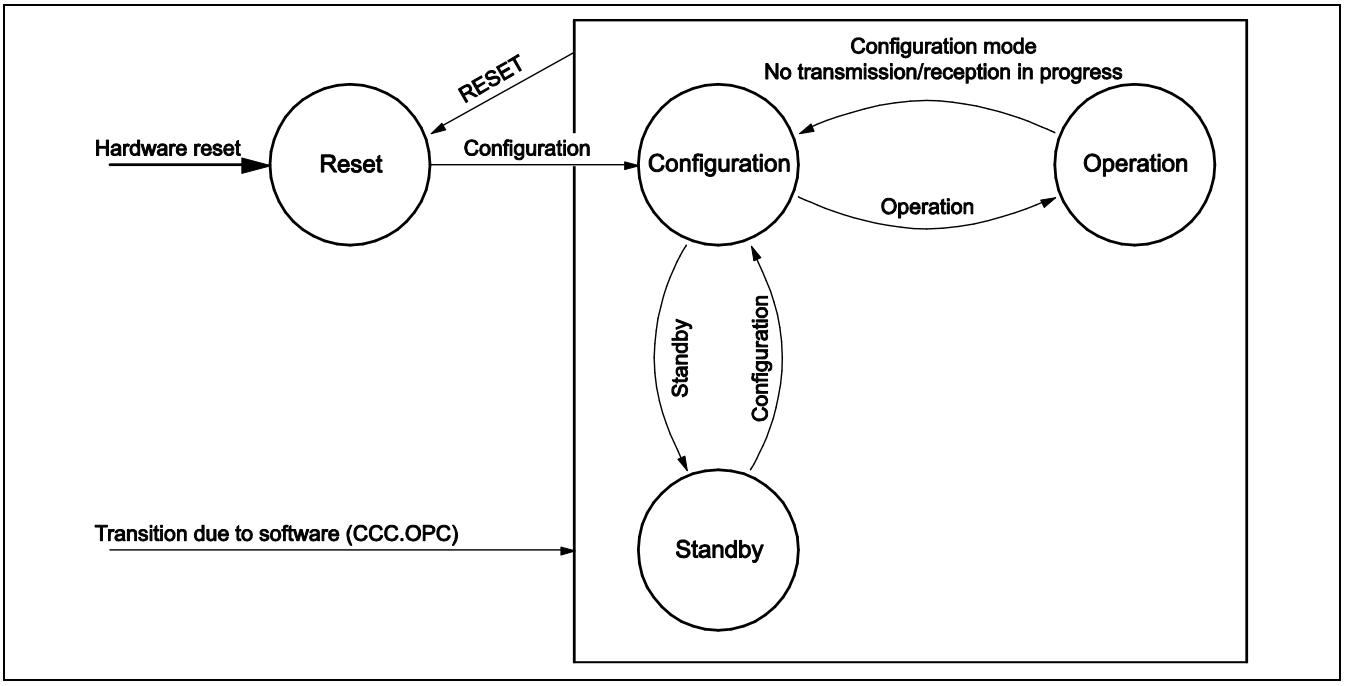

Figure 100.1.3.1.1 Operating Mode of AVB-DMAC

(1) Operating Modes

(a) Reset mode

After a hardware reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(b) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operation of most functions is stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.
By **CCC.GAC** it is possible to enable gPTP support already in CONFIG mode.

(c) Operation mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.

(d) Standby mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used.
When **CCC.GAC** is 1b CPU should not enter STANDBY mode.

(2) How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 100.1.3.1.2).

For transitions from operation mode to configuration mode, follow the procedure in Figure 100.1.3.1.3 because any transmission and reception in progress will be executed before the transition to configuration mode.

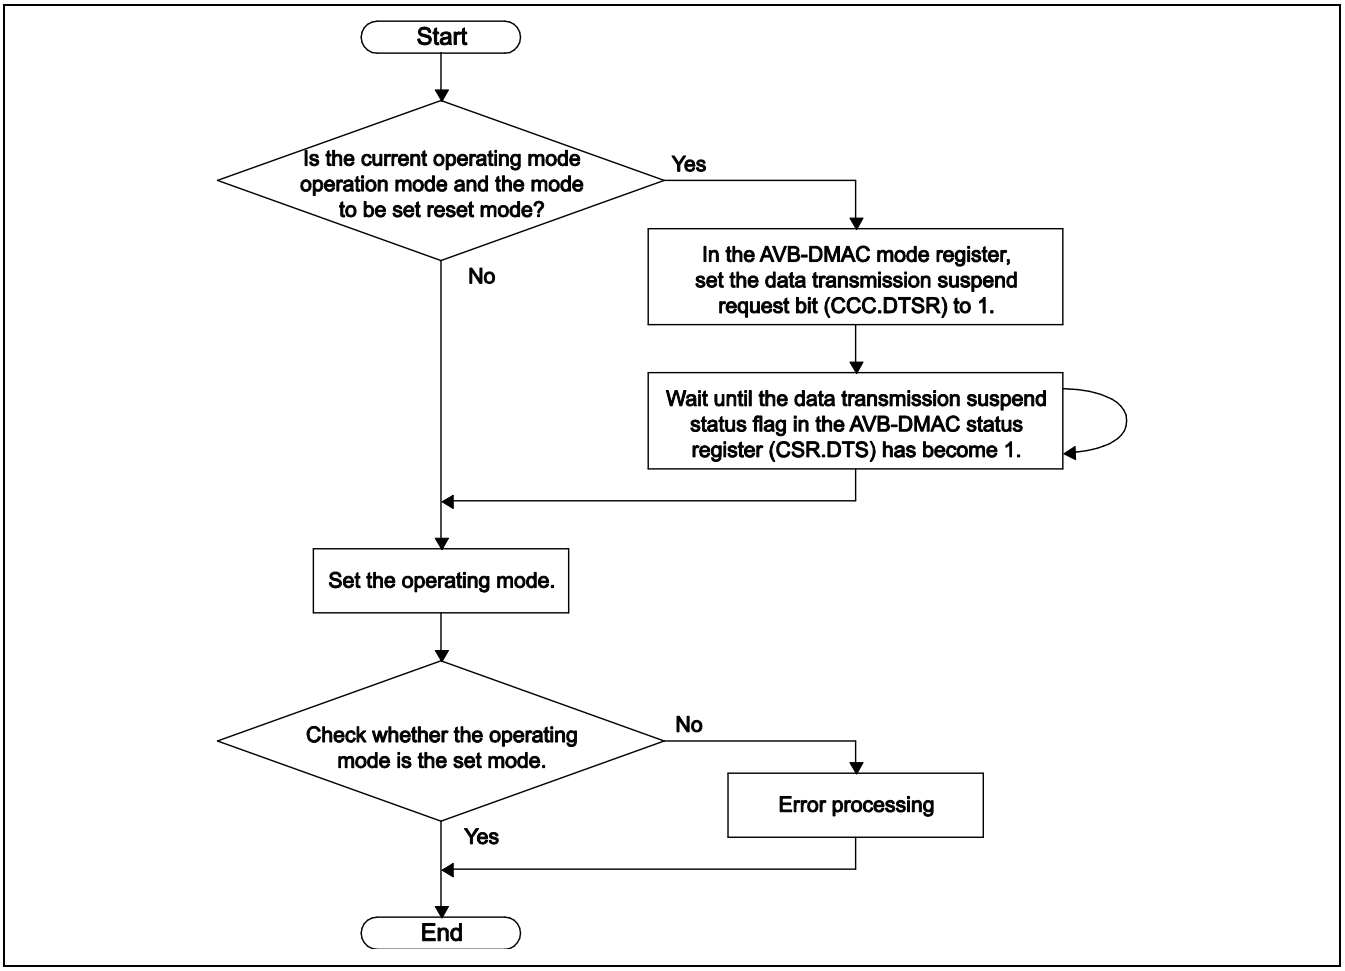

Figure 100.1.3.1.2 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

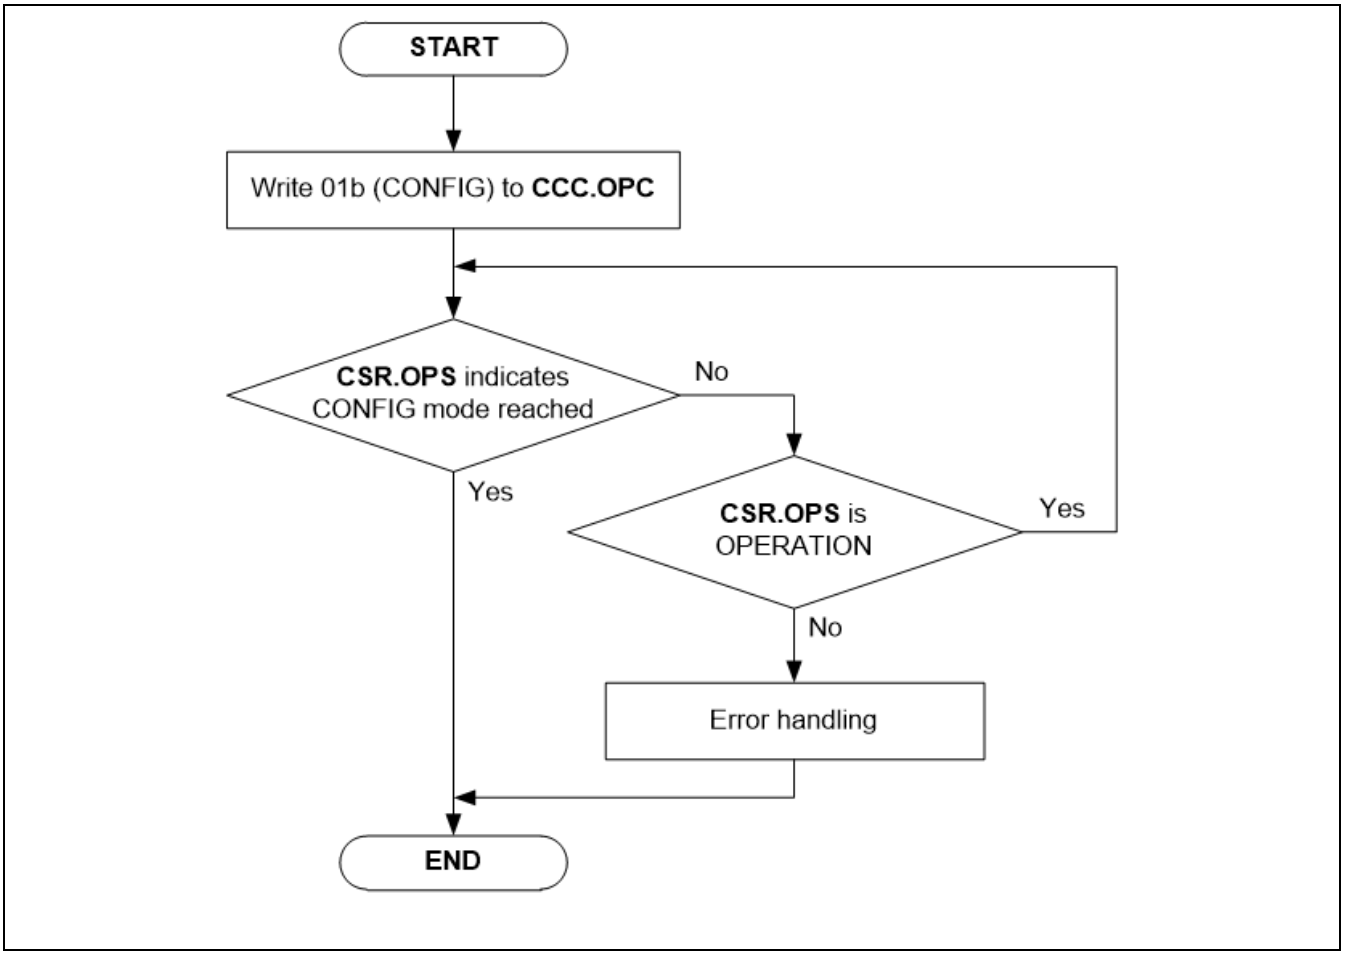

Figure 100.1.3.1.3 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

The CPU should not disable URAM transfers by CCC.DTSR nor prevent transmission by MAC when requesting transition from OPERATION to CONFIG, else EthernetAVB-IF cannot perform requested mode change.

Notes: When the operating mode shifts to configuration mode, all status registers are cleared.
When need status register information, the reception and transmission path can be individually disabled and can check the status before leaving operating mode with follow.
We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.

5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

(3) Leave RESET mode with additional configuration

When writing 01b (CONFIG) to **CCC.OPC** while EthernetAVB-IF is in RESET mode, it is possible to configure availability of gPTP support within CONFIG mode

To enable gPTP support in CONFIG mode use a 32 bit write access when setting **CCC.OPC** to 01b. This write should also set **CCC.GAC** to 1b and **CCC.CSEL** to intended configuration.

(4) Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(a) Hardware reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB-IF module. The operating mode shifts to reset mode.

(b) Transition during power-off by module standby

This transition is triggered by module standby of CPG during the power-off sequence.

The AVB-DMAC completes the bus master access in progress, and then shifts to reset mode. At this time, the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) are set to B'00.

100.1.3.2 Common Control for Transmission and Reception

(1) Initialization Procedure

Figure 100.1.3.2.1 shows the overall initialization procedure in outline.

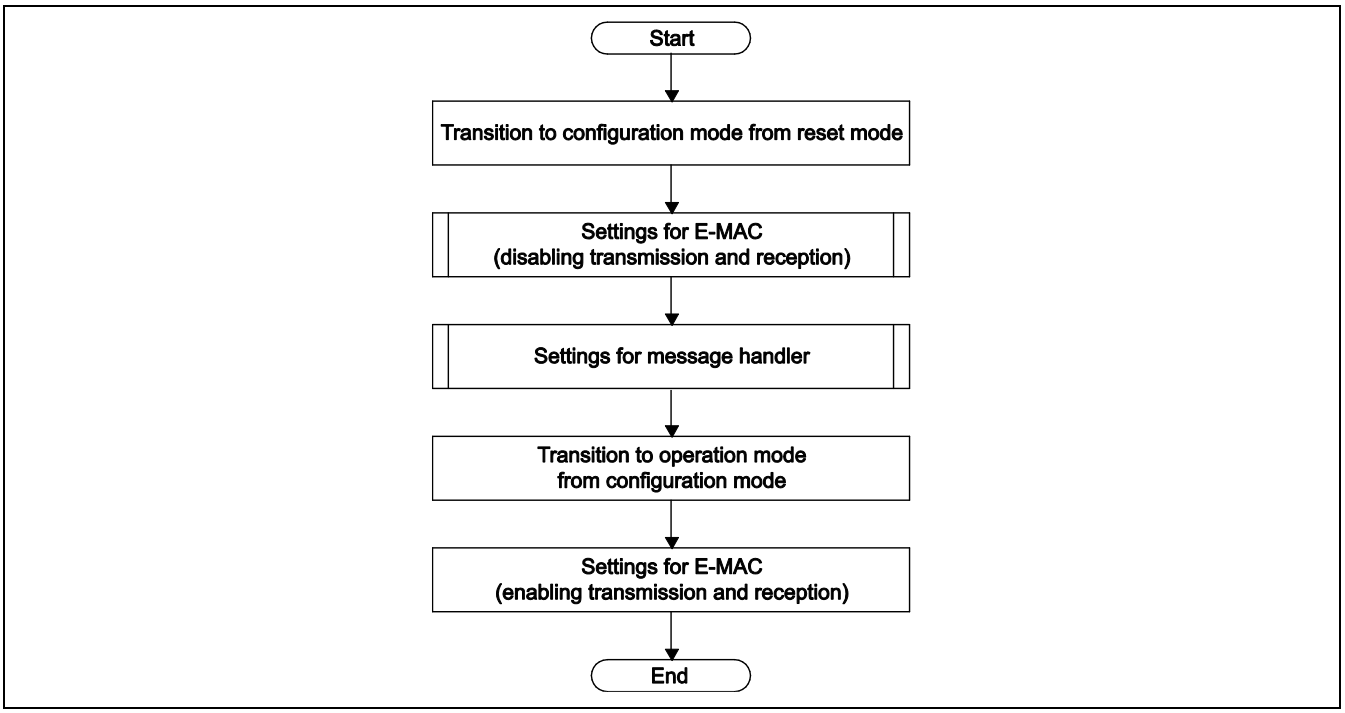

Figure 100.1.3.2.1 Outline of the Initialization Procedure

(a) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Keep the operating mode to configuration mode, and do not enable reception until the settings for the AVB-DMAC are completed. However, there is a limitation that if it can be determined that no data is received, it is no problem to change the setting.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for table address in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers (UFCVs) 0 to 4.

(b) Initializing the Transmitter Section

Figure 100.1.3.2.2 illustrates initialization of the transmitter section.

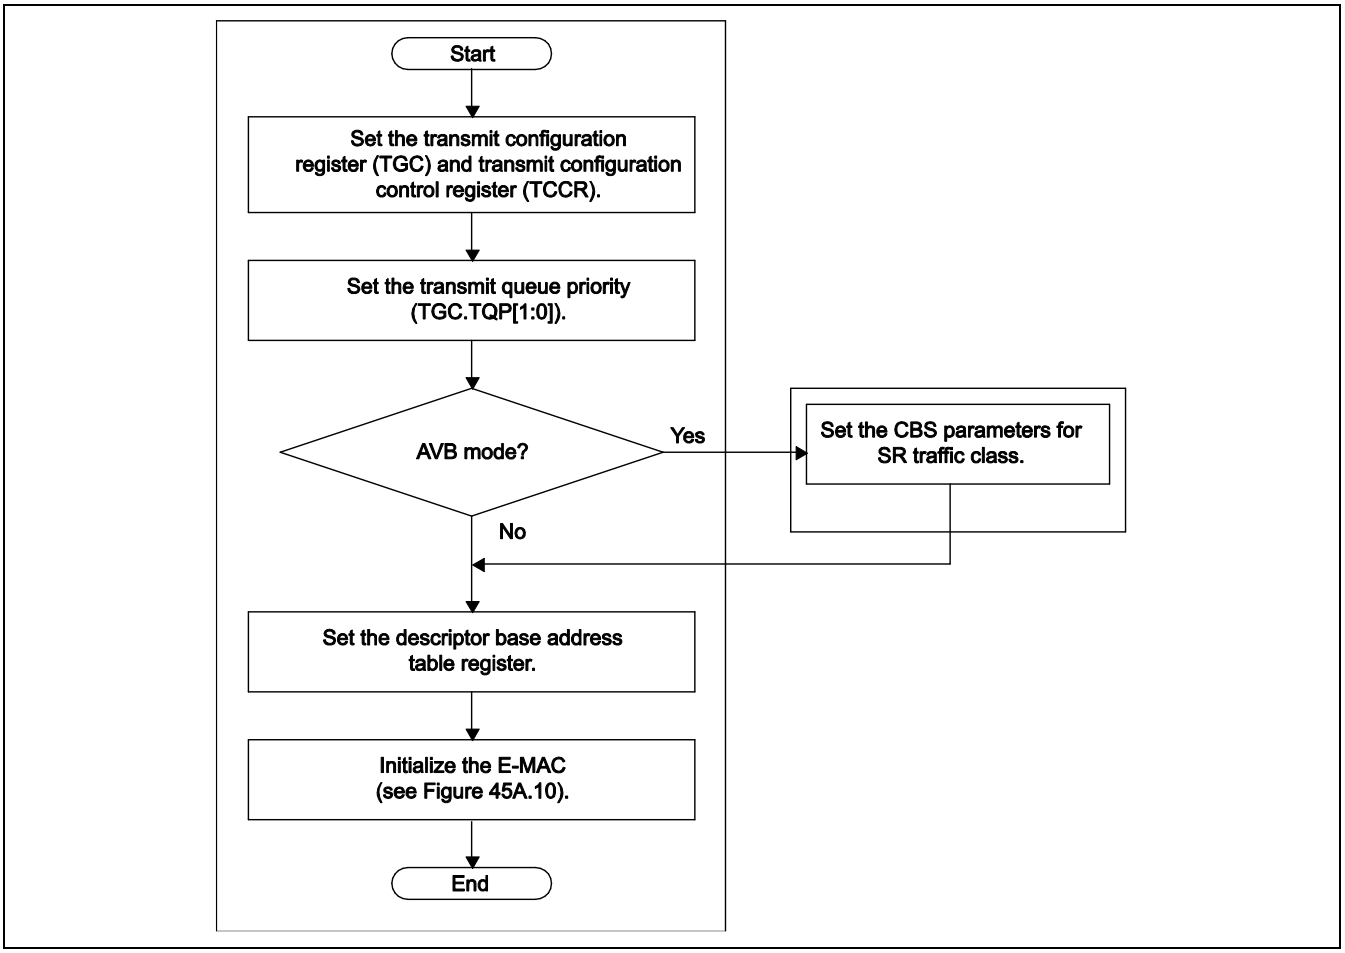

Figure 100.1.3.2.2 Procedure for Initializing the Transmitter Section

(c) Initializing the E-MAC Section

Figure 100.1.3.2.3 illustrates initialization of the E-MAC section.

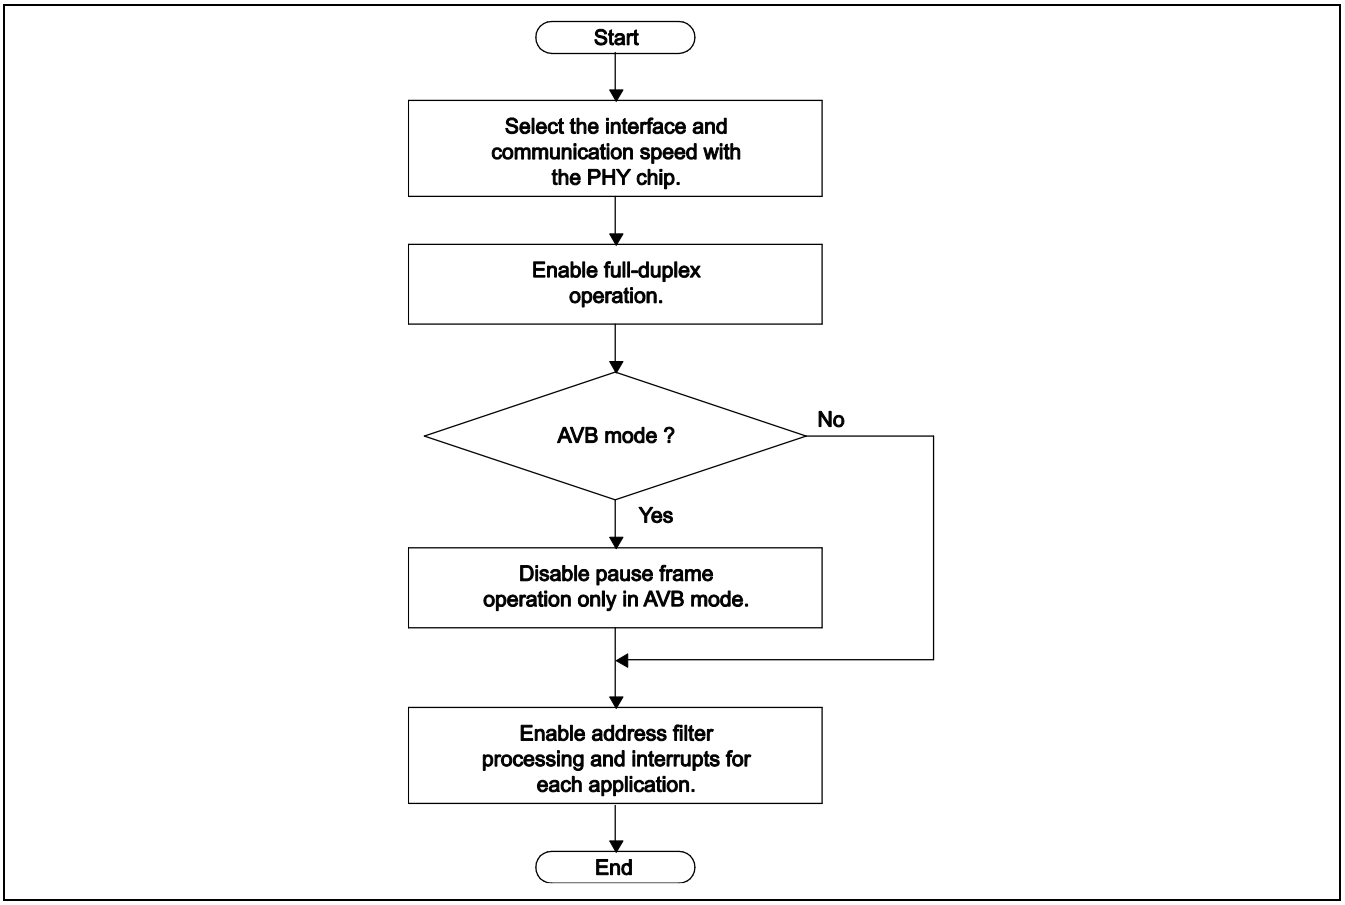

Figure 100.1.3.2.3 Procedure for Initializing the E-MAC Section

(d) Initialization of the Application Unit

Figure 100.1.3.2.4 illustrates initialization of the application unit.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see section 100.1.3.3 Descriptors, and section 100.1.3.6 CBS (Credit-Based Shaping).

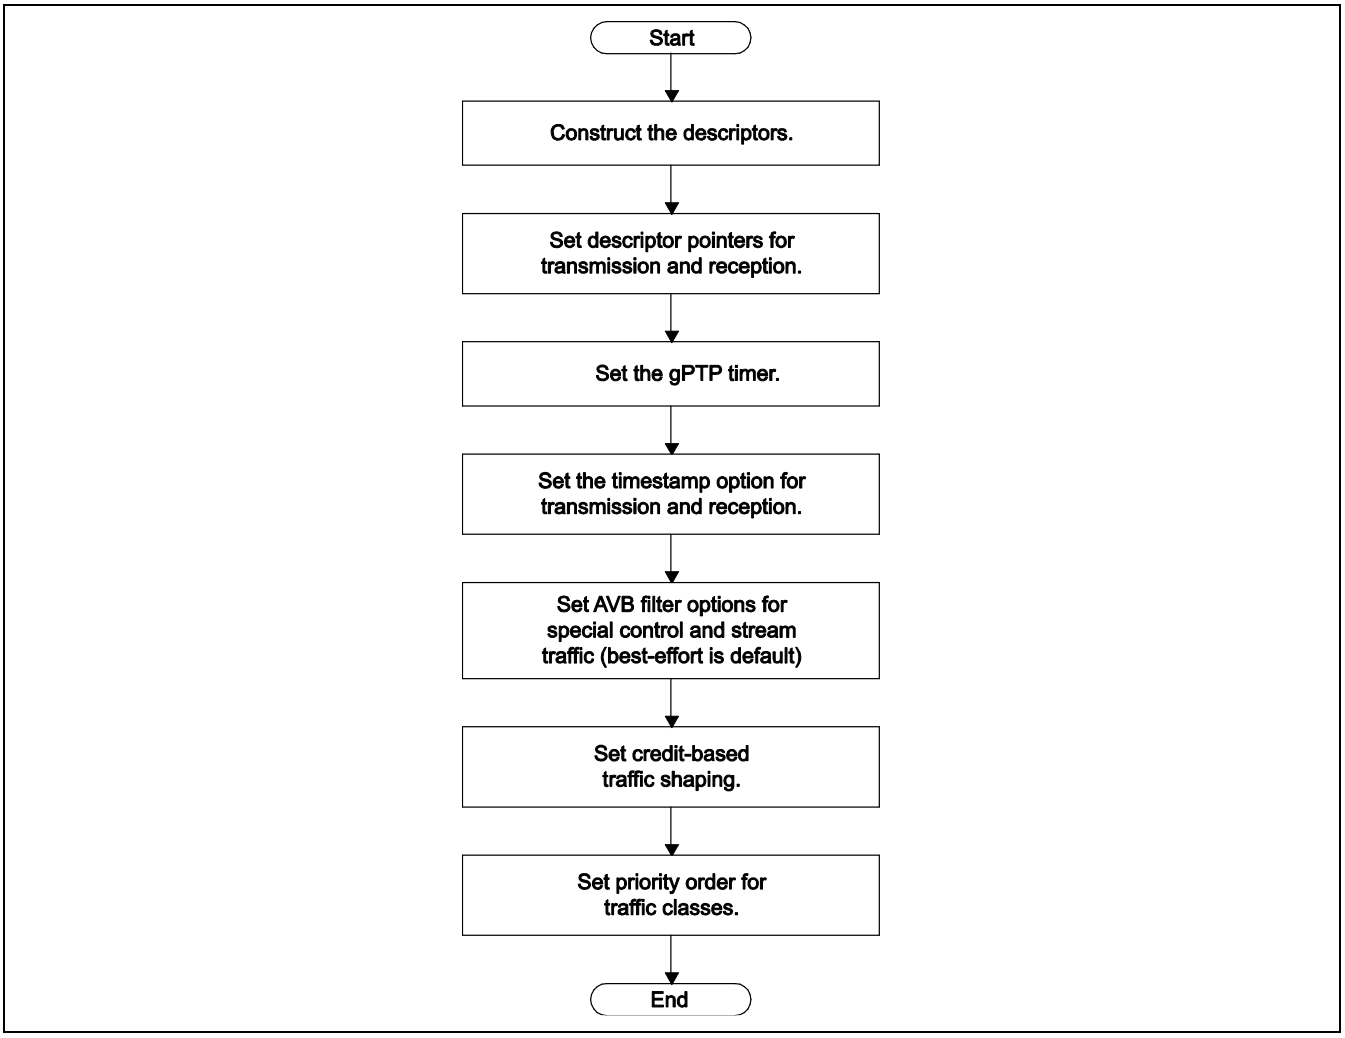

Figure 100.1.3.2.4 Initializing the Sections for Use by the Application

(e) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

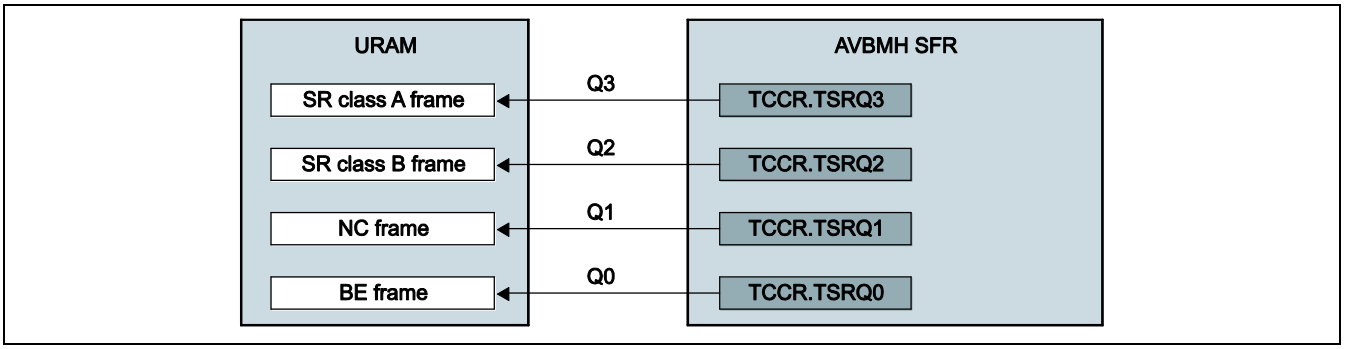

Figure 100.1.3.2.5 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bit and enable credit based shaping bit in the transmit configuration register {TGC.TQP, TGC.ECBS} are B'00 or B'01, the priority order is Q3 → Q 2 → Q1 → Q0.

When the transmit queue priority bit and enable credit based shaping bit in the transmit configuration register {TGC.TQP, TGC.ECBS} are B'11, the priority order is Q1 → Q3 → Q2 → Q0.

(2) Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(a) Concept of Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

Note: If a special descriptor chain is to be used for separation of received headers from the associated data, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

(b) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

(c) Items for Monitoring in Both Reception and Transmission

Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus. EthernetAVB-IF flags only one access error per descriptor read.

Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.
Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

(d) Items for Monitoring in Reception

Errors in access to the URAM for writing of data or time stamps

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.
EthernetAVB-IF flags each access error individually, even they are related to same frame.

Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the reception FIFO RAM faults, AVB-DMAC detects the fault as error of the reception FIFO.

Queue Synchronisation Fault of the Reception

EthernetAVB-IF will not continue splitting frame across EOS descriptor. A queue synchronisation fault is detected when read descriptor with DESCR.DT = EOS at position where FMID, or FEND should be written

- RIS2.QFFr is set 1b
- CDARq.CDA is updated as in fault free operation.
- Neither CIARr.CIA nor LIARr.LIA is changed.
- Neither UFCVi.CVr nor RIS0.FRFr is changed.
- Received frame is lost. There is an incomplete frame (no FEND) in descriptor chain.

Note: Reading descriptor may be one or more storage elements ahead in descriptor chain.

(e) Items for Monitoring in Transmission

Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  The current descriptor address (CDARq.CDA) is not updated.
  The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

Frame size error during transmission

— As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1966 or more bytes. Such frames are cut out and transmitted.

Damaged Data in the Transmission FIFO

— Fetching is not affected by damaged data.
— Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

(f) Items for Monitoring in gPTP

Access error while reading AVTP timestamps from Tx-Buffer RAM

— AVTP timestamps are invalidated.
— gPTP unit ignores the issue. It uses the value as read for AVTP comparison.

An access error when reading timestamps from Tx-Buffer RAM is flagged to EthernetAVB-IF by external RAM protection logic.

100.1.3.3 Descriptors

(1) Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the AVB-DMAC.

Figure 100.1.3.3.1 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 100.1.3.4(2) Setting Up Reception Descriptors, and section 100.1.3.5(2) Setting Up Transmission Descriptors.

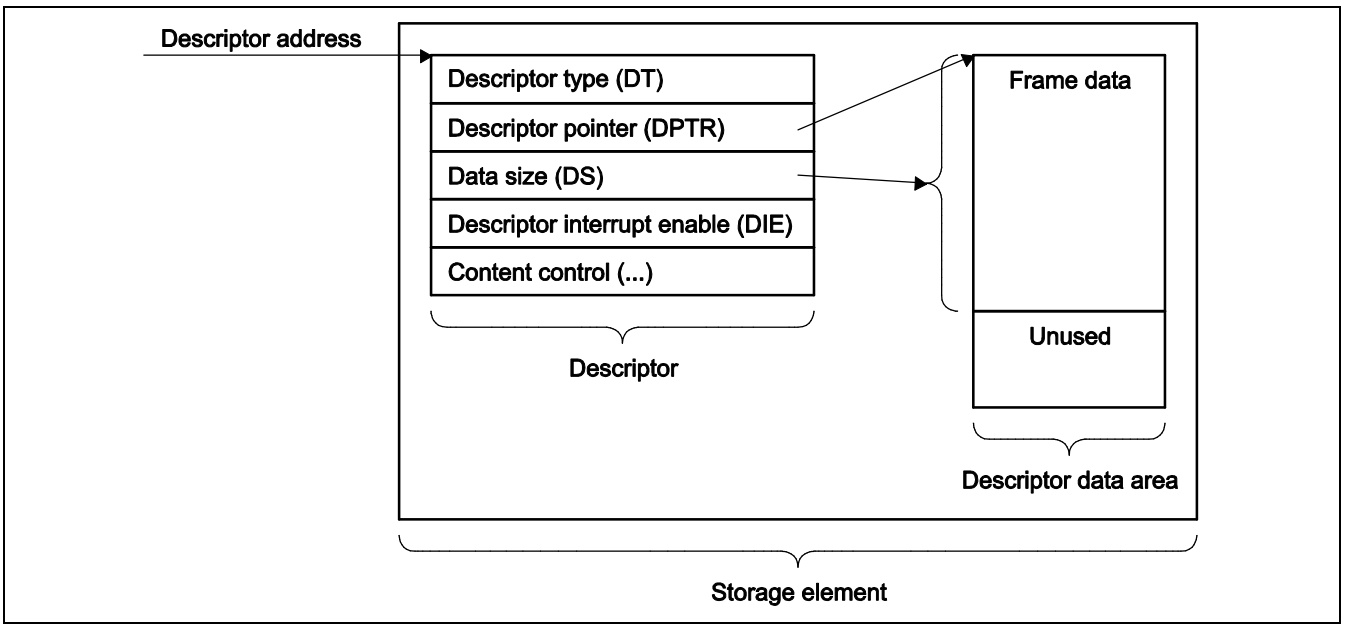

Figure 100.1.3.3.1 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 8-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

(2) Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 100.1.3.3(6) Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 100.1.3.3.2 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

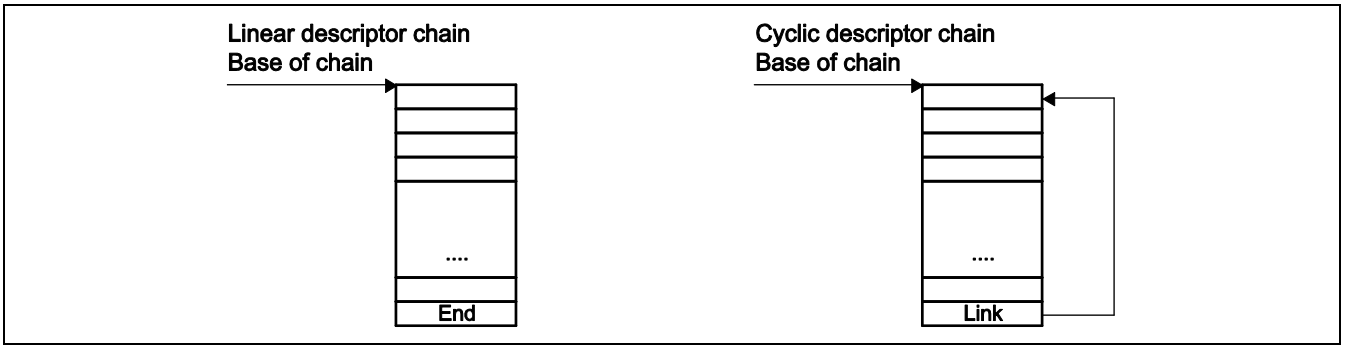

Figure 100.1.3.3.2 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 100.1.3.4(2) Setting Up Reception Descriptors, and section 100.1.3.5(2) Setting Up Transmission Descriptors.

(3) Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 100.1.3.3.3 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

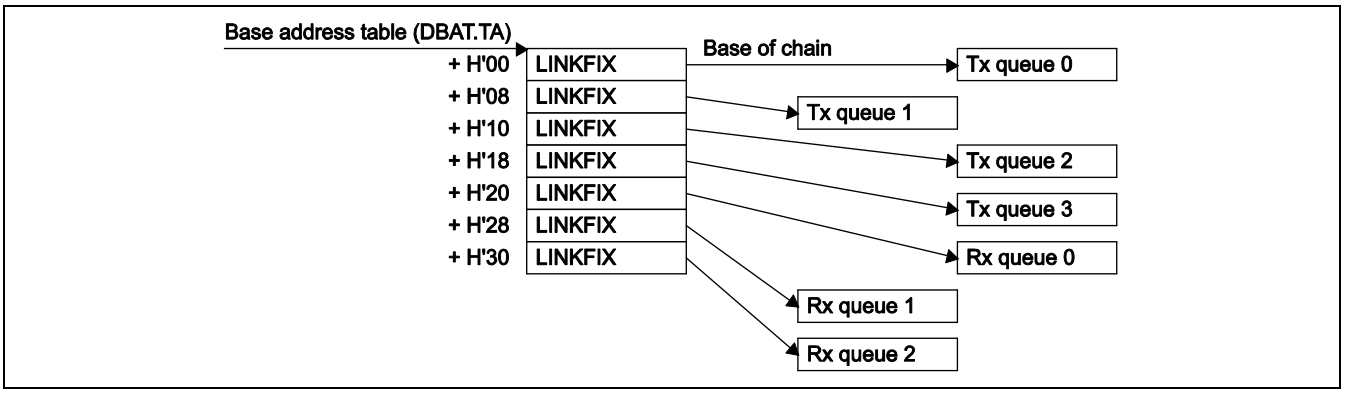

Figure 100.1.3.3.3 Example of a Base Address Table for Reception and Transmission Queues

Note: The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

(4) Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

(5) Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

EthernetAVB-IF provides two kinds of descriptor interrupts:
- Queue specific descriptor interrupt (1 per receive/transmit queue)
- Universal descriptor interrupt (15 shared between all receive/transmit queues)

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 100.1.3.3.4 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

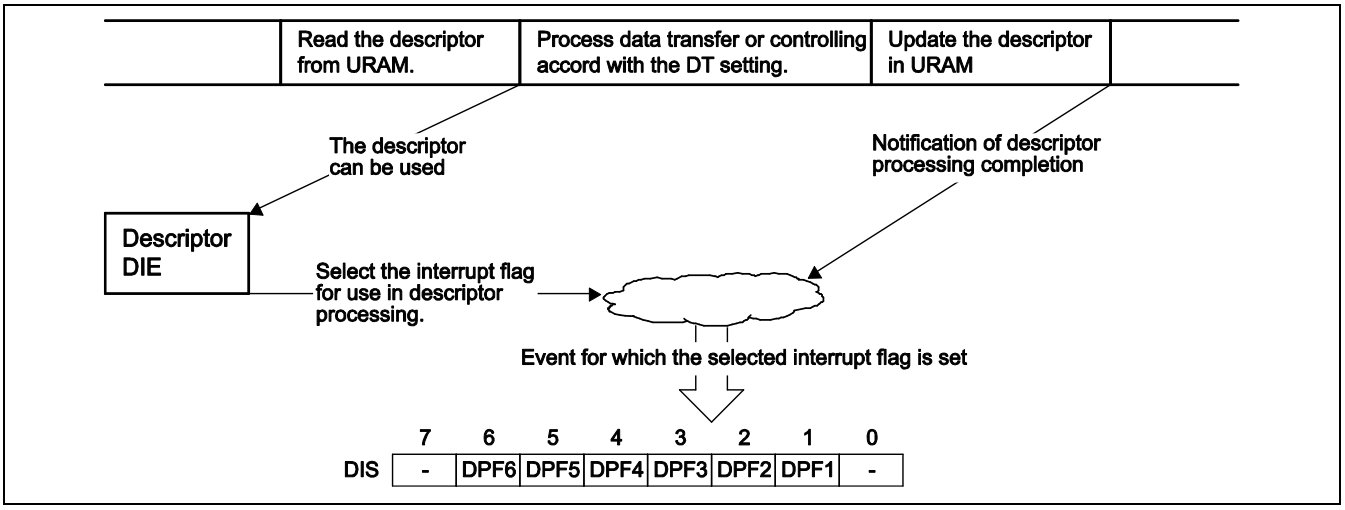

Figure 100.1.3.3.4 Method of Descriptor Interrupt Generation

(6) Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 100.10 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

— The descriptor is processed by software.
— Software has access to and may modify the descriptor and descriptor data area.
— This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

— The descriptor is processed by hardware (AVB-DMAC).
— Software must modify neither the descriptor nor the descriptor data area.
— Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 100.10 Summary of Descriptor Type

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Same as LINK, but not changed by AVB-DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split a descriptor chain. The chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame. DESCR.DPTR sets the base address of an “incremental data area” in the URAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame. Data is stored to the incremental data area in the URAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame. The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

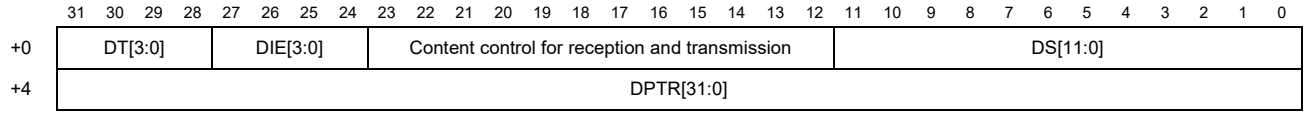
(7) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(a) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)



- Extended descriptor (usable only in reception)

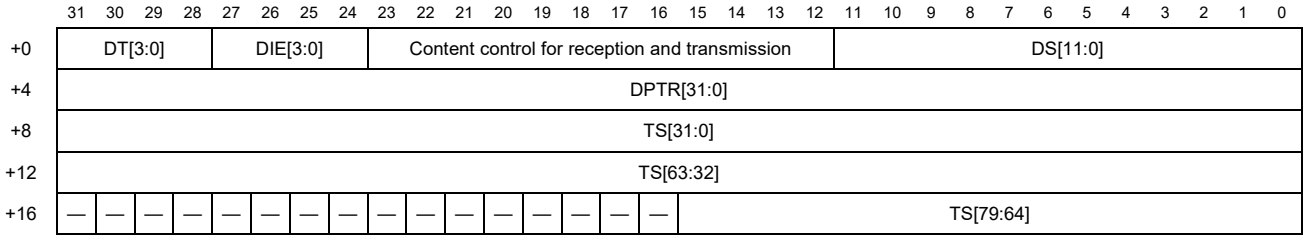


Table 100.11 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see section 100.1.3.4(2) Setting Up Reception Descriptors, and section 100.1.3.5(2) Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 100.1.3.4(2) Setting Up Reception Descriptors, and section 100.1.3.5(2) Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

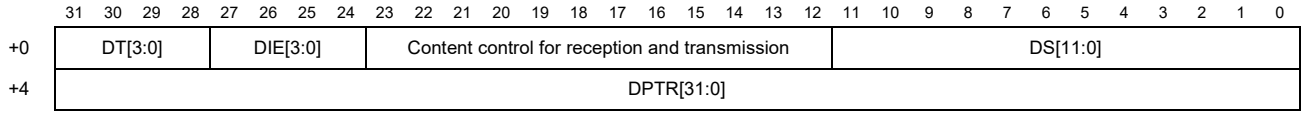
Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
Some bits in extended descriptors are reserved (The reserved bits (above DESCR.TS[79:64]) in an extended descriptor are set to H'0000 after the time stamp is stored).

(b) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor



- Extended descriptor (usable only in reception)

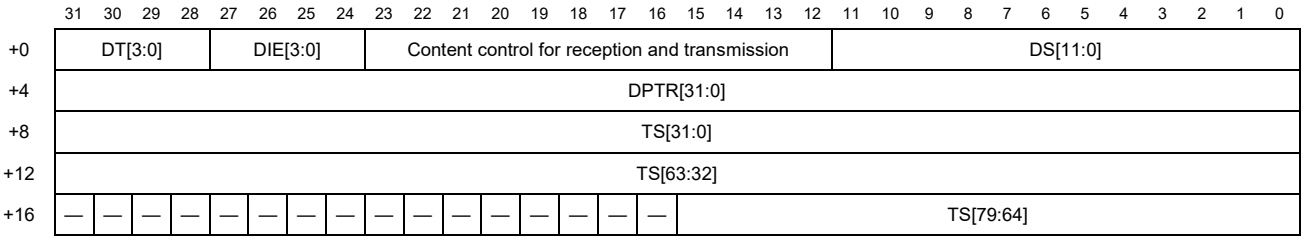


Table 100.12 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 100.10, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 100.1.3.4(2) Setting Up Reception Descriptors, and section 100.1.3.5(2) Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(c) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

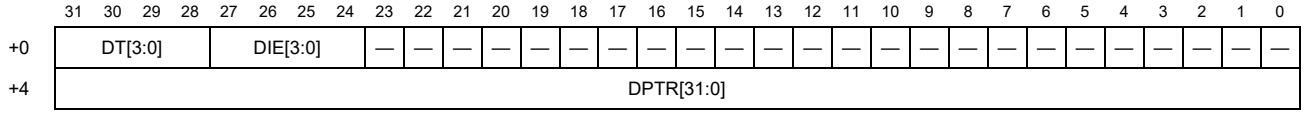

Table 100.13 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see Table 100.10, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(d) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 100.14 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 100.10, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

(8) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

Figure 100.1.3.3.5 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

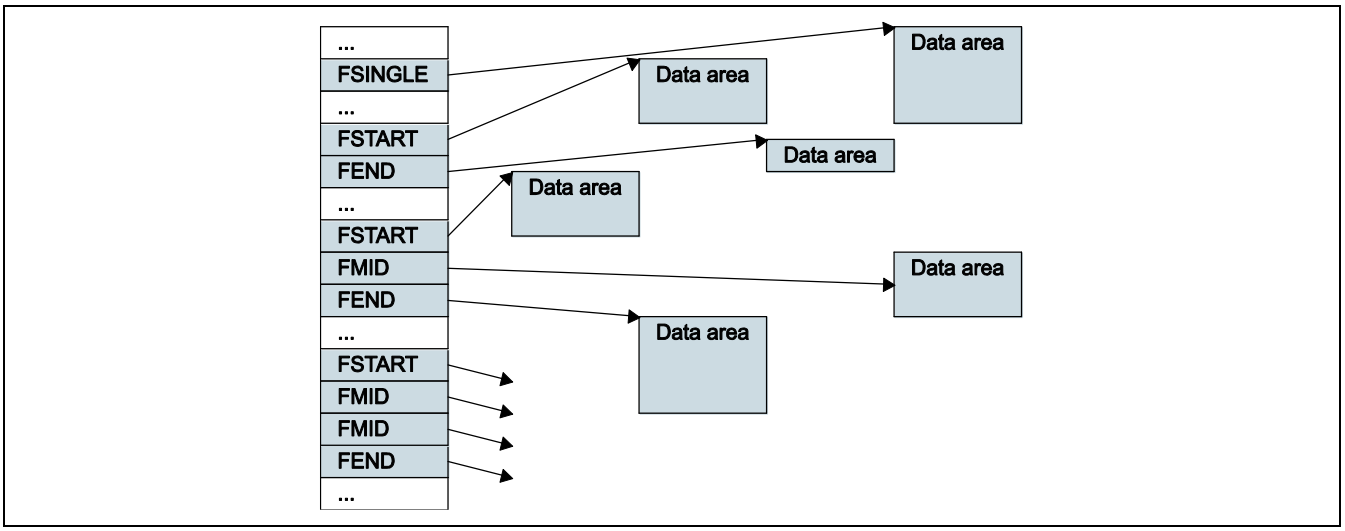

Figure 100.1.3.3.5 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the descriptor data area size field to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an “incremental data area” can be used to prevent empty spaces. For incremental data areas, see section 100.1.3.4(3)(b) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(9) How to Use Chain Control Descriptors

Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see section 100.1.3.3(2) Using Descriptor Chains in Queues)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

(10) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

(11) Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of EthernetAVB-IF can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 100.10 Summary of Descriptor Type).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

(12) Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H'x xx00 and H'x xx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

100.1.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

AVB-DMAC needs descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the E-MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see section 100.1.3.4(2) Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see section 100.1.3.4(1)(a) Separation Filtering.

Figure 100.1.3.4.1 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

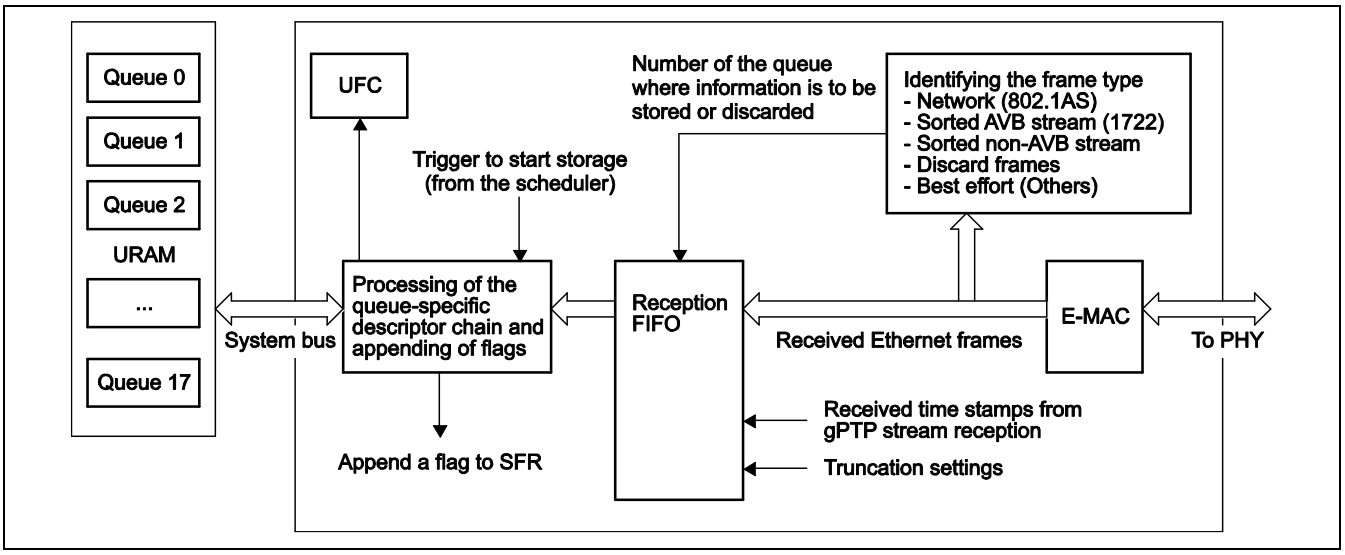

Figure 100.1.3.4.1 Mechanism of General Reception Queue Selection

(1) Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Frame fails the separation filter
  - It depends on RCR.ESF if such frame is discarded or stored in receive queue 0 (best effort).

The flowchart in Figure 100.1.3.4.2 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

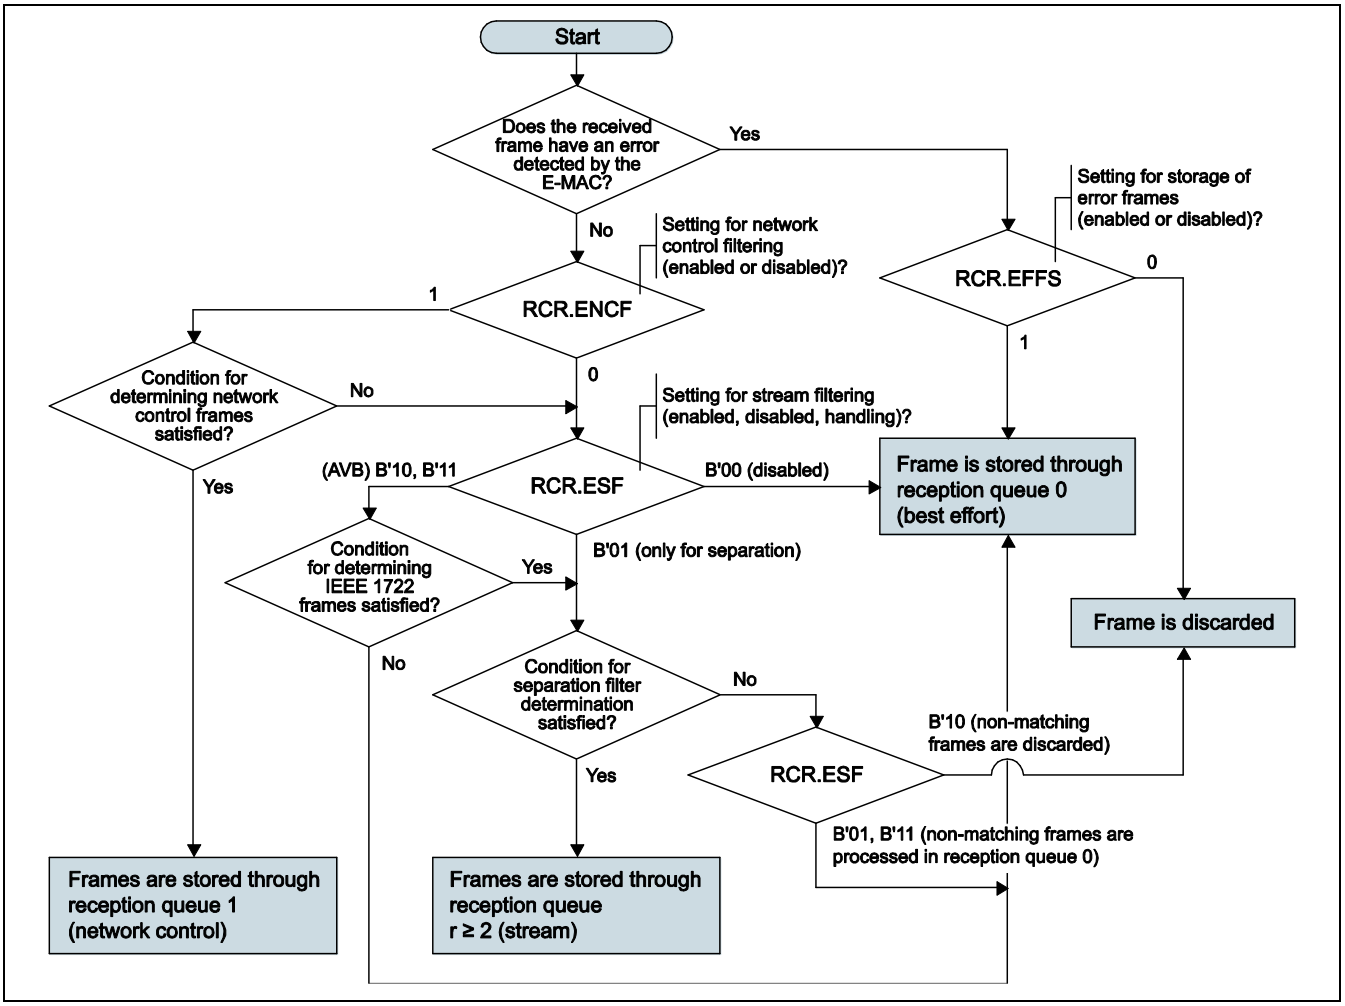

Figure 100.1.3.4.2 Mechanism of Reception Queue Selection

Notes on the meanings of entries in the flowchart

- “Condition for determining network control frames”
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
  The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
  The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00.
  The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
  See section 100.1.3.4(1)(a) Separation Filtering.

Figure 100.1.3.4.3 shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

Figure 100.1.3.4.3 Data Bytes of Ethernet Frames Used in Classification

(a) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can be freely set to reduce the number of bytes used in separation filtering or to mask particular bits.

Examples

To use one byte in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H'0000 0000.

To use seven bytes in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H'00FF FFFF.

Note: If bits at some positions are set to 0 in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only those bits in which the separation filter pattern configuration register (SFPi.FPs) setting is equal to the separation filter mask configuration register (SFMi.CFM) are sorted by matching with received data.

Figure 100.1.3.4.4 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

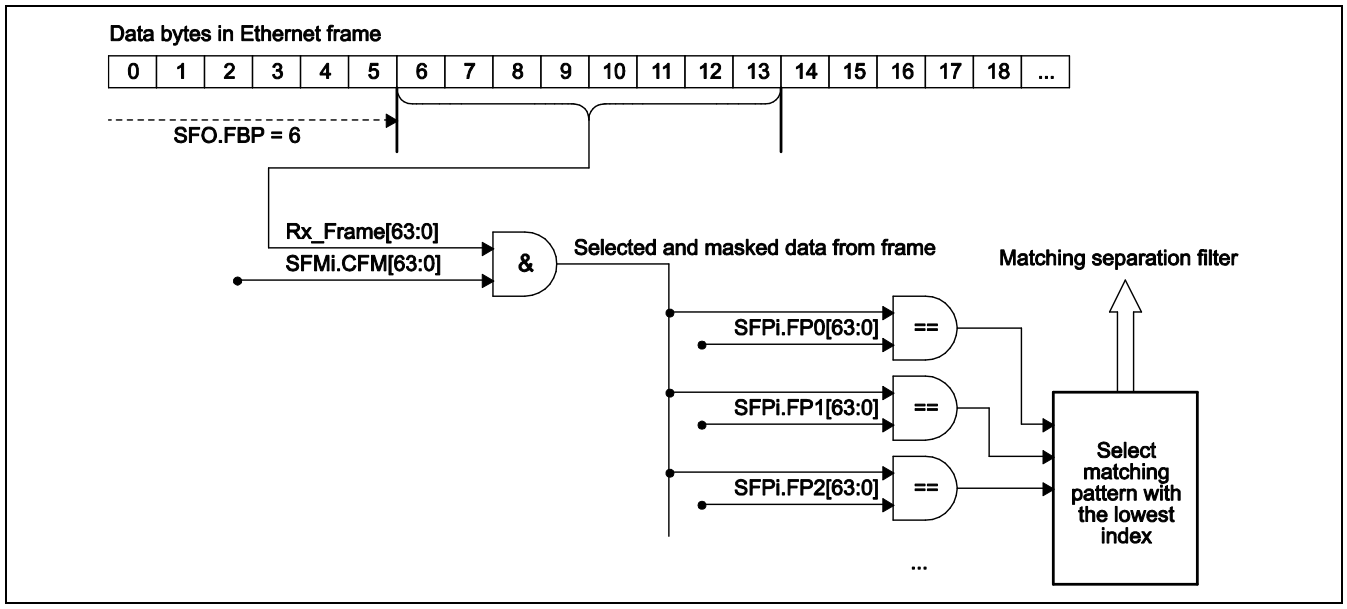

Figure 100.1.3.4.4 Separation Filtering

(b) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. Figure 100.1.3.4.5 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

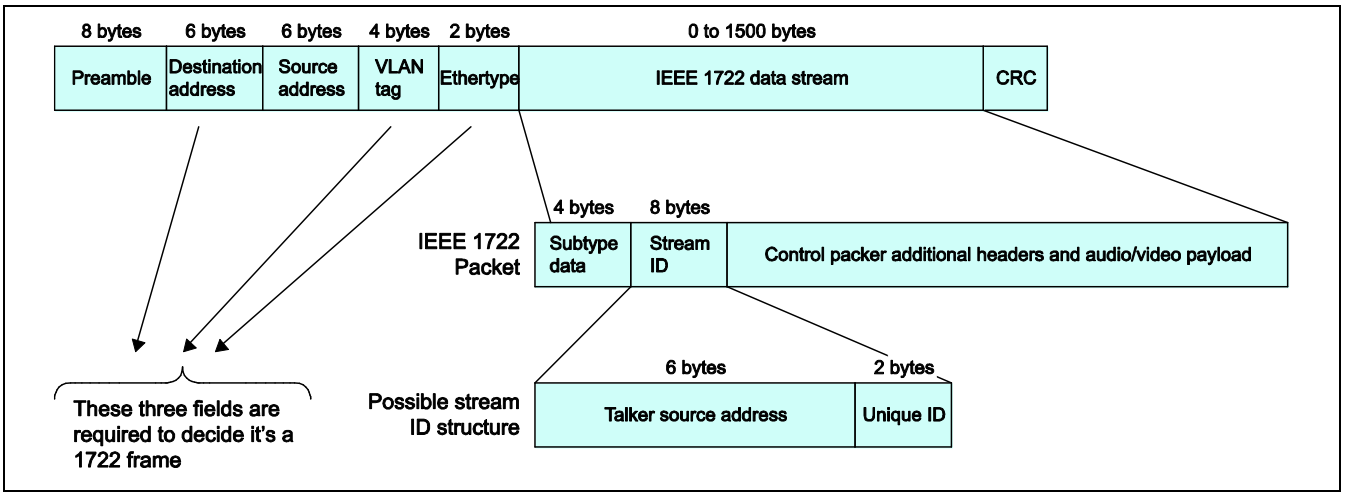

Figure 100.1.3.4.5 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in Figure 100.1.3.4.5, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'FFFF FFFF.
- To divide streams from various talkers into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'0000 FFFF. This excludes the unique ID from the filter condition.

(c) Reconfiguration of separation filter during OPERATION

In CONFIG mode the initial separation filter configuration is defined. To prevent inconsistent filter results during OPERATION direct parameter change is not possible; instead update mechanism by **SFVi.LV** and **SFL.LC** should be used.

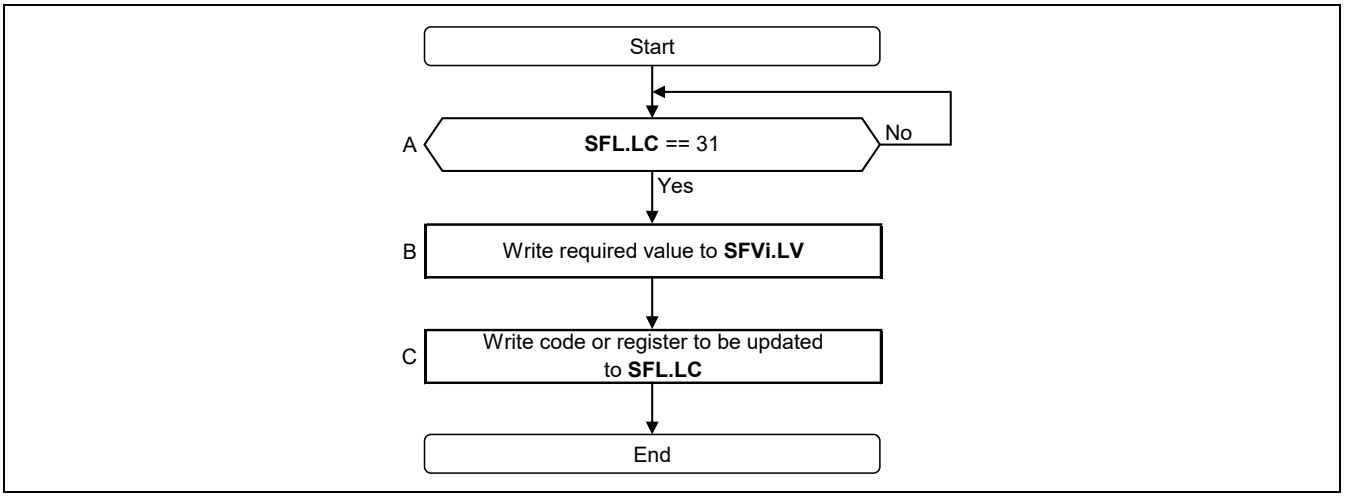

Figure 100.1.3.4.6 SW flow to update separation filter during OPERATION

When reconfigure separation filter, EthernetAVB-IF guarantees consistent classification for one received frame. If reconfiguration requires a sequence of parameter changes, CPU has to order reconfiguration based on application demand.

EthernetAVB-IF updates filter configurations when no frame reception is handled. In worse case the update is delayed by one frame reception. Exact duration depends on PHY speed and frame size. By reading **SFL.LC** CPU can observe when a previous update has been processed.

Note: Frame classification happens during frame reception and storage into internal Rx-FIFO. There may be frames with old classification pending in Rx-FIFO or under storage to URAM when filter reconfiguration is accepted.

(2) Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in section 100.1.3.3 Descriptors.

This section describes memory operations that are especially required in handling reception queues.

(a) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 100.15 shows the descriptor types used in reception.

Table 100.15 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	Condition for data not being stored in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see section 100.1.3.4(3)(a) Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	The descriptor can be used to store received data. All data for the frame are stored in the descriptor data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see section 100.1.3.4(3)(b) Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see section 100.1.3.4(3)(b) Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see section 100.1.3.4(3)(b) Incremental Data Areas.	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

(b) Configuration of Reception Frame Data Descriptors

Figure 100.1.3.4.7 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 100.16.

For the other fields and the descriptor types, see section 100.1.3.3(6) Descriptor Type.

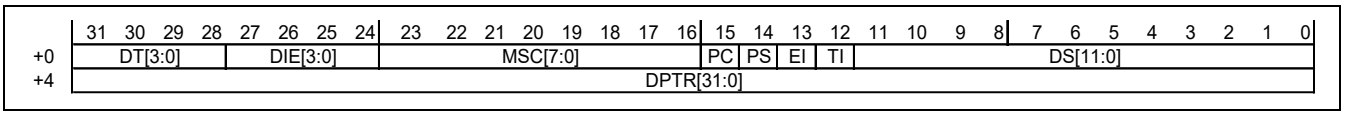

Figure 100.1.3.4.7 Configuration of Descriptor for a Received Frame

Table 100.16 Configuration of a Received Descriptor

Bit Name	Function
MSC	E-MAC Status Code These bits indicate errors in reception detected by the E-MAC. In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Carrier extend error MSC[5]: Carrier sense error MSC[4]: Received frame has alignment error. MSC[3]: Received frame is too long. MSC[2]: Received frame is too short MSC[1]: Error in frame reception (PHY detects an error) MSC[0]: Received frame has a CRC error.
PC	Payload Crc status This register is functional safety use only.
PS	Padding Selection These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the RPC register. 0: Padding is not to be inserted. 1: Padding data may be inserted. This depends on the RPC settings.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. 0: No error 1: Error is detected
TI	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored. These bits are set to the same value within all frame data descriptors for a divided frame. 0: Data have not been truncated. 1: Data have been truncated.

Note: The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

(3) Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the URAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in section 100.1.3.4(1)(a) Separation Filtering.

If the reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

(a) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY_ND descriptor after processing.

Also, the FSINGLE descriptor is stored in place of the FEMPTY_IS or FEMPTY_IC descriptor, which always hold the descriptor data area greater than all frame data in Rx-FIFO after processing.

Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.DS are only valid in the last descriptor of the sequence for a divided frame.

Note: If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(b) Incremental Data Areas

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 100.1.3.4.8 shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY_IC) within the descriptor chain holds received data. Figure 100.1.3.4.9 shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

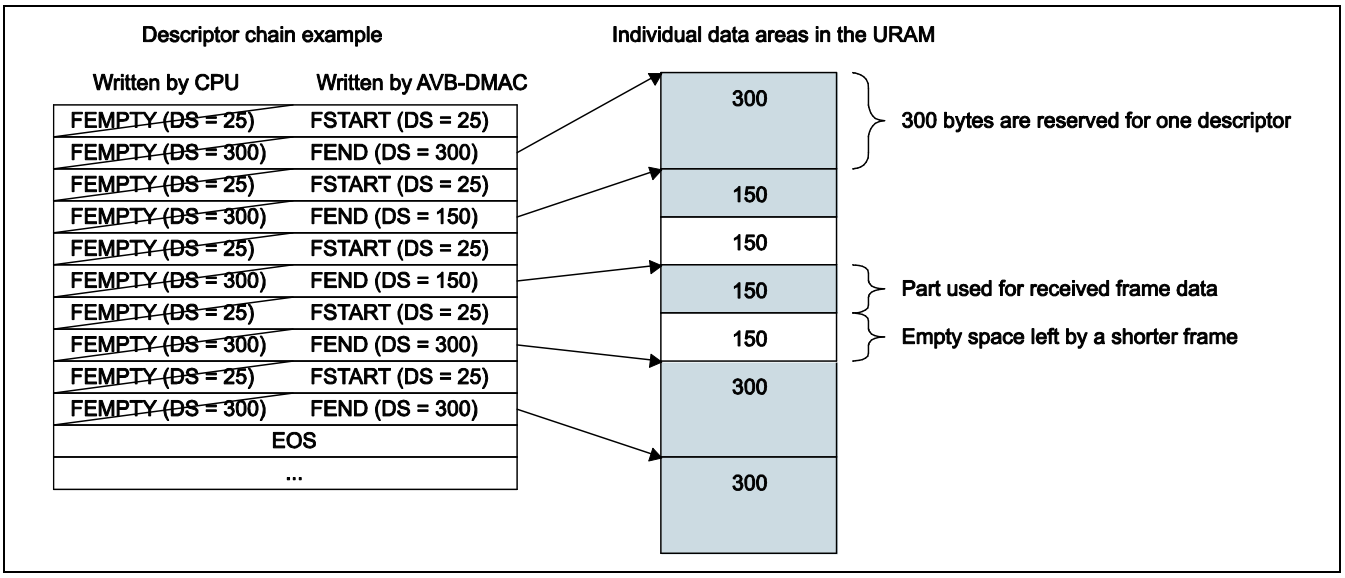

Figure 100.1.3.4.8 A Reception Queue Using Individual Descriptor Data Areas

Figure 100.1.3.4.8 and Figure 100.1.3.4.9 show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header (which is treated as one descriptor; and is outside the scope) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In Figure 100.1.3.4.8, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so recovery is automatic without software interaction. The EOS is not required with the incremental descriptors because all data being processed are always stored while an incremental data area is in use.

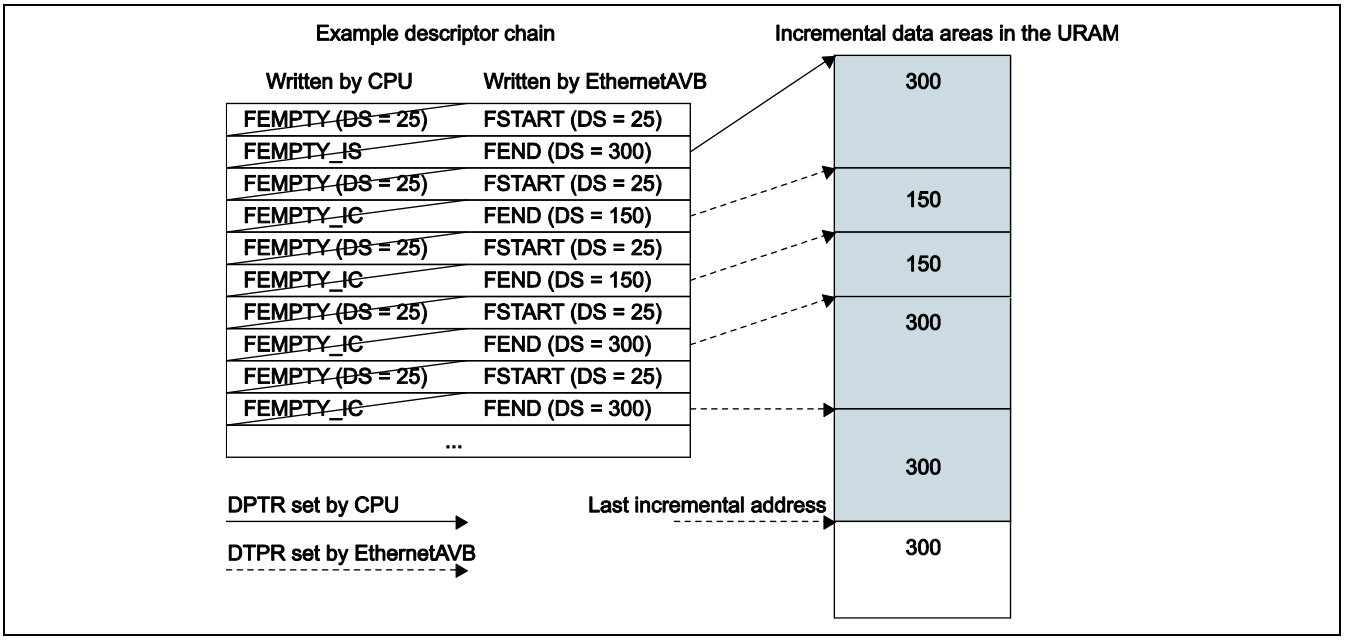

Figure 100.1.3.4.9 Reception Queue Using a Common Incremental Data Area

As Figure 100.1.3.4.9 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area, which has no empty storage areas between frame data. The only empty space is that at the end of the incremental data area. The sizes of incremental data areas and of blocks of data for storage in incremental data areas must be multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced. DESCR.DS can be read to check for such empty spaces.

CPU cannot restrict directly the amount of received data stored by an incremental descriptor (FEMPTY_IS, FEMPTY_IC) as this is possible for other descriptors (FEMPTY, FEMPTY_ND) by DESCR.DS. Incremental descriptors store always all received data.

Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC) means that the incremental storage area of N times of maximum frame size is needed.

As Figure 100.1.3.4.9 shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The next FEMPTY_IS descriptor in the chain indicates the processing step where data must be stored in the incremental data area.

Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (RPC.DCNT) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received by the E-MAC, and B indicates the frame data stored in the descriptor data area (32-bit word units).

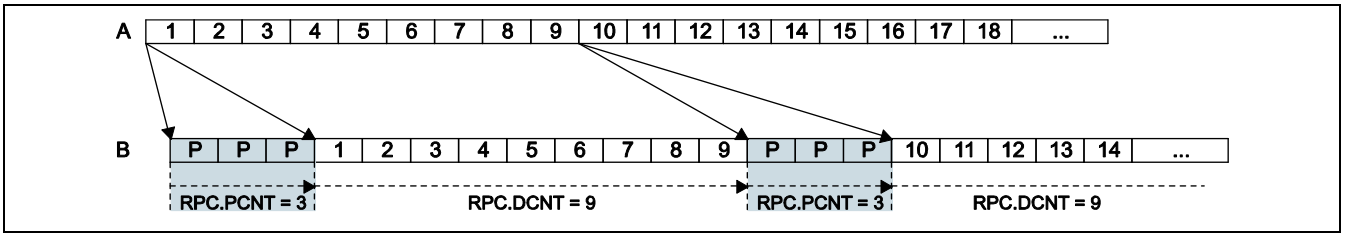

Figure 100.1.3.4.10 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(c) Mode with Write-Back

Constructing a descriptor chain requires software (see Figure 100.1.3.4.11).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

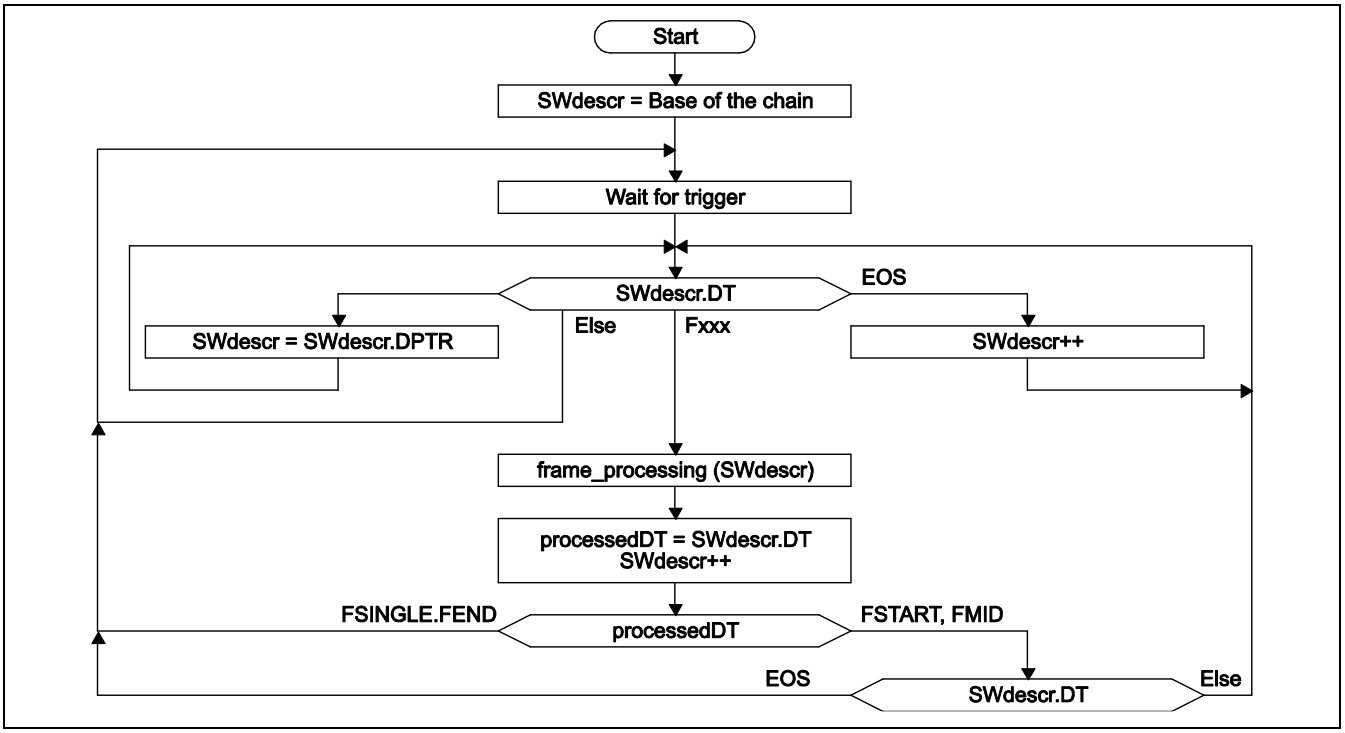

Figure 100.1.3.4.11 Flow of Reception Descriptor Processing (with Write-Back)

(d) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supports reception time stamps based on the gPTP timer by storing time stamps, which have been captured when Start Frame Delimiter (SFD) of a received frame is arrived, in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see section 100.1.3.7(1) gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

(4) Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four warning and stop levels for each unread frame counter. The 0 setting disables the stop and warning functions. For how to set this up, see Figure 100.1.3.4.12.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in section 100.1.3.4(4)(a) Unread Frame (UFC) Synchronization Failure.

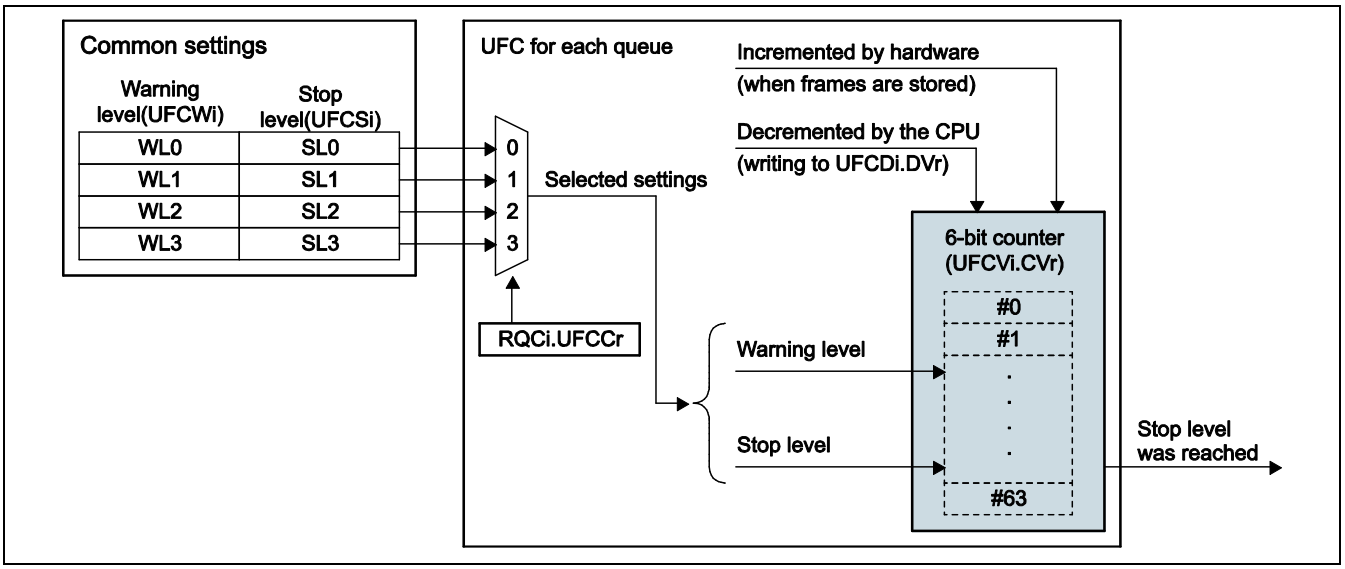

Figure 100.1.3.4.12 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(a) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value
  When the value of a counter in an unread frame counter register i (UFCVi) (i = 0 to 4) reaches 63, synchronization for the corresponding queue can fail.
  The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor
  In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
  If an unread frame counter reaches its stop level while synchronization remains normal, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set. Software must respond to this.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain may contain more available frames than it actually can. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

100.1.3.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see section 100.1.3.3 Descriptors).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

(1) Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the {TGC.TQP, TGC.ECBS} bits) being B'01 or B'11.
- Non-AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the {TGC.TQP, TGC.ECBS} bits) being B'00.

(a) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for SR traffic is Highest priority queue.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*1, MVRPDU*2, best effort (BE), etc.)

Notes: 1. MSRPDU: Multiple Stream Registration Protocol Data Unit
2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bit and enable credit based shaping bit in the transmit configuration register (TGC.TQP and TGC.ECBS). In the default priority scheme, which is called AVB mode 1 (selected by {TGC.TQP, TGC.ECBS} = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits {TGC.TQP, TGC.ECBS} = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting is for non-AVB-mode transmission.

Table 100.17 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
Default	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
Alternative	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under section 8.6.8, Transmission selection, of the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see section 100.1.3.6 CBS (Credit-Based Shaping).

