The output data transfer function should be activated before usage. The activation of the output transfer hander will initialize the FIFO put and get index pointer and FIFO fill level (**FROTS.FGIDX** and **FROTS.FFL**) to zero, set the bits **FROTS.FDA**, **FROTS.OWP**, **FROTS.FWP** and **FROTS.UORP** to '0'. Also the interrupt status flags **FROTS.OTIS**, **FROTS.FIS**, **FROTS.OWIS** and **FROTS.FWIS**) are set to '0'.
The activation has no influence to the data available flags (**FRDAi.DA**) which are related to the dedicated buffers; these flags have to be cleared by the application.

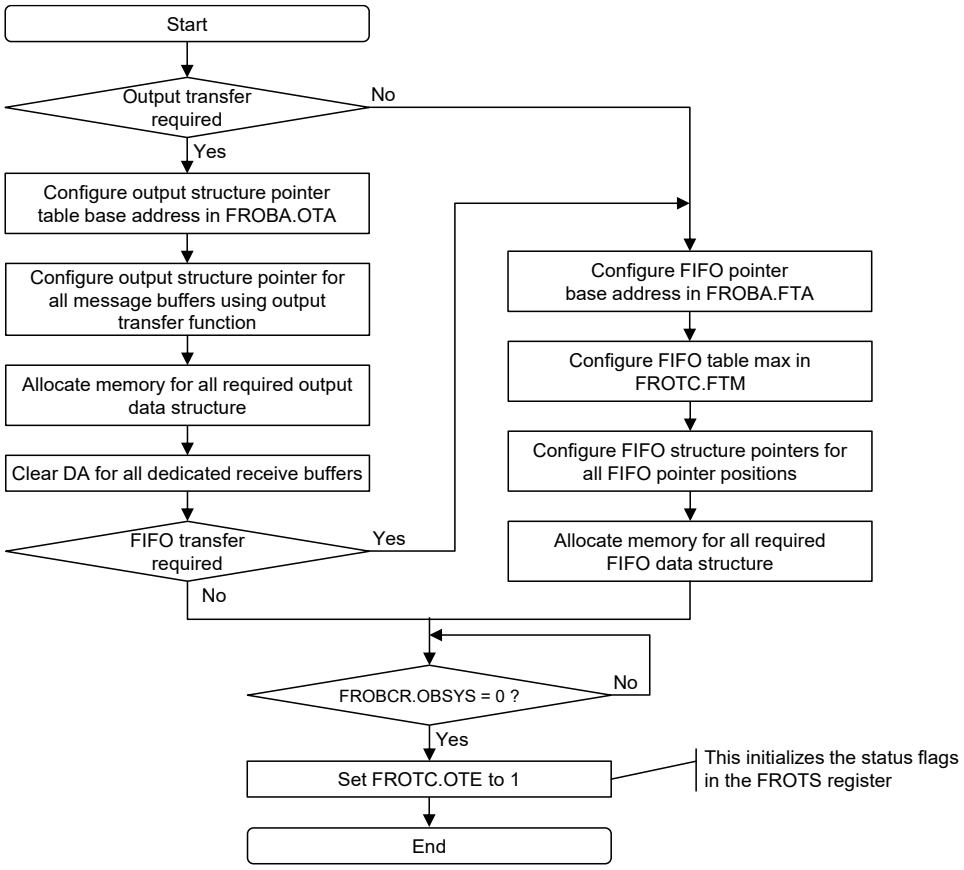

Figure 103.24 Output transfer enable flow

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time **FROTS.OTS** remains '1'.
When **FROTS.OTS** changes from '1' to '0', the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

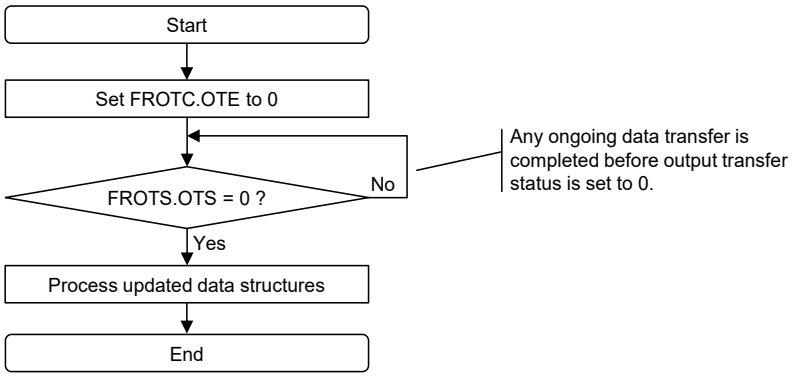

Figure 103.25 Output transfer disable flow

(2) **Output transfer data structure**

The data in the URAM is stored in an output data structure. The location of the output data structures are determined by output data structure pointers also located in the URAM. The output data structure and indexing is visualized in Figure 103.26.

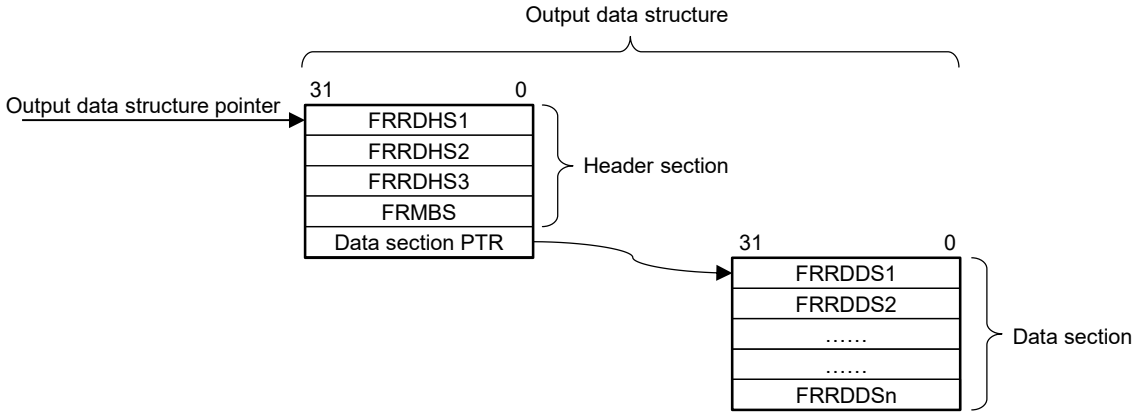

Figure 103.26 Output data structure

The output data structure consists of two sections, the header and data section. The header section consists of **FRRDHS1**, **FRRDHS2**, **FRRDHS3**, **FRMBS** and the data section pointer. **FRRDHS1** is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of **FRRDHS1**. For information about the bit alignment and bit function within the header section refer to section 103.3.13.1.

FRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of **FRRDDS1** and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit **BEC** in the **FROC** register. For information about the payload data alignment within the data section refer to section 103.3.13.2.

The length of the data section as well as the total structure size to be allocated in the URAM depends on the configured payload length (**FRRDHS2.PLC**) of the related message buffer. In case the configured payload length is an odd number

of words or the received payload length (**FRRDHS2.PLR**) is smaller than the configured payload length, the remaining data words in the URAM are unused and should not be used by the application.

The output data structure is identical for all three kinds of output transfers. In case only the header section is transferred the data section pointer is not evaluated by the output handler and the data section remains unchanged.

(3) **Output pointer table**

For the output data transfer function the application needs to setup an output pointer table in the URAM.
The location of the first element of this table should be programmed into the output pointer table base address (**FROBA.OTA**). This base address has to be aligned to a 32 bit address.
The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number which will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the URAM location where a memory space is reserved for the target message buffer content (header section and data section).
There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see Figure 103.27): the output pointer table starts with the entry for message buffer number 0 at the address configured in **FROBA.OTA** and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address **OTA** + 4, message buffer 2 at address **OTA** + 8, etc.) for all possible message buffers.

When a set **ND** bit is the only transfer condition (**FROTC.OTCS** is set to 0) only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set **ND** bit or a set **MBC** bit is the transfer condition (**FROTC.OTCS** is set to 1) all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

(4) **FIFO output pointer table**

The FlexRay module internal FIFO can be extended by a queued buffer structure in the URAM.
If the FlexRay module internal FIFO is used the application needs to setup the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (**FRFBA.FTA**). This base address has to be aligned to a 32 bit address.
The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (**FROTC.FTM**).

The FIFO pointer table holds pointers (output data structure pointers) to the URAM location where a memory space is reserved the target message buffer content (header section and data section). For each table entry a data pointer shall be configured in this table.

(5) **Transfer function of dedicated message buffers**

To use this transfer function the output transfer has to be activated (see section 103.3.16.2.(1)). The activation process requires to setup the output pointer table (see section 103.3.16.2.(3)) in order to specify the destination location (output data structures) for the data to transfer. Figure 103.27 shows how the output pointer table references the output data structures.

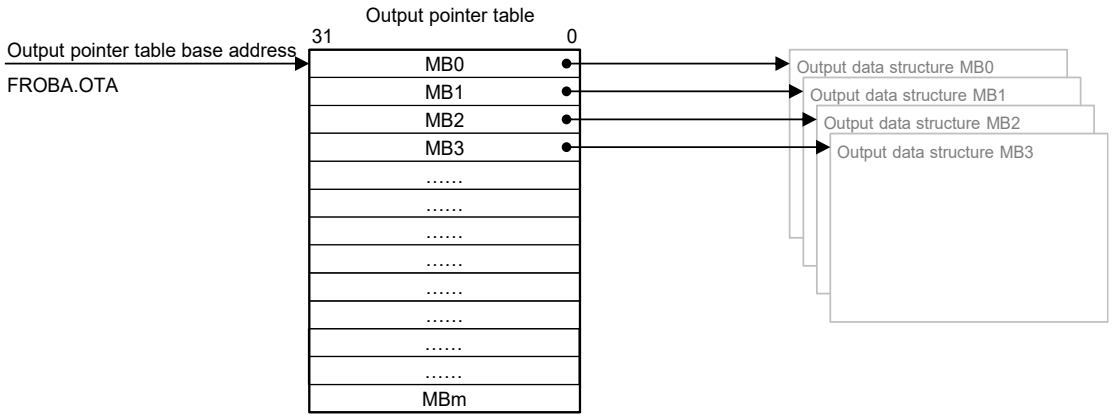

Figure 103.27 Output data structure and indexing

With **FROTC.OTCS** the output transfer condition can be selected between the 'New data only mode' and the 'New data and status changed mode'.

In the 'New data only mode' an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer which causes the related **ND** flag in the **FRNDATn** register to set. The **ND** flag in the **FRNDATn** register is automatically set to '0' during the transfer procedure. The header section is also transferred and hence the **MBC** flag in the **FRMBSCn** register is set to '0'.