When the following conditions both hold, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 100.1.3.5.1 and Figure 100.1.3.5.2 are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

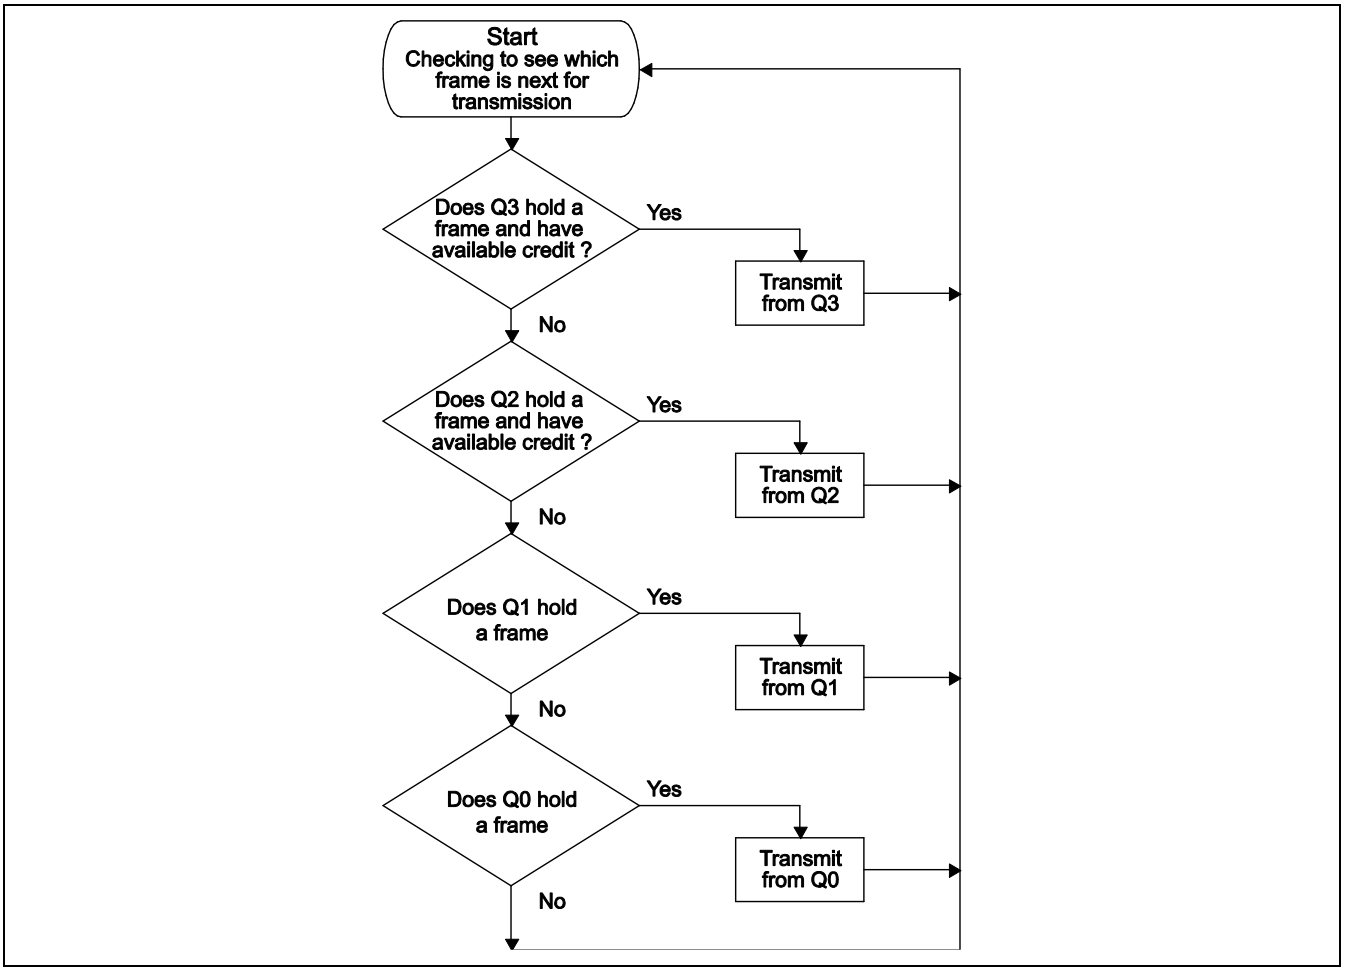

Figure 100.1.3.5.1 Flow of Selection for Transmission in AVB Mode 1 (Default)

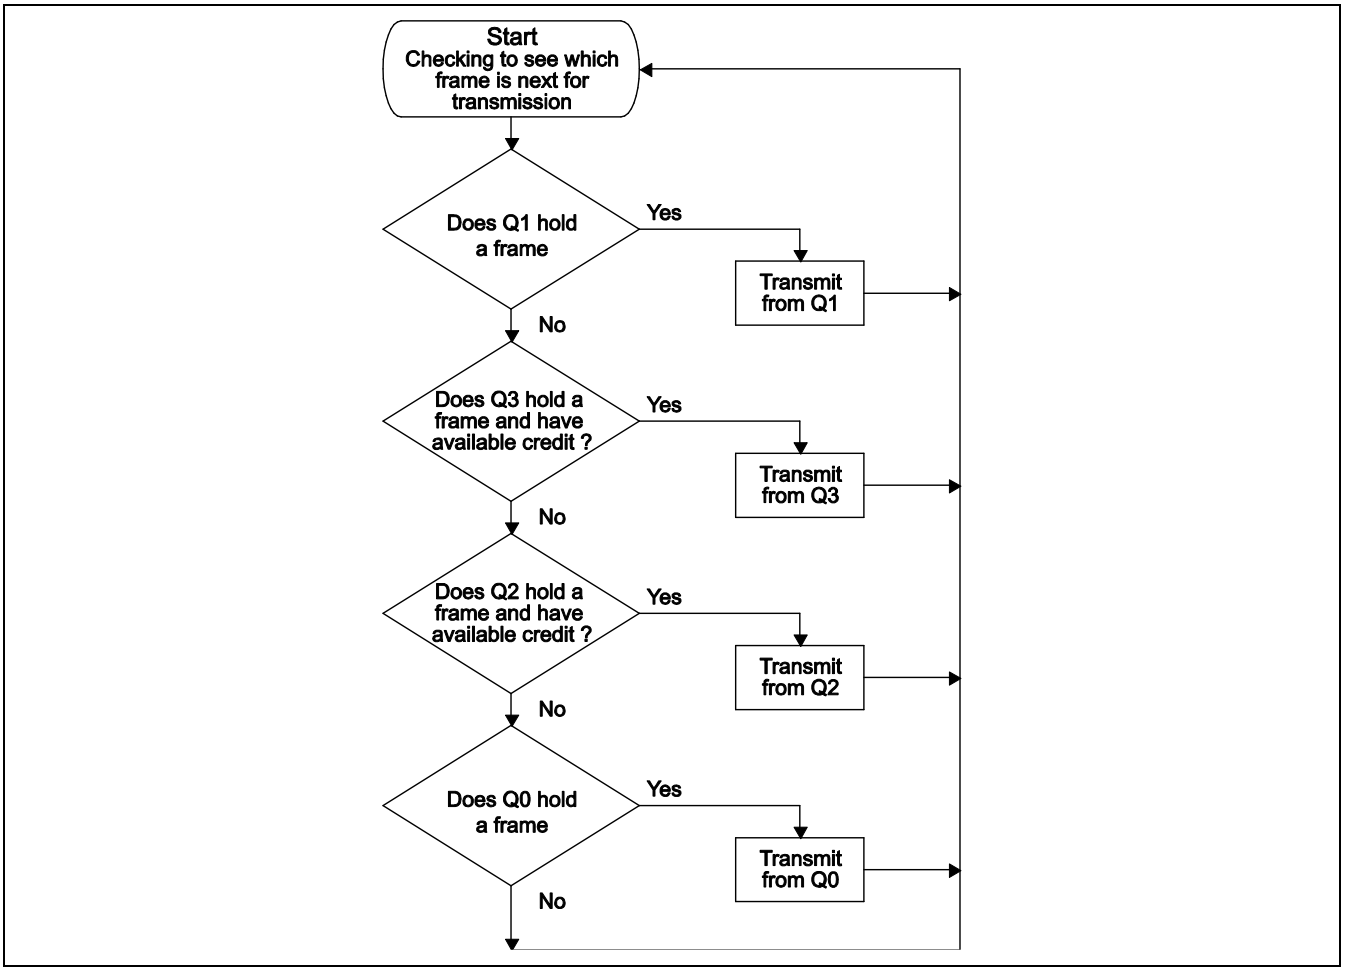

Figure 100.1.3.5.2 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

(b) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bit and enable credit based shaping bit in the transmit configuration register {TGC.TQP, TGC.ECBS} are B'00), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

Figure 100.1.3.5.3 shows the flow of selection in non-AVB transmission mode.

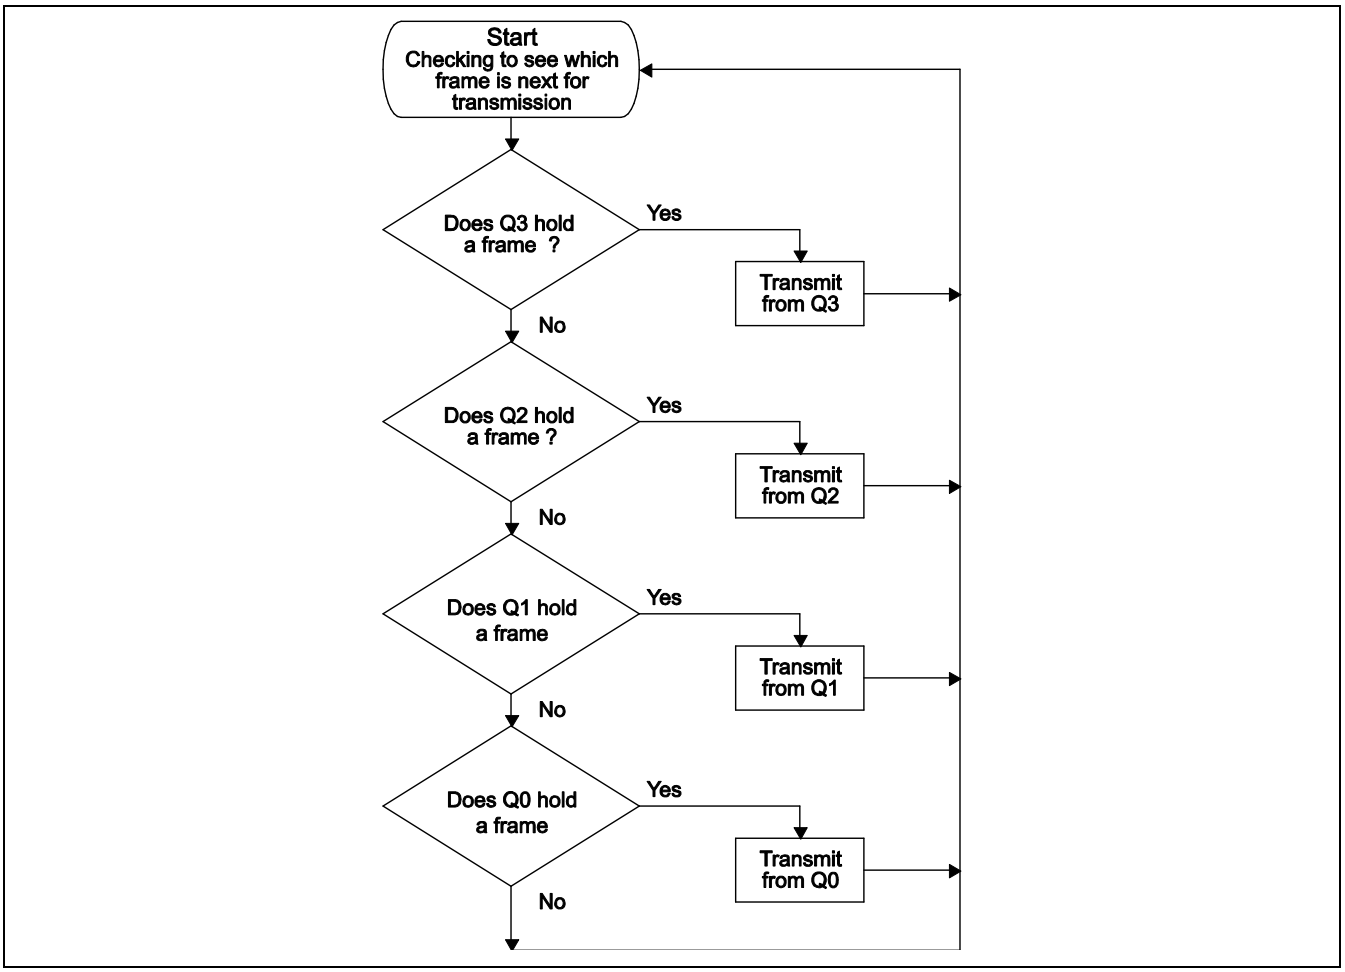

Figure 100.1.3.5.3 Flow of Selection for Transmission in Non-AVB Mode

(c) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 122 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq). The setting of TGC.TBDq is fixed to 2.

General Usage Examples:

Q0: Frames containing up to 1500 bytes → 1500/128 = 11.7 → 12 clusters
Q1: Frames containing up to 1024 bytes → 1024/128 = 8.0 → 8 clusters
Q3: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters
Q4: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters
When the depth of all transmission queues is 2, only the following number of clusters is required.
$2 \times (12 + 8 + 16 + 16) + 16 = 2 \times 52 + 16 = 120$

In the worst case (each of the transmission queues holds 1996 bytes), $2 \times 64 + 16 = 144$ clusters are required, so the maximum length of transmission frames must be less than 1996 bytes for some queues.

(2) Setting Up Transmission Descriptors

(a) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 100.18 shows the descriptor types used in transmission.

Table 100.18 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(b) Configuration of Transmission Frame Data Descriptors

Figure 100.1.3.5.4 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.MSR, DESCR.TSR, and DESCR.TAG) are described in Table 100.19.

For the other fields and the descriptor types, see section 100.1.3.3(6) Descriptor Type.

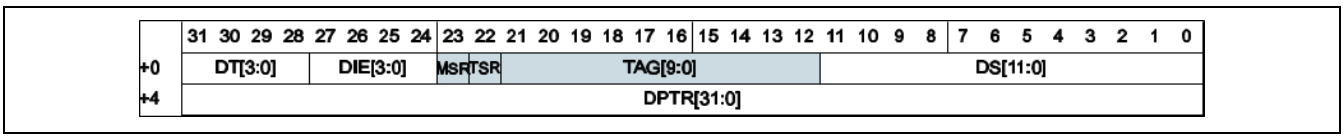

Figure 100.1.3.5.4 Configuration of Descriptor for a Transmitted Frame

Table 100.19 Configuration of a Transmission Descriptor

Bit Name	Function
MSR	MAC Status storage Request This bit configures if E-MAC transmission status of the frame is stored in E-MAC status FIFO. 0b: No status information is stored 1b: Status information is to be kept for this frame in MAC status FIFO This bit is considered only if DESCR.DT = FEND or FSINGLE. Note: If there is error during transmission of frame by E-MAC then status is always stored.
TSR	Time Stamp Store Request This bit specifies whether the transmission time stamp is to be stored within the EthernetAVB-IF module. 0: The time stamp status FIFO within the EthernetAVB-IF module does not retain a transmission time stamp. 1: The time stamp status FIFO within the EthernetAVB-IF module retains a transmission time stamp. This bit is available while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data with a time stamp. Frame TAG is not required but is recommended. This bit is available while the current DESCR.DT is FEND or FSINGLE.

For the time stamp FIFO function, see section 100.1.3.5(4) Time Stamping in Transmission.

(3) Transmission

(a) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue t (with q = t) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in section 100.1.3.3 Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 100.1.3.5.5 shows descriptor processing during transmission.

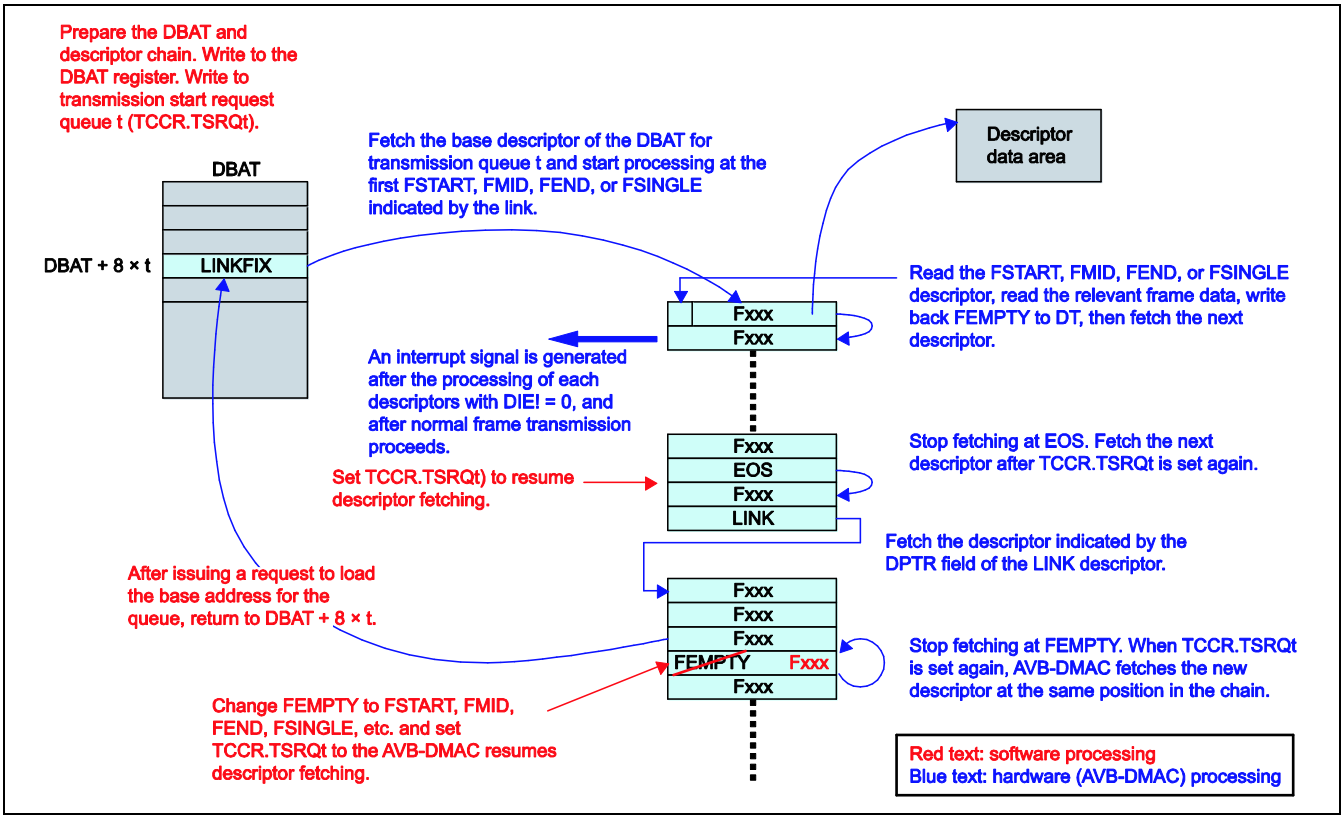

Figure 100.1.3.5.5 Descriptor Processing During Transmission

(b) Examples of Descriptor Usage

Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 100.1.3.5.6 shows the flow for software implementing this pattern. SW should read back written descriptor between changing FEMPTY descriptor before writing to TCCR.TSRQt.

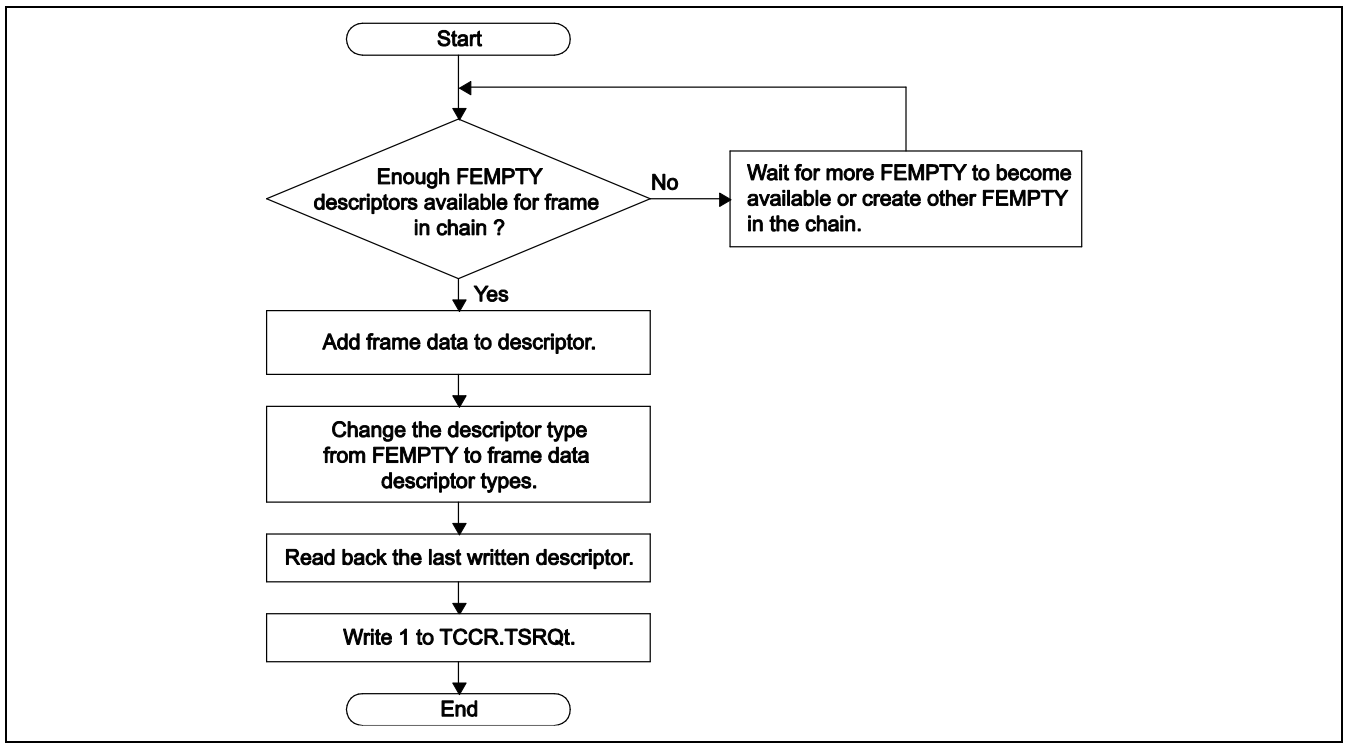

Figure 100.1.3.5.6 Software Flow for Immediate Frame Transmission

Figure 100.1.3.5.7 shows software and AVB-DMAC operations for immediate frame transmission.

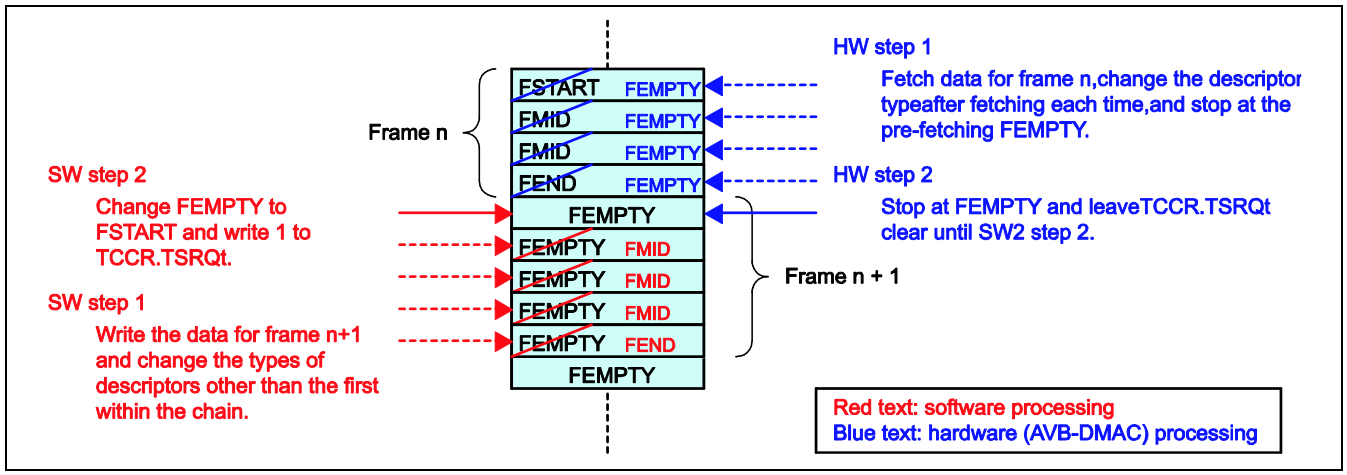

Figure 100.1.3.5.7 Software and AVB-DMAC Operations for Immediate Frame Transmission

Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 100.1.3.5.8 shows the software flow in this pattern.

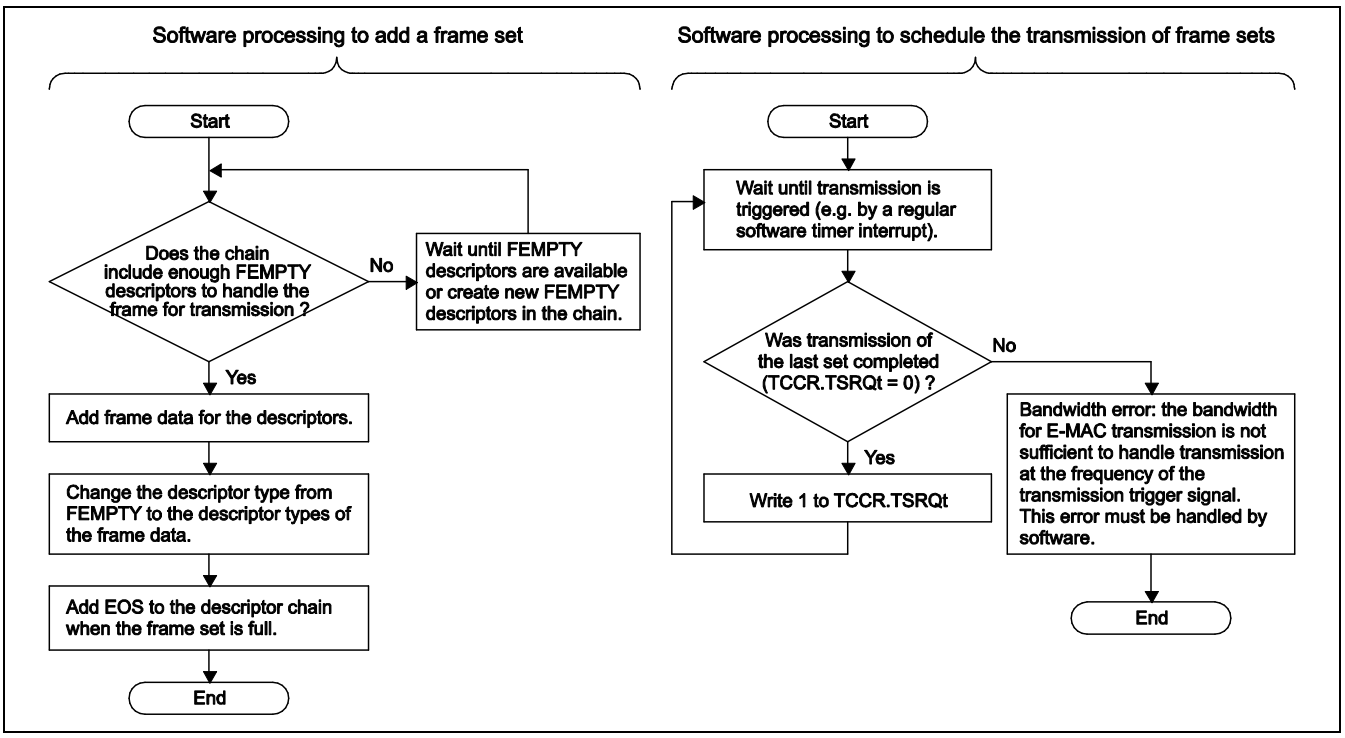

Figure 100.1.3.5.8 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 100.1.3.5.9 shows software and AVB-DMAC operations for frame set transmission.

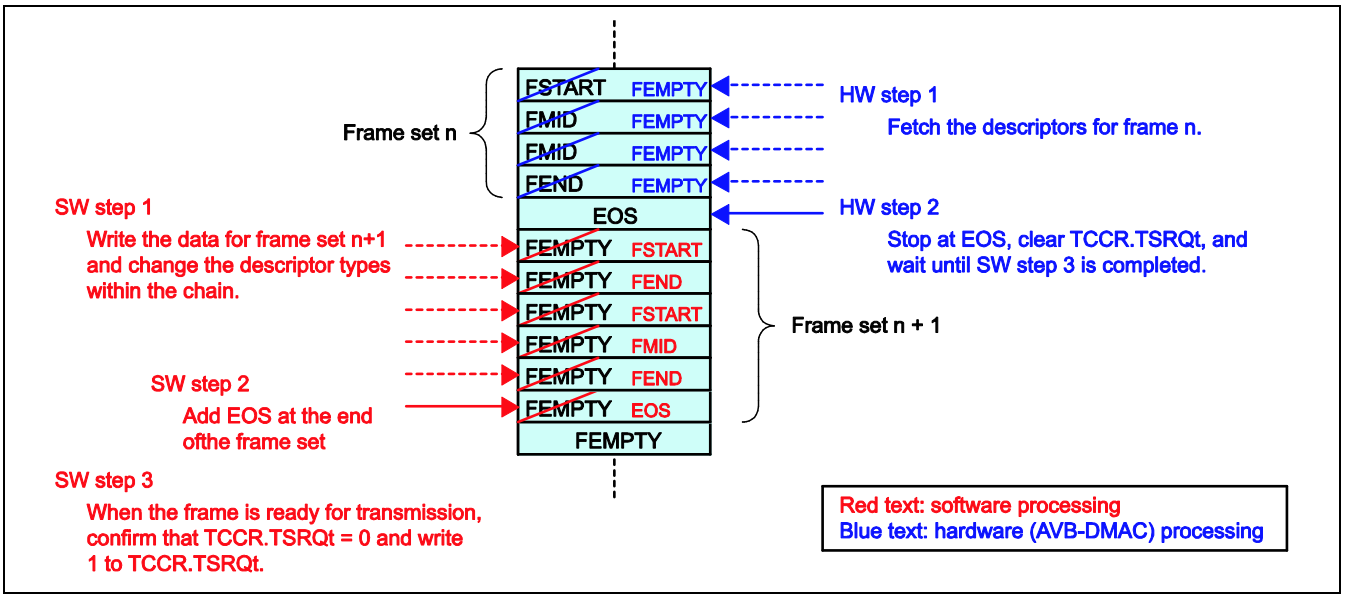

Figure 100.1.3.5.9 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 100.1.3.5.10 shows the flow for software implementing this pattern.

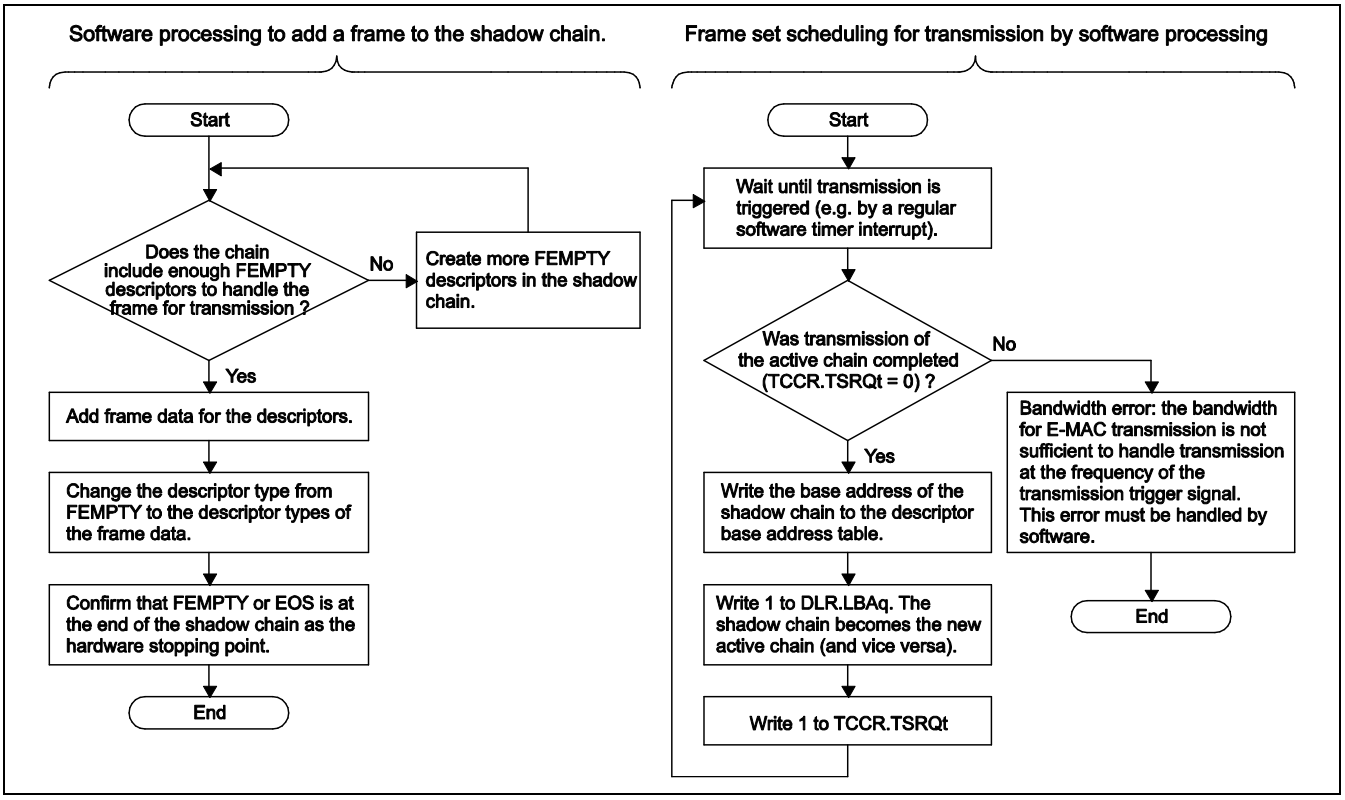

Figure 100.1.3.5.10 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 100.1.3.5.11 shows software and AVB-DMAC operations for frame set transmission.

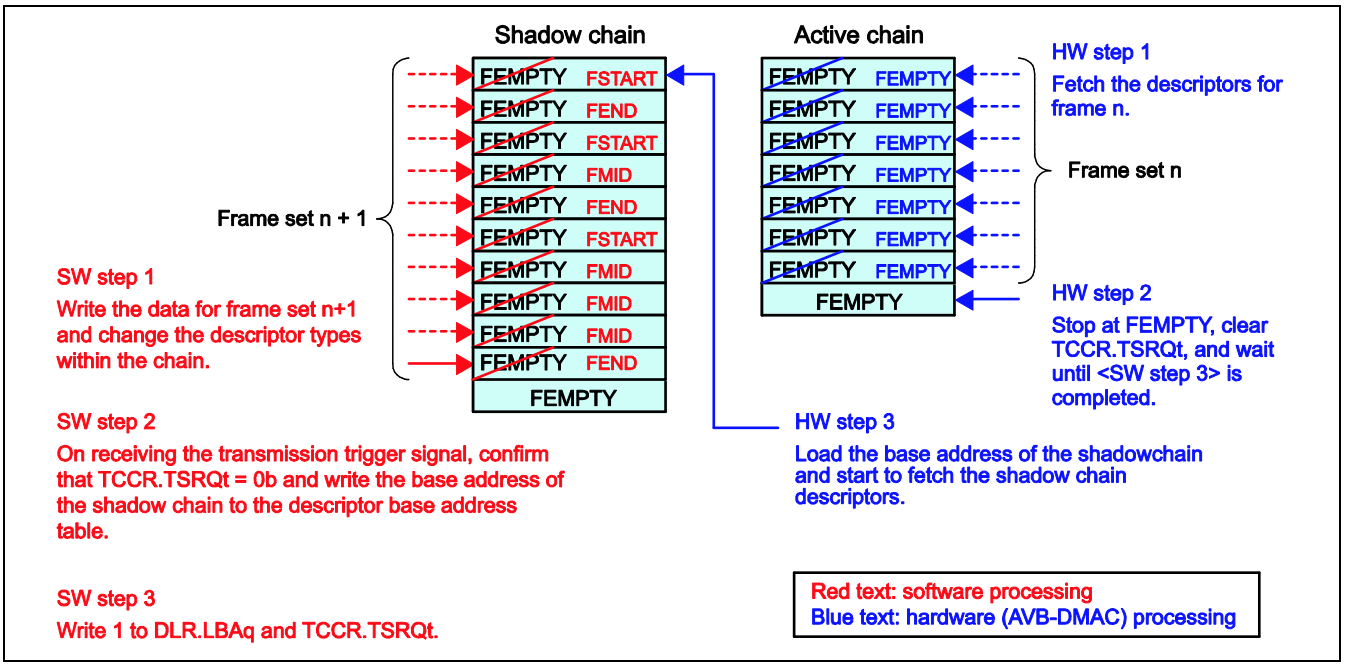

Figure 100.1.3.5.11 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

(4) Time Stamping in Transmission

Transmission time stamps are important in satisfying the requirements for timing and synchronization of the IEEE 802.1AS standard. Reference to this information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of time stamps for transmitted frames. The time-stamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor (FEND or FSINGLE) for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

Figure 100.1.3.5.12 shows the mechanism supporting transmission time stamping.

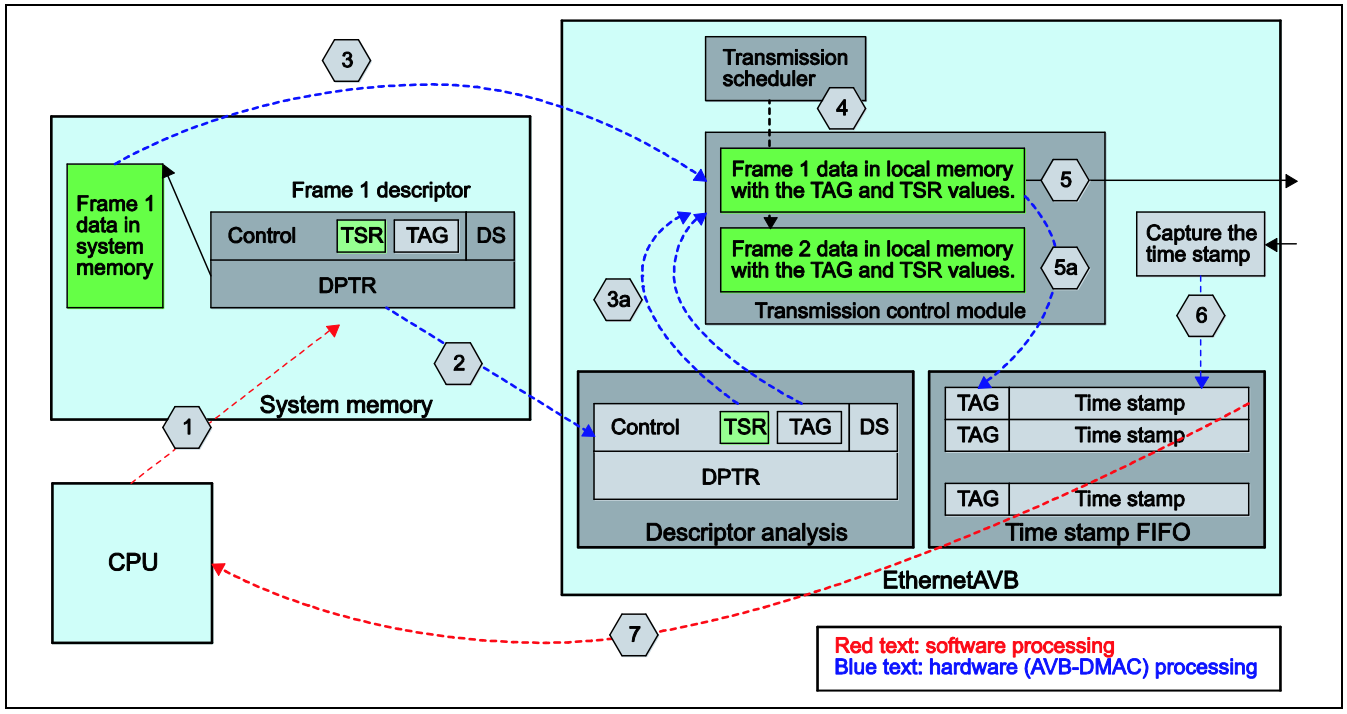

Figure 100.1.3.5.12 Mechanism to Support Transmission Time Stamps

The method of using this function is described below:

1. Secure space in the URAM for the frame requiring time stamping.
   Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. The time stamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the time stamp.
3. The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.
   3a: The frame tag field (DESCR.TAG) and time stamp storage request field (DESCR.TSR) are stored with the fetched data.)
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame 1.
5. Transmission of frame 1 starts.
   5a: Frame 1's tag is stored in the time-stamp FIFO.
6. The gPTP time stamp is captured at the start of frame delimiter (SFD) for transmission and stored with the tag in the time-stamp FIFO when the frame is completely transmitted. An interrupt is generated to indicate existence of new timestamp information. For this to happen, the descriptor interrupt control register (DIC) must be set beforehand.
7. The entry can now be read from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the FIFO is full, further time stamps supplied to it are lost.

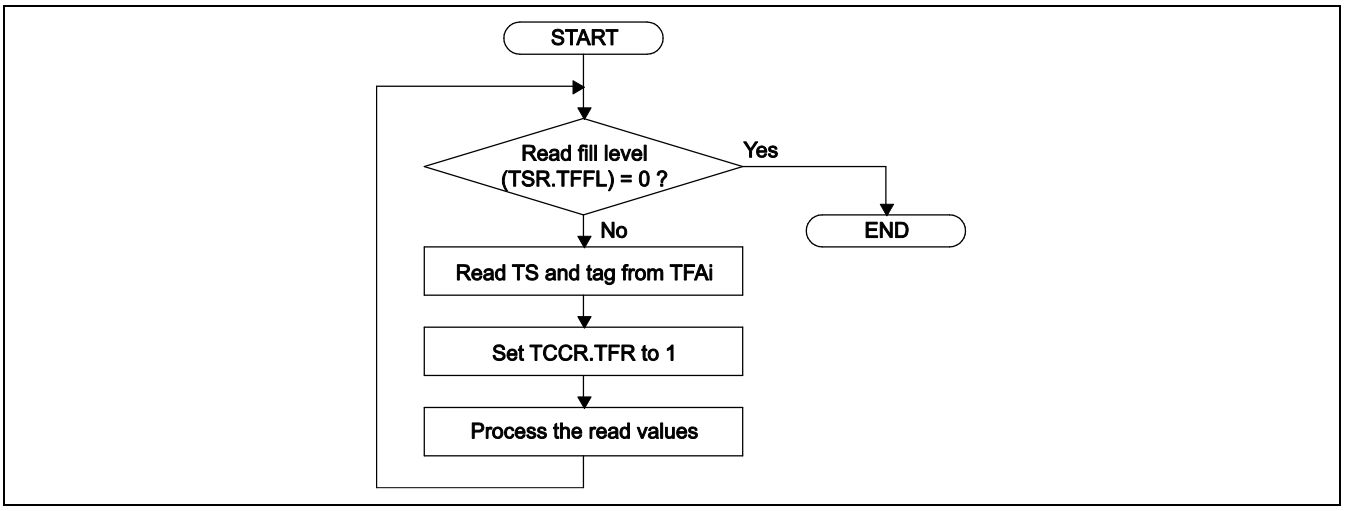

Figure 100.1.3.5.13 Flow of Transmission Time Stamping

(5) Ending Transmission

Figure 100.1.3.5.14 shows the procedure for ending transmission.

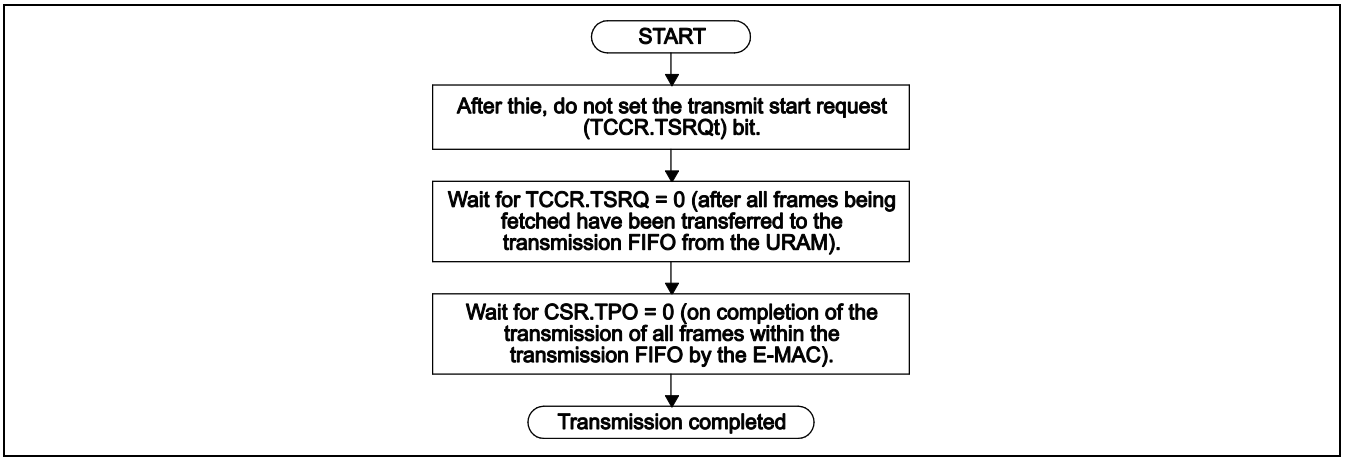

Figure 100.1.3.5.14 Procedures for Ending Transmission

100.1.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority bit and enable credit based shaping bit in the transmit configuration register {TGC.TQP, TGC.ECBS} are B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

At least one frame is stored in the queue.

The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.
idleSlope = bandwidthFraction × portTransmitRate

sendSlope: Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.
The value of sendSlope is defined as follows:
sendSlope = idleSlope – portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize × (idleSlope / portTransmitRate)

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation:
loCredit = maxFrameSize × (sendSlope / portTransmitRate)

Figure 100.1.3.6.1 shows how the CBS algorithm works and the meaning of the above parameters.

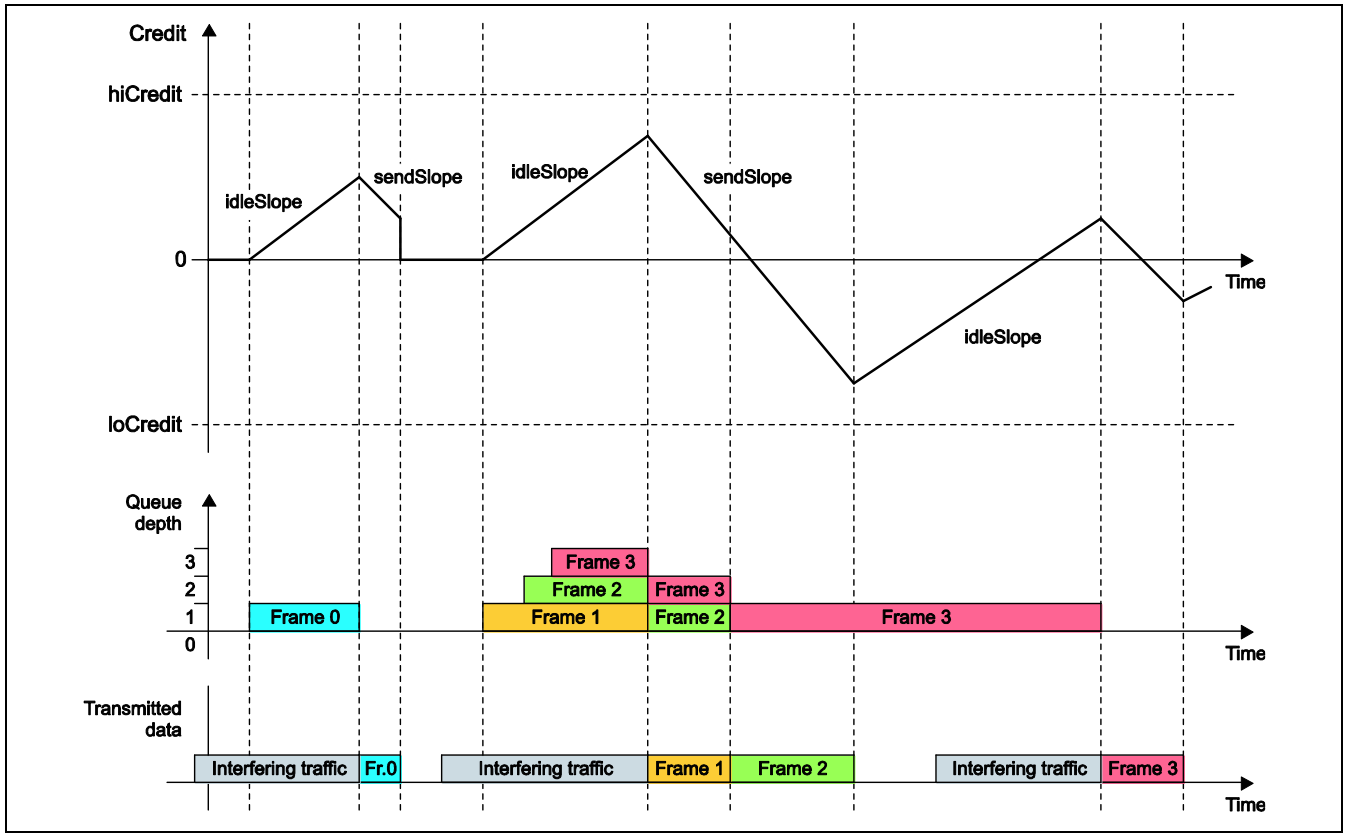

Figure 100.1.3.6.1 CBS (Credit-Based Shaping) Operation

Figure 100.1.3.6.2 shows the implementation of CBS in the AVB-DMAC.

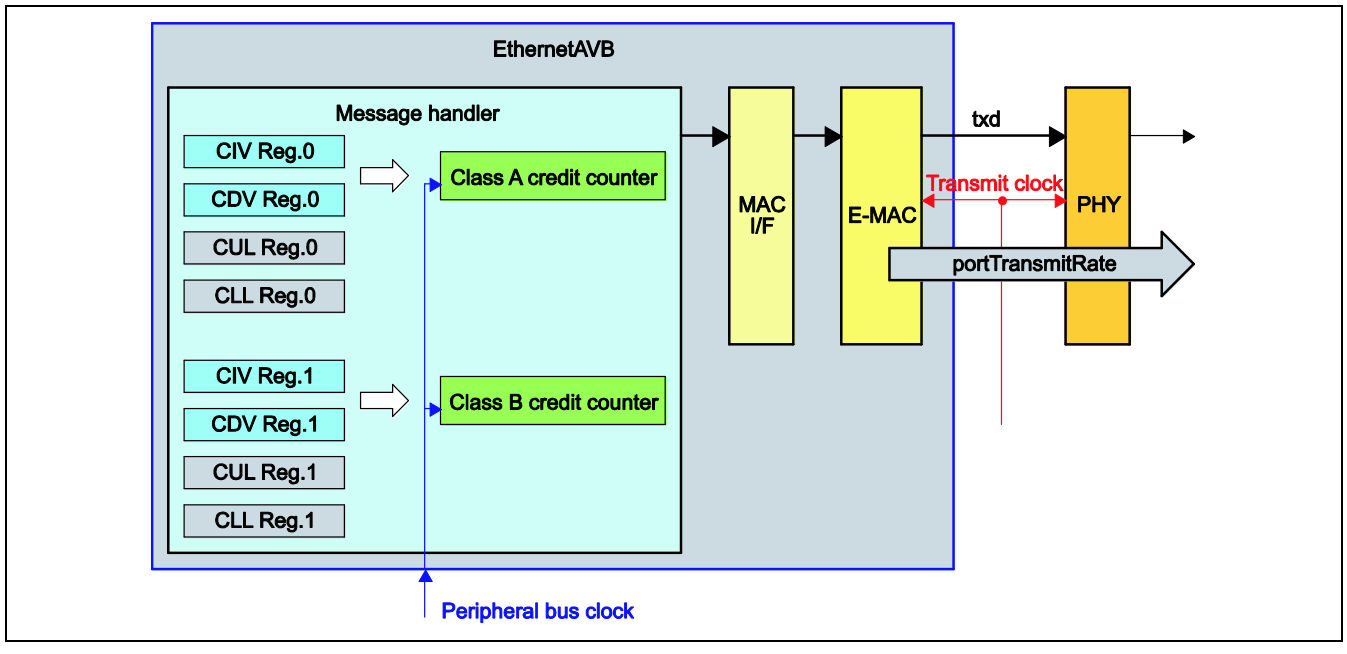

Figure 100.1.3.6.2 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every high-speed peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every high-speed peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

CIV = idleSlope × Mfactor
CDV = sendSlope × Mfactor

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.

CIV = (portTransmitRate/HPϕ) × bwFraction × Mfactor
CDV = (portTransmitRate/HPϕ) × (bwFraction – 1) × Mfactor

HPϕ is the frequency of the high-speed peripheral bus clock. The credit counters are driven by the high-speed peripheral bus clock, so calculating the slope parameters for CBS requires (1/HPϕ).

Use software to prepare Mfactor for the CBS parameters. All queues for the same class must have the same Mfactor for all CBS parameters. Mfactor for a specified class c can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class A and class B are 0. Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). These are treated as dynamic settings since they should be updated when streams are registered and erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

CUL = hiCredit × Mfactor = maxInterferenceSize × bwFraction × Mfactor
CLL = loCredit × Mfactor = maxFrameSize × (bwFraction – 1) × Mfactor

Example:

Assume that portTransmitRate = 100 Mbps, HPϕ = 133.33 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the high-speed peripheral bus clock are as follows.

idleSlope = (portTransmitRate/HPϕ) × bwFraction = 100/133.33 (Mbps/MHz) × 3% = 0.023 bit per high-speed peripheral bus clock cycle
sendSlope = idleSlope – (portTransmitRate / HPϕ) = –0.727 bits per high-speed peripheral bus clock cycle
Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV = idleSlope × Mfactor = 2.3
CDV = sendSlope × Mfactor = –72.7

Note : 133MHz is calculation example. Need to replace with S0D8_HSC ϕ and calculate.

(1) Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
  classA bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.
  hiCredit_max_classA ≅ maxInterferenceSize for class A = Interference due to one max. sized frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (≅80 bytes) ≅ 2100 bytes
- Class B maximum value (hiCredit_max_classB)
  classB bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the class A transmission queue and other transmission queues.
  hiCredit_max_classB ≅ maxInterferenceSize for class B = Interference due to two max-size frames = 2 × hiCredit_max_classA ≅ 4200 bytes

hiCredit_max_classA = 16800

hiCredit_max_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:

Mfactor_max_classA = 2^{31}–1 / hiCredit_max_classA ≅ 127826 and
Mfactor_max_classB = 2^{31}–1 / hiCredit_max_classB ≅ 63913.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

CIV = idleSlope x Mfactor = (portTransmitRate / HPϕ) × bandwidthFraction × Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

CIV_max_classA = (portTransmitRate / HPϕ) × Mfactor_max_classA and
CIV_max_classB = (portTransmitRate / HPϕ) × Mfactor_max_classB.

The maximum values when portTransmitRate = 1000 Mbps and HPϕ = 133.33 MHz are as follows:

CIV_max_classA ≅ 958719

CIV_max_classB ≅ 479359

These values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV ≤ 65535 applies to both class A and class B.

Note : 133MHz is calculation example. Need to replace with S0D8_HSCφ and calculate.

(2) Credit Incrementation during Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CBS credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 100.1.3.6.3 illustrates credit operations during IFGs.

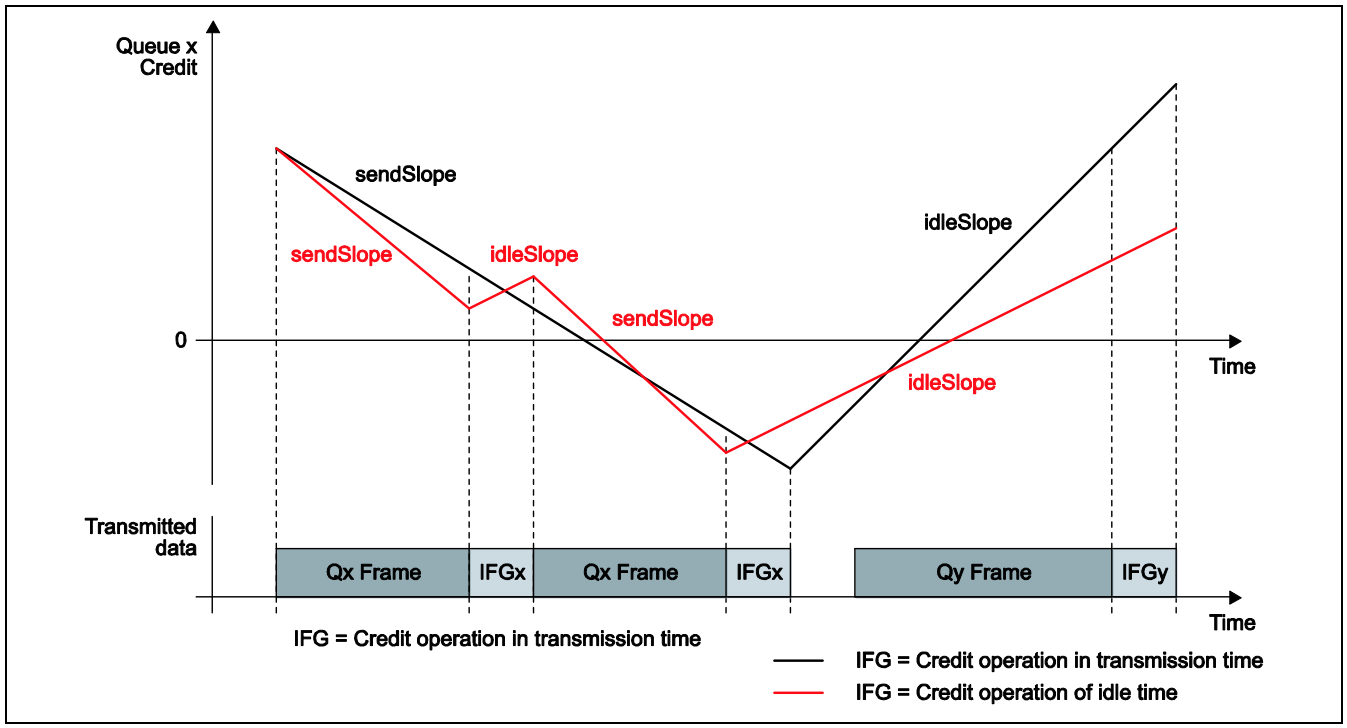

Figure 100.1.3.6.3 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate. This is described in *Section 35.2.2.8.4* of *IEEE 802.1Q*.

(3) Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 µs), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets × 8 bits per octet × 8000 frames per second) for this class. If the E-MAC is assumed to run at 1 Gbps (portTransmitRate), this is equivalent to the allocation of about 0.78% of the total bandwidth to each class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 0.78% allocation does not lead to the total allocation of bandwidth being greater than 100% of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80-bit payload + 30-bit overhead = 110-octet measurement interval for the class → the total bandwidth for the class = 7.04 Mbps = 0.704% of portTransmitRate.

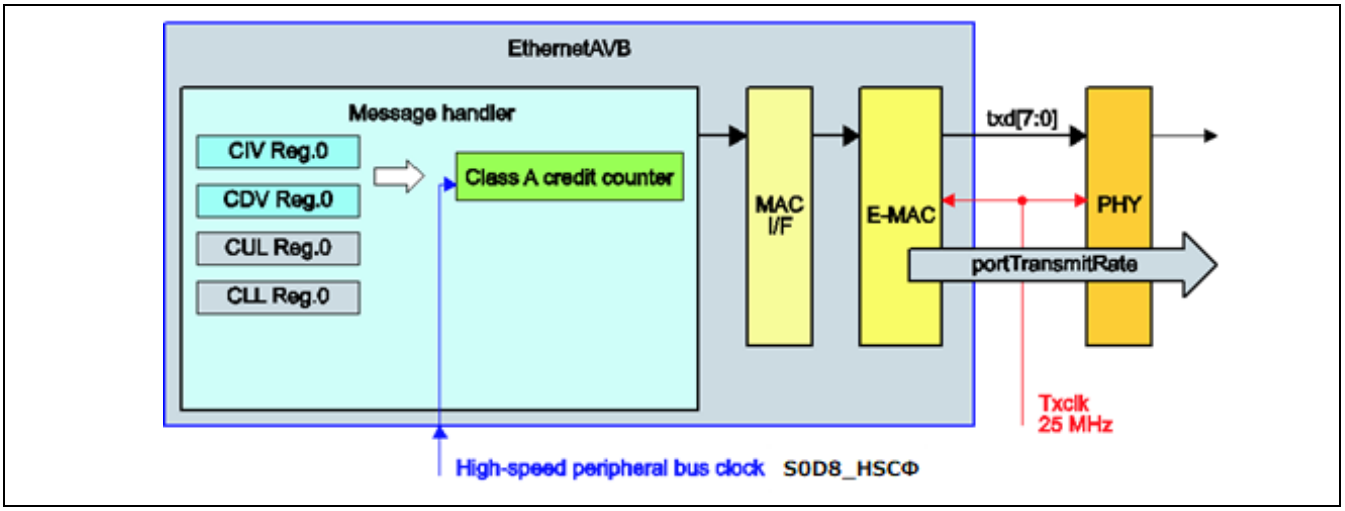

Figure 100.1.3.6.4 Example of CBS Settings

Given that:

- the E-MAC runs at 1000 Mbps, so portTransmitRate = 1000 Mbps and
- high-speed peripheral bus clock (operating clock for the credit counter) frequency = 133.33 MHz, securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.
  bandwidthFraction = 0.704%
  idleSlope = (portTransmitRate / HPϕ) × bandwidthFraction ≅ 0.0528 bits per high-speed peripheral bus clock cycle
  sendSlope = idleSlope – (portTransmitRate / HPϕ) ≅ –7.44739 bits per high-speed peripheral bus clock cycle

When Mfactor = 100000, the parameters are as follows.

- CIV = idleSlope × Mfactor = 5280 bits per high-speed peripheral bus clock cycle
- CDV = sendSlope × Mfactor = 744739bits per high-speed peripheral bus clock cycle

These are the final values for setting in the CIVR1 and CDVR1 registers.

Note : 133MHz is calculation example. Need to replace with S0D8_HSCφ and calculate.

100.1.3.7 Flow Control

The EthernetAVB-IF does not support flow control in the specification. Flow control is only effective when transmitting and receiving only normal (non-AVB) packets.

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the RXF bit in the E-MAC mode register (ECMR) is set to 1. The number of received PAUSE frames is counted.

(3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ECMR.ZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is disabled

  PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

100.1.3.8 Magic Packet Detection

The E-MAC has a Magic Packet detection function. This function provides a facility for host devices and other sources to start other peripheral devices connected to a LAN. A peripheral device that handles Magic Packets starts itself in response to receiving a Magic Packet.

When a Magic Packet is detected, data from broadcast packets that were previously being received are stored in the FIFO and the E-MAC is notified of the receiving status. To return to normal operation from the associated interrupt processing, the E-MAC and AVB-DMAC must be initialized by using the operating mode configuration bit in the AVB-DMAC mode register (CCC.OPC) to set the operating mode to reset mode.

Magic Packets are received regardless of the destination address. As a result, the AVB_MAGIC pin is only enabled in the case of a match with the destination address specified in the Magic Packet.

The procedure for using the Magic Packet detection function with this LSI chip is as follows.

1. Use the various interrupt enabling and masking registers to disable the output of interrupts from interrupt sources.
2. Set the Magic Packet detection enable bit in the E-MAC mode register (ECMR.MPDE).
3. Set the Magic Packet detection interrupt enable bit in the E-MAC interrupt enable register (ECSIPR.MPDIP) to enable the interrupt.
4. Place the CPU in sleep mode as required.
5. An interrupt is conveyed to the CPU on detection of a Magic Packet.
6. The AVB_MAGIC pin notifies connected devices of Magic Packet detection.

Note: The Magic Packet detection interrupt status can be read in the E-MAC status register (ECSR.MPD). The bit can be cleared by setting the E-MAC status register Magic Packet TM detection bit (ECSR.MPD) to 1.

But EthernetAVB-IF can’t detect 2nd or later Magic PacketTM and the AVB_MAGIC pin can be negated though the bit is cleared.

The AVB_MAGIC pin can be negated and EthernetAVB-IF can detect MAGIC PacketTM again according to below way.

1) Hardware reset — set reset pin in the R-Car series to reset signal.
2) Software reset — set mstp/srst register for EthernetAVB-IF to software reset mode.
3) Software reset register in AVB — set AVB DMAC mode register Operating Mode Configuration bits (CCC.OPC) to reset mode.

100.1.3.9 Interrupts

For details, refer to the “Interrupt Controller” section in the manual.

The interrupts of EthernetAVB-IF are indicated by individual flags **DIS**, **EIS**, **RISi**, **TIS**, and **GIS**. Each interrupt is controllable by the corresponding interrupt enable bit. The status flags are independent from this enable bits.

Additionally grouped interrupt status available in **ISS** and **EIS.QFS**. The summary status allows CPU to locate the interrupt source with a minimum number of read accesses to EthernetAVB-IF.

EthernetAVB-IF interrupts are combined to 4 groups of interrupt lines for request an interrupt service by CPU. Interrupt requests in group 0 and 1 are only generated in OPERATION mode. Interrupt requests in group 2 are only generated in OPERATION mode and in CONFIG mode if gPTP support is enabled (**CCC.GAC**). Interrupt request on line 3 depends on E-MAC configuration and can be generated in CONFIG, OPERATION and STANDBY mode.

Interrupt lines are level output and each line is asserted when at least one of the interrupt status registers bits belonging to the group associated with that line is set to 1b, and the corresponding enable bit in the related interrupt control register is also set to 1b.

For **ISS** bits the combined flag/enable is used. The green dots in detailed interrupt figures in detailed interrupt line description illustrates the point where status information for **ISS** is taken.

(1) Concurrent interrupt enable support

The interrupt enable bits can be directly modified by writing the interrupt control registers (**xxC.yyE**). If concurrent processes enable/disable interrupts located in same interrupt control register inter-process communication is required. To reduce SW overhead there are dedicated registers available controlling conflict free enable/disable of interrupts.

To enable an interrupt CPU should write 1b to the corresponding bit (**xxE.yyS**) in the enable register. Because written 0b have no effect, there is no side effect to concurrent processes.

To disable an interrupt CPU should write 1b to the corresponding bit (**xxD.yyD**) in the disable register. Because written 0b have no effect, there is no side effect to concurrent processes.

The current interrupt enable status is readable in **xxC.yyE**.

Grouping of interrupts for each interrupt line is as described in following sub-chapters.

(2) Group 0 (Data related interrupts)

This group consists on:

Frame received interrupts **RIS0.FRFr** (for each received frame stored in URAM)
Receive warning interrupts **RIS1.RWFr** (when Unread Frame Counter reaches warning level)
Descriptor processed interrupts **RIS3.RDPFr** (for reception)Frame transmitted interrupts **TIS.FTFt** (for completion of frame transmission by E-MAC)
Descriptor processed interrupts **TIS.TDPFr** (for transmission)
Descriptor processed interrupts **DIS.DPFi** (for reception and transmission)

By reading **ISS**, CPU get an overview of all data related interrupts (**ISS.FRM**, **ISS.RWM**, **ISS.DPMi, ISS.FTM**).

Interrupt group 0 consists on these 24 interrupt lines:

Line0_Rx[17:0]
Line0_Tx[3:0]
Line0_DiA (Share the interrupt line : Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)
Line0_DiB (Share the interrupt line : Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

(a) Reception interrupts

There are 18 dedicated interrupt lines flagging frame reception. For the queue full flag it is configurable by **CIE.RQFM** if these notification are part of the queue specific reception interrupt lines or part of the error interrupt lines (group 1).

There is a common interrupt enable (**CIE.CRIE**) for all reception lines.

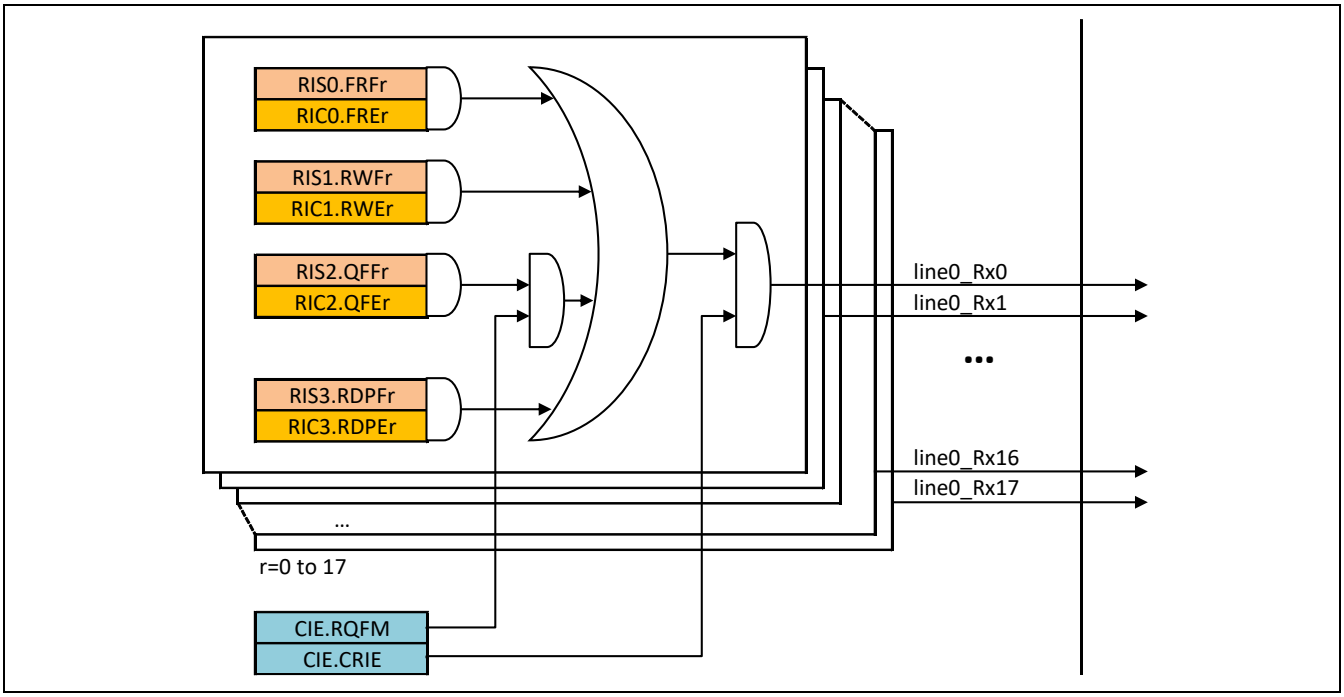

Figure 100.1.3.11.1 Interrupt group 0, reception interrupt lines

(b) Transmission interrupts

There are 4 dedicated interrupt lines flagging frame transmission.

There is a common interrupt enable (**CIE.CTIE**) for all reception lines.

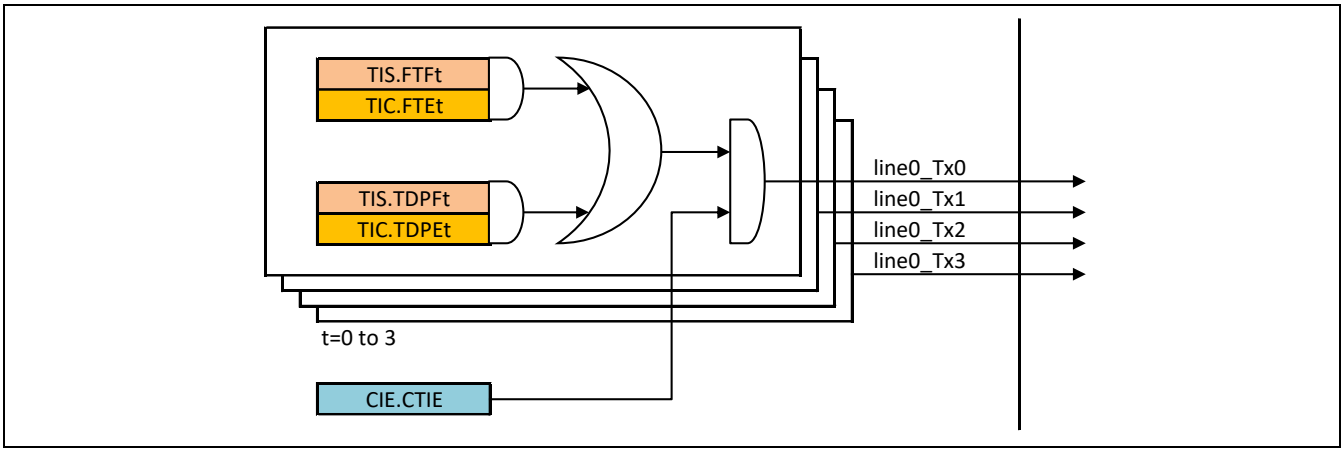

Figure 100.1.3.11.2 Interrupt group 0, transmission interrupt lines

(c) Descriptor and merged interrupts

There are 2 interrupt lines flagging descriptor interrupts. Line **line0_DiA** has also the capability to generate a merged data interrupt (controlled by **CIE.CL0M**).

Descriptor interrupt 1 is not available as common descriptor interrupt; this descriptor interrupt is split into queue specific descriptor interrupts.

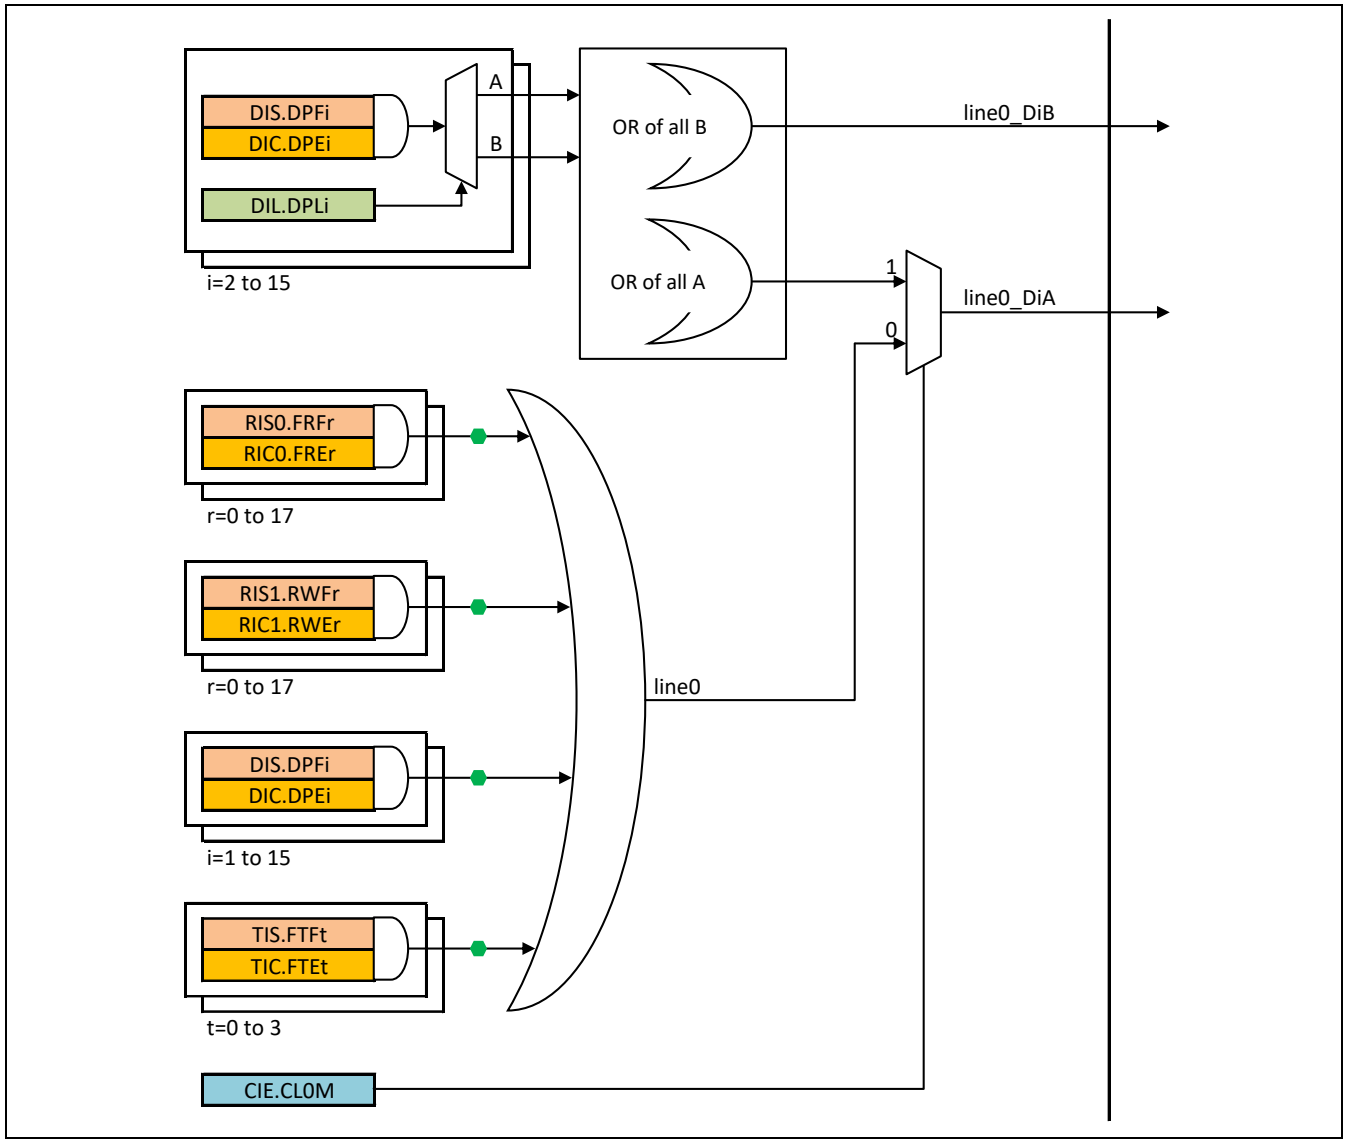

Figure 100.1.3.11.3 Interrupt group 0, common descriptor and merged interrupt lines

(3) Group 1 (Error related interrupts)

This group consists on:

Tx-Buffer full interrupt **EIS.TBFF** (when delaying fetching of transmit frame)
Interrupt for E-MAC Status FIFO overwrite (**EIS.MFFF**)
Interrupt for Timestamp FIFO overrun (**EIS.TFFF**)
Interrupts for CBS limits (**EIS.CULF1**, **EIS.CULF0**, **EIS.CLLF1**, **EIS.CLLF0**)
Interrupt for separation filtering error (**EIS.SEF**)
Interrupt for queue error (error while processing receive or transmit queue) (**EIS.QEF**)
Interrupt for transmission error detected by E-MAC (**EIS.MTEF, EIS.MREF**)
Rx-FIFO full interrupt **RIS2.RFFF** (when Rx-FIFO overflows)
Receive queue full interrupts **RIS2.QFFr** (when no sufficient space is in receive queue)

By reading **EIS**, CPU get an overview of all error interrupts. Additionally **ISS.EM** informs about pending error related interrupt.

Interrupt group 1 consists on these 2 interrupt lines:

Line1_A (Share the interrupt line : Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)
Line1_B (Share the interrupt line : Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

For the queue full flag it is configurable by **CIE.RQFM** if these notification are part of the queue specific reception interrupt lines or part of the error interrupt line **line1_A.**

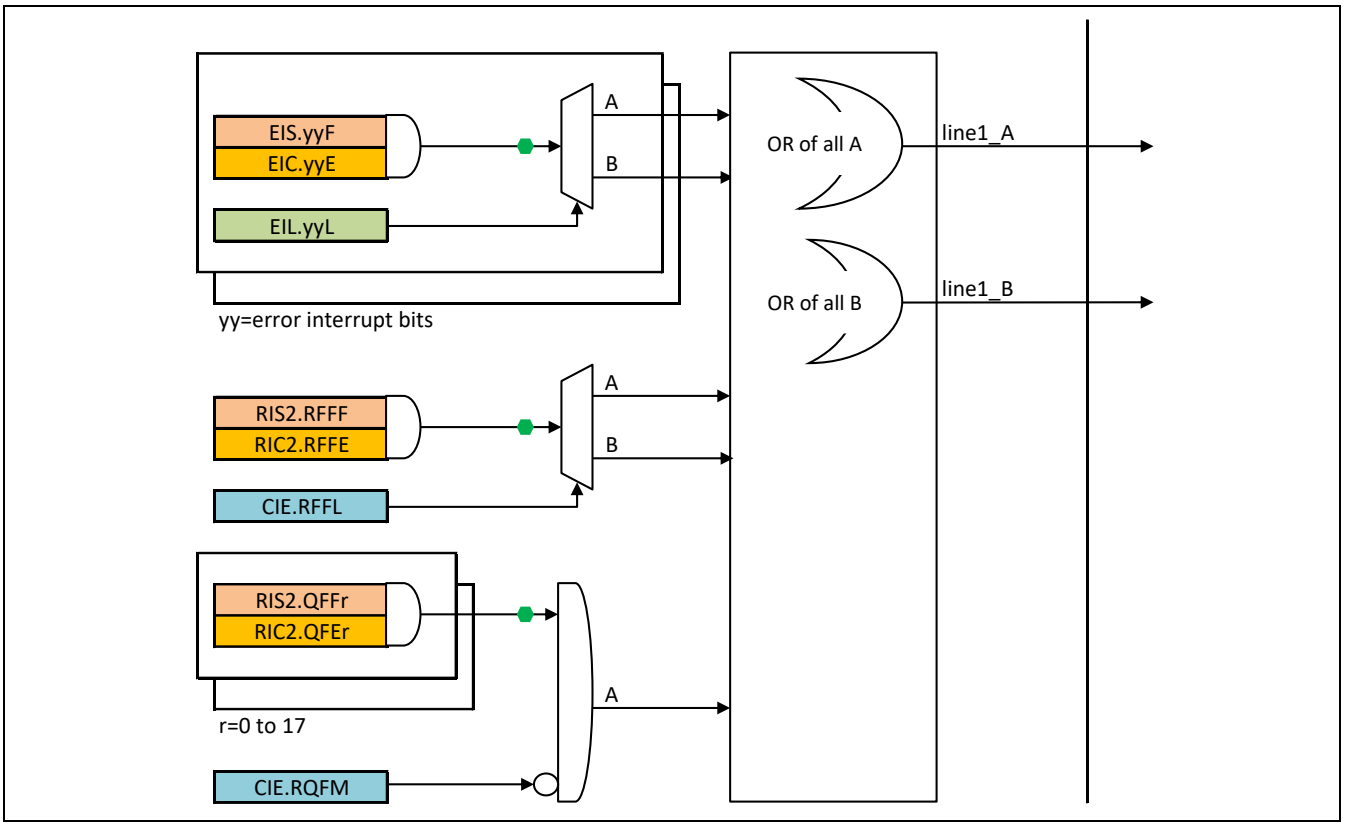

Figure 100.1.3.11.4 Interrupt group 1, error interrupt lines

The abbreviation **yy** in figure indicates error interrupts: **TBF**, **MFF**, **TFF**, **CULFc**, **CLLFc**, **SE**, **QE**, **MTE**, and **MRE**.

(4) Group 2 (Management related interrupts)

Reception

Rx-FIFO Warning interrupt **RIS1.RFWF** (Rx-FIFO has reached configured warning level)

Transmission

E-MAC status FIFO warning interrupt **TIS.MFWF**
E-MAC Status FIFO updated interrupt **TIS.MFUF**
Timestamp FIFO warning interrupt **TIS.TFWF**
Timestamp FIFO updated interrupt **TIS.TFUF**

gPTP

AVTP time captured interrupt **GIS.ATCFi**
AVTP presentation target matched interrupt **GIS.PTMFi**
AVTP presentation time overrun interrupt **GIS.PTOF** (when external trigger before old value is processed)
AVTP presentation time captured interrupt **GIS.PTCF**

By reading **ISS**, CPU get an overview of all management related interrupts (**ISS.RFWM**, **ISS.MFWM**, **ISS.MFUM**, **ISS.TFWM**, **ISS.TFUM**, **ISS.CGIM**).