In the 'New data and status changed mode' an output data transfer is initiated as described in the 'New data only mode'. In addition an output data transfer is initiated when only the message buffer status has been changed which causes the related **MBC** flag in the **FRMBSCn** register to be set. In this case only the header section is transferred. The **MBC** flag in the **FRMBSCn** register is automatically set to '0' during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure the corresponding data available flag in the **FRDAi** (i from 0 to 3) registers is set to '1'. The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (**FROTS.OTIS**).

As long as the data available flag remains '1' the corresponding output data structure will not be updated.

In the case
the data available flag is '1' and a valid received message was stored or
when **FROTC.OTCS** is '1' and the message buffer status was updated,
the output transfer warning interrupt flag (**FROTS.OWIS**) is set to '1' notifying the application that new data is available but the output data structure transfer cannot be processed. In addition **FROTS.OWP** is set to '1' that continuously flags that status of the output transfer warning condition.

If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (**FRMBS.MLST**) is set to '1'. This flag can be evaluated after the message buffer has been transferred into an output data structure.

Following sections are giving a guidance how output data structures can be handled.

(a) Data section copy method

One option is to copy the information from the output data structure to a different location of the URAM and then release the output data structure by clearing the related data available flag. The application should use the copied information for further processing.

(b) Data structure pointer method

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data available flag. The changed output data pointer should refer to a free data structure. The application should use the old data structure for further processing.

(c) Data section pointer method

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data available flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

(6) **Transfer function of FIFO message buffers**

To use this buffer transfer function the output transfer has to be activated (see section 103.3.16.2.(1)). The activation process requires the setup of the FIFO pointer table (see section 103.3.16.2.(4)) in order to specify a location in the URAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.
After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (**FROTS.FIS**) and **FROTS.FDA** are set to '1'. The bit **FROTS.FIS** can be used as an interrupt source. The bit **FROTS.FDA** indicates that the FIFO is not empty.
Up to **FROTC.FTM** output structures configured in the **FROTC** register can be queued.

The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure.
The FIFO reception handler also maintains a get index which is flagged in **FROTS.FGIDX**. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (initially set to the zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing '1' to **FROTS.FDA**. By comparing the put index and the get index the FIFO handler knows about the current fill level of the queued buffer structure.
The current FIFO fill level is flagged in **FROTS.FFL**. When **FROTS.FDA** is '1', there is at least one entry in the FIFO queue.

In case the queued buffer structure in the URAM is full (**FROTS.FFL** = **FROTC.FTM**+1), no further transfers are initialized, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (**FROTS.FWIS**) is set to '1'.
In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure may get overwritten. The related status flags and configuration registers of the FlexRay core module can be used to generate desired warning notifications.

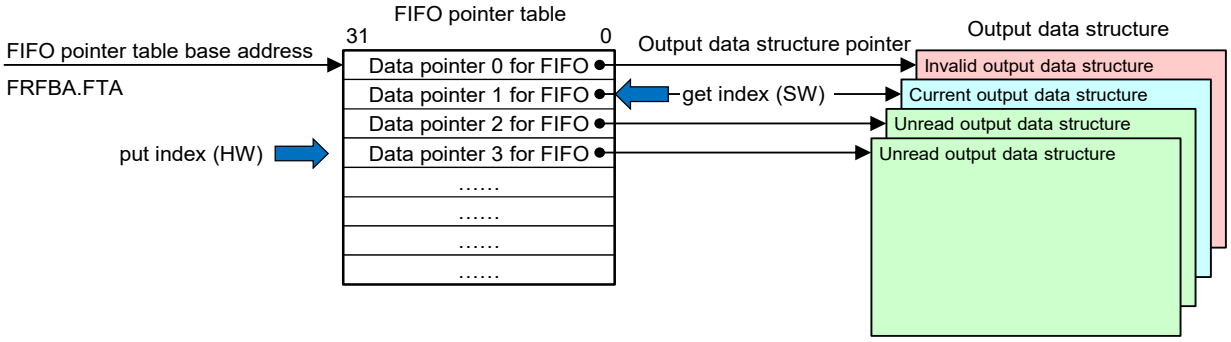

Figure 103.28 FIFO pointer table

(7) Transfer function of user output transfer requests

To use this transfer function the output transfer has to be activated (see section 103.3.16.2.(1)). The activation process requires to setup the output pointer table (see section 103.3.16.2.(3)) in order to specify the location in the URAM reserved for the transfer of the data (output data structures).

The application is capable, by using **FRUOR.UMBNR**, to request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO should not be requested.
The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting **FRUOR.URDS** to '1'. The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.
The data available status and transfer blocking by the **DA** bits in the **FRDAi** register is also used for the user requested transfers. Therefore the **DA** bit in the **FRDAi** register related to the requested buffer number (**FRUOR.UMBNR**) should be released before making the transfer request.
After writing to **FRUOR.UMBNR**, the bit **FROTS.UORP** is set to '1' to indicate that there is a pending user transfer request. When the transfer has been processed the bit **FROTS.UORP** is set to '0', the bit **FROTS.OTIS** is set to '1' and the **DA** bit in the **FRDAi** register related to the requested buffer number (**FRUOR.UMBNR**) is set to '1'.
User output transfer requests cannot be queued. The application should check the bit **FROTS.UORP** before writing to **FRUOR.UMBNR**.

User output transfer requests should not be made for message buffers which are pending in the input transfer queue.

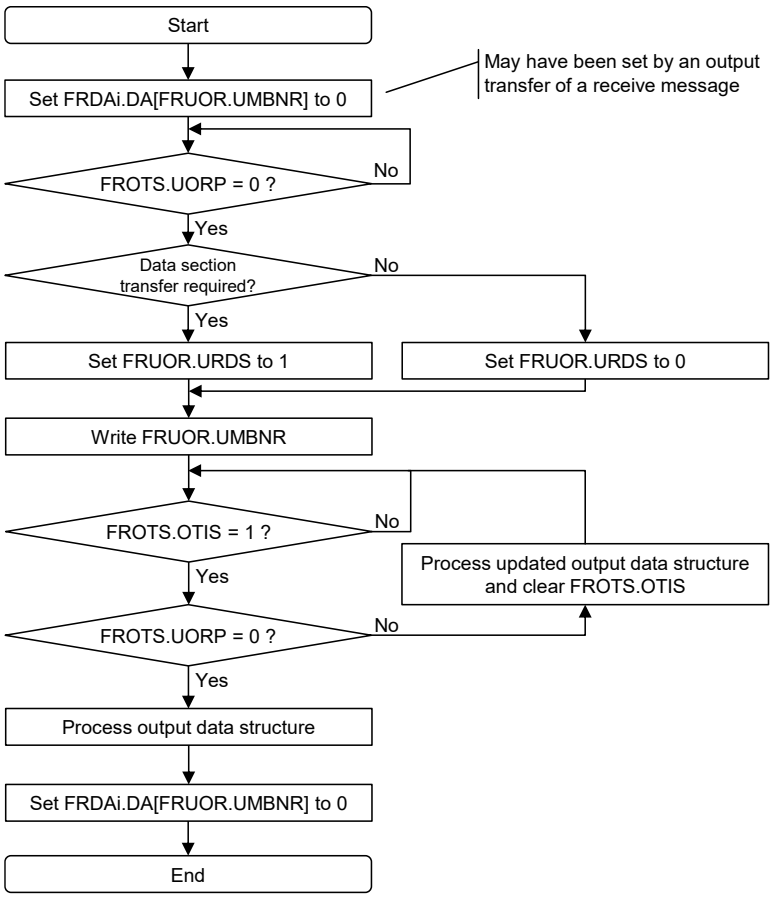

Figure 103.29 User output transfer request flow

Note that it may be possible that the data structure addressed by a user request is being updated due to a receive message buffer update (which causes the bit **DA** in the **FRDAi** register being set). This set **DA** flags inhibits the user output transfer request. Therefore polling **FROTS.UORP** is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits **FROTS.OTIS** or the **DA** bit in the **FRDAi** register can be used instead. The exact flow depends on the software architecture.

103.3.16.3 Data structure transfer scheduling

Cyclically the different types of transfer requests are checked. In order to guarantee a certain transfer time the different types of transfers have different priorities.

Use requested input transfers have highest priority followed by the transfer of data structures committed into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

1) All dedicated message buffers in ascending order
   When **FROTC.OTCS** is set to '0', set flags in the **FRNDATn** register are causing a transfer of the message buffer to the output data structure if the destination area is free (**DA** bit in the **FRDAi** register is '0').
   When **FROTC.OTCS** is set to '1', set flags in the **FRNDATn** register or set flags in the **FRMBSC1/2/3/4** register are causing a transfer of the message buffer to the output data structure if the destination area is free (**DA** bit in the **FRDAi** register is '0').

2) FlexRay internal FIFO
   When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.
3) User output request
   If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer occurs.

103.3.16.4 Behaviour in case of data transfer access error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the **FRAES** register is set.

The ongoing transfer is immediately terminated but succeeding transfers are processed and may generate further access errors. Any following access errors are only flagged in **FRAES.MAE**. The other status flags are not updated.

(1) **Access error during input transfer**

When an access error occurs during an input transfer:

The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated

The address, the FlexRay module wanted to access to, is captured in the **FRAEA** register

FRAES.IAE is set to '1'

The input pointer table index is flagged in **FRAES.EIDX**

In case of an normal input transfer the to the transfer related **DA** flag in the **FRDAi** register is set to '0'

In case of an user input transfer request **FRITS.UIRP** is set to '0'

With the given status information the application is able to identify and correct the faulty data structure.
In addition the application needs to clear the input access error flag (**FRAES.IAE**).

(2) **Access error during output transfer**

When an access error occurs during an output transfer:

The ongoing transfer is immediately terminated but the update of the data structure may have started.
The address, the FlexRay module wanted to access to, is captured in the **FRAEA** register
FRAES.OAE is set to '1'
The output pointer table index is flagged in **FRAES.EIDX**
In case of an normal output transfer the to the transfer related **DA** flag in the **FRDAi** register remains '0' and no outputt transfer interrupt is generated
In case of an user output transfer request **FROTS.UORP** is set to '0'
With the given status information the application is able to identify and correct the faulty data structure. The data structure in the URAM cannot be treated as valid.
In addition the application needs to clear the output access error flag (**FRAES.OAE**).

The FlexRay module internal transfer of the message buffer is completed before the URAM access error is detected. The output transfer will not be re-initiated. To avoid loss of data, the application can perform a user output transfer request of this message buffer to a correct URAM location.

(3) **Access error during FIFO transfer**

When an access error occurs during an FIFO transfer:

The ongoing transfer is immediately terminated
The address, the FlexRay module wanted to access to, is captured in the **FRAEA** register
FRAES.FAE is set to '1'
The FIFO pointer table index is flagged in **FRAES.EIDX**
The FIFO index pointer are not changed and hence the FIFO status flags are unchanged
With the given status information the application is able to identify and correct the faulty data structure.
In addition the application needs to clear the FIFO access error flag (**FRAES.FAE**).

The data in the URAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

103.3.16.5 Behaviour in case of RAM read errors

The FlexRay internal message RAM has an ECC checking mechanism. In case a not correctable RAM read error occurs the application has to analyse the status in the **FRMHDS** register and react as described in section 103.3.16.3. The input and output transfer handler reacts also on these errors detected in the message RAM when the error is related to an active transfer.

In addition the Transient Buffer RAM A and Transient Buffer RAM B have an ECC checking mechanism as well. Not correctable RAM read errors does not impact the data transfer functionality but have to be handled as described in section 103.3.13.1.(4).

In all cases data causing a read error is never transferred to the URAM. If there is no recovery available in the application, the message is lost.

(1) **Read error during transfer from TBF to MBF**

This internal transfer is done for each valid received FlexRay message.

A read error can only occur when reading the header section in the FlexRay Message RAM (see read error flags in **FRMHDS**). In this case the message buffer needs to be re-configured.

For dedicated receive message buffers the related **ND** flag in the **FRNDATn** register will not get set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers the **ND** flag in the **FRNDATn** register is not set but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However if the read error is still present in the header section the update of the output data structure will not start (see 6.16.5.2); thus the data in the URAM remains correct.

Note that the correction or any other reconfiguration of FIFO related message buffers while there are pending FIFO transfers may result in incorrect data in the URAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before to reactivate the output data transfer.

(2) **Read error during transfer from MBF to OBF**

This internal transfer is done for every output data transfer (dedicated reception, FIFO, user requested).

A read error can occur in the header and data section (see read error flags in **FRMHDS**). In both cases the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer the output data structure will not be updated and the data available will not be set to '1', the FIFO put index and the FIFO fill level is not changed.

In case of an user output transfer request **FROTS.UORP** is set to '0' even if there was no update of the output data structure.

(3) **Read error during transfer from IBF to MBF**

This internal transfer is done for every input data transfer.

A read error can occur only when there is no update of the header section requested (the bit **LHS** in **FRWRHS4** is set to "0") due to the reading of the header section from the message RAM (see read error flags in **FRMHDS**). In this case the message buffer needs to be re-configured.

When a read error occurs during the input data transfer the actually transferred message in the input queue gets lost.

(4) **Message RAM read errors**

Read errors when reading the header section are flagged in the **FRMHDS** register.

Depending on the buffer type and set buffer protection a reconfiguration of the message buffer may not be possible.

The input transfer function cannot be used to reconfigure a locked message buffer using the method described in section 103.3.13.4.(3)

Before reconfiguring a locked buffers the user should disable the input transfer function and the output transfer function.

103.3.16.6 Reserved

103.3.17 Byte alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with **FROC.BEC** a byte alignment function to support different byte ordering styles.

Figure 103.30 shows the payload byte alignment within a FlexRay frame.

Figure 103.30 Byte alignment on the FlexRay bus

103.3.17.1 Little endian alignment

When **FROC.BEC** is '0' the byte alignment is set to Little endian.

(1) **FRNMVn (n=1 to 3)**

The byte alignment of the NMV bytes is as below.

(2) **FRWRDSn (n=1 to 64)**

The byte alignment for the message payload in the FlexRay input buffer and in the input data structure is as below.

FRWRDSn.MD[7:0]= $Data_{4n-4}$
FRWRDSn.MD[15:8]= $Data_{4n-3}$
FRWRDSn.MD[23:16]= $Data_{4n-2}$
FRWRDSn.MD[31:24]= $Data_{4n-1}$

Transmission order on the FlexRay bus is **FRWRDSn.MD**[7:0], **FRWRDSn.MD**[15:8], **FRWRDSn.MD**[23:16], **FRWRDSn.MD**[31:24] with the most significant bit transmitted first.

(3) **FRRDDSn (n=1 to 64)**

The byte alignment for the message payload in the FlexRay output buffer and in the output data structure is as below.

FRRDDSn.MD[7:0]= $Data_{4n-4}$
FRRDDSn.MD[15:8]= $Data_{4n-3}$
FRRDDSn.MD[23:16]= $Data_{4n-2}$
FRRDDSn.MD[31:24]= $Data_{4n-1}$

Reception order on the FlexRay bus is **FRRDDSn.MD**[7:0], **FRRDDSn.MD**[15:8], **FRRDDSn.MD**[23:16], **FRRDDSn.MD**[31:24] with the most significant bit received first.

103.3.17.2 Big endian alignment

When **FROC.BEC** is '1' the byte alignment is set to Big endian.

(1) **FRNMVn (n=1 to 3)**

The byte alignment of the NMV bytes is as below.

(2) **FRWRDSn (n=1 to 64)**

The byte alignment for the message payload in the FlexRay input buffer and in the input data structure is as below.

FRWRDSn.MD[7:0]= $Data_{4n-1}$
FRWRDSn.MD[15:8]= $Data_{4n-2}$
FRWRDSn.MD[23:16]= $Data_{4n-3}$
FRWRDSn.MD[31:24]= $Data_{4n-4}$

Transmission order on the FlexRay bus is **FRWRDSn.MD**[31:24], **FRWRDSn.MD**[23:16], **FRWRDSn.MD**[15:8], **FRWRDSn.MD**[7:0] with the most significant bit transmitted first.

(3) **FRRDDSn (n=1 to 64)**

The byte alignment for the message payload in the FlexRay output buffer and in the output data structure is as below.

FRRDDSn.MD[7:0]= $Data_{4n-1}$
FRRDDSn.MD[15:8]= $Data_{4n-2}$
FRRDDSn.MD[23:16]= $Data_{4n-3}$
FRRDDSn.MD[31:24]= $Data_{4n-4}$

Reception order on the FlexRay bus is **FRRDDSn.MD**[31:24], **FRRDDSn.MD**[23:16], **FRRDDSn.MD**[15:8], **FRRDDSn.MD**[7:0] with the most significant bit received first.

104. PCIe Controller

104.1 Overview

This module performs PCIe controls, and transfers data between this LSI internal bus (AXI bus) and the PCI devices connected to the PCIe Controller. This module facilitates the design of systems using the PCI Express while at the same time permitting high-speed data transfers in a compact system.

This module functions as a bus bridge connecting the PCI Express to this LSI internal bus (AXI bus), and provides transfer channels between PCI Express devices and devices connected to the LSI internal bus (AXI bus).

This LSI incorporates a PCI Express physical module that supports dual lanes and one channel.

This module has two modes: a Root Port and an Endpoint and can operate as a Root Port or Endpoint that is defined in the PCI Express specification.

This module supports AVS.

Note:

104.1.1 Features

This module has the following features.

- The AXI bus clocks are S0D2_HSCφ.
- The AXI bus support 32bit address.
- The APB bus clocks are S0D4_HSCφ.
- Functions as a bridge that connects the PCI Express to the LSI internal bus (AXI bus)
  - Generates a PCIe packet from the AXI bus transaction to the PCI area
  - Generates a AXI bus transaction from a PCI Express packet
- Supports high-speed data transfer between PCI Express devices and internal bus (AXI bus) via the internal DMAC
- Supports the subset of PCI Express Base Specification Revision 4.0 (Sep. 27, 2017)
- Operates as a PCI Express Endpoint or a PCI Express Root Port
- Supports the requester and completer functions for the PCIe transaction
- Incorporates configuration registers and the following capability structures
  - Power management capability structure
  - MSI capability structure (supports masking function and pending bits.)
  - PCI Express capability structure
  - Advanced Error Reporting (AER) Capability structure
  - Device Serial Number Capability structure
  - Vendor-Specific Extended Capability (for RAS DP, RAS D.E.S., and PTM.)
  - Latency Tolerance Reporting (LTR) Capability structure
  - Secondary PCI Express Extended Capability structure
  - L1 PM Substates Extended Capability structure
  - Precision Time Management (PTM) Capability structure
  - Data Link Feature Extended Capability structure
  - Physical Layer 16.0 GT/s Extended Capability structure
  - Lane Margining at the Receiver Extended Capability structure
- Supports interrupts by INTx and MSI

- Supports one lane (x1), two lanes (x2) or four lanes (x4).
- Supports multiple speeds (2.5 GT/s, 5.0 GT/s, 8.0 GT/s and 16.0 GT/s).
- Automatically performs link training and link configurations
- Supports the D+/D-line automatic swap function (lane polarity inversion)
- Achieves QoS through transaction ordering.
- Supports only VC0.
- Automatically performs flow control by managing six types of credits
- Automatic handling function by hardware
- Buffer for holding error packet headers and error indication status provided
- Supports the link power control function (L0, L0s, L1 states and L1 PM Substates)
- Supports device power control function (D0, $D3_{hot}$, and $D3_{cold}$ states).
- Supports 256-byte max payload size.
- Supports completion timeout disable.
- Supports Multi-Function Device (Up to two functions)
- Supports FLR(Function Level Reset)
- Resizable BAR

Note: This module does not support the following PCI Express functions.

- Expansion ROM for system boot
- Card bus
- Phantom function
- Power-management event (PME) handling by hardware
- Slot function (including Hot Plug)
- SR-IOV
  - However supports for external SR-IOV capable EndPoint devices is provided in RootComplex mode
- BIST function
- ARI forwarding function
- Port arbitration function
- MSI-X interrupt
  - However supports MSI-X by INTC-AP
- Surprise Down error function
- TLP Prefix
- Peer-to-peer transfer
- ECRC Generation and Checking
- M-PCIe

Note: The configuration parameter of the PCIe controller in this document is shown as below.