Interrupt group 2 consists on these 2 interrupt lines:

Line2_A (Share the interrupt line : Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)
Line2_B (Share the interrupt line : Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

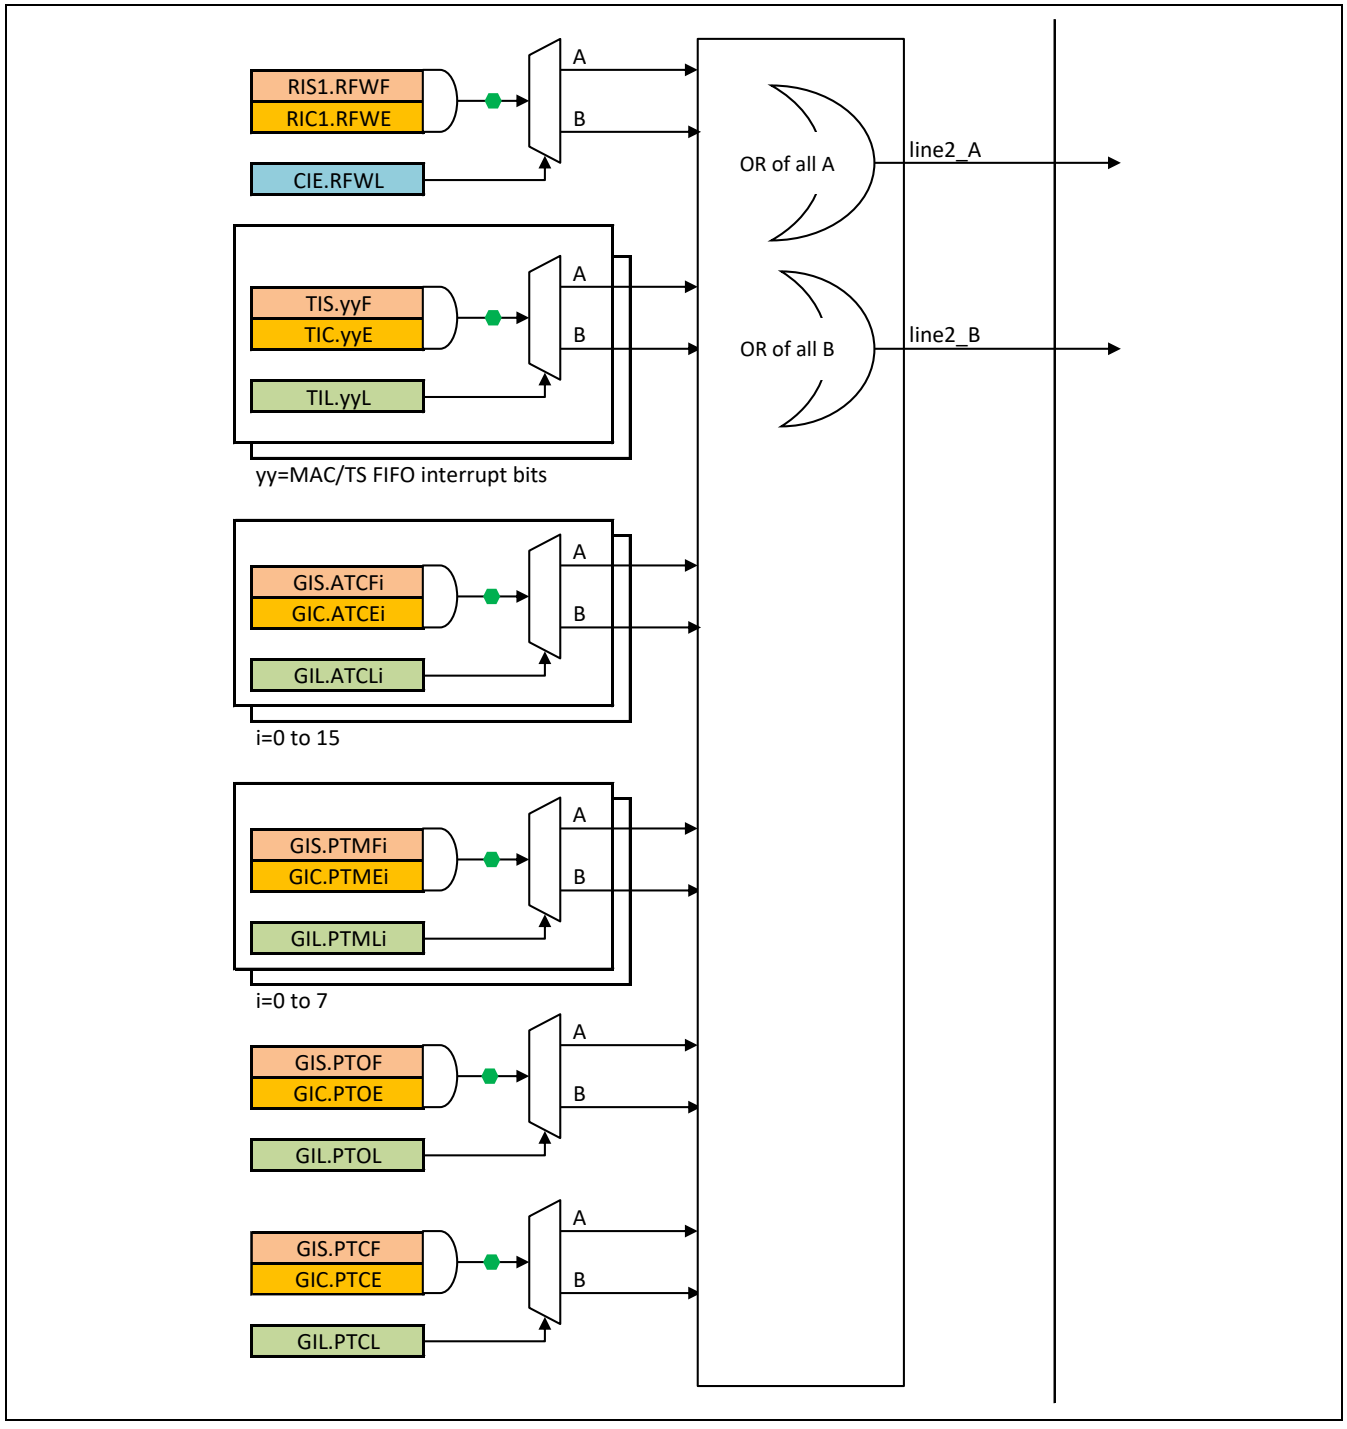

Figure 100.1.3.11.5 Interrupt group 2, management interrupt lines

The abbreviation **yy** in figure indicates error interrupts: **MFW**, **MFU**, **TFW**, and **TFU**.

(5) Line 3 (E-MAC interrupt)

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MS).

100.1.3.10 Flows of Operations

(1) Flow of E-MAC Initialization

Figure 100.1.3.12.1 shows the flow of E-MAC initialization (for AVB mode and full-duplex operation).

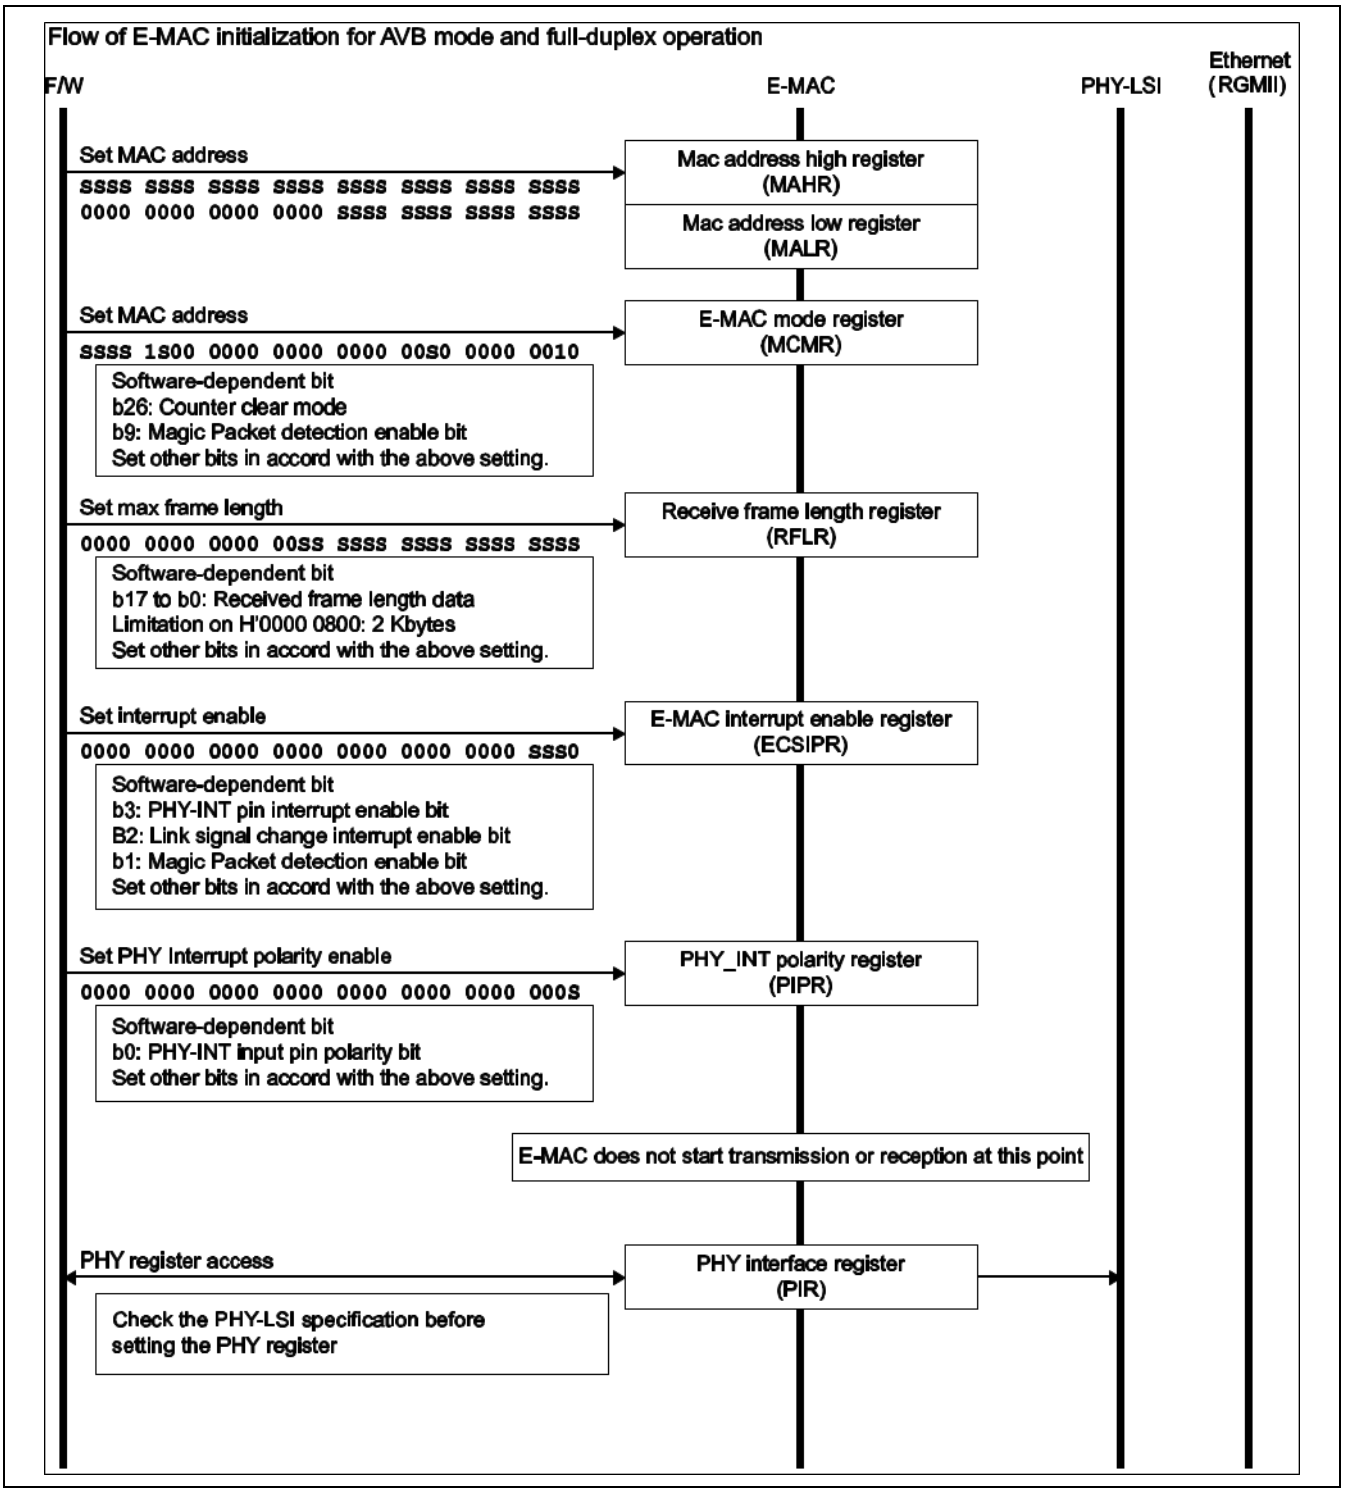

Figure 100.1.3.12.1 Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation)

(2) Flow of AVB-DMAC Initialization

Figure 100.1.3.12.2 shows the flow of AVB-DMAC initialization (for AVB mode and full-duplex operation).

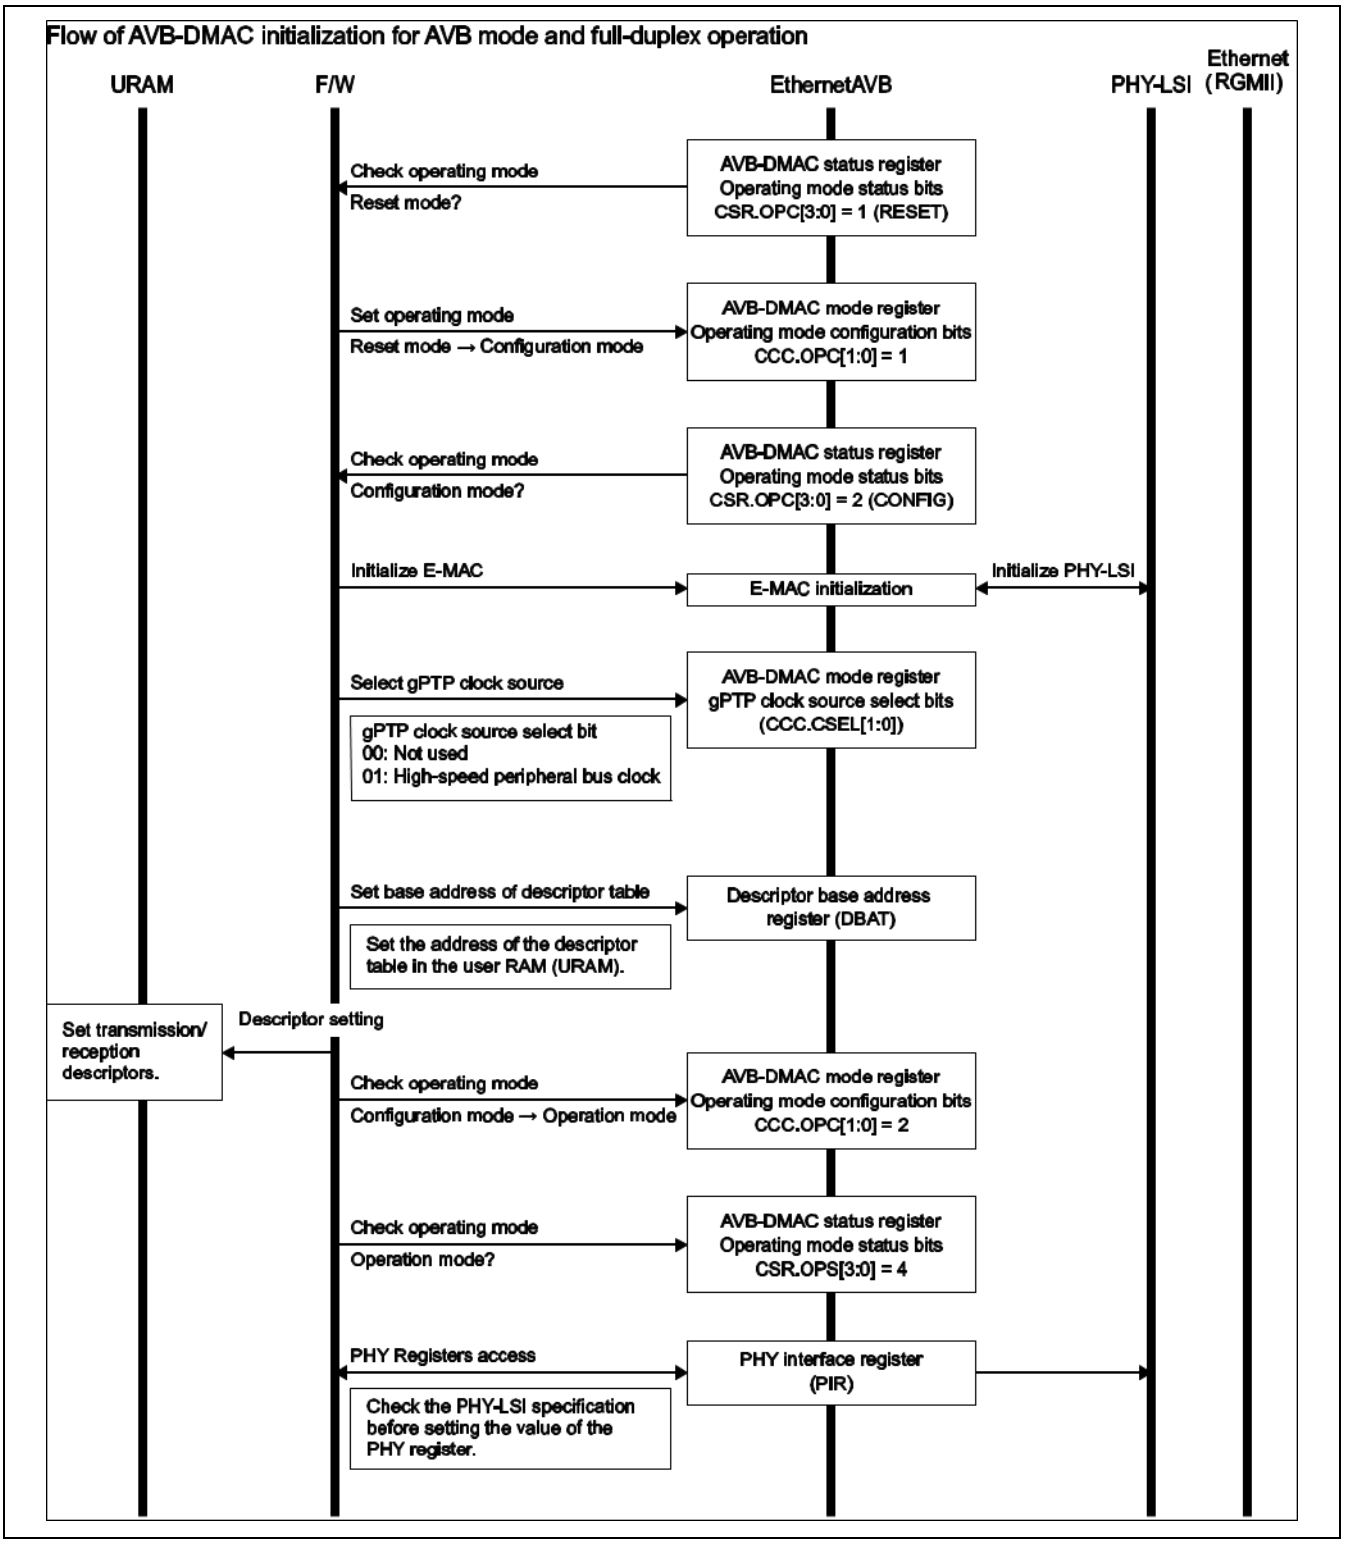

Figure 100.1.3.12.2 Flow of AVB-DMAC Initialization (for AVB Mode and Full-Duplex Operation)

(3) Flow for the AVB-DMAC in Reception

Figure 100.1.3.12.3 shows the flow for the AVB-DMAC in reception (in AVB mode and full-duplex operation).

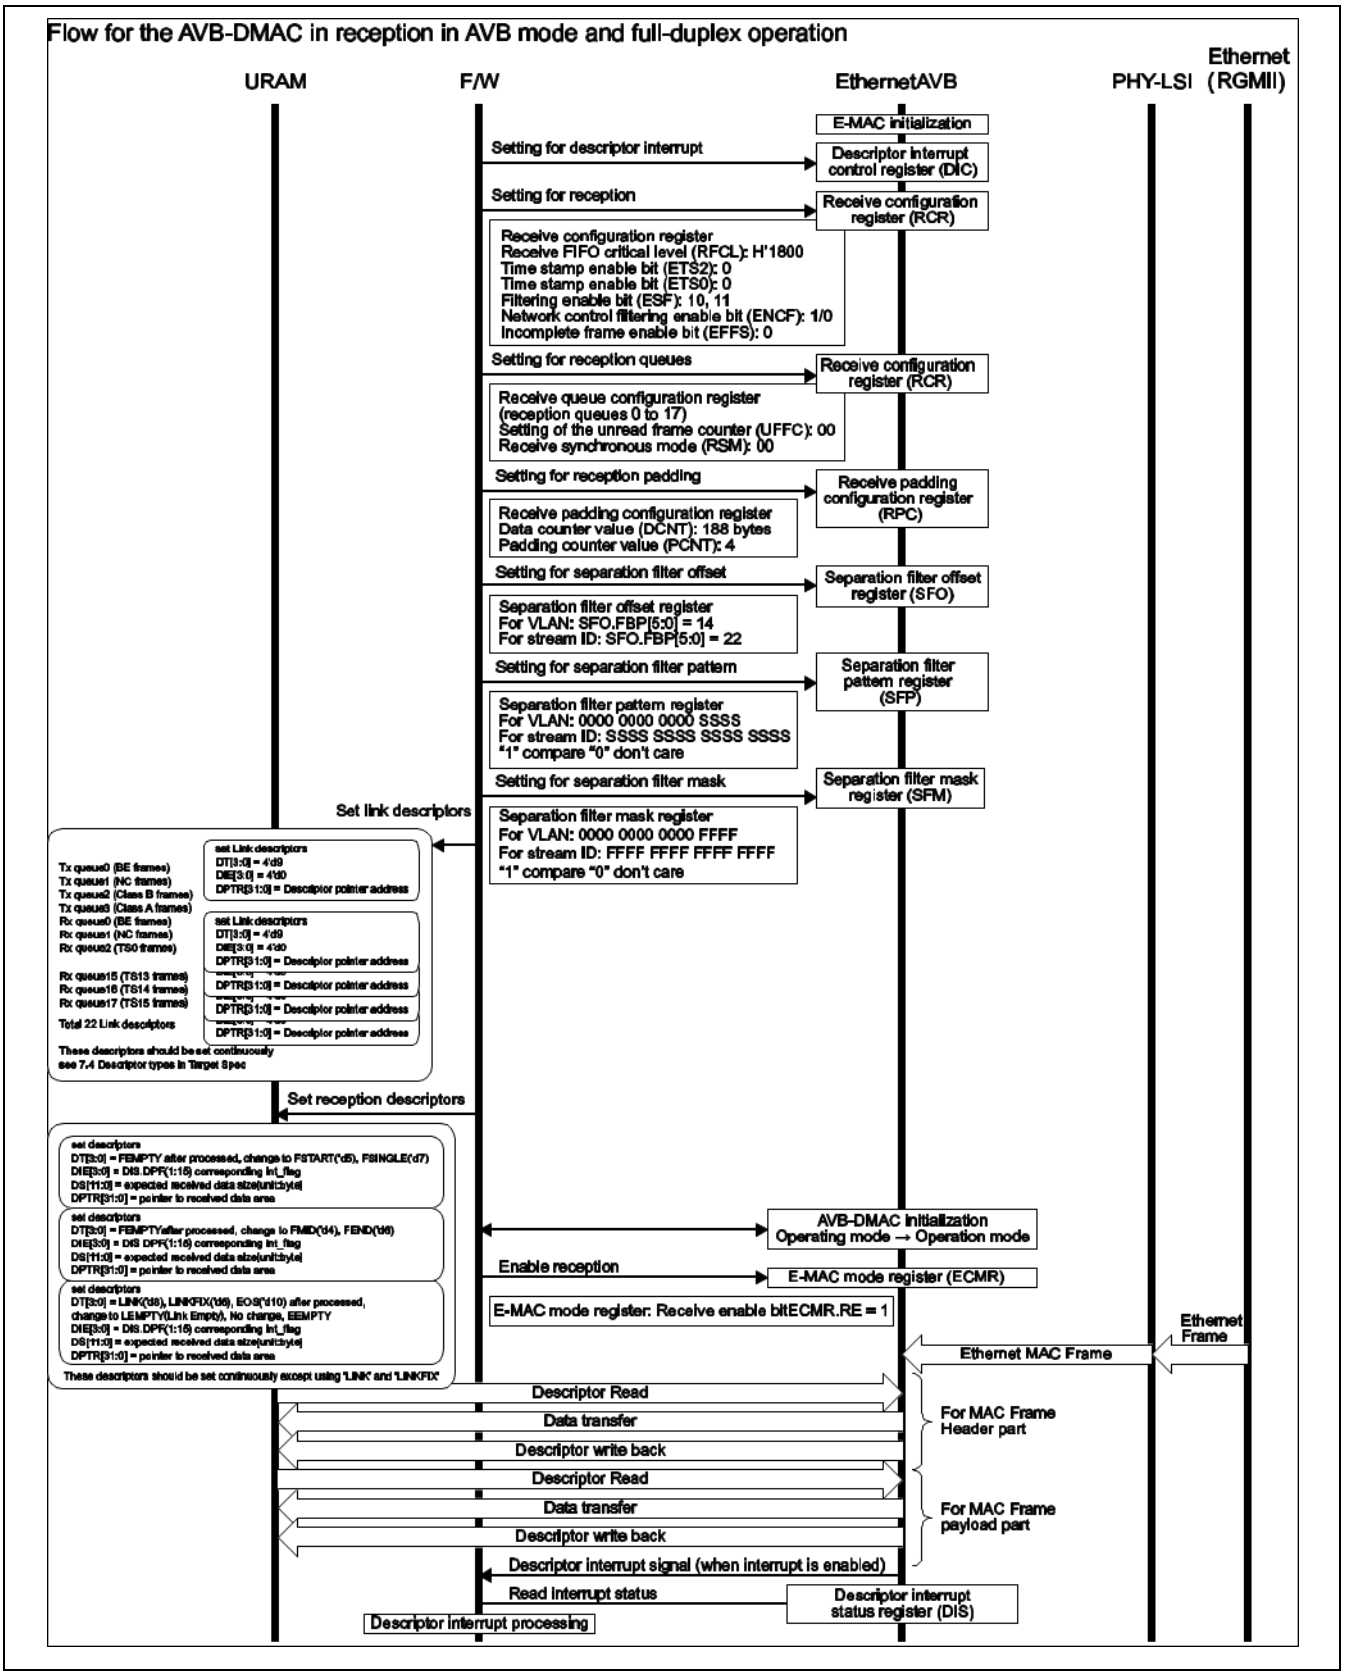

Figure 100.1.3.12.3 Flow for the AVB-DMAC in Reception (in AVB Mode and Full-Duplex Operation)

(4) Flow for the AVB-DMAC in Transmission

Figure 100.1.3.12.4 shows the flow for the AVB-DMAC in transmission (in AVB mode and full-duplex operation).

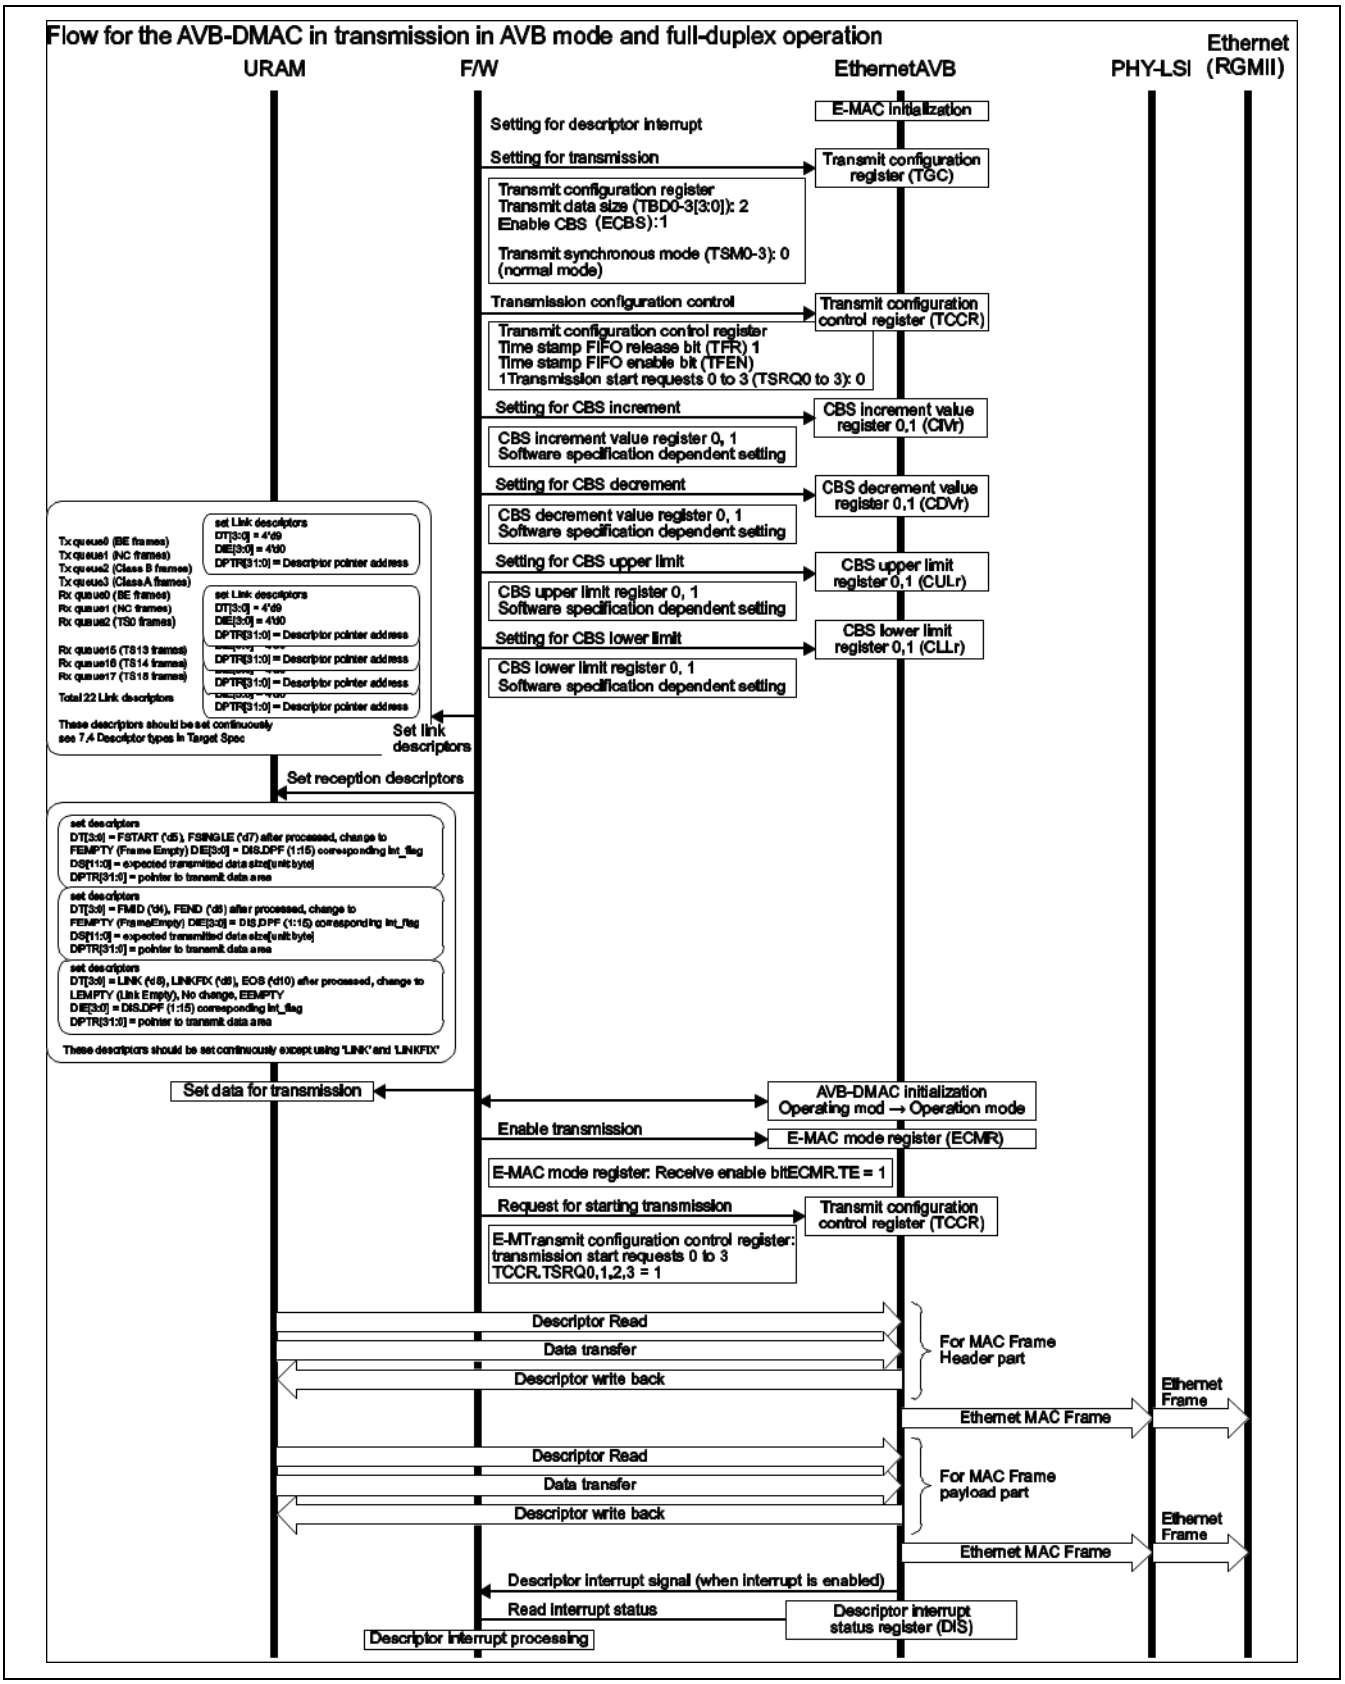

Figure 100.1.3.12.4 Flow for the AVB-DMAC in Transmission (in AVB Mode and Full-Duplex Operation)

(5) Flow for Stopping AVB-DMAC Operation in Reception

Figure 100.1.3.12.5 shows the flow for stopping AVB-DMAC operation in reception (normal, common to all modes).

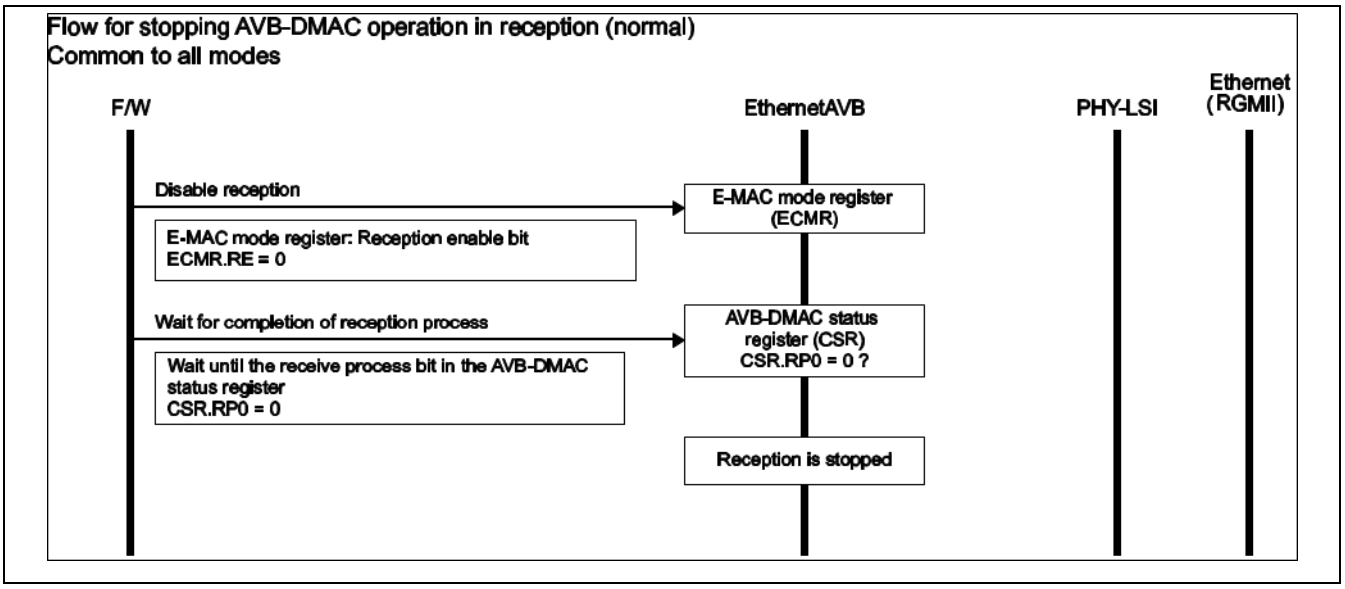

Figure 100.1.3.12.5 Flow for Stopping AVB-DMAC Operation in Reception (Normal, Common to All Modes)

(6) Flow for Stopping AVB-DMAC Operation in Transmission

Figure 100.1.3.12.6 shows the flow for stopping AVB-DMAC operation in transmission (normal, common to all modes).

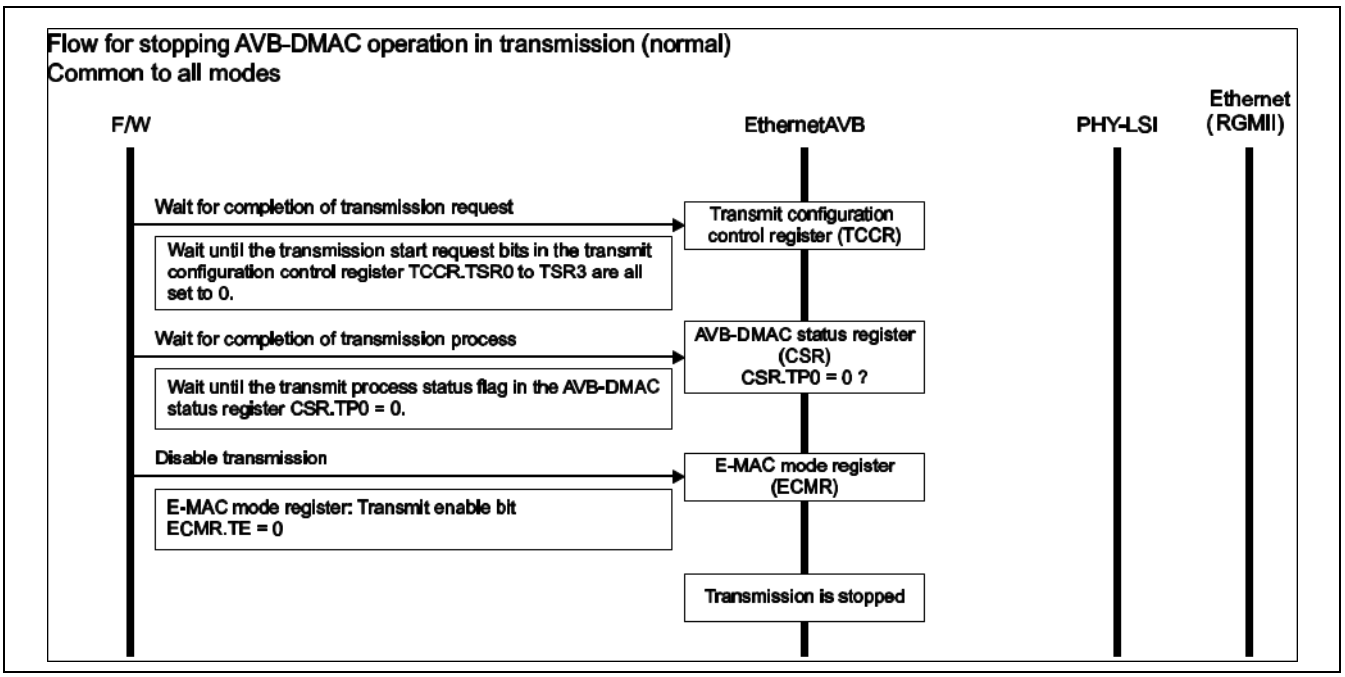

Figure 100.1.3.12.6 Flow for Stopping AVB-DMAC Operation in Transmission (Normal, Common to All Modes)

(7) Flow for Stopping and Resetting the AVB-DMAC

Figure 100.1.3.12.7 shows the flow for stopping and resetting the AVB-DMAC (normal, common to all modes).

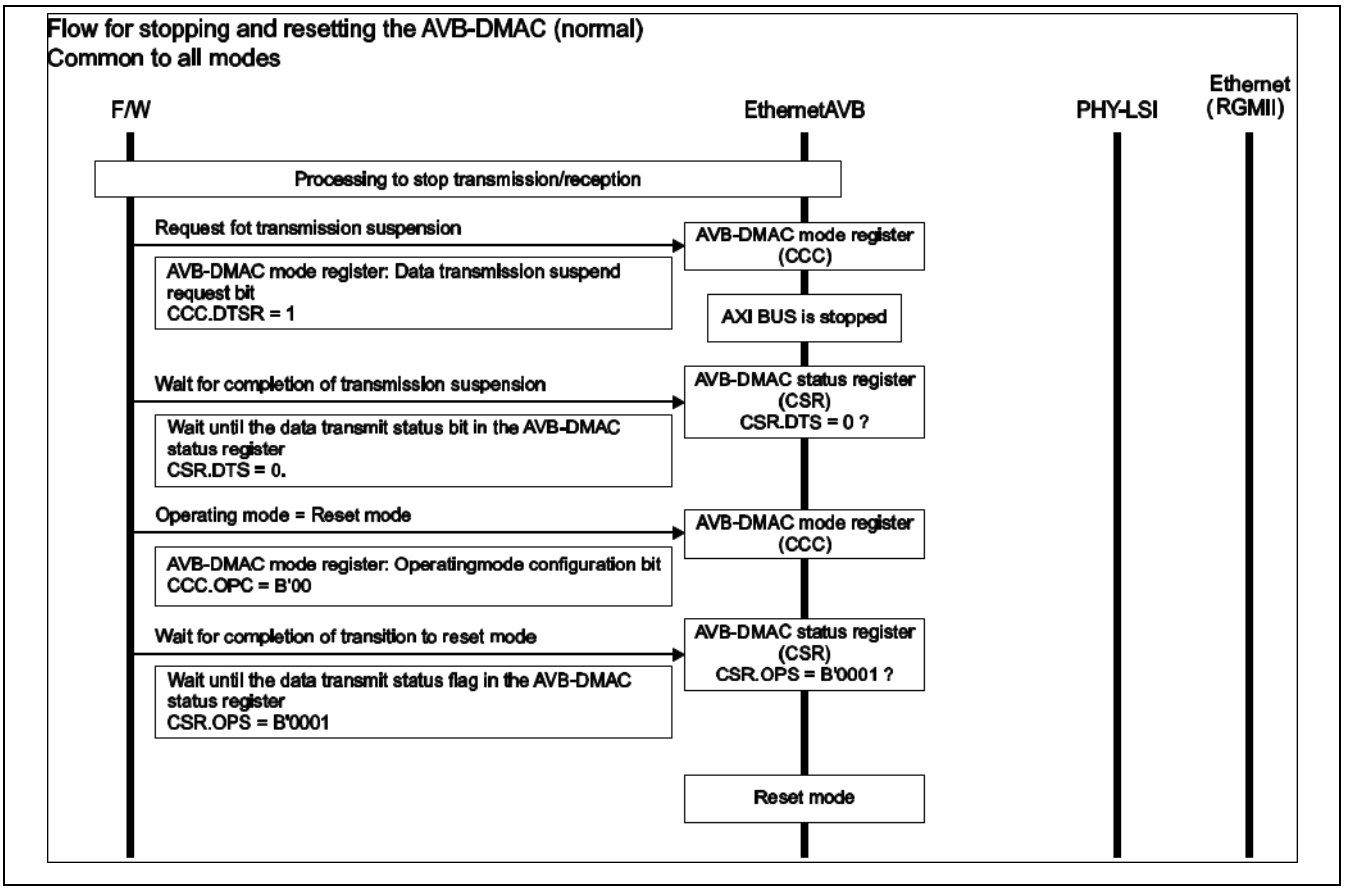

Figure 100.1.3.12.7 Flow for Stopping and Resetting the AVB-DMAC (Normal, Common to All Modes)

(8) Flow for Emergency Stopping the AVB-DMAC

Figure 100.1.3.12.8 shows the flow for emergency stopping the AVB-DMAC (normal, common to all modes).

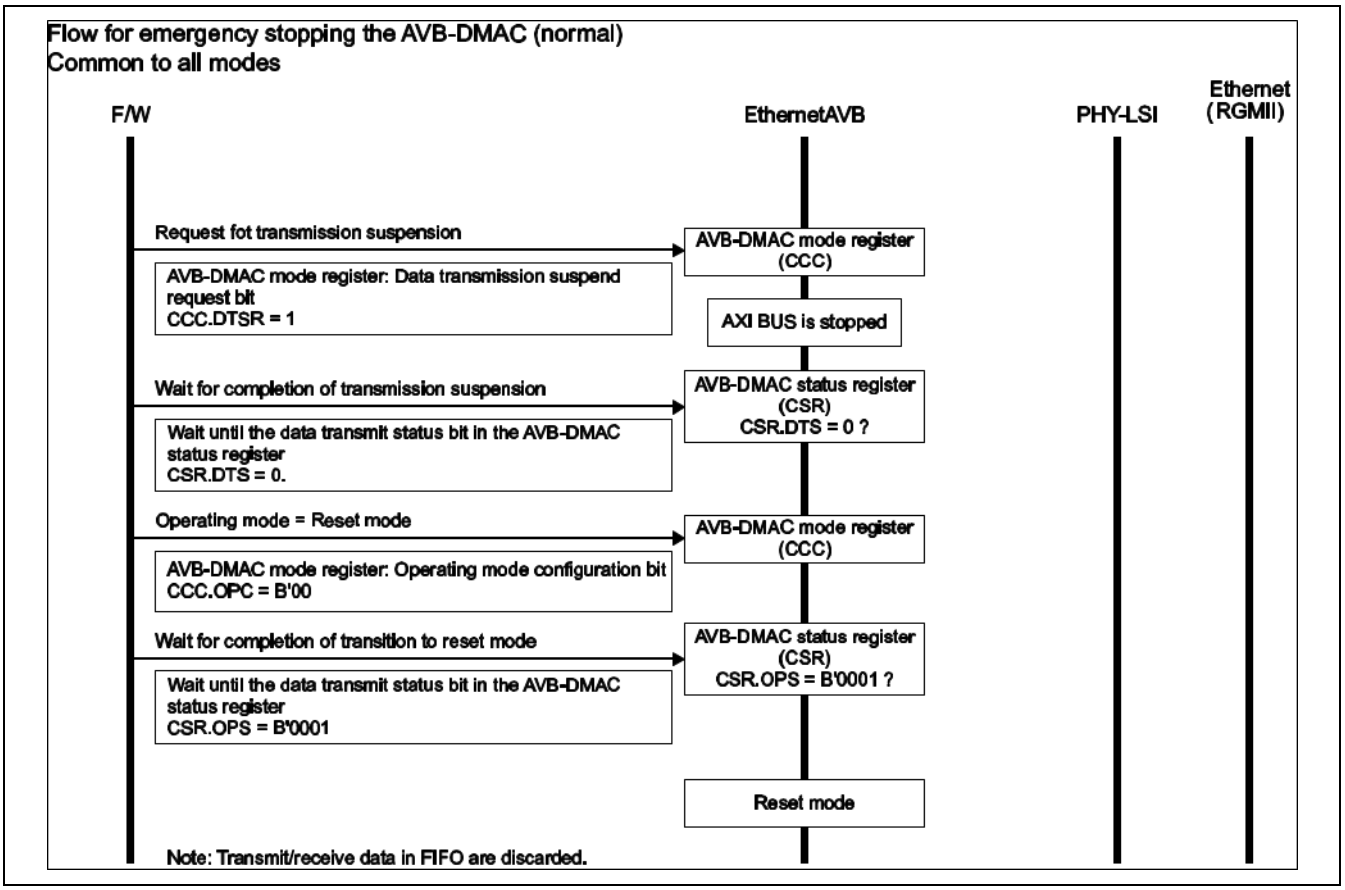

Figure 100.1.3.12.8 Flow for Emergency Stopping the AVB-DMAC (Normal, Common to All Modes)

(9) Flow of gPTP Initialization

Figure 100.1.3.12.9 shows the flow of gPTP initialization (normal, common to all modes).

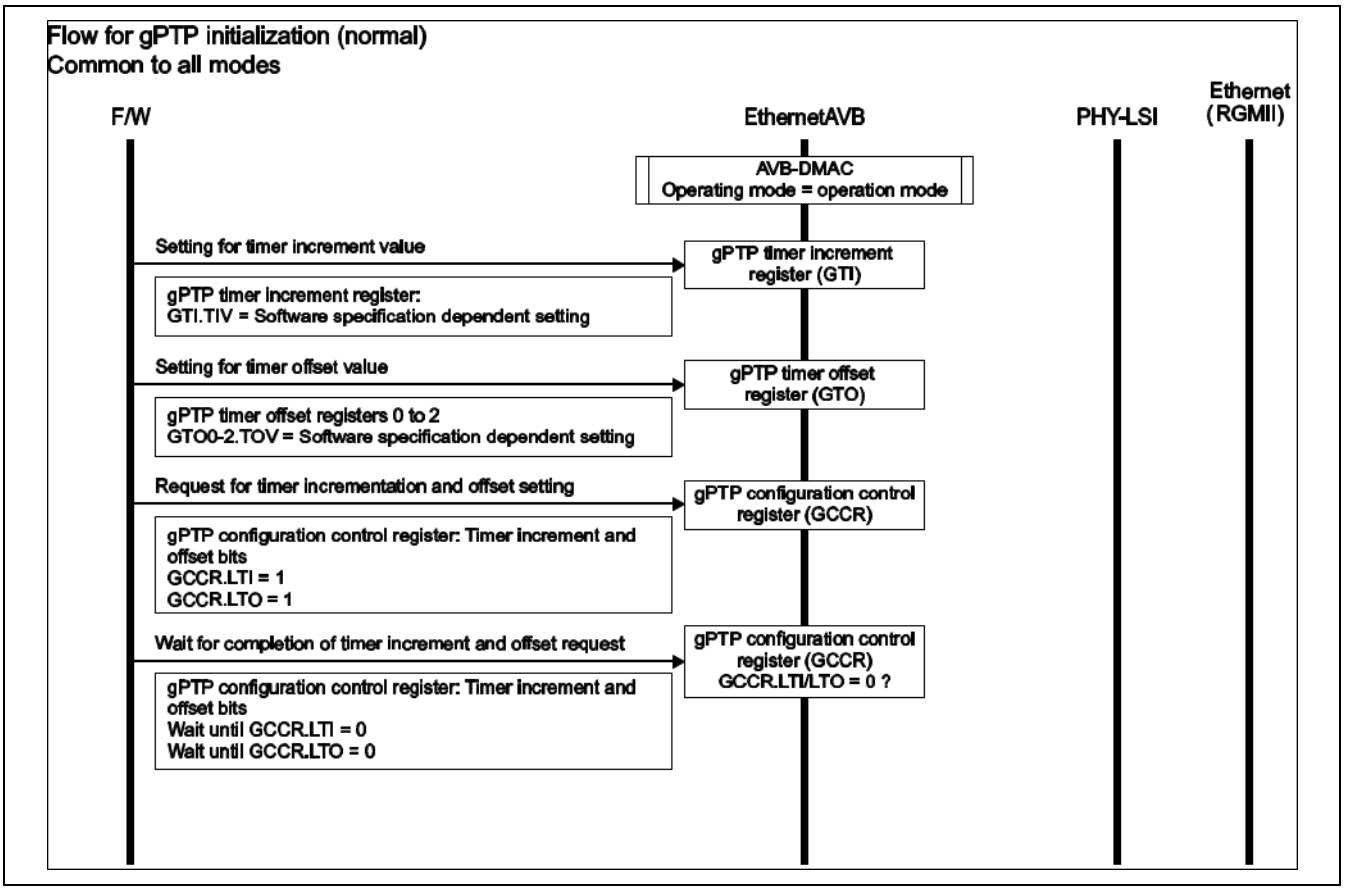

Figure 100.1.3.12.9 Flow of gPTP Initialization (Normal, Common to All Modes)

(10) Flow of gPTP Time Stamping in Transmission

Figure 100.1.3.12.10 shows the flow of gPTP time stamping in transmission (normal, common to all modes).

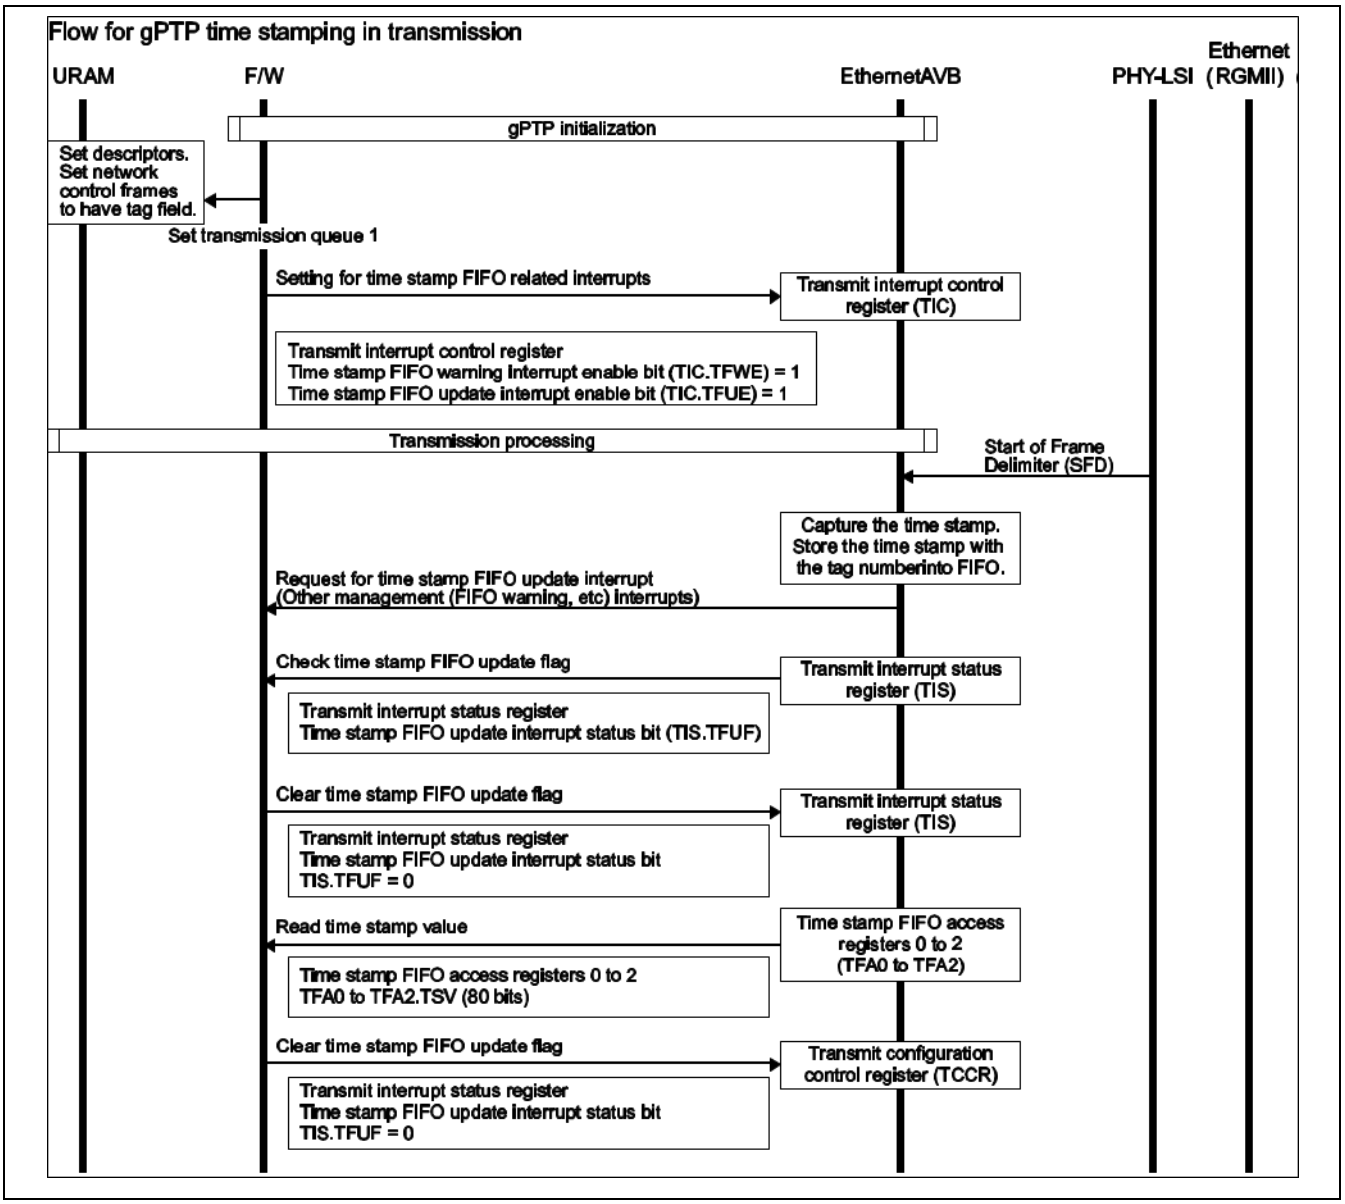

Figure 100.1.3.12.10 Flow of gPTP Time Stamping in Transmission (Normal, Common to All Modes)

(11) Flow of gPTP Time Stamping and Synchronization in Reception

(2) Accessing MII Management Registers

MII management registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(a) MII Management Frame Format

Figure 100.1.3.13.9 shows the format of an MII management frame. To access an MII management register, a management frame is implemented by the program in accordance with the procedures shown in MII Management Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D...D	
Write	1..1	01	01	00001	RRRRR	10	D...D	X

[Legend]
PRE: 32 consecutive 1 s
ST: Write of B'01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of B'00001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(b) Read: Bus already released in TA: control unnecessary

Figure 100.1.3.13.9 MII Management Frame Format

(b) MII Management Register Access Procedure

The program accesses MII management registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 100.1.3.13.10 to Figure 100.1.3.13.13 show the MII management register timing. The timing will differ depending on the PHY-LSI type.

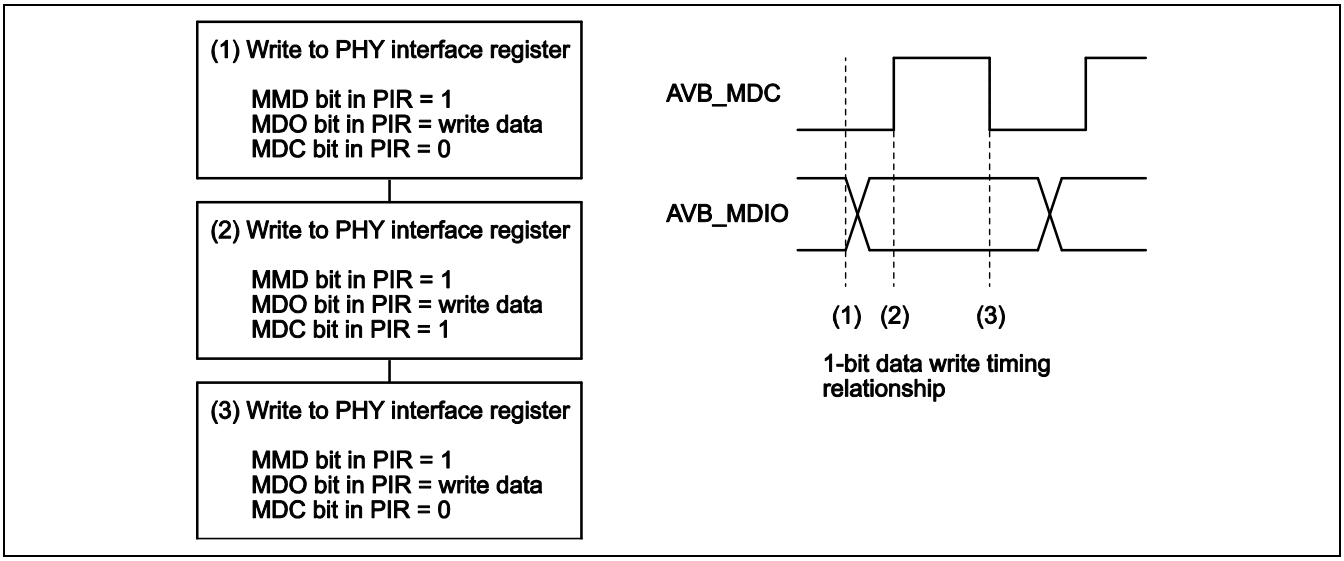

Figure 100.1.3.13.10 1-Bit Data Write Flowchart

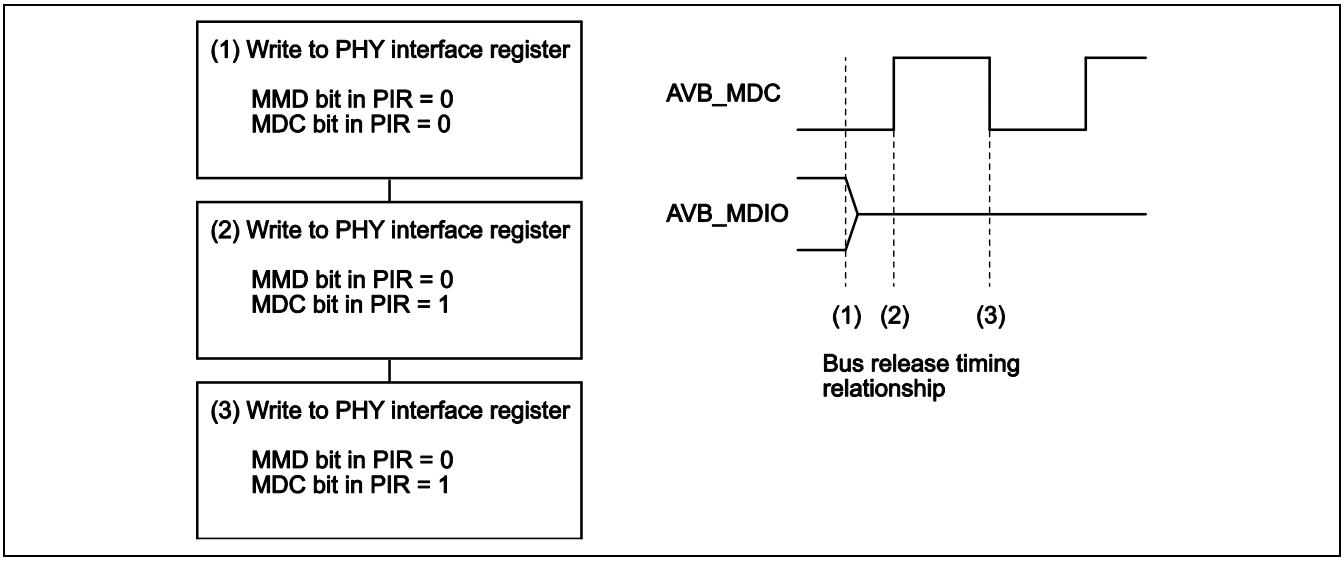

Note: TA in Read in Figure 100.1.3.13.9

Note: IDLE in Write in Figure 100.1.3.13.9

Figure 100.1.3.13.13 Independent Bus Release Flowchart

100.1.3.12 Usage Notes

(a) Reception is Ignored when AVB_RX_CTL indicates an error from PHY is Flagged at 1st Data Byte

The issue is limited to reception of frames with physical faults. Flagging of occurrence in SFR is missing. When EthernetAVB-IF is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS there is no storage.

(b) Unexpected Data are Exported when AVB_RX_CTL indicates an error is Flagged at 8th Data Byte

The issue is limited to reception of frames with physical faults.

Flagging of occurrence in SFR is invalid. When EthernetAVB-IF is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS corrupted data is stored and MAC status code is wrong.

(c) Receive Frame Interrupt and Descriptor Interrupt may be Issued before Completion of Writing Data

When receive frame interrupt and descriptor interrupt are issued, whether writing data is completed by DESCR.DT in a descriptor can be confirmed.

And CDARq register has the descriptor address which EthernetAVB-IF is processing currently or is going to process at the next time.

The descriptors before one indicated by CDARq register are scope for receive frame interrupt and descriptor interrupt scope.

If there is a descriptor which wait for HW processing (ex. FEMPTY), it's delayed. Confirm the descriptor again after waiting for 1ms.

100.1.3.13 Support for UDP/IP

(1) Reception Queues Selection

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.

- Frame fails the separation filter
  - It depends on RCR.ESF if such frame is discarded or stored in receive queue 0 (best effort).

The flowchart in Figure 100.1.3.15.1 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

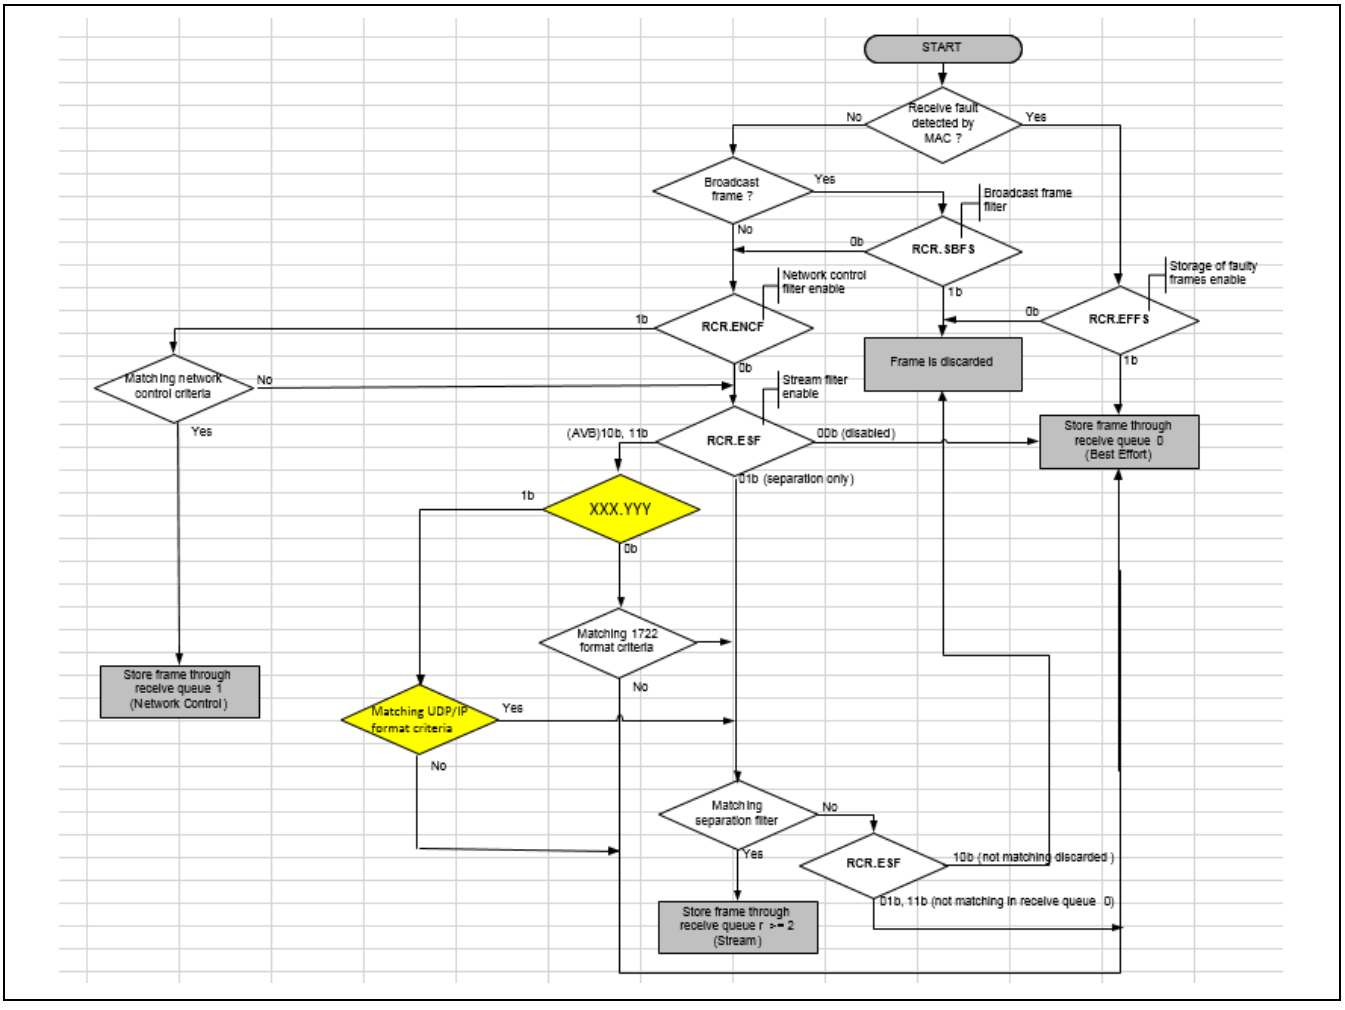

Figure 100.1.3.15.1 Mechanism of Reception Queue Selection

Notes on the meanings of entries in the flowchart

- “Condition for determining network control frames”
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
  The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
  The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00.
  The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
  See section 100.1.3.4(1)(a) Separation Filtering.

Figure 100.1.3.15.2 shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

Figure 100.1.3.15.2 Data Bytes of Ethernet Frames Used in Classification

(a) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can be freely set to reduce the number of bytes used in separation filtering or to mask particular bits.

Examples

To use one byte in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H'0000 0000.

To use seven bytes in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H'00FF FFFF.

Note: If bits at some positions are set to 0 in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only those bits in which the separation filter pattern configuration register (SFPi.FPs) setting is equal to the separation filter mask configuration register (SFMi.CFM) are sorted by matching with received data.

Figure 100.1.3.15.3 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

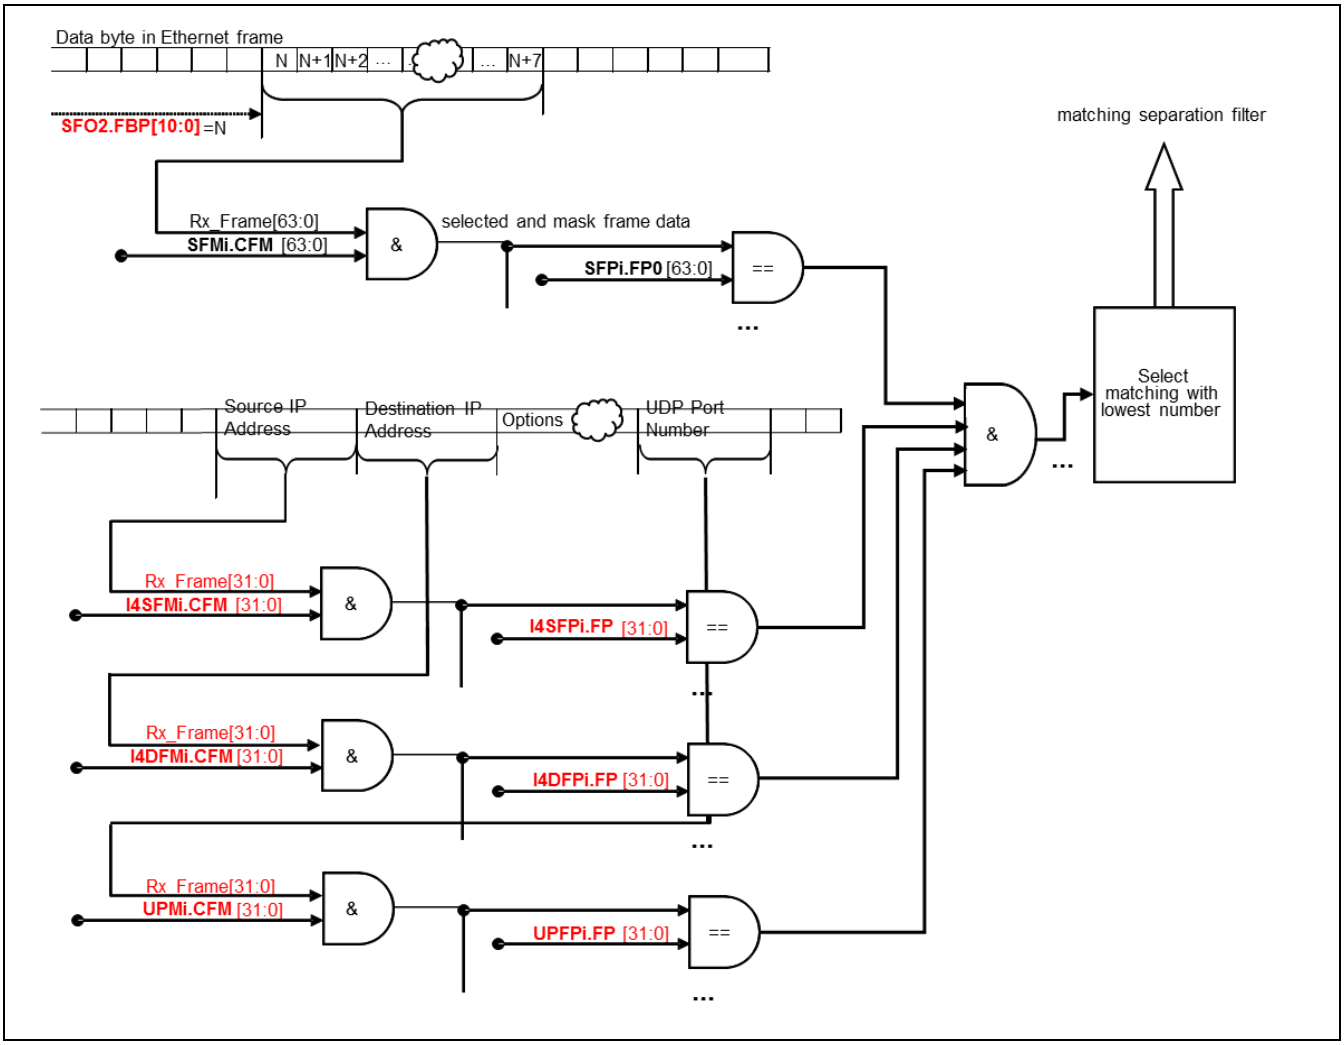

Figure 100.1.3.15.3 Separation Filtering

(b) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. Figure 100.1.3.4.5 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

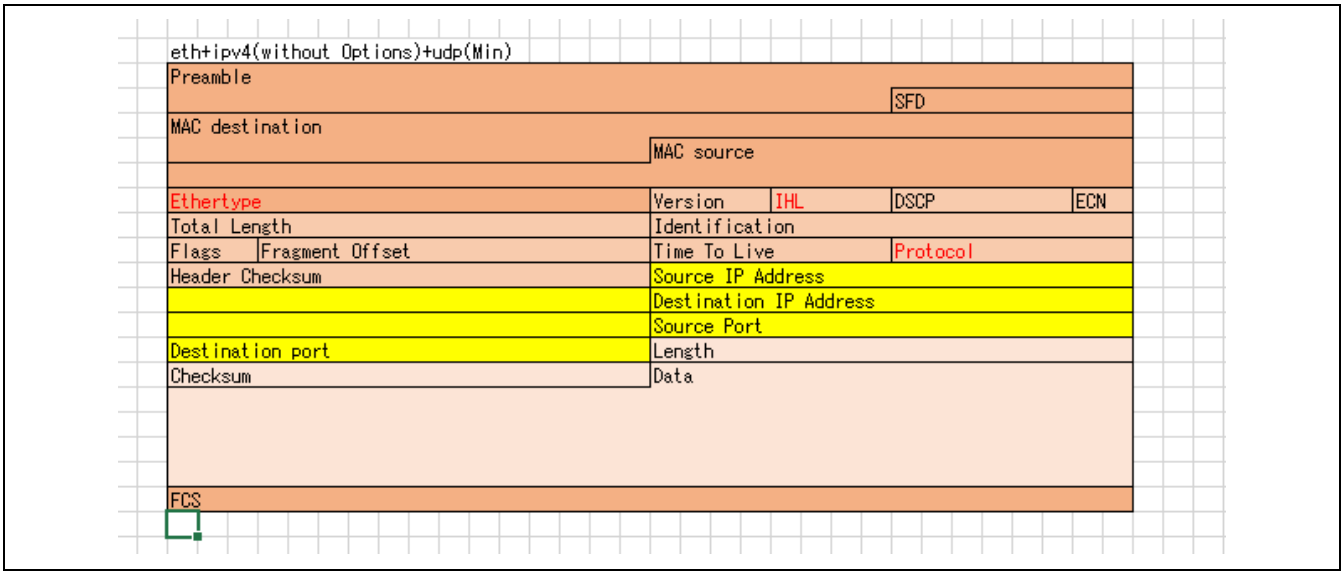

Figure 100.1.3.15.4 With UDP/IPv4 Frame Layout

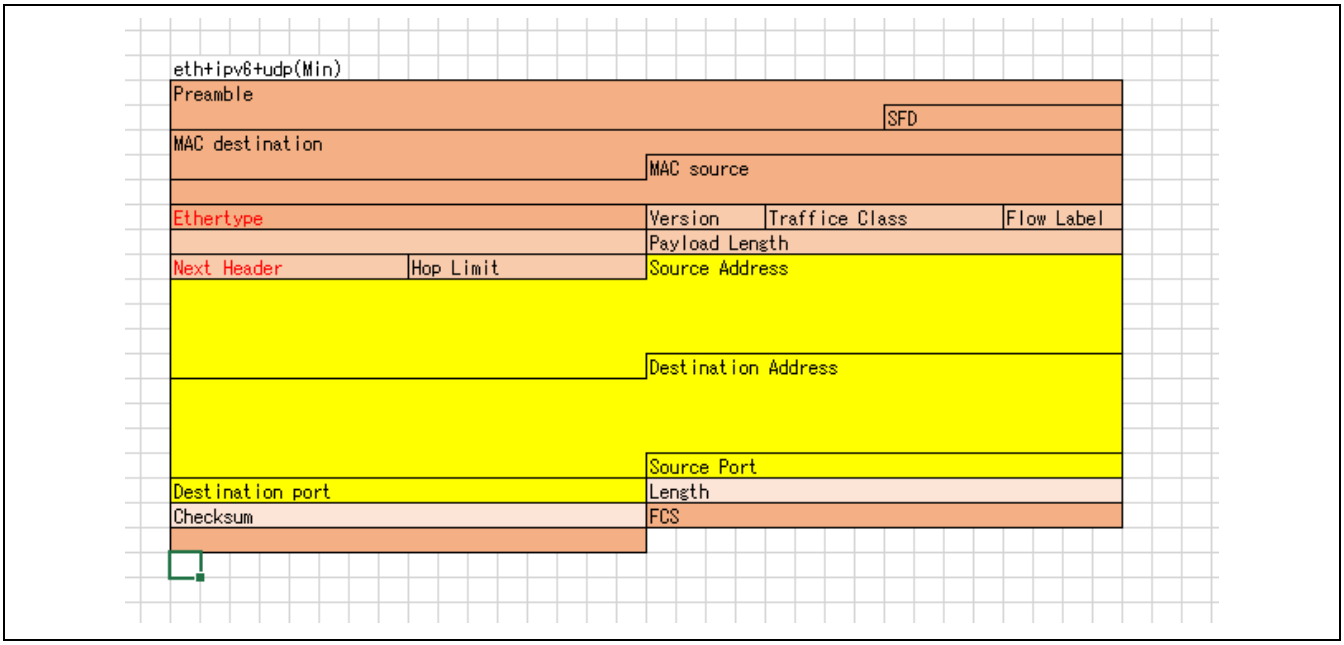

Figure 100.1.3.15.5 With UDP/IPv6 Frame Layout

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in Figure 100.1.3.4.5, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'FFFF FFFF.
- To divide streams from various talkers into individual queues, set SFM0.CFM to H'FFFF FFFF and SFM1.CFM to H'0000 FFFF. This excludes the unique ID from the filter condition.

(c) Reconfiguration of separation filter during OPERATION

In CONFIG mode the initial separation filter configuration is defined. To prevent inconsistent filter results during OPERATION direct parameter change is not possible; instead update mechanism by **SFVi.LV** and **SFL.LC** should be used.

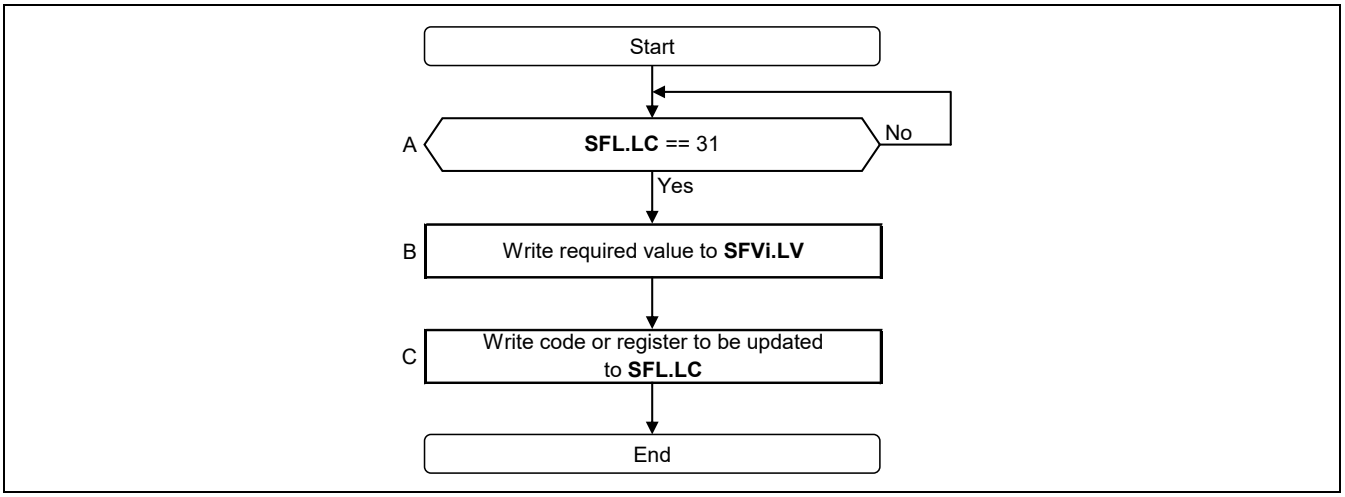

Figure 100.1.3.15.6 SW flow to update separation filter during OPERATION

When reconfigure separation filter, EthernetAVB-IF guarantees consistent classification for one received frame. If reconfiguration requires a sequence of parameter changes, CPU has to order reconfiguration based on application demand.

EthernetAVB-IF updates filter configurations when no frame reception is handled. In worse case the update is delayed by one frame reception. Exact duration depends on PHY speed and frame size. By reading **SFL.LC** CPU can observe when a previous update has been processed.

Note: Frame classification happens during frame reception and storage into internal Rx-FIFO. There may be frames with old classification pending in Rx-FIFO or under storage to URAM when filter reconfiguration is accepted.

(d) Disable Manual Offset Mode

Enable Manual Offset Mode

0: Manual Offset Mode disabled
1: Manual Offset Mode enabled

When this bit is 0, These bits set the position in Ethernet frames of the first byte of the bytes(see section (a) Disable Manual Offset Mode) to be used by the separation filter. A fixed value by rx_data[31:16] is selected as shown in the table below.

mir_macrx_data[31:16]	IPv4 Source Address Filter Offset	IPv4 Destination Address Filter Offset	IPv6 Source Address Filter Offset	IPv6 Destination Address Filter Offset	UDP Port Number Filter Offset
16'h8100 (802.1)	(ipv4_ihl << 2) + 10'd10	(ipv4_ihl << 2) + 10'd14	10'd26	10'd42	10'd58
16'h0800 (ipv4)	(ipv4_ihl << 2) + 10'd6	(ipv4_ihl << 2) + 10'd10	10'd22	10'd38	(ipv4_ihl << 2) + 10'd14
others	(ipv4_ihl << 2) + 10'd6	(ipv4_ihl << 2) + 10'd10	10'd22	10'd38	10'd54

When this bit is 1, These bits set the position in Ethernet frames of the first byte of the bytes**(I4SFO.FBP, I4DFO.FBP, I6SFO.FBP, I6DFO.FBP and UPFO.FBP)** to be used by the separation filter.