- CC_MAX_MSTR_TAGS_AXI : 64
- CC_NUM_DMA_RD_CHAN : 8
- CC_NUM_DMA_WR_CHAN : 8
- CX_ACS_ENABLE : false (0)
- CX_ARI_ENABLE : false (0)
- CX_ATOMIC_ROUTING_EN : false (0)
- CX_ATU_MAX_REGION_SIZE : 4G (0)
- CX_ATU_MIN_REGION_SIZE : 4k (4096)
- CX_ATU_NUM_INBOUND_REGIONS : 16
- CX_ATU_NUM_OUTBOUND_REGIONS : 16
- CX_AUTO_LANE_FLIP_CTRL_EN : true (1)
- CX_COMM_NFTS : 200
- CX_GEN3_EQ_COEFQ_DEPTH : 8
- CX_IDO_ENABLE : false (0)
- CX_L1_SUBSTATES_ENABLE : true (1)

- CX_LBC_EXT_AW : 32
- CX_NPRFX : 0
- CX_PIPE_VER : PIPE4.4.1 (2)
- CX_PIPE43_P0_P1CPM : 1: P0 -> P1.CPM
- CX_PIPE43_P1CPM_ENCODING : 0x4
- CX_PTM_ENABLE : true (1)
- CX_PTM_EXTERNAL_MASTER_TIME : true (1)
- CX_SRIOV_ENABLE : false (0)
- DEFAULT_CLK_PM_CAP : 0x0
- DEFAULT_L0S_EXIT_LATENCY : 2us to 4us (0x6)
- DEFAULT_L1_EXIT_LATENCY : 32us to 64us (0x6)
- DEFAULT_TARGET : Drop (0x0)
- FLT_Q_ADDR_WIDTH : 64
- MULTI_DEVICE_AND_BUS_PER_FUNC_EN : false (0)
- SLAVE_BUS_ADDR_WIDTH : 64
- CX_NL : x4
- DEFAULT_FAST_LINK_SCALING_FACTOR : false (0)
- CC_DMA_EFETCH_EN : true (1)

104.1.2 Block Diagram

Figure 104.1 shows a block diagram of the PCIe Controller.

The PCIe Controller comprises a bridge, PCIe Controller, and PCIe Controller physical unit.

The bridge provides the bridge function of connecting the internal bus (AXI bus and APB bus) to the PCI Express controller.

The PCIe Controller is a block that controls the PCI Express packet transmission and reception, and it implements the functions of transaction and data link layers that are defined by the PCI Express standards. The configuration registers defined by the PCI Express standards are installed in this block.

The PCIe Controller physical unit is a block that controls PCI Express transmission paths and implements the physical layer function that is defined by the PCI Express standards.

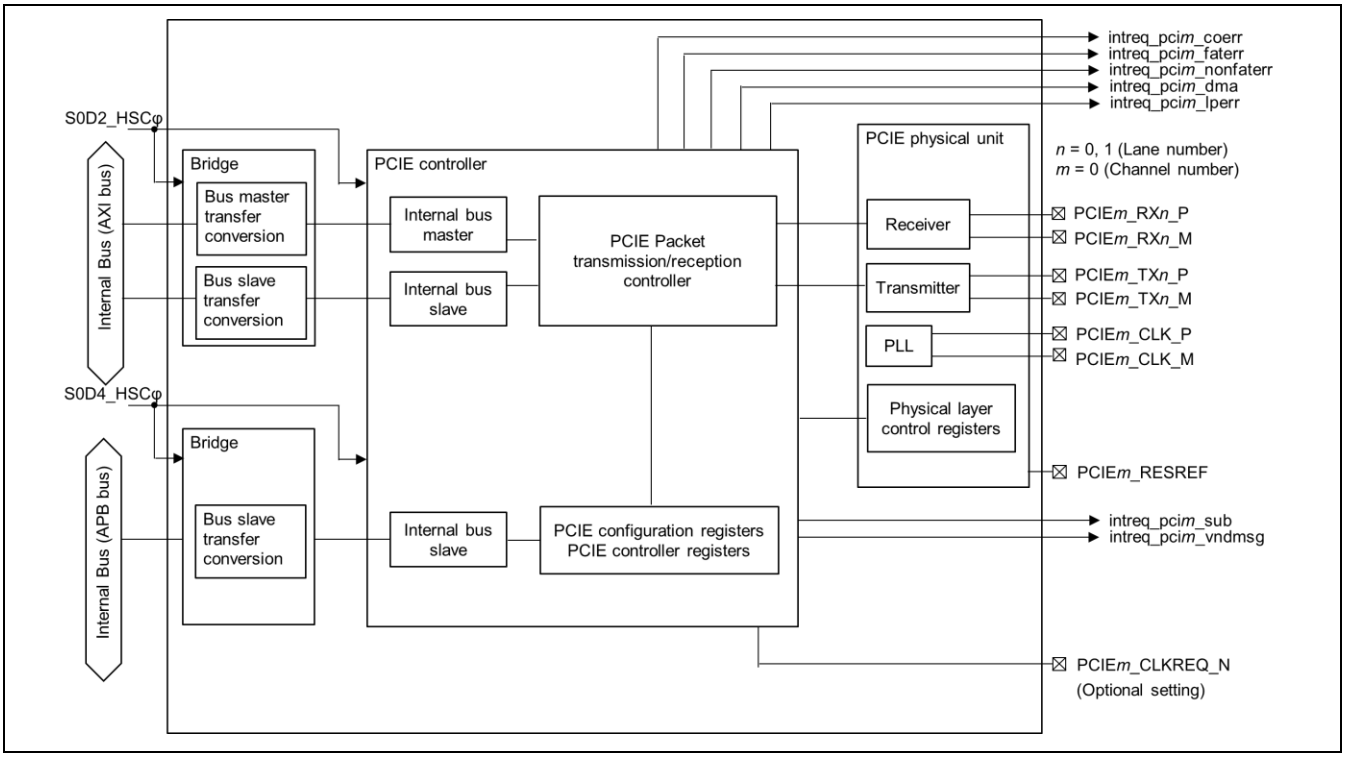

Figure 104.1 Block Diagram

104.1.3 External Pins

Table 104.1 shows the pin configuration.

Table 104.1 Pin Configuration

Signal Name	Signal Conforming to PCI Standard	I/O	Description
PCIE*m*_CLK_P PCIE*m*_CLK_M	REFCLK+ REFCLK-	Input	Reference clock inputs to the PLL incorporated in the PCIe Controller module (differential inputs). 100-MHz clock should be applied.
PCIE*m*_TX*n*_P PCIE*m*_TX*n*_M (*n*=0,1)	PETp*N* PETn*N* (*N*=0,1)	Output	Transmit data pins used by a physical module, where 2.5, 5.0, 8.0 or 16.0 GHz signals are propagated. (Differential output)
PCIE*m*_RX*n*_P PCIE*m*_RX*n*_M (*n*=0,1)	PERp*N* PERn*N* (*N*=0,1)	Input	Receive data pins used by a physical module, where 2.5, 5.0, 8.0 or 16.0 GHz signals are propagated. (Differential input)
PCIE*m*_RESREF	-	InOut	Reference Resistor Connection Attach a 200-Ω ±1% ±100 ppm/°C precision resistor-to-ground on the board.
PCIE*m*_CLKREQ_N	CLKREQ#	I/O	Open drain pins to enable or disable the platform reference clocks. These pins appear by pin multiplexing setting.

m=0

104.1.4 Register Configuration

Table 104.3 shows the PCIe Controller registers. In Table 104.3, the Address Offset columns show an offset for register from the PCIe Controller base address.The actual access address is obtained by adding each offset to the PCIe Controller base address. Table 104.2 shows the PCIe Controller base address. These registers should be accessed through the APB bus. Only the little endian mode can be used for this module.

Table 104.2 PCIe Controller Base Address

	PCI Express
PCIE0 Base Address	H'E65D 0000

Notes: 1. APB: APB bus (internal bus)
PCI: PCI local bus
'—' in R/W column: Access prohibited.
For details of R/W attribute for each bit, see section 104.2, Register Description.
2. Depends on the setting of the local address mask register 0.
3. R/W changes by the state. RootPort:R/W.EndPoint:R.
4. Depends on the setting of the local address mask register 1.
5. Depends on the setting of the local address mask register 2.
6. Depends on the setting of the local address mask register 3.
7. Depends on the setting of the local address mask register 4.
8. Depends on the setting of the local address mask register 5.
9. *m* is channel number. (*m* = 0)

Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

104.1.5 Address Map

Table 104.5 shows the PCIe Controller Address Map.

Table 104.5 PCIe Controller Address Map

Address	Space name	Note
H'3000_0000 – H'3FFF_FFFF	PCIE0 Memory	
H'E65D_0000 – H' E65D_0FFF	PCIE0 PCI Configuration for Function 0	Common address in Root Complex mode and Endpoint mode
H'E65D_1000 – H' E65D_1FFF	PCIE0 PCI Configuration for Function 1	Endpoint mode only
H'E65D_2000 – H' E65D_27FF	PCIE0 PCI shadow register for Function 0	Common address in Root Complex mode and Endpoint mode
H'E65D_2800 – H' E65D_2FFF	PCIE0 PCI shadow register for Function 1	Endpoint mode only
H'E65D_3000 – H' E65D_7FFF	PCIE0 PCIe Control Register	Common for All functions
H'FE00_0000 – H' FE3F_FFFF	PCIE0 Configuration for Remote	This area can be used for Memory

104.1.6 Connected Module

Table 104.6 Connected modules

Module name	Connected module name	Function of connected module
PCIEC	AP-System Core	Access the Registers
	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-AP, REALTIME CORE	Control to interrupt
	IMP-X7	Image Processing
	RT-DMAC	DMA controller

104.2 Register Description

[Legend for the Register Description]

A bit assignment figure is shown for each register. The initial value and R/W attribute are indicated for each bit.

Bit:	Bit number or bit range
Bit Name:	Bit name or field name
Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
RW1C:	Readable/writable. The bit is initialized when 1 is written. Writing 0 is ignored.
R:	Read-only. The write value should always be 0. (If there is a direction on a read or write value in the Description column, set the bit as directed.)
RWS*:	Sticky-read write bit. Readable/writable. The bit is not initialized by a hot reset.
RW1CS*:	Sticky-read-only status bit. The bit is initialized when 1 is written. Writing 0 is ignored. The bit is not initialized by a hot reset.
RSVDP:	Reserved and Preserved – Reserved for future RW implementations. Register bits are read-only and must return zero when read. Software must preserve the value read for writes to bits.

Note: * RWS and RW1CS are only used for the configuration registers. For details, see section 104.4.1, Write/Read Attributes of Configuration Registers.

104.2.1 PCI Configuration Register 0 function *i* (PCICONF0F*i*) *i* = 0, 1

Note: *1: R/W changes by the TYPE. TYPE00: R, TYPE01: -

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	DPE	0	RW1C	RW1C	Detected Parity Error Indicates that a parity error has been detected on the primary bus side. • Root Port: This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. The bit is set when the Poisoned TLP is received by a Function's primary side. • Endpoint: This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register.
30	SSE	0	RW1C	RW1C	Signaled System Error Indicates that a system error has been detected. • Root Port: This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR# Enable bit in the Command register is 1b.. • Endpoint: This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL message, and the SERR# Enable bit in the Command register is 1b. For Functions that do not send ERR_FATAL or ERR_NONFATAL messages, the controller hardwires this bit to 0b.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
29	RMA	0	RW1C	RW1C	Received Master Abort This bit is set when a Requester receives a Completion with Unsupported Request Completion status. • Root Port: The bit is set when the Unsupported Request is received by a Function's primary side. • Endpoint: For Functions that do not make Non-Posted Requests on their own behalf, the controller hardwires this bit to 0b.
28	RTA	0	RW1C	RW1C	Received Target Abort This bit is set when a Requester receives a Completion with Completer Abort Completion status. • Root Port: The bit is set when the Completer Abort is received by a Function's primary side. • Endpoint: For Functions that do not make Non-Posted Requests on their own behalf, the controller hardwires this bit to 0b.
27	STA	0	RW1C	RW1C	Signaled Target Abort This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. • Root Port: This applies to a Function when the Completer Abort was generated by its primary side. • Endpoint: The controller hardwires this bit to 0b for Functions that do not signal Completer Abort.
26, 25	DEVSEL TIMING	All 0	R	R	DEVSEL Timing Fixed to 0. These bits are not used for PCI Express.
24	MDPE	0	RW1C	RW1C	Master Data Parity Error This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs. If the Parity Error Response bit is 0b, this bit is never set. • Root Port: 1. Port receives a Poisoned Completion going downstream 2. Port transmits a Poisoned Request upstream • Endpoint: 1. Function receives a Poisoned Completion 2. Function transmits a Poisoned Request
23	FBBTCAP	0	R	R	Fast Back to Back Transaction Capable Fixed to 0. This bit is not used for PCI Express.
22	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
21	66MCAP	0	R	R	66 MHz Capable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
20	CAPL	1	R	R	Capabilities List Indicates that the extended capabilities list exists in the PCI compatible configuration space. This IP supports the extended capabilities list. This bit must not be set to a value other than 1.
19	INTST	0	R	R	Interrupt Status When set, indicates that an INTx emulation interrupt is pending internally in the Function. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b.
18 to 17	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
16	IMMR	0	R	R	Immediate Readiness. This optional bit, when set, indicates the Function is guaranteed to be ready to successfully complete valid configuration accesses at any time following any reset that the host is capable of issuing Configuration Requests to this Function.
15 to 11	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
10	INTDIS	0	R/W	R/W	Interrupt Disable Controls the ability of a Function to generate INTx emulation interrupts. When set, Functions are prevented from asserting INTx interrupts.
9	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
8	SERRE	0	R/W	R/W	SERR# Enable. Enables an error message transmission when a non-fatal/fatal error is detected. Setting this bit to 1 enables an error message transmission.
7	IDSS	0	R	R	IDSEL Stepping/Wait Cycle Control This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
6	PERS	0	R/W	R/W	Parity Error Response This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register.
5	VGAPS	0	R	R	VGA Plate Snoop This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
4	MWIE	0	R	R	Memory Write and Invalidate Enable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
3	SC	0	R	R	Special Cycle Enable This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
2	BME	0	R/W	R/W	Bus Master Enable • Root Port: This bit controls forwarding of Memory or I/O requests by a port in the Upstream direction. When this bit is 0b, Memory and I/O Requests received at a Root Port must be handled as Unsupported Requests (UR) For Non-Posted Requests a Completion with UR completion status must be returned. This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O Requests is not controlled by this bit. • Endpoint: Controls the ability of a Function to issue Memory and I/O Read/Write requests. ・When this bit is set, the Function is allowed to issue Memory or I/O Requests. ・When this bit is clear, the Function is not allowed to issue any Memory or I/O Requests. Requests other than Memory or I/O Requests are not controlled by this bit.
1	MSE	0	*1	R/W	Memory Space Enable Enables an access to memory space. When this bit is 0, the memory request to this device is handled as an unsupported request.
0	IOSE	0	*1	R/W	IO Space Enable Enables an access to I/O space. When this bit is 0, the IO request to this device is handled as an unsupported request.

104.2.3 PCI Configuration Register 2 function *i* (PCICONF2F*i*) *i* = 0, 1

Common to Header TYPE00/01

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	DPE	0	RW1C	Detected Parity Error Indicates that a parity error has been detected on the secondary bus side. This bit is set to 1 upon reception of a poisoned TLP.
30	RSE	0	RW1C	Received System Error Indicates that a system error has been detected. This bit is set to 1 upon reception of an ERR_FATAL/NON_FATAL message.
29	RMA	0	RW1C	Received Master Abort Indicates that a master abort has been detected on the secondary bus side. This bit is set to 1 upon reception of a completion with the unsupported request completion status.
28	RTA	0	RW1C	Received Target Abort Indicates that a target abort has been detected on the secondary bus side. This bit is set to 1 upon reception of a completion with the completer abort completion status.
27	STA	0	RW1C	Signaled Target Abort Indicates that a target abort has been transmitted to the secondary bus side. This bit is set to 1 upon transmission of a completion with the completer abort completion status.
26, 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	MDPE	0	RW1C	Master Data Parity Error Indicates that a master data parity error has occurred on the secondary bus side. This bit is set when either of the following conditions is satisfied. 1. A poisoned completion has been received. 2. A poisoned request has been transmitted.
23 to 16	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 12	IOLEA	All 0	R/W	IO Limit End Address These bits correspond to the address[15:12] of IO address range.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IOLT	0	R/W	IO Limit Type This bit encodes the IO addressing capability of the bridge. 0: 16-bit I/O address 1: 32-bit I/O address
7 to 4	IOBEA	All 0	R/W	IO Base End Address According to the PCI standard, sets the address[15:12] of the base address of the IO transaction to be transferred to the primary bus. In this IP, this field has no effect on the hardware.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IOBT	0	R/W	IO Base Type According to the PCI standard, indicates the base address decoding format of the IO transactions to be transferred to the primary bus. 0: 16-bit I/O address 1: 32-bit I/O address

BAR5 Base Address. ■ IO Space: Bit 2 is Base Address. Bit 1 is reserved and must return 0.
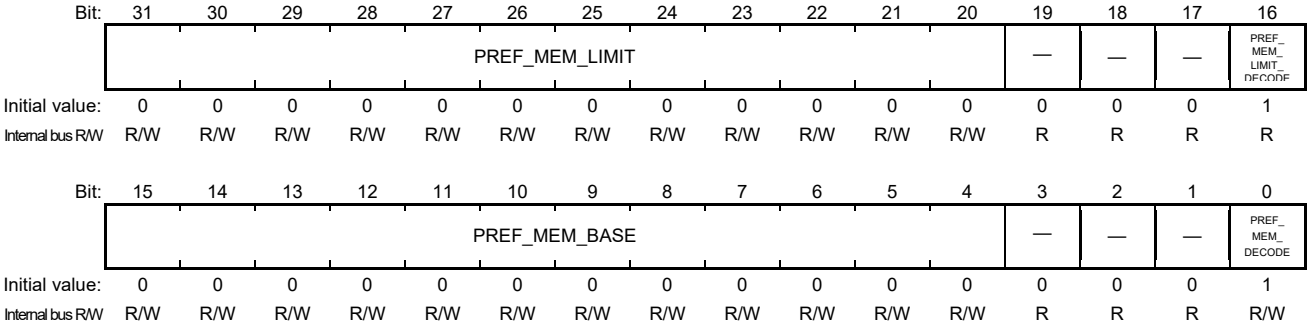
0	BAR5_MIO	0	R	R	BAR5 Memory Space Indicator. This bit is used to determine whether the register maps into Memory or I/O Space. Base Address registers that map to Memory Space must return a 0b. Base Address registers that map to I/O Space must return a 1b.

Header TYPE01

Prefetchable Memory Limit and Base Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 20	PREF_MEM_LIMIT	H'000	R/W	Prefetchable Memory Limit Address If the Prefetchable Memory Limit register indicates support for 32-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read-only register that returns zero when read. If the Prefetchable Memory Limit registers indicate support for 64-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read/write register which must be initialized by configuration software. If a 64-bit prefetchable memory address range is supported, the Prefetchable Limit Upper 32 Bits register specifies the upper 32 bits, corresponding to Address[63:32], of the 64-bit limit addresses which specify the prefetchable memory address range.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	PREF_MEM_LIMIT_DECODE	1	R	Prefetchable Memory Limit DecodeThis bit encodes whether or not the bridge supports 64-bit addresses. 0: 32-bit address 1: 64-bit address.
15 to 4	PREF_MEM_BASE	H'000	R/W	Prefetchable Memory Base If the Prefetchable Memory Base register indicates support for 32-bit addressing, then the Prefetchable Base Upper 32 Bits register is implemented as a read-only register that returns zero when read. If the PrefetchableMemory Base register indicates support for 64-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read/write register which must be initialized by configuration software. If a 64-bit prefetchable memory address range is supported, the Prefetchable Base Upper 32 Bits register spec ifies the upper 32 bits, corresponding to Address[63:32], of the 64-bit base addresses which specify the prefetchable memory address range.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	PREF_MEM_DECODE	1	R	Prefetchable Memory Base DecodeThis bit encodes whether or not the bridge supports 64-bit addresses. The value indicates the following: 0: 32-bit address 1: 64-bit address