IPv4 Source Address Filter Offset	IPv4 Destination Address Filter Offset	IPv6 Source Address Filter Offset	IPv6 Destination Address Filter Offset	UDP Port Number Filter Offset
I4SFO.FBP Register	I4DFO.FBP Register	I6SFO.FBP Register	I6DFO.FBP Register	UPFO.FBP Register

(2) Checksum

(a) UDP/IPv4

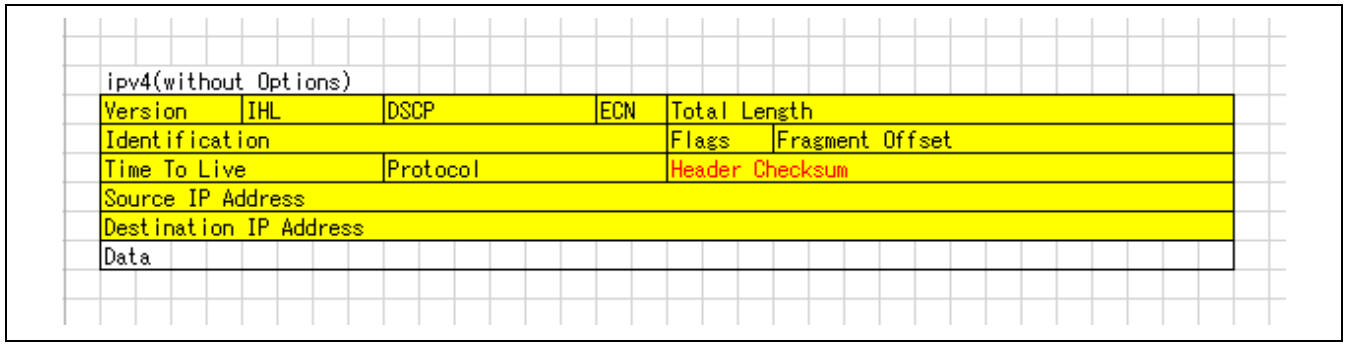

Figure 100.1.3.15.7 IPv4 checksum

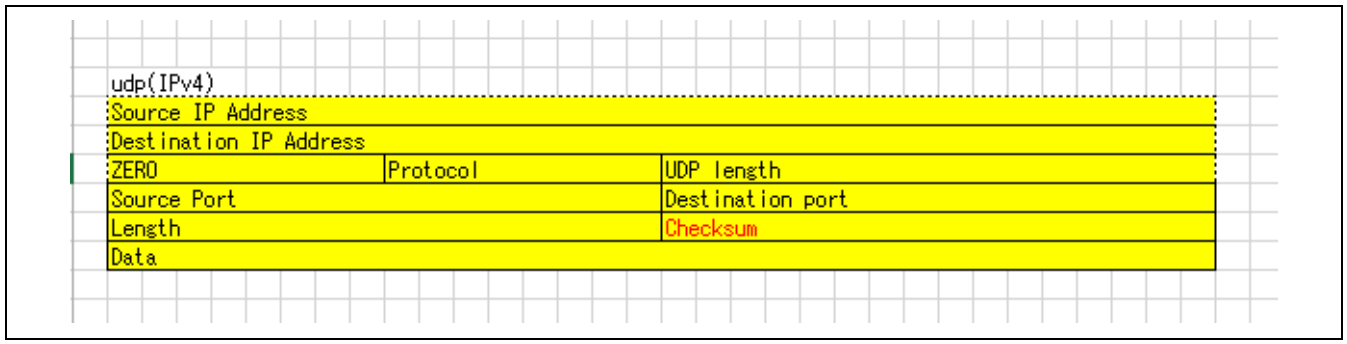

Figure 100.1.3.15.8 UDP/IPv4 checksum

(b) UDP/IPv6

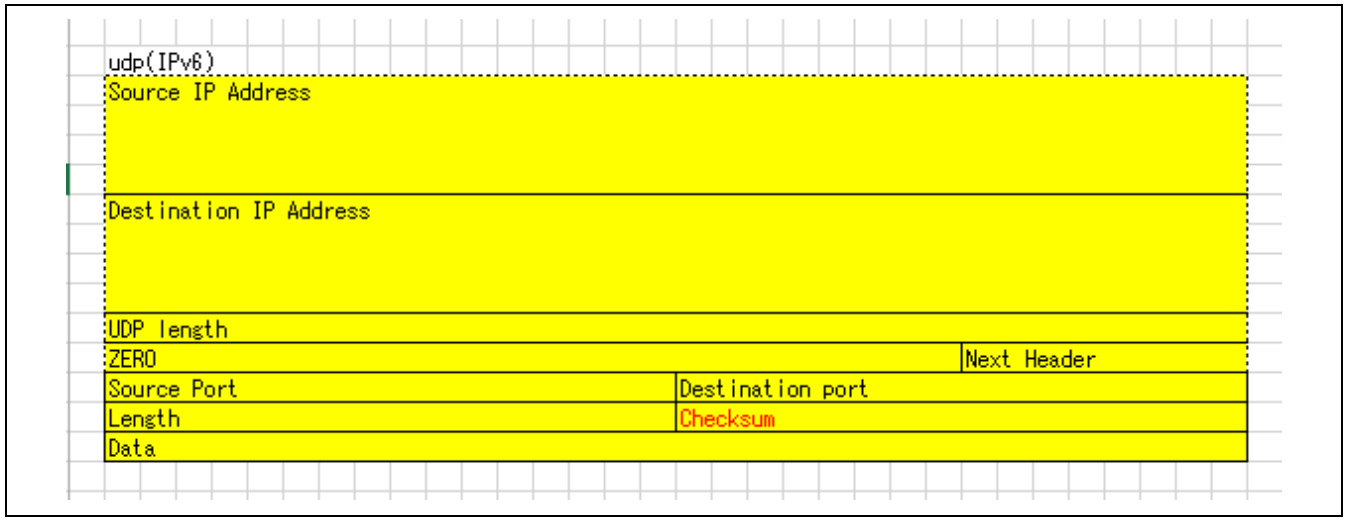

Figure 100.1.3.15.9 UDP/IPv6 checksum

(c) Configuration of Reception Frame Data Descriptors

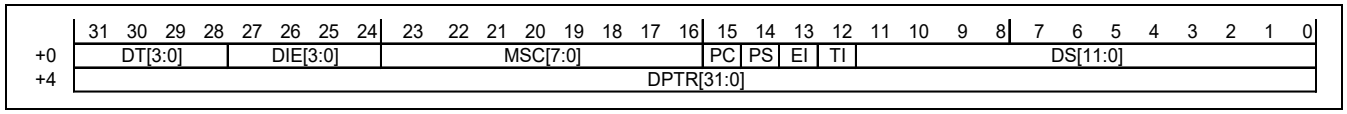

Figure 100.1.3.15.10 Configuration of Descriptor for a Received Frame

Table 100.26 Configuration of a Received Descriptor

Bit Name	Function
MSC	E-MAC Status Code These bits indicate errors in reception detected by the E-MAC. In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Check-sum error. MSC[5]: Received Unsupported frame. MSC[4]: Received frame has alignment error. MSC[3]: Received frame is too long. MSC[2]: Received frame is too short MSC[1]: Error in frame reception (PHY detects an error) MSC[0]: Received frame has a CRC error.

PS	Refer Table 100.16.
EI	Refer Table 100.16.
TI	Refer Table 100.16.

100.1.4 Usage Notes

100.1.4.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 100.1.4.1.1 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 100.1.4.1.2 shows schematics of Ethernet frames to which the checksum data has been added.

Note: Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

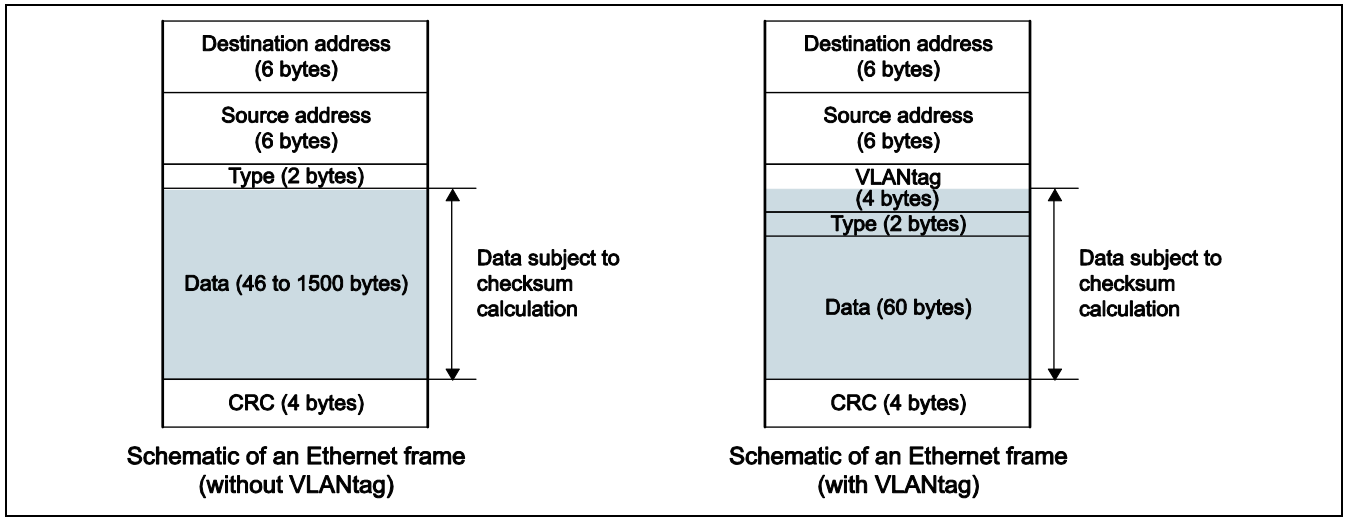

Figure 100.1.4.1.1 Data Subject to Checksum Calculation

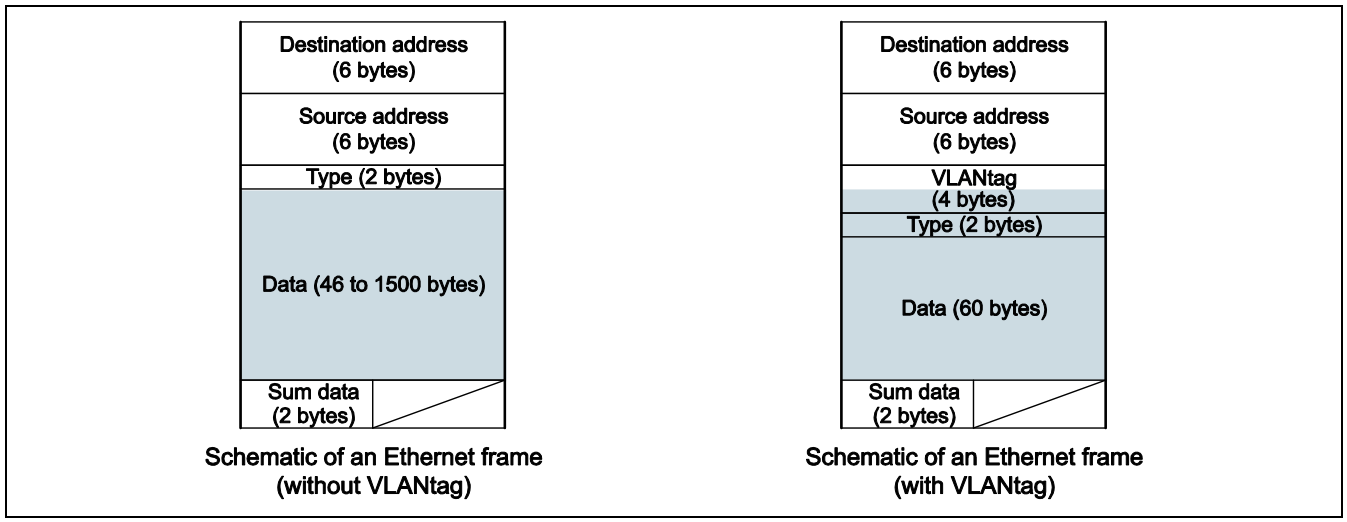

Figure 100.1.4.1.2 Data after Checksum Data Addition

100.1.4.2 Data Transfer Function Stops after Read Access Error

If EthernetAVB-IF gets an access error when reading from work RAM, it may happen that no further work RAM accesses are issued. So transfer of receive/transmit frames is halted. By using the data transfer suspend function SW can observe if data transfer function is available or not.

Perform one of given SW flows which are triggered by this start condition: when AXI read access error has been flagged by EIS.QEF is 1, and ESR.ET is B'0000 or B'0100; additionally when ESR.EIL is 1 (this is an indication that an work RAM read error may be lost).

There are two possible SW flows given. Figure 100.1.4.2.1 applies always the SW reset, independently if this is required or not. Figure 100.1.4.2.2 checks in addition if SW reset is required; checking CSR.DTS after wait gives an indication that issue has been occurred.

Note that the wait after write of CCC.DTSR is mandatory to prevent cases where issue has not been occurred.

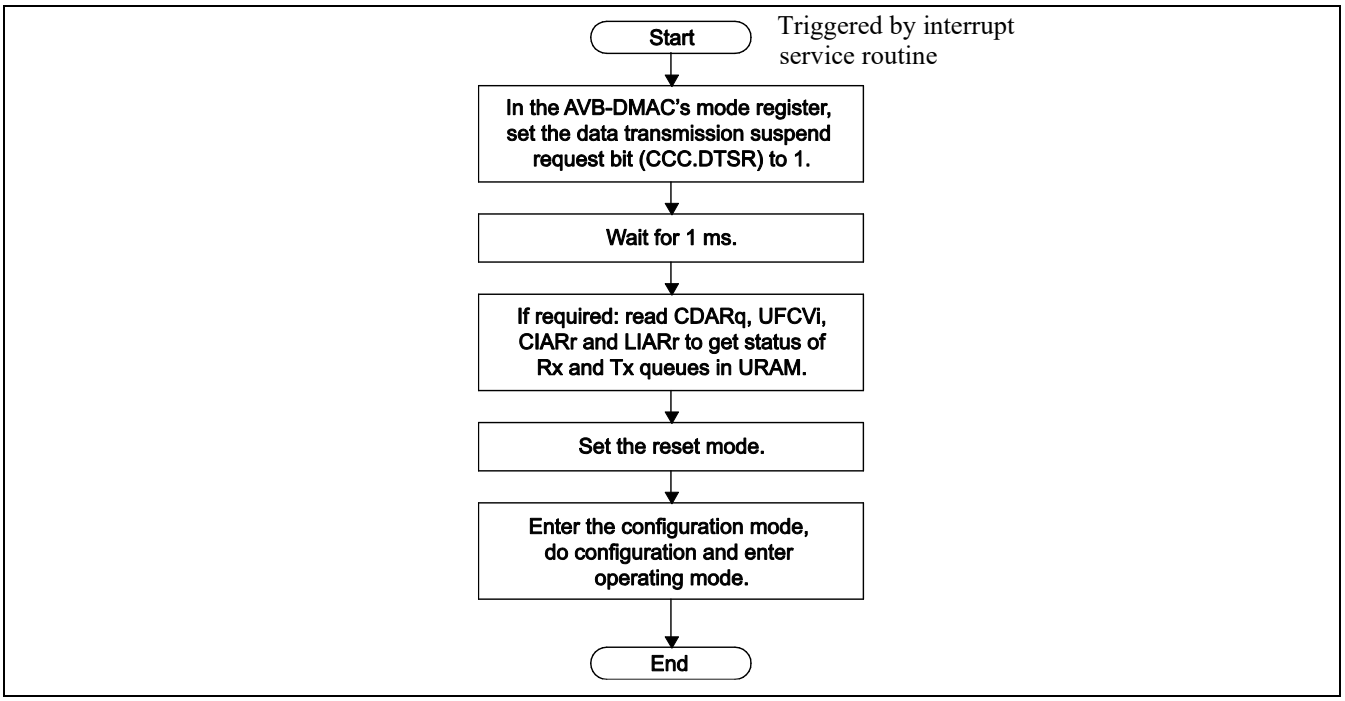

Figure 100.1.4.2.1 Data Transfer Function Stop Flow1 after Read Access Error

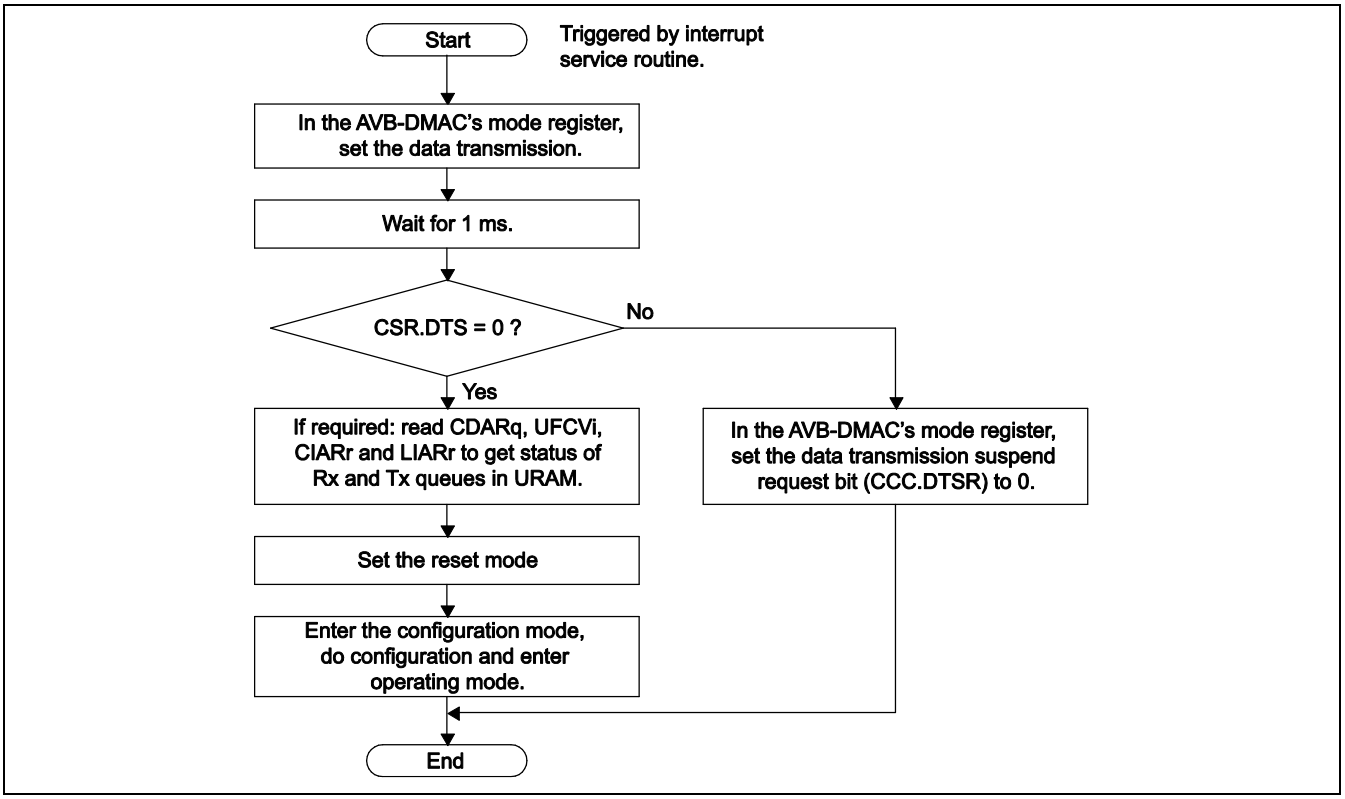

Figure 100.1.4.2.2 Data Transfer Function Stop Flow2 after Read Access Error

100.1.4.3 Power Down Request

If EthernetAVB-IF gets a power down request while writing to work RAM, it may happen that the request is not accepted even if the transfer is completed. Due to this the external power down module cannot complete the power down sequence.

A power down request is acceptable only when EthernetAVB-IF is in RESET state.

100.1.4.4 MII Interface

(1) Specifications of the MII in Outline

The media independent interface (MII) is a specification for use in connection between the MAC and PHY layers of an Ethernet communications interface. The MII is originally defined in IEEE802.3 as a standard interface to connect a Ethernet media access control (MAC) block to a PHY chip at 100Mbps.
MII supports 3.3V CMOS interface voltage for all IO pins and 25MHz reference clock for 100Mbps communication.

(a) Signal Line Specification in the MII

The MII uses fourteen signals to connect the MAC and PHY layers. With an MII, the contents of the data and control signals for transmission and reception change on rise edges of the respective clock signals.

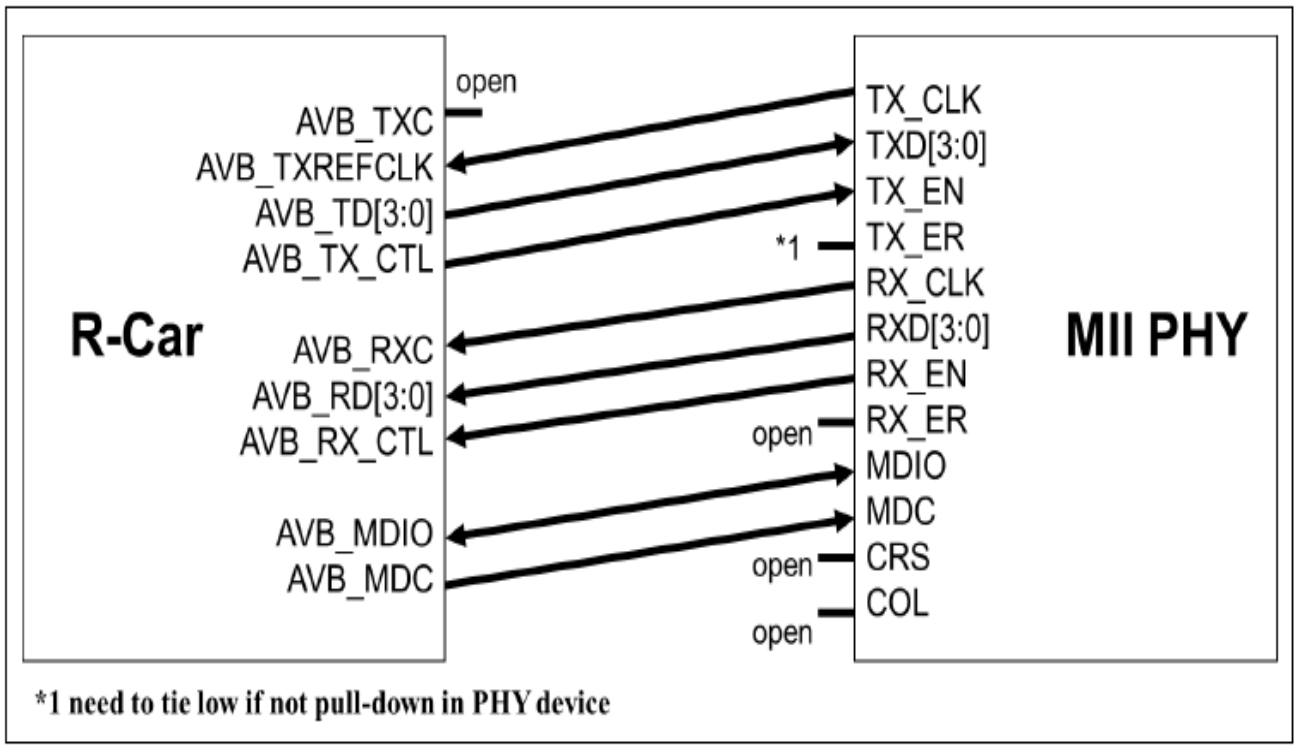
Definitions of Signals Used in an MII is shown below:

MII Signal	Source	Sink	Description
TXC	PHY	MAC	Reference clock for use in transmission. It runs at 25MHz.
TD[3:0]	MAC	PHY	Data being transmitted. The meanings of the signals differ with the edge of the TXC signal.
TX_EN	MAC	PHY	Control signal for transmission. The meaning of the signal differs with the edge of the TXC signal.
RXC	PHY	MAC	Reference clock for use in reception. It runs at 25MHz.
RD[3:0]	PHY	MAC	Data being received. The meanings of the signals differ with the edge of the RXC signal.
RX_EN	PHY	MAC	Control signal for reception. The meaning of the signal differs with the edge of the RXC signal.
MDIO	MAC or PHY	MAC or PHY	IO signal for control over the PHY layer.
MDC	MAC	PHY	Clock signal for control over the PHY layer.
TX_ER	MAC	PHY	Transmit enable
RX_ER	PHY	MAC	Receive error
CLS	PHY	MAC	Carrier sense
COL	PHY	MAC	Collision detect

(b) External Devices

We assume that two types of device, PHY devices and switches, may be externally connected to the MII of an R-Car device. Note that the MII connections to both types of device are handled in the same way.

• PHY device
This type of device is used for systems with a single port directly connected to an Ethernet cable.



(2) Specifications for the MII in R-Car Series Devices

(a) Specifications for the MII in R-Car Series Devices

The correspondence between pins of R-Car devices and MII signals is given in below table. MII Signal “TXC” should be connected to “AVB_TXCREFCLK” in R-Car. “AVB_TXC” is not used in MII connection mode.

MII Signal	R-Car Signal	Source	Sink
TX_CLK	AVB_TXCREFCLK	PHY	MAC
TXD[3:0]	AVB_TD[3:0]	MAC	PHY
TX_EN	AVB_TX_CTL	MAC	PHY
TX_ER	—	MAC	PHY
RX_CLK	AVB_RXC	PHY	MAC
RXD[3:0]	AVB_RD[3:0]	PHY	MAC
RX_DV	AVB_RX_CTL	PHY	MAC
RX_ER	—	PHY	MAC
MDIO	AVB_MDIO	MAC or PHY	MAC or PHY
MDC	AVB_MDC	MAC	PHY
CRS	—	PHY	MAC
COL	—	PHY	MAC

(b) Clock setting

RGMII mode and MII mode can be switched by AVB-DMAC Product Specific Register (APSR)：H'E68n 008C (n=0-2).

Bit24 of APSR should be set “1” to change RGMII mode(default) to MII mode. The value should be fixed before starting communication.

(c) Data rate setting

Because MII is limited at 100Mbps, it should be set 100Mbps. Bit0 of E-MAC Mode Register 2 should be set “0” to change 1000Mbps to 100Mbps. The value should be fixed before starting communication.

(3) Timing Specification: MII Timing

Timing specification between R-Car and PHY with MII communication is showed in below table. R-Car is not fully compliant with MII standard pin. Therefore, TX_ER, RX_ER, CLS and COL is not supported and undefined in timing specification.

Conditions: VDDQ18_25_AVB = 1.8/2.5V Tj= -40 to +125℃ GND = VSS = 0 V, CL = 30 pF

Ensure that TXCREFCLK is provided prior to the start of EtherAVB initialization

100.2 gPTP

100.2.1 Overview

The gPTP module is described in the gPTP specification. Refer to "100_2_uciapgptp020(gPTP)_IPSpec_v1.01.pdf".

100.3 RGMII

100.3.1 Overview

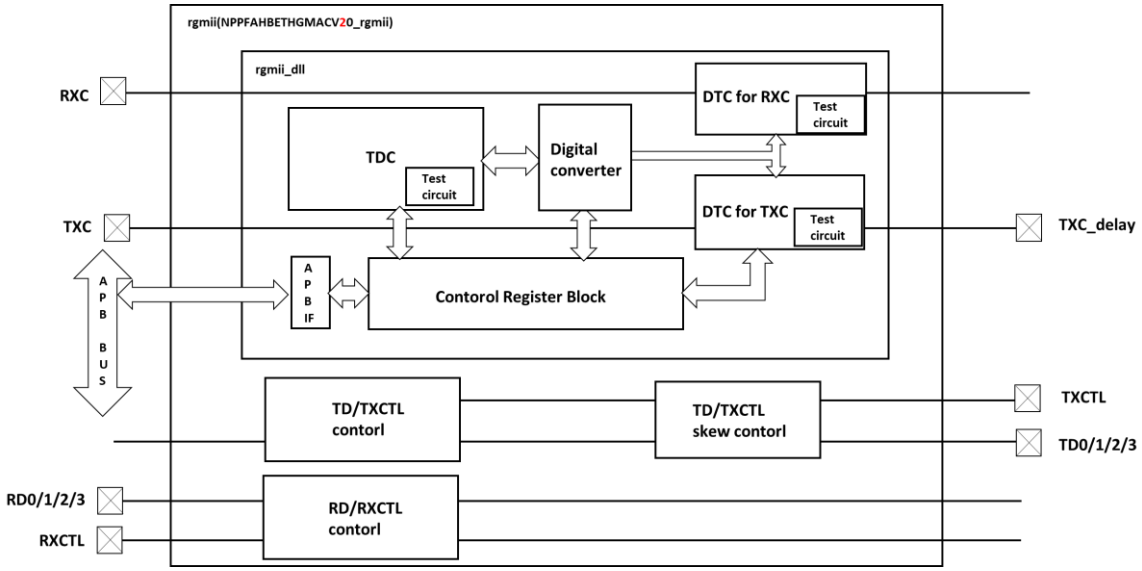
RGMII Interface logic.

Ethernet network using a 10 Mbps, 100 Mbps, or 1 Gbps full-duplex link via RGMII. Depending on the connected PHY.

AC spec covers RGMII Specification V2.0 and OPEN Alliance RGMII EPL v2.2

- Parallel loopback mode for AC measure and sort.
- Internal delay is adjusted with delay calibration circuit.
- Offset adjustment function for software workaround.
- Delay can be changed by software.

100.3.1.1 Block diagram



100.3.1.2 Register Configuration

Ch	Base Address
AVB0 (EthernetAVB-IF 0)	H'E680 1000
AVB1 (EthernetAVB-IF 1)	H'E681 1000
AVB2 (EthernetAVB-IF 2)	H'E682 1000

Name	Abbreviation	R/W	Offset Address	Initial Value	Access Size
TDC enable register	TDCEN	R/W	H'0004	H'0000 0000	32
Offset value setting register	OFFSET	R/W	H'0008	H'0000 0000	32

dTDC monitor register	DTDC	R/W	H'00A0	H'0000 0000	32

100.3.2 Register Description

The registers of the RGMII are assigned to and located in the address space of the internal bus.

[Legend for Register Descriptions]

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be initial value.

−/WB: Write-only. The read value is undefined.

100.3.2.1 TDCEN Register (TDCEN)

TDCEN is a 32-bit register that controls the enable/disable of the TDC circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	tdcen
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
0	tdcen	0	R/W	TDC circuit enable bit 0 : TDC circuit disable 1 : TDC circuit enable

100.3.2.2 OFFSET Register (OFFSET)

OFFSET is a 32-bit register to specify the Offset value for TDC circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	offset [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
7 to 0	offset [7:0]	H’00	R/W	TDC offset delay value setting H’00 : Shortest offset delay … H’FF : Longest offset delay

100.3.2.3 DTCDEC_TX_MANUAL_MODE Register (DTCDEC_TX_MANUAL_MODE)

DTCDEC_TX_MANUAL_MODE is a 32-bit register to specify delay value of DTC for TXC manually.

If Manual mode is selected, delay converter result is ignored.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	tx_manual_sel_mode	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

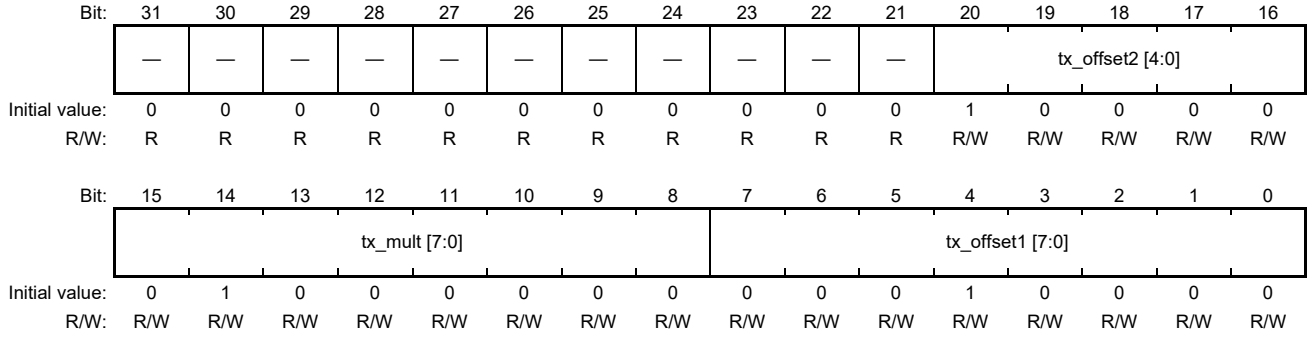
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	tx_manual_tap_num [6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	tx_manual_sel_mode	0	R/W	TXC DTC tap selection mode 0 : Auto mode 1 : Manual mode
30 to 7	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
6 to 0	tx_manual_tap_num [6:0]	H'00	R/W	DTC offset delay value setting for TXC. If TX_MAN_SEL=1, this value is used for DTC delay value. H'00 : Shortest offset delay … H'7F : Longest offset delay

100.3.2.4 DTCDEC_TX_CONFIG Register (DTCDEC_TX_CONFIG)

DTCDEC_TX_CONFIG is a 32-bit register to specify the calculation value for delay decoder circuit.

If “Auto mode” of DTCDEC_TX_MANUAL_MODE is selected, this result is used for DTC delay value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
20 to 16	tx_offset2 [4:0]	H’10	R/W	Delay decoder offset2 value H’00 : Shortest offset delay … H’1F : Longest offset delay
15 to 8	tx_mult [7:0]	H’40	R/W	Delay decoder dividing value of TDC result Set target delay value point of delay decorder. Initial value is 64/256 = 1/4 period. dDTC= (dTDC+offset1[7:0]-128)×TX_MULT[7:0]/256+offset2[4:0]-16 dDTC : DTC delay value. dTDC : The result of TDC to measure 1 period.
7 to 0	tx_offset1 [7:0]	H’10	R/W	Delay decoder offset1 value H’00 : Shortest offset delay … H’FF : Longest offset delay

Note : Recommended setting of DTCDEC_TX_CONFIG

		DTCDEC_TX_CONFIG
1.8V	AVB0	H’014880
	AVB1	H’0F4840
	AVB2	H’104840
2.5V	AVB0	H’034880
	AVB1	H’114840
	AVB2	H’004880

100.3.2.5 DTCDEC_RX_MANUAL_MODE Register (DTCDEC_RX_MANUAL_MODE)

DTCDEC_RX_MANUAL_MODE is a 32-bit register to specify delay value of DTC for RXC manually.

If Manual mode is selected, delay converter result is ignored.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	rx_manual_sel_mode	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

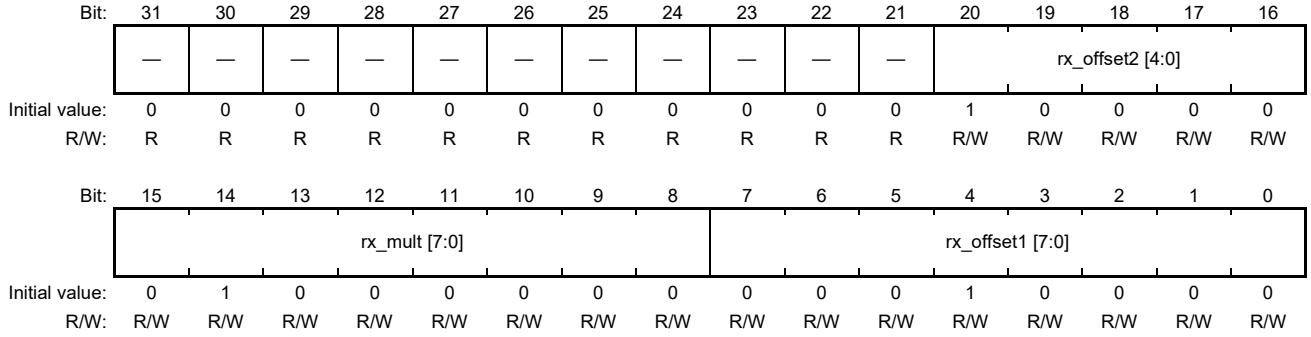
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	rx_manual_tap_num [6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	rx_manual_sel_mode	0	R/W	RXC DTC tap selection mode 0 : Auto mode 1 : Manual mode
30 to 7	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
6 to 0	rx_manual_tap_num [6:0]	H'00	R/W	DTC offset delay value setting for RXC. If RX_MAN_SEL=1, this value is used for DTC delay value. H'00 : Shortest offset delay … H'7F : Longest offset delay

100.3.2.6 DTCDEC_RX_CONFIG Register (DTCDEC_RX_CONFIG)

DTCDEC_RX_CONFIG is a 32-bit register to specify the calculation value for delay decoder circuit.

If “Auto mode” of DTCDEC_RX_MANUAL_MODE is selected, this result is used for DTC delay value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
20 to 16	rx_offset2 [4:0]	H’10	R/W	Delay decoder offset2 value H’00 : Shortest offset delay … H’1F : Longest offset delay
15 to 8	rx_mult [7:0]	H’40	R/W	Delay decoder dividing value of TDC result Set target delay value point of delay decorder. Initial value is 64/256 = 1/4 period. dDTC= (dTDC+offset1[7:0]-128)×RX_MULT[7:0]/256+offset2[4:0]-16 dDTC : DTC delay value. dTDC : The result of TDC to measure 1 period.
7 to 0	rx_offset1 [7:0]	H’10	R/W	Delay decoder offset1 value H’00 : Shortest offset delay … H’FF : Longest offset delay

Note : Recommended setting of DTCDEC_RX_CONFIG

		DTCDEC_RX_CONFIG
1.8V	AVB0	H’114840
	AVB1	H’014880
	AVB2	H’0C4840
2.5V	AVB0	H’014880
	AVB1	H’044880
	AVB2	H’0F4840

100.3.2.7 DTDC Register (DTDC)

DTDC is a 32-bit register to monitor the measurement result of TDC circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	dtdc [8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
8 to 0	dtdc [8:0]	H'000	R	TDC measurement result of 1 period. H'000 : Shortest TDC delay is selected … H'1FF : Longest TDC delay is selected

100.3.2.8 Select output signal register (SEL_OUT)

SEL_OUT is a 32-bit register that controls the signal of the test function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

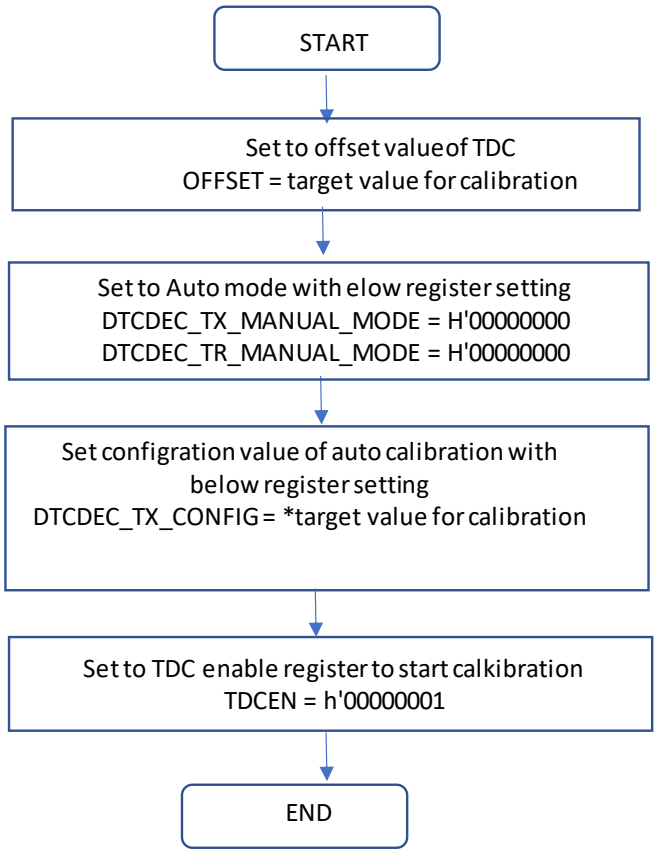
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PLL mode	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
5	—	1	R	Reserved These bits are always read as initial value. The write value should always be initial value.
4	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.
3	PLL mode	0	R/W	REFCLK selection 0 : TXC clock = Normal mode 1 : TXC clock = PLL mode
2 to 0	—	0	R	Reserved These bits are always read as initial value. The write value should always be initial value.

100.3.3 Operation

100.3.3.1 Initialize sequence with Auto calibration

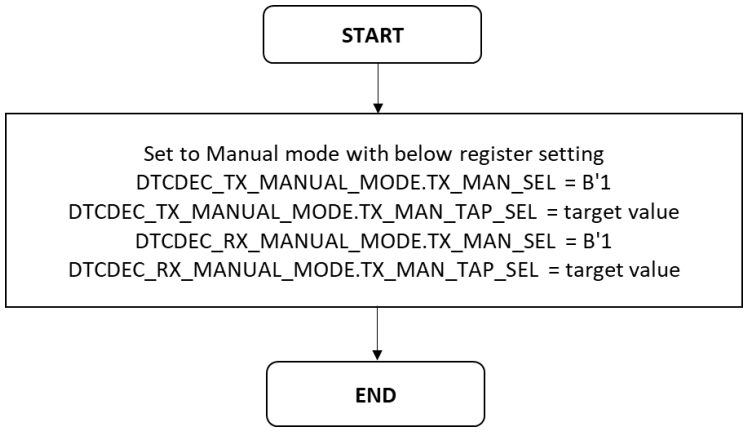
Refer following figure to initialize and activate sequence of this auto calibration function.



* TX/RX_OFFSET1 value shoukd be set ti same vlue with OFFSET register

100.3.3.2 Initialize sequence without Auto calibration

Refer following figure to initialize and activate sequence without auto calibration function.



100.3.3.3 PLL mode

[Block diagram of delay block with PLL mode circuit]
PLL mode use PLL7 for TXC clock.

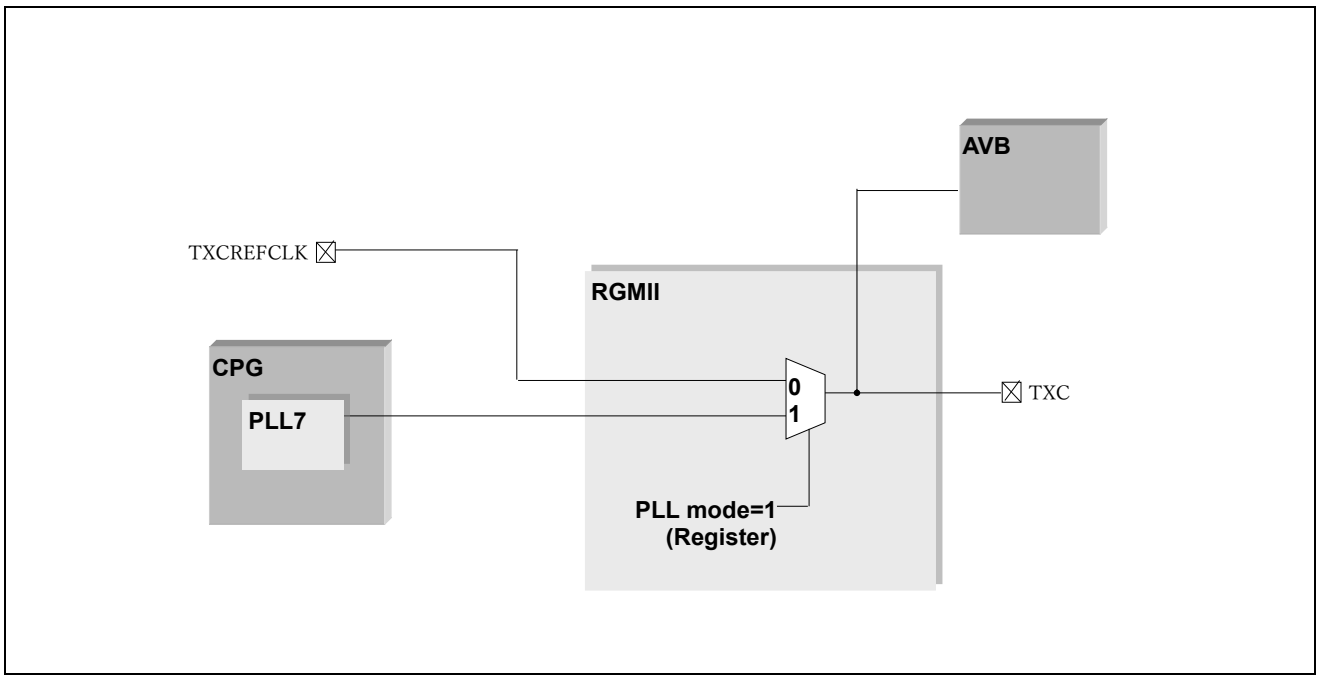


Figure 100.1 Block diagram of PLL mode

[Initialization procedure of PLL mode]
Enable PLL7 and set RGMII PLL mode=1 before RGMII initialization.

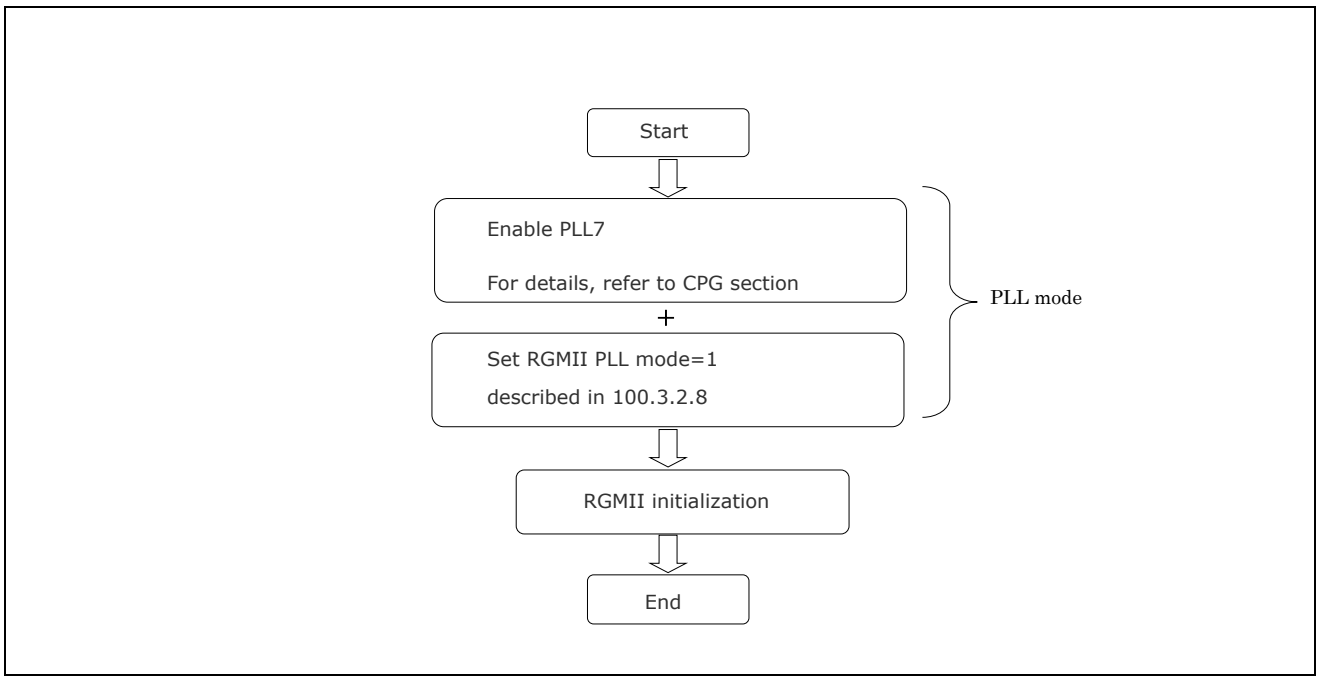

Figure 100.2 Initialization procedure of PLL mode

100.3.4 Usage Notes

100.3.4.1 Supply clock for Ethernet module

When using RGMII interface, need to supply clock for EtherAVB module.

100.3.4.2 Timing Dependency Between TXCREFCLK and Ethernet module Initialization

Ensure that TXCREFCLK is provided prior to the start of EtherAVB initialization

100.3.5 Safety Mechanisms

No description on this section.

102. CAN-FD

This section contains a generic description of the CANFD interface (RS-CANFD).
The first part of this section describes all specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

102.1 Overview

102.1.1 Functional Overview

Table 102.1 RS-CANFD Module Specifications

Item	Specification
Communication	CAN functionality conform to CAN-FD ISO 11898-1 (2015)
Protocol engine Version	RS-CANFD_PE V3.0
Gateway Function	CAN 2.0 <> CAN 2.0 CAN 2.0 <> CAN-FD Gateway (Only 8 Byte Payload) CAN-FD <> CAN-FD
Data transfer rate	up to 1Mbps for arbitration phase and up to 8Mbps for data phase , individually for each CAN channel
Proposed min. operation frequency peripheral clock/APB clock	133.33MHz
Data Link Layer clock (DLLC)	40MHz(Max)
Input/Output pins	TX/RX
CAN channels	4
Selectable ID type	11-bit Standard ID
	11-bit Standard ID + 18-bit Extended ID
Selectable Frame Type	Data Frame (RTR = 0) (CAN and CAN-FD frames)
	Remote Frame (RTR = 1) (only CAN frames)
Variable Data Byte Count for Data Frames	DLC range: 0 to F
Message Buffer	32 transmit message buffers per channel **1 4 transmission queue per channel Automatic message transfer into transmission queues supported
	64 shared buffers for RXMB and FIFO buffers per channel **1 - RXMB: - Up to 16*(n+1) reception message buffers, shared among all the CAN channels - FIFO buffers: - 8 Reception FIFO Buffers - Up to 3*(n+1) FIFOs individually configurable as Reception FIFO / Transmission FIFO / CAN to CAN Gateway FIFO
Automatic delay interval timer for transmission	The delay timer can be applied to: -Transmission FIFO -CAN to CAN Gateway FIFO
Enhanced reception filtering	support of 11bit and 29bit CAN identifier
	programmable 29 bit CAN identifier acceptance filter mask for each entry
	programmable GW routing capability for each channel (up to 8 routing destinations)

	RTR and IDE masking
	DLC filter
	Message buffer payload overload protection
	Payload filter
	Updating AFL entry during communication
General SW Support	**Automatic label information added to receive message (for upper SW layer support)**
Timer	**TX and RX Time Stamp function**
Power down function	**Module start stop function for each CAN node (Channel & Global Sleep Mode)**
RAM	**RAM ECC protected**
Bus traffic measurement	**CAN bus traffic measurement of each Channel is possible**
FFI mode	**This product cannot use FFI mode.**

102.1.2 Features of RS-CANFD

RS-CANFD has two interface modes (classical CAN mode and CAN FD mode), and uses different registers in each mode. The different register names RSCFD{unit}XXX and RSCFD{unit}CFDXXX are used in the different interface modes (XXX can be any character). In this document, the registers common to the two modes are indicated as RSCFD{unit}CFDXXX.

102.1.2.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units.

Number of Units and Channels

Product Name	R-Car V4M
Number of Units	1
Number of Channels	4
Number of Channel per Unit	4
Transmission Message Buffers per Channel	32
Shared Buffers for per Channel	64
Total Message Buffer	384

Table 102.1 Index

Index	Description
unit	Throughout this section, the individual RS-CANFD units are generically indicated by the index “unit”. For example, RSCFD[unit]CFDGCTR is the global control register of the RSCFDunit unit.
n	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “n”. For example, RSCFD[unit]CFDCnSTS is the channel n status register.
m	The individual channels of RSCFD unit is generically indicated by the index “m”. For example, CANFDm_RX is receive data input.
d	The individual common FIFO buffers are generically indicated by the index “d”. For example, RSCFD[unit]CFDCFCCd is the common FIFO buffer configuration/control register.
a	The individual receive FIFO buffers are generically identified by the index “a”. For example, RSCFD[unit]CFDRFSTSa is the receive FIFO buffer status register.
p	Data field registers of common FIFO buffers and receive FIFO buffers are identified by “p”. For example, RSCFD[unit]CFDCFDFp is the common FIFO access data field register.
i	The individual transmit control buffers are generically indicated by the index “i”. For example, RSCFD[unit]CFDTMCi is transmit message buffer control register.
j	The individual transmit status buffers are generically indicated by the index “j”. For example, RSCFD[unit]CFDTMSTSj is transmit message buffer status register.
k	The individual RAM tests for CAN are generically indicated by the index “k”. For example, RSCFD[unit]CFDRPGACCk is the RAM test page access register.
f	The transmit message buffer transmission are generically indicated by index “f”. For example, RSCFD[unit]CFDTMTRSTSf is the transmit message buffer transmission request status register.
w	A global register which setting for channels indicated by the index "w". For example, RSCFD[unit]CFDGAFLCFGw is global Acceptance Filter List configuration register.
v	A global register which setting for 04 channels indicated by the index “v”. For example, RSCFD[unit]CFDGTINTSTSv is the global transmit interrupt status register.
t	The receive message buffer new data are generically indicated by index “t”. For example, RSCFD[unit]CFDRMNDt is a receive message buffer new data register.

Note 1. The functions and descriptions of registers in this section are for the RS-CANFDs that has 4 channels (m = 0 to 3). When referring to information with indices, regard the index values as the ones corresponding to the target product.

Note 2. In some figure or table, this section use acronyms: CH, Ch, Ch instead of "channel".

Table 102.2 Indices for Individual Products

Index Correspondence of Each Product	R-CarV4M
unit	0
n	0 to 3
m	0 to 3
d	0 to 11
a	0 to 7
p	0 to 15
i	0 to 127
j	0 to 127
k	0 to 63
f	0 to 7
w	0 to 1 for RSCFD[unit]CFDGAFLCFGw 0 for RSCFD[unit]CFDGPFLCFGw
v	0
t	0 to 1

102.1.3 Interface Mode

RS-CANFD has the following two interface modes.

- Classical CAN mode: Only classical CAN frames are handled.
- CAN FD mode: both the classical CAN frames and CAN FD frames are handled.

Two modes use different register maps with the same base address, and the register maps are switched by switching the modes.

Interface modes can be switched using the CLOE bit in the RSCFD{unit}CFDCnFDCFG register.

102.1.4 Block Diagram

The block diagram which shows connection with a peripheral module is shown.

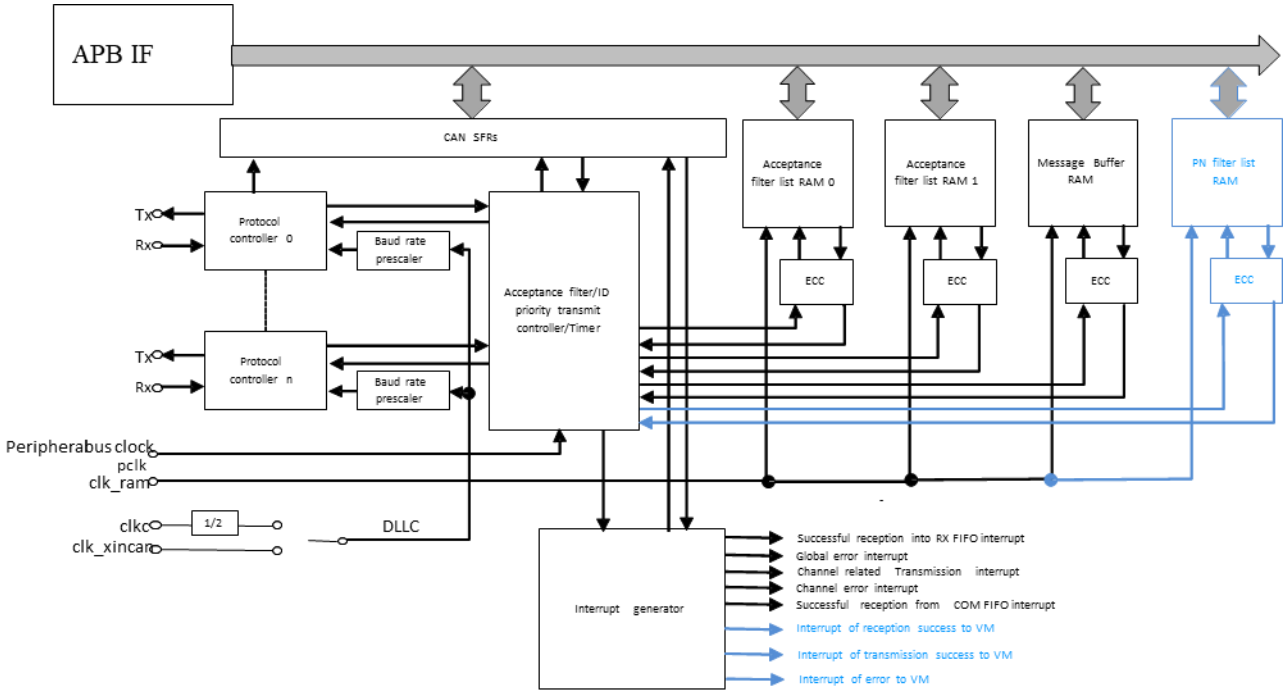

Figure 102.1 RS-CANFD Module Block Diagram (in classical CAN mode)

CANFDϕ must be set as follows.

R-Car V4M: 80(MHz) **(nominal)**

Peripheral bus clock (pclk): SASYNCPERD2ϕ

clkc: CANFDϕ

clk_xincan: CAN_CLK

clk_ram: SASYNCPERD1ϕ

102.1.5 External Pins

Table 102.3 shows the CAN module pin.

Pin switching is required for pins which are multiplexed with other Function. For details, see section 7, Pin Function Controller (PFC).

Table 102.3 Pin Configuration

Name	Abbreviation	I/O	Function
CANFDm_RX	—	Input	Pins for receiving data
CANFDm_TX	—	Output	Pins for transmitting data
CAN_CLK	—	Input	Input pin used for external clock input.

102.1.6 Connected module

Table 102.4 Connected module

Module name	Connected module name	function of the related module
CANFD	AXI	Register access of CPU
	CPG	Clock output
	PFC	Selection of external pins
	Module Standby	Clock stop control
	Software Reset	Soft reset execution
	INTC	Interruption
	SYS-DMAC	DMA transmission
	CRC	CRC module
	MFIS	MFIS module

102.1.6.1 Register Base Address

RSCFD{unit} base addresses are listed in the following table.

RSCFD{unit} register addresses are given as offsets from the base addresses in general.

Table 102.5 Register Base Address

Base Address Name	Base Address
<RSCFD0_base>	H'E666 0000

102.1.7 Register Configuration

This section describes all registers of RS-CANFD

102.1.7.1 List of Registers

RSCFD registers are listed in the table below.

For details about Register Base Addresses.

Register Name	Symbol RSCFD0+{registers of RS-CANFD}	R/W (*1)	Address	Access Size
Channel n Nominal Bitrate Configuration Register	RSCFD0CFDCnNCFG	-	<RSCFD0_base> + 0000h + n*0010h	8, 16, 32
Channel n Control Registers	RSCFD0CFDCnCTR	-	<RSCFD0_base> + 0004h + n*0010h	8, 16, 32
Channel n Status Registers	RSCFD0CFDCnSTS	-	<RSCFD0_base> + 0008h + n*0010h	8, 16, 32
Channel n Error Flag Registers	RSCFD0CFDCnERFL	-	<RSCFD0_base> + 000Ch + n*0010h	8, 16, 32
Global IP Version Register	RSCFD0CFDGIPV	-	<RSCFD0_base> + 0080h	8, 16, 32
Global Configuration Register	RSCFD0CFDGCFG	-	<RSCFD0_base> + 0084h	8, 16, 32
Global Control Register	RSCFD0CFDGCTR	-	<RSCFD0_base> + 0088h	8, 16, 32
Global Status Register	RSCFD0CFDGSTS	-	<RSCFD0_base> + 008Ch	8, 16, 32
Global Error Flag Register	RSCFD0CFDGERFL	-	<RSCFD0_base> + 0090h	8, 16, 32
Global Timestamp Counter Register	RSCFD0CFDGTSC	-	<RSCFD0_base> + 0094h	16, 32
Global Acceptance Filter List Entry Control Register	RSCFD0CFDGAFLECTR	-	<RSCFD0_base> + 0098h	8, 16, 32
Global Acceptance Filter List Configuration Register w	RSCFD0CFDGAFLCFGw	-	<RSCFD0_base> + 009Ch + w*0004h	8, 16, 32
RX Message Buffer Number Register	RSCFD0CFDRMNB	-	<RSCFD0_base> + 00Ach	8, 16, 32
RX Message Buffer New Data Register t	RSCFD0CFDRMNDt	-	<RSCFD0_base> + 00B0h + t*0004h	8, 16, 32
RX FIFO Configuration / Control Registers a	RSCFD0CFDRFCCa	-	<RSCFD0_base> + 00C0h + a*0004h	8, 16, 32
RX FIFO Status Registers a	RSCFD0CFDRFSTSa	-	<RSCFD0_base> + 00E0h + a*0004h	8, 16, 32
RX FIFO Pointer Control Registers a	RSCFD0CFDRFPCTRa	-	<RSCFD0_base> + 0100h + a*0004h	8, 16, 32
Common FIFO Configuration / Control Registers d	RSCFD0CFDCFCCd	-	<RSCFD0_base> + 0120h + d*0004h	8, 16, 32
Common FIFO Configuration / Control Enhancement Registers d	RSCFD0CFDCFCCEd	-	<RSCFD0_base> + 0180h + d*0004h	8, 16, 32
Common FIFO Status Registers d	RSCFD0CFDCFSTSd	-	<RSCFD0_base> + 01E0h + d*0004h	8, 16, 32
Common FIFO Pointer Control Registers d	RSCFD0CFDCFPCTRd	-	<RSCFD0_base> + 0240h + d*0004h	8, 16, 32
FIFO Empty Status Register	RSCFD0CFDFESTS	-	<RSCFD0_base> + 02A0h	8, 16, 32
FIFO Full Status Register	RSCFD0CFDFFSTS	-	<RSCFD0_base> + 02A4h	8, 16, 32
FIFO Message Lost Status Register	RSCFD0CFDFMSTS	-	<RSCFD0_base> + 02A8h	8, 16, 32

RX FIFO Interrupt Flag Status Register	RSCFD0CFDRFISTS	-	<RSCFD0_base> + 02Ach	8, 16, 32
Common FIFO RX Interrupt Flag Status Register	RSCFD0CFDCFRISTS	-	<RSCFD0_base> + 02B0h	8, 16, 32
Common FIFO TX Interrupt Flag Status Register	RSCFD0CFDCFTISTS	-	<RSCFD0_base> + 02B4h	8, 16, 32
Common FIFO One Frame RX Interrupt Flag Status Register	RSCFD0CFDCFOFRISTS	-	<RSCFD0_base> + 02B8h	8, 16, 32
Common FIFO One Frame TX Interrupt Flag Status Register	RSCFD0CFDCFOFTISTS	-	<RSCFD0_base> + 02BCh	8, 16, 32
Common FIFO Message Over Write Status Register	RSCFD0CFDCFMOWSTS	-	<RSCFD0_base> + 02C0h	8, 16, 32
FIFO FDC Full Status Register	RSCFD0CFDFFFSTS	-	<RSCFD0_base> + 02C4h	8, 16, 32
TX Message Buffer Control Registers i	RSCFD0CFDTMCi	-	<RSCFD0_base> + 02D0h + i*0001h	8
TX Message Buffer Status Registers j	RSCFD0CFDTMSTSj	-	<RSCFD0_base> + 07D0h + j*0001h	8
TX Message Buffer Transmission Request Status Register f	RSCFD0CFDTMTRSTSf	-	<RSCFD0_base> + 0CD0h + f*0004h	8, 16, 32
TX Message Buffer Transmission Abort Request Status Register f	RSCFD0CFDTMTARSTSf	-	<RSCFD0_base> + 0D70h + f*0004h	8, 16, 32
TX Message Buffer Transmission Completion Status Register f	RSCFD0CFDTMTCSTSf	-	<RSCFD0_base> + 0E10h + f*0004h	8, 16, 32
TX Message Buffer Transmission Abort Status Register f	RSCFD0CFDTMTASTSf	-	<RSCFD0_base> + 0EB0h + f*0004h	8, 16, 32
TX Message Buffer Interrupt Enable Configuration Register f	RSCFD0CFDTMIECf	-	<RSCFD0_base> + 0F50h + f*0004h	8, 16, 32
TX Queue Configuration / Control Registers 0 [n]	RSCFD0CFDTXQCC0[n]	-	<RSCFD0_base> + 1000h + n*0004h	8, 16, 32
TX Queue Status Registers 0 [n]	RSCFD0CFDTXQSTS0[n]	-	<RSCFD0_base> + 1020h + n*0004h	8, 16, 32
TX Queue Pointer Control Registers 0 [n]	RSCFD0CFDTXQPCTR0[n]	-	<RSCFD0_base> + 1040h + n*0004h	8, 16, 32
TX Queue Configuration / Control Registers 1 [n]	RSCFD0CFDTXQCC1[n]	-	<RSCFD0_base> + 1060h + n*0004h	8, 16, 32
TX Queue Status Registers 1 [n]	RSCFD0CFDTXQSTS1[n]	-	<RSCFD0_base> + 1080h + n*0004h	8, 16, 32
TX Queue Pointer Control Registers 1 [n]	RSCFD0CFDTXQPCTR1[n]	-	<RSCFD0_base> + 10A0h + n*0004h	8, 16, 32
TX Queue Configuration / Control Registers 2 [n]	RSCFD0CFDTXQCC2[n]	-	<RSCFD0_base> + 10C0h + n*0004h	8, 16, 32
TX Queue Status Registers 2 [n]	RSCFD0CFDTXQSTS2[n]	-	<RSCFD0_base> + 10E0h + n*0004h	8, 16, 32
TX Queue Pointer Control Registers 2 [n]	RSCFD0CFDTXQPCTR2[n]	-	<RSCFD0_base> + 1100h + n*0004h	8, 16, 32
TX Queue Configuration / Control Registers 3 [n]	RSCFD0CFDTXQCC3[n]	-	<RSCFD0_base> + 1120h + n*0004h	8, 16, 32
TX Queue Status Registers 3 [n]	RSCFD0CFDTXQSTS3[n]	-	<RSCFD0_base> + 1140h + n*0004h	8, 16, 32
TX Queue Pointer Control Registers 3 [n]	RSCFD0CFDTXQPCTR3[n]	-	<RSCFD0_base> + 1160h + n*0004h	8, 16, 32
TX Queue Empty Status Register	RSCFD0CFDTXQESTS	-	<RSCFD0_base> + 1180h	8, 16, 32
TX Queue Full Interrupt Status Register	RSCFD0CFDTXQFISTS	-	<RSCFD0_base> + 1184h	8, 16, 32
TX Queue Message Lost Status Register	RSCFD0CFDTXQMSTS	-	<RSCFD0_base> + 1188h	8, 16, 32
TX Queue Message Overwrite Status Register	RSCFD0CFDTXQOWSTS	-	<RSCFD0_base> + 118Ch	8, 16, 32
TX Queue Interrupt Status Register	RSCFD0CFDTXQISTS	-	<RSCFD0_base> + 1190h	8, 16, 32
TX Queue One Frame TX Interrupt Status Register	RSCFD0CFDTXQOFTISTS	-	<RSCFD0_base> + 1194h	8, 16, 32
TX Queue One Frame RX Interrupt Status Register	RSCFD0CFDTXQOFRISTS	-	<RSCFD0_base> + 1198h	8, 16, 32
TX Queue Full Status Register	RSCFD0CFDTXQFSTS	-	<RSCFD0_base> + 119Ch	8, 16, 32
TX History List Configuration / Control Register n	RSCFD0CFDTHLCCn	-	<RSCFD0_base> + 1200h + n*0004h	8, 16, 32
TX History List Status Register n	RSCFD0CFDTHLSTSn	-	<RSCFD0_base> + 1220h + n*0004h	8, 16, 32
TX History List Pointer Control Registers n	RSCFD0CFDTHLPCTRn	-	<RSCFD0_base> + 1240h + n*0004h	8, 16, 32
Global TX Interrupt Status Register v	RSCFD0CFDGTINTSTSv	-	<RSCFD0_base> + 1300h + v*4	8, 16, 32
Global Test Configuration Register	RSCFD0CFDGTSTCFG	-	<RSCFD0_base> + 1308h	8, 16, 32
Global Test Control Register	RSCFD0CFDGTSTCTR	-	<RSCFD0_base> + 130Ch	8, 16, 32
Global FD Configuration register	RSCFD0CFDGFDCFG	-	<RSCFD0_base> + 1314h	8, 16, 32
Global FD CRC Configuration register	RSCFD0CFDGCRCCFG	-	<RSCFD0_base> + 1318h	8, 16, 32
Global Lock Key Register	RSCFD0CFDGLOCKK	-	<RSCFD0_base> + 131Ch	16, 32

Global AFL Ignore Entry Register	RSCFD0CFDGAFLIGNENT	-	<RSCFD0_base> + 1324h	8, 16, 32
Global AFL Ignore Control Register	RSCFD0CFDGAFLIGNCTR	-	<RSCFD0_base> + 1328h	16, 32
DMA Transfer Control Register	RSCFD0CFDCDTCT	-	<RSCFD0_base> + 1330h	8, 16, 32
DMA Transfer Status Register	RSCFD0CFDCDTSTS	-	<RSCFD0_base> + 1334h	8, 16, 32
DMA TX Transfer Control Register	RSCFD0CFDCDTTCT	-	<RSCFD0_base> + 1340h	8, 16, 32
DMA TX Transfer Status Register	RSCFD0CFDCDTTSTS	-	<RSCFD0_base> + 1344h	8, 16, 32
Global RX Interrupt Status Register n	RSCFD0CFDGRINTSTSn	-	<RSCFD0_base> + 1350h + n*0004h	8, 16, 32
Pretended Network Filter List Entry control Register	RSCFD0CFDGPFLECTR	-	<RSCFD0_base> + 1370h	8, 16, 32
Pretended Network Filter List Entry Configuration Register u	RSCFD0CFDGPFLCFGu	-	<RSCFD0_base> + 1374h + u * 0004h	8, 16, 32
Global SW reset Register	RSCFD0CFDGRSTC	-	<RSCFD0_base> + 1380h	16, 32
Global Flexible CAN mode Configuration Register	RSCFD0CFDGFCMC	-	<RSCFD0_base> + 1384h	8, 16, 32
Global Flexible transmission buffer assignment Configuration Register	RSCFD0CFDGFTBAC	-	<RSCFD0_base> + 138Ch	8, 16, 32
Channel n Data Bitrate Configuration Register	RSCFD0CFDCnDCFG	-	<RSCFD0_base> + 1400h + n*0020h	8, 16, 32
Channel n CAN-FD Configuration Register	RSCFD0CFDCnFDCFG	-	<RSCFD0_base> + 1404h + n*0020h	8, 16, 32
Channel n CAN-FD Control Register	RSCFD0CFDCnFDCTR	-	<RSCFD0_base> + 1408h + n*0020h	8, 16, 32
Channel n CAN-FD Status Register	RSCFD0CFDCnFDSTS	-	<RSCFD0_base> + 140Ch + n*0020h	8, 16, 32
Channel n CAN-FD CRC Register	RSCFD0CFDCnFDCRC	-	<RSCFD0_base> + 1410h + n*0020h	8, 16, 32
Channel n Bus load Control Register	RSCFD0CFDCnBLCT	-	<RSCFD0_base> + 1418h + n*0020h	8, 16, 32
Channel n Bus load Status Register	RSCFD0CFDCnBLSTS	-	<RSCFD0_base> + 141Ch + n*0020h	8, 16, 32
Global Acceptance Filter List ID Registers r = [1…10]h	RSCFD0CFDGAFLIDr	-	<RSCFD0_base> + 1800h + (r-1)*0010h	8, 16, 32
Global Acceptance Filter List Mask Registers r = [1…10]h	RSCFD0CFDGAFLMr	-	<RSCFD0_base> + 1804h + (r-1)*0010h	8, 16, 32
Global Acceptance Filter List Pointer 0 Registers r = [1…10]h	RSCFD0CFDGAFLP0r	-	<RSCFD0_base> + 1808h + (r-1)*0010h	8, 16, 32
Global Acceptance Filter List Pointer 1 Registers r = [1…10]h	RSCFD0CFDGAFLP1r	-	<RSCFD0_base> + 180Ch + (r-1)*0010h	8, 16, 32
Global Pretended Network Filter List ID Registers s = [1…4]	RSCFD0CFDGPFLIDs	-	<RSCFD0_base> + 1A00h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Mask Registers s = [1...4]	RSCFD0CFDGPFLMs	-	<RSCFD0_base> + 1A04h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Pointer 0 Registers s = [1...4]	RSCFD0CFDGPFLP0s	-	<RSCFD0_base> + 1A08h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Pointer 1 Registers s = [1...4]	RSCFD0CFDGPFLP1s	-	<RSCFD0_base> + 1A0Ch + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Filter Payload Type Registers s = [1...4]	RSCFD0CFDGPFLPTs	-	<RSCFD0_base> + 1A10h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Payload Data 0 Registers s = [1...4]	RSCFD0CFDGPFLPD0s	-	<RSCFD0_base> + 1A14h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Payload Mask 0 Registers s = [1...4]	RSCFD0CFDGPFLPM0s	-	<RSCFD0_base> + 1A18h + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Payload Data 1 Registers s = [1...4]	RSCFD0CFDGPFLPD1s	-	<RSCFD0_base> + 1A1Ch + (s-1) * 0040h	8, 16, 32
Global Pretended Network Filter List Payload Mask 1 Registers s = [1...4]	RSCFD0CFDGPFLPM1s	-	<RSCFD0_base> + 1A20h + (s-1) * 0040h	8, 16, 32
Channel n TX History List Access Registers 0	RSCFD0CFDTHLACC0[n]	-	<RSCFD0_base> + 8000h + n*0008h	8, 16, 32
Channel n TX History List Access Registers 1	RSCFD0CFDTHLACC1[n]	-	<RSCFD0_base> + 8004h + n*0008h	8, 16, 32
RAM Test Page Access Registers k	RSCFD0CFDRPGACCk	-	<RSCFD0_base> + 8400h + k*0004h	8, 16, 32
RX Message Buffer ID Registers	RSCFD0CFDRMID	-	<RSCFD0_base> + Note2	8, 16, 32
RX Message Buffer Pointer Registers	RSCFD0CFDRMPTR	-	<RSCFD0_base> + Note2	8, 16, 32
RX Message Buffer CAN-FD Status Register	RSCFD0CFDRMFDSTS	-	<RSCFD0_base> + Note2	8, 16, 32
RX Message Buffer Data Field p Registers	RSCFD0CFDRMDFp	-	<RSCFD0_base> + Note2	8, 16, 32
RX FIFO Access ID Registers	RSCFD0CFDRFID	-	<RSCFD0_base> + Note2	8, 16, 32
RX FIFO Access Pointer Register	RSCFD0CFDRFPTR	-	<RSCFD0_base> + Note2	8, 16, 32
RX FIFO Access CAN-FD Status Register	RSCFD0CFDRFFDSTS	-	<RSCFD0_base> + Note2	8, 16, 32
RX FIFO Access Data Field p Registers	RSCFD0CFDRFDFp	-	<RSCFD0_base> + Note2	8, 16, 32

Common FIFO Access ID Registers	RSCFD0CFDCFID	-	<RSCFD0_base> + Note2	8, 16, 32
Common FIFO Access Pointer Registers	RSCFD0CFDCFPTR	-	<RSCFD0_base> + Note2	8, 16, 32
Common FIFO Access CAN-FD Control/Status Register	RSCFD0CFDCFFDCSTS	-	<RSCFD0_base> + Note2	8, 16, 32
Common FIFO Access Data Field p Registers	RSCFD0CFDCFDFp	-	<RSCFD0_base> + Note2	8, 16, 32
TX Message Buffer ID Registers	RSCFD0CFDTMID	-	<RSCFD0_base> + Note2	8, 16, 32
TX Message Buffer Pointer Registers	RSCFD0CFDTMPTR	-	<RSCFD0_base> + Note2	8, 16, 32
TX Message Buffer CAN-FD Control Register	RSCFD0CFDTMFDCTR	-	<RSCFD0_base> + Note2	8, 16, 32
TX Message Buffer Data Field p Registers	RSCFD0CFDTMDFp	-	<RSCFD0_base> + Note2	8, 16, 32

102.3 Operation

Refer to the section 5 to 18 of "102_uciaprcn0140_IPSpec_v1p06_r2.pdf"

102.4 Usage Notes

No description on this section.

102.5 Safety Mechanisms

102.5.1 ECC for CAN-FD (IP uciapecc7w10)

102.5.1.1 Overview

ECC IP – Function block diagram:

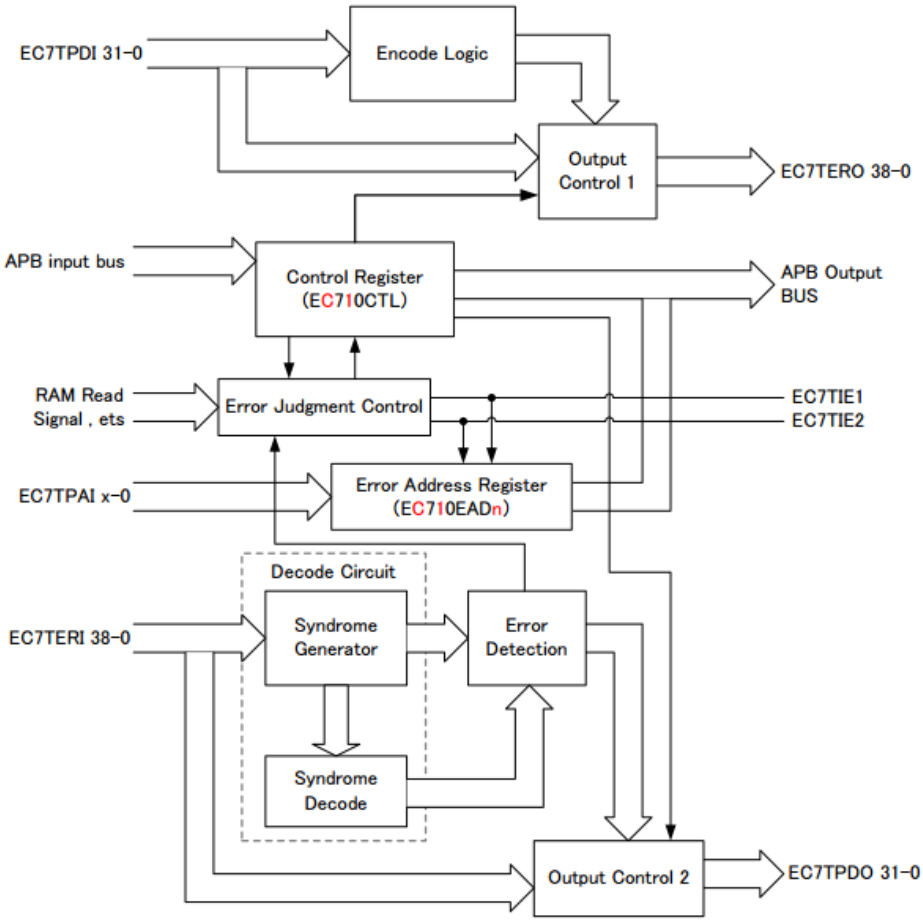

Figure 102.2 ECC Block diagram

EDC protection is applied to internal buffer (Acceptance filter list RAM, Message Buffer RAM) of CAN-FD.

102.5.1.1.1 Error Detection and Correction

-Seven-bit ECC data is appended to the 32-bit RAM data.

-This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.

*Note: This module is not capable of reliably detecting errors in three or more bits. If errors occur in three or more bits, the module may detect the errors as 1- or 2-bit ECC errors or not detect any errors. Depending on the settings, this may lead to the correction of a bit that was not actually inverted.

102.5.1.1.2 Enabling or Disabling ECC Error Detection and Correction

-ECC error detection can be either enabled or disabled.

-One-bit ECC error correction can be either enabled or disabled.

-If all the bits of RAM output data are stuck to 0 or 1, it is detected as a 2-bit ECC error.

102.5.1.1.3 Error Notification

-The ECM is notified when 2-bit ECC errors are detected (this can be enabled or disabled).

-The ECM is notified when 1-bit ECC errors are detected (this can be enabled or disabled).

-Once the ECM has been notified of an error, even if another ECC error is detected, the ECM is not notified until the error status bit corresponding to the initial error is cleared.

102.5.1.1.4 Error Status

-Detection of 2-bit and 1-bit ECC errors can be monitored.

-Special registers are provided to clear error status.

102.5.1.1.5 Address Capture

-Only one address at which an ECC error has occurred can be captured.

-When a 2-bit or 1-bit ECC error is detected, the error-causing address is captured. It is used to capture only when the first error is detected after the flag is cleared.

102.5.1.1.6 Testing Function (Error Insertion)

-By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the ECEDB[31:0] register value can be written to the RAM data section, and the ECERDB[6:0] register value can be written to the ECC redundant bit section.

-By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed.

-By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed.

102.5.1.2 Hardware Description

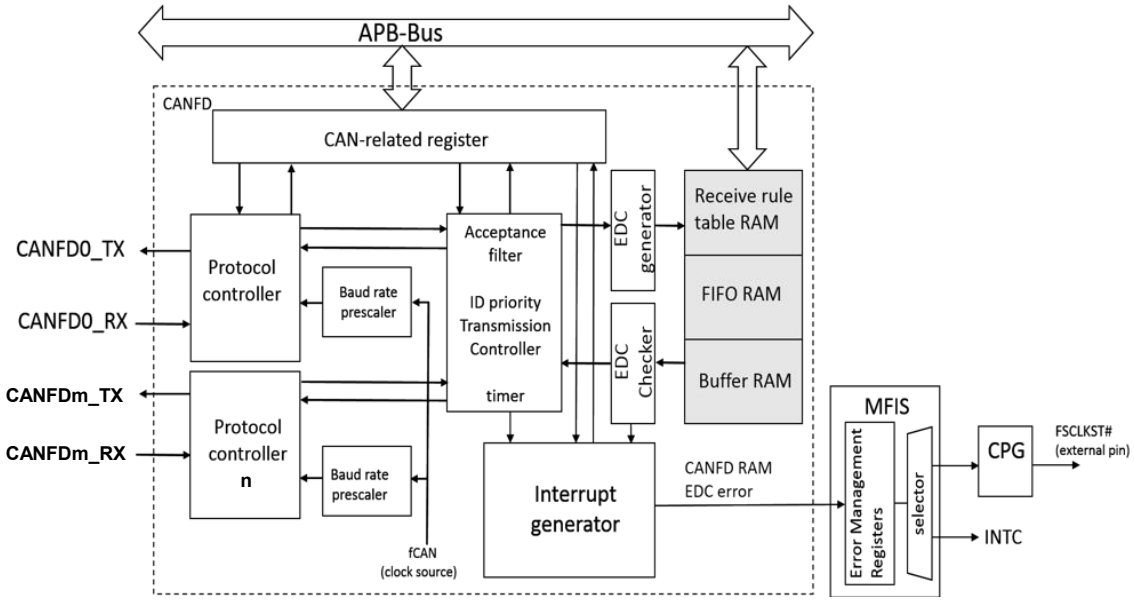

Figure 102.3 EDC protection for CAN-FD

Table 102.6 Register Configuration

Register Name	Abbreviation	R/W	Address	Initial Value	Size
ECC control register	EC710CTL	R/W	H'E66C_8000	H'0000 0000	32
ECC test mode control register	EC710TMC	R/W	H'E66C_8004	H'0000 0000	32
ECC redundant bit data control test register	EC710TRC	R	H'E66C_8008	H'0000 0000	32
ECC encoder and decoder data test register	EC710TED	R/W	H'E66C_800C	H'0000 0000	32
ECC error address register	EC710EAD	R	H'E66C_8010	H'0000 0000	32

102.5.1.2.1 Register Description

(a) EC710CTL — ECC control register

E710CTL controls the status and modes of the ECC module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	-	-	-	ECER2C	ECER1C	-	ECTHM	ECERVF	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X
R/W:	R/W	R/W	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 14	EMCA[1:0]	All 0	R/W	These 2bits are the write trigger reserve bits to bit6. These read value are always B’0. When the value of these bits is 2’b01, then it is possible to write access to bit6 “ECERVF”. If these bits are not 2’b01, the write access to bit6 is ignored and the value is not written. These bits reserve the write trigger to bit 7.
13 to 11	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	ECER2C	0	R/W	2-Bit ECC Error Detection Flag Clear Clears the bit 2 “ECER2F” status flag. The read value is always B’0, and writing B’0 to ECER2C does not change the state. If writing B’1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing B’1 to ECER2C while “ECER2F” is set clears “ECER2F”
9	ECER1C	0	R/W	1-Bit ECC Error Detection Flag Clear Clears the bit 1 “ECER1F” status flag. The read value is always B’0, and writing B’0 to ECER1C does not change the state. If writing B’1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing B’1 to ECER1C while “ECER1F” is set clears “ECER1F”. Flag clear bit of accumulating ECC error detection and correctio
8	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	ECTHM	0	R/W	ECC Function Disable Select Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is 2'b01. Therefore, only the 16-bit manipulation instruction is valid. Setting ECTHM to B'1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to B'1 has no effect on the encoder side. 0: Enables ECC detection and correction. 1: Disables ECC detection and correction.
6	ECERVF	0	R/W	Flag bit to enable ECC error judgment Setting this bit to B'1 enables to judge error. The correction of output data and the interrupt output depend on setting of bit 5 "EC1ECP", bit 4 "EC2EDIC" and bit 3 "EC1EDIC". But the write access to this bit is valid when the value of upper bit15 and bit14 is 2'b01. So only the 16bits operation command is valid in the case of the write access to this bit.
5	EC1ECP	0	R/W	Permission bit of ECC 1bit error correction This bit sets enable or disable to correct the 1bit error when ECC error detection and correction is valid. By setting B'1 to this bit, the non-corrected data is outputted if 1bit error is detected. 0: At 1bit error detection, the error correction is executed. 1: At 1bit error detection, the error correction is not executed.
4	EC2EDIC	0	R/W	Control bit of interrupt at ECC 2bits error detection This bit controls the interrupt output at detecting 2bits error. By setting B'1 to this bit, the 2bits error interrupt "EC7TIE2" is outputted when 2bits error detected. 0: When a 2-bit error is detected, the ECM is not notified of the error. 1: When a 2-bit error is detected, the ECM is notified of the error.
3	EC1EDIC	0	R/W	Control bit of interrupt at ECC 1bit error detection This bit controls the interrupt output at detecting 1bit error. By setting "1" to this bit, the 1bit error interrupt "EC7TIE1" is outputted when 1bit error detected. 0: Interrupt is not occurred at detecting 1bit error. (initial value) 1: EC7TIE1 is outputted at detecting 1bit error.