104.2.11 PCI Configuration Register 10 function *i* (PCICONF10F*i*) *i* = 0, 1

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	SECBRST	0	R/W	Secondary Bus Reset Setting this bit triggers a hot reset on the corresponding PCI Express Port.
21	MABMD	0	R	Master Abort Mode This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
20	VGA16DEC	0	R/W	VGA 16-bit Decode According to the PCI standard, enables VGA IO decoding. The following actions are taken based on the value of the VGA_16B_DEC bit: ・0b: Execute 10-bit address decodes on VGA I/O accesses ・1b: Execute 16-bit address decodes on VGA I/O accesses For Functions that do not support VGA, the controller hardwires this bit to 0b.
19	VGAE	0	R/W	VGA Enable The following actions are taken based on the value of the VGA_EN bit: ・0b: Do not forward VGA compatible memory and I/O addresses from the primary to the secondary interface (addresses defined above) unless they are enabled for forwardingby the defined I/O and memory address ranges ・1b: Forward VGA compatible memory and I/O addresses (addresses defined above) from the primary interface to the secondary interface (if the I/O Space Enable and Memory Space Enable bits are set) independent of the I/O and memory address ranges and independent of the ISA Enable bit For Functions that do not support VGA, the controller hardwires this bit to 0b.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
18	ISAE	0	R/W	ISA Enable Modifies the response by the bridge to ISA I/O addresses. The following actions are taken based on the value of the ISA_EN bit: ■ 0b: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers ■ 1b: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the first 64 KB of PCI I/O address space (top 768 bytes of each 1-KB block.)
17	SERRE	0	R/W	SERR Enable Enables ERR_FATAL/ERR_NONFATAL/ERR_COR message transfer (notification) from the secondary IF to the primary IF. 1: Enables error message transfer (notification). 0: Disables error message transfer (notification).
16	PERS	0	R/W	Parity Error Response This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Secondary Status register.
15 to 8	Interrupt Pin	All 0	R/W	Interrupt Pin The Interrupt Pin Registers that identifies the legacy interrupt Message(s) the Function uses. Valid valuesare: ・01h, 02h, 03h, and 04h: map to legacy interrupt Messages for INTA, INTB, INTC, and INTD respectively. ・00h: indicates that the Function uses no legacy interrupt Message(s). ・05h through FFh: Reserved.
7 to 0	Interrupt Line	H'FF	R/W	Interrupt Line The Interrupt Line register communicates interrupt line routing information.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 27	PMESP	H'1B	R	R	Power Management Event Support This 5-bit field indicates the power states in which the Function may generate a PME and/or forward PME Messages. A value of 0b for any bit indicates that the Function is not capable of asserting PME while in that power state. bit(27) X XXX1b - PME can be generated from D0 bit(28) X XX1Xb - PME can be generated from D1 bit(29) X X1XXb - PME can be generated from D2 (not support D2 Power Management State) bit(30) X 1XXXb - PME can be generated from D3hot bit(31) 1 XXXXb - PME can be generated from D3cold Bit 31 (PME can be asserted from D3cold) represents a special case.
26	D2SP	0	R	R	D2 Support If this bit is Set, this Function supports the D2 Power Management State. Functions that do not support D2 must always return a value of 0b for this bit. (not support D2 Power Management State)
25	D1SP	1	R	R	D1 Support If this bit is Set, this Function supports the D1 Power Management State. Functions that do not support D1 must always return a value of 0b for this bit.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
24 to 22	AUX Current	H'0	R	R	AUX Current Indicates the current of 3.3V auxiliary power supply. Set this field at initialization. H'0: 0 mA (without auxiliary power supply) H'1: 55 mA H'2: 100 mA H'3: 160 mA H'4: 220 mA H'5: 270 mA H'6: 320 mA H'7: 375 mA
21	DSI	0	R	R	Device Specific Initialization The DSI bit indicates whether special initialization of this Function is required. When Set indicates that the Function requires a device specific initialization sequence following a transition to the D0 uninitialized state.
20	IRORD0	0	R	R	Immediate_Readiness_on_Return_to_D0 If this bit is a “1”, this Function is guaranteed to be ready to successfully complete valid accesses immediately after being set to D0. When this bit is “1”, for accesses to this Function, software is exempt from all requirements to delay accesses following a transition to D0, including but not limited to the 10 ms delay.
19	PMECLK	0	R	R	PME Clock This bit is always read as 0. The write value should always be 0. This bit is not used for PCI Express.
18 to 16	PCI PM Version	H'3	R	R	PCI PM Version Indicate the corresponding PCI PM Interface Specification version. This device corresponds to the PCI PM Interface Specification version 1.2.
15 to 8	Next Capability Pointer	H'50	R	R	PM Next Capability Pointer This field provides an offset into the Function’s Configuration Space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to 00h.
7 to 0	Capability ID	H'01	R	R	Capability ID Capability List ID Indicates the power management capability (H'01).

104.2.18 PCI Power Management Capability Register 1 function *i* (PMCAP1F*i*) *i* = 0, 1

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	RW1C	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	DATA	All 0	R	R	Power Data Information Register. Fixed to 0. This function is not supported.
23	BPCCE	0	R	R	Bus Power Clock Control Enable Enables the PCI bus power/clock control function. 0: Disables the PCI bus power/clock control function. 1: Enables the PCI bus power/clock control function. Set this field to 0 at initialization. Fixed to 0. This function is not supported.
22	B2B3SP	0	R	R	B2 B3 Support Indicates the bus state in the D3Hot state. 0: Clock supply to the secondary IF does not stop in the D3Hot state. (B3) 1: Clock supply to the secondary IF stops in the D3Hot state. (B2) Set this field to 0 at initialization. Fixed to 0. This function is not supported.
21 to 16	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
15	PMEST	0	RW1C	RW1C	PME Status This field is valid when the PME is supported. Indicates the PME generation status. 0: A PME message is not being transmitted. 1: A PME message is being transmitted.
14, 13	Data Scale	All 0	R	R	Data Scale This field indicates the scaling factor to be used when interpreting the value of the Data register. Fixed to 0. This function is not supported.
12 to 9	Data Select	All 0	R	R	Data Select This 4-bit field is used to select which data is to be reported through the Data register and Data_Scale field. Fixed to 0. This function is not supported.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
8	PMEE	0	R/W	R/W	PME Enable Enables PME message transmission. 0: Disables PME message transmission. 1: Enables PME message transmission.
7 to 4	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
3	NOSRST	1	R	R	No Soft Reset Indicates whether internal reset is performed or not when the device makes a transition from the D3Hot state to the D0 state. 0: Internal reset is performed when the device makes a transition from D3Hot state to D0 state. 1: Internal reset is not performed when the device makes a transition from D3Hot state to D0 state. Set the device function at initialization.
2	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	Power State	B’00	R/W	R/W	Power State Specifies the power state. B’00: D0 B’01: D1 B’10: D2 (not support D2 Power Management State, Read/Write value B'10 always read as 0. The write value should always be 0.) B’11: D3Hot

104.2.19 MSI Capability Register 0 function *i* (MSICAP0F*i*) *i* = 0, 1

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 27	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
26	PMEDE	0	R	R/W	Extended Message Data Enable. If Set, the Function is enabled to provide Extended Message Data. If Clear, the Function is not enabled to provide Extended Message Data. This bit must be read-write if the Extended Message Data Capable bit is 1b; otherwise it must be hardwired to 0b.
25	PMEDC	0	R	R	Extended Message Data Capable. If Set, the Function is capable of providing Extended Message Data. If Clear, the Function does not support providing Extended Message Data.
24	PVMSK	1	R	R	MSI Per Vector Masking Capable Indicates whether the per vector masking function is supported or not. 0: The per vector masking function is not supported. 1: The per vector masking function is supported.
23	64ADCAP	1	R	R	MSI 64-bit Address Capable Indicates whether transmission of a 64-bit address message is supported or not. 0: A 64-bit address message cannot be transmitted. 1: A 64-bit address message can be transmitted. This device supports transmission of a 64-bit address message.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
22 to 20	MMESE	B’000	R/W	R/W	MSI Multiple Message Enable Sets the number of interrupt vectors that can be transmitted. B’000: 1 vector B’001: 2 vectors B’010: 4 vectors B’011: 8 vectors B’100: 16 vectors B’101: 32 vectors B’110: Reserved B’111: Reserved
19 to 17	MMESCAP	B’000	R	R	MSI Multiple Message Capable Sets the number of interrupt vectors that a device can transmit. B’000: 1 vector B’001: 2 vectors B’010: 4 vectors B’011: 8 vectors B’100: 16 vectors B’101: 32 vectors B’110: Reserved B’111: Reserved Set the device function at initialization.
16	MSIE	0	R/W	R/W	MSI Enable Enables the MSI function. 0: Disables the MSI function. 1: Enables the MSI function.
15 to 8	Next Capability Pointer	H'70	R	R	MSI Next Capability Pointer Pointer to the extended capability list. Initial Value: Pointer value calculated at configuration time.
7 to 0	Capability ID	H'05	R	R	MSI Capability ID Capability list ID Indicates the MSI capability ID (H'05).

104.2.20 MSI Capability Register 1 function *i* (MSICAP1F*i*) *i* = 0, 1

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Lower Message Address

	Next Capability Pointer								Capability ID							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31, 30	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 25	Interrupt Message Number	All 0	R	R	PCIe Interrupt Message Number This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure.
24	SLTIMP	0	R	R	PCIe Slot Implemented When Set, this bit indicates that the Link associated with this Port is connected to a slot (as compared to being connected to a system-integrated device or being disabled). This bit is valid for Downstream Ports. This bit is undefined for Upstream Ports.
23 to 20	Device Port Type	H'0	R	R	PCIe Device Port Type Indicates the device type. Defined encodings for Functions that implement a Type 00h PCI Configuration Space header are: H'0: PCI Express Endpoint H'1: Legacy PCI Express Endpoint H'9: Root Complex Integrated Endpoint Device H'A: Root Complex Event Collector Defined encodings for Functions that implement a Type 01h PCI Configuration Space header are: H'4: Root Port of PCI Express Root Complex H'5: Upstream Port of PCI Express Switch H'6: Downstream Port of PCI Express Switch H'7: PCI Express to PCI/PCI-X Bridge H'8: PCI/PCI-X to PCI Express Bridge
19 to 16	Capability Version	H'2	R	R	PCIe Capability Version Number Indicates the version of this capability.
15 to 8	NEXT Capability Pointer	H'00	R	R	PCIe Next Capability Pointer Pointer to the extension capability list Indicates H'00, which is End Of List.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
7 to 0	Capability ID	H'10	R	R	Capability ID Capability List ID Indicates the PCI Express capability ID (H'10).

104.2.26 PCI Express Capability Register 1 function *i* (EXPCAP1F*i*) *i* = 0, 1

Header TYPE00

- Device capability register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 29	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
28	FLRCAP	0	R	R/W	Function Level Reset Capability Indicates that the function level reset function is supported. • Endpoints only. For all other Function types this bit doesn't exist.
27, 26	CAPSLPLSC	B'00	R	R	Captured Slot Power Limit Scale Indicates the slot power limit value scale. B'00: 1.0x B'01: 0.1x B'10: 0.01x B'11: 0.001x
25 to 18	Captured Slot Power Limit Value	H'00	R	R	Captured Slot Power Limit Value In combination with the Captured Slot Power Limit Scale value, specifies the upper limit on power available to the adapter.
17, 16	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
15	RBER	1	R	R	Role-Based Error Reporting When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1.
14 to 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
11 to 9	EL1ACLAT	B’000	R	R/W	Endpoint L1 Acceptable Latency Indicates the maximum L1 to L0 transition latency that the device can accept. B’000: L0 recovery must be completed within 1 µs. B’001: L0 recovery must be completed within 2 µs. B’010: L0 recovery must be completed within 4 µs. B’011: L0 recovery must be completed within 8 µs. B’100: L0 recovery must be completed within 16 µs. B’101: L0 recovery must be completed within 32 µs. B’110: L0 recovery must be completed within 64 µs. B’111: No time limit Set the device support status at initialization.
8 to 6	EL0ACLAT	B’000	R	R/W	Endpoint L0s Acceptable Latency Indicates the maximum L0s to L0 transition latency that the device can accept. B’000: L0 recovery must be completed within 64 ns. B’001: L0 recovery must be completed within 128 ns. B’010: L0 recovery must be completed within 256 ns. B’011: L0 recovery must be completed within 512 ns. B’100: L0 recovery must be completed within 1 µs. B’101: L0 recovery must be completed within 2 µs. B’110: L0 recovery must be completed within 4 µs. B’111: No time limit
5	ETAGS	1	R	R	Extended Tag Field Supported Indicates the tag ID size supported as the requester ID. 0: 5-bit tag 1: 8-bit extension tag
4, 3	PFS	B’00	R	R	Phantom Function Supported Indicates the phantom function support status for transaction ID extension. B’00: The phantom function is not supported. B’01: The MSB of requester ID function number can be used for the phantom function. B’10: The upper two bits of requester ID function number can be used for the phantom function. B’11: All the three bits of requester ID function number can be used for the phantom function.
2 to 0	MPSS	B’001	R	R	Max Payload Size Supported Indicates the maximum payload size supported by the device. B’000: 128 bytes B’001: 256 bytes B’010: 512 bytes B’011: 1024 bytes B’100: 2048 bytes B’101: 4096 bytes B’110: Reserved B’111: Reserved

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 22	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
21	TRPD	0	R	R	Transaction Pending Indicates that there is a non-posted request not yet completed. ・ Endpoints: When Set, this bit indicates that the Function has issued Non-Posted Requests that have not been completed. ・ Root and Switch Ports: When Set, this bit indicates that a Port has issued Non-Posted Requests on its own behalf (using the Port's own Requester ID) which have not been completed.
20	AUXPDTCD	0	R	R	AUX Power Detected Functions that require Aux power report this bit as Set if Aux power is detected by the Function.
19	URDTCD	0	RW1C	RW1C	Unsupported Request Detected Indicates the unsupported request detection status. 0: An unsupported request has not been detected. 1: An unsupported request has been detected. This field is set to 1 when an unsupported request is detected.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
18	FEDTCD	0	RW1C	RW1C	Fatal Error Detected Status Indicates the fatal error detection status. 0: A fatal error has not been detected. 1: A fatal error has been detected. This field is set to 1 when a fatal error is detected.
17	NFEDTCD	0	RW1C	RW1C	Non-fatal Error Detected Indicates the non-fatal error detection status. 0: A non-fatal error has not been detected. 1: A non-fatal error has been detected. This field is set to 1 when a non-fatal error is detected.
16	CEDTCD	0	RW1C	RW1C	Correctable Error Detected Indicates the correctable error detection status. 0: A correctable error has not been detected. 1: A correctable error has been detected. This field is set to 1 when a correctable error is detected.
15	PCIF	0	R/W	R/W	Initiate Function Level Reset (applicable to Endpoints with Function Level Reset Capability set to 1b). A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.
14 to 12	Max Read Request Size	B’010	R/W	R/W	Max Read Request Size Indicates the maximum size of the read request that can be issued as the requester. B’000: 128 bytes max. B’001: 256 bytes max. B’010: Reserved B’011: Reserved B’100: Reserved B’101: Reserved B’110: Reserved B’111: Reserved
11	ENSNP	1	*1	R/W	Enable No Snoop Enables the device to issue the no-snoop transaction. 0: The no-snoop transaction cannot be issued. 1: The no-snoop transaction can be issued.
10	AUXPPME	0	RWS	R/W	AUX Power PM Enable Enables AUX power power management. 0: AUX power power management is disabled. 1: AUX power power management is enabled.
9	PFE	0	*2	R/W	Phantom Function Enable Enables the phantom function. 0: The phantom function is disabled. 1: The phantom function is enabled.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
8	ETAGE	0	*1	R/W	Extended Tag Field Enable This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. The following applies when the 10-Bit Tag Requester Enable bit is Clear. If the Extended Tag Field Enable bit is Set, the Function is permitted to use an 8-bit Tag field as a Requester.
7 to 5	Max Payload Size	B'000	R/W	R/W	Max Payload Size Indicates the maximum payload size for the device. B'000: 128 bytes max. B'001: 256 bytes max. B'010: 512 bytes max. B'011: 1024 bytes max. B'100: 2048 bytes max. B'101: 4096 bytes max. B'110: Reserved B'111: Reserved
4	ERLOD	1	*1	R/W	Enabled Relax Ordering Enables the device to issue the relaxed ordering transaction. 0: The relaxed ordering transaction cannot be issued. 1: The relaxed ordering transaction can be issued.
3	URRPE	0	R/W	R/W	Unsupported Request Reporting Enable Enables the error message report on detection of an unsupported request. 0: The FATAL_ERR or NONFATAL_ERR message is not transmitted on detection of an unsupported request. 1: The FATAL_ERR or NONFATAL_ERR message is transmitted on detection of an unsupported request.
2	FERPE	0	R/W	R/W	Fatal Error Reporting Enable Enables the error message report on detection of a FATAL_ERR. 0: The ERR_FATAL message is not transmitted on detection of a FATAL_ERR. 1: The ERR_FATAL message is transmitted on detection of a FATAL_ERR.
1	NFERPE	0	R/W	R/W	Non-fatal Error Reporting Enable Enables the error message report on detection of a NON_FATAL_ERR. 0: The ERR_NONFATAL message is not transmitted on detection of a NON FATAL_ERR. 1: The ERR_NONFATAL message is transmitted on detection of a NON FATAL_ERR.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	CERPE	0	R/W	R/W	Correctable Error Reporting Enable Enables the error message report on detection of a correctable error. 0: The ERR_COR message is not transmitted on detection of a correctable error. 1: The ERR_COR message is transmitted on detection of a correctable error.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	Port Number	All 0	R	R	Port Number Indicates the port number of this PCI Express port. Specify the port number at initialization.
23	—	All 0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
22	PCAOC	0	R	R	ASPM Optionality Compliance This bit must be set to 1b in all Functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b.
21	LKBWNOTFCAP	1	R	R	Link Bandwidth Notification Capability A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms.
20	DLLACTRPCAP	1	R	R	Data Link Layer Active Reporting Capable For a Downstream Port, this bit must be hardwired to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, this bit must be hardwired to 1b. For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b.
19	SDNERPCAP	1	R	R	Surprise Down Error Reporting Capable For a Downstream Port, this bit must be Set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
18	CLKPM	0	R	R	Clock Power Management Indicates that the clock can be stopped when the link is in the L1, L2Ready, or L3Ready state. 0: Clock cannot be stopped. 1: Clock can be stopped. For Downstream Ports, this bit must be hardwired to 0b.
17 to 15	L1ELAT	B’110	R	R	L1 Exit Latency Indicates the L1 to L0 transition latency of the device. B’000: less than 1 µs. B’001: 1 µs to less than 2 µs. B’010: 2 µs to less than 4 µs. B’011: 4 µs to less than 8 µs. B’100: 8 µs to less than 16 µs. B’101: 16 µs to less than 32 µs. B’110: 32 µs - 64 µs. B’111: More than 64 µs.
14 to 12	L0s Exit Latency	B’111	R	R	L0s Exit Latency Indicates the L0s to L0 transition latency of the device. B’000: Less than 64 ns. B’001: 64 ns to less than 128 ns. B’010: 128 ns to less than 256 ns. B’011: 256 ns to less than 512 ns. B’100: 512 ns to less than 1 µs. B’101: 1 µs to less than 2 µs. B’110: 2 µs - 4 µs B’111: More than 4 µs.
11, 10	ASPM Supported	B’01	R	R	ASPM Supported Indicates the ASPM support status. B’00: No ASPM Support B’01: L0s Supported B’10: L1 Supported B’11: L0s and L1 Supported
9 to 4	Maximum Link Width	H'01	R	R	Maximum Link Width Indicates the maximum link width. H'00: Reserved H'01: x1 H'02: x2 H'04: x4 H'08: x8 H'0C: x12 H'10: x16 H'20: x32

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description

[Root Port mode]

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	LKAUTOBWSTS	0	R	RW1C	Link Autonomous Bandwidth Status • Root Port: When a change of link bandwidth due to intentional factor is detected, 1 is set. This bit is cleared to 0 when 1 is written.
30	LKBWMNGSTS	0	R	RW1C	Link Bandwidth Management Status • Root Port: When a change of link bandwidth due to reliability-related factor is detected, 1 is set. This bit is cleared to 0 when 1 is written.
29	DLLACT	0	R	R	Data Link Layer Active Indicates that DLCMSM is in the DL_ACTIVE state. 0: Not in the DL_ACTIVE state 1: In the DL_ACTIVE state
28	SLCLKCFG	0	R	R/W	Slot Clock Configuration Indicates that the same reference clock as that supplied to the connector by the platform is used. 0: The same reference clock is not used. 1: The same reference clock is used.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
27	LKTR	0	R	R	Link Training Indicates that link training by MAC LTSSM is in progress. • Root Port: Set to 1 when link training is in progress.
26	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
25 to 20	Negotiated Link Width	H'04	R	R	Negotiated Link Width Indicates the link width determined by negotiation between links. H'01: x1 H'02: x2 H'04: x4 H'08: x8 H'0C: x12 H'10: x16 H'20: x32 This field value is undefined while a link is not established.
19 to 16	Current Link Speed	H'1	R	R	Current Link Speed Indicates the link speed determined by negotiation between links. H’1 Supported Link Speeds Vector field bit 0 H’2 Supported Link Speeds Vector field bit 1 H’3 Supported Link Speeds Vector field bit 2 H’4 Supported Link Speeds Vector field bit 3 H’5 Supported Link Speeds Vector field bit 4 H’6 Supported Link Speeds Vector field bit 5 H’7 Supported Link Speeds Vector field bit 6
15, 14	PCDSC	All 0	R	R	DRS Signaling Control H’0 DRS not Reported H’1 DRS Interrupt Enabled H’2 DRS to FRS Signaling Enabled Fixed to 0. This function is not supported.
13, 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
11	LKAUTOBWINTE	0	—	R/W	Link Autonomous Bandwidth Interrupt Enable • Root Port: When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
10	LKBWMNGINTE	0	—	R/W	Link Bandwidth Management Interrupt Enable • Root Port: When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set.
9	HWAUTOWDIS	0	R	R	Hardware Autonomous Width Disable Disables autonomous change of link width by hardware except for the cases of poor link reliability. 0: Autonomous change of link width by hardware is enabled. 1: Autonomous change of link width by hardware is disabled. According to the standard, fixing this bit to 0 is allowed if hardware does not provide the autonomous link width changing mechanism. Since this IP does not provide the autonomous link.
8	ECLKPM	0	R/W	R/W	Enable Clock Power Management Enables the clock power management function.
7	EXTSYNC	0	R/W	R/W	Extended SYNC Transmits the ordered set when the MAC LTSSM makes a transition from L0s or in the recovery state.
6	CCLKCFG	0	R/W	R/W	Common Clock Configuration Indicates that the same clock is used by both ends of the link.
5	RTRNLK	0	R	R/W	Retrain Link Directs link retraining. Note: The read value is always 0. • Root Port: Write 1 to allow link retraining.
4	LKDIS	0	R	R/W	Link Disable Disables the link. • Root Port: Write 1 to disable the link.
3	RCB	0	R/W	R/W	Read Completion Boundary Indicates the read completion boundary. 0: 64-byte boundary 1: 128-byte boundary
2	Reserved	0	R	R	This bit is always read as 0. The write value should always be 0.
1, 0	ASPM Control	B’00	R/W	R/W	ASPM Control Sets the ASPM support level. B’00: Disabled B’01: L0s transition enabled B’10: L1 transition enabled B’11: L0s/L1 transition enabled