Bit	Bit Name	Initial Value	R/W	Description
2	ECER2F	0	R/W	2-Bit ECC Error Detection Flag Indicates that errors have been detected at two bits in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. When the 2bits error interrupt output is enabled, 2bits error interrupt signal “E7TIE2” is outputted by setting this flag. This bit is a read only flag, so writing “1” or “0” does not influence on inner condition. When 2bits error is detected again under the condition that this bit is set, the interrupt signal is not occurred. 0: 2-bit error is not generated 1: 2-bit error is generated Clearing conditions (1) Reset is applied. (2) 1 is written to ECER2C. (3) ECC detection and correction being disabled (ECTHM = 1).
1	ECER1F	0	R/W	1-Bit ECC Error Detection And Correction Flag Indicates that an error has been detected at one bit in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. When the 1bit error interrupt output is enabled, 1bit error interrupt signal “E7TIE1” is outputted by setting this flag. This bit is a read only flag, so writing “1” or “0” does not influence on inner condition. When 1bit error is detected again under the condition that this bit is set, the interrupt signal is not occurred. 0: 1-bit error is not generated 1: 1-bit error is generated Clearing conditions (1) Reset is applied. (2) 1 is written to ECER1C. (3) ECC detection and correction being disabled (ECTHM = 1).

Bit	Bit Name	Initial Value	R/W	Description
0	ECEMF	X	R	ECC Error Message Flag Indicates that the current read data bus contains an error. ECEMF is updated every time RAM data is output. Since the RAM value after reset is undefined, the initial value of this module is determined to be an error, and thus ECEMF may be set. Therefore, the ECEMF value after reset is undefined. 0: The current read data bus contains no bit errors. 1: The current RAM output data contains bit errors. ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled. Clearing conditions (1) ECC detection and correction being disabled (ECTHM = B'1). (2) Decoding circuit input data contains no 1-bit errors.

(b) E710TMC — ECC Test Mode Control Register

E710TMC is a register to switch the mode to test mode and controls the mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 14	ETMA[1:0]	All 0	R/W	Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13 to 8	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ECTMCE	0	R/W	ECC Test Mode Control Enable ECTMCE enables or disables access to the test registers and test control bits. Write access to ETCMCE is enabled when the value of bits 15 and 14 is B'10. 0: Disables access to the test registers and test control bits. 1: Enables access to the test registers and test control bits.

Bit	Bit Name	Initial Value	R/W	Description
6 to 5	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ECTRRS	0	R/W	ECC RAM Read Test Mode Control Enable ECTRRS enables the read status of RAM to be generated by reading the E710TED register, and also allows the RAM output data to be read out when the E710TRC.ECERDB[7:0] bits and the E710TED register are read. Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Disables generation of RAM read status for testing when E710TED is read. 1: Enables generation of RAM read status for testing when E710TED is read. When E710TRC.ECERDB[7:0] and E710TED are read, the values of the RAM output data pin are read out.
3	ECREOS	0	R/W	ECC Redundant Bit Output Data Select ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows encoding result to be output as the ECC redundant bit output. 1: Allows the E710TRC.ECERDB[6:0] value to be output as the ECC redundant bit output.
2	ECENS	0	R/W	ECC Encoder Input Select ECENS selects either the data value from the peripheral module or the test register value (E710TED.ECEDB[31:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the RAM write data from the peripheral module to be input as the ECC encoder input data. 1: Allows the E710TED.ECEDB[31:0] value to be input as the ECC encoder input data.

Bit	Bit Name	Initial Value	R/W	Description
1	ECDCS	0	R/W	ECC Decoder Input Select ECDCS selects either the lower 32-bit data value from the RAM or the test register value (E710TED.ECEDB[31:0]) as the lower 32-bit data of the input signal to be decoded. Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously). ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the lower 32-bit RAM output data to be input to the data area (32 lower-order bits) to the decoder. 1: Allows the E710TED.ECEDB[31:0] value to be input to the data area to the decoder.
0	ECREIS	0	R/W	ECC Redundant Bit Input Data Select ECREIS selects either the upper 7-bit data value from the RAM (redundant bit area) or the test register value (E710TRC.ECERDB[6:0]) as the upper 7-bit data of the input signal to be decoded. Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the upper 7-bit RAM output data to be input to the ECC redundant bit area to the decoder. 1: Allows the E710TRC.ECERDB[6:0] value to be input to the ECC redundant bit area to the decoder.

(c) E710TRC — ECC Redundant Bit Data Control Test Register

E710TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECRODM) corresponding to the ECC redundant bit area. Each field can be accessed as the 8-bit register with the same name.

When ECTMCE = 0, E710TRC is always read as 0.

When ECTMCE = 1, E710TRC can be read using the 32-bit manipulation instruction.

Note: Changing ECTMCE from 1 to 0 resets E710TED synchronously

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	ECSYND[6:0]							-	ECHORD[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	ECECRD[6:0]							-	ECERDB[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W: R R R R R R R R R R R R R R R R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0	R	Reserved These bits are always read as 0. The write value should always be 0.
30 to 24	ECSYND [6:0]	All 0	R	ECC Decoder Syndrome Data Register ECSYND is a read-only register to confirm the syndrome code generated by the decoding circuit in test mode (ECTMCE = 1). Write access to ECSYND is ignored. When read, the ECSYND bits return the value of the syndrome code (synd[6:0]) generated based on the input data to the decoding circuit. The ECSYND bits are not holding circuits; the register value changes as the input signal changes. ECSYND is valid only when ECTMCE = 1, and is always read as 00H when ECTMCE = 0.
23	-	0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	ECHORD [6:0]	All 0	R	ECC 7-Bit Redundant Data Holding Test Register ECHORD holds the 7-bit ECC redundant area (upper 7-bit RAM data), which cannot be confirmed by the peripheral module, when the peripheral module accesses the RAM for reading in test mode (ECTMCE = 1). The ECHORD bits are loaded with the upper 7-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode (ECTMCE = 1). The ECHORD bits are also loaded with the data on the input pins EC7TERI38 to EC7TERI32 at the next operating clock pulse when the ECEDB[15:0] register is read while E710TMC:ECTRRS = 1. ECHORD is valid only when ECTMCE = 1, and is always read as 00H when ECTMCE = 0.
15	-	0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 8	ECECRD [6:0]	All 0	R	ECC Encoder Test Register ECECRD is a read-only register to read the 7-bit redundant section generated by the encoding circuit in test mode (ECTMCE = 1). ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the read-out data is the result of encoding (ecc[6:0]), not the output value. ECECRD is valid only when ECTMCE = 1, and is always read as 00H when ECTMCE = 0.
7	-	0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	ECERDB [6:0]	All 0	R	ECC Redundant Bit Input and Output Substitution Buffer Register ECERDB is a buffer register for the data that substitutes for the input and output data for the 7-bit ECC redundant data area in test mode (ECTMCE = 1). ECERDB can be read and written to in ECC test mode (ECTMCE = 1). When ECREOSS = 1, the ECERDB value, instead of the seven redundant bits generated by the encoding circuit, is output to the pin to be supplied to the RAM. When ECREIESS = 1, the ECERDB value, instead of the upper seven data bits to be input to the decoding circuit, is handled by the decoding circuit. When ECTRRS = 1, reading ECERDB returns the signal value supplied to RAM instead of the data written to ECERDB.

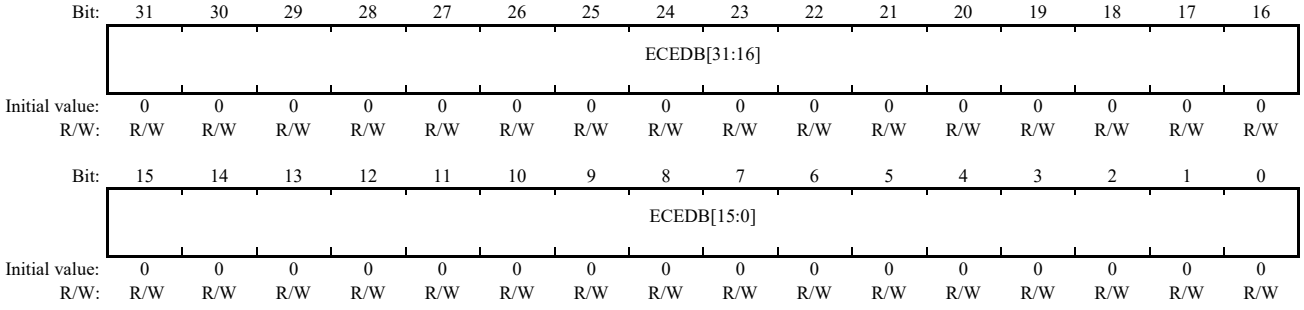
(d) E710TED — ECC Encoder and Decoder Data Test Register

E710TED is a 32-bit data test register for ECC encoding and decoding.

When ECTMCE = 1, E710TED can be read and written to using the 32-bit manipulation instruction.

When ECTMCE = 0, E710TED is always read as 0.

In test mode, the E710TED value can be used as the input data to the encoding circuit and decoding circuit.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECEDB	All 0	R/W	ECC Encoder and Decoder Data Test Register When E710TMC:ECENS = B'1, the ECEDB value is input to the encoding circuit and supplied to the RAM. When E710TMC:ECDCS = B'1, the ECEDB value is input as the 31th to 0th bits of the input data to the decoding circuit. When E710TMC:ECTRRS = B'1, reading ECEDB returns the RAM output data instead of the data written to ECEDB. Note: Changing ECTMCE from B'1 to B'0 resets E710TED synchronously.

(e) E710EAD — ECC Error Address Register

E710EAD is a read-only register to hold the address at which an ECC error has occurred.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD [31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECEAD	All 0	R	ECC Error Address Register If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E710EAD as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status flag is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in E710EAD.

102.5.1.2.2 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification

  While EC1EDIC is set to B'1, when an error is detected in one bit from among bits 0 to 38 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.

- 2-bit Error Notification

While EC2EDIC is set to B'1, when an error is detected in two bits from among bits 0 to 38 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

102.5.1.2.3 Test Function

(1) Writing to RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

(2) Reading RAM Data

(a) Set the ECTHM bit in the ECC control register to 1 to disable ECC error detection and correction.

(b) Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:

(a) Set the ECTHM bit in the ECC control register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC Bits

(a) Set the ECTMCE bit in the ECC test mode control register to 1 to set ECC test mode.

(b) Write the value for writing to the ECC bits to the E710TRC.ECERDB[6:0] bits.

(c) Set the ECREOS bit in the ECC test mode control register to 1 to select writing of the value of the E710TRC.ECERDB[6:0] bits to the ECC bits.

(d) When data are written to the peripheral RAM, the value in the E710TRC.ECERDB[6:0] bits will be written to the ECC bits.

How to exit this test mode:

(a) Set the ECTMCE bit in the ECC test mode control register to 0 to set normal mode.

(4) Reading the ECC Bits

(a) Set the ECTMCE bit in the ECC test mode control register to 1 to set ECC test mode.

(b) When data in the peripheral RAM is read, the ECC bits are stored in the E710TRC.ECHORD[6:0] bits.

How to exit this test mode:

(a) Set the ECTMCE bit in the ECC test mode control register to 0 to set normal mode.

102.5.1.3 Error detection operation

102.5.1.3.1 Setting initial value

In this IP (ECC IP), it is possible to select whether the error in the initial value after reset is judged or not with the value of IP terminal “EC7TERVE”.

Followings show operation table with terminal condition and bit setting

EC7TERVE terminal	ECTHM bit	ECERVF bit	Operation	
			Error judgment operation	ECERVF bit access
0	0	0	Error judgment is permitted. (reset value)	Writing access is invalid
	0	1	Error judgment is permitted. (reset value)	Writing access is invalid
	1	0	Error judgment is prohibited (through mode)	Writing access is invalid
	1	1	Error judgment is prohibited (through mode)	Writing access is invalid
1	0	0	Error judgment is prohibited (reset value)	Writing access is valid
	0	1	Error judgment is permitted.	Writing access is valid
	1	0	Error judgment is prohibited (through mode)	Writing access is valid
	1	1	Error judgment is prohibited (through mode)	Writing access is valid

Example to use at EC7TERVE=1

If the peripheral IP using RAM needs the read access to RAM before completing the RAM initial setting after releasing reset (IP’s RAM access way is read-modify-write type, etc.), the error judgment is prohibited during the initial setting and permitted (ECERVF=1) after completing the RAM initial setting with software. (If some treatment is done to peripheral IP, these operations are not needed.)

102.5.1.3.2 1bit error judgment

If the total number of “1” is odd in the syndrome code (7bits) generated from readout data (including ECC bit) “EC7TERO38-0”, then it is judged as 1bit error. (When 1bit error is occurred in data bit 31-0 and ECC bit 6-0, the total number of “1” set in syndrome code is necessarily odd. When there are plural errors, total number of “1” in syndrome code is odd. But this IP does not guarantee the function like it.)

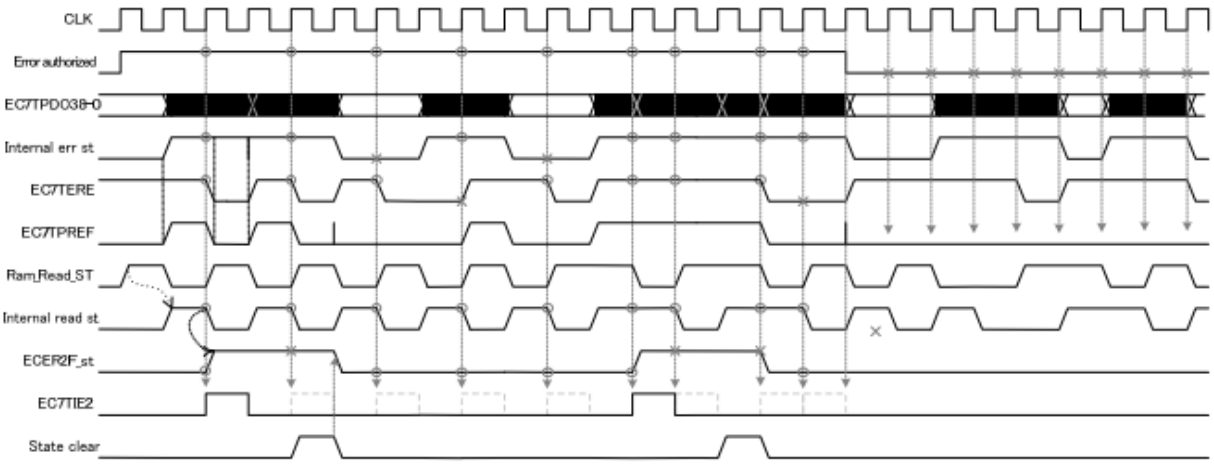
102.5.1.3.3 2bit error judgment

If the syndrome code (7bits) generated from readout data (including ECC bit) “EC7TERO38－0” is not 7’h00 and the error bit placement detecting code (p38-0) (p38-32 are ECC bit parts (7bits redundant bit parts)) is 39’h0000000000, then it is judged 2bits error.

When “Synd[6:0] is not 7’h00” and “p[38:0] is 39’h0000000000”, then it is 2bits error.

Primly the 2bits error is judged when the total number of “1” set in syndrome code (7bits). But this IP judges with the syndrome code and the error bit placement detecting code to not detect the false error in the case that all data (including ECC bit part) are fixed to “0” or “1”. (So if there is more than 3bits error, the possibility is up to judge as 2bits error.)

102.5.1.3.4 Timing chart error judgment (Close to user)



When the condition is not the error judgment enable (Error authorized =1 on above timing chart) and EC7TERE (error judgment enable signal) is not “High”, the 2bits error detect flag (ECER2F) and interrupt (EC7TIE2) are not occurred. (ECER1F: Flag bit of ECC 1bits error detection and correction and 1bit error interrupt is also. And ECEMF (ECC error detecting flag) is not outputted when the error judgment is enable and EC7TERE is not active.

102.5.1.3.5 Error address capture overflow detection

When this IP has error address register (P_ERR_STAG=1-8), the overflow flag (ECOVFF) is set and the overflow interruption is outputted by detecting new error address under the condition that the register is full.
If all error address register is full of 1bit error address and 2bits error is detected, overflow flag (ECOVFF) and 2bits error detection flag (ECER2F) are set at the same time. And when 2bits error interruption output is permitted, so it occurs, too.

103. FlexRay

103.1 Overview

The FlexRay IP-module performs communication according to the FlexRay protocol specification v2.1. With maximum specified sample clock the bitrate is 10 MBit/s. Additional bus driver (BD) hardware is required for connection to the physical layer.

103.1.1 Features

For communication on a FlexRay network, individual message buffers with up to 254 data bytes are configurable. The message storage is a Message RAM that holds up to 128 message buffers. All functions concerning the handling of messages are implemented in the Message Handler. Those functions are the acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule as well as providing message status information.
The register set of the FlexRay IP-module can be accessed directly by an external Host via the module's Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input / Output Buffer; and to control the data transfer between the Message RAM and the user RAM(URAM).

In this section, User RAM means to the local RAM (and external memory for the SoC if possible in your product).

The FlexRay IP-module supports the following features:

Item	Specification
Communication	Comply with FlexRay protocol specification v2.1
Data transfer rate	up to 10 Mbit/s on each channel
FlexRay channels	2 (channel A and B)
Message buffer	Up to 128 message buffers configurable Configuration of message buffers with different payload lengths possible Each message buffer can be configured as receive buffer, as transmit buffer or as part of the receive FIFO Filtering for slot counter, cycle counter, and channel
Message RAM	8 Kbyte of Message RAM for storage of e.g. 128 message buffers with max. 48 byte data section up to 30 message buffers with 254 byte data section
FIFO	One configurable receive FIFO
Message buffer access	by Host CPU via Input and Output Buffer Input Buffer: Holds message to be transferred to the Message RAM Output Buffer: Holds message read from the Message RAM
	by data transfer function Input transfer: Message buffer content is transferred from URAM to Message RAM on CPU request Output transfer: Message buffer content is transferred from Message RAM to URAM automatically
Network management	Automatic HW support
Interrupts	Maskable module interrupts
Timer	2 absolute timers 1 relative timer

103.1.2 Block Diagram

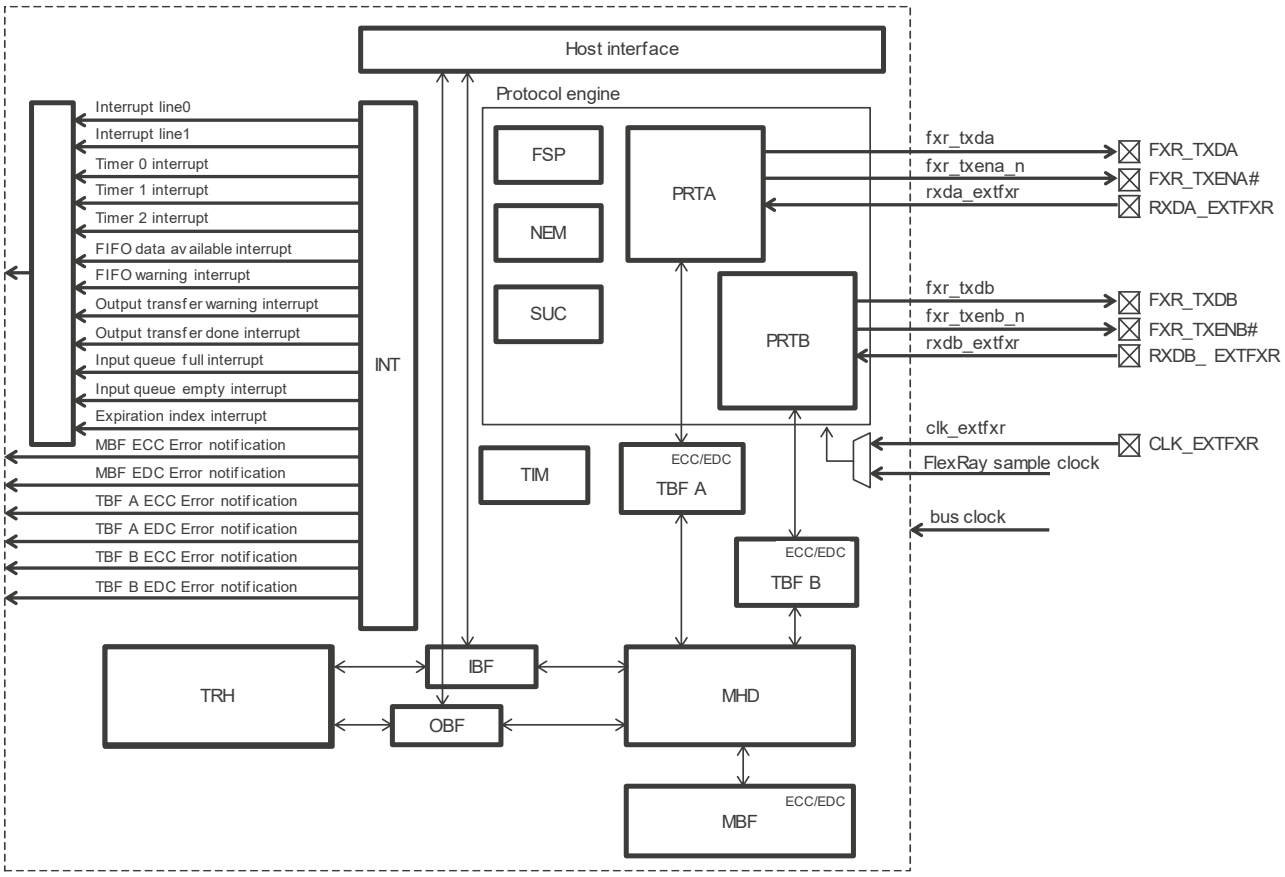


Figure 103.1 FlexRay Block Diagram

Input Buffer (IBF)
For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

Output Buffer (OBF)
For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

Message Handler (MHD)
The FlexRay Message Handler controls data transfers between the following components:

Input / Output Buffer and Message RAM

Transient Buffer RAMs of the two FlexRay Protocol Controllers and Message RAM

Message RAM (MRAM, MBF)
The Message RAM (MBF) consists of a single-ported RAM that stores up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

Transient Buffer RAM (TBF A/B)
Stores the data section of two complete messages.

FlexRay Channel Protocol Controllers (PRT A/B)
The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the Transient Buffer RAMs for intermediate message storage and to the physical layer via bus driver BD.

They perform the following functionality:
Control and check of bit timing
Reception / transmission of FlexRay frames and symbols
Check of header CRC
Generation / check of frame CRC
Interfacing to bus driver

System Universal Control (SUC)
The System Universal Control controls the following functions:
Configuration
Wakeup
Startup
Normal Operation
Passive Operation

Frame and Symbol Processing (FSP)
The Frame and Symbol Processing controls the following functions:
Checks the correct timing of frames and symbols
Tests the syntactical and semantical correctness of received frames
Sets the slot status flags

Network Management (NEM)
Handles the network management vector.

Interrupt Control (INT)
The Interrupt Controller performs the following functions:
Provides error and status interrupt flags
Enable / disable interrupt sources
Assignment of interrupt sources to one of the two general module interrupt lines
Enable / disable module interrupt lines

Timer (TIM)
The Timer module includes the following macrotick timer:
Two absolute timer
One relative timer
One stop watch timer

Transfer Handler (TRH)
Handles the data transfer between URAM and FlexRay module.
The Transfer Handler supports the following transfer types:
Transfer of buffer configuration data from the URAM to the Message RAM
Transfer of payload data for transmit buffer from the URAM to the Message RAM

Transfer of buffer configuration data and payload data for transmit buffer from the URAM to the Message RAM
Automatic transfer of payload data from receive buffer to the URAM upon frame reception
Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the URAM upon frame reception
Automatic transfer of buffer configuration data and message buffer status data from dedicated transmit and receive buffer to the URAM upon slot status update
Manual transfer of payload data, buffer configuration data and message buffer status data from dedicated transmit and receive buffer to the URAM

103.1.3 External Pins

Table 103.1 Pin Configuration

Name	Abbreviation	I/O	Function

FXR_TXENB#	—	O	FlexRay transmit enable channel B
CLK_EXTFXR	—	I	Conformance test clock

103.1.3.1 RXDA_EXTFXR

FlexRay receive data channel A

If FlexRay communication is not used in systems, please input fixed value 1'b1 to this port.

103.1.3.2 RXDB_EXTFXR

FlexRay receive data channel B

If FlexRay communication is not used in systems, please input fixed value 1'b1 to this port.

103.1.3.3 FXR_TXDA

FlexRay transmit data signal channel A

Initial value is 1'b1. If FlexRay communication is not used in systems, please left fxr_txda open.

103.1.3.4 FXR_TXDB

FlexRay transmit data signal channel B

Initial value is 1'b1. If FlexRay communication is not used in systems, please left fxr_txda open.

103.1.3.5 FXR_TXENA#

FlexRay transmit enable signal channel A

When HIGH, channel A transmission is inactive. When LOW, channel A transmission is active.

103.1.3.6 FXR_TXENB#

FlexRay transmit enable signal channel B

When HIGH, channel B transmission is inactive. When LOW, channel B transmission is active.

103.1.3.7 CLK_EXTFXR

Conformance test clock

103.1.4 Register Configuration

The FlexRay module allocates an address space as shown in Table 103.2

Within this specification the "Values after reset" refers to the microcontroller's HW RESET. For registers in the address range h'0010 to h'0FFF the "Value after reset" are also applicable when the SW RESET (using **FROC.OE**) is applied.

The addresses given in this specification are relative addresses. The address offset ERAY needs to be added to all given addresses.

Offset Address : ERAY = h'E6B0

AccessSize : AS = 32/16/8

Table 103.2 Register Configuration

Name	Abbreviation	R/W	Address	Initial value	Access Size
FlexRay Operation Control register	FROC	R/W	<ERAY>+H'0004	H'0000 0000	32,16,8
FlexRay Operation Status register	FROS	R/W	<ERAY>+H'000C	H'0000 0000	32,16,8
FlexRay LoCK register	FRLCK	R/W	<ERAY>+H'001C	H'0000 0000	32,16,8
FlexRay Error Interrupt Register	FREIR	R/W	<ERAY>+H'0020	H'0000 0000	32,16,8
FlexRay Status Interrupt Register	FRSIR	R/W	<ERAY>+H'0024	H'0000 0000	32,16,8
FlexRay Error Interrupt Line Select	FREILS	R/W	<ERAY>+H'0028	H'0000 0000	32,16,8
FlexRay Status Interrupt Line Select	FRSILS	R/W	<ERAY>+H'002C	H'0303 FFFF	32,16,8
FlexRay Error Interrupt Enable Set	FREIES	R/W	<ERAY>+H'0030	H'0000 0000	32,16,8
FlexRay Error Interrupt Enable Reset	FREIER	R/W	<ERAY>+H'0034	H'0000 0000	32,16,8
FlexRay Status Interrupt Enable Set	FRSIES	R/W	<ERAY>+H'0038	H'0000 0000	32,16,8
FlexRay Status Interrupt Enable Reset	FRSIER	R/W	<ERAY>+H'003C	H'0000 0000	32,16,8
FlexRay Interrupt Line Enable	FRILE	R/W	<ERAY>+H'0040	H'0000 0000	32,16,8
FlexRay Timer 0 Configuration	FRT0C	R/W	<ERAY>+H'0044	H'0000 0000	32,16,8
FlexRay Timer 1 Configuration	FRT1C	R/W	<ERAY>+H'0048	H'0002 0000	32,16,8
FlexRay STop Watch register 1	FRSTPW1	R/W	<ERAY>+H'004C	H'0000 0000	32,16,8
FlexRay STop Watch register 2	FRSTPW2	R/W	<ERAY>+H'0050	H'0000 0000	32,16,8
FlexRay SUC Configuration register 1	FRSUCC1	R/W	<ERAY>+H'0080	H'0C40 1080	32,16,8
FlexRay SUC Configuration register 2	FRSUCC2	R/W	<ERAY>+H'0084	H'0100 0504	32,16,8
FlexRay SUC Configuration register 3	FRSUCC3	R/W	<ERAY>+H'0088	H'0000 0011	32,16,8
FlexRay NEM Configuration register	FRNEMC	R/W	<ERAY>+H'008C	H'0000 0000	32,16,8
FlexRay PRT Configuration register 1	FRPRTC1	R/W	<ERAY>+H'0090	H'084C 0633	32,16,8
FlexRay PRT Configuration register 2	FRPRTC2	R/W	<ERAY>+H'0094	H'0F2D 0A0E	32,16,8
FlexRay MHD Configuration register	FRMHDC	R/W	<ERAY>+H'0098	H'0000 0000	32,16,8
FlexRay GTU Configuration register 1	FRGTUC1	R/W	<ERAY>+H'00A0	H'0000 0280	32,16,8
FlexRay GTU Configuration register 2	FRGTUC2	R/W	<ERAY>+H'00A4	H'0002 000A	32,16,8
FlexRay GTU Configuration register 3	FRGTUC3	R/W	<ERAY>+H'00A8	H'0202 0000	32,16,8
FlexRay GTU Configuration register 4	FRGTUC4	R/W	<ERAY>+H'00AC	H'0008 0007	32,16,8
FlexRay GTU Configuration register 5	FRGTUC5	R/W	<ERAY>+H'00B0	H'0E00 0000	32,16,8
FlexRay GTU Configuration register 6	FRGTUC6	R/W	<ERAY>+H'00B4	H'0002 0000	32,16,8
FlexRay GTU Configuration register 7	FRGTUC7	R/W	<ERAY>+H'00B8	H'0002 0004	32,16,8

Name	Abbreviation	R/W	Address	Initial value	Access Size
FlexRay GTU Configuration register 8	FRGTUC8	R/W	<ERAY>+H'00BC	H'0000 0002	32,16,8
FlexRay GTU Configuration register 9	FRGTUC9	R/W	<ERAY>+H'00C0	H'0000 0101	32,16,8

103.1.5 Connected Module

Table 103.3 Connected Modules

Module Name	Connected Module Name	Connected Module Function
FlexRay	CPG	Clock output
	RST	Reset output
	INTC and ECM	Interrupt input
	PAD logic	I/O terminal connection
		Bus connection (register access and data transfer)

103.2 Register Description

[Initial value Symbol Description]

- : Undefined value

[R/W Symbol Description]

R/W : read and write allowed. You can read the writing value.

R/WC0 : read and write allowed. 0 is written, the bit is initialized, but one of the writing will be ignored.

R : Read only variable. Please value is always set to 0 to write.

-/WB : write only variable. Read value is undefined.

103.2.1 Register Operation register

103.2.1.1 FROC [h'0004]

FlexRay Operation Control register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	T2IE	T1IE	T0IE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	OEP	-	-	-	-	-	BEC	OE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18]	T2IE	0	R/W	Timer 2 interrupt enable. 0: Disabled , 1: Enabled
[17]	T1IE	0	R/W	Timer 1 interrupt enable. 0: Disabled , 1: Enabled
[16]	T0IE	0	R/W	Timer 0 interrupt enable. 0: Disabled , 1: Enabled
[15:8]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[7]	OEP	0	R/W	Operation Enable bit Protection. 0: OE is unprotected , 1: OE is protected
[6:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	BEC	0	R/W	Byte Endian Control. 0: Little endian , 1: Big endian
[0]	OE	0	R/W	Operation Enable. 0: Operation disabled, SW reset , 1: Operation Enabled

(1) FROC.T2IE

Timer 2 interrupt enable

This bit controls the timer 2 interrupt.

0: Disabled
No interrupt will be requested and the timer 2 interrupt line will be released if pending.

1: Enabled
Timer 2 interrupt will be asserted when **FROS.T2IS** is '1'.

(2) FROC.T1IE

Timer 1 interrupt enable

The user should only set this bit to '1' when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (**FRSIES.TI1E** should be '0').

This bit controls the timer 1 interrupt.

0: Disabled
No interrupt will be requested and the timer 1 interrupt line will be released if pending.

1: Enabled
Timer 1 interrupt will be asserted when **FROS.T1IS** is '1'.

(3) FROC.T0IE

Timer 0 interrupt enable

The user should only set this bit to '1' when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (**FRSIES.TI0E** should be '0').

This bit controls the timer 0 interrupt.

0: Disabled

No interrupt will be requested and the timer 0 interrupt line will be released if pending.

1: Enabled
Timer 0 interrupt will be asserted when **FROS.T0IS** is '1'.

(4) FROC.OEP

Operation Enable bit Protection

This bit protects against unintended write access to the **FROC.OE** bit.

0: **OE** is unprotected
Write access to the **OE** bit is enabled

1: **OE** is protected
Write access to the **OE** bit is disabled

(5) FROC.BEC

Byte Endian Control

The user should only change this bit when **FROS.OS** is '1'.

This bit controls the byte order on reading and writing the FlexRay Network Management Vector register (**FRNMVn**), FlexRay Write Data Section (**FRWRDSn**) and FlexRay Read Data Section (**FRRDDSn**). This bit also controls the byte order when reading or writing FlexRay payload data using the data transfer function.

For details about the byte alignment please refer to section 103.3.17.

0: Little endian
Byte alignment in **FRNMVn**, **FRWRDSn** and **FRRDDSn** is in little endian style.

1: Big endian
Byte alignment in **FRNMVn**, **FRWRDSn** and **FRRDDSn** is in big endian style.

(6) FROC.OE

Operation Enable

The user can only write to this bit when **FROC.OEP** is '0'.

The user should only write this bit with '0' when **FROS.OS** is '1'.

The user should only write this bit with '1' when **FROS.OS** is '0' and the FlexRay sample clock is enabled.

This bit controls the operation state and serves the software reset of the FlexRay module. The operation status bit (**FROS.OS**) indicates whether the FlexRay module is in reset state or not.

0: Operation disabled, SW reset
Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.

1: Operation Enabled
Reset state of the FlexRay module is released.

103.2.1.2 FROS [h'000C]

FlexRay operation status register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	T2IS	T1IS	T0IS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18]	T2IS	0	R/W	Timer 2 Interrupt Status. 0: Timer 2 has not matched the conditions configured in the FRT2C register. 1: Timer 2 matched the conditions configured in the FRT2C register.
[17]	T1IS	0	R/W	Timer 1 Interrupt Status. 0: Timer 1 has not matched the conditions configured in the FRT1C register. 1: Timer 1 matched the conditions configured in the FRT1C register.
[16]	T0IS	0	R/W	Timer 0 Interrupt Status. 0: Timer 0 has not matched the conditions configured in the FRT0C register. 1: Timer 0 matched the conditions configured in the FRT0C register.
[15:1]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[0]	OS	0	R	Operation Status. 0: Operation disabled, reset state , 1: Operation enabled

(1) FROS.T2IS

Timer 2 Interrupt Status

Writing '0' has no effect on the bit value.

This bit represents that the expiration criteria configured in **FRT2C** register has matched the FlexRay local time.

If enabled in **FROC.T2IE** the timer 2 interrupt is generated when **FROS.T2IS** is '1'.

[Clearing condition]
This bit is cleared by writing '1' to **FROS.T2IS**.
This bit is cleared when **FROS.OS** changes from '1' to '0'.

[Setting condition]
This bit is set when the expiration criteria configured in **FRT2C** matches the FlexRay local time.

(2) FROS.T1IS

Timer 1 Interrupt Status

Writing '0' has no effect on the bit value.

This bit represents that the expiration criteria configured in **FRT1C** register has matched the FlexRay local time.

If enabled in **FROC.T1IE** the timer 1 interrupt is generated when **FROS.T1IS** is '1'.

[Clearing condition]
This bit is cleared by writing '1' to **FROS.T1IS**.
This bit is cleared when **FROS.OS** changes from '1' to '0'.

[Setting condition]
This bit is set when the expiration criteria configured in **FRT1C** matches the FlexRay local time.

(3) FROS.T0IS

Timer 0 Interrupt Status

Writing '0' has no effect on the bit value.

This bit represents that the expiration criteria configured in **FRT0C** register has matched the FlexRay local time.

If enabled in **FROC.T0IE** the timer 0 interrupt is generated when **FROS.T0IS** is '1'.

[Clearing condition]
This bit is cleared by writing '1' to **FROS.T0IS**.
This bit is cleared when **FROS.OS** changes from '1' to '0'.

[Setting condition]
This bit is set when the expiration criteria configured in **FRT0C** matches the FlexRay local time.

(4) FROS.OS

Operation Status

This bit represents if the FlexRay module is in the reset or the operation state.

When **FROS.OS** is '0' the FlexRay module gets initialized and registers mapped to the address area ERAY+h'0010 to ERAY+h'0FFF cannot be accessed; read access from these registers will return undefined data.

When **FROS.OS** is '1' it is possible to access to the address area ERAY+h'0010 to ERAY+h'0FFF and to perform FlexRay communication.

When **FROS.OS** changes from '0' to '1' all registers in the address range ERAY+h'0010 to ERAY+h'0FFF are set to the "Values after reset".

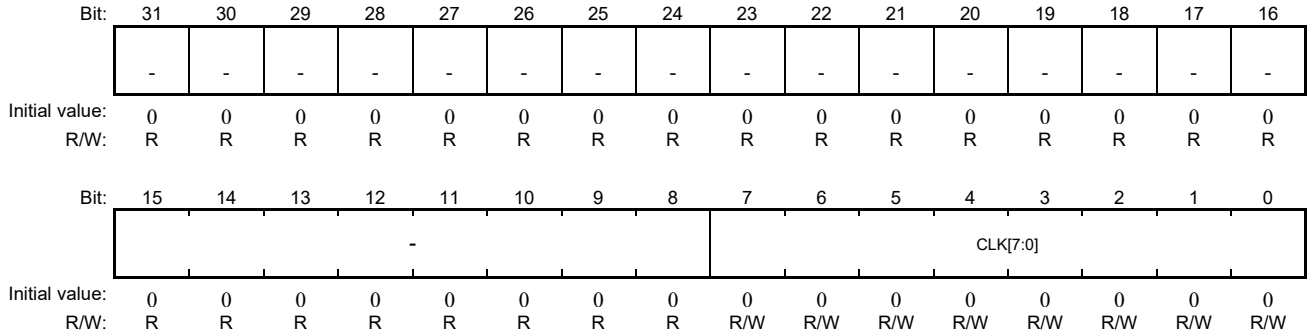
[Clearing condition]
When **FROC.OE** is set to ‘0’. It takes up to two peripheral bus clock cycles until **FROS.OS** is set to '0'.

[Setting condition]
When **FROC.OE** is set to ‘1’ it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until **FROS.OS** is set to ‘1’.

103.2.2 Special Registers

103.2.2.1 FRLCK [h'001C]

FlexRay Lock Register



Bit	Bit Name	Initial Value	R/W	Description
[31:16]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[15:8]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[7:0]	CLK	0	R/W	Configuration Lock Key

(1) FRLCK.CLK

Configuration Lock Key

The Lock Register is write-only. Reading the register will return 0x0000 0000.

To leave CONFIG state by writing **FRSUCC1.CMD** (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Configuration Lock Key and the write access to the **FRSUCC1** register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: **FRLCK.CLK** = "1100 1110" (0xCE)
Second write: **FRLCK.CLK** = "0011 0001" (0x31)
Third write: **FRSUCC1.CMD**

Note: In case that the Host uses 8/16-bit accesses to write the listed bit fields, the programmer has to ensure that no "dummy accesses" e.g. to the remaining register bytes / words are inserted by the compiler.

103.2.3 Interrupt Registers

103.2.3.1 FREIR [h'0020]

FlexRay Error Interrupt Register

The flags are set when the CC detects one of the listed error conditions. The flags remain set until the Host clears them.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	TABB	LTVB	EDB	-	-	-	-	-	TABA	LTVA	EDA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MHF	IOBA	IIBA	EFA	RFO	AERR	CCL	CCF	SFO	SFBM	CNA	PEMC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26]	TABB	0	R/W	Transmission Across Boundary Channel B 0 = No transmission across slot boundary detected on channel B 1 = Transmission across slot boundary detected on channel B
[25]	LTVB	0	R/W	Latest Transmit Violation Channel B 0 = No latest transmit violation detected on channel B 1 = Latest transmit violation detected on channel B
[24]	EDB	0	R/W	Error Detected on Channel B 0 = No error detected on channel B 1 = Error detected on channel B
[23:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18]	TABA	0	R/W	Transmission Across Boundary Channel A 0 = No transmission across slot boundary detected on channel A 1 = Transmission across slot boundary detected on channel A
[17]	LTVA	0	R/W	Latest Transmit Violation Channel A 0 = No latest transmit violation detected on channel A 1 = Latest transmit violation detected on channel A
[16]	EDA	0	R/W	Error Detected on Channel A 0 = No error detected on channel A 1 = Error detected on channel A
[15:12]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[11]	MHF	0	R/W	Message Handler Constraints Flag 0 = No Message Handler failure detected 1 = Message Handler failure detected
[10]	IOBA	0	R/W	Illegal Output buffer Access 0 = No illegal Host access to Output Buffer occurred 1 = Illegal Host access to Output Buffer occurred
[9]	IIBA	0	R/W	Illegal Input Buffer Access 0 = No illegal Host access to Input Buffer occurred 1 = Illegal Host access to Input Buffer occurred

Bit	Bit Name	Initial Value	R/W	Description
[8]	EFA	0	R/W	Empty FIFO Access 0 = No Host access to empty FIFO occurred 1 = Host access to empty FIFO occurred
[7]	RFO	0	R/W	Receive FIFO Overrun 0 = No receive FIFO overrun detected 1 = A receive FIFO overrun has been detected
[6]	AERR	0	R/W	Access Error 0 = No access error detected 1 = Access error detected
[5]	CCL	0	R/W	CHI Command Locked 0 = CHI command accepted 1 = CHI command not accepted
[4]	CCF	0	R/W	Clock Correction Failure 0 = No clock correction error 1 = Clock correction failed
[3]	SFO	0	R/W	Sync Frame Overflow 0 = Number of received sync frames <= FRGTUC2.SNM 1 = More sync frames received than configured by FRGTUC2.SNM
[2]	SFBM	0	R/W	Sync Frames Below Minimum 0 = Sync node: 1 or more sync frames received, non-sync node: 2 or more sync frames received 1 = Less than the required minimum of sync frames received
[1]	CNA	0	R/W	Command Not Accepted 0 = CHI command accepted 1 = CHI command not accepted
[0]	PEMC	0	R/W	POC Error Mode Changed 0 = Error mode has not changed 1 = Error mode has changed

(1) **FREIR.TABB**

Transmission Across Boundary Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals to the Host that a transmission across a slot boundary occurred for channel B.

(2) **FREIR.LTVB**

Latest Transmit Violation Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals a latest transmit violation on channel B to the Host.

(3) **FREIR.EDB**

Error Detected on Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit is set whenever one of the flags **FRACS.SEDB**, **FRACS.CEDB**, **FRACS.CIB**, **FRACS.SBVB** changes from ’0’ to ’1’.

(4) **FREIR.TABA**

Transmission Across Boundary Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals to the Host that a transmission across a slot boundary occurred for channel A.

(5) **FREIR.LTVA**

Latest Transmit Violation Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals a latest transmit violation on channel A to the Host.

(6) **FREIR.EDA**

Error Detected on Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit is set whenever one of the flags **FRACS.SEDA**, **FRACS.CEDA**, **FRACS.CIA**, **FRACS.SBVA** changes from ’0’ to ’1’.

(7) **FREIR.MHF**

Message Handler Constraints Flag

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals a Message Handler constraints violation condition. It is set whenever one of the flags **FRMHDF.SNUA**, **FRMHDF.SNUB**, **FRMHDF.FNFA**, **FRMHDF.FNFB**, **FRMHDF.TBFA**, **FRMHDF.TBFB**, **FRMHDF.WAHP** changes from ’0’ to ’1’.

(8) **FREIR.IOBA**

Illegal Output buffer Access

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Host requests the transfer of a message buffer from the Message RAM to the Output Buffer while **FROBCR.OBSYS** is set to ’1’.

(9) **FREIR.IIBA**

Illegal Input Buffer Access

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Host wants to modify a message buffer via Input Buffer and one of the following conditions applies:

1) The CC is not in CONFIG or DEFAULT_CONFIG state and the Host writes to the Input Buffer Command Request register to modify the

Header section of message buffer 0, 1 if configured for transmission in key slot

Header section of static message buffers with buffer number < **FRMRC.FDB** while **FRMRC.SEC** = "01"

Header section of any static or dynamic message buffer while **FRMRC.SEC** = "1x"

Header and / or data section of any message buffer belonging to the receive FIFO

2) The Host writes to any register of the Input Buffer while **FRIBCR.IBSYH** is set to ’1’.

(10) **FREIR.EFA**

Empty FIFO Access

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Host requests the transfer of a message from the receive FIFO via Output Buffer while the receive FIFO is empty.

(11) **FREIR.RFO**

Receive FIFO Overrun

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. The actual state of the FIFO is monitored in register **FRFSR**.

(12) **FREIR.AERR**

Access Error

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals an access error to the Host.

It is set when of the flags **FRMHDS.AMR**, **FRMHDS.ATBF1** or **FRMHDS.ATBF2** changes from ’0’ to ’1’.

(13) **FREIR.CCL**

CHI Command Locked

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals that the write access to the CHI command vector **FRSUCC1.CMD** was not successful because the execution of the previous CHI command has not yet completed. In this case bit **FREIR.CNA** is also set to ’1’.

(14) **FREIR.CCF**

Clock Correction Failure

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set at the end of the cycle whenever one of the following errors occurred:
Missing offset and / or rate correction
Clock correction limit reached
The clock correction status is monitored in registers **FRCCEV** and **FRSFS**. A failure may occur during startup, therefore bit **FREIR.CCF** should be cleared by the Host after the CC entered NORMAL_ACTIVE state.

(15) **FREIR.SFO**

Sync Frame Overflow

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

Set when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last double cycle exceeds the maximum number of sync frames as defined by **FRGTUC2.SNM**.

(16) **FREIR.SFBM**

Sync Frames Below Minimum

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. missing offset and / or missing rate correction). The clock correction status is monitored in **FRCCEV** and **FRSFS**.

The required limit may be dropped during startup. Therefore **FREIR.SFBM** should be cleared by the Host after the CC entered NORMAL_ACTIVE state.

(17) **FREIR .CNA**

Command Not Accepted

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

The flag signals that the write access to the CHI command vector **FRSUCC1.CMD** was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked (**FREIR.CCL** = '1').

(18) **FREIR .PEMC**

POC Error Mode Changed

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever the error mode signaled by **FRCCEV.ERRM** has changed.

103.2.3.2 FRSIR [h'0024]

FlexRay Status Interrupt Register

The flags are set when the CC detects one of the listed events. The flags remain set until the Host clears them.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	MTSB	WUPB	-	-	-	-	-	-	MTSA	WUPA

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:26]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[25]	MTSB	0	R/W	MTS Received on Channel B (vSS!ValidMTSB) 0 = No MTS symbol received on channel B 1 = MTS symbol received on channel B
[24]	WUPB	0	R/W	Wakeup Pattern Channel B 0 = No wakeup pattern received on channel B 1 = Wakeup pattern received on channel B
[23:18]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[17]	MTSA	0	R/W	MTS Received on Channel A (vSS!ValidMTSA) 0 = No MTS symbol received on channel A 1 = MTS symbol received on channel A
[16]	WUPA	0	R/W	Wakeup Pattern Channel A 0 = No wakeup pattern received on channel A 1 = Wakeup pattern received on channel A
[15]	SDS	0	R/W	Start of Dynamic Segment 0 = Dynamic segment not yet started 1 = Dynamic segment started
[14]	MBSI	0	R/W	Message Buffer Status Interrupt 0 = No message buffer status change of message buffer with MBI = '1' 1 = Message buffer status of at least one message buffer with MBI = '1' has changed
[13]	SUCS	0	R/W	Startup Completed Successfully 0 = No startup completed successfully 1 = Startup completed successfully

Bit	Bit Name	Initial Value	R/W	Description
[12]	SWE	0	R/W	Stop Watch Event 0 = No Stop Watch Event 1 = Stop Watch Event occurred
[11]	TOBC	0	R/W	Transfer Output Buffer Completed 0 = No transfer completed 1 = Transfer between Message RAM and Output Buffer completed
[10]	TIBC	0	R/W	Transfer Input Buffer Completed 0 = No transfer completed 1 = Transfer between Input Buffer and Message RAM completed
[9]	TI1	0	R/W	Timer Interrupt 1 0 = No timer interrupt 1 1 = Timer interrupt 1 occurred
[8]	TI0	0	R/W	Timer Interrupt 0 0 = No timer interrupt 0 1 = Timer interrupt 0 occurred
[7]	NMVC	0	R/W	Network Management Vector Changed 0 = No change in the network management vector 1 = Network management vector changed
[6]	RFCL	0	R/W	Receive FIFO Critical Level 0 = Receive FIFO below critical level 1 = Receive FIFO critical level reached
[5]	RFNE	0	R/W	Receive FIFO Not Empty 0 = Receive FIFO is empty 1 = Receive FIFO is not empty
[4]	RXI	0	R/W	Receive Interrupt 0 = No ND flag of a receive buffer with MBI = ’1’ has been set to ’1’ 1 = At least one ND flag of a receive buffer with MBI = ’1’ has been set to ’1’
[3]	TXI	0	R/W	Transmit Interrupt 0 = No frame transmitted from a transmit buffer with MBI = ’1’ 1 = At least one frame was transmitted from a transmit buffer with MBI = ’1’
[2]	CYCS	0	R/W	Cycle Start Interrupt 0 = No communication cycle started 1 = Communication cycle started
[1]	CAS	0	R/W	Collision Avoidance Symbol 0 = No bit pattern matching the CAS symbol received 1 = Bit pattern matching the CAS symbol received
[0]	WST	0	R/W	Wakeup Status 0 = Wakeup status unchanged 1 = Wakeup status changed

(1) **FRSIR.MTSB**

MTS Received on Channel B (vSS!ValidMTSB)

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

Media Access Test symbol received on channel B during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

(2) **FRSIR.WUPB**

Wakeup Pattern Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a wakeup pattern was received on channel B.
Only set when the CC is in one of these states:
WAKEUP
READY
STARTUP

(3) **FRSIR.MTSA**

MTS Received on Channel A (vSS!ValidMTSA)

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

Media Access Test symbol received on channel A during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

(4) **FRSIR.WUPA**

Wakeup Pattern Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a wakeup pattern was received on channel A.
Only set when the CC is in one of these states:
WAKEUP
READY
STARTUP

(5) **FRSIR.SDS**

Start of Dynamic Segment

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the dynamic segment starts.

(6) **FRSIR.MBSI**

Message Buffer Status Interrupt

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the message buffer status **FRMBS** has changed and if bit **MBI** of that message buffer is set (see received valid data frames only. Table 103.3).

(7) **FRSIR.SUCS**

Startup Completed Successfully

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever a startup completed successfully and the CC entered NORMAL_ACTIVE state.

(8) **FRSIR.SWE**

Stop Watch Event

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set after a stop watch activation when the actual cycle counter and macrotick value are stored in the Stop Watch register (see section 103.2.4.4).

(9) **FRSIR.TOBC**

Transfer Output Buffer Completed

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever a transfer from the Message RAM to the Output Buffer has completed and **FROBCR.OBSYS** has been reset by the Message Handler.

(10) **FRSIR.TIBC**

Transfer Input Buffer Completed

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever a transfer from Input Buffer to the Message RAM has completed and **FRIBCR.IBSYS** has been reset by the Message Handler.

(11) **FRSIR.TI1**

Timer Interrupt 1

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever timer 1 matches the conditions configured in register **FRT1C**.

A FlexRay timer interrupt 1 is generated if enabled in **FROC.T1IE**.

(12) **FRSIR.TI0**

Timer Interrupt 0

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set whenever timer 0 matches the conditions configured in register **FRT0C**.

A FlexRay timer interrupt 0 is generated if enabled in **FROC.T0IE**.

(13) **FRSIR.NMVC**

Network Management Vector Changed

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This interrupt flag signals a change in the Network Management Vector visible to the Host.

(14) **FRSIR.RFCL**

Receive FIFO Critical Level

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set when the receive FIFO fill level **FRFSR.RFFL** is equal or greater than the critical level as configured by **FRFCL.CL**.

(15) **FRSIR.RFNE**

Receive FIFO Not Empty

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a received valid frame was stored into the empty receive FIFO. The actual state of the receive FIFO is monitored in register **FRFSR**.

(16) **FRSIR.RXI**

Receive Interrupt

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC whenever the set condition of a message buffers **ND** flag is fulfilled (see section 103.2.8.6), and if bit **MBI** of that message buffer is set to ’1’ (see received valid data frames only. Table 103.3)

(17) **FRSIR.TXI**

Transmit Interrupt

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC at the end of frame transmission if bit **MBI** in the respective message buffer is set to ’1’ (see received valid data frames only. Table 103.3).

(18) **FRSIR.CYCS**

Cycle Start Interrupt

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a communication cycle starts.

(19) **FRSIR.CAS**

Collision Avoidance Symbol

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC during STARTUP state when a CAS or a potential CAS was received.

(20) **FRSIR.WST**

Wakeup Status

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set when **FRCCSV.WSV** changes to a value other than UNDEFINED.

103.2.3.3 FREILS [h'0028]

FlexRay Error Interrupt Line Select

The FlexRay Error Interrupt Line Select register assigns an interrupt generated by a specific error interrupt flag from register **FREIR** to one of the FlexRay IP interrupt lines (FlexRay interrupt 0, FlexRay interrupt 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

103.2.3.5 FREIES [h'0030]

FlexRay Error Interrupt Enable Set

The settings in the FlexRay Error Interrupt Enable Set and FlexRay Error Interrupt Enable Reset registers determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to **FREIES** and reset by writing to **FREIER**. Reading from both addresses will result in the same value.

Writing '0' has no effect on the bit value.

Writing a '1' sets the interrupt enable bit.

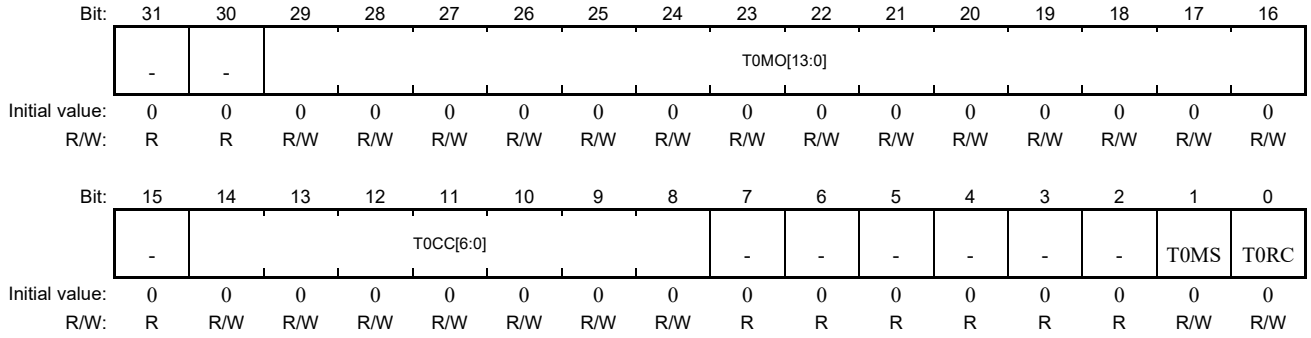
103.2.4 FlexRay Timer

103.2.4.1 FRT0C [h'0044]

FlexRay Timer 0 Configuration

Absolute timer.
Specifies in terms of cycle count and macrotick the point in time when the FlexRay timer 0 interrupt occurs.
When the FlexRay timer 0 elapses, **FRSIR.TI0** and **FROS.T0IS** are set to '1' and, if enabled in **FROC.T0IE** the FlexRay timer interrupt 0 is asserted.

Note: The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0.



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:16]	T0MO	0	R/W	Timer 0 Macrotick Offset
[15]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[14:8]	T0CC	0	R/W	Timer 0 Cycle Code
[7:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	T0MS	0	R/W	Timer 0 Mode Select 0 = Single-shot mode 1 = Continuous mode
[0]	T0RC	0	R/W	Timer 0 Run Control 0 = Timer 0 halted 1 = Timer 0 running

(1) **FRT0C.T0MO**

Timer 0 Macrotick Offset

Before reconfiguration of the timer, the timer has to be halted first by writing bit **FRT0C.T0RC** to ’0’.

Configures the macrotick offset from the beginning of the cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

(2) **FRT0C.T0CC**

Timer 0 Cycle Code

Before reconfiguration of the timer, the timer has to be halted first by writing bit **FRT0C.T0RC** to ’0’.

The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code see section 103.3.8.2.

(3) **FRT0C.T0MS**

Timer 0 Mode Select

Before reconfiguration of the timer, the timer has to be halted first by writing bit **FRT0C.T0RC** to ’0’.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(4) **FRT0C.T0RC**

Timer 0 Run Control

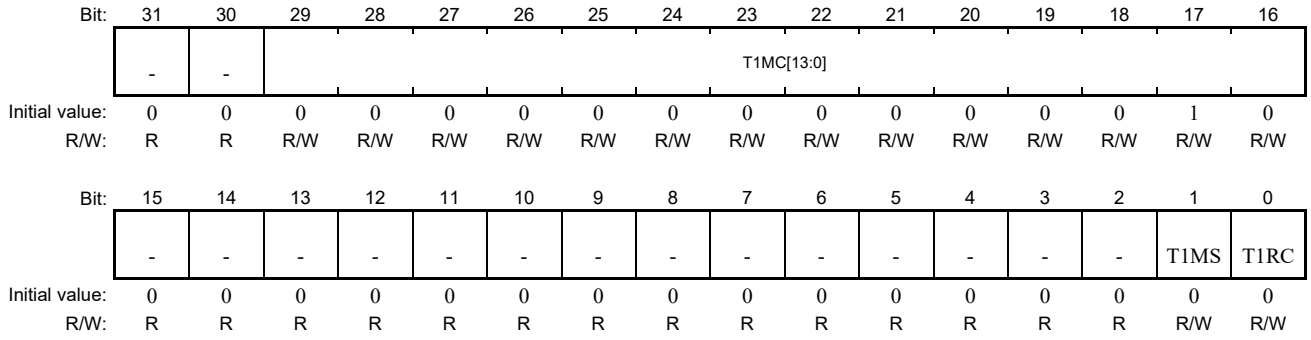
Timer 0 can be only activated (set **FRT0C.T0RC** to '1') when the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 0 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

103.2.4.2 FRT1C [h'0048]

FlexRay Timer 1 Configuration

Relative timer.
After the specified number of macroticks has expired, the FlexRay timer 1 interrupt is asserted.
When the FlexRay timer 1 elapses, **FRSIR.TI1** and **FROS.T1IS** are set to '1' and, if enabled in **FROC.T1IE** the FlexRay timer interrupt 1 is asserted.



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:16]	T1MC	2h	R/W	Timer 1 Macrotick Count
[15:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	T1MS	0	R/W	Timer 1 Mode Select 0 = Single-shot mode 1 = Continuous mode
[0]	T1RC	0	R/W	Timer 1 Run Control 0 = Timer 1 halted 1 = Timer 1 running

(1) **FRT1C.T1MC**

Timer 1 Macrotick Count

Before reconfiguration of the timer, the timer has to be halted first by writing bit **FRT1C.T1RC** to '0'.

Valid values are 2 to 16383 MT in continuous mode
Valid values are 1 to 16383 MT in single-shot mode

When the configured macrotick count is reached the FlexRay timer 1 interrupt is generated.

(2) **FRT1C.T1MS**

Timer 1 Mode Select

Before reconfiguration of the timer, the timer has to be halted first by writing bit **FRT1C.T1RC** to ’0’.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(3) **FRT1C.T1RC**

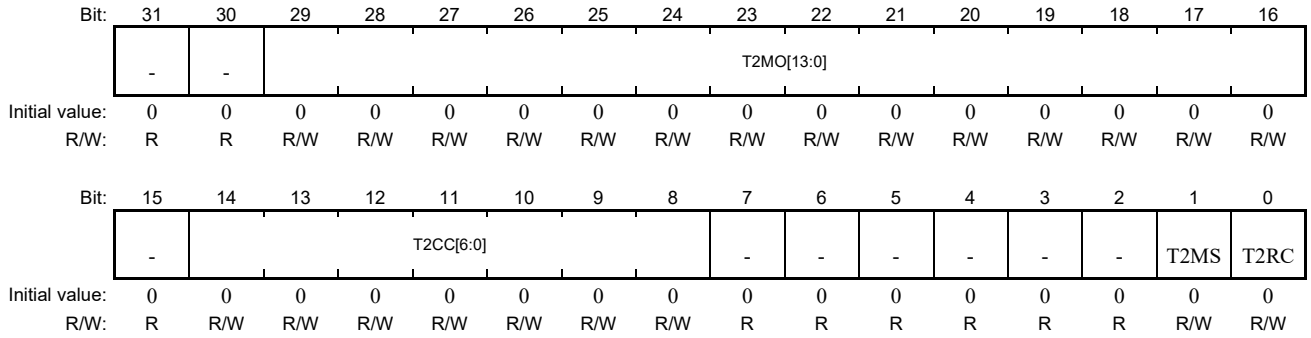
Timer 1 Run Control

Timer 1 can be activated (set **FRT1C.T1RC** to '1') as long as the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 1 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

103.2.4.3 FRT2C [h'0844]

FlexRay Timer 2 Configuration



Bit	Bit Name	Initial Value	R/W	Description

(1) **FRT2C.T2MO**

Timer 2 Macrotick Offset

The user can only write to these bits when **FRT2C.T2RC** is '0'.

Allowed range is 0 to **FRGTUC2.MPC**.

These bits represent the timer macrotick value defining the timer expiration condition.

(2) **FRT2C.T2CC**

Timer 2 Cycle Code

The user can only write to these bits when **FRT2C.T2RC** is '0'.

These bits represent the cycle counter filter code defining the timer expiration condition. See section 103.3.8.2 for cycle filtering.

(3) **FRT2C.T2MS**

Timer 2 Mode Select

The user can only write to these bits when **FRT2C.T2RC** is '0'.

This bit represents the operation mode of the Timer 2.

0: Single-shot mode

The timer is operating in the non-repetitive (single shot) mode. Once the configured expiration criteria are matching the timer will be automatically halted.

1: Continuous mode

The timer is operating in the repetitive (continuous) mode. The timer will expire every time the configured expiration criteria are matching. The timer is not halted.

(4) **FRT2C.T2RC**

Timer 2 Run Control

The user can only set this bit to '1' when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

This bit represents the activation state of the Timer 2.

When the expiration criteria are matching for a single shot timer, then this bit is cleared automatically and the Timer 2 is halted.

[Setting condition]
This bit is set by writing '1' to it when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

[Clearing condition]
This bit is cleared when the POC state leaves the NORMAL_ACTIVE or NORMAL_PASSIVE state except for transitions between the two states.

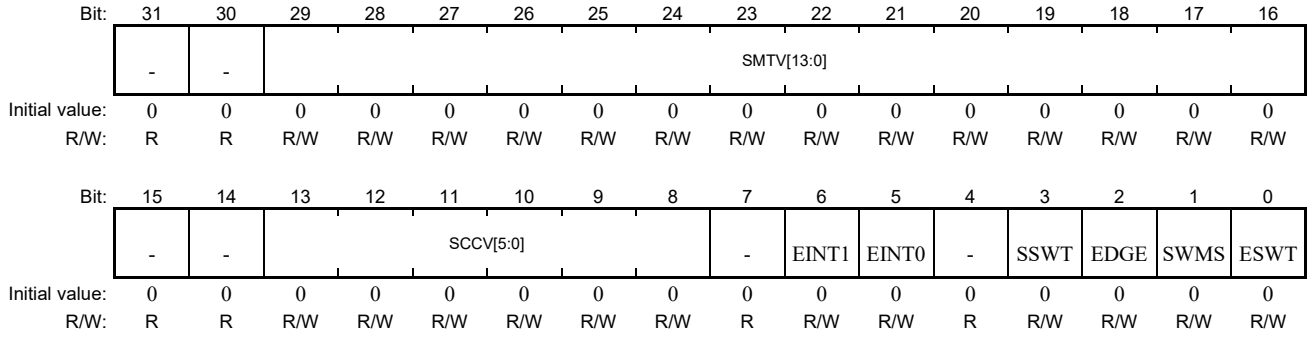
This bit is cleared when the timer is operating in the non-repetitive (single shot) mode (**FRT2C.T2MS** is '0') and the expiration criteria are matching.

This bit is cleared by writing '0' to it.

103.2.4.4 FRSTPW1 [h'004C]

FlexRay Stop Watch Register 1

The stop watch is activated by
a FlexRay interrupt 0 event, FlexRay interrupt 1 event or
by the Host by writing bit **FRSTPW1.SSWT** to '1'.
With the macrotick counter increment following next to the stop watch activation the actual cycle counter and macrotick values are captured in register **FRSTPW1** while the slot counter values for channel A and B are captured in register **FRSTPW2**.



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:16]	SMTV	0	R/W	Stop Watch Captured Macrotick Value
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:8]	SCCV	0	R/W	Stop Watch Captured Cycle Counter Value
[7]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[6]	EINT1	0	R/W	Enable FlexRay Interrupt 1 Trigger 0 = Stop watch trigger by FlexRay interrupt 1 disabled 1 = FlexRay interrupt 1 event triggers stop watch
[5]	EINT0	0	R/W	Enable FlexRay Interrupt 0 Trigger 0 = Stop watch trigger by FlexRay interrupt 0 disabled 1 = FlexRay interrupt 0 event triggers stop watch
[4]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[3]	SSWT	0	R/W	Software Stop Watch Trigger 0 = Software trigger reset 1 = Stop watch activated by software trigger

Bit	Bit Name	Initial Value	R/W	Description
[2]	EDGE	0	R/W	Stop Watch Trigger Edge Select 0 = Falling edge 1 = Rising edge
[1]	SWMS	0	R/W	Stop Watch Mode Select 0 = Single-shot mode 1 = Continuous mode
[0]	ESWT	0	R/W	Enable Stop Watch Trigger 0 = Stop watch trigger disabled 1 = Stop watch trigger enabled

(1) **FRSTPW1.SMTV**

Stop Watch Captured Macrotick Value

State of the macrotick counter when the stop watch event occurred.

(2) **FRSTPW1.SCCV**

Stop Watch Captured Cycle Counter Value

State of the cycle counter when the stop watch event occurred.

(3) **FRSTPW1.EINT1**

Enable FlexRay Interrupt 1 Trigger

Enables stop watch trigger by FlexRay interrupt 1 event if **FRSTPW1.ESWT** = ’1’.

(4) **FRSTPW1.EINT0**

Enable FlexRay Interrupt 0 Trigger

Enables stop watch trigger by FlexRay interrupt 0 event if **FRSTPW1.ESWT** = ’1’.

(5) **Reserved**

(6) **FRSTPW1.SSWT**

Software Stop Watch Trigger

Bits **FRSTPW1.ESWT** and **FRSTPW1.SSWT** cannot be set to ’1’ simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

When the Host writes this bit to ’1’ the stop watch is activated. After the actual cycle counter, slot counter and macrotick value are stored in the FlexRay Stop Watch registers and this bit is reset to ’0’.

(7) **FRSTPW1.EDGE**

Stop Watch Trigger Edge Select

(8) **FRSTPW1.SWMS**

Stop Watch Mode Select

(9) **FRSTPW1.ESWT**

Enable Stop Watch Trigger

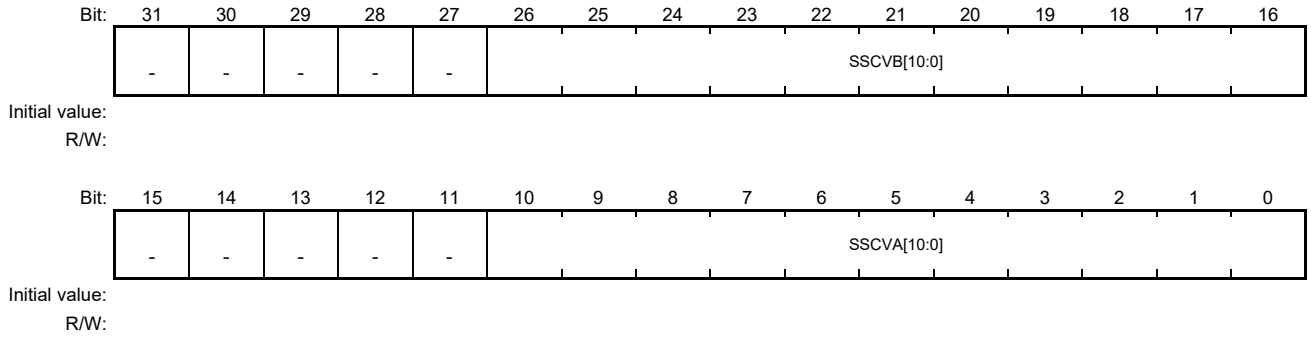
Bits **FRSTPW1.ESWT** and **FRSTPW1.SSWT** cannot be set to ’1’ simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

If enabled an edge on input STPWT_FLEXRAY or a FlexRay interrupt 0 event or a FlexRay interrupt 1 event activates the stop watch.

In single-shot mode this bit is reset to ’0’ after the actual cycle counter, slot counter and macrotick value are stored in the FlexRay Stop Watch registers.

103.2.4.5 FRSTPW2 [h'0050]

FlexRay Stop Watch Register 2



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:16]	SSCVB	0	R/W	Stop Watch Captured Slot Counter Value Channel B
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	SSCVA	0	R/W	Stop Watch Captured Slot Counter Value Channel A

(1) **FRSTPW2.SSCVB**

Stop Watch Captured Slot Counter Value Channel B

State of the slot counter for channel B when the stop watch event occurred.

(2) **FRSTPW2.SSCVA**

Stop Watch Captured Slot Counter Value Channel A

State of the slot counter for channel A when the stop watch event occurred.

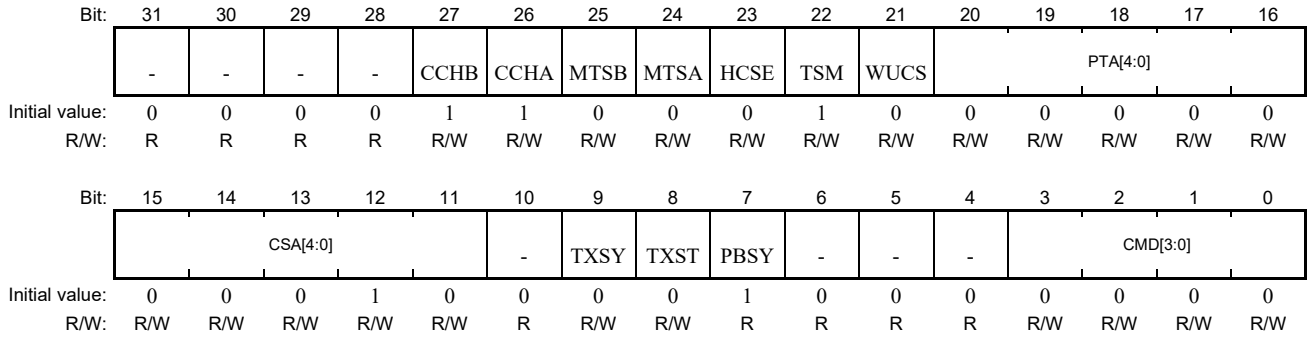
103.2.5 CC Control Registers

This section describes the registers provided by the CC to allow the Host to control the operation of the CC. The FlexRay protocol specification requires the Host to write application configuration data in CONFIG state only. Please consider that the configuration registers are not locked for writing in DEFAULT_CONFIG state.

The configuration data is reset when DEFAULT_CONFIG state is entered from reset. To change POC state from DEFAULT_CONFIG to CONFIG state the Host has to apply CHI command CONFIG. If the Host wants the CC to leave CONFIG state, the Host has to proceed an unlock sequence as described in section 103.2.2.1.

103.2.5.1 FRSUCC1 [h'0080]

FlexRay SUC Configuration Register 1



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(1) **FRSUCC1.CCHB**

Connected to Channel B

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel B (pChannels).

(2) **FRSUCC1.CCHA**

Connected to Channel A

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel A (pChannels).

(3) **FRSUCC1.MTSB**

Select Channel B for MTS Transmission

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

FRSUCC1.MTSB may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to **FRSUCC1** register is directly preceded by the unlock sequence for the Configuration Lock Key as described in section 103.2.2.1. This may be combined with CHI command SEND_MTS.

If both bits **FRSUCC1.MTSA** and **FRSUCC1.MTSB** are set to '1' an MTS symbol will be transmitted on both channels when requested by writing **FRSUCC1.CMD** = "1000".

The bit selects channel B for MTS symbol transmission.

(4) **FRSUCC1.MTSA**

Select Channel A for MTS Transmission

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

FRSUCC1.MTSA may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to **FRSUCC1** register is directly preceded by the unlock sequence for the Configuration Lock Key as described in section 103.2.2.1. This may be combined with CHI command SEND_MTS.

If both bits **FRSUCC1.MTSA** and **FRSUCC1.MTSB** are set to '1' an MTS symbol will be transmitted on both channels when requested by writing **FRSUCC1.CMD** = "1000".

The bit selects channel A for MTS symbol transmission.

(5) **FRSUCC1.HCSE**

Halt due to Clock Sync Error

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

(6) **FRSUCC1.TSM**

Transmission Slot Mode

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Selects the initial transmission slot mode (pSingleSlotEnabled).

In SINGLE slot mode the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 respectively message buffers 0 and 1 depending on bit **FRMRC.SPLM**.

In case **FRSUCC1.TSM** = '1', message buffer 0 respectively message buffers 0,1 can be (re)configured in DEFAULT_CONFIG or CONFIG state only. In ALL slot mode the CC may transmit in all slots.

FRSUCC1.TSM is a configuration bit which can only be set / reset by the Host.

The CC changes to ALL slot mode when the Host successfully applied the ALL_SLOTS command by writing **FRSUCC1.CMD** = "0101" in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. The actual slot mode is monitored by **FRCCSV.SLM**.

(7) **FRSUCC1.WUCS**

Wakeup Channel Select

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

With this bit the Host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

(8) **FRSUCC1.PTA**

Passive to Active

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 31 even / odd cycle pairs.

Defines the number of consecutive even / odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state (pAllowPassiveToActive).

If set to "00000" the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

(9) **FRSUCC1.CSA**

Cold Start Attempts

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Must be identical in all nodes of a cluster.

Valid values are 2 to 31.

Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

(10) **FRSUCC1.TXSY**

Transmit Sync Frame in Key Slot

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

(11) **FRSUCC1.TXST**

Transmit Startup Frame in Key Slot

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

Note: The protocol requires that both bits **FRSUCC1.TXST** and **FRSUCC1.TXSY** are set for coldstart nodes.

(12) **FRSUCC1.PBSY**

POC Busy

Signals that the POC is busy and cannot accept a command from the Host. **FRSUCC1.CMD** is locked against write accesses.

Set to ’1’ after reset during initialization of internal RAM blocks.

(13) **FRSUCC1.CMD**

CHI Command Vector

The Host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted, and flag **FREIR.CNA** will be set to '1'.

In general the Host must check **FRSUCC1.PBSY** before writing a new CHI command.

In case the previous CHI command has not yet completed, **FREIR.CCL** is set to '1' together with **FREIR.CNA**; the CHI command needs to be repeated.

Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will **FREIR.CNA** be set.

Reading **FRSUCC1.CMD** shows whether the last CHI command was accepted. The actual POC state is monitored by **FRCCSV.POCS**.

command_not_accepted
FRSUCC1.CMD is reset to "0000" due to one of the following conditions:
Illegal command applied by the Host
Host applied command to leave CONFIG state without preceding config lock key
Host applied new command while execution of the previous Host command has not completed
Host writes command_not_accepted
When **FRSUCC1.CMD** is reset to "0000", **FREIR.CNA** is set, and, if enabled, an interrupt is generated.

Commands which are not accepted are not executed.

CONFIG
Go to POC state CONFIG when called in POC states DEFAULT_CONFIG, or READY. When called in HALT state the CC transits to POC state DEFAULT_CONFIG. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

READY
Go to POC state READY when called in POC states CONFIG, NORMAL_ACTIVE, NORMAL_PASSIVE, STARTUP, or WAKEUP. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

WAKEUP
Go to POC state WAKEUP when called in POC state READY. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

RUN
Go to POC state STARTUP when called in POC state READY. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

ALL_SLOTS
Leave SINGLE slot mode after successful startup / integration at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

HALT
Set halt request **FRCCSV.HRQ** and go to POC state HALT at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

FREEZE
Set the freeze status indicator **FRCCSV.FSI** and go to POC state HALT immediately. Can be called from any state.

SEND_MTS

Send single MTS symbol during the next following symbol window on the channel configured by **FRSUCC1.MTSA**, **FRSUCC1.MTSB**, when called in POC state NORMAL_ACTIVE after CC entered ALL slot mode (**FRCCSV.SLM** = "11"). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

ALLOW_COLDSTART
The command resets **FRCCSV.CSI** to enable the node to become leading coldstarter. When called in states DEFAULT_CONFIG, CONFIG, or HALT, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted. To become leading coldstarter it is also required that both **FRSUCC1.TXST** and **FRSUCC1.TXSY** are set.

RESET_STATUS_INDICATORS
Resets status flags **FRCCSV.CSNI**, **FRCCSV.CSAI**, and **FRCCSV.WSV** to their default values. May be called in POC states READY and STARTUP. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

CLEAR_RAMS
Sets **FRMHDS.CRAM** when called in DEFAULT_CONFIG or CONFIG state. When called in any other state, **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted.

FRMHDS.CRAM is also set when the CC leaves reset. By setting **FRMHDS.CRAM** all internal RAM blocks are initialized to zero. During the initialization of the RAMs, **FRSUCC1.PBSY** will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR_RAMS.

The initialization of the internal message RAM requires 2048 bus clock cycles. There should be no Host access to IBF or OBF during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR_RAMS.

Before asserting CHI command CLEAR_RAMS the Host should make sure that no transfer between Message RAM and IBF / OBF or the Transient Buffer RAMs is ongoing and the data transfer handlers are disabled (**FRITS.ITS** = '0' and **FROTS.OTS** = '0'). This command also resets the Message Buffer Status registers **FRMHDS**, **FRLDTS**, **FRFSR**, **FRMHDF**, **FRTXRQ1/2/3/4.TXR**, **FRNDAT1/2/3/4**, and **FRMBSC1/2/3/4**.

Note: All accepted commands with exception of CLEAR_RAMS and SEND_MTS will cause a change of the POC state in the FlexRay sample clock domain after at most 8 cycles of the slower of the two clocks 'bus clock' and 'FlexRay sample clock', assumed that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register **FRCCSV** will show data that is additionally delayed by synchronization from the FlexRay sample clock domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks 'bus clock' and 'FlexRay sample clock'.

Table 103.2a below references the CHI commands from the FlexRay Protocol Specification [FR_PROT] (section 2.2.1.1, Table 2-2) to the FlexRay CHI command vector **FRSUCC1.CMD**.

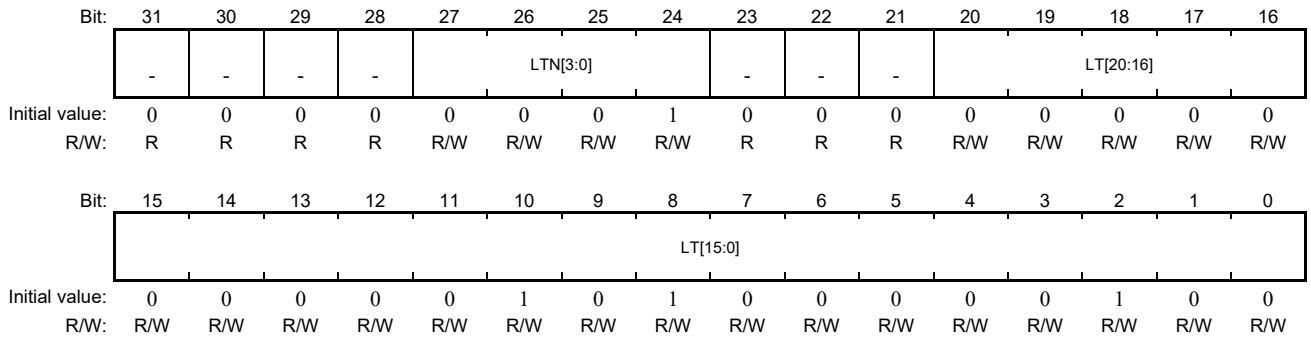
Table 103.2a Reference to CHI Host command summary from FlexRay protocol specification

CHI command	Where processed (POC States)	CHI Command Vector CMD
ALL_SLOTS	POC:normal active, POC:normal passive	ALL_SLOTS
ALLOW_COLDSTART	All except POC:default config, POC:config, POC:halt	ALLOW_COLDSTART
CONFIG	POC:default config, POC:ready	CONFIG
CONFIG_COMPLETE	POC:config	Unlock sequence & READY
DEFAULT_CONFIG	POC:halt	CONFIG
FREEZE	All	FREEZE
HALT	POC:normal active, POC:normal passive	HALT
READY	All except POC:default config, POC:config,	READY

	POC:ready, POC:halt	
RUN	POC:ready	RUN
WAKEUP	POC:ready	WAKEUP

103.2.5.2 FRSUCC2 [h'0084]

FlexRay SUC Configuration Register 2



Bit	Bit Name	Initial Value	R/W	Description
[31:28]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[27:24]	LTN	1	R/W	Listen Timeout Noise Configures (gListenNoise - 1)
[23:21]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[20:0]	LT	504h	R/W	Listen Timeout Configures pdListenTimeout

(1) **FRSUCC2.LTN**

Listen Timeout Noise

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

The range for gListenNoise is 2 to 16.

FRSUCC2.LTN must be configured identical in all nodes of a cluster.

Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

Note: The wakeup / startup noise timeout is calculated as follows:

pdListenTimeout * gListenNoise = **FRSUCC2.LT** * (**FRSUCC2.LTN** + 1)

(2) **FRSUCC2.LT**

Listen Timeout

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

The range for pdListenTimeout is 1284 to 1283846 µT.

Configures wakeup / startup listen timeout in µT.

103.2.5.3 FRSUCC3 [h'0088]

FlexRay SUC Configuration Register 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
[31:8]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[7:4]	WCF	1	R/W	Maximum Without Clock Correction Fatal Configures gMaxWithoutClockCorrectionFatal
[3:0]	WCP	1	R/W	Maximum Without Clock Correction Passive Configures gMaxWithoutClockCorrectionPassive

(1) **FRSUCC3.WCF**

Maximum Without Clock Correction Fatal

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

FRSUCC3.WCF must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

Note: The transition to HALT state is prevented if **FRSUCC1.HCSE** is not set.

(2) **FRSUCC3.WCP**

Maximum Without Clock Correction Passive

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

FRSUCC3.WCP must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE to NORMAL_PASSIVE state.

103.2.5.4 FRNEMC [h'008C]

FlexRay NEM Configuration Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

[31:4]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[3:0]	NML	0	R/W	Network Management Vector Length Configures gNetworkManagementVectorLength

(1) **FRNEMC.NML**

Network Management Vector Length

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

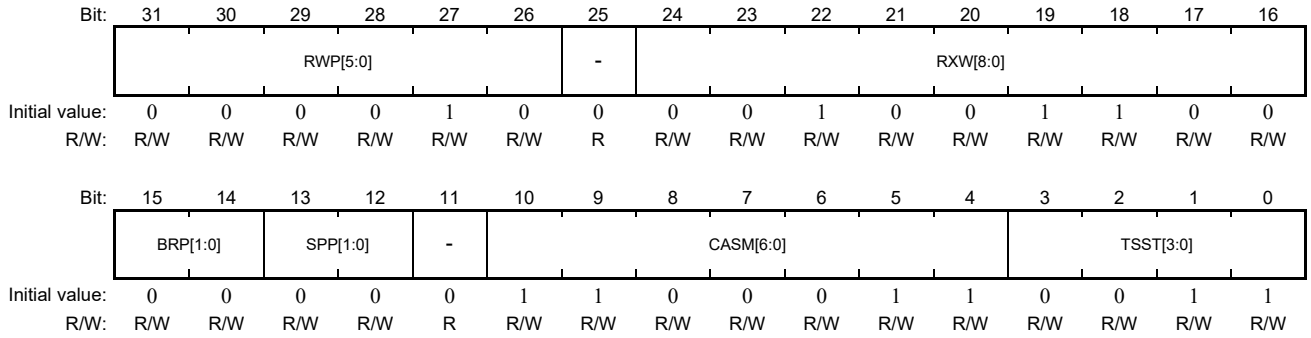
Valid values are 0 to 12 bytes.

FRNEMC.NML must be identical in all nodes of a cluster.

These bits configure the length of the NM vector.

103.2.5.5 FRPRTC1 [h'0090]

FlexRay PRT Configuration Register 1



Bit	Bit Name	Initial Value	R/W	Description
[31:26]	RWP	2h	R/W	Repetitions of Tx Wakeup Pattern Configures pWakeupPattern
[25]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[24:16]	RXW	4Ch	R/W	Wakeup Symbol Receive Window Length Configures gdWakeupSymbolRxWindow
[15:14]	BRP	0	R/W	Baud Rate Prescaler Configures gdSampleClockPeriod and pSamplesPerMicrotick 00 = 10 MBit/s 01 = 5 MBit/s 10 = 2.5 MBit/s 11 = 2.5 MBit/s
[13:12]	SPP	0	R/W	Strobe Point Position Configures Strobe point position 00 = Sample 5 01 = Sample 4 10 = Sample 6 11 = Sample 5
[11]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[10:4]	CASM	63h	R/W	Collision Avoidance Symbol Max Configures gdCASRxLowMax
[3:0]	TSST	3h	R/W	Transmission Start Sequence Transmitter Configures gdTSSTransmitter

Notes: Bit[10]=CASM[6] is fixed to 1, therefore bit[10] is "Read Only" bit: user cannot write this bit.

(1) **FRPRTC1.RWP**

Repetitions of Tx Wakeup Pattern

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63.

Configures the number of repetitions (sequences) of the Tx wakeup symbol.

(2) **FRPRTC1.RXW**

Wakeup Symbol Receive Window Length

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 76 to 301 bit times.

FRPRTC1.RXW must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

(3) **FRPRTC1.BRP**

Baud Rate Prescaler

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz. One bit time always consists of 8 samples independent of the configured baud rate.

00 = 10 MBit/s
gdSampleClockPeriod = 12.5 ns = 1 * 'sample clock'
pSamplesPerMicrotick = 2 (1 µT = 25 ns)

01 = 5 MBit/s
gdSampleClockPeriod = 25 ns = 2 * 'sample clock'
pSamplesPerMicrotick = 1 (1 µT = 25 ns)

10, 11 = 2.5 MBit/s
gdSampleClockPeriod = 50 ns = 4 * 'sample clock'
pSamplesPerMicrotick = 1 (1 µT = 50 ns)

(4) **FRPRTC1.SPP**

Strobe Point Position

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Defines the sample count value for strobing. The strobed bit value is set to the voted value when the sample count is incremented to the value configured by **FRPRTC1.SPP**.

Note: The current revision 2.1 of the FlexRay protocol requires that **FRPRTC1.SPP** = "00". The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.

(5) **FRPRTC1.CASM**

Collision Avoidance Symbol Max

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

CASM6 is fixed to ’1’.

Valid values are 67 to 99 bit times.

Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

(6) **FRPRTC1.TSST**

Transmission Start Sequence Transmitter

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

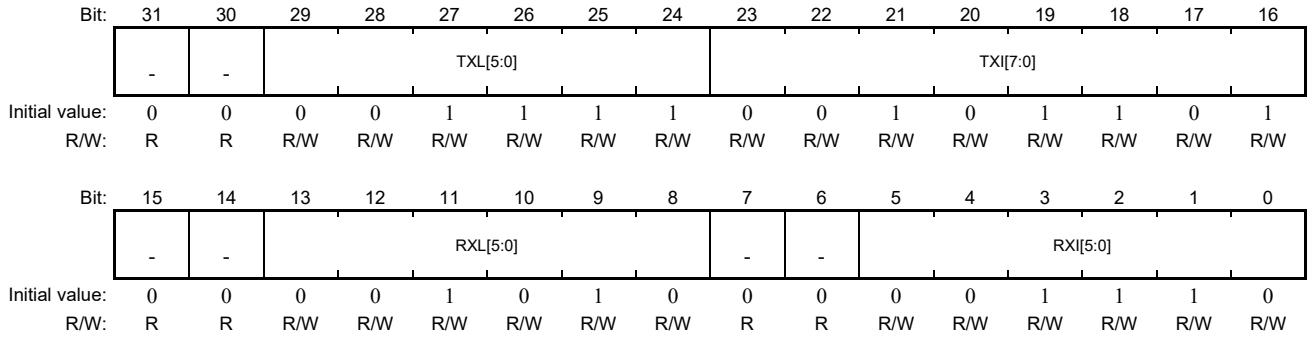
Valid values are 3 to 15 bit times.

FRPRTC1.TSST must be identical in all nodes of a cluster.

Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times (1 bit time = 4 µT = 100ns @ 10Mbps).

103.2.5.6 FRPRTC2 [h'0094]

FlexRay PRT Configuration Register 2



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:24]	TXL	Fh	R/W	Wakeup Symbol Transmit Low Configures gdWakeupSymbolTxLow
[23:16]	TXI	2Dh	R/W	Wakeup Symbol Transmit Idle Configures gdWakeupSymbolTxIdle
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:8]	RXL	Ah	R/W	Wakeup Symbol Receive Low Configures gdWakeupSymbolRxLow
[7:6]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[5:0]	RXI	Eh	R/W	Wakeup Symbol Rx Idle Configures gdWakeupSymbolRxIdle

(1) **FRPRTC2.TXL**

Wakeup Symbol Transmit Low

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 15 to 60 bit times.

FRPRTC2.TXL must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

(2) **FRPRTC2.TXI**

Wakeup Symbol Transmit Idle

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 45 to 180 bit times.

FRPRTC2.TXI must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

(3) **FRPRTC2.RXL**

Wakeup Symbol Receive Low

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 10 to 55 bit times.

FRPRTC2.RXL must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

(4) **FRPRTC2.RXI**

Wakeup Symbol Rx Idle

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

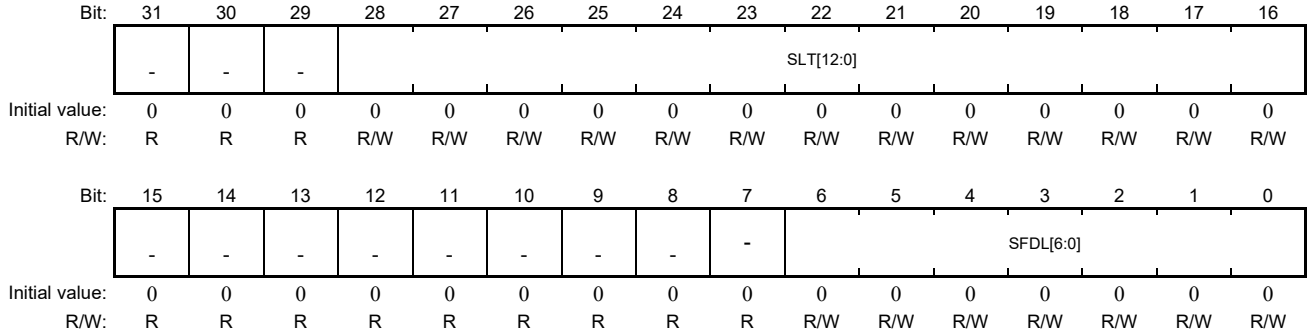
Valid values are 14 to 59 bit times.

FRPRTC2.RXI must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

103.2.5.7 FRMHDC [h'0098]

FlexRay MHD Configuration Register



Bit	Bit Name	Initial Value	R/W	Description
[31:29]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[28:16]	SLT	0	R/W	Start of Latest Transmit Configures pLatestTx
[15:7]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[6:0]	SFDL	0	R/W	Static Frame Data Length Configures gPayloadLengthStatic

(1) **FRMHDC.SLT**

Start of Latest Transmit

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7981 minislots.

Configures the maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if **FRMHDC.SLT** is set to zero.

(2) **FRMHDC.SFDL**

Static Frame Data Length

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

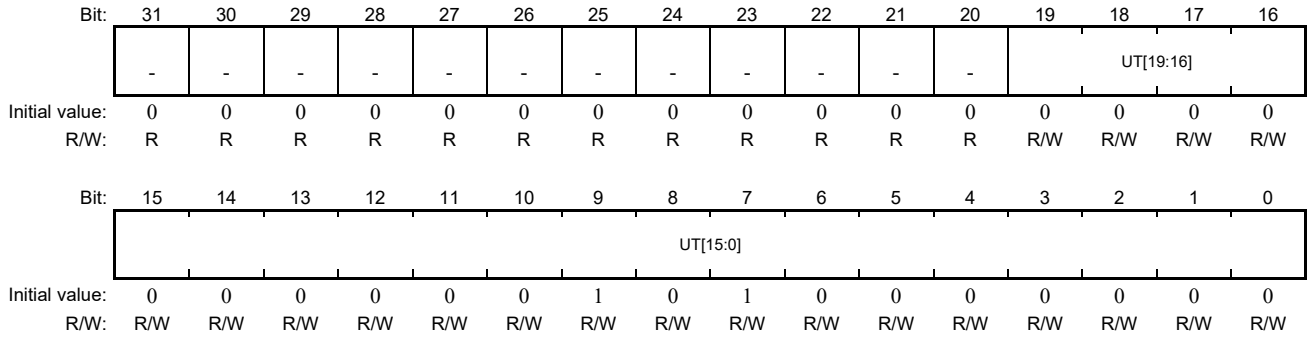
Valid values are 0 to 127.

FRMHDC.SLT must be identical in all nodes of a cluster.

Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

103.2.5.8 FRGTUC1 [h'00A0]

FlexRay GTU Configuration Register 1



Bit	Bit Name	Initial Value	R/W	Description
[31:20]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[19:0]	UT	280h	R/W	Microtick per Cycle Configures pMicroPerCycle

(1) **FRGTUC1.UT**

Microtick per Cycle

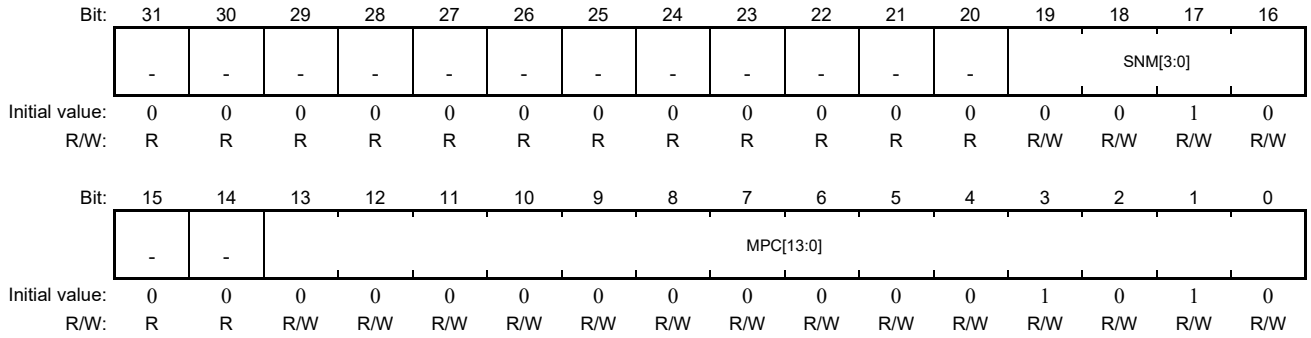
The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 640 to 640000 µT.

Configures the duration of the communication cycle in microticks.

103.2.5.9 FRGTUC2 [h'00A4]

FlexRay GTU Configuration Register 2



Bit	Bit Name	Initial Value	R/W	Description
[31:20]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[19:16]	SNM	2h	R/W	Sync Node Max Sync Node Max
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:0]	MPC	Ah	R/W	Macrotick Per Cycle Configures gMacroPerCycle

(1) **FRGTUC2.SNM**

Sync Node Max

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 15.

FRGTUC2.SNM must be identical in all nodes of a cluster.

Maximum number of frames within a cluster with sync frame indicator bit SYN set to '1'.

(2) **FRGTUC2.MPC**

Macrotick Per Cycle

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

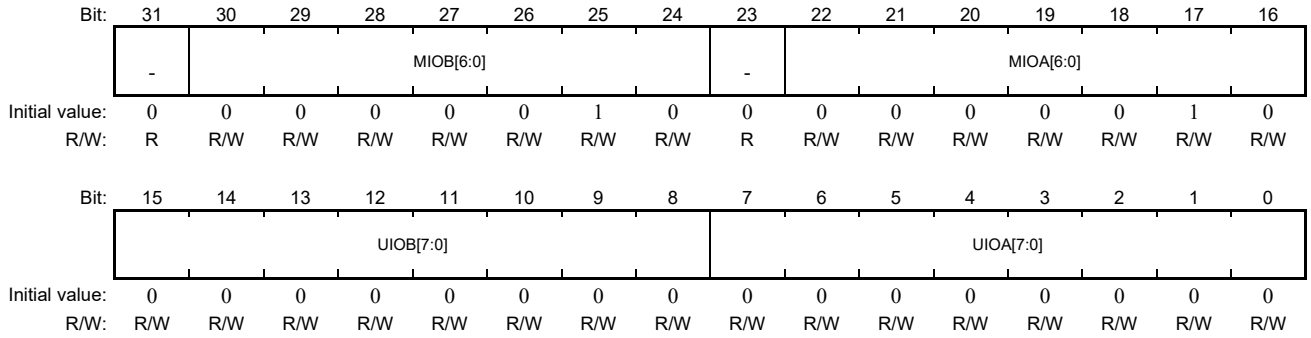
Valid values are 10 to 16000 MT.

FRGTUC2.MPC must be identical in all nodes of a cluster.

Configures the duration of one communication cycle in macroticks.

103.2.5.10 FRGTUC3 [h'00A8]

FlexRay GTU Configuration Register 3



Bit	Bit Name	Initial Value	R/W	Description
[31]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[30:24]	MIOB	2h	R/W	Macrotick Initial Offset Channel B Configures pMacroInitialOffset[B]
[23]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[22:16]	MIOA	2h	R/W	Macrotick Initial Offset Channel A Configures pMacroInitialOffset[A]
[15:8]	UIOB	0	R/W	Microtick Initial Offset Channel B Configures pMicroInitialOffset[B]
[7:0]	UIOA	0	R/W	Microtick Initial Offset Channel A Configures pMicroInitialOffset[A]

(1) **FRGTUC3.MIOB**

Macrotick Initial Offset Channel B

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

FRGTUC3.MIOB must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(2) **FRGTUC3.MIOA**

Macrotick Initial Offset Channel A

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

FRGTUC3.MIOA must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(3) **FRGTUC3.UIOB**

Microtick Initial Offset Channel B

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation[B] and therefore has to be set for each channel independently.

(4) **FRGTUC3.UIOA**

Microtick Initial Offset Channel A

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation[A] and therefore has to be set for each channel independently.

103.2.5.11 FRGTUC4 [h'00AC]

FlexRay GTU Configuration Register 4

For details about configuration of **FRGTUC4.NIT** and **FRGTUC4.OCS** see section 103.3.2.5.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	OCS[13:0]

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	NIT[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:16]	OCS	8h	R/W	Offset Correction Start Configures (gOffsetCorrectionStart - 1)
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:0]	NIT	7h	R/W	Network Idle Time Start Configures (gMacroPerCycle - gdNIT - 1)

(1) **FRGTUC4.OCS**

Offset Correction Start

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 8 to 15998 MT.

For cluster consisting of ERAY implementations only, it is sufficient to program **FRGTUC4.OCS** = **FRGTUC4.NIT** + 1.

FRGTUC4.OCS must be identical in all nodes of a cluster.

Determines the start of the offset correction within the NIT phase, calculated from start of cycle.

(2) **FRGTUC4.NIT**

Network Idle Time Start

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

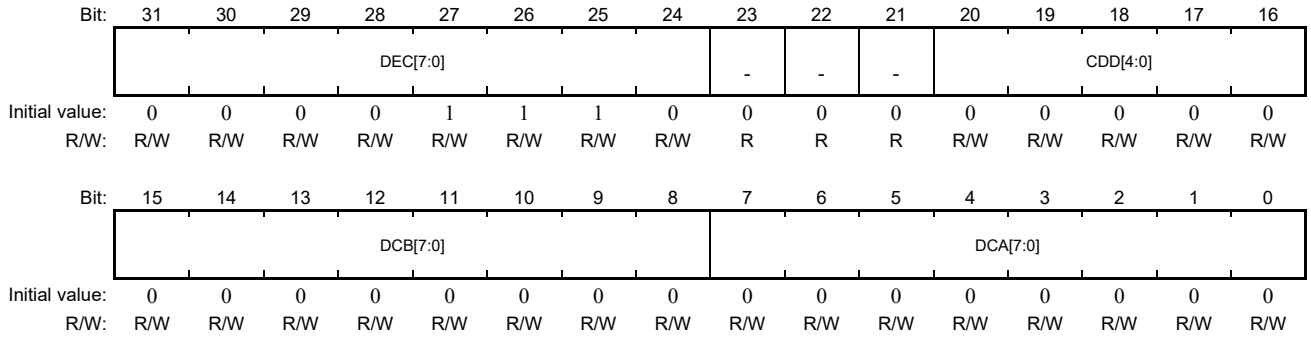
Valid values are 7 to 15997 MT.

FRGTUC4.NIT must be identical in all nodes of a cluster.

Configures the starting point of the Network Idle Time (NIT) at the end of the communication cycle expressed in terms of macroticks from the beginning of the cycle.

103.2.5.12 FRGTUC5 [h'00B0]

FlexRay GTU Configuration Register 5



Bit	Bit Name	Initial Value	R/W	Description
[31:24]	DEC	Eh	R/W	Decoding Correction Configures pDecodingCorrection
[23:21]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[20:16]	CDD	0	R/W	Cluster Drift Damping Configures pClusterDriftDamping
[15:8]	DCB	0	R/W	Delay Compensation Channel B Configures pDelayCompensation[B]
[7:0]	DCA	0	R/W	Delay Compensation Channel A Configures pDelayCompensation[A]

(1) **FRGTUC5.DEC**

Decoding Correction

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 14 to 143 µT.

Configures the decoding correction value used to determine the primary time reference point.

(2) **FRGTUC5.CDD**

Cluster Drift Damping

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 20 µT.

Configures the cluster drift damping value used in clock synchronization to minimize accumulation of rounding errors.

(3) **FRGTUC5.DCB**

Delay Compensation Channel B

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on the indicated channel. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

(4) **FRGTUC5.DCA**

Delay Compensation Channel A

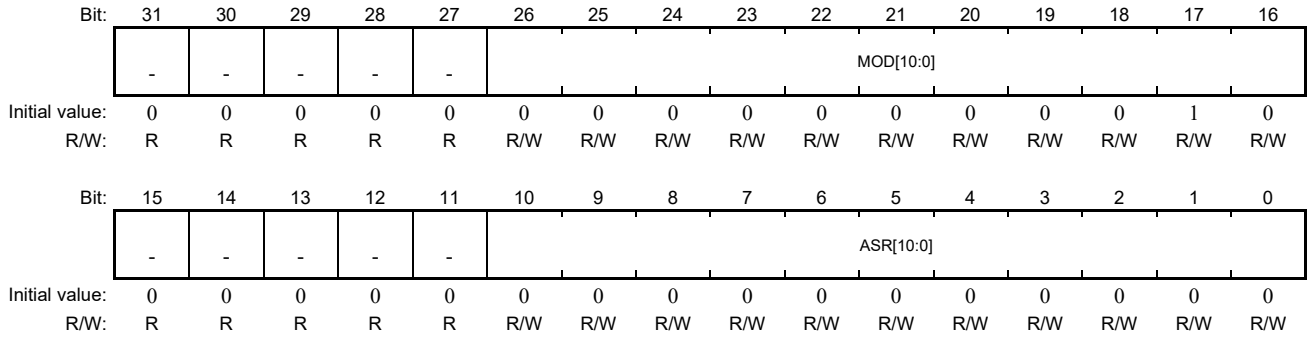
The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on the indicated channel. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

103.2.5.13 FRGTUC6 [h'00B4]

FlexRay GTU Configuration Register 6



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:16]	MOD	2h	R/W	Maximum Oscillator Drift Configures pdMaxDrift
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	ASR	0	R/W	Accepted Startup Range Configures pdAcceptedStartupRange

(1) **FRGTUC6.MOD**

Maximum Oscillator Drift

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in µT.

(2) **FRGTUC6.ASR**

Accepted Startup Range

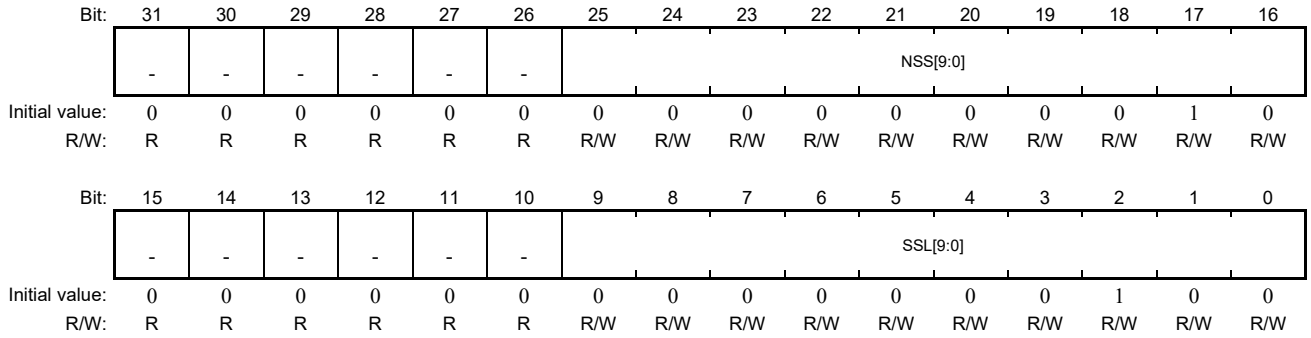
The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 1875 µT.

Number of microticks constituting the expanded range of measured deviation for startup frames during integration.

103.2.5.14 FRGTUC7 [h'00B8]

FlexRay GTU Configuration Register 7



Bit	Bit Name	Initial Value	R/W	Description
[31:26]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[25:16]	NSS	2h	R/W	Number of Static Slots Configures gNumberOfStaticSlots
[15:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9:0]	SSL	4h	R/W	Static Slot Length Configures gdStaticSlot

(1) **FRGTUC7.NSS**

Number of Static Slots

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1023.

FRGTUC7.NSS must be identical in all nodes of a cluster.

Configures the number of static slots in a cycle.

(2) **FRGTUC7.SSL**

Static Slot Length

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

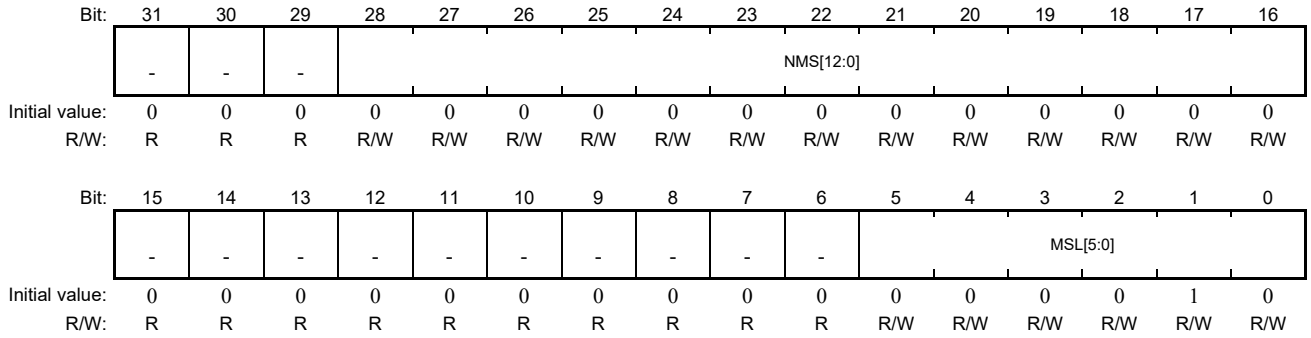
Valid values are 4 to 659 MT.

FRGTUC7.SSL must be identical in all nodes of a cluster.

Configures the duration of a static slot in macroticks.

103.2.5.15 FRGTUC8 [h'00BC]

FlexRay GTU Configuration Register 8



Bit	Bit Name	Initial Value	R/W	Description
[31:29]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[28:16]	NMS	0	R/W	Number of Minislots Configures gNumberOfMinislots
[15:6]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[5:0]	MSL	2h	R/W	Minislot Length Configures gdMinislot

(1) **FRGTUC8.NMS**

Number of Minislots

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7986.

FRGTUC8.NMS must be identical in all nodes of a cluster.

Configures the number of minislots within the dynamic segment of a cycle.

(2) **FRGTUC8.MSL**

Minislot Length

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63 MT.

FRGTUC8.MSL must be identical in all nodes of a cluster.

Configures the duration of a minislot in macroticks.

103.2.5.16 FRGTUC9 [h'00C0]

FlexRay GTU Configuration Register 9

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
[31:18]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[17:16]	DSI	0	R/W	Dynamic Slot Idle Phase Configures gdDynamicSlotIdlePhase
[15:13]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[12:8]	MAPO	1h	R/W	Minislot Action Point Offset Configures gdMinislotActionPointOffset
[7:6]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[5:0]	APO	1h	R/W	Action Point Offset Configures gdActionPointOffset

(1) **FRGTUC9.DSI**

Dynamic Slot Idle Phase

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 2 Minislot.

FRGTUC9.DSI must be identical in all nodes of a cluster.

Configures the duration of the dynamic slot idle phase and has to be greater or equal than the idle detection time.

(2) **FRGTUC9.MAPO**

Minislot Action Point Offset

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 31 MT.

FRGTUC9.MAPO must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within the minislots of the dynamic segment.

(3) **FRGTUC9.APO**

Action Point Offset

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

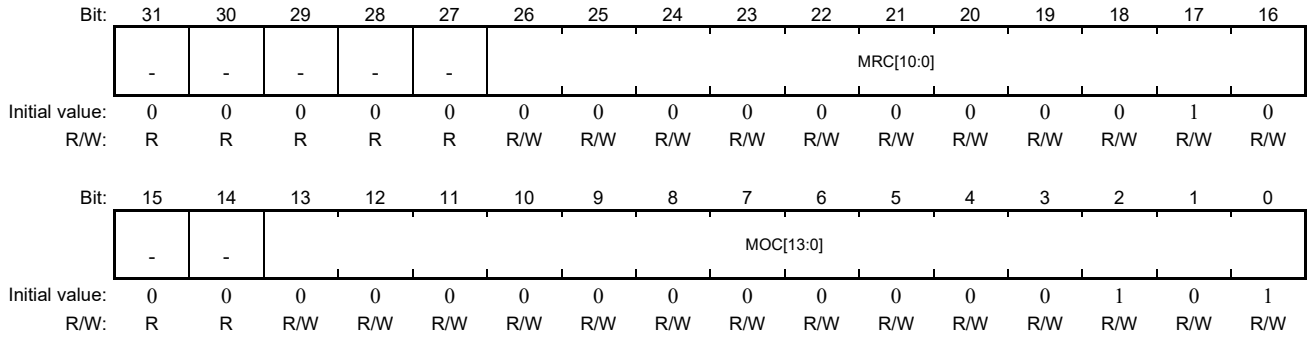
Valid values are 1 to 63 MT.

FRGTUC9.APO must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within static slots and symbol window.

103.2.5.17 FRGTUC10 [h'00C4]

FlexRay GTU Configuration Register 10



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:16]	MRC	2h	R/W	Maximum Rate Correction Configures pRateCorrectionOut
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:0]	MOC	5h	R/W	Maximum Offset Correction Configures pOffsetCorrectionOut

(1) **FRGTUC10.MRC**

Maximum Rate Correction

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Holds the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm. The CC checks only the internal rate correction value against the maximum rate correction value (absolute value).

(2) **FRGTUC10.MOC**

Maximum Offset Correction

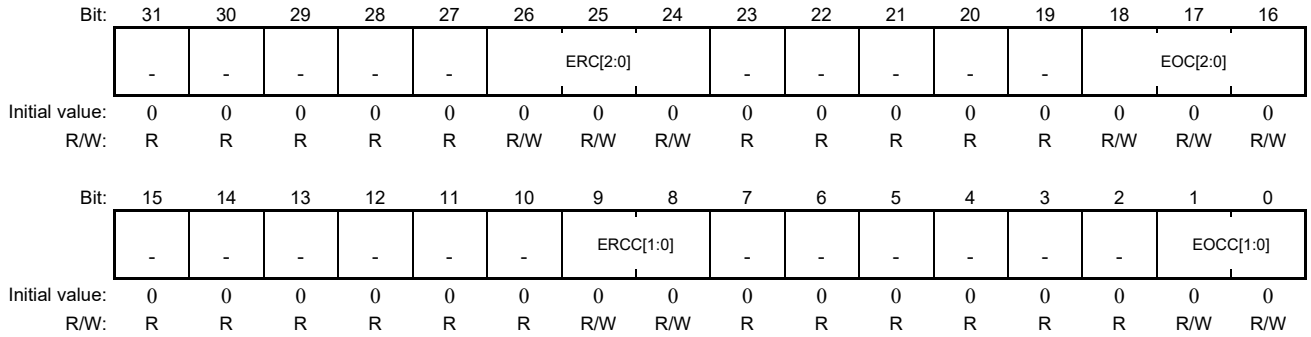
The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 5 to 15266 µT.

Holds the maximum permitted offset correction value to be applied by the internal clock synchronization algorithm (absolute value). The CC checks only the internal offset correction value against the maximum offset correction value.

103.2.5.18 FRGTUC11 [h'00C8]

FlexRay GTU Configuration Register 11



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:24]	ERC	0	R/W	External Rate Correction Configures pExternRateCorrection
[23:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18:16]	EOC	0	R/W	External Offset Correction Configures pExternOffsetCorrection
[15:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9:8]	ERCC	0	R/W	External Rate Correction Control Configures vExternRateControl 00 = No external rate correction 01 = No external rate correction 10 = Subtract 11 = Add
[7:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1:0]	EOCC	0	R/W	External Offset Correction Control Configures vExternOffsetControl 00 = No external offset correction 01 = No external offset correction 10 = Subtract 11 = Add

(1) **FRGTUC11.ERC**

External Rate Correction

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated rate correction value. The value is applied during NIT.

(2) **FRGTUC11.EOC**

External Offset Correction

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated offset correction value. The value is applied during NIT.

(3) **FRGTUC11.ERCC**

External Rate Correction Control

Should be modified only outside NIT.

By writing to **FRGTUC11.ERCC** the external rate correction is enabled as specified below.

00 = No external rate correction

01 = No external rate correction

10 = Subtract
External rate correction value subtracted from calculated rate correction value

11 = Add
External rate correction value added to calculated rate correction value

(4) **FRGTUC11.EOCC**

External Offset Correction Control

Should be modified only outside NIT.

By writing to **FRGTUC11.EOCC** the external offset correction is enabled as specified below.

00 = No external offset correction

01 = No external offset correction

10 = Subtract
External offset correction value subtracted from calculated offset correction value

11 = Add
External offset correction value added to calculated offset correction value

103.2.6 CC Status Registers

During 8/16-bit accesses to status variables coded with more than 8/16-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

103.2.6.1 FRCCSV [h'0100]

FlexRay CC Status Vector

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	PSL[5:0]						RCA[4:0]					WSV[2:0]

[7]	HRQ	0	R	Halt Request Indicates vPOC!CHIHaltRequest
[6]	FSI	0	R	Freeze Status Indicator Indicates vPOC!Freeze
[5:0]	POCS	0	R	Protocol Operation Control Status Protocol Operation Control Status

(1) **FRCCSV.PSL**

POC Status Log

Status of **FRCCSV.POCS** immediately before entering HALT state.

Set when entering HALT state. Set to HALT when FREEZE command is applied during HALT state and **FRCCSV.FSI** is not already set i.e. the HALT state was not reached by FREEZE command.

Reset to "00 0000" when leaving HALT state.

(2) **FRCCSV.RCA**

Remaining Coldstart Attempts

Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).

The initial value of **FRCCSV.RCA** during CONFIG and DEFAULT_CONFIG state is also **FRSUCC1.CSA**.

The RUN command resets this counter to the maximum number of coldstart attempts as configured by **FRSUCC1.CSA**.

(3) **FRCCSV.WSV**

Wakeup Status

Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).

Reset when entering Wakeup state, by CHI command RESET_STATUS_INDICATORS, or by transition from DEFAULT_CONFIG to CONFIG state

000 = UNDEFINED
Wakeup not yet executed by the CC.

001 = RECEIVED_HEADER
Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP_LISTEN state.

010 = RECEIVED_WUP
Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP_LISTEN state.

011 = COLLISION_HEADER

Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.

100 = COLLISION_WUP
Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.

101 = COLLISION_UNKNOWN
Set when the CC stops wakeup by leaving WAKEUP_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.

110 = TRANSMITTED
Set when the CC has successfully completed the transmission of the wakeup pattern.

111 = reserved

(4) **FRCCSV.CSI**

Cold Start Inhibit

Indicates that the node is disabled from cold starting (vColdStartInhibit).

The flag is set whenever the POC enters READY state due to CHI command READY.

The flag has to be reset under control of the Host by CHI command ALLOW_COLDSTART (**FRSUCC1.CMD** = "1001").

(5) **FRCCSV.CSAI**

Coldstart Abort Indicator

Indicates that a coldstart attempt was aborted.

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(6) **FRCCSV.CSNI**

Coldstart Noise Indicator

Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(7) **FRCCSV.SLM**

Slot Mode

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL_ACTIVE, and NORMAL_PASSIVE.

Default value is SINGLE. Changes to ALL, depending on **FRSUCC1.TSM**.

In NORMAL_ACTIVE or NORMAL_PASSIVE state the CHI command ALL_SLOTS will change the slot mode from SINGLE over ALL_PENDING to ALL.

Set to SINGLE in all other states.

(8) **FRCCSV.HRQ**

Halt Request

Indicates that a request from the Host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(9) **FRCCSV.FSI**

Freeze Status Indicator

Indicates that the POC has entered the HALT state due to CHI command FREEZE or due to an error condition requiring an immediate POC halt (vPOC!Freeze).

Reset by transition from HALT to DEFAULT_CONFIG state.

(10) **FRCCSV.POCS**

Protocol Operation Control Status

Indicates the actual state of operation of the CC Protocol Operation Control
00 0000 = DEFAULT_CONFIG state
00 0001 = READY state
00 0010 = NORMAL_ACTIVE state
00 0011 = NORMAL_PASSIVE state
00 0100 = HALT state
00 1111 = CONFIG state

Indicates the actual state of operation of the POC in the wakeup path
01 0000 = WAKEUP_STANDBY state
01 0001 = WAKEUP_LISTEN state
01 0010 = WAKEUP_SEND state
01 0011 = WAKEUP_DETECT state

Indicates the actual state of operation of the POC in the startup path
10 0000 = STARTUP_PREPARE state
10 0001 = COLDSTART_LISTEN state
10 0010 = COLDSTART_COLLISION_RESOLUTION state
10 0011 = COLDSTART_CONSISTENCY_CHECK state
10 0100 = COLDSTART_GAP state
10 0101 = COLDSTART_JOIN State
10 0110 = INTEGRATION_COLDSTART_CHECK state
10 0111 = INTEGRATION_LISTEN state
10 1000 = INTEGRATION_CONSISTENCY_CHECK state
10 1001 = INITIALIZE_SCHEDULE state
10 1010 = ABORT_STARTUP state
10 1011 = STARTUP_SUCCESS state

others = reserved

103.2.6.2 FRCCEV [h'0104]

FlexRay CC Error Vector

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:13]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[12:8]	PTAC	0	R	Passive to Active Count Indicates vAllowPassiveToActive
[7:6]	ERRM	0	R	Error Mode Indicates vPOC!ErrorMode 00 = ACTIVE 01 = PASSIVE 10 = COMM_HALT 11 = reserved
[5:4]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[3:0]	CCFC	0	R	Clock Correction Failed Counter Indicates vClockCorrectionFailed

(1) **FRCCEV.PTAC**

Passive to Active Count

Indicates the number of consecutive even / odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL_PASSIVE state to NORMAL_ACTIVE state. The transition takes place when **FRCCEV.PTAC** equals **FRSUCC1.PTA** -1.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(2) **FRCCEV.ERRM**

Error Mode

Indicates the actual error mode of the POC (vPOC!ErrorMode).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(3) **FRCCEV.CCFC**

Clock Correction Failed Counter

Indicates the clock correction failed counter of the POC (vClockCorrectionFailed).

The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the missing offset correction error or missing rate correction error are active.

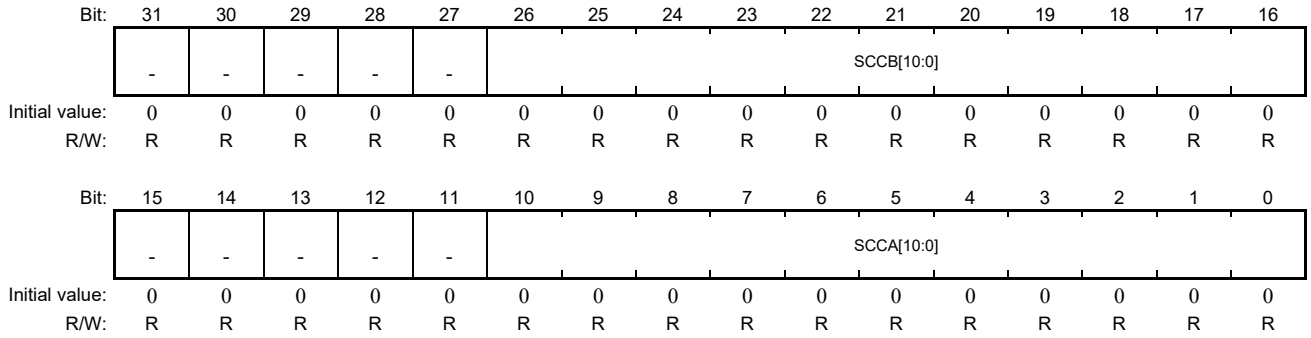
The Clock Correction Failed Counter is reset to ’0’ at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.

The Clock Correction Failed Counter stops incrementing at 15.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

103.2.6.3 FRSCV [h'0110]

FlexRay Slot Counter Value



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:16]	SCCB	0	R	Slot Counter Channel B Indicates vSlotCounter[B]
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	SCCA	0	R	Slot Counter Channel A Indicates vSlotCounter[A]

(1) **FRSCV.SCCB**

Slot Counter Channel B

Current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FRSCV.SCCA**

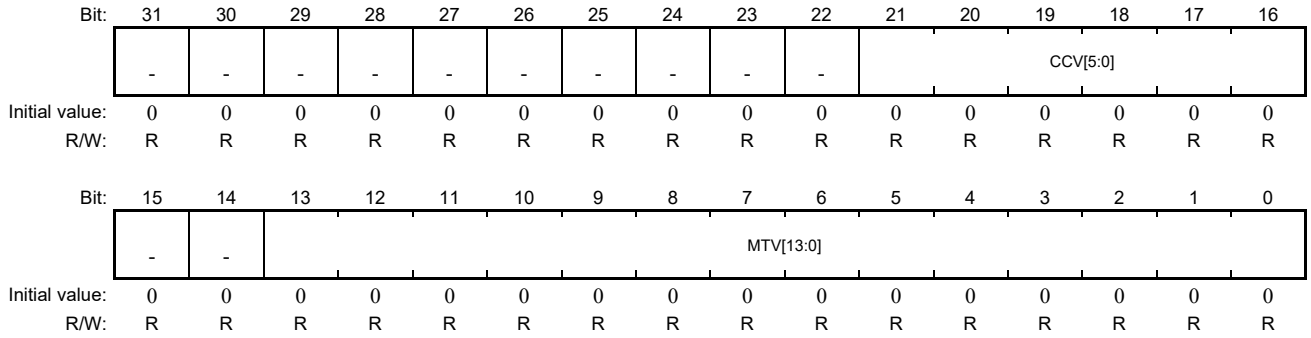
Slot Counter Channel A

Current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.4 FRMTCCV [h'0114]

FlexRay Macrotick and Cycle Counter Value



Bit	Bit Name	Initial Value	R/W	Description
[31:22]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[21:16]	CCV	0	R	Cycle Counter Value Indicates vCycleCounter
[15:14]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[13:0]	MTV	0	R	Macrotick Value Indicates vMacrotick

(1) **FRMTCCV.CCV**

Cycle Counter Value

Current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FRMTCCV.MTV**

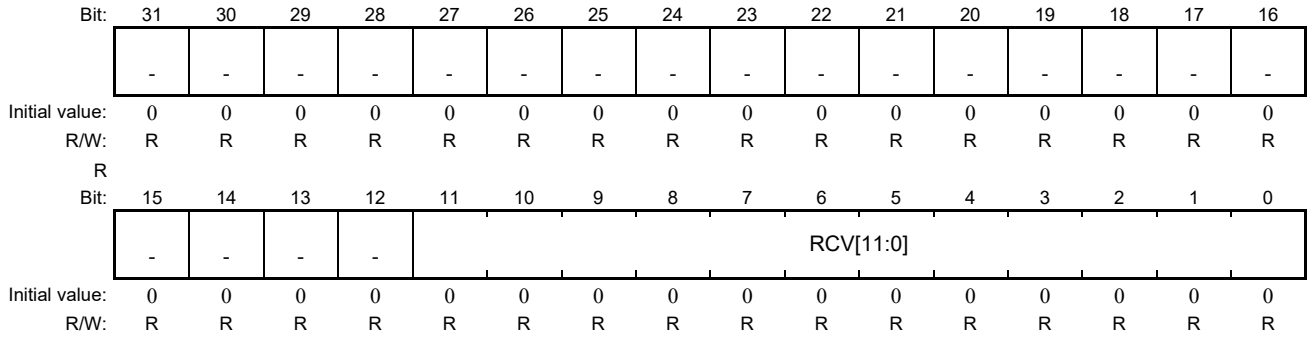
Macrotick Value

Current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.5 FRRCV [h'0118]

FlexRay Rate Correction Value



Bit	Bit Name	Initial Value	R/W	Description
[31:12]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[11:0]	RCV	0	R	Rate Correction Value Indicates vRateCorrection

(1) **FRRCV.RCV**

Rate Correction Value

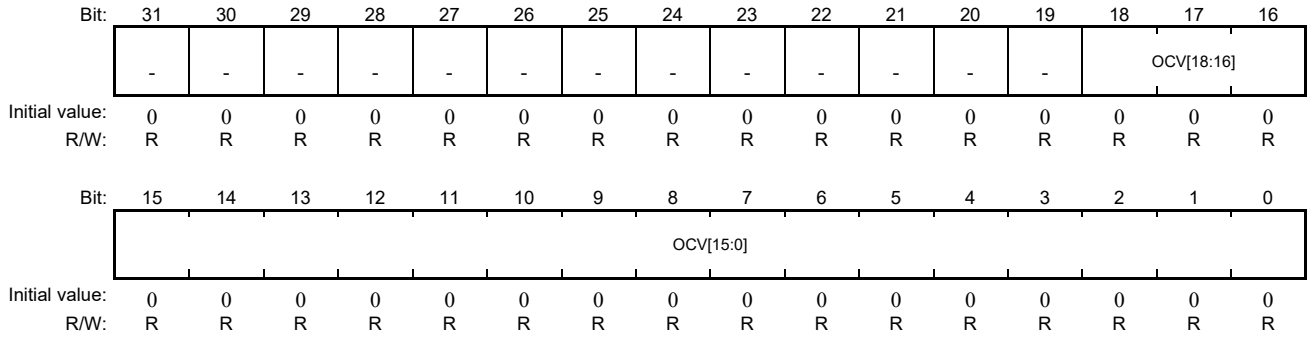
Rate correction value (vRateCorrection/ two's complement). Calculated internal rate correction value before limitation. If the **FRRCV.RCV** value exceeds the limits defined by **FRGTUC10.MRC**, flag **FRSFS.RCLR** is set to '1'.

Note: The external rate correction value is added to the limited rate correction value.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.6 FROCV [h'011C]

FlexRay Offset Correction Value



Bit	Bit Name	Initial Value	R/W	Description
[31:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18:0]	OCV	0	R	Offset Correction Value Indicates vOffsetCorrection

(1) **FROCV.OCV**

Offset Correction Value

Offset correction value (vOffsetCorrection/ two's complement). Calculated internal offset correction value before limitation. If the **FROCV.OCV** value exceeds the limits defined by **FRGTUC10.MOC**, flag **FRSFS.OCLR** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Note: The external offset correction value is added to the limited offset correction value.

103.2.6.7 FRSFS [h'0120]

FlexRay Sync Frame Status

[19]	RCLR	0	R	Rate Correction Limit Reached 0 = Rate correction below limit 1 = Rate correction limit reached
[18]	MRCS	0	R	Missing Rate Correction Signal 0 = Rate correction signal valid 1 = Missing rate correction signal
[17]	OCLR	0	R	Offset Correction Limit Reached 0 = Offset correction below limit 1 = Offset correction limit reached
[16]	MOCS	0	R	Missing Offset Correction Signal 0 = Offset correction signal valid 1 = Missing offset correction signal
[15:12]	VSBO	0	R	Valid Sync Frames Channel B, odd communication cycle
[11:8]	VSBE	0	R	Valid Sync Frames Channel B, even communication cycle
[7:4]	VSAO	0	R	Valid Sync Frames Channel A, odd communication cycle
[3:0]	VSAE	0	R	Valid Sync Frames Channel A, even communication cycle

(1) **FRSFS.RCLR**

Rate Correction Limit Reached

The Rate Correction Limit Reached flag signals to the Host, that the rate correction value has exceeded its limit as defined by **FRGTUC10.MRC**. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(2) **FRSFS.MRCS**

Missing Rate Correction Signal

The Missing Rate Correction flag signals to the Host, that no rate correction calculation can be performed because no pairs of even / odd sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(3) **FRSFS.OCLR**

Offset Correction Limit Reached

The Offset Correction Limit Reached flag signals to the Host, that the offset correction value has exceeded its limit as defined by **FRGTUC10.MOC**. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(4) **FRSFS.MOCS**

Missing Offset Correction Signal

The Missing Offset Correction flag signals to the Host, that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(5) **FRSFS.VSBO**

Valid Sync Frames Channel B, odd communication cycle

These bits are only valid when **FRSUCC1.CCHB** is '1'.

Holds the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by **FRSUCC1.TXSY** the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(6) **FRSFS.VSBE**

Valid Sync Frames Channel B, even communication cycle

These bits are only valid when **FRSUCC1.CCHB** is '1'.

Holds the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by **FRSUCC1.TXSY** the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(7) **FRSFS.VSAO**

Valid Sync Frames Channel A, odd communication cycle

These bits are only valid when **FRSUCC1.CCHA** is '1'.

Holds the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by **FRSUCC1.TXSY** the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(8) **FRSFS.VSAE**

Valid Sync Frames Channel A, even communication cycle

These bits are only valid when **FRSUCC1.CCHA** is '1'.

Holds the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by **FRSUCC1.TXSY** the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

103.2.6.8 FRSWNIT [h'0124]

FlexRay Symbol Window and NIT Status

Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(1) **FRSWNIT.SBNB**

Indicates a Slot Boundary Violation during NIT Channel B (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FRSWNIT.SENB**

Indicates a Syntax Error during NIT Channel B (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

(3) **FRSWNIT.SBNA**

Indicates a Slot Boundary Violation during NIT Channel A (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

(4) **FRSWNIT.SENA**

Indicates a Syntax Error during NIT Channel A (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

(5) **FRSWNIT.MTSB**

Indicates a MTS Received on Channel B (vSS!ValidMTSB).

Media Access Test symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to ’1’, also interrupt flag **FRSIR.MTSB** is set to ’1’.

Reset when leaving CONFIG state or when entering STARTUP state.

(6) **FRSWNIT.MTSA**

Indicates a MTS Received on Channel A (vSS!ValidMTSA).

Media Access Test symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to ’1’, also interrupt flag **FRSIR.MTSA** is set to ’1’.

Reset when leaving CONFIG state or when entering STARTUP state.

(7) **FRSWNIT.TCSB**

Indicates a Transmission Conflict in Symbol Window Channel B (vSS!TxConflictB).

Reset when leaving CONFIG state or when entering STARTUP state.

(8) **FRSWNIT.SBSB**

Indicates a Slot Boundary Violation in Symbol Window Channel B (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

(9) **FRSWNIT.SESB**

Indicates a Syntax Error in Symbol Window Channel B (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

(10) **FRSWNIT.TCSA**

Indicates a Transmission Conflict in Symbol Window Channel A (vSS!TxConflictA).

Reset when leaving CONFIG state or when entering STARTUP state.

(11) **FRSWNIT.SBSA**

Indicates a Slot Boundary Violation in Symbol Window Channel A (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

(12) **FRSWNIT.SESA**

Indicates a Syntax Error in Symbol Window Channel A (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.9 FRACS [h'0128]

FlexRay Aggregated Channel Status

The aggregated channel status provides the Host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.

The status data is updated (set) after each slot and aggregated until it is reset by the Host.

During startup the status data is not updated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(1) **FRACS.SBVB**

Slot Boundary Violation on Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from '0' to '1', interrupt flag **FREIR.EDB** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FRACS.CIB**

Communication Indicator Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more valid frames were received on channel B in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

Note: The set condition of the flag **FRACS.CIB** is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDB** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(3) **FRACS.CEDB**

Content Error Detected on Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDB** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(4) **FRACS.SEDB**

Syntax Error Detected on Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDB** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(5) **FRACS.VFRB**

Valid Frame Received on Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more valid frames were received on channel B in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

(6) **FRACS.SBVA**

Slot Boundary Violation on Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from '0' to '1', interrupt flag **FREIR.EDA** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(7) **FRACS.CIA**

Communication Indicator Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

Note: The set condition of the flag **FRACS.CIA** is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDA** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(8) **FRACS.CEDA**

Content Error Detected on Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDA** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(9) **FRACS.SEDA**

Syntax Error Detected on Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.

When this flag changes from '0' to '1', interrupt flag **FREIR.EDA** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

(10) **FRACS.VFRA**

Valid Frame Received on Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

One or more valid frames were received on channel A in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.10 FRESIDn (n=1 to 15) [h'0130 – h'0168]

FlexRay Even Sync ID n (n=1 to 15)

Registers **FRESID1** to **FRESID15** hold the frame IDs of the sync frames received in even communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register **FRESID1** holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register **FRESID1** holds the respective sync frame ID as configured in message buffer 0 and flags **FRESID1.RXEA**, **FRESID1.RXEB** are set. The value is updated during the NIT of each even communication cycle.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXEB	RXEA	-	-	-	-	EID[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:16]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[15]	RXEB	0	R	Received / Configured Even Sync ID on Channel B 0 = No sync frame received on channel B / node not configured to transmit sync frames 1 = Sync frame received on channel B / node configured to transmit sync frames
[14]	RXEA	0	R	Received / Configured Even Sync ID on Channel A 0 = No sync frame received on channel A / node not configured to transmit sync frames 1 = Sync frame received on channel A / node configured to transmit sync frames
[13:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9:0]	EID	0	R	Even Sync ID (vsSyncIDListA,B even)

(1) **FRESIDn.RXEB**

Received / Configured Even Sync ID on Channel B

Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot = **FRESID1.EID**.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FRESIDn.RXEA**

Received / Configured Even Sync ID on Channel A

Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot = **FRESID1.EID**.

Reset when leaving CONFIG state or when entering STARTUP state.

(3) **FRESIDn.EID**

Even Sync ID (vsSyncIDListA,B even)

Sync frame ID even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.11 FROSIDn (n=1 to 15) [h'0170 – h'01A8]

FlexRay Odd Sync ID n (n=1 to 15)

Registers **FROSID1** to **FROSID15** hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register **FROSID1** holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register **FROSID1** holds the respective sync frame ID as configured in message buffer 0 and flags **FROSID1.RXOA**, **FROSID1.RXOB** are set. The value is updated during the NIT of each odd communication cycle.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXOB	RXOA	-	-	-	-	OID[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:16]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[15]	RXOB	0	R	Received / Configured Odd Sync ID on Channel B 0 = No sync frame received on channel B / node not configured to transmit sync frames 1 = Sync frame received on channel B / node configured to transmit sync frames
[14]	RXOA	0	R	Received / Configured Odd Sync ID on Channel A 0 = No sync frame received on channel A / node not configured to transmit sync frames 1 = Sync frame received on channel A / node configured to transmit sync frames
[13:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9:0]	OID	0	R	Odd Sync ID (vsSyncIDListA,B odd)

(1) **FROSIDn.RXOB**

Received / Configured Odd Sync ID on Channel B

Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot = **FROSID1.OID**.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) **FROSIDn.RXOA**

Received / Configured Odd Sync ID on Channel A

Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot = **FRISID1.OID**.

Reset when leaving CONFIG state or when entering STARTUP state.

(3) **FROSIDn.OID**

Odd Sync ID (vsSyncIDListA,B odd)

Sync frame ID odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.6.12 FRNMVn (n=1 to 3) [h'01B0 – h'01B8]

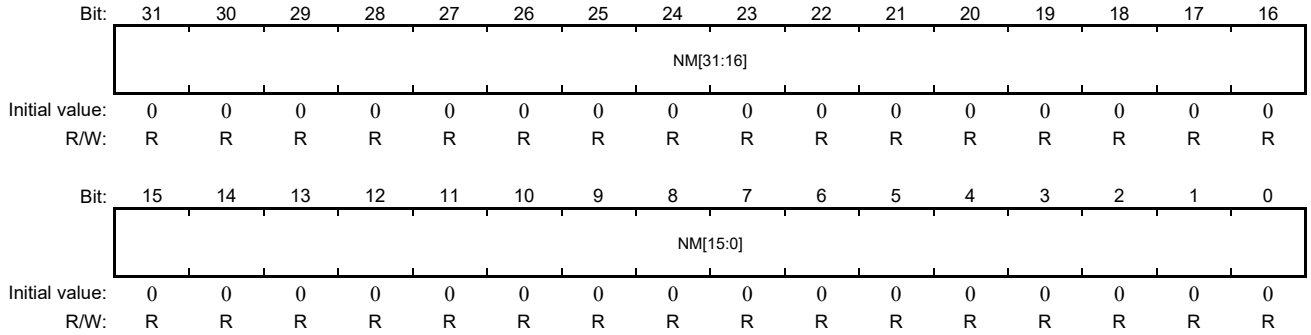
FlexRay Network Management Vector n (n=1 to 3)

The three network management registers hold the accrued NM vector (see section 103.3.7).

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

NMVn-bytes exceeding the configured NM vector length are not valid.

For information about the byte alignment of the received NM vector in this register see section 103.3.17.



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	NM	0	R	NM vector

(1) **FRNMVn.NM**

NM vector

The three network management registers hold the accrued NM vector (configurable 0 to 12 bytes).

The accrued NM vector is generated by the CC by bit-wise ORing each NM vector received (valid static frames with PPI = '1') on each channel (see section 103.3.7).

For information about the byte alignment of the received NM vector in this register see section 103.3.17.

FRNMVn-bytes exceeding the configured NM vector length are not valid.

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

Reset when leaving CONFIG state or when entering STARTUP state.

103.2.7 Message Buffer Control Registers

103.2.7.1 FRMRC [h'0300]

FlexRay Message RAM Configuration

The Message RAM Configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The Message RAM can be divided into up three different areas; Static Buffer area, Static and Dynamic Buffer area, FIFO area. If present, the Static Buffer area is starting at Message Buffer 0.

The start of the Static and Dynamic Buffer area is configured by **FRMRC.FDB**. **FRMRC.FDB** defines the end of the Static Buffer area. If no Static Buffer area is present, the Static and Dynamic Buffer area starts at Message Buffer 0.

The start of the FIFO area is configured by **FRMRC.FFB**. **FRMRC.FFB** defines the end of the previous area, which can be either the Static Buffer area or the Static and Dynamic Buffer area. If no Static Buffer area and no Static and Dynamic Buffer area is present, the FIFO area starts at Message Buffer 0.

With **FRMRC.LCB** the end of the last configured area is configured which can be the Static Buffer area, the Static and Dynamic Buffer area or the FIFO area.

Figure 103.2 shows an example configuration of the Message RAM where all there area are configured.

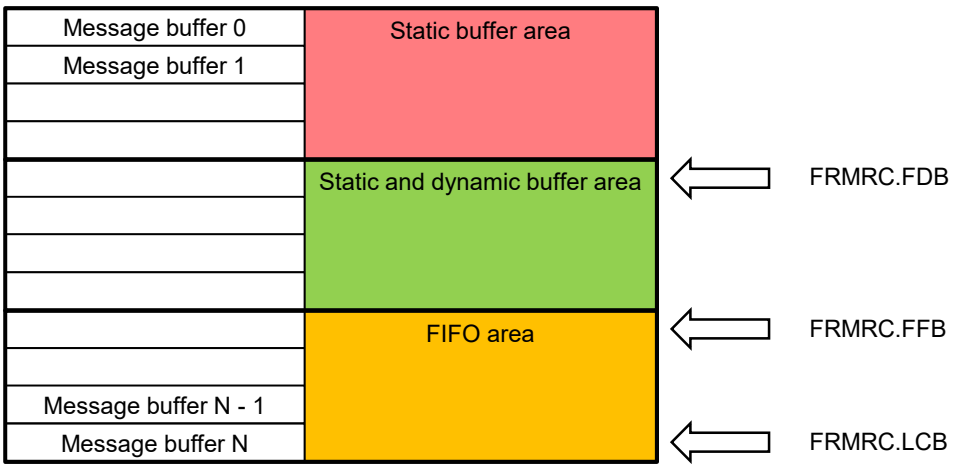


Figure 103.2 Message RAM organisation

Note 1: In case the node is configured as sync node (**FRSUCC1.TXSY** = '1') or for single slot mode operation (**FRSUCC1.TSM** = '1'), message buffer 0 resp. 1 is reserved for sync frames or single slot frames and have to be configured with the node-specific key slot ID. In case the node is neither configured as sync node nor for single slot operation message buffer 0 resp. 1 is treated like all other message buffers.

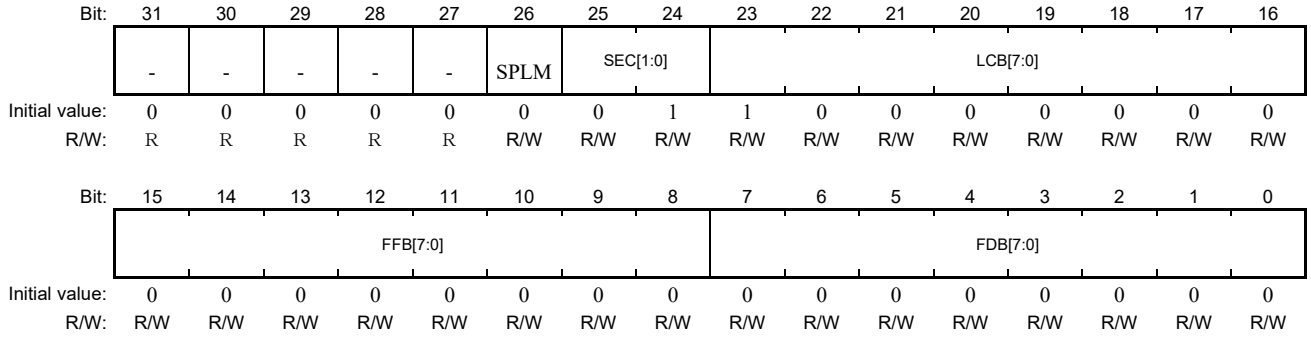
Note 2: The maximum number of header sections is 128. This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section may be configured differently for each message buffer. For details see section 103.3.13.

Note 3: In case two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the "Static Buffer area" or at the beginning of the "Static and Dynamic Buffer area" section.

Note 4: The FlexRay protocol specification requires that each node has to send a frame in its key slot. Therefore at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement a maximum number of 127 message

buffers can be assigned to the FIFO area. Nevertheless, a non protocol conform configuration without a transmission slot in the static segment would still be operational.

Note 5: The payload length configured and the length of the data section need to be configured identical for all message buffers belonging to the FIFO area via **FRWRHS2.PLC** and **FRWRHS3.DP**. When the CC is not in DEFAULT_CONFIG or CONFIG state reconfiguration of message buffers belonging to the FIFO area is locked.



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26]	SPLM	0	R/W	Sync Frame Payload Multiplex 0 = Only message buffer 0 locked against reconfiguration 1 = Both message buffers 0 and 1 are locked against reconfiguration
[25:24]	SEC	1h	R/W	Secure Buffers 00 = all buffers unlocked 01 = static buffers locked, FIFO locked, limited transmission 10 = all buffers locked 11 = all buffers locked, limited transmission
[23:16]	LCB	80h	R/W	Last Configured Buffer 0…127 = Number of message buffers is FRMRF.LCB + 1 128 = No message buffer configured
[15:8]	FFB	0	R/W	First Buffer of FIFO 0 = All message buffers assigned to the FIFO 1…127 = Message buffers from FRMRC.FFB to FRMRC.LCB assigned to the FIFO 128 = No message buffer assigned to the FIFO
[7:0]	FDB	0	R/W	First Dynamic Buffer 0 = No group of message buffers exclusively for the static segment configured 1…127 = Message buffers 0 to FRMRC.FDB - 1 reserved for static segment 128 = No dynamic message buffers configured

(1) **FRMRC.SPLM**

Sync Frame Payload Multiplex

The user can only write to this bit when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

This bit is only evaluated if the node is configured as sync node (**FRSUCC1.TXSY** = ’1’) or for single slot mode operation (**FRSUCC1.TSM** = ’1’).

When this bit is set to ’1’ message buffers 0 and 1 are dedicated for sync frame transmission with different payload data on channel A and B.

When this bit is set to ’0’, sync frames are transmitted from message buffer 0 with the same payload data on all configured channels.

Note that the channel filter configuration for message buffer 0 resp. message buffer 1 has to be chosen accordingly.

(2) **FRMRC.SEC**

Secure Buffers

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Not evaluated when the CC is in DEFAULT_CONFIG or CONFIG state. For temporary unlocking see section 6.13.4.3.

00 = all buffers unlocked
Reconfiguration of message buffers enabled with numbers < **FRMRC.FFB** enabled
Exception: In nodes configured for sync frame transmission or for single slot mode operation message buffer 0 (and if **FRMRC.SPLM** = ’1’, also message buffer 1) is always locked

01 = static buffers locked, FIFO locked, limited transmission
Reconfiguration of message buffers with numbers < **FRMRC.FDB** and with numbers => **FRMRC.FFB** locked and transmission of message buffers for static segment with numbers => **FRMRC.FDB** disabled

10 = all buffers locked
Reconfiguration of all message buffers locked

11 = all buffers locked, limited transmission
Reconfiguration of all message buffers locked and transmission of message buffers for static segment with numbers >= **FRMRC.FDB** disabled

(3) **FRMRC.LCB**

Last Configured Buffer

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (**FRMRC.FDB** < 128), the user should configure **FRMRC.LCB** >= **FRMRC.FDB**.

When a FIFO area is configured (**FRMRC.FFB** < 128), the user should configure **FRMRC.LCB** >= **FRMRC.FFB**.

(4) **FRMRC.FFB**

First Buffer of FIFO

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (**FRMRC.FDB** < 128), the user should configure **FRMRC.FFB** > **FRMRC.FDB**.

(5) **FRMRC.FDB**

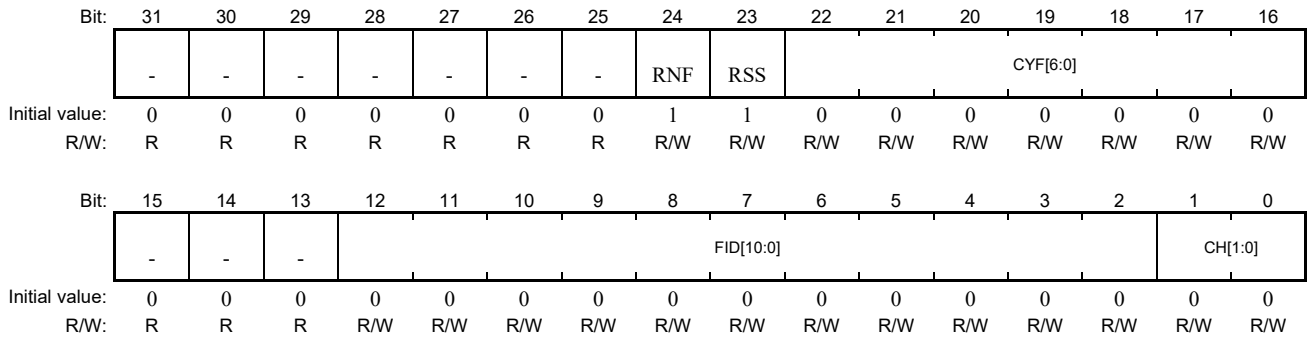
First Dynamic Buffer

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

103.2.7.2 FRFRF [h'0304]

FlexRay FIFO Rejection Filter

The FIFO Rejection Filter defines a user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask this register determines whether a message is rejected by the FIFO.



Bit	Bit Name	Initial Value	R/W	Description
[31:25]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[24]	RNF	1	R/W	Reject Null Frames 0 = Null frames are stored in the FIFO 1 = Reject all null frames
[23]	RSS	1	R/W	Reject in Static Segment 0 = FIFO also used for static segment 1 = Reject messages in static segment
[22:16]	CYF	0	R/W	Cycle Counter Filter
[15:13]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[12:2]	FID	0	R/W	Frame ID Filter 0 ... 2047 = Frame ID filter values
[1:0]	CH	0	R/W	Channel Filter 00 = receive on both channels 01 = receive only on channel B 10 = receive only on channel A 11 = no reception

(1) **FRFRF.RNF**

Reject Null Frames

The user can only write to this bit when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

If this bit is set, received null frames are not stored in the FIFO.

(2) **FRFRF.RSS**

Reject in Static Segment

The user can only write to this bit when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

If this bit is set, the FIFO is used only for the dynamic segment.

(3) **FRFRF.CYF**

Cycle Counter Filter

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by **FRFRF.CYF**, all frames are rejected. For details about the configuration of the cycle counter filter see section 103.3.8.2.

(4) **FRFRF.FID**

Frame ID Filter

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

Determines the frame ID to be rejected by the FIFO. With the additional configuration of register **FRFRFM**, the corresponding frame ID filter bits are ignored, which results in further rejected frame IDs. When **FRFRFM.MFID** is zero, a frame ID filter value of zero means that no frame ID is rejected.

(5) **FRFRF.CH**

Channel Filter

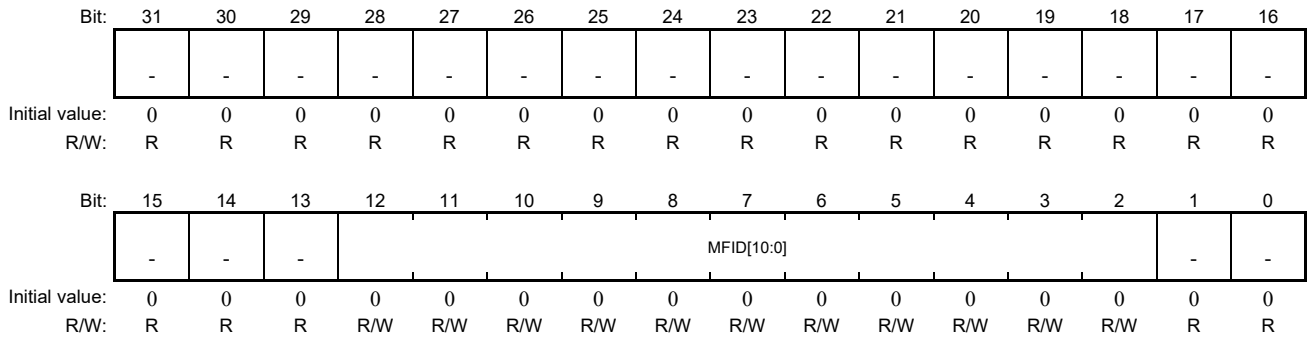
The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

If reception on both channels is configured, also in static segment always both frames (from channel A and B) are stored in the FIFO, even if they are identical.

103.2.7.3 FRFRFM [h'0308]

FlexRay FIFO Rejection Filter Mask

The FlexRay FIFO Rejection Filter Mask specifies which of the corresponding frame ID filter bits are relevant for rejection filtering. If a bit is set, it indicates that the corresponding bit in the **FRFRF** register will not be considered for rejection filtering.



Bit	Bit Name	Initial Value	R/W	Description
[31:13]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[12:2]	MFID	0	R/W	Mask Frame ID Filter 0 = Corresponding frame ID filter bit is used for rejection filtering 1 = Ignore corresponding frame ID filter bit.
[1:0]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0

(1) **FRFRFM.MFID**

Mask Frame ID Filter

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

103.2.7.4 FRFCL [h'030C]

FlexRay FIFO Critical Level

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:8]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[7:0]	CL	80h	R/W	Critical Level

(1) **FRFCL.CL**

Critical Level

The user can only write to these bits when **FRCCSV.POCS** is DEFAULT_CONFIG or CONFIG.

When the receive FIFO fill level **FRFSR.RFFL** is equal or greater than the critical level configured by **FRFCL.CL**, the receive FIFO critical level flag **FRFSR.RFCL** is set.

If **FRFCL.CL** is programmed to values > 128, bit **FRFSR.RFCL** is never set.

103.2.8 Message Buffer Status Registers

103.2.8.1 FRMHDS [h'0310]

FlexRay Message Handler Status

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	MBU[6:0]							-	MBT[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	FMB[6:0]							CRAM	MFMB	FMBD	ATBF2	ATBF1	AMR	-	-
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[30:24]	MBU	0	R	Message Buffer Updated
[23]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[22:16]	MBT	0	R	Message Buffer Transmitted
[15]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[14:8]	FMB	0	R	Faulty Message Buffer
[7]	CRAM	1	R	Clear all internal RAM's 0 = No execution of the CHI command CLEAR_RAMS 1 = Execution of the CHI command CLEAR_RAMS ongoing
[6]	MFMB	0	R/W	Multiple Faulty Message Buffers detected 0 = No additional faulty message buffer 1 = Another faulty message buffer was detected while flag FRMHDS.FMBD is set
[5]	FMBD	0	R/W	Faulty Message Buffer Detected 0 = No faulty message buffer 1 = Message buffer referenced by FRMHDS.FMB holds faulty data due to an access error
[4]	ATBF2	0	R/W	Access Error Transient buffer RAM B 0 = No access error 1 = Access error occurred when reading the Transient buffer RAM B
[3]	ATBF1	0	R/W	Access Error Transient buffer RAM A 0 = No access error 1 = Access error occurred when reading the Transient buffer RAM A
[2]	AMR	0	R/W	Access Error Message RAM 0 = No access error 1 = Access error occurred when reading the Message RAM
[1:0]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0

(1) **FRMHDS.MBU**

Message Buffer Updated

Number of message buffer that was updated last by the CC. For this message buffer the respective **ND** and / or **MBC** flag in the **FRNDAT1/2/3/4** registers and the **FRMBSC1/2/3/4** registers are also set.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) **FRMHDS.MBT**

Message Buffer Transmitted

Number of last successfully transmitted message buffer. If the message buffer is configured for single-shot mode, the respective **FRTXRQn.TXR** flag in the **FRTXRQ1/2/3/4** registers was reset.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) **FRMHDS.FMB**

Faulty Message Buffer

Access error occurred when reading from the message buffer referenced by **FRMHDS.FMB**.

Value only valid when one of the flags **FRMHDS.AMR**, **FRMHDS.ATBF1**, **FRMHDS.ATBF2** or **FRMHDS.FMBD** is set.

Flag is not updated while flag **FRMHDS.FMBD** is set.

Reset by the CHI command CLEAR_RAMS.

(4) **FRMHDS.CRAM**

Clear all internal RAM’s

Signals that execution of the CHI command CLEAR_RAMS is ongoing (all bits of all message RAM, input buffer, output buffer and transient buffer are written to ’0’).

This bit is set by the CHI command CLEAR_RAMS.

(5) **FRMHDS.MFMB**

Multiple Faulty Message Buffers detected

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit indicates that another faulty message buffer was detected while flag **FRMHDS.FMBD** is set

Reset by the CHI command CLEAR_RAMS.

(6) **FRMHDS.FMBD**

Faulty Message Buffer Detected

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit indicates that the Message buffer referenced by **FRMHDS.FMB** holds faulty data due to an access error

Reset by the CHI command CLEAR_RAMS.

(7) **FRMHDS.ATBF2**

Access Error Transient buffer RAM B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit indicates that an access error occurred when reading the Transient buffer RAM B

Note: When **FRMHDS.ATBF2** changes from ’0’ to ’1’ **FREIR.AERR** is set to ’1’.

Reset by the CHI command CLEAR_RAMS.

(8) **FRMHDS.ATBF1**

Access Error Transient buffer RAM A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This bit indicates that an access error occurred when reading the Transient buffer RAM A

Note: When **FRMHDS.ATBF1** changes from ’0’ to ’1’ **FREIR.AERR** is set to ’1’.

Reset by the CHI command CLEAR_RAMS.

(9) **FRMHDS.AMR**

Access Error Message RAM

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

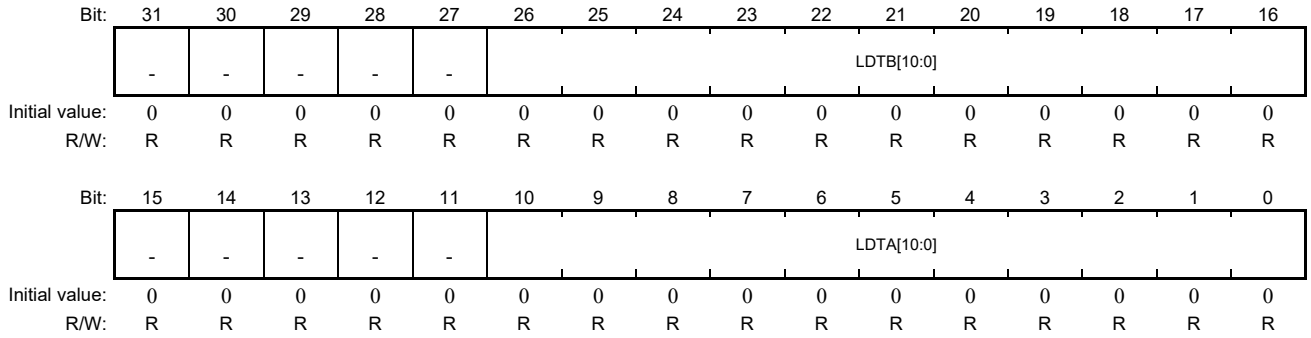
This bit indicates that an access error occurred when reading the Message RAM

Note: When **FRMHDS.AMR** changes from ’0’ to ’1’ **FREIR.AERR** is set to ’1’.

Reset by the CHI command CLEAR_RAMS.

103.2.8.2 FRLDTS [h’0314]

FlexRay Last Dynamic Transmit Slot



Bit	Bit Name	Initial Value	R/W	Description
[31:27]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[26:16]	LDTB	0	R	Last Dynamic Transmission Channel B

Bit	Bit Name	Initial Value	R/W	Description
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	LDTA	0	R	Last Dynamic Transmission Channel A

(1) **FRLDTS.LDTB**

Last Dynamic Transmission Channel B

Value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment on channel B.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) **FRLDTS.LDTA**

Last Dynamic Transmission Channel A

Value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment on channel A.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

103.2.8.3 FRFSR [h'0318]

FlexRay FIFO Status Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFFL[7:0]								-	-	-	-	-	RFO	RFCL	RFNE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:16]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0

Bit	Bit Name	Initial Value	R/W	Description
[15:8]	RFFL	0	R	Receive FIFO Fill Level
[7:3]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[2]	RFO	0	R	Receive FIFO Overrun 0 = No receive FIFO overrun detected 1 = A receive FIFO overrun has been detected
[1]	RFCL	0	R	Receive FIFO Critical Level 0 = Receive FIFO below critical level 1 = Receive FIFO critical level reached
[0]	RFNE	0	R	Receive FIFO Not Empty 0 = Receive FIFO is empty 1 = Receive FIFO is not empty

(1) **FRFSR.RFFL**

Receive FIFO Fill Level

Number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) **FRFSR.RFO**

Receive FIFO Overrun

The flag is set by the CC when a receive FIFO overrun is detected.

When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag **FREIR.RFO** is set.

The flag is cleared by the next FIFO read access issued by the Host.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) **FRFSR.RFCL**

Receive FIFO Critical Level

This flag is set when the receive FIFO fill level **FRFSR.RFFL** is equal or greater than the critical level as configured by **FRFCL.CL**.

When **FRFSR.RFCL** changes from ’0’ to ’1’ bit **FRSIR.RFCL** is set to ’1’, and if enabled, an interrupt is generated.

The flag is cleared by the CC as soon as **FRFSR.RFFL** drops below **FRFCL.CL**.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(4) **FRFSR.RFNE**

Receive FIFO Not Empty

This flag is set by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, interrupt flag **FRSIR.RFNE** is set.

The bit is reset after the Host has read all messages from the FIFO.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

103.2.8.4 FRMHDF [h'031C]

FlexRay Message Handler Constraints Flags

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic (see Addendum to ERAY FlexRay IP-Module Specification). To simplify software development, constraints violations are reported by setting flags in the **FRMHDF**.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	WAHP	TNSB	TNSA	TBFB	TBFA	FNFB	FNFA	SNUB	SNUA

R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:9]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[8]	WAHP	0	R/W	Write Attempt to Header Partition 0 = No write attempt to header partition 1 = Write attempt to header partition
[7]	TNSB	0	R/W	Transmission Not Started Channel B 0 = No transmission not started on channel B 1 = Transmission not started on channel B
[6]	TNSA	0	R/W	Transmission Not Started Channel A 0 = No transmission not started on channel A 1 = Transmission not started on channel A
[5]	TBFB	0	R/W	Transient Buffer Access Failure B 0 = No TBF B access failure 1 = TBF B access failure
[4]	TBFA	0	R/W	Transient Buffer Access Failure A 0 = No TBF A access failure 1 = TBF A access failure
[3]	FNFB	0	R/W	Find Sequence Not Finished Channel B 0 = No find sequence not finished for channel B 1 = Find sequence not finished for channel B
[2]	FNFA	0	R/W	Find Sequence Not Finished Channel A 0 = No find sequence not finished for channel A 1 = Find sequence not finished for channel A

Bit	Bit Name	Initial Value	R/W	Description
[1]	SNUB	0	R/W	Status Not Updated Channel B 0 = No overload condition occurred when updating MBS for channel B 1 = MBS for channel B not updated
[0]	SNUA	0	R/W	Status Not Updated Channel A 0 = No overload condition occurred when updating MBS for channel A 1 = MBS for channel A not updated

(1) **FRMHDF.WAHP**

Write Attempt to Header Partition

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

Outside DEFAULT_CONFIG and CONFIG state this flag is set by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) **FRMHDF.TNSB**

Transmission Not Started Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) **FRMHDF.TNSA**

Transmission Not Started Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(4) **FRMHDF.TBFB**

Transient Buffer Access Failure B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a read or write access to TBF B requested by PRT B could not complete within the available time.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(5) **FRMHDF.TBFA**

Transient Buffer Access Failure A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when a read or write access to TBF A requested by PRT A could not complete within the available time.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(6) **FRMHDF.FNFB**

Find Sequence Not Finished Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer) with respect to channel B.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(7) **FRMHDF.FNFA**

Find Sequence Not Finished Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer) with respect to channel A.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(8) **FRMHDF.SNUB**

Status Not Updated Channel B

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status MBS with respect to channel B.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(9) **FRMHDF.SNUA**

Status Not Updated Channel A

Writing '0' has no effect on the bit value.

This bit is cleared when writing a '1' to it.

This flag is set by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status MBS with respect to channel A.

When this flag changes from '0' to '1', interrupt flag **FREIR.MHF** is set to '1'.

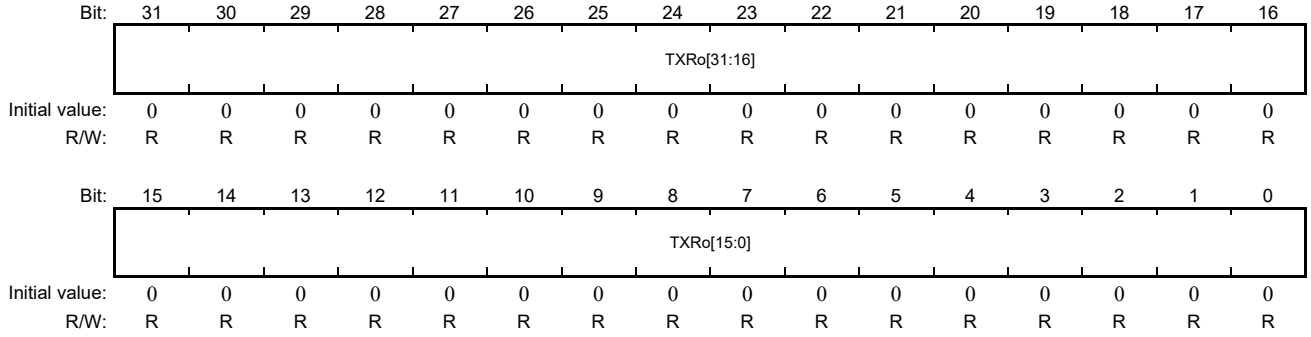
Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

103.2.8.5 FRTXRQi (i=1 to 4) [h'0320 – h'032C]

FlexRay Transmission Request i (i=1 to 4)

The four registers reflect the state of the **TXR** flags of all configured message buffers. The flags are evaluated for transmit buffers only. If the number of configured message buffers is less than 128, the remaining **TXR** flags have no meaning.



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	TXRo	0	R	Transmission Request o

(1) **FRTXRQi.TXRo (o=(i-1)*32 to (i*32-1))**

Transmission Request o

If the flag is set, the respective message buffer is ready for transmission respectively transmission of this message buffer is in progress.

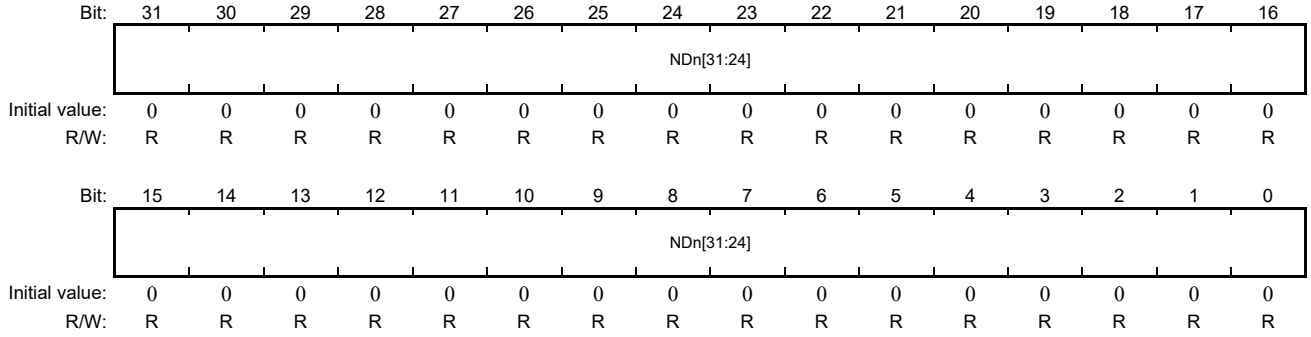
In single-shot mode the flags are reset after transmission has completed.

Reset by the CHI command CLEAR_RAMS.

103.2.8.6 FRNDATi (i=1 to 4) [h'0330 – h'033C]

FlexRay New Data i (i=1 to 4)

The four registers reflect the state of the **ND** flags of all configured message buffers. **ND** flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, the remaining **ND** flags have no meaning.



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	NDn	0	R	New Data n

(1) **FRNDATi.NDn (n=(i-1)*32 to (i*32-1))**

New Data n

The flags are set when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.

The flags are not set after reception of null frames except for message buffers belonging to the receive FIFO.

An **ND** flag is reset when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

103.2.8.7 FRMBSCi (i=1 to 4) [h'0340 – h'034C]

FlexRay Message Buffer Status Changed i (i=1 to 4)

The four registers reflect the state of the **MBC** flags of all configured message buffers. If the number of configured message buffers is less than 128, the remaining **MBC** flags have no meaning.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBCm[31:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MBCm[31:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:0]	MBCm	0	R	Message Buffer Status Changed m

(1) **FRMBSCi.MBCm (m=(i-1)*32 to (i*32-1))**

Message Buffer Status Changed m

An **MBC** flag is set whenever the Message Handler changes one of the status flags **VFRA**, **VFRB**, **SEOA**, **SEOB**, **CEOA**, **CEOB**, **SVOA**, **SVOB**, **TCIA**, **TCIB**, **ESA**, **ESB**, **MLST**, **FTA**, **FTB** in the header section (see section 103.2.11.5 and section 103.3.13.1 of the respective message buffer.

An **MBC** flag is reset when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

103.2.9 Reserved

103.2.10 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in section 103.2.11.5 is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via **FRWRHS2.PLC** and **FRWRHS3.DP**. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

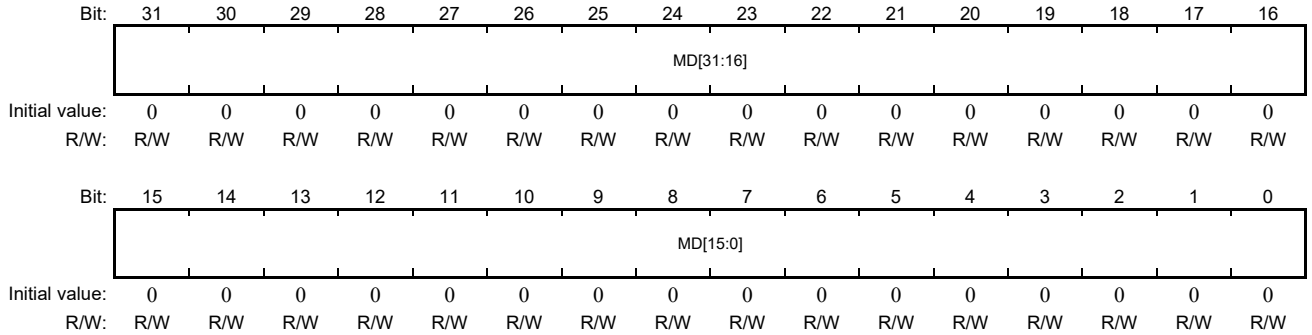
The data transfer between Input Buffer (IBF) and Message RAM is described in detail in section 103.3.12.2.(1).

When using the input data transfer function as described in section 103.3.16.1 and **FRITS.ITS** is '1', the user should not write to these registers.

103.2.10.1 FRWRDSn (n=1 to 64) [h'0400 – h'04FC]

FlexRay Write Data Section n (n=1 to 64)

Holds the data words to be transferred to the data section of the addressed message buffer. The number of data words written to the Message RAM is defined by the payload length configured in **FRWRHS2.PLC**.



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	MD	0	R/W	Message Data

(1) **FRWRDSn.MD**

Message Data

For information about the byte alignment of the Message Data in this register see section 103.3.17.

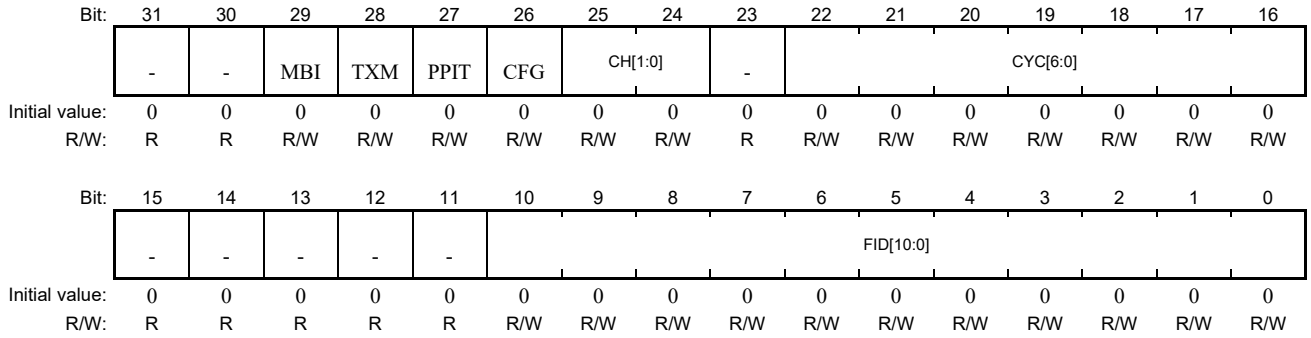
Note 1: In case **FRWRHS2.PLC** specifies an odd payload length, the remaining message data bytes are unused.

Note 2: When writing to **FRWRDSn**, each 32-bit word has to be filled up by one 32-bit access OR two consecutive 16-bit accesses OR four consecutive 8- bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32- bit word have been written by the Host (8/16-bit access only), **FRWRDSn** holds partly undefined data.

Reset by the CHI command CLEAR_RAMS.

103.2.10.2 FRWRHS1 [h'0500]

FlexRay Write Header Section 1



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29]	MBI	0	R/W	Message Buffer Interrupt 0 = Message buffer interrupt is disabled 1 = Message buffer interrupt is enabled
[28]	TXM	0	R/W	Transmission Mode 0 = Continuous mode 1 = Single-shot mode
[27]	PPIT	0	R/W	Payload Preamble Indicator Transmit 0 = Payload Preamble Indicator not set 1 = Payload Preamble Indicator set
[26]	CFG	0	R/W	Message Buffer Direction Configuration Bit 0 = Message buffer is configured as Receive Buffer 1 = Message buffer is configured as Transmit Buffer
[25:24]	CH	0	R/W	Channel Filter Control
[23]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[22:16]	CYC	0	R/W	Cycle Code
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	FID	0	R/W	Frame ID

(1) **FRWRHS1.MBI**

Message Buffer Interrupt

This bit enables the receive / transmit interrupt for the corresponding message buffer.

After a dedicated receive buffer has been updated by the Message Handler, flag **FRSIR.RXI** and /or **FRSIR.MBSI** are set. After a transmission has completed flag **FRSIR.TXI** is set.

(2) **FRWRHS1.TXM**

Transmission Mode

This bit is used to select the transmission mode (see section 103.3.9.3) for the corresponding message buffer.

(3) **FRWRHS1.PPIT**

Payload Preamble Indicator Transmit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames for the corresponding message buffer.

If the bit is set in a static message buffer, the respective message buffer holds network management information.

If the bit is set in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

(4) **FRWRHS1.CFG**

Message Buffer Direction Configuration Bit

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.

(5) **FRWRHS1.CH**

Channel Filter Control

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

CH[1:0]	Transmit Buffer transmit frame on	Receive Buffer store frame received from
00	no transmission	ignore frame
01	channel A	channel A
10	channel B	channel B
11	both channels (static segment only)	channel A or B (store first semantically valid frame; static segment only)

Note: If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to ’1’, no frames are transmitted resp. received frames are ignored (same function as **CH** = "00")

(6) **FRWRHS1.CYC**

Cycle Code

The 7-bit cycle code determines the cycle set used for cycle counter filtering.

For details about the configuration of the cycle code section 103.3.8.2.

(7) **FRWRHS1.FID**

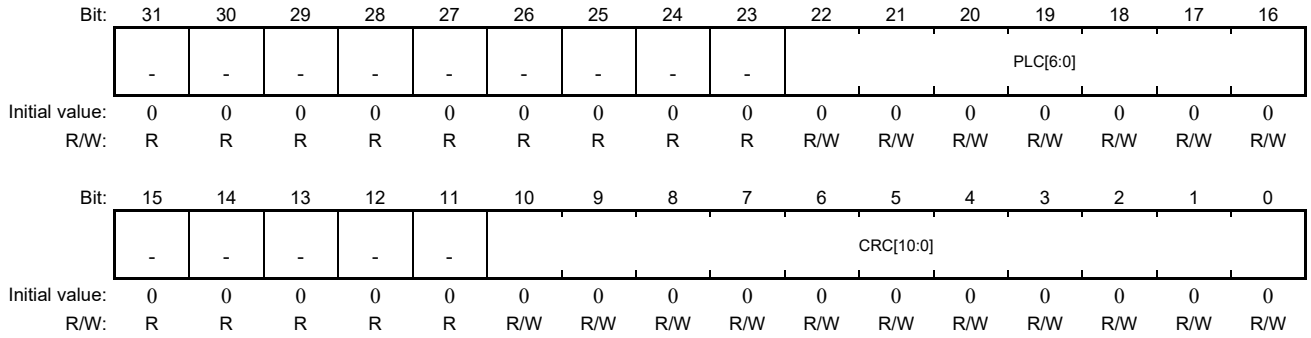
Frame ID

Frame ID of the selected message buffer. The frame ID defines the slot number for transmission / reception of the respective message.

Message buffers with frame ID = ’0’ are considered as not valid.

103.2.10.3 FRWRHS2 [h'0504]

FlexRay Write Header Section 2



Bit	Bit Name	Initial Value	R/W	Description
[31:23]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[22:16]	PLC	0	R/W	Payload Length Configured
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	CRC	0	R/W	Header CRC Receive Buffer: Configuration not required Transmit Buffer: Header CRC calculated and configured by the Host

(1) **FRWRHS2.PLC**

Payload Length Configured

Length of data section (number of 2-byte words) as configured by the Host.

During static segment the static frame payload length as configured by **FRMHDC.SFDL** defines the payload length for all static frames. If the payload length configured by **FRWRHS2.PLC** is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is logical zero (see section 103.3.9.3).

(2) **FRWRHS2.CRC**

Header CRC

For receive message buffer configuration not required

For transmit message buffer the header CRC needs to be calculated and configured by the Host
For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by **FRMHDC.SFDL**.

103.2.10.4 FRWRHS3 [h'0508]

FlexRay Write Header Section 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

[10:0]	DP	0	R/W	Data Pointer

(1) **FRWRHS3.DP**

Data Pointer

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

103.2.10.5 FRIBCM [h'0510]

FlexRay Input Buffer Command Mask

Configures how the message buffer in the Message RAM selected by register **FRIBCR** is updated. When IBF Host and IBF Shadow are swapped, also mask bits **FRIBCM.LHSH**, **FRIBCM.LDSH**, and **FRIBCM.STXRH** are swapped with bits **FRIBCM.LHSS**, **FRIBCM.LDSS**, and **FRIBCM.STXRS** to keep them attached to the respective Input Buffer transfer.

Bit	Bit Name	Initial Value	R/W	Description
[31:19]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[18]	STXRS	0	R/W	Set Transmission Request Shadow 0 = Reset TXR flag 1 = Set TXR flag, transmit buffer released for transmission (operation ongoing or finished)
[17]	LDSS	0	R/W	Load Data Section Shadow 0 = Data section is not updated 1 = Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
[16]	LHSS	0	R/W	Load Header Section Shadow 0 = Header section is not updated 1 = Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
[15:3]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[2]	STXRH	0	R/W	Set Transmission Request Host 0 = Reset TXR flag 1 = Set TXR flag, transmit buffer released for transmission
[1]	LDSH	0	R/W	Load Data Section Host 0 = Data section is not updated 1 = Data section selected for transfer from Input Buffer to the Message RAM
[0]	LHSH	0	R/W	Load Header Section Host 0 = Header section is not updated 1 = Header section selected for transfer from Input Buffer to the Message RAM

(1) **FRIBCM.STXRS**

Set Transmission Request Shadow

(2) **FRIBCM.LDSS**

Load Data Section Shadow

(3) **FRIBCM.LHSS**

Load Header Section Shadow

(4) **FRIBCM.STXRH**

Set Transmission Request Host

If this bit is set to ’1’, the **TXR** flag for the selected message buffer is set in the **FRTXRQ1/2/3/4** registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.

TXR is evaluated for transmit buffers only.

(5) **FRIBCM.LDSH**

Load Data Section Host

(6) **FRIBCM.LHSH**

Load Header Section Host

103.2.10.6 FRIBCR [h'0514]

FlexRay Input Buffer Command Request

When the Host writes the number of the target message buffer in the Message RAM to **FRIBCR.IBRH**,

IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under **FRIBCR.IBRH** and **FRIBCR.IBRS** are also swapped (see section 103.3.12.2.(1)).

With this write operation the **FRIBCR.IBSYS** is set to '1'. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by **FRIBCR.IBRS**.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, **FRIBCR.IBSYS** is set back to '0' and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to **FRIBCR.IBRH**.

If a write access to **FRIBCR.IBRH** occurs while **FRIBCR.IBSYS** is '1', **FRIBCR.IBSYH** is set to '1'. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, **FRIBCR.IBSYH** is reset to '0'. **FRIBCR.IBSYS** remains set to '1', and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under **FRIBCR.IBRH** and **FRIBCR.IBRS** are also swapped.

Any write access to an Input Buffer register while both **FRIBCR.IBSYS** and **FRIBCR.IBSYH** are set will cause the error flag **FREIR.IIBA** to be set. In this case the write access has no effect and the Input Buffer will not be changed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IBSYS	-	-	-	-	-	-	-	-	IBRS[6:0]

[31]	IBSYS	0	R	Input Buffer Busy Shadow 0 = Transfer between IBF Shadow and Message RAM completed 1 = Transfer between IBF Shadow and Message RAM in progress
[30:23]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[22:16]	IBRS	0	R	Input Buffer Request Shadow
[15]	IBSYH	0	R	Input Buffer Busy Host 0 = No request pending 1 = Request while transfer between IBF Shadow and Message RAM in progress

Bit	Bit Name	Initial Value	R/W	Description
[14:7]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[6:0]	IBRH	0	R/W	Input Buffer Request Host

(1) **FRIBCR.IBSYS**

Input Buffer Busy Shadow

Set to ’1’ after writing **FRIBCR.IBRH**.

This bit indicates that a transfer between IBF Shadow and Message RAM is in progress.

When the transfer between IBF Shadow and the Message RAM has completed, **FRIBCR.IBSYS** is set back to ’0’.

(2) **FRIBCR.IBRS**

Input Buffer Request Shadow

Number of the target message buffer actually updated / lately updated.

(3) **FRIBCR.IBSYH**

Input Buffer Busy Host

Set to ’1’ by writing **FRIBCR.IBRH** while **FRIBCR.IBSYS** is still ’1’.

This bit indicates that a transfer between IBF Shadow and Message RAM is in progress

After the ongoing transfer between IBF Shadow and the Message RAM has completed, the **FRIBCR.IBSYH** is set back to ’0’.

(4) **FRIBCR.IBRH**

Input Buffer Request Host

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

103.2.11 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in section 103.3.12.2.(2).

When using the output data transfer function as described in section 103.3.16.2 and **FROTS.OTS** is '1', the user should not write to these registers.

103.2.11.1 FRRDDSn (n=1 to 64) [h'0600 – h'06FC]

FlexRay Read Data Section n (n=1 to 64)

Holds the data words read from the data section of the addressed message buffer. The number of data words read from the Message RAM is defined by the payload length configured in **FRRDHS2.PLC**.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MD[31:16]

[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	FID	0	R	Frame ID

(1) **FRRDHS1.MBI**

Message Buffer Interrupt

Value as configured by the Host via **FRWRHS1.MBI**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to '0'.

(2) **FRRDHS1.TXM**

Transmission Mode

Value as configured by the Host via **FRWRHS1.TXM**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to '0'.

(3) **FRRDHS1.PPIT**

Payload Preamble Indicator Transmit

Value as configured by the Host via **FRWRHS1.PPIT**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to '0'.

(4) **FRRDHS1.CFG**

Message Buffer Direction Configuration Bit

Value as configured by the Host via **FRWRHS1.CFG**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to '0'.

(5) **FRRDHS1.CH**

Channel Filter Control

Value as configured by the Host via **FRWRHS1.CH**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to '0'.

(6) **FRRDHS1.CYC**

Cycle Code

Value as configured by the Host via **FRWRHS1.CYC**.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to '0'.

(7) **FRRDHS1.FID**

Frame ID

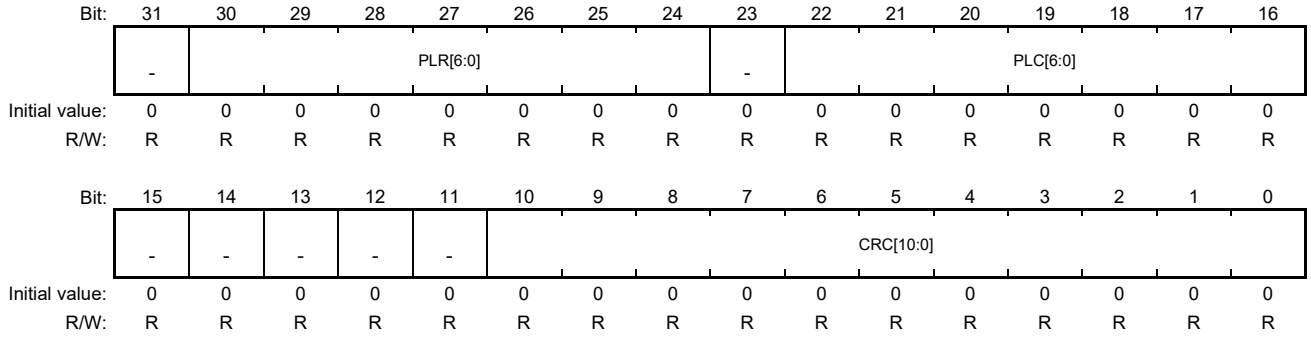
Value as configured by the Host via **FRWRHS1.FID**

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

103.2.11.3 FRRDHS2 [h'0704]

FlexRay Read Header Section 2

Note: For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area **FRWRHS2** is updated from data frames only.



Bit	Bit Name	Initial Value	R/W	Description
[31]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[30:24]	PLR	0	R	Payload Length Received vRF!Header!Length
[23]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[22:16]	PLC	0	R	Payload Length Configured
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	CRC	0	R	Header CRC vRF!Header!HeaderCRC

(1) **FRRDHS2.PLR**

Payload Length Received

Payload length value updated from received data frames (vRF!Header!Length) (exception: if message buffer belongs to the receive FIFO **PLR** is also updated from received null frames).

(2) **FRRDHS2.PLC**

Payload Length Configured

Length of data section (number of 2-byte words) as configured by the Host.

(3) **FRRDHS2.CRC**

Header CRC

Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames

Transmit Buffer: Header CRC calculated and configured by the Host

(4) **Data storage**

When a message is stored into a message buffer the following behaviour with respect to payload length received and payload length configured is implemented:

FRRDHS2.PLR > **FRRDHS2.PLC**:
The payload data stored in the message buffer is truncated to the payload length configured if **FRRDHS2.PLC** even or else truncated to **FRRDHS2.PLC** + 1.

FRRDHS2.PLR <= **FRRDHS2.PLC**:
The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by **FRRDHS2.PLC** are filled with undefined data.

FRRDHS2.PLR = zero:
The message buffer's data section is filled with undefined data

FRRDHS2.PLC = zero:
Message buffer has no data section configured. No data is stored into the message buffer's data section.

Note 1: The Message RAM is organized in 4-byte words. When received data is stored into a message buffer's data section, the number of 2-byte data words written into the message buffer is **FRRDHS2.PLC** rounded to the next even value.

Note 2: **FRRDHS2.PLC** should be configured identical for all message buffers belonging to the receive FIFO.

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area **FRWRHS2** is updated from data frames only.

103.2.11.4 FRRDHS3 [h'0708]

FlexRay Read Header Section 3

Note: For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area **FRWRHS3** is updated from data frames only.

[21:16]	RCC	0	R	Receive Cycle Count vRF!Header!CycleCount
[15:11]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[10:0]	DP	0	R	Data Pointer

(1) **FRRDHS3.RES**

Reserved Bit

Reflects the state of the received reserved bit (vRF!Header!Reserved). The reserved bit is transmitted as ’0’.

(2) **FRRDHS3.PPI**

Payload Preamble Indicator

The payload preamble indicator (vRF!Header!PPIndicator) defines whether a network management vector or message ID is contained within the payload segment of the received frame.

0 = PPI indicator set to '0'
The payload segment of the received frame does not contain a network management vector nor a message ID

1 = PPI indicator set to '1'
Static segment: Network management vector in the first part of the payload
Dynamic segment: Message ID in the first part of the payload

(3) **FRRDHS3.NFI**

Null Frame Indicator

The Null Frame Indicator (vRF!Header!NFIndicator) is set to ’1’ after storage of the first received data frame.

(4) **FRRDHS3.SYN**

Sync Frame Indicator

A sync frame is marked by the sync frame indicator (vRF!Header!SyFIndicator).

(5) **FRRDHS3.SFI**

Startup Frame Indicator

A startup frame is marked by the startup frame indicator (vRF!Header!SuFIndicator).

(6) **FRRDHS3.RCI**

Received on Channel Indicator

Indicates the channel from which the received data frame was taken to update the respective receive buffer (vSS!Channel).

(7) **FRRDHS3.RCC**

Receive Cycle Count

Cycle counter value updated from received data frame (vRF!Header!CycleCount).

(8) **FRRDHS3.DP**

Data Pointer

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

Value as configured by the Host via **FRWRHS3.DP**.

103.2.11.5 FRMBS [h'070C]

FlexRay Message Buffer Status

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel-specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all **FRMBS** flags are reset to zero independent of which **FRIBCM** bits are set or not.

For details about receive / transmit filtering see section 103.3.8, section 103.3.9 and section 103.3.10.

Whenever the Message Handler changes one of the flags **FRMBS.VFRA**, **FRMBS.VFRB**, **FRMBS.SEOA**, **FRMBS.SEOB**, **FRMBS.CEOA**, **FRMBS.CEOB**, **FRMBS.SVOA**, **FRMBS.SVOB**, **FRMBS.TCIA**, **FRMBS.TCIB**, **FRMBS.ESA**, **FRMBS.ESB**, **FRMBS.MLST**, **FRMBS.FTA**, **FRMBS.FTB** the respective message buffer's **MBC** flag in registers **FRMBSC1/2/3/4** is set.

[0]	VFRA	0	R	Valid Frame Received on Channel A 0 = No valid frame received on channel A 1 = Valid frame received on channel A

(1) **FRMBS.RESS**

Reserved Bit Status

Reflects the state of the received reserved bit (vRF!Header!Reserved). The reserved bit is transmitted as ’0’.

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(2) **FRMBS.PPIS**

Payload Preamble Indicator Status

The payload preamble indicator (vRF!Header!PPIndicator) defines whether a network management vector or message ID is contained within the payload segment of the received frame.

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

0 = PPI indicator set to '0'
The payload segment of the received frame does not contain a network management vector or a message ID

1 = PPI indicator set to '1'
Dynamic segment: Message ID at the beginning of the payload
Static segment: Network management vector at the beginning of the payload

(3) **FRMBS.NFIS**

Null Frame Indicator Status

If set to ’0’ the PPI bit (vRF!Header!NFIndicator) was set to '0' and the payload segment of the received frame contains no usable data.

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(4) **FRMBS.SYNS**

Sync Frame Indicator Status

A sync frame is marked by the sync frame indicator (vRF!Header!SyFIndicator).

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(5) **FRMBS.SFIS**

Startup Frame Indicator Status

A startup frame is marked by the startup frame indicator (vRF!Header!SuFIndicator).

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(6) **FRMBS.RCIS**

Received on Channel Indicator Status

Indicates the channel on which the frame was received (vSS!Channel).

For receive buffers (**FRWRHS1.CFG** = ’0’) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(7) **FRMBS.CCS**

Cycle Count Status

Actual cycle count when status was updated.

(8) **FRMBS.FTB**

Frame Transmitted on Channel B

Indicates that this node has transmitted a data frame in the configured slot on channel B.

Note: The FlexRay protocol specification requires that **FRMBS.FTB** can only be reset by the Host. Therefore the Cycle Count Status **FRMBS.CCS** for this bit is only valid for the cycle where the bit is set to ’1’.

(9) **FRMBS.FTA**

Frame Transmitted on Channel A

Indicates that this node has transmitted a data frame in the configured slot on channel A.

Note: The FlexRay protocol specification requires that **FRMBS.FTA** can only be reset by the Host. Therefore the Cycle Count Status **FRMBS.CCS** for this bit is only valid for the cycle where this bit is set to ’1’.

0 = No data frame transmitted on channel A

(10) **FRMBS.MLST**

Message Lost

The flag is set in case the Host did not read the message before the message buffer was updated from a received data frame.

Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset by a Host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers **ND** flag was reset by reading out the message buffer via OBF.

(11) **FRMBS.ESB**

Empty Slot Channel B

In an empty slot there is no activity detected on the bus. The condition is checked in static and dynamic slots.

(12) **FRMBS.ESA**

Empty Slot Channel A

In an empty slot there is no activity detected on the bus. The condition is checked in static and dynamic slots.

(13) **FRMBS.TCIB**

Transmission Conflict Indication Channel B

A transmission conflict indication (vSS!TxConflictB) is set if a transmission conflict has occurred on channel B.

(14) **FRMBS.TCIA**

Transmission Conflict Indication Channel A

A transmission conflict indication (vSS!TxConflictA) is set if a transmission conflict has occurred on channel A.

(15) **FRMBS.SVOB**

Slot Boundary Violation Observed on Channel B

A slot boundary violation (channel active at the start or at the end of the assigned slot) (vSS!BViolationB) was observed on channel B.

(16) **FRMBS.SVOA**

Slot Boundary Violation Observed on Channel A

A slot boundary violation (channel active at the start or at the end of the assigned slot) (vSS!BViolationA) was observed on channel A.

(17) **FRMBS.CEOB**

Content Error Observed on Channel B

A content error (vSS!ContentErrorB) was observed in the assigned slot on channel B.

(18) **FRMBS.CEOA**

Content Error Observed on Channel A

A content error (vSS!ContentErrorA) was observed in the assigned slot on channel A.

(19) **FRMBS.SEOB**

Syntax Error Observed on Channel B

A syntax error (vSS!SyntaxErrorB) was observed in the assigned slot on channel B.

(20) **FRMBS.SEOA**

Syntax Error Observed on Channel A

A syntax error was (vSS!SyntaxErrorA) observed in the assigned slot on channel A.

(21) **FRMBS.VFRB**

Valid Frame Received on Channel B

A valid frame indication (vSS!ValidFrameB) is set if a valid frame was received on channel B.

(22) **FRMBS.VFRA**

Valid Frame Received on Channel A

A valid frame indication (vSS!ValidFrameA) is set if a valid frame was received on channel A.

103.2.11.6 FROBCM [h'0710]

FlexRay Output Buffer Command Mask

Configures how the Output Buffer is updated from the message buffer in the Message RAM selected by **FROBCR.OBRS**.

Mask bits **FROBCM.RDSS** and **FROBCM.RHSS** are copied to the register internal storage when a Message RAM transfer is requested by **FROBCR.REQ**.

When OBF Host and OBF Shadow are swapped, mask bits **FROBCM.RDSH** and **FROBCM.RHSH** are swapped with the register internal storage to keep them attached to the respective Output Buffer transfer.

The data transfer between Output Buffer and Message RAM is described in detail in section 103.3.12.2.(2).

Note: After the transfer of the header section from the Message RAM to OBF Shadow has completed, the message buffer status changed flag **MBC** of the selected message buffer in the **FRMBSC1/2/3/4** registers is cleared. After the transfer of the data section from the Message RAM to OBF Shadow has completed, the new data flag **ND** of the selected message buffer in the **FRNDAT1/2/3/4** registers is cleared.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:18]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0

Bit	Bit Name	Initial Value	R/W	Description
[17]	RDSH	0	R	Read Data Section Host 0 = Data section is not read 1 = Data section selected for transfer from Message RAM to Output Buffer
[16]	RHSH	0	R	Read Header Section Host 0 = Header section is not read 1 = Header section selected for transfer from Message RAM to Output Buffer
[15:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	RDSS	0	R/W	Read Data Section Shadow 0 = Data section is not read 1 = Data section selected for transfer from Message RAM to Output Buffer
[0]	RHSS	0	R/W	Read Header Section Shadow 0 = Header section is not read 1 = Header section selected for transfer from Message RAM to Output Buffer

(1) **FROBCM.RDSH**

Read Data Section Host

(2) **FROBCM.RHSH**

Read Header Section Host

(3) **FROBCM.RDSS**

Read Data Section Shadow

(4) **FROBCM.RHSS**

Read Header Section Shadow

103.2.11.7 FROBCR [h'0714]

FlexRay Output Buffer Command Request

After setting bit **FROBCR.REQ** to '1' while **FROBCR.OBSYS** is '0', **FROBCR.OBSYS** is automatically set to '1', **FROBCR.OBRS** is copied to the register internal storage, mask bits **FROBCM.RDSS** and **FROBCM.RHSS** are copied to register **FROBCM** internal storage, and the transfer of the message buffer selected by **FROBCR.OBRS** from the Message RAM to OBF Shadow is started. When the transfer between the Message RAM and OBF Shadow has completed, this is signaled by setting **FROBCR.OBSYS** back to '0'.

By setting bit **FROBCR.VIEW** to '1' while **FROBCR.OBSYS** is '0', OBF Host and OBF Shadow are swapped. Additionally mask bits **FROBCM.RDSH** and **FROBCM.RHSH** are swapped with the register **FROBCM** internal storage to keep them attached to the respective Output Buffer transfer. **FROBCR.OBRH** signals the number of the message buffer currently accessible by the Host.

If bits **FROBCR.REQ** and **FROBCR.VIEW** are set to '1' with the same write access while **FROBCR.OBSYS** is '0', **FROBCR.OBSYS** is automatically set to '1' and OBF Shadow and OBF Host are swapped. Additionally mask bits **FROBCM.RDSH** and **FROBCM.RHSH** are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards **FROBCR.OBRS** is copied to the register internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting **FROBCR.OBSYS** back to '0'.

Any write access to **FROBCR[15:8]** while **FROBCR.OBSYS** is set will cause the error flag **FREIR.IOBA** to be set. In this case the write access has no effect and the Output buffer will not be changed.

The data transfer between Output Buffer and Message RAM is described in detail in section 103.3.12.2.(2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
[31:23]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[22:16]	OBRH	0	R	Output Buffer Request Host
[15]	OBSYS	0	R	Output Buffer Busy Shadow 0 = No transfer in progress 1 = Transfer between Message RAM and OBF Shadow in progress
[14:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0

Bit	Bit Name	Initial Value	R/W	Description
[9]	REQ	0	R/W	Request Message RAM Transfer 0 = No request 1 = Transfer to OBF Shadow requested
[8]	VIEW	0	R/W	View Shadow Buffer 0 = No action 1 = Swap OBF Shadow and OBF Host
[7]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[6:0]	OBRS	0	R/W	Output Buffer Request Shadow

(1) **FROBCR.OBRH**

Output Buffer Request Host

Number of message buffer currently accessible by the Host via **FRRDHS1/2/3**, **FRMBS**, and **FRRDDSn (n=1 to 64)**.

By writing **FROBCR.VIEW** to ’1’ OBF Shadow and OBF Host are swapped and the transferred message buffer is accessible by the Host.

(2) **FROBCR.OBSYS**

Output Buffer Busy Shadow

Set to ’1’ after setting bit **FROBCR.REQ**. When the transfer between the Message RAM and OBF Shadow has completed, **FROBCR.OBSYS** is set back to ’0’.

(3) **FROBCR.REQ**

Request Message RAM Transfer

Only writeable while **FROBCR.OBSYS** = ’0’.

Requests transfer of message buffer addressed by **FROBCR.OBRS** from Message RAM to OBF Shadow.

(4) **FROBCR.VIEW**

View Shadow Buffer

Only writeable while **FROBCR.OBSYS** = ’0’.

Toggles between OBF Shadow and OBF Host.

(5) **FROBCR.OBRS**

Output Buffer Request Shadow

Only writeable while **FROBCR.OBSYS** = ’0’.

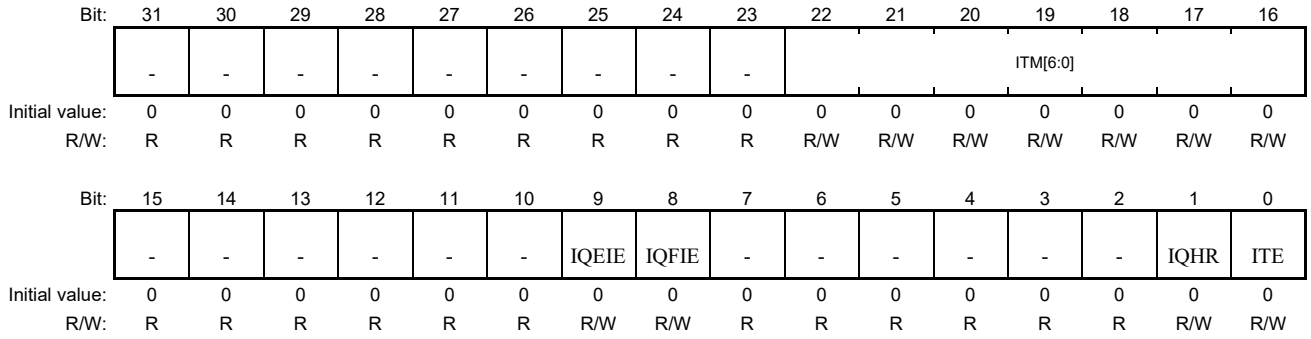
Number of source message buffer to be transferred from the Message RAM to OBF Shadow.

If the number of the first message buffer of the receive FIFO is written to this register the Message Handler transfers the message buffer addressed by the GET Index (GIDX, see section 103.3.11) to OBF Shadow.

103.2.12 Data transfer control register

103.2.12.1 FRITC [h'0800]

FlexRay Input Transfer Configuration register



Bit	Bit Name	Initial Value	R/W	Description
[31:23]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[22:16]	ITM	0	R/W	Input queue Table Max These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.
[15:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9]	IQEIE	0	R/W	Input Queue Empty Interrupt Enable 0: Disabled 1: Enabled
[8]	IQFIE	0	R/W	Input Queue Full Interrupt Enable 0: Disabled 1: Enabled
[7:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	IQHR	0	R/W	Input Queue Halt Request 0: Input queue run request 1: Input queue halt request
[0]	ITE	0	R/W	Input Transfer Enable 0: Operation Disable request 1: Operation Enable request

(1) **FRITC.ITM**

Input queue Table Max

The user can only write to this bit when **FRITS.ITS** is '0'.

These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.

Valid values are h'00 (1 queue entry) to h'7F (128 queue entries).

Note that each entry requires two long words in the input pointer table.

(2) **FRITC.IQEIE**

Input Queue Empty Interrupt Enable

This bit controls the input queue empty interrupt.

0: Disabled
No interrupt will be requested and the input queue empty interrupt line will be released if pending.

1: Enabled
Input queue empty interrupt will be asserted when **FRITS.IQEIS** is '1'.

(3) **FRITC.IQFIE**

Input Queue Full Interrupt Enable

This bit controls the input queue full interrupt.

0: Disabled
No interrupt will be requested and the input queue full interrupt line will be released if pending.

1: Enabled
Input queue full interrupt will be asserted when **FRITS.IQFIS** is '1'.

(4) **FRITC.IQHR**

Input Queue Halt Request

The **IQHR** bit should not be set to '1' when **FRITS.ITS** is '0'.

This bit requests a halt of the input queue.

The status of the halt request is shown in the **FRITS.IQH** register.
Refer to section 103.3.16.1.(5) about usage of this bit.

0: Input queue run request
The input queue resumes their operation.

1: Input queue halt request
The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

(5) **FRITC.ITE**

Input Transfer Enable

The user should only set this bit to '1' when **FRIBCR.IBSYS** is '0'.

The user should only set this bit to '0' when **FRITC.IQHR** '0'. Otherwise committed input transfers get lost.

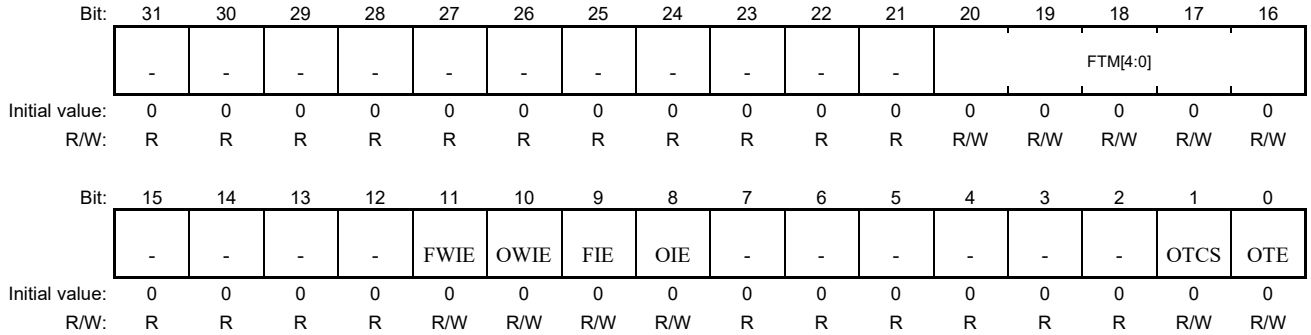
This bit controls the operation mode of the input transfer queue.
The operation status of the input transfer queue function is shown in **FRITS.ITS**.
Refer to section 103.3.16.1.(1) about usage of this bit.

0: Operation Disable request
The input transfer queue gets disabled when it becomes empty.

1: Operation Enable request
The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

103.2.12.2 FROTC [h'0804]

FlexRay Output Transfer Configuration register



Bit	Bit Name	Initial Value	R/W	Description
[31:21]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[20:16]	FTM	0	R/W	FIFO Table Max Configures the number of FIFO entries the output transfer handler is capable to maintain in the URAM.
[15:12]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[11]	FWIE	0	R/W	FIFO transfer Warning Interrupt Enable 0: Disabled 1: Enabled
[10]	OWIE	0	R/W	Output transfer Warning Interrupt Enable 0: Disabled 1: Enabled
[9]	FIE	0	R/W	FIFO transfer Interrupt Enable 0: Disabled 1: Enabled
[8]	OIE	0	R/W	Output transfer Interrupt Enable 0: Disabled 1: Enabled
[7:2]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[1]	OTCS	0	R/W	Output Transfer Condition Select 0: New data only mode 1: New data and status changed mode

Bit	Bit Name	Initial Value	R/W	Description
[0]	OTE	0	R/W	Output Transfer Enable 0: Operation Disable request 1: Operation Enable request

(1) **FROTC.FTM**

FIFO Table Max

The user can only write to these bits when **FROTS.OTS** is '0'.

Configures the number of FIFO entries the output transfer handler is capable to maintain in the URAM.

Valid values are h'00 (1 FIFO entry) to h'1F (32 FIFO entries).

(2) **FROTC.FWIE**

FIFO transfer Warning Interrupt Enable

This bit controls the FIFO transfer warning interrupt.

0: Disabled
No interrupt will be requested and the FIFO transfer warning interrupt line will be released if pending.

1: Enabled
FIFO transfer warning interrupt will be asserted when **FROTS.FWIS** is '1'.

(3) **FROTC.OWIE**

Output transfer Warning Interrupt Enable

This bit controls the output transfer warning interrupt.

0: Disabled
No interrupt will be requested and the output transfer warning interrupt line will be released if pending.

1: Enabled
Output transfer warning interrupt will be asserted when **FROTS.OWIS** is '1'.

(4) **FROTC.FIE**

FIFO transfer Interrupt Enable

This bit controls the FIFO transfer interrupt.

0: Disabled
No interrupt will be requested and the FIFO transfer interrupt line will be released if pending.

1: Enabled
FIFO transfer interrupt will be asserted when **FROTS.FIS** is '1'.

(5) **FROTC.OIE**

Output transfer Interrupt Enable

This bit controls the output transfer interrupt.

0: Disabled
No interrupt will be requested and the output transfer interrupt line will be released if pending.

1: Enabled
Output transfer interrupt will be asserted when **FROTS.OTIS** is '1'.

(6) **FROTC.OTCS**

Output Transfer Condition Select

The user can only write to this bit when **FROTS.OTS** is '0'.

This bit controls the output transfer condition.

0: New data only mode
The **ND** bits in the **FRNDATi** registers are used to detect a transfer condition for dedicated receive buffer

1: New data and status changed mode
The **ND** bits in the **FRNDATi** registers and the **MBC** bits in the **FRMBSC** register are used to detect a transfer condition for dedicated transmit and receive buffer

(7) **FROTC.OTE**

Output Transfer Enable

The user should only set this bit to '1' when **FROBCR.OBSYS** is '0'.

This bit controls the operation mode of the output transfer function.
The operation status of the output buffer transfer function is shown in **FROTS.OTS**.
Refer to section 103.3.16.2.(1) about usage of this bit.

0: Operation Disable request
The output buffer transfer gets disabled.
An active message buffer transfer will be completed but no further transfer will start.

1: Operation Enable request
The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.

The user should not change the ERAY message RAM configuration by writing to the **FRMRC** register.

103.2.12.3 FRIBA [h'0808]

FlexRay Input pointer table Base Address register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ITA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ITA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:2]	ITA	0	R/W	Input Table Address These bits configure the base address of the input pointer table.
[1:0]	ITA	0	R	Input Table Address The address should be 32 bit aligned, thus bits[1:0] are always ‘0’.

(1) **FRIBA.ITA**

Input Table Address

The user can only write to this bit when **FRITS.ITS** is '0'.

The address should be 32 bit aligned, thus the bits **FRIBA.ITA[1:0]** are always '0'.

These bits configure the base address of the input pointer table.

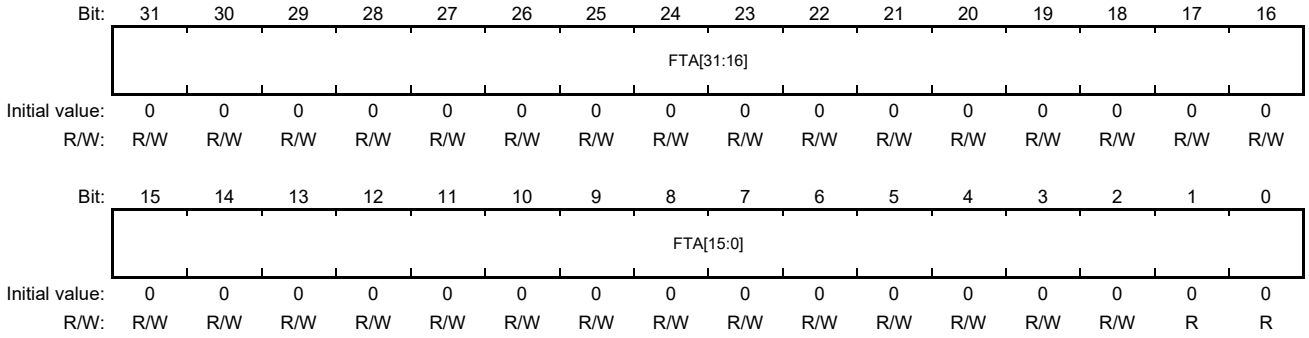
The table is used for the input transfer queue transferring message buffers from the URAM into the FlexRay internal message RAM.

The size of the input queue is configured in **FRITC.ITM**.

Note that each entry requires two long words in the input pointer table.

103.2.12.4 FRFBA [h’080C]

FlexRay FIFO pointer table Base Address register



Bit	Bit Name	Initial Value	R/W	Description
[31:2]	FTA	0	R/W	FIFO pointer Table Address These bits configure the base address of the FIFO pointer table.
[1:0]	FTA	0	R	FIFO pointer Table Address The address should be 32 bit aligned, thus bits[1:0] are always ‘0’.

(1) **FRFBA.FTA**

FIFO pointer Table Address

The user can only write to this bit when **FROTS.OTS** is '0'.

The address should be 32 bit aligned, thus the bits **FRFBA.FTA[1:0]** are always '0'.

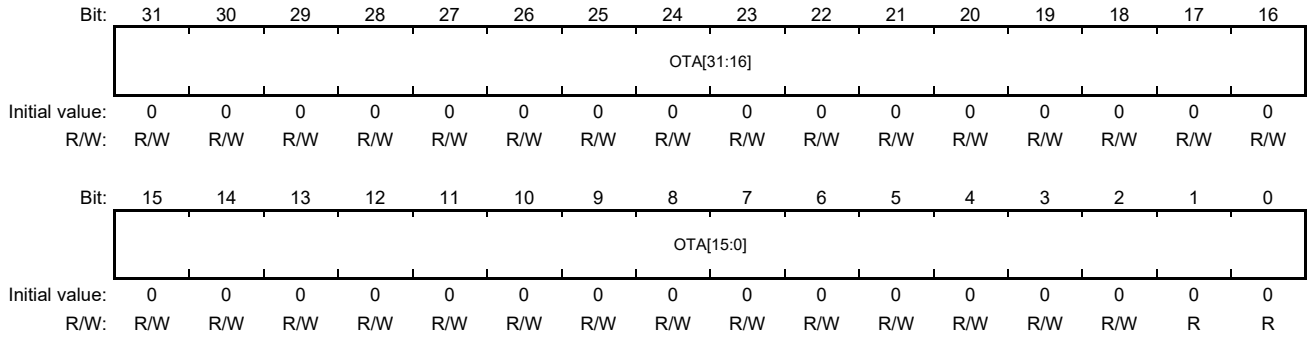
These bits configure the base address of the FIFO pointer table.

The table is used for message buffers transferred from the FlexRay internal FIFO to the URAM.

The size of the FIFO is configured in **FROTC.FTM**.

103.2.12.5 FROBA [h'0810]

FlexRay Output pointer table Base Address register



Bit	Bit Name	Initial Value	R/W	Description
[31:2]	OTA	0	R/W	Output pointer Table Address These bits configure the base address of the output pointer table
[1:0]	OTA	0	R	Output pointer Table Address The address should be 32 bit aligned, thus bits[1:0] are always '0'

(1) **FROBA.OTA**

Output pointer Table Address

The user can only write to this bit when **FROTS.OTS** is '0'.

The address should be 32 bit aligned, thus the bits **FROBA.OTA[1:0]** are always '0'.

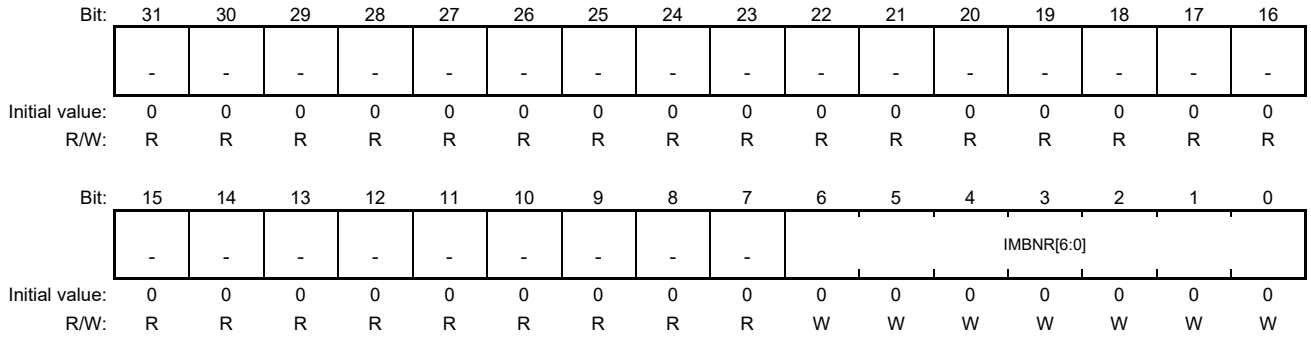
These bits configure the base address of the output pointer table.

The table is used for message buffers transferred from the FlexRay internal message RAM to the URAM.

The size of the table depends on the utilisation of the FlexRay internal message RAM and can have up to 128 entries.

103.2.12.6 FRIQC [h'0814]

FlexRay Input Queue Control register



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	IMBNR[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
[31:7]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[6:0]	IMBNR	0	W	Input Message Buffer NumbeR Message buffer number added to the input queue

(1) **FRIQC.IMBNR**

Input Message Buffer NumbeR

The user can only write to this bit when **FRITS.IQFP** is '0'.

The user should not write to this register when **FRITS.ITS** is '0' or when **FRITC.ITE** is '0'.

These bits are read as "0".

This value specifies the message buffer added to the input queue.
The number has to be identical to **FRWRHS4.IMBNR** (see section 103.3.16.1.(3)) of the input pointer table.
The address to the input data structure has to be provided in the input pointer table at the put index (**FRITS.IPIDX**) before writing to this register.
Writing to this register increases the input put index (**FRITS.IPIDX**).

103.2.12.7 FRUIR [h'0818]

FlexRay User Input transfer Request register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	UIDX[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:8]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[7:0]	UIDX	0	R/W	User requested Input inDeX Input pointer table index requested for input transfer

(1) **FRUIR.UIDX**

User requested Input inDeX

The user can only write to this bit when **FRITS.UIRP** is '0'.

The user should not write to this register when **FRITS.ITS** is '0'.
The user should not write to this register when **FRITS.UIRP** is '1'.
The user should not write to this register when **FRITS.IQH** is '1'.
The user should only write **FRITC.ITM+1** to this register.

This value specifies the input pointer table index for the user requested input transfer.
The address to the input data structure has to be provided in the input pointer table at the index **UIDX** before writing to this register.

When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.

In opposite to queued input transfers the related **DA** flag in the **FRDA** register is not influenced by the user input transfer.

103.2.12.8 FRUOR [h'081C]

FlexRay User Output transfer Request register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	URDS	-	-	UMBNR[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
[31:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9]	URDS	0	R/W	User request Read Data Section 0: Data section is not transferred 1: Data section is transferred
[8:7]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[6:0]	UMBNR	0	R/W	User requested output Message Buffer NumbeR Message buffer number requested for output transfer

(1) **FRUOR.URDS**

User request Read Data Section

The user can only write to this bit when **FROTS.UORP** is '0'.

The user should not write to this register when **FROTS.OTS** is '0'.

The user should not write to this register when **FROTS.UORP** is '1'.

0: Data section is not transferred
The data section of the message buffer selected by the bits **UMBNR** is not requested

1: Data section is transferred
The data section of the message buffer selected by the bits **UMBNR** is requested

(2) **FRUOR.UMBNR**

User requested output Message Buffer NumbeR

The user can only write to this bit when **FROTS.UORP** is '0'.

The user should not write to this register when **FROTS.OTS** is '0'.

The user should not write to this register when **FROTS.UORP** is '1'.

The user should restrict **UMBNR** to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.

When writing to this register, the header sections and optionally the data section (configurable by **FRUOR.URDS**) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

103.2.12.9 Reserved

103.2.13 Data transfer status register

103.2.13.1 FRITS [h'0820]

FlexRay Input Transfer Status register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	IGIDX[6:0]							-	IPIDX[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	IQFP	-	-	IQEIS	IQFIS	-	-	-	-	-	UIRP	IQH	ITS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[30:24]	IGIDX	0	R	Input queue Get InDeX Represents the get index of the input pointer table
[23]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[22:16]	IPIDX	0	R	Input queue Put InDeX Represents the put index of the input pointer table
[15:13]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[12]	IQFP	0	R	Input Queue Full condition Pending 0: Entries in the input queue are available 1: All entries in the input queue are occupied
[11:10]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[9]	IQEIS	0	R/W	Input Queue Empty Interrupt Status 0: No input queue empty condition detected 1: Input queue empty condition detected

Bit	Bit Name	Initial Value	R/W	Description
[8]	IQFIS	0	R/W	Input Queue Full Interrupt Status 0: No input queue full condition detected 1: Input queue full condition detected
[7:3]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[2]	UIRP	0	R	User Input transfer Request Pending 0: No user input transfer request pending 1: User input transfer request pending
[1]	IQH	0	R	Input Queue Halted 0: Input queue not halted 1: Input queue halted
[0]	ITS	0	R	Input Transfer Status 0: Disabled 1: Enabled

(1) **FRITS.IGIDX**

Input queue Get InDeX

These bits are only valid when **FRITS.IQH** is '1'

These bits represent the input pointer index the input queue handler will transfer next.
Valid values are h'00 to **FRITC.ITM**.

The get index is incremented when the input data structure has been transferred from the URAM and the related **DA** flag in the **FRDA** register is cleared.

The index is set to h'00 when **FRITS.ITS** changes from '0' to '1'.

(2) **FRITS.IPIDX**

Input queue Put InDeX

These bits represent the index where the next input data structure pointer in the input pointer table should be stored.
Valid values are h'00 to **FRITC.ITM**.

After reaching the maximum value the put index continues from h'00.

The index is incremented when writing to **FRIQC.IMBNR**.
The index is set to h'00 when **FRITS.ITS** changes from '0' to '1'.

(3) **FRITS.IQFP**

Input Queue Full condition Pending

This bit represents that the input queue is full.

There should be no further input transfer requests, by writing to **FRIQC.IMBNR**, as long as **FRITS.IQFP** is '1'.

[Clearing condition]
This bit is cleared when there is one free entry in the input queue.

[Setting condition]
This bit is set when all entries in the input queue are occupied.

(4) **FRITS.IQEIS**

Input Queue Empty Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FRITC.IQEIE** the input queue empty interrupt is generated when **FRITS.IQEIS** is '1'.

[Clearing condition]
This bit is cleared when writing a '1' to **FRITS.IQEIS**.
This bit is cleared when **FRITS.ITS** changes from '0' to '1'.

[Setting condition]
This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

(5) **FRITS.IQFIS**

Input Queue Full Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FRITC.IQFIE** the input queue full interrupt is generated when **FRITS.IQFIS** is '1'.

This flag is intended as interrupt status flag. It does not represent the current input queue status; for this status refer to **FRITS.IQFP**.

[Clearing condition]
This bit is cleared when writing a '1' to **FRITS.IQFIS**.
This bit is cleared when **FRITS.ITS** changes from '0' to '1'.

[Setting condition]
This bit is set when all entries in the input queue are occupied.

(6) **FRITS.UIRP**

User Input transfer Request Pending

This bit represents that a user input transfer is still pending.

There should be no further write access to **FRUIR.UIDX** when this bit is '1'.

[Clearing condition]
This bit is cleared when the user input transfer request is processed by the input transfer handler.

[Setting condition]
This bit is set when writing to **FRUIR.UIDX**.

(7) **FRITS.IQH**

Input Queue Halted

This bit represents the status of the input queue.

There should be no further write access to **FRUIR.UIDX** when this bit is '1'.

[Clearing condition]
This bit is cleared when **FRITC.IQHR** is set to '0'.

[Setting condition]
This bit is set immediately when the **FRITC.IQHR** is set to '1' and there is no ongoing input transfer.

This bit is set only after an ongoing input transfer has been completed and **FRITC.IQHR** is set to '1'.

(8) **FRITS.ITS**

Input Transfer Status

This bit represents the status of the input queue handler.
While this bit is '1', there should be no read or write access to the address area ERAY+h'0400 to ERAY+h'05FF and there should be no CLEAR_RAMS command applied to **FRSUCC1.CMD** register.

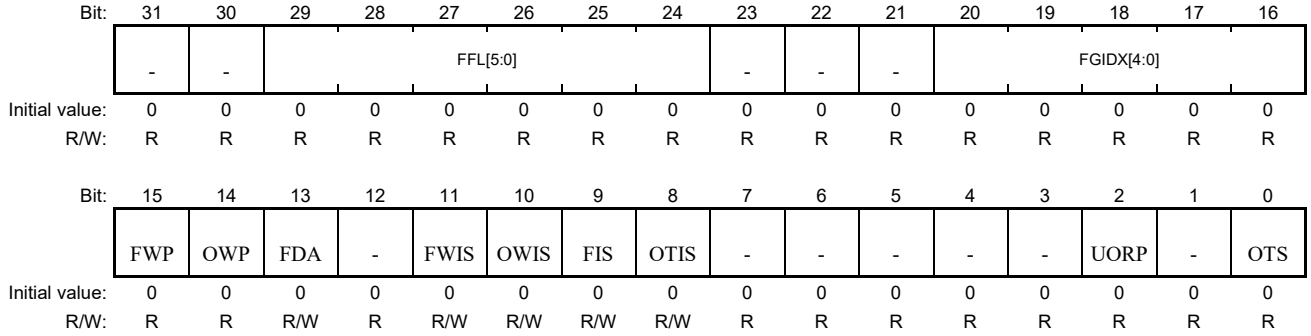
The input transfer queue indexes and related status flags are set to '0' when **FRITS.ITS** changes from '0' to '1'.

[Clearing condition]
This bit is cleared immediately when **FRITC.ITE** is set to '0' and there are no pending input transfers
This bit is cleared after all pending requests have been processed and **FRITC.ITE** is '0'.

[Setting condition]
This bit is set when **FRITC.ITE** is set to '1'.

103.2.13.2 FROTS [h'0824]

FlexRay Output Transfer Status register



Bit	Bit Name	Initial Value	R/W	Description
[31:30]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[29:24]	FFL	0	R	FIFO Fill Level Represent the number of unprocessed output FIFO structures
[23:21]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[20:16]	FGIDX	0	R	FIFO Get InDeX Represent the get index in the FIFO pointer table
[15]	FWP	0	R	FIFO transfer Warning condition Pending 0: No FIFO transfer warning condition pending 1: FIFO transfer warning condition pending
[14]	OWP	0	R	Output transfer Warning condition Pending 0: No output transfer warning condition pending 1: Output transfer warning condition pending
[13]	FDA	0	R/W	FIFO Data Available 0: No available FIFO structures 1: FIFO structures available at current FROTS.FGIDX index
[12]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[11]	FWIS	0	R/W	FIFO transfer Warning Interrupt Status 0: No FIFO transfer warning condition detected 1: FIFO transfer warning condition detected
[10]	OWIS	0	R/W	Output transfer Warning Interrupt Status 0: No output transfer warning condition detected 1: Output transfer warning condition detected
[9]	FIS	0	R/W	FIFO transfer Interrupt Status 0: No FIFO structure updated in URAM 1: FIFO structure updated in URAM

Bit	Bit Name	Initial Value	R/W	Description
[8]	OTIS	0	R/W	Output transfer Interrupt Status 0: No output structure updated in URAM 1: Output structure updated in URAM
[7:3]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[2]	UORP	0	R	User Output transfer Request Pending 0: No user output transfer request pending 1: User output transfer request pending
[1]	-	0	R	Reserved This bit is always read as 0. The write value should be always 0
[0]	OTS	0	R	Output Transfer Status 0: Disabled 1: Enabled

(1) **FROTS.FFL**

FIFO Fill Level

These bits represent the number of available output FIFO structures in the URAM.
Valid values are h'00 to **FROTC.FTM**+1.

The value h'00 represents that the FIFO is empty.
The value **FROTC.FTM**+1 represents that the FIFO is full and no further FIFO transfers will be done.

The FIFO fill level is incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the URAM.
The FIFO fill level is decremented when the user releases a FIFO data structure in the URAM by writing '1' to **FROTS.FDA**.
The FIFO fill level is set to h'00 when the bit **FROTS.OTS** changes from '0' to '1'.

(2) **FROTS.FGIDX**

FIFO Get InDeX

These bits represent the index where the current output data structure pointer in the FIFO pointer table is available for reading.
Valid values are h'00 to **FROTC.FTM**.
After reaching the maximum value the get index continues from h'00.

The index is incremented when a FIFO data structure is released by writing '1' to **FROTS.FDA**.
The index is set to h'00 when **FROTS.OTS** changes from '0' to '1'.

(3) **FROTS.FWP**

FIFO transfer Warning condition Pending

This bit represents the FIFO transfer warning condition.

[Clearing condition]
This bit is cleared when there are free output data structures (**FROTS.FFL** <= **FROTC.FTM**).
This bit is cleared when the **FROTS.OTS** changes from '0' to '1'.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (**FROTS.FFL** = **FROTC.FTM**+1).

(4) **FROTS.OWP**

Output transfer Warning condition Pending

This bit represents the output transfer warning condition.

[Clearing condition]
This bit is cleared, when all output structure pointers that have a pending output handler transfer condition detected, are released (for dedicated transmit and receive message buffers or a user output transfer request).

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to '1').
This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to '1' due to the input transfer request).

(5) **FROTS.FDA**

FIFO Data Available

Writing '0' has no effect on the bit value.

When this bit is '1', the next valid output data structure is available.
The related data structure pointer is in the FIFO pointer table at **FROTS.FGIDX**.

Writing '1' to **FROTS.FDA**
increments **FROTS.FGIDX** and
decrements the FIFO fill level (**FROTS.FFL**)
If there are still unprocessed data structures **FROTS.FDA** remains '1'.

[Clearing condition]
This bit is cleared when writing '1' to **FROTS.FDA** and the FIFO fill level becomes h'00.
This bit is cleared when the **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when there is at least one FIFO data structure available in the URAM.

(6) **FROTS.FWIS**

FIFO transfer Warning Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FROTC.FWIE** the FIFO transfer warning interrupt is generated when **FROTS.FWIS** is '1'.

[Clearing condition]
This bit is cleared when writing a '1' to **FROTS.FWIS**.
This bit is cleared when the bit **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (**FROTS.FFL** = **FROTC.FTM**+1).

(7) **FROTS.OWIS**

Output transfer Warning Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FROTC.OWIE** the FIFO transfer warning interrupt is generated when **FROTS.OWIS** is '1'.

[Clearing condition]
This bit is cleared when writing a '1' to **FROTS.OWIS**.
This bit is cleared when the bit **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to '1').
This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to '1' due to the input transfer request).

(8) **FROTS.FIS**

FIFO transfer Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FROTC.FIE** the FIFO transfer interrupt is generated when **FROTS.FIS** is '1'.

[Clearing condition]
This bit is cleared when writing a '1' to **FROTS.FIS**.
This bit is cleared when the bit **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when a FIFO data structure is updated by the transfer handler and **FROTS.FFL** changes from h'00 to h'01.

(9) **FROTS.OTIS**

Output transfer Interrupt Status

Writing '0' has no effect on the bit value.

If enabled in **FROTC.OIE** the output transfer interrupt is generated when **FROTS.OTIS** is '1'.

[Clearing condition]
This bit is cleared when writing a '1' to **FROTS.OTIS**.
This bit is cleared when the bit **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by a user output transfer request).

(10) **FROTS.UORP**

User Output transfer Request Pending

This bit represents that a user output transfer is still pending.

There should be no further write access to **FRUOR.UMBNR** when this bit is '1'.

[Clearing condition]
This bit is cleared when the user output transfer request is processed by the output transfer handler.
This bit is cleared when the bit **FROTS.OTS** changes from '0' to '1'.

[Setting condition]
This bit is set when writing to **FRUOR.UMBNR**.

(11) **FROTS.OTS**

Output Transfer Status

This bit represents the status of the output transfer handler.
While this bit is '1', there should be no read or write access to the address area ERAY+h'0600 to ERAY+h'07FF and there should be no CLEAR_RAMS command applied to **FRSUCC1.CMD** register.

While this bit is '1', the user should not change the ERAY message RAM configuration by writing to the **FRMRC** register.

The output hander transfer indexes and related status flags are set to '0' when **FROTS.OTS** changes from '0' to '1'.

[Clearing condition]
This bit is cleared immediately when **FROTC.OTE** is set to '0' and there are no ongoing output transfers.
This bit is cleared after an ongoing transfer has been completed and **FROTC.OTE** is '0'.

[Setting condition]
This bit is set when **FROTC.OTE** is set to '1'.

103.2.13.3 FRAES [h'0828]

FlexRay Access Error Status register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MAE	FAE	OAE	IAE	EIDX[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
[31:12]	-	0	R	Reserved These bits are always read as 0. The write value should be always 0
[11]	MAE	0	R/W	Multiple Access Errors 0: No multiple access errors occurred 1: Multiple access errors occurred
[10]	FAE	0	R/W	FIFO transfer Access Error 0: No access error occurred during FIFO transfer 1: Access error occurred during FIFO transfer
[9]	OAE	0	R/W	Output transfer Access Error 0: No access error occurred during output transfer 1: Access error occurred during output transfer
[8]	IAE	0	R/W	Input transfer Access Error 0: No access error occurred during input transfer 1: Access error occurred during input transfer
[7:0]	EIDX	0	R	Error InDeX Data structure pointer index number

(1) **FRAES.MAE**

Multiple Access Errors

Writing '0' has no effect on the bit value.

This bit represents that there were multiple access errors during a data transfer.

[Clearing condition]
This bit is cleared when writing a '1' to **FRAES.MAE**.

[Setting condition]
This bit is set when one of the bits **FRAES.FAE**, **FRAES.OAE** or **FRAES.IAE** are set and
an access to an protected address occurred during a FIFO data transfer or
an access to an protected address occurred during an output data transfer or

an access to an protected address occurred during an input data transfer

(2) **FRAES.FAE**

FIFO transfer Access Error

Writing '0' has no effect on the bit value.

This bit represent that there was an access error during a FIFO data transfer.

[Clearing condition]
This bit is cleared when writing a '1' to **FRAES.FAE**.

[Setting condition]
This bit is set when a URAM access error was detected during a FIFO transfer and the bits **FRAES.OAE**, **FRAES.IAE** and **FRAES.MAE** are '0'.

(3) **FRAES.OAE**

Output transfer Access Error

Writing '0' has no effect on the bit value.

This bit represent that there was an access error during a output data transfer.

[Clearing condition]
This bit is cleared when writing a '1' to **FRAES.OAE**.

[Setting condition]
This bit is set when a URAM access error was detected during an output transfer and the bits **FRAES.FAE**, **FRAES.IAE** and **FRAES.MAE** are '0'.

(4) **FRAES.IAE**

Input transfer Access Error

Writing '0' has no effect on the bit value.

This bit represent that there was an access error during an input data transfer.

[Clearing condition]
This bit is cleared when writing a '1' to **FRAES.IAE**.

[Setting condition]
This bit is set when a URAM access error was detected during an input transfer and the bits **FRAES.OAE**, **FRAES.FAE** and **FRAES.MAE** are '0'.

(5) **FRAES.EIDX**

Error InDeX

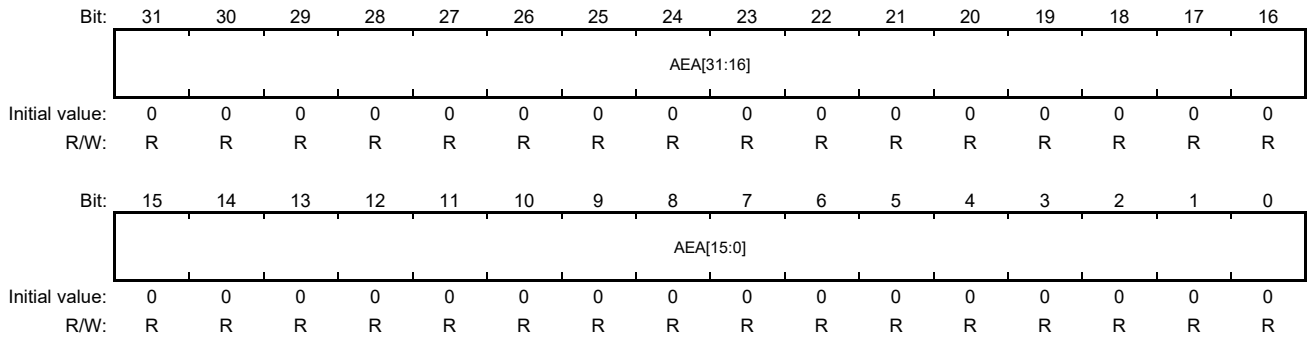
This value is only valid when one of the bits **FRAES.FAE**, **FRAES.OAE** or **FRAES.IAE** is '1'.

When the bit **FRAES.FAE** is '1', **FRAES.EIDX** holds the used FIFO put index when the access error has occurred.
When the bit **FRAES.OAE** is '1', **FRAES.EIDX** holds the used output table entry (which is related to message buffer number) when the access error has occurred.
When the bit **FRAES.IAE** is '1', **FRAES.EIDX** holds the used input pointer table get index when the access error has occurred during the input transfer or user requested input transfer.

These bits are updated when one of the bits **FRAES.FAE**, **FRAES.OAE** or **FRAES.IAE** is changing from '0' to '1'.

103.2.13.4 FRAEA [h'082C]

FlexRay Access Error Address register



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	AEA	0	R	Access Error Address Address in the URAM when an access error has occurred

(1) **FRAEA.AEA**

Access Error Address

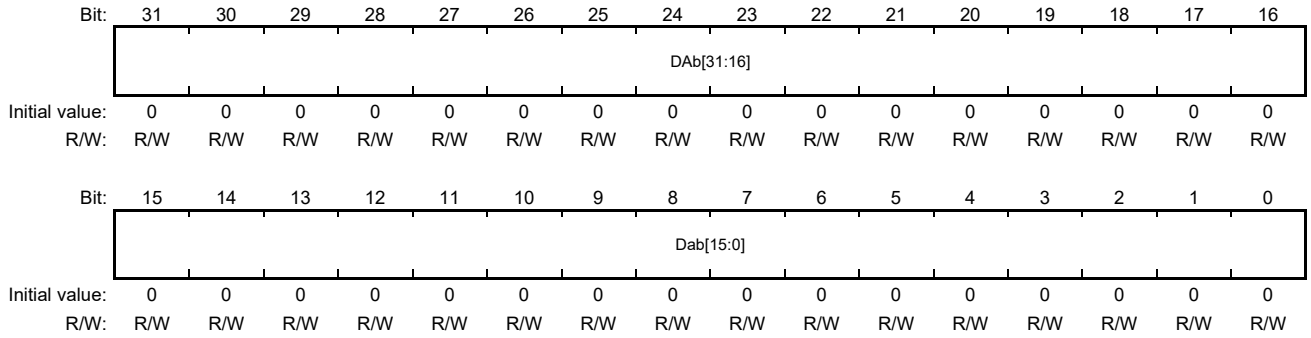
This value is only valid when one of the bits **FRAES.FAE**, **FRAES.OAE** or **FRAES.IAE** is '1'.

These bits represent the address of the access error indicated in the **FRAES** register.

These bits are updated when one of the bits **FRAES.FAE**, **FRAES.OAE** or **FRAES.IAE** is changing from '0' to '1'.

103.2.13.5 FRDAi (i=0 to 3) [h'0830 – h'083C]

FlexRay message Data Available register i (i 0 to 3)



Bit	Bit Name	Initial Value	R/W	Description
[31:0]	DAb	0	R/W	Data Available b 0 : No data available for destination 1 : Data available for destination

(1) **FRDAi.DAb (b = i*32 to ((i+1)*32)-1)**

Data Available b

The user should not write a '1' to bits that are '0'.
To maintain the status of input transfers, the user should not clear bits related to input transfers.

This register is used for input and output transfers.
Each flag corresponds to a FlexRay message buffer.

[Clearing condition]
Input transfer:
This bit is cleared when the input data structure has been transferred from the URAM. The data structure and the data structure pointer can be changed when the related flag is '0'.

Output transfer:
This bit is cleared when writing a '1' to it.

[Setting condition]
Input transfer:
This bit is set when the corresponding message buffer number has been written to **FRIQC.IMBNR**.
As long as this bit is '1', the input data structure and the data structure pointer corresponding to this input transfer request should not be changed.

Output transfer:
This bit is set when the output data structure corresponding to this message buffer has been updated.
As long as this bit is '1', the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is '1', the application is allowed to change the output data structure pointer in the output pointer table for this message buffer number.

103.3 Operation

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification [FR_PROT].

103.3.1 FlexRay module operation control

103.3.1.1 FlexRay Module enable

After hardware reset or after the FlexRay module has been disabled (following section 103.3.1.2) the FlexRay module is in the reset state (**FROS.OS** is '0') and the clocks of the FlexRay core module are disabled.

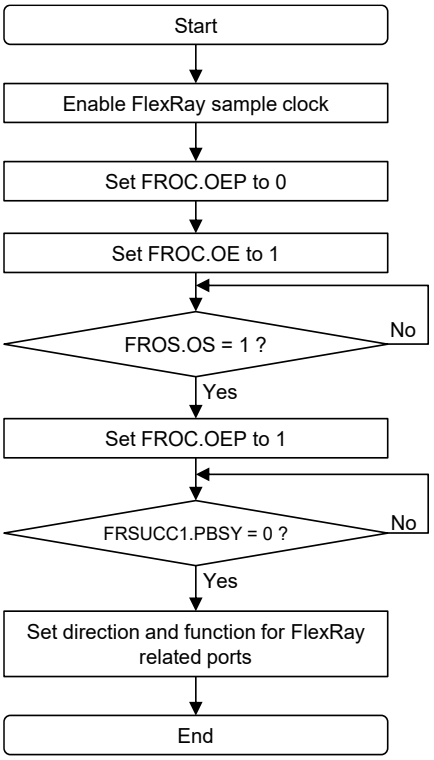


Figure 103.3 FlexRay enable flow

103.3.1.2 FlexRay Module disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the **FROC.OE** register only when the FlexRay module is in HALT, CONFIG or DEFAULT_CONFIG state. Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.
If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see section 103.3.16.1.(1) for suspending input transfer function and section 103.3.16.2.(1) for suspending output transfer).
The following flow should be executed to disable the FlexRay module.

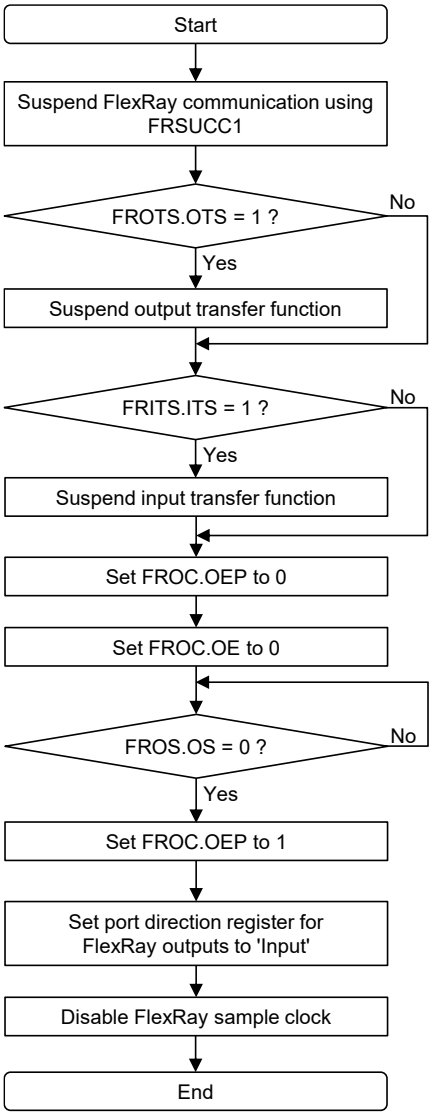

Figure 103.3.1 FlexRay disable flow

103.3.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to setup the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following elements:

Static Segment

Dynamic Segment (optional)

Symbol Window (optional)

Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid which means that they use the same synchronized macrotick.

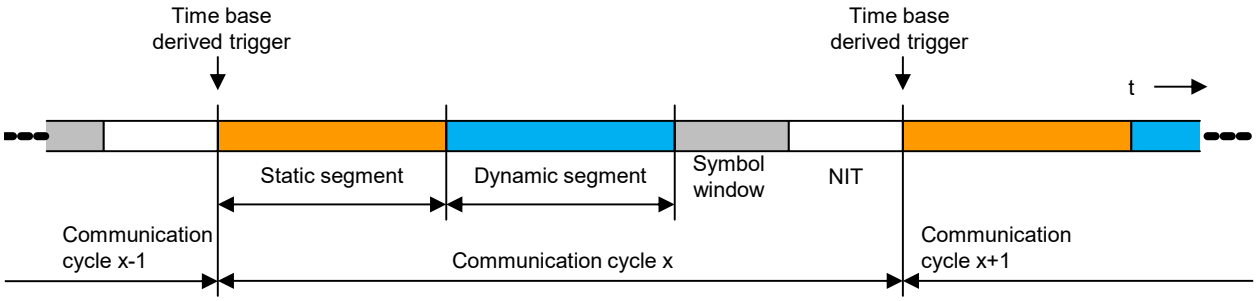

Figure 103.4 Structure of communication cycle

103.3.2.1 Static Segment

The Static Segment is characterized by the following features:

Time slots of fixed length (optionally protected by bus guardian)

Start of frame transmission at action point of the respective static slot

Payload length same for all frames on both channels

Parameters:

Number of Static Slots **FRGTUC7.NSS**, Static Slot Length **FRGTUC7.SSL**, Payload Length Static **FRMHDC.SFDL**, Action Point Offset **FRGTUC9.APO**

103.3.2.2 Dynamic Segment

The Dynamic Segment is characterized by the following features:

All controllers have bus access (no bus guardian protection possible)

Variable payload length and duration of slots, different for both channels

Start of transmission at minislot action point

Parameters:

Number of Minislots **FRGTUC8.NMS**, Minislot Length **FRGTUC8.MSL**, Minislot Action Point Offset **FRGTUC9.MAPO**, Start of Latest Transmit (last minislot) **FRMHDC.SLT**

103.3.2.3 Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are send in NORMAL_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

Send single symbol

Transmission of the MTS symbol starts at the symbol windows action point

Parameters:

Symbol Window Action Point Offset **FRGTUC9.APO** (same as for static slots), Network Idle Time Start **FRGTUC4.NIT**

103.3.2.4 Network Idle Time (NIT)

During network idle time the CC has to perform the following tasks:

Calculate clock correction terms (offset and rate)

Distribute offset correction over multiple macroticks after offset correction start

Perform cluster cycle related tasks
Parameters:

Network Idle Time Start **FRGTUC4.NIT**, Offset Correction Start **FRGTUC4.OCS**

103.3.2.5 Configuration of NIT Start and Offset Correction Start

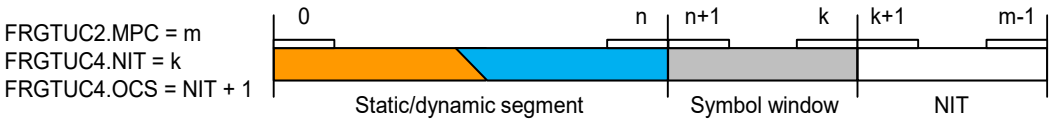

Figure 103.5 Configuration of NIT start and offset correction start

The number of macroticks per cycle gMacroPerCycle is assumed to be m. It is configured by programming **FRGTUC2.MPC** = m.

The static / dynamic segment starts with macrotick 0 and ends with macrotick n:
n = static segment length + dynamic segment offset + dynamic segment length - 1MT
n = gNumberOfStaticSlots • gdStaticSlot + dynamic segment offset + gNumberOfMinislots • gdMinislot - 1 MT

The static segment length is configured by **FRGTUC7.SSL** and **FRGTUC7.NSS**.
The dynamic segment length is configured by **FRGTUC8.MSL** and **FRGTUC8.NMS**.

The dynamic segment offset is:
If gdActionPointOffset <= gdMinislotActionPointOffset:

dynamic segment offset = 0 MT

Else if gdActionPointOffset > gdMinislotActionPointOffset:

dynamic segment offset = gdActionPointOffset -gdMinislotActionPointOffset

The NIT starts with macrotick k+1 and ends with the last macrotick of cycle m-1. It has to be configured by setting **FRGTUC4.NIT** = k.

For the FlexRay module the offset correction start is required to be **FRGTUC4.OCS** => **FRGTUC4.NIT** + 1 = k+1.

The length of symbol window results from the number of macroticks between the end of the static / dynamic segment and the beginning of the NIT. It can be calculated by k - n.

103.3.3 Communication Modes

The FlexRay Protocol Specification [FR_PROT] defines the Time-Triggered Distributed (TT-D) mode.

103.3.3.1 Time-triggered Distributed (TT-D)

In TT-D mode the following configurations are possible:

Pure static: Minimum 2 static slots + symbol window (optional)

Mixed static/dynamic: Minimum 2 static slots + dynamic segment + symbol window (optional)
A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

103.3.4 Clock Synchronization

In TT-D mode a distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

103.3.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time, even though each individual node maintains its own view of it. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values; the cycle (cycle counter) and the cycle time (macrotick counter).

Cluster specific:

Macrotick (MT) = basic unit of time measurement in a FlexRay network, a macrotick consists of an integer number of microticks (µT)

Cycle length = duration of a communication cycle in units of macroticks (MT)

103.3.4.2 Local Time

Internally, nodes time their behaviour with microtick resolution. Microticks are time units derived from the oscillator clock tick of the specific node. Therefore microticks are controller-specific units. They may have different duration in different controllers. The precision of a node's local time difference measurements is a microtick (µT).

Node specific:

Oscillator clock -> prescaler -> microtick (µT)

µT = basic unit of time measurement in a CC, clock correction is done in units of µTs

Cycle counter + macrotick counter = nodes local view of the global time

103.3.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster a sync node has to send its sync frame on both channels.

For synchronization in FlexRay the following constraints have to be considered:

Max. one sync frame per node in one communication cycle

Max. 15 sync frames per cluster in one communication cycle

Every node has to use a preconfigured number of sync frames (**FRGTUC2.SNM**) for clock synchronization

Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details see FlexRay protocol specification [FR_PROT], chapter 8.

(1) **Offset (phase) Correction**

Only deviation values measured and stored in the current cycle used

For a two channel node the smaller value will be taken

Calculation during NIT of every communication cycle

Offset correction value calculated in even cycles used for error checking only

Checked against limit values

Correction value is a signed integer number of µTs

Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction start up to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened / shortened)

(2) **Rate (frequency) Correction**

Pairs of deviation values measured and stored in even / odd cycle pair used
For a two channel node the average of the differences from the two channels is used
Calculated during NIT of odd numbered cycles
Cluster drift damping is performed using global damping value
Checked against limit values
Correction value is a signed integer number of µTs
Distributed over macroticks comprising the next even / odd cycle pair (MTs lengthened / shortened)

(3) **Sync Frame Transmission**

Sync frame transmission is only possible from Message buffer 0 and 1. Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case bit **FRMRC.SPLM** has to be programmed to '1'.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re)configured in DEFAULT_CONFIG or CONFIG state only. For nodes transmitting sync frames **FRSUCC1.TXSY** must be set to '1'.

(4) **External Clock Synchronization**

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary; even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

External offset / rate correction value is a signed integer
External offset / rate correction value is added to calculated offset / rate correction value
Aggregated offset / rate correction term (external + internal) is not checked against configured limits

103.3.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in one single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set **FREIR.PEMC** and may trigger an interrupt to the Host if enabled. The actual error mode is signaled by **FRCCEV.ERRM**.

Table 103.3 Error modes of the POC (degradation model)

Error Mode	Activity
ACTIVE	Full operation, State: NORMAL_ACTIVE The CC is fully synchronized and supports the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers **FREIR** and **FRSIR**.
PASSIVE	Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed The CC stops transmitting frames and symbols, but received frames are still processed. Clock synchronization mechanisms are continued based on received frames. No active contribution to the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers **FREIR** and **FRSIR**.
COMM_HALT	Operation halted, State: HALT, CC self rescue not allowed The CC stops frame and symbol processing, clock synchronization processing, and the macrotick generation. The host has still access to error and status information by reading the error and status interrupt flags from registers **FREIR** and **FRSIR**. The bus drivers are disabled.

103.3.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the "maximum without clock correction passive" limit defined by **FRSUCC3.WCP**, the POC transits from NORMAL_ACTIVE to NORMAL_PASSIVE state. When it reaches the "maximum without clock correction fatal" limit defined by **FRSUCC3.WCF**, it transits from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

The Clock Correction Failed Counter **FRCCEV.CCFC** allows the Host to monitor the duration of the inability of a node to compute clock correction terms after the CC passed protocol startup phase. It will be incremented by one at the end of any odd communication cycle during which either the missing offset correction **FRSFS.MOCS** or the missing rate correction **FRSFS.MRCS** flag is set.

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction **FRSFS.MOCS** nor the missing rate correction **FRSFS.MRCS** flag is set.

The Clock Correction Failed Counter stops incrementing when the "maximum without clock correction fatal" value **FRSUCC3.WCF** is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL_ACTIVE state is entered.

Note: The transition to HALT state is prevented if **FRSUCC1.HCSE** is not set.

103.3.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL_PASSIVE to NORMAL_ACTIVE state. **FRSUCC1.PTA** defines the number of consecutive even / odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state. If **FRSUCC1.PTA** is set to zero the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

103.3.5.3 HALT Command

In case the Host wants to stop FlexRay communication of the local node it can bring the CC into HALT state by asserting the HALT command. This can be done by writing **FRSUCC1.CMD** = "0110". In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to assure that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from **FRCCSV.PSL**.

When called in NORMAL_ACTIVE or NORMAL_PASSIVE state the POC transits to HALT state at the end of the current cycle. When called in any other state **FRSUCC1.CMD** will be reset to "0000" = command_not_accepted and bit **FREIR.CNA** is set to ’1’. If enabled an interrupt to the Host is generated.

103.3.5.4 FREEZE Command

In case the Host detects a severe error condition it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing **FRSUCC1.CMD** = "0111". The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from **FRCCSV.PSL**.

103.3.6 Communication Controller States

103.3.6.1 Communication Controller State Diagram

(1) **Reserved**

(2) **Reserved**

103.3.6.2 DEFAULT_CONFIG State

In DEFAULT_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

When the reset is applied (HW reset or SW reset)

When exiting from HALT state
To leave DEFAULT_CONFIG state the Host has to write **FRSUCC1.CMD** = "0001". The CC then transits to CONFIG state.

103.3.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

When exiting from DEFAULT_CONFIG state

When exiting from READY state
When the state has been entered via HALT and DEFAULT_CONFIG state, the Host can analyse status information and configuration. Before leaving CONFIG state the Host has to assure that the configuration is fault-free.

To leave CONFIG state, the Host has to perform the unlock sequence as described is section 103.2.2.1. Directly after unlocking the CONFIG state the Host has to write **FRSUCC1.CMD** to enter the next state.

Note: Status bits **FRMHDS[14:0]**, registers **FRTXRQ1/2/3/4**, and status data stored in the Message RAM are not affected by the transition of the POC from CONFIG to READY state.

When the CC is in CONFIG state it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this the Host has to assure that all Message RAM transfers have finished before turning off the clocks.

103.3.6.4 READY State

After unlocking CONFIG state and writing **FRSUCC1.CMD** = "0010" the CC enters READY state. From this state the CC can transit to WAKEUP state and perform a cluster wakeup or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

When exiting from CONFIG, WAKEUP, STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state by writing **FRSUCC1.CMD** = "0010" (READY command).

The CC exits from this state

To CONFIG state by writing **FRSUCC1.CMD** = "0001" (CONFIG command)

To WAKEUP state by writing **FRSUCC1.CMD** = "0011" (WAKEUP command)

To STARTUP state by writing **FRSUCC1.CMD** = "0100" (RUN command)
Internal counters and the CC status flags are reset when the CC enters STARTUP state.

Note: Status bits **FRMHDS[14:0]**, registers **FRTXRQ1/2/3/4**, and status data stored in the Message RAM are not affected by the transition of the POC from READY to STARTUP state.

103.3.6.5 WAKEUP State

The description below is intended to help configuring wakeup for the FlexRay IP-module. A detailed description of the wakeup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification [FR_PROT], section 7.1.

The CC enters this state

When exiting from READY state by writing **FRSUCC1.CMD** = "0011" (WAKEUP command).

The CC exits from this state to READY state

After complete non-aborted transmission of wakeup pattern

After WUP reception

After detecting a WUP collision

After reception of a frame header

By writing **FRSUCC1.CMD** = "0010" (READY command)

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The Host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and CC to perform the cluster wakeup. The CC provides to the Host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup may be performed on only one channel at a time. The Host has to configure the wakeup channel while the CC is in CONFIG state by writing **FRSUCC1.WUCS**. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup the CC returns to READY state and signals the change of the wakeup status to the Host by setting flag **FRSIR.WST**. The wakeup status vector can be read from **FRCCSV.WSV**. If a valid wakeup pattern was received also either flag **FRSIR.WUPA** or flag **FRSIR.WUPB** is set.

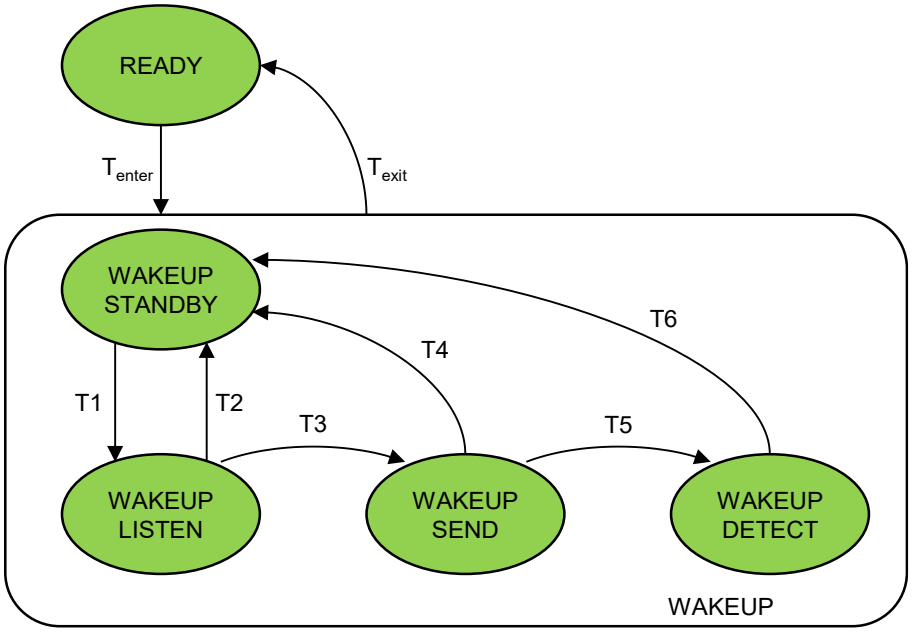

Figure 103.6 Structure of POC state WAKEUP

Table 103.6 State transitions WAKEUP

T#	Condition	From	To
enter	Host commands change to WAKEUP state by writing **FRSUCC1.CMD** = "0011" (WAKEUP command)	READY	WAKEUP
1	CHI command WAKEUP triggers wakeup FSM to transit to WAKEUP_LISTEN state	WAKEUP_STANDBY	WAKEUP_LISTEN
2	Received WUP on wakeup channel selected by bit **FRSUCC1.WUCS** OR frame header on either available channel	WAKEUP_LISTEN	WAKEUP_STANDBY
3	Timer event	WAKEUP_LISTEN	WAKEUP_SEND
4	Complete, non-aborted transmission of wakeup pattern	WAKEUP_SEND	WAKEUP_STANDBY
5	Collision detected	WAKEUP_SEND	WAKEUP_DETECT
6	Wakeup timer expired OR WUP detected on wakeup channel selected by bit **FRSUCC1.WUCS** OR frame header received on either available	WAKEUP_DETECT	WAKEUP_STANDBY
exit	Wakeup completed (after T2 or T4 or T6) OR Host commands change to READY state by writing **FRSUCC1.CMD** = "0010" (READY command). This command also resets the wakeup FSM to WAKEUP_STANDBY state	WAKEUP	READY

The WAKEUP_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the parameters listen timeout **FRSUCC2.LT** and listen timeout noise **FRSUCC2.LTN**. Listen timeout enables a fast cluster wakeup in case of a noise free environment, while listen timeout noise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP_SEND state the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup the Host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP_DETECT state the CC attempts to identify the reason for the wakeup collision detected in WAKEUP_SEND state. The monitoring is bounded by the expiration of listen timeout as configured by **FRSUCC2.LT**. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header

indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP_DETECT is left after expiration of listen timeout; in this case the reason for wakeup collision is unknown.

The Host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification [FR_PROT] recommends that two different CCs shall awake the two channels.

(1) **Host activities**

The host must coordinate the wakeup of the two channels and must decide whether, or not, to wake a specific channel. The sending of the wakeup pattern is initiated by the Host. The wakeup pattern is detected by the remote BDs and signaled to their local Host.

Wakeup procedure controlled by Host (single-channel wakeup):

Configure the CC in CONFIG state
- Select wakeup channel by programming bit **FRSUCC1.WUCS**

Check local BDs whether a WUP was received

Activate BD of selected wakeup channel

Command CC to enter READY state

Command CC to start wakeup on the configured channel by writing **FRSUCC1.CMD** = "0011"
- CC enters WAKEUP
- CC returns to READY state and signals status of wakeup attempt to the Host

Wait predefined time to allow the other nodes to wakeup and configure themselves

Coldstart node:
- In a dual channel cluster wait for WUP on the other channel
- Reset coldstart inhibit flag **FRCCSV.CSI** by writing **FRSUCC1.CMD** = "1001" (ALLOW_COLDSTART command)

Command CC to enter startup by writing **FRSUCC1.CMD** = "0100" (RUN command)

Wakeup procedure triggered by BD:

Wakeup recognized by BD

BD triggers power-up of Host (if required)

BD signals wakeup event to Host

Host configures its local CC

If necessary, Host commands wakeup of second channel and waits predefined time to allow the other nodes to wakeup and configure themselves

Host commands CC to enter STARTUP state by writing **FRSUCC1.CMD** = "0100" (RUN command)

(2) **Wakeup pattern (WUP)**

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers **FRPRTC1** and **FRPRTC2**.

Single channel wakeup, wakeup symbol may not be sent on both channels at the same time

Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)

Wakeup symbol must be configured identical in all nodes of a cluster

Wakeup symbol transmit low time configured by **FRPRTC2.TXL**

Wakeup symbol idle time used to listen for activity on the bus, configured by **FRPRTC2.TXI**

A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup

Number of repetitions configurable by **FRPRTC1.RWP** (2 to 63 repetitions)

Wakeup symbol receive window length configured by **FRPRTC1.RXW**

Wakeup symbol receive low time configured by **FRPRTC2.RXL**

Wakeup symbol receive idle time configured by **FRPRTC2.RXI**

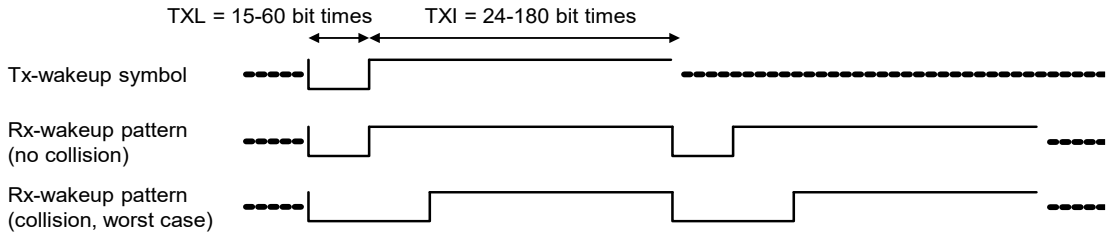

Figure 103.7 Timing of wakeup pattern

103.3.6.6 STARTUP State

The description below is intended to help configuring startup for the FlexRay IP-module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification [FR_PROT], section 7.2.

Any node entering STARTUP state that has coldstart capability should assure that both channels attached have been awakened before initiating coldstart.

It cannot be assumed that all nodes and stars need the same amount of time to become completely awake and to be configured. Since at least two nodes are necessary to start up the cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is specified for initial synchronization of all nodes. In general, a node may enter NORMAL_ACTIVE state via (see Figure 103.8):

Coldstart path initiating the schedule synchronization (leading coldstart node)

Coldstart path joining other coldstart nodes (following coldstart node)

Integration path integrating into an existing communication schedule (all other nodes)

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits **FRSUCC1.TXST** and **FRSUCC1.TXSY** set to ’1’. Message buffer 0 holds the key slot ID which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set.

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to startup.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by **FRSUCC1.CSA**.

A non-coldstart node requires at least two startup frames from distinct nodes for integration. It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start passive integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable at the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

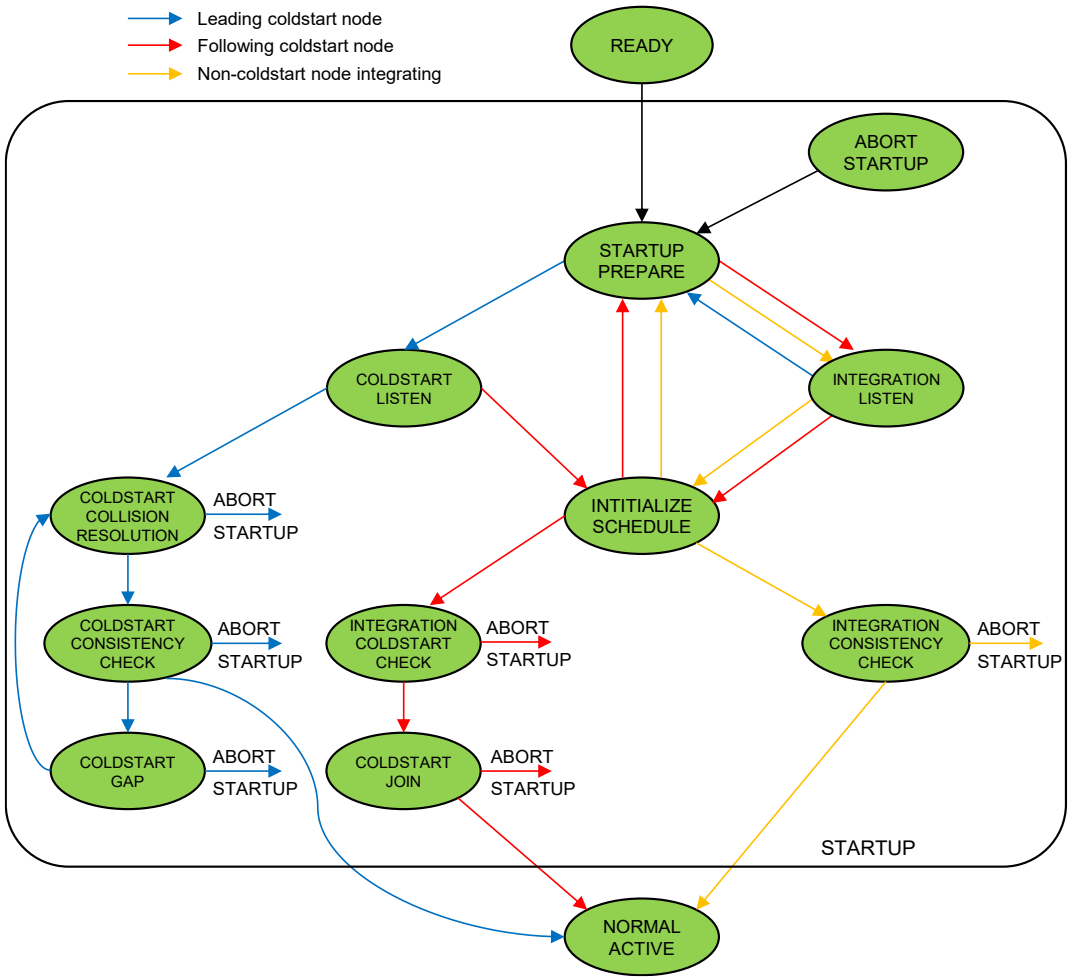

Figure 103.8 State diagram time-triggered startup

(1) **Coldstart Inhibit Mode**

In coldstart inhibit mode the node is prevented from initializing the TDMA communication schedule. If bit **FRCCSV.CSI** is set, the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit **FRCCSV.CSI** is set whenever the POC enters READY state. The bit has to be cleared under control of the Host by CHI command ALLOW_COLDSTART (**FRSUCC1.CMD** = "1001")

(2) **Startup Timeouts**

The CC supplies two different µT timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART_LISTEN state) with the intention of starting up communication.

Note: The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values **FRSUCC2.LT** and **FRSUCC2.LTN**.

(a) Startup Timeout

The startup timeout limits the listen time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming **FRSUCC2.LT** (see section 103.2.5.2).

The startup timeout is:
pdListenTimeout = **FRSUCC2.LT**

The startup timer is restarted upon:

Entering the COLDSTART_LISTEN state

Both channels reaching idle state while in COLDSTART_LISTEN state
The startup timer is stopped:

If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART_LISTEN state

When the COLDSTART_LISTEN state is left
Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

(b) Startup Noise Timeout

At the same time the startup timer is started for the first time (transition from STARTUP_PREPARE state to COLDSTART_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming **FRSUCC2.LTN** (see section 103.2.5.2).

The startup noise timeout is:
pdListenTimeout * gListenNoise = **FRSUCC2.LT** * (**FRSUCC2.LTN** + 1)

The startup noise timer is restarted upon:

Entering the COLDSTART_LISTEN state

Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART_LISTEN state
The startup noise timer is stopped when the COLDSTART_LISTEN state is left.

Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer won't be restarted when random

channel activity is sensed, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

(3) **Path of leading Coldstart Node (initiating coldstart)**

When a coldstart node enters COLDSTART_LISTEN, it listens to its attached channels.

If no communication is detected, the node enters the COLDSTART_COLLISION_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART_COLLISION_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART_CONSISTENCY_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART_CONSISTENCY_CHECK and enters NORMAL_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by **FRSUCC1.CSA**. The number of remaining coldstarts attempts can be read from **FRCCSV.RCA**. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART_LISTEN state only if this value is larger than one and it may enter the COLDSTART_COLLISION_RESOLUTION state only if this value is larger than zero. If the number of coldstart attempts is one, coldstart is inhibited but integration is still possible.

(4) **Path of following Coldstart Node (responding to leading Coldstart Node)**

When a coldstart node enters the COLDSTART_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_COLDSTART_CHECK state is entered.

In INTEGRATION_COLDSTART_CHECK state it is assured that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still available. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART_JOIN state is entered.

In COLDSTART_JOIN state following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules agree with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node leaves COLDSTART_JOIN state and enters NORMAL_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

(5) **Path of Non-coldstart Node**

When a non-coldstart node enters the INTEGRATION_LISTEN state, it listens to its attached channels.

As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_CONSISTENCY_CHECK state is entered.

In INTEGRATION_CONSISTENCY_CHECK state the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2) are sending startup frames that agree with the node's own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to see two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

103.3.6.7 NORMAL_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even / odd cycle pairs required).

In NORMAL_ACTIVE state the CC supports regular communication functions

The CC performs transmissions and reception on the FlexRay bus as configured

Clock synchronization is running

The Host interface is operational

The CC exits from that state to

HALT state by writing **FRSUCC1.CMD** = "0110" (HALT command, at the end of the current cycle)

HALT state by writing **FRSUCC1.CMD** = "0111" (FREEZE command, immediately)

HALT state due to change of the error state from ACTIVE to COMM_HALT

NORMAL_PASSIVE state due to change of the error state from ACTIVE to PASSIVE

READY state by writing **FRSUCC1.CMD** = "0010" (READY command)

103.3.6.8 NORMAL_PASSIVE State

NORMAL_PASSIVE state is entered from NORMAL_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

In NORMAL_PASSIVE state

The CC performs reception on the FlexRay bus

The CC does not transmit any frames or symbols on the FlexRay bus

Clock synchronization is running

The Host interface is operational

The CC exits from this state to
HALT state by writing **FRSUCC1.CMD** = "0110" (HALT command, at the end of the current cycle)
HALT state by writing **FRSUCC1.CMD** = "0111" (FREEZE command, immediately)
HALT state due to change of the error state from PASSIVE to COMM_HALT
NORMAL_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when **FRCCEV.PTAC** equals **FRSUCC1.PTA** - 1
To READY state by writing **FRSUCC1.CMD** = "0010" (READY command)

103.3.6.9 HALT State

In this state all communication (reception and transmission) is stopped.

The CC enters this state
By writing **FRSUCC1.CMD** = "0110" (HALT command) while the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state
By writing **FRSUCC1.CMD** = "0111" (FREEZE command) from all states
When exiting from NORMAL_ACTIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and **FRSUCC1.HCSE** is set
When exiting from NORMAL_PASSIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and **FRSUCC1.HCSE** is set
The CC exits from this state to DEFAULT_CONFIG state
By writing **FRSUCC1.CMD** = "0001" (CONFIG command)
When the CC enters HALT state, all configuration and status data is maintained for analysing purposes.

When the Host writes **FRSUCC1.CMD** = "0110" (HALT command), the CC sets bit **FRCCSV.HRQ** and enters HALT state at the next end of cycle.

When the Host writes **FRSUCC1.CMD** = "0111" (FREEZE command), the CC enters HALT state immediately and sets bit **FRCCSV.FSI**.

The POC state from which the transition to HALT state took place can be read from **FRCCSV.PSL**.

103.3.7 Network Management

The accrued Network Management (NM) vector can be read from registers **FRNMV1/2/3**. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle.

The length of the NM vector can be configured from 0 to 12 bytes by **FRNEMC.NML**. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set, bit PPIT in the header section of the respective transmit buffer has to be set via **FRWRHS1.PPIT**. In addition the Host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the Host.

For information about the byte alignment of the received NM vector in the **FRNMV1/2/3** registers see section 103.3.17.

Note 1: In case a message buffer is configured for transmission / reception of network management frames, the payload length configured in header 2 of that message buffer should be equal or greater than the length of the NM vector configured by **FRNEMC.NML**.

Note 2: When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case **FRNMV1/2/3** holds the value from the cycle before.

103.3.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated / transmitted if the required matches occur.

Filtering is done on:

Slot Counter

Cycle Counter

Channel ID

The following filter combinations for acceptance / transmit filtering are allowed:

Slot Counter + Channel ID

Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

Note: For the FIFO the acceptance filter is configured by the FIFO Rejection Filter (**FRFRF**) and the FIFO Rejection Filter Mask (**FRFRFM**).

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled the configured cycle filter value must also match.

103.3.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

103.3.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the notion of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 resp. 1 is configured to hold the startup / sync frame or the single slot frame by bits **FRSUCC1.TXST**, **FRSUCC1.TXSY**, and **FRSUCC1.TSM**, cycle counter filtering for message buffer 0 resp. 1 shall be disabled.

Note: Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.

The set of cycle numbers belonging to a cycle set is determined as described in Table 103.7.

Table 103.7 Definition of cycle set

Cycle Code	Matching Cycle Counter Values
0b000000x	all Cycles
0b000001c	every second Cycle at (Cycle Count)mod2 = c

0b00001cc	every fourth Cycle	at (Cycle Count)mod4	= cc
0b0001ccc	every eighth Cycle	at (Cycle Count)mod8	= ccc
0b001cccc	every sixteenth Cycle	at (Cycle Count)mod16	= cccc
0b01ccccc	every thirty-second Cycle	at (Cycle Count)mod32	= ccccc
0b1cccccc	every sixty-fourth Cycle	at (Cycle Count)mod64	= cccccc

Table 103.8 below gives some examples for valid cycle sets to be used for cycle counter filtering:

Table 103.8 Examples for valid cycle sets

Cycle Code	Matching Cycle Counter Values
0b0000011	1-3-5-7- …. -63
0b0000100	0-4-8-12- …. -60
0b0001110	6-14-22-30- …. -62
0b0011000	8-24-40-56
0b0100011	3-35
0b1001001	9

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer's cycle set. Other filter criteria must also be met.

The content of a transmit buffer is transmitted on the configured channel(s) when an element of the cycle set matches the current cycle counter value. Other filter criteria must also be met.

103.3.8.3 Channel ID Filtering

There is a 2-bit channel filtering field (CH) located in the header section of each message buffer in the Message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers (see Table 103.9).

Table 103.9 Channel filtering configuration

CH[1:0]	Transmit Buffer transmit frame	Receive Buffer store valid receive frame
00	no transmission	ignore frame
01	on channel A	received on channel A
10	on channel B	received on channel B
11	on both channels (static segment only)	received on channel A or B (store first semantically valid frame, static segment only)

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels (CH = "11").

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels (CH = "11").

Note: If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to '1', no frames are transmitted resp. received frames are ignored (same function as CH = "00").

103.3.8.4 FIFO Filtering

For FIFO filtering there is one rejection filter and one rejection filter mask available. The FIFO filter consists of channel filter **FRFRF.CH**, frame ID filter **FRFRF.FID**, and cycle counter filter **FRFRF.CYF**. Registers **FRFRF** and **FRFRFM** can be configured in DEFAULT_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by **FRFRF.CYF**, all frames are rejected.

A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by the configured rejection filter and rejection filter mask, and if there is no matching dedicated receive buffer.

103.3.9 Transmit Process

103.3.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

103.3.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

The start of latest transmit configured by **FRMHDC.SLT** defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

103.3.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the respective message buffer to ’1’ via **FRWRHS1**.

There exist the following possibilities to assign a transmit buffer to the CC channels:

Static segment: channel A or channel B,
channel A and channel B

Dynamic segment: channel A or channel B

Message buffer 0 resp. 1 is dedicated to hold the startup frame, the sync frame, or the designated single slot frame as configured by **FRSUCC1.TXST**, **FRSUCC1.TXSY**, and **FRSUCC1.TSM**. In this case, it can be reconfigured in DEFAULT_CONFIG or CONFIG state only. This ensures that any node transmits at most one startup / sync frame per communication cycle. Transmission of startup / sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of **FRMRC.SEC** (see section 103.3.12.1). Due to the organization of the data partition in the Message RAM (reference by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not send out in the respective communication cycle.

The CC does not have the capability to calculate the header CRC. The Host is supposed to provide the header CRCs for all transmit buffers. If network management is required, the Host has to set the **FRWRHS1.PPIT** bit in the header

section of the respective message buffer to ’1’ and write the network management information to the data section of the message buffer (see section 103.3.7).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by **FRMHDC.SFDL**, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is logical zero.

Note: In case of an odd payload length (**FRWRHS2.PLC** = 1,3,5,...) the application has to write zero to the last 16 bit of the message buffers data section to ensure that the padding pattern is all zero.

Each transmit buffer provides a transmission mode flag **FRWRHS1.TXM** that allows the Host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in the single-shot mode. If this bit is cleared, the transmitter operates in the continuous mode.

In single-shot mode the CC resets the respective **TXR** flag after transmission has completed. Now the Host may update the transmit buffer.

In continuous mode, the CC does not reset the respective transmission request flag **TXR** after successful transmission. In this case a frame is sent out each time the filter criteria match. The **TXR** flag can be reset by the Host by writing the respective message buffer number to the **FRIBCR** register while bit **FRIBCM.STXRH** is set to ’0’.

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

103.3.9.4 Frame Transmission

The following steps are required to prepare a message buffer for transmission:
Configure the transmit buffer in the Message RAM via **FRWRHS1**, **FRWRHS2**, and **FRWRHS3**
Write the data section of the transmit buffer via **FRWRDSn**
Transfer the configuration and message data from Input Buffer to the Message RAM by writing the number of the target message buffer to register **FRIBCR**
If configured in register **FRIBCM**, the transmission request flag **TXR** for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
Check whether the message buffer has been transmitted by checking the respective **TXR** bit (**FRTXRQn.TXR** = ’0’) in the **FRTXRQ1/2/3/4** registers (single-shot mode only).
After transmission has completed, the respective **TXR** flag in the **FRTXRQ1/2/3/4** register is reset (single-shot mode), and, if bit **MBI** in the header section of the message buffer is set, flag **FRSIR.TXI** is set to ’1’. If enabled, an interrupt is generated.

103.3.9.5 Null Frame Transmission

If in static segment the Host does not set the transmission request flag before transmit time, the CC transmits a null frame with the null frame indication bit set to ’0’ and the payload data set to zero.

In the following cases the CC transmits a null frame:
If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set (**TXR** = ’0’).
No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status **FRMBS** is updated.
Null frames are not transmitted in the dynamic segment.

103.3.10 Receive Process

103.3.10.1 Dedicated Receive Buffers

A portion of the FlexRay message buffers can be configured as dedicated receive buffers by programming bit **CFG** in the header section of the respective message buffer to ’0’ via **FRWRHS1**.

The following possibilities exist to assign a receive buffer to the CC channels:

Static segment: channel A or channel B,
channel A and channel B (the CC stores the first semantically valid frame)

Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of **FRMRC.SEC** (see section 103.3.12.1). If a message buffer is reconfigured (header section updated) during runtime it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

103.3.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

Configure the receive buffer in the Message RAM via **FRWRHS1**, **FRWRHS2**, and **FRWRHS3**

Transfer the configuration from Input Buffer to the Message RAM by writing the number of the target message buffer to register **FRIBCR**

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective **ND** flag in the **FRNDAT1/2/3/4** registers is set, and, if bit **MBI** in the header section of that message buffer is set, flag **FRSIR.RXI** is set to ’1’. If enabled, an interrupt is generated.

In case that bit **ND** was already set when the Message Handler updates the message buffer, bit **FRMBS.MLST** of the respective message buffer is set and the unprocessed message data is lost.

If no frame, a null frame, or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status **FRMBS** is updated.

When the Message Handler changed the message buffer status **FRMBS** in the header section of a message buffer, the respective **MBC** flag in the **FRMBSC1/2/3/4** registers is set, and if bit **MBI** in the header section of that message buffer is set, flag **FRSIR.MBSI** is set to ’1’. If enabled an interrupt is generated.

If the payload length of a received frame **PLR** is longer than the value programmed by **PLC** in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the Message RAM via the Output Buffer, proceed as described in section 103.3.12.2.(2).

Note: The **ND** and **MBC** flags are automatically cleared by the Message Handler when the payload data and the header of a received message have been transferred to the Output Buffer, respectively.

103.3.10.3 Null Frame Reception

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status **FRMBS** of the matching message buffer is updated from the received null frame. All bits in header 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the Message Handler changed the message buffer status **FRMBS** in the header section of a message buffer, the respective **MBC** flag in the **FRMBSC1/2/3/4** register is set, and if bit **MBI** in the header section of that message buffer is set, flag **FRSIR.MBSI** is set to '1'. If enabled, an interrupt is generated.

103.3.11 FIFO Function

103.3.11.1 Description

A group of the message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by **FRMRC.FFB** and ending with the message buffer referenced by **FRMRC.LCB**. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case frame ID, payload length, receive cycle count, and the message buffer status **FRMBS** of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. Bit **FRSIR.RFNE** shows that the FIFO is not empty, bit **FRSIR.RFCL** is set when the receive FIFO fill level **FRFSR.RFFL** is equal or greater than the critical level as configured by **FRFCL.CL**, bit **FREIR.RFO** shows that a FIFO overrun has been detected. If enabled, interrupts are generated.

If null frames are not rejected by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the Output Buffer. The PUT Index Register and the GET Index Register are not accessible by the Host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag **FREIR.RFO**.

A FIFO non empty status is detected when the PUT index (PIDX) differs from the GET index (GIDX). In this case flag **FRSIR.RFNE** is set. This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in Figure 103.9 for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (**FRFRF**) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit **FRFRF.RSS** is set to '1', all messages received in the static segment are rejected by the FIFO. If bit **FRFRF.RNF** is set to '1', received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (**FRFRFM**) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked 'don't care' for rejection filtering.

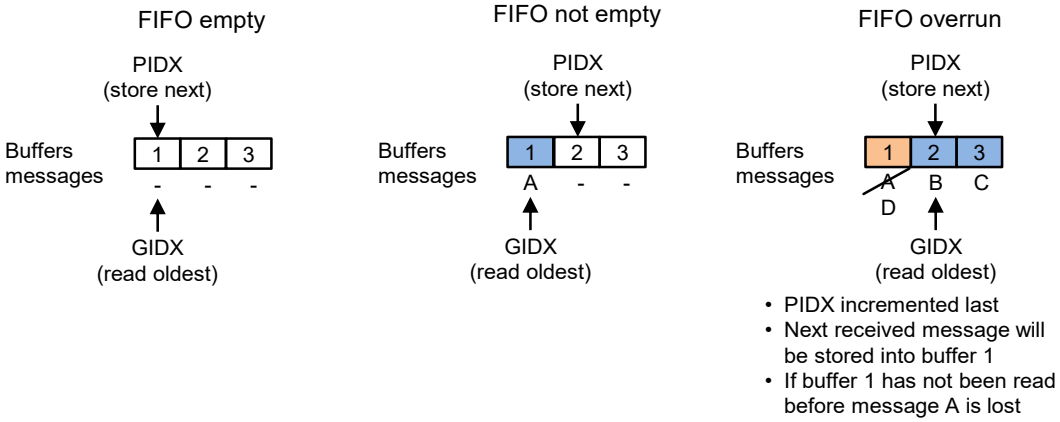

Figure 103.9 FIFO status: empty, not empty, overrun

103.3.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT_CONFIG or CONFIG state. While the CC is in DEFAULT_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured should be programmed to the same value via **FRWRHS2.PLC**. The data pointer to the first 32-bit word of the data section of the respective message buffer in the Message RAM has to be configured via **FRWRHS3.DP**.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask. The values configured in the header sections of the message buffers belonging to the FIFO are, with exception of **DP** and **PLC**, irrelevant.

Note 1: It is recommended to program the **MBI** bits of the message buffers belonging to the FIFO to ’0’ via **FRWRHS1.MBI** to avoid generation of RX interrupts.

Note 2: If the payload length of a received frame is longer than the value programmed by **FRWRHS2.PLC** in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.

103.3.11.3 Access to the FIFO

(1) **Using output buffer**

For FIFO access outside DEFAULT_CONFIG and CONFIG state, the Host has to trigger a transfer from the Message RAM to the Output Buffer by writing the number of the first message buffer of the FIFO (referenced by **FRMRC.FFB**) to the register **FROBCR**. The Message Handler then transfers the message buffer addressed by the GET Index Register (GIDX) to the Output Buffer. After this transfer the GET Index Register (GIDX) is incremented.

(2) **Using data transfer function**

Messages received into the FIFO can be also transferred into the URAM using the Output data transfer function as described in section 103.3.16.2.

103.3.12 Message Handling

The Message Handler controls data transfers between the Input / Output Buffer and the Message RAM and between the Message RAM and the two Transient Buffers.

Access to the message buffers stored in the Message RAM is done under control of the Message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the Host to the Message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to **FRGTUC7.NSS**. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from **FRGTUC7.NSS** + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

This section describes the Host access to the Message buffer content using the input buffer and output buffer function. In section 103.3.16 the access to the Message buffer content using the data transfer function is described.

103.3.12.1 Reconfiguration of Message Buffers

In case that an application needs to operate with more than 128 different messages, static and dynamic message buffers may be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via Input Buffer registers **FRWRHS1**/**2**/**3**.

Reconfiguration has to be enabled via control bits **FRMRC.SEC** in the Message RAM Configuration register.

If a message buffer has not been transmitted / updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission / reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted / updated from a received frame in the cycle where it was reconfigured.

The Message RAM is scanned according to Table 103.10 below:

Table 103.10 Scan of Message RAM

Start of Scan in Slot	Scan for Slots
1	2…15, 1 (next cycle)
8	16…23, 1 (next cycle)
16	24…31, 1 (next cycle)
24	32…39, 1 (next cycle)
…	…

A Message RAM scan is terminated with the start of NIT regardless whether it has completed or not. The scan of the Message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the Message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the Message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by **FRMRC.FDB**. In case a Message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by **FRMRC.FDB**.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the following has to be considered:
If the message buffer to be reconfigured for slot 1 is part of the "Static Buffers", it will only be found if it is reconfigured

before the last Message RAM scan in the static segment of the actual cycle evaluates this message buffer.
If the message buffer to be reconfigured for slot 1 is part of the "Static + Dynamic Buffers", it will be found if it is reconfigured before the last Message RAM scan in the actual cycle evaluates this message buffer.
The start of NIT terminates the Message RAM scan. In case the Message RAM scan has not evaluated the reconfigured message buffer until this point in time, the message buffer will not be considered for the next cycle.

Note: Reconfiguration of message buffers may lead to the loss of messages and therefore has to be used very carefully. In worst case (reconfiguration in consecutive cycles) it may happen that a message buffer is never transmitted / updated from a received frame.

103.3.12.2 Host access to Message RAM

The message transfer between Input Buffer and Message RAM as well as between Message RAM and Output Buffer is triggered by the Host by writing the number of the target / source message buffer to be accessed to **FRIBCR** or **FROBCR** register.

The **FRIBCM** and **FROBCM** registers can be used to write / read header and data section of the selected message buffer separately.

If bit **FRIBCM.STXR** is set to = '1', the transmission request flag **FRTXRQn.TXR** of the selected message buffer is automatically set after the message buffer has been updated. If bit **FRIBCM.STXR** is reset to '0', the transmission request flag **FRTXRQn.TXR** of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.

Input Buffer (IBF) and Output Buffer (OBF) are build up as a double buffer structure. One half of this double buffer structure is accessible by the Host (IBF Host / OBF Host), while the other half (IBF Shadow / OBF Shadow) is accessed by the Message Handler for data transfers between IBF / OBF and Message RAM.

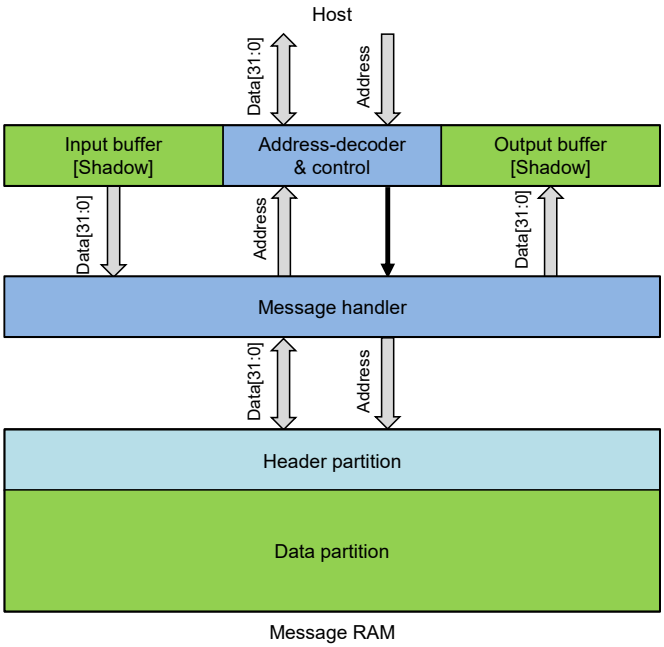

Figure 103.10 Host access to Message RAM

(1) **Data Transfer from Input Buffer to Message RAM**

To configure / update a message buffer in the Message RAM, the Host has to write the data to **FRWRDSn** and the header to **FRWRHS1**/**2**/**3**. The specific action is selected by configuring the FlexRay Input Buffer Command Mask **FRIBCM**.

When the Host writes the number of the target message buffer in the Message RAM to **FRIBCR.IBRH**, IBF Host and IBF Shadow are swapped (see Figure 103.11).

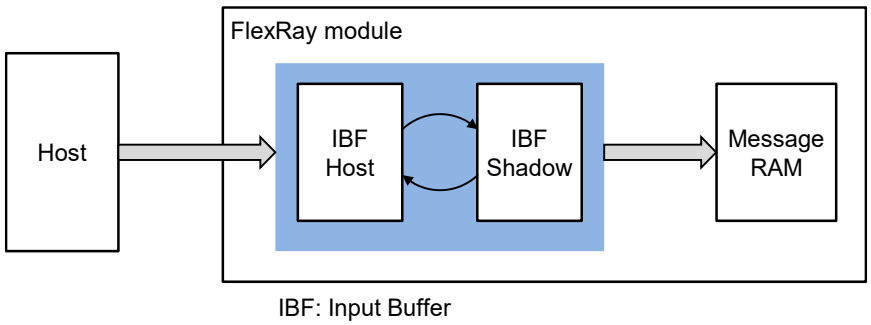

Figure 103.11 Double buffer structure Input Buffer

In addition the bits in the **FRIBCM** and **FRIBCR** registers are also swapped to keep them attached to the respective IBF section (see Figure 103.12).

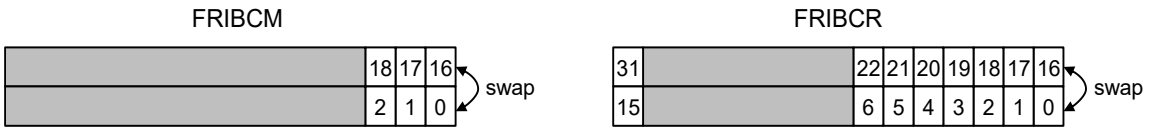

Figure 103.12 Swapping of FRIBCM and FRIBCR bits

With this write operation bit **FRIBCR.IBSYS** is set to '1'. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by **FRIBCR.IBRS**.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message to IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit **FRIBCR.IBSYS** is set back to '0' and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to **FRIBCR.IBRH**.

If a write access to **FRIBCR.IBRH** occurs while **FRIBCR.IBSYS** is '1', **FRIBCR.IBSYH** is set to '1'. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, **FRIBCR.IBSYH** is reset to '0', **FRIBCR.IBSYS** remains set to '1', and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under **FRIBCR.IBRH** and **FRIBCR.IBRS** and the command mask flags are also swapped.

Example of a 8/16/32-bit Host access sequence:
Configure / update n-th message buffer via IBF
Wait until **FRIBCR.IBSYH** is reset
Write data section to **FRWRDSn**
Write header section to **FRWRHS1/2/3**
Write Command Mask: write **FRIBCM.STXRH**, **FRIBCM.LDSH**, **FRIBCM.LHSH**
Demand data transfer to target message buffer: write **FRIBCR.IBRH**
Configure / update (n+1)th message buffer via IBF
Wait until **FRIBCR.IBSYH** is reset
Write data section to **FRWRDSn**
Write header section to **FRWRHS1/2/3**

Write Command Mask: write **FRIBCM.STXRH**, **FRIBCM.LDSH**, **FRIBCM.LHSH**

Demand data transfer to target message buffer: write **FRIBCR.IBRH**

…

Note: Any write access to IBF while **FRIBCR.IBSYH** is '1' will set error flag **FREIR.IIBA** to '1'. In this case the write access has no effect.

Table 103.11 Assignment of FRIBCM bits

Pos.	Access	Bit	Function
18	r	STXRS	Set Transmission Request Shadow ongoing or finished
17	r	LDSS	Load Data Section Shadow ongoing or finished
16	r	LHSS	Load Header Section Shadow ongoing or finished
2	r/w	STXRH	Set Transmission Request Host
1	r/w	LDSH	Load Data Section Host
0	r/w	LHSH	Load Header Section Host

Table 103.12 Assignment of FRIBCR bits

Pos.	Access	Bit	Function
31	r	IBSYS	IBF Busy Shadow, signals ongoing transfer from IBF Shadow to Message RAM
22…16	r	IBRS	IBF Request Shadow, number of message buffer currently / lately updated
15	r	IBSYH	IBF Busy Host, transfer request pending for message buffer referenced by IBRH
6…0	r/w	IBRH	IBF Request Host, number of message buffer to be updated next

(2) **Data Transfer from Message RAM to Output Buffer**

To read a message buffer from the Message RAM, the Host has to write to register **FROBCR** to trigger the data transfer as configured in **FROBCM**. After the transfer has completed, the Host can read the transferred data from **FRRDDSn**, **FRRDHS1**/**2**/**3**, and **FRMBS**.

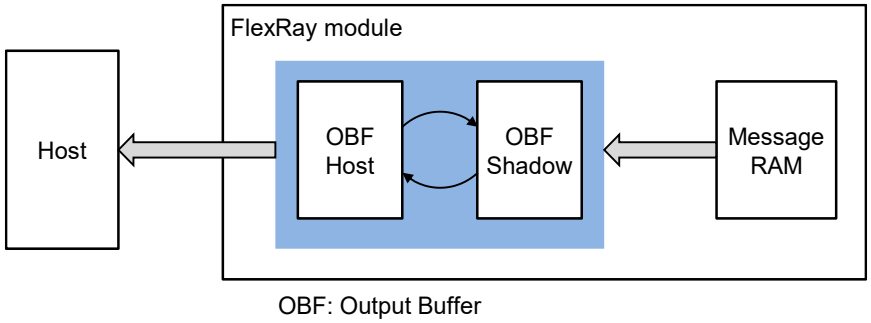

Figure 103.13 Double buffer structure Output Buffer

OBF Host and OBF Shadow as well as bits **FROBCM.RHSS**, **FROBCM.RDSS**, **FROBCM.RHSH**, **FROBCM.RDSH** and bits **FROBCR.OBRS**, **FROBCR.OBRH** are swapped under control of bits **FROBCR.VIEW** and **FROBCR.REQ**.

Writing bit **FROBCR.REQ** to '1' copies bits **FROBCM.RHSS**, **FROBCM.RDSS** and bits **FROBCR.OBRS** to an internal storage (see Figure 103.14).

After setting **FROBCR.REQ** to '1', **FROBCR.OBSYS** is set to '1', and the transfer of the message buffer selected by **FROBCR.OBRS** from the Message RAM to OBF Shadow is started. After the transfer between the Message RAM and OBF Shadow has completed, the **FROBCR.OBSYS** bit is set back to '0'. Bits **FROBCR.REQ** and **FROBCR.VIEW** can only be set to '1' while **FROBCR.OBSYS** is '0'.

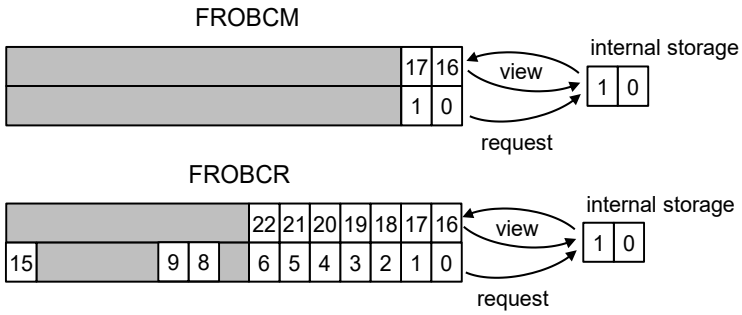

Figure 103.14 Swapping of FROBCM and FROBCR bits

OBF Host and OBF Shadow are swapped by setting bit **FROBCR.VIEW** to '1' while bit **FROBCR.OBSYS** is '0' (see Figure 103.13).

In addition bits **FROBCR.OBRH** and bits **FROBCM.RHSH**, **FROBCM.RDSH** are swapped with the registers internal storage thus assuring that the message buffer number stored in **FROBCR.OBRH** and the mask configuration stored in **FROBCM.RHSH**, **FROBCM.RDSH** matches the transferred data stored in OBF Host (see Figure 103.14).

Now the Host can read the transferred message buffer from OBF Host while the Message Handler may transfer the next message from the Message RAM to OBF Shadow.

If bits **REQ** and **VIEW** are set to '1' with the same write access while **FROBCR.OBSYS** is '0', **FROBCR.OBSYS** is automatically set to '1' and OBF Shadow and OBF Host are swapped. Additionally mask bits **FROBCM.RDSH** and **FROBCM.RHSH** are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards **FROBCR.OBRS** is copied to the register internal storage, mask bits **FROBCM.RDSS** and **FROBCM.RHSS** are copied to register **FROBCM** internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting **FROBCR.OBSYS** back to '0'.

Example of an 8/16/32-bit Host access to a single message buffer:
If a single message buffer has to be read out, two separate write accesses to **FROBCR.REQ** and **FROBCR.VIEW** are necessary:

Wait until **FROBCR.OBSYS** is reset

Write Output Buffer Command Mask **FROBCM.RHSS**, **FROBCM.RDSS**

Request transfer of message buffer to OBF Shadow by writing **FROBCR.OBRS** and **FROBCR.REQ** (in case of and 8-bit Host interface, **FROBCR.OBRS** has to be written before **FROBCR.REQ**).

Wait until **FROBCR.OBSYS** is reset

Toggle OBF Shadow and OBF Host by writing **FROBCR.VIEW** = '1'

Read out transferred message buffer by reading **FRRDDSn**, **FRRDHS1/2/3**, and **FRMBS**

Example of an 8/16/32-bit Host access sequence:
Request transfer of 1st message buffer to OBF Shadow

Wait until **FROBCR.OBSYS** is reset

Write Output Buffer Command Mask **FROBCM.RHSS**, **FROBCM.RDSS** for 1st message buffer

Request transfer of 1st message buffer to OBF Shadow by writing **FROBCR.OBRS** and **FROBCR.REQ** (in case of an 8-bit Host interface, **FROBCR.OBRS** has to be written before **FROBCR.REQ**).

Toggle OBF Shadow and OBF Host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

Wait until **FROBCR.OBSYS** is reset

Write Output Buffer Command Mask **FROBCM.RHSS**, **FROBCM.RDSS** for 2nd message buffer

Toggle OBF Shadow and OBF Host and start transfer of 2nd message buffer to OBF Shadow simultaneously by writing **FROBCR.OBRS** of 2nd message buffer, **FROBCR.REQ**, and **FROBCR.VIEW** (in case of and 8-bit Host interface, **FROBCR.OBRS** has to be written before **FROBCR.REQ** and **FROBCR.VIEW**).

Read out 1st transferred message buffer by reading **FRRDDSn**, **FRRDHS1/2/3**, and **FRMBS**

…

Demand access to last requested message buffer without request of another message buffer:
Wait until **FROBCR.OBSYS** is reset
Demand access to last transferred message buffer by writing **FROBCR.VIEW**
Read out last transferred message buffer by reading **FRRDDSn**, **FRRDHS1/2/3**, and **FRMBS**

Table 103.13 Assignment of FROBCM bits

Pos.	Access	Bit	Function
17	r	RDSH	Data Section available for Host access
16	r	RHSH	Header Section available for Host access
1	r/w	RDSS	Read Data Section Shadow
0	r/w	RHSS	Read Header Section Shadow

Table 103.14 Assignment of FROBCR bits

Pos.	Access	Bit	Function
22…16	r	OBRH	OBF Request Host, number of message buffer available for Host access
15	r	OBSYS	OBF Busy Shadow, signals ongoing transfer from Message RAM to OBF Shadow
9	r/w	REQ	Request Transfer from Message RAM to OBF Shadow
8	r/w	VIEW	View OBF Shadow, swap OBF Shadow and OBF Host
6…0	r/w	OBRS	OBF Request Shadow, number of message buffer for next request

103.3.12.3 FlexRay Protocol Controller access to Message RAM

The two Transient Buffers (TBF A,B) are used to buffer the data for transfer between the two FlexRay Protocol Controllers and the Message RAM.

Each Transient Buffer is build up as a double buffer, able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding Protocol Controller while the other one is accessible by the Message Handler.

If e.g. the Message Handler writes the next message to be send to Transient Buffer Tx, the FlexRay Channel Protocol Controller can access Transient Buffer Rx to store the message it is actually receiving. During transmission of the message stored in Transient Buffer Tx, the Message Handler transfers the last received message stored in Transient Buffer Rx to the Message RAM (if it passes acceptance filtering) and updates the respective message buffer.

Data transfers between the Transient Buffers and the shift registers of the FlexRay Channel Protocol Controllers are done in words of 32 bit. This enables the use of a 32 bit shift register independent of the length of the FlexRay messages.

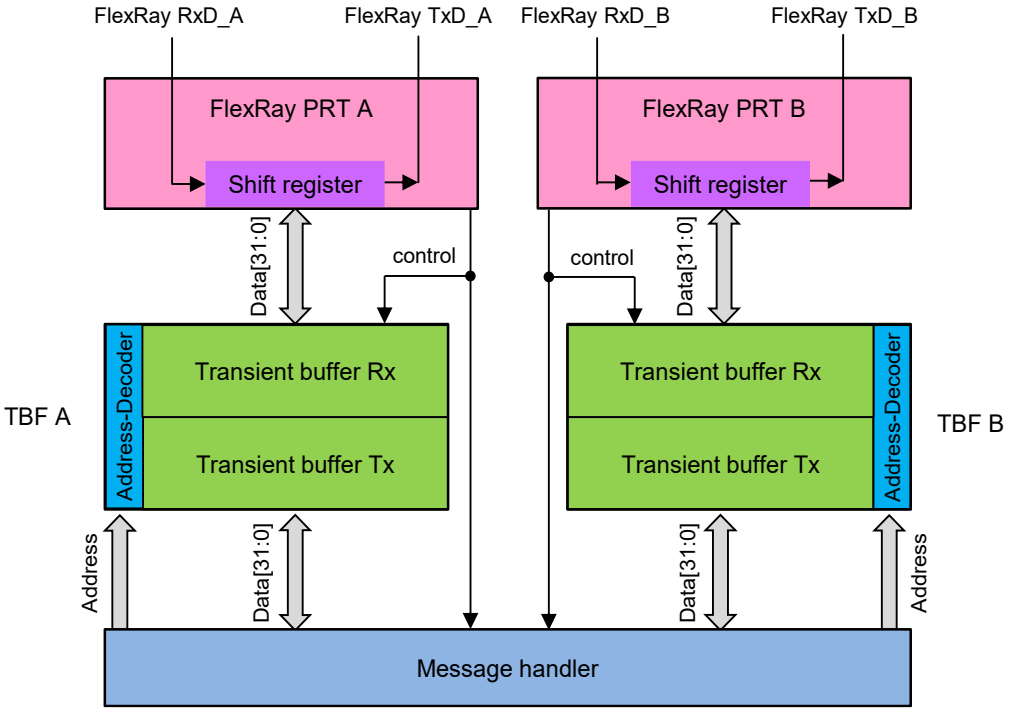

Figure 103.15 Access to Transient Buffers

103.3.13 Message RAM

To avoid conflicts between Host access to the Message RAM and FlexRay message reception / transmission, the Host cannot directly access the message buffers in the Message RAM. These accesses are handled via the Input and Output Buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The Message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame (0…254), the Message RAM has a structure as shown in **Figure 103.16**.

The data partition is allowed to start at Message RAM word number: (**FRMRC.LCB** + 1) * 4

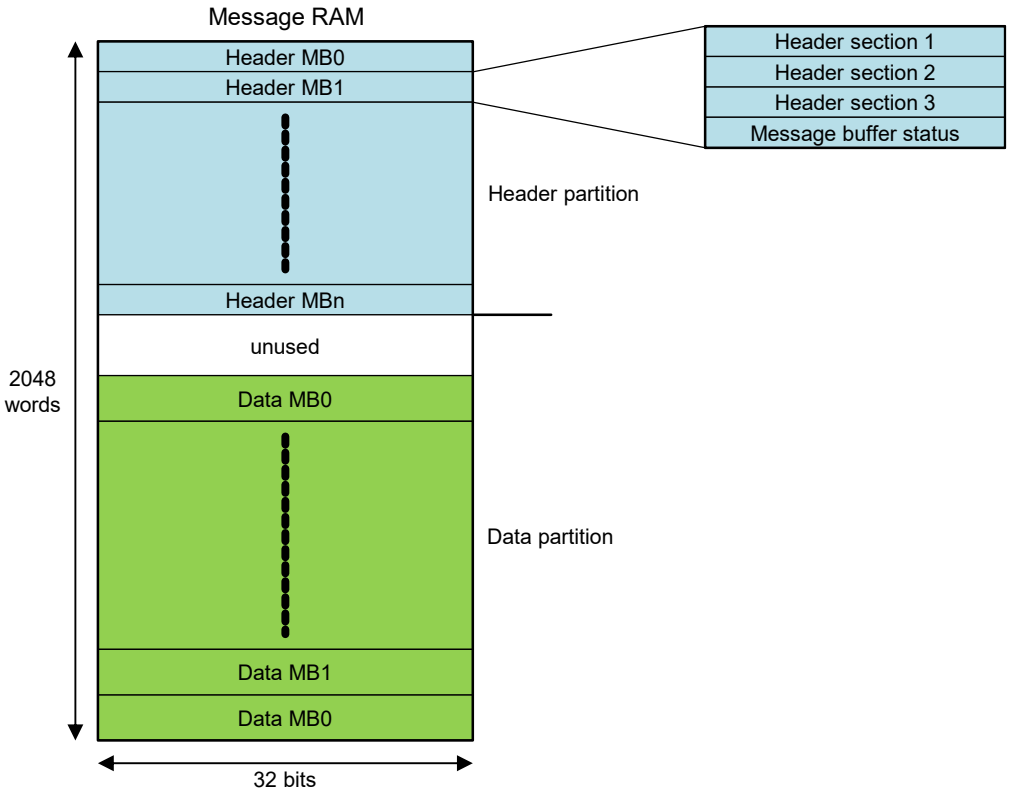

Figure 103.16 Configuration example of message buffers in the Message RAM

Header Partition
Stores header sections of the configured message buffers:
Supports a maximum of 128 message buffers
Each message buffer has a header section of four 32 bit words
Header section 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition
Data Partition
Flexible storage of data sections with different length. Some maximum values are:
30 message buffers with 254 byte data section each
Or 56 message buffers with 128 byte data section each
Or 128 message buffers with 48 byte data section each
Restriction: header partition + data partition may not occupy more than 2048 32-bit words.

103.3.13.1 Header Partition

The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the Message RAM as listed in received valid data frames only.

Table 103.3 below. Configuration of the header sections of the message buffers is done via IBF (**FRWRHS1/2/3**). Read access to the header sections are done via OBF (**FRRDHS1/2/3** + **FRMBS**). The data pointer has to be calculated by the programmer to define the starting point of the data section for the respective message buffer in the data partition of the Message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT_CONFIG or CONFIG state only.

The header section of each message buffer occupies four 32-bit words in the header partition of the Message RAM. The header of message buffer 0 starts with the first word in the Message RAM.

For transmit buffers the Header CRC has to be calculated by the Host.

Payload Length Received **PLR**, Receive Cycle Count **RCC**, Received on Channel Indicator **RCI**, Startup Frame Indicator **SFI**, Sync Frame Indicator **SYN**, Null Frame Indicator **NFI**, Payload Preamble Indicator **PPI**, and Reserved Bit **RES** are updated from received valid data frames only.

Table 103.15 Header section of a message buffer in the Message RAM

Bit Word	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

2			RES	PPI	NFI	SYN	SFI	RCI			Receive cycle count											Data pointer										
3			RESS	PPIS	NFIS	SYNS	SFIS	RCIS			Cycle count status						FTB	FTA		MLST	ESB	ESA	TCIB	TCIA	SVOB	SVOA	CEOB	CEOA	SEOB	SEOA	VFRB	VFRA
…	…																															
…	…																															

Frame configuration
Filter configuration
Message buffer control
Message RAM configuration
Updated from received data frame
Message buffer status (MBS)
unused

(1) **Header section 1 (word 0)**

Write access via **FRWRHS1**, read access via **FRRDHS1**:

Frame ID - Slot counter filtering configuration
Cycle Code - Cycle counter filtering configuration
CH - Channel filtering configuration
CFG - Message buffer direction configuration: receive / transmit
PPIT - Payload Preamble Indicator Transmit
TXM - Transmit mode configuration: single-shot / continuous
MBI - Message buffer receive / transmit interrupt enable

(2) **Header section 2 (word 1)**

Write access via **FRWRHS2**, read access via **FRRDHS2**:

Header CRC - Transmit Buffer: Configured by the Host (calculated from frame header)
- Receive Buffer: Updated from received frame

Payload Length Configured - Length of data section (2-byte words) as configured by the Host
Payload Length Received - Length of payload segment (2-byte words) stored from received frame

(3) **Header section 3 (word 2)**

Write access via **FRWRHS3**, read access via **FRRDHS3**:

Data Pointer - Pointer to the beginning of the corresponding data section in the data partition
Read access via **FRRDHS3**, valid for receive buffers only, updated from received frames:
Receive Cycle Count - Cycle count from received frame
RCI - Received on Channel Indicator

SFI - Startup Frame Indicator
SYN - Sync Frame Indicator
NFI - Null Frame Indicator
PPI - Payload Preamble Indicator
RES - Reserved bit

(4) **Message Buffer Status FRMBS (word 3)**

Read access via **FRMBS**, updated by the CC at the end of the configured slot.

VFRA - Valid Frame Received on channel A
VFRB - Valid Frame Received on channel B
SEOA - Syntax Error Observed on channel A
SEOB - Syntax Error Observed on channel B
CEOA - Content Error Observed on channel A
CEOB - Content Error Observed on channel B
SVOA - Slot boundary Violation Observed on channel A
SVOB - Slot boundary Violation Observed on channel B
TCIA - Transmission Conflict Indication channel A
TCIB - Transmission Conflict Indication channel B
ESA - Empty Slot Channel A
ESB - Empty Slot Channel B
MLST - Message LoST
FTA - Frame Transmitted on Channel A
FTB - Frame Transmitted on Channel B
Cycle Count Status - Actual cycle count when status was updated
RCIS - Received on Channel Indicator Status
SFIS - Startup Frame Indicator Status
SYNS - Sync Frame Indicator Status
NFIS - Null Frame Indicator Status
PPIS - Payload Preamble Indicator Status
RESS - Reserved bit Status

103.3.13.2 Data Partition

The data partition of the Message RAM stores the data sections of the message buffers configured for reception / transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay Protocol Controllers and the Message RAM as well as between the Host interface and the Message RAM, the physical width of the Message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the Message RAM the programmer has to assure that the data pointers point to addresses within the data partition. Table 103.16 below shows an example how the data sections of the configured message buffers can be stored in the data partition of the Message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32bit word are unused (see Table 103.16 below).

Table 103.16 Example for structure of the data partition in the Message RAM

Bit Word	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

103.3.13.3 Message Data Integrity Check

There is a data integrity checking mechanism implemented in the FlexRay core to assure the integrity of the data stored in the related RAM. Each RAM has a checksum generator / checker attached as shown in Figure 103.17.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags **FRMHDS.AMR**, **FRMHDS.ATBF1**, **FRMHDS.ATBF2** and the faulty message buffer indicators **FRMHDS.FMBD**, **FRMHDS.MFMB**, **FRMHDS.FMB** are located in the FlexRay Message Handler Status register. These single access error flags control the error interrupt flag **FREIR.AERR**.

Figure 103.17 shows the data paths between the Input Buffer, Transient Buffer and Message RAM.

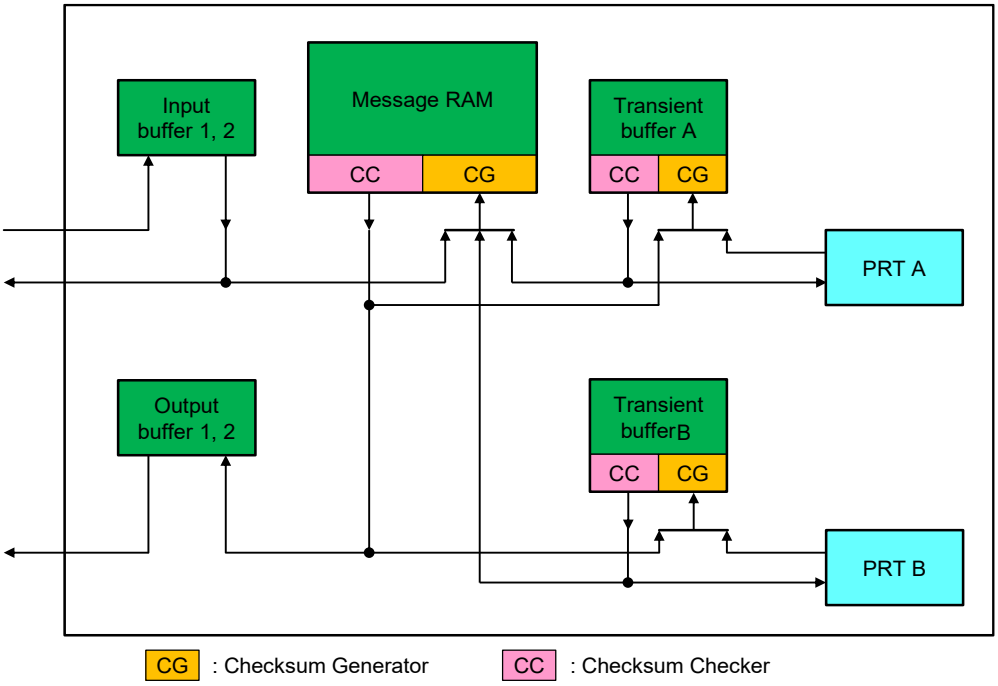

Figure 103.17 Checksum generation and check

When an access error has been detected the following actions will be performed:

In all cases

The respective access error flag in **FRMHDS** register is set

The access error flag **FREIR.AERR** is set and, if enabled, a module interrupt to the Host will be generated.

Additionally in specific cases

1) Access error during data transfer from Input Buffer 1,2 to Message RAM when reading header section of respective message buffer from Message RAM.

FRMHDS.AMR is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

The data section of the respective message buffer is not updated

Transmit buffer: Transmission request for the respective message buffer is not set

2) Access error during scan of header sections in Message RAM

FRMHDS.AMR is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

Ignore message buffer (message buffer is skipped)

3) Access error during data transfer from Message RAM to Transient Buffer 1, 2

FRMHDS.AMR is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

Frame not transmitted, frames already in transmission are invalidated by setting the frame CRC to zero

4) Access error during data transfer from Transient Buffer 1, 2 to Message RAM when reading header section of respective message buffer from Message RAM:

FRMHDS.AMR is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

The data section of the respective message buffer is not updated

5) Access error during data transfer from Message RAM to Output Buffer

The access error flag **FRMHDS.AMR** is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

6) Access error during a data transfer from Transient Buffer 1, 2 to Protocol Controller 1, 2

FRMHDS.ATBF1, 2 bit is set

Frames already in transmission are invalidated by setting the frame CRC to zero

7) Access error during data transfer from Transient Buffer 1, 2 to Message RAM when reading Transient Buffer RAM 1, 2:

FRMHDS.ATBF1, 2 bit is set

FRMHDS.FMBD bit is set to indicate that **FRMHDS.FMB** points to a faulty message buffer

FRMHDS.FMB indicates the number of the faulty message buffer

8) Access error during data read of Transient Buffer RAM 1, 2:

When an access error occurs when the Message Handler read a frame with network management information (PPI = '1') from the Transient Buffer RAM 1, 2 the corresponding network management vector register **FRNMV1/2/3** is not updated from this frame.

103.3.13.4 Host Handling of Access Errors

Access error caused by transient bit flips can be fixed by:

(1) **Self-healing**

Access errors located in the Data Section of Message RAM, Transient Buffer RAM A or Transient Buffer RAM B are overwritten with the next write access to the disturbed bit(s) caused by Host access or by FlexRay communication.

(2) **CLEAR_RAMS Command**

When called in DEFAULT_CONFIG or CONFIG state POC command CLEAR_RAMS initializes the message RAM to zero.

(3) **Temporary Unlocking of Header Section**

An access error in the header section of a locked message buffer can be fixed by a transfer from the Input Buffer to the locked buffer Header Section. For this transfer, the write access to the **FRIBCR** (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see section 103.2.2.1).

For that single transfer the respective message buffer header is unlocked, regardless whether it belongs to the FIFO or whether its locking is controlled by **FRMRC.SEC**, and will be updated with new data.

103.3.14 Module Interrupt

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the Host to react very quickly on specific error conditions, status changes, or

timer events. On the other hand too many interrupts can cause the Host to miss deadlines required for the application. Therefore the CC supports enable / disable controls for each individual interrupt source separately.

An interrupt may be triggered when

An error was detected

A status flag is set

A timer reaches a preconfigured value

A message transfer from Input Buffer to Message RAM or from Message RAM to Output Buffer has completed

A message transfer from the URAM to Message RAM or from Message RAM to URAM has completed

A stop watch event occurred

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The Host has access to the actual status and error information by reading registers **FREIR**, **FRSIR**, **FROS**, **FROTS** and **FRITS**.

The general purpose interrupt lines to the Host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in **FREIES** and **FRSIES**. In addition each of the two interrupt lines can be enabled / disabled separately by programming bit **FRILE.EINT0** and **FRILE.EINT1**.

The input data transfer interrupt lines to the Host, FlexRay input queue empty interrupt, FlexRay input queue full interrupt, are controlled by the enabled interrupts in **FRITS**. In addition each of the input data transfer interrupts can be enabled / disabled separately by programming the related bits in **FRITC.**

The output data transfer interrupt lines to the Host, FlexRay FIFO transfer warning interrupt, FlexRay output transfer warning interrupt, FlexRay FIFO transfer interrupt, FlexRay output transfer interrupt, are controlled by the enabled interrupts in **FROTS**. In addition each of the output data transfer interrupts can be enabled / disabled separately by programming the related bits in **FROTC.**

The three timer interrupts lines to the Host are controlled by the enabled interrupts in **FROS**. In addition each of the interrupt lines can be enabled / disabled separately by programming bit **FROC.T0IE**, **FROC.T1IE** and **FROC.T2IE**.

103.3.16 Usage of data transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the URAM (user RAM) and have transfers between the FlexRay internal message RAM and the URAM and vice versa with minimum CPU support. The data in the URAM should be indexed by data structure pointers located in data pointer tables stored in the URAM.
Data transfer from the URAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.
A data transfer from the FlexRay internal message RAM to the URAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.
The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application should not directly access message buffers using the FlexRay output buffer.

103.3.16.1 Input data transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the URAM to the FlexRay internal message RAM with minimum CPU support.

(1) **Activation and deactivation**

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (**FRITS.IPIDX**) and get index (**FRITS.IGIDX**) to zero. Also the interrupt status flags in the **FRITS** register (**IQEIS** and **IQFIS**) are set to '0'.

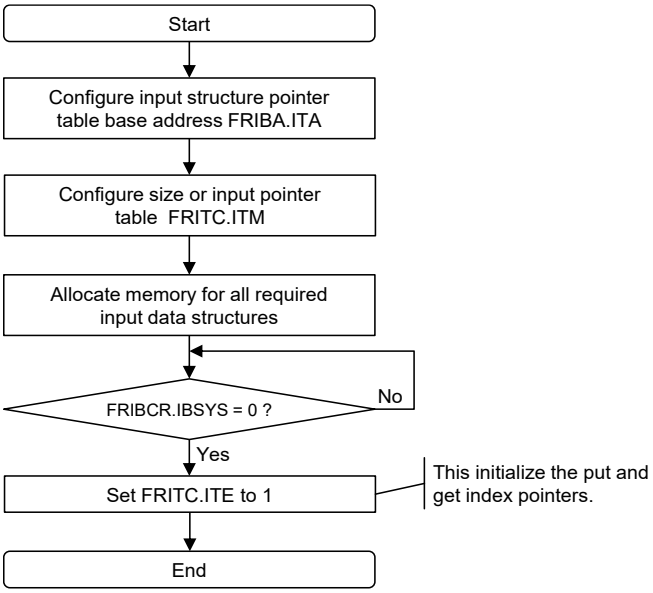

Figure 103.18 Input transfer enable flow

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function gets disabled (status indicated by **FRITS.ITS**), user requested input transfers and all committed input transfers will be completed.

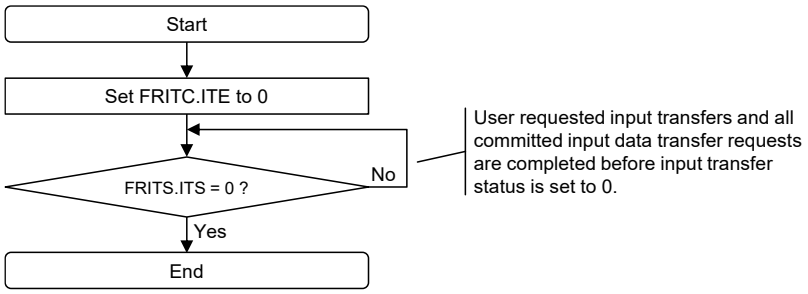

Figure 103.19 Input transfer disable flow

(2) **Input data structure**

The application has to reserve a location in the URAM to provide the content for message buffer configuration (input data structure).
The location of this input data structure needs to be defined by an input data structure pointer also located in the URAM.

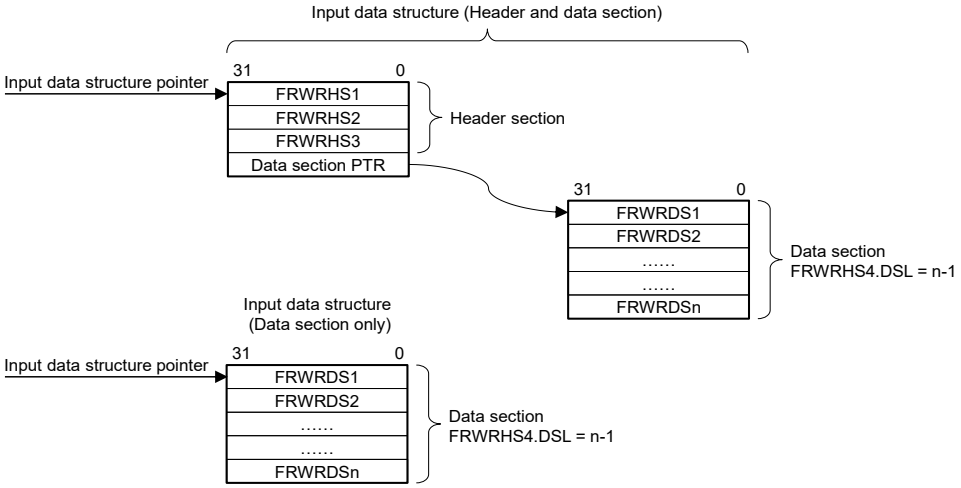

Figure 103.20 Input data structure

In general the input data structure consists of two sections, the header and the data section.
The header section consists of **FRWRHS1**, **FRWRHS2**, **FRWRHS3** and the data section pointer.

For information about the bit alignment and bit function within the header section refer to section 103.3.13.1.

Depending on the settings in the control field (**FRWRHS4**) located in the input pointer table, the data structure pointer is a reference to the address of **FRWRHS1** or **FRWRDS1**. The data structure pointer has to be aligned to a 32 bit address.

If the bit **LHS** in the address related to **FRWRHS4** is set to '1' it is required to provide a valid header section. In this case **FRWRHS1** is the first element of the data structure.

If the bit **LHS** in the address related to **FRWRHS4** is set to '0' a header section is not required. In this case **FRWRDS1** is the first element of the data structure.

If the bit **LDS** in the address related to **FRWRHS4** is set to '1' it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (**FRWRDS1**) and has to be aligned to a 32 bit address.

If the bit **LDS** in the address related to **FRWRHS4** is set to '0' a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by **FROC.BEC**. For information about the payload data alignment within the data section refer to section 103.3.13.2 and section 103.3.17.

The length of the data section and the size to be allocated in the URAM depends on the configuration of the bits **DSL** in the address related to **FRWRHS4**.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by **FRWRHS2.PLC** is used. The application has to ensure, that a proper number of data words is provided in the URAM. In case the buffer is configured by **FRWRHS2.PLC** to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

(3) **Input pointer table**

To transfer data from the input data structures located in the URAM to the FlexRay internal message RAM the related input data structure pointer and control field needs to be added to the input pointer table which is located in the URAM. The location of the first element of this table is identified by the input pointer table base address (**FRIBA.ITA**). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (**FRITC.ITM**).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

$$input_pointer_table_size[bytes] = (((\mathrm{FRITC.ITM} + 1) * 2) * 4)$$

Equation 4-1

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table. The pointer table index related to this entry and hence the number to be written to **FRUIR.UIDX**, is **FRITC.ITM**+1. The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

$$user_input_address = \mathrm{FRIBA.ITA} + input_pointer_table_size$$

Equation 4-2

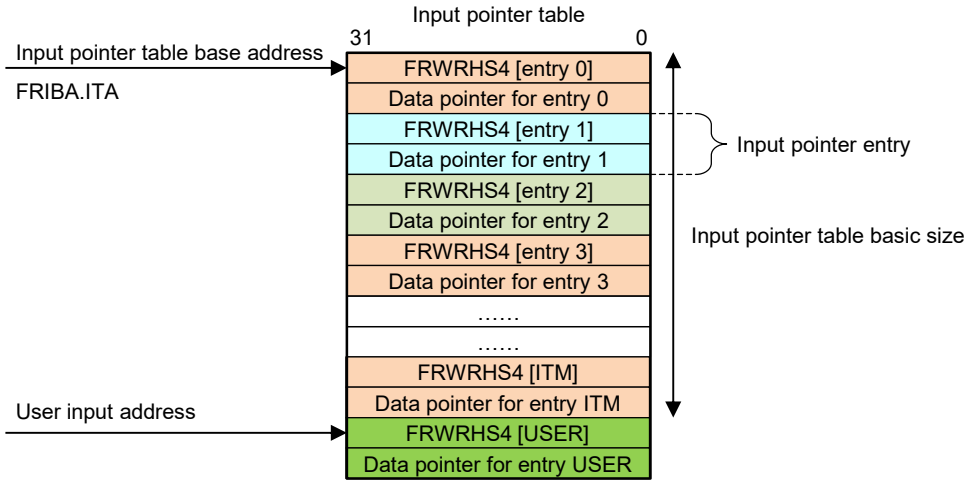

Figure 103.21 Input pointer table

The input pointer table holds the control field **FRWRHS4** and the pointers to the URAM location where the message buffer content (header section and/or data section) is stored.
The application has to write **FRWRHS4** and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

FRWRHS4:

b31	b30	b29	b28	b27	b26	b25	b24
—	—	—	—	—	—	—	—
b23	b22	b21	b20	b19	b18	b17	b16
—	—	DSL[5:0]					
b15	b14	b13	b12	b11	b10	b9	b8
—	—	—	—	INV	STR	LDS	LHS
b7	b6	b5	b4	b3	b2	b1	b0
—	IMBNR[6:0]						

Bit Functions

Bit	Symbol	Bit Name	Function
b[31:22]	-	Reserved	The read value is undefined. The write value should be always '0'.
b[21:16]	DSL	Data Section Length	Specifies the length of the data section in terms of 32 bit values.
b[15:12]	-	Reserved	The read value is undefined. The write value should be always '0'.
b11	INV	Invalidate entry	0: The data structure is valid and will be transferred to the FlexRay internal message RAM. 1: The data structure is invalid. FlexRay internal message RAM is not updated using this input pointer entry.
b10	STR	Set transmission request	0: The bit **FRTXRQn.TXR** for the message buffer selected by the bits **IMBNR** is set to '0'. No data from this message buffer is transmitted.

Bit	Symbol	Bit Name	Function
			1: The bit **FRTXRQn.TXR** for the message buffer selected by the bits **IMBNR** is set to '1' to release the message buffer for transmission The application should not set the bit **STR** to '1' for receive buffers.
b9	LDS	Load data section	0: No update of data section. 1: Data section for the message buffer selected by the bits **IMBNR** is updated.
b8	LHS	Load header section	0: no update of header section. 1: Header section for the message buffer selected by the bits **IMBNR** is updated.
b7	-	Reserved	The read value is undefined. The write value should be always '0'.
b[6:0]	IMBNR	Message buffer number to be updated	Selects the target message buffer number in the FlexRay internal message RAM for transfer

Note that the **LHS** bit should not be set for protected message buffers.

The bit **LDS** defines if the data section of the message buffer selected by the bits **IMBNR** should be updated.
If **LDS** is set to '1' (**DSL** + 1) 32 bit words of payload data are transferred from the URAM to the message buffer selected by the bits **IMBNR**.
If **LDS** is set to '0' no payload data is transferred from the URAM.
Note that the payload transferred is independent from the configured payload length (bits **PLC** in the address related to **FRWRHS2**).

The bit **INV** can be used to invalidate a committed data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see section 103.3.16.1.(5)).

When this bit is set to '1' the message buffer number **IMBNR** is not updated. When the bit is set to '0' the message buffer number **IMBNR** is updated.

(4) **Transfer function of input data structure**

To use the input data structure transfer function the input transfer has to be activated (see section 103.3.16.1.(1)). The activation process requires the setup of the input pointer table (see section 103.3.16.1.(3)) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer gets enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.
To commit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (**FRIQC.IMBNR**). Afterwards the application has to increment the application internal put index. By writing to the input queue control register the data available flag (**FRDAi.DA[IMBNR]**) is automatically set to '1'. The input transfer handler also maintains the put index pointer in the status register (**FRITS.IPIDX**).

In case the input queue gets full (number of queued input transfer requests is equal to the input queue table size) **FRITS.IQFP** and **FRITS.IQFIS** are set to '1'. The input queue full condition pending flag (**FRITS.IQFP**) changes from '1' to '0' when there are entries in the input queue available, whereby the input queue full interrupt status flag (**FRITS.IQFIS**) needs to be cleared by the application.
The application should not make any further write access to the bit **IMBNR** in the **FRIQC** register as long as the bit **IQFP** in the **FRITS** register is '1'.

In case the input queue gets empty (number of queued input transfer requests changes to zero) **FRITS.IQEIS** is set to '1'. The input queue empty interrupt status flag (**FRITS.IQEIS**) needs to be cleared by the application.

The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in **FRITS.IGIDX**. Note that the index is referring to the input entry and not the address offset in the input pointer table.
If the input queue is not empty, the transfer handler reads out the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to '0' and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see section 103.3.16.1.(5)) no FlexRay internal message buffer is updated and the related data available flag is automatically set to '0'. The change of the data available flag can be used to confirm the cancellation a transmit request

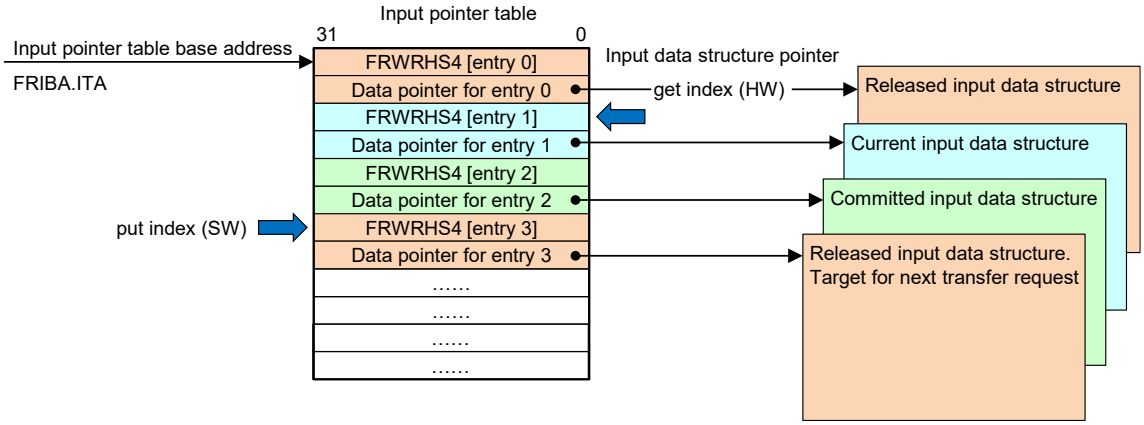

Figure 103.22 Input pointer table

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (**FRWRHS4.LDS** = '0', **FRWRHS4.LHS** = '1') to be updated in the FlexRay module.

(5) Halting the input queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.
To cancel data structures already committed to the input queue, the queue can be halted by writing a '1' to **FRITC.IQHR**.

After the ongoing input transfer has been completed the queue is halted and **FRITS.IQH** changes from '0' to '1'.

To invalidate an entry of the input queue **FRWRHS4.INV** has to be set to '1'. All other bits in **FWRHS4** should be unchanged.

Following flow shall be used to analyse whether a committed message has been already transferred to the FlexRay internal message RAM or not.

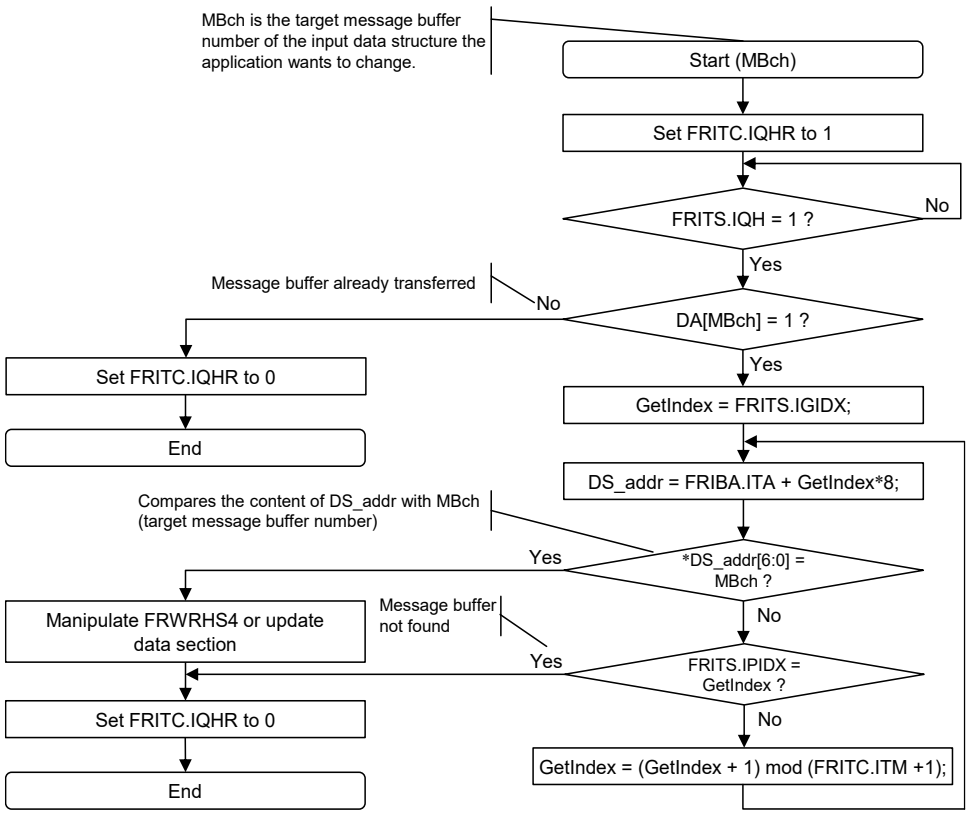

Figure 103.23 Input table analysis

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see section 103.3.16.2.(6)).

(6) **Transfer function of user requested input transfers**

To use this function the input transfer has to be activated (see section 103.3.16.1.(1)).

The application is capable, by using **FRUIR.UIDX,** to request a transfer of an input data structure. The user input transfer request is serviced first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. The table entry for the user input transfer request should be added after the end of the input pointer table (see section 103.3.16.1.(3)).
To commit this table entry to the input handler, the application has to write the index (**FRITC.ITM**+1) to the user input transfer request register (**FRUIR.UIDX**).

By writing to the user input transfer request register, the user input transfer request pending flag (**FRITS.UIRP**) is automatically set to '1'.
As long this flag is '1' the application should not make any further user input transfer requests.

The user input transfer request pending flag (**FRITS.UIRP**) changes from '1' to '0' when the requested input transfer is completed. As next the pending transfers are processed.

103.3.16.2 Output data transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the URAM by the output data handler. The output data handler can also transfer the message buffer content to the URAM on application request. When enabled the output handler is also capable to initiate a transfer when the message buffer status has changed.

(1) **Activation and deactivation**