[Endpoint mode]

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	LKAUTOBWSTS	0	R	R	Link Autonomous Bandwidth Status • Endpoint: Use the initial value. Not need to be changed.
30	LKBWMNGSTS	0	R	R	Link Bandwidth Management Status • Endpoint: Use the initial value. Not need to be changed.
29	DLLACT	0	R	R	Data Link Layer Active Indicates that DLCMSM is in the DL_ACTIVE state. 0: Not in the DL_ACTIVE state 1: In the DL_ACTIVE state
28	SLCLKCFG	0	R	R/W	Slot Clock Configuration Indicates that the same reference clock as that supplied to the connector by the platform is used. 0: The same reference clock is not used. 1: The same reference clock is used.
27	LKTR	0	R	R	Link Training Indicates that link training by MAC LTSSM is in progress. • Endpoint: Fixed to 0.
26	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
25 to 20	Negotiated Link Width	H'04	R	R	Negotiated Link Width Indicates the link width determined by negotiation between links. H'01: x1 H'02: x2 H'04: x4 H'08: x8 H'0C: x12 H'10: x16 H'20: x32 This field value is undefined while a link is not established.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
19 to 16	Current Link Speed	H'1	R	R	Current Link Speed Indicates the link speed determined by negotiation between links. H'1 Supported Link Speeds Vector field bit 0 H'2 Supported Link Speeds Vector field bit 1 H'3 Supported Link Speeds Vector field bit 2 H'4 Supported Link Speeds Vector field bit 3 H'5 Supported Link Speeds Vector field bit 4 H'6 Supported Link Speeds Vector field bit 5 H'7 Supported Link Speeds Vector field bit 6
15, 14	PCDSC	All 0	R	R	DRS Signaling Control H'0 DRS not Reported H'1 DRS Interrupt Enabled H'2 DRS to FRS Signaling Enabled Fixed to 0. This function is not supported.
13, 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
11	LKAUTOBWINTE	0	R	R	Link Autonomous Bandwidth Interrupt Enable • Endpoint: Use the initial value. Not need to be changed.
10	LKBWMNGINTE	0	R	R	Link Bandwidth Management Interrupt Enable • Endpoint: Use the initial value. Not need to be changed.
9	HWAUTOWDIS	0	R	R	Hardware Autonomous Width Disable Disables autonomous change of link width by hardware except for the cases of poor link reliability. 0: Autonomous change of link width by hardware is enabled. 1: Autonomous change of link width by hardware is disabled. According to the standard, fixing this bit to 0 is allowed if hardware does not provide the autonomous link width changing mechanism. Since this IP does not provide the autonomous link.
8	ECLKPM	0	R/W	R/W	Enable Clock Power Management Enables the clock power management function.
7	EXTSYNC	0	R/W	R/W	Extended SYNC Transmits the ordered set when the MAC LTSSM makes a transition from L0s or in the recovery state.
6	CCLKCFG	0	R/W	R/W	Common Clock Configuration Indicates that the same clock is used by both ends of the link.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
5	RTRNLK	0	R	R/W	Retrain Link Directs link retraining. Note: The read value is always 0. • Endpoint: This bit is reserved. The write value should always be 0.
4	LKDIS	0	R	R/W	Link Disable Disables the link. • Endpoint: This bit is reserved. The write value should always be 0.
3	RCB	0	R/W	R/W	Read Completion Boundary Indicates the read completion boundary. 0: 64-byte boundary 1: 128-byte boundary
2	Reserved	0	R	R	This bit is always read as 0. The write value should always be 0.
1, 0	ASPM Control	B’00	R/W	R/W	ASPM Control Sets the ASPM support level. B’00: Disabled B’01: L0s transition enabled B’10: L1 transition enabled B’11: L0s/L1 transition enabled

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	DLLSTCHG	0	RW1C	Data Link Layer State Changed This bit is Set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed
23	EMLKSTS	0	R	Electromechanical Interlock Status Indicates the Electromechanical Interlock state. 0: Not locked by Electromechanical Interlock. 1: Locked by Electromechanical Interlock
22	PRDETST	0	R	Presence Detect State Indicates that the adapter is inserted in the slot. 0: The slot is empty. 1: The adapter is inserted in the slot.
21	MRLSENST	0	R	MRL Sensor State Indicates the MRL sensor state. 0: MRL Closed. 1: MRL Open
20	COMCPL	0	RW1C	Command Completed Indicates that the Hot Plug command has been completed. 0: The Hot Plug command is being executed. 1: The Hot Plug command execution has been completed.
19	PRDETCHG	0	RW1C	Presence Detect Changed This bit is Set when the value reported in the Presence Detect State bit is changed.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
18	MRLSENCHG	0	RW1C	MRL Sensor Changed If an MRL sensor is implemented, this bit is Set when a MRL Sensor state change is detected. If an MRL sensor is not implemented, this bit must not be Set.
17	PWFALDET	0	RW1C	Power Fault Detect Indicates that the power fault has been detected.
16	ATBTNPRES	0	RW1C	Attention Button Pressed Indicates that the attention button has been pressed.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DLLSTCHGE	0	RW	Data Link Layer State Change Enable If the Data Link Layer Link Active Reporting capability is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed.
11	EMLKCON	0	R	Electro Mechanical Interlock Control If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. This function is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
10	PWCONCON	0	RW	Power Controller Control If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. 0: Power On 1: Power Off
9, 8	PWINDCON	B’11	RW	Power Indicator Control If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state. B’00: Reserved B’01: On B’10: Blink B’11: Off
7, 6	ATINDCON	B’11	RW	Attention Indicator Control If an Attention Indicator is implemented, writes to this field set the Attention Indicator to the written state. B’00: Reserved B’01: On B’10: Blink B’11: Off
5	HOTPLGINTE	0	RW	Hot Plug Interrupt Enable When Set, this bit enables generation of an interrupt on enabled hot-plug events.
4	COMCPLINTE	0	RW	Command Completed Interrupt Enable If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), when Set, this bit enables software notification when a hot-plug command is completed by the Hot-Plug Controller.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
3	PRDETCHGE	0	RW	Presence Detect Changed Enable When Set, this bit enables software notification on a presence detect changed event.
2	MRLSENCHGE	0	RW	MRL Sensor Changed Enable When Set, this bit enables software notification on a MRL sensor changed event
1	PWFALDETE	0	RW	Power Fault Detect Enable When Set, this bit enables software notification on a power fault event.
0	ATBTNPRESE	0	RW	Attention Button Pressed Enable When Set to 1b, this bit enables software notification on an attention button pressed event.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	PCFS	0	R	R	FRS Supported When Set, indicates support for the optional Function Readiness Status (FRS) capability.
30 to 24	—	All 0	R	R	Reserved These bits are always read as 0.The write value should always be 0.
23, 22	PCCMETP	H'0	R	R	Max Number of End-End TLP Prefixes Supported. Indicates the maximum number of End-End TLP Prefixes supported by this Function. H'1 1 End-End TLP Prefix H'2 2 End-End TLP Prefixes H'3 3 End-End TLP Prefixes H'0 4 End-End TLP Prefixes
21	PCCETPS	0	R	R	End-End TLP Prefix Supported Indicates whether End-End TLP Prefix support is offered by a Function. 0 : No Support 1 : Support is provided to receive TLPs containing End-End TLP Prefixes.
20	PCCEFS	0	R	R	Extended Fmt Field Supported If Set, the Function supports the 3-bit definition of the Fmt field. If Clear, the Function supports a 2-bit definition of the Fmt field. This function is not supported. This bit is Reserved, always read as 0, the write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
19, 18	PCOS	H'0	R	R	OBFF Supported This field indicates if OBFF is supported and, if so, what signaling mechanism is used. H'0 OBFF Not Supported H'1 OBFF supported using Message signaling only H'2 OBFF supported using WAKE# signaling only H'3 OBFF supported using WAKE# and Message signaling Root Ports, Switch Ports, and Endpoints are permitted to implement this capability.
17	PC10BTRS	0	R	R	10-Bit Tag Requester Supported If this bit is Set, the Function supports 10-Bit Tag Requester capability.
16	PC10BTCS	0	R	R	10-Bit Tag Completer Supported If this bit is Set, the Function supports 10-Bit Tag Completer capability.
15, 14	PCLSC	H'0	R	R	LN System CLS Applicable only to Root Ports and RCRBs H'0 LN Completer either not supported or not in effect H'1 LN Completer with 64-byte cachelines in effect H'2 LN Completer with 128-byte cachelines in effect H'3 Reserved
13, 12	PCTCS	H'0	R	R	TPH Completer Supported Value indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. H'0 : TPH and Extended TPH Completer not supported. H'1 : TPH Completer supported; Extended TPH Completer not supported. H'2 : Reserved. H'3 : Both TPH and Extended TPH Completer supported.
11	PCLS	0	R	R	LTR Mechanism Supported A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability.
10	PCNREPP	0	R	R	No RO-enabled PR-PR Passing This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports.
9	PC128CCS	0	R	R	128-bit CAS Completer Supported Applicable to Functions with Memory Space BARs as well as all Root Ports.
8	PC64ACS	0	R	R	64-bit AtomicOp Completer Supported Applicable to Functions with Memory Space BARs as well as all Root Ports.
7	PC32ACS	0	R	R	32-bit AtomicOp Completer Supported Applicable to Functions with Memory Space BARs as well as all Root Ports.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
6	PCARS	0	R	R	AtomicOp Routing Supported Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types.
5	ARIFWDSUP	0	R	R	ARI Forwarding Support Indicates the ARI Forwarding support status. • Root Port: This IP does not support the ARI Forwarding. Fixed to 0. • Endpoint: Fixed to 0.
4	CPLTODISSUP	1	R	R	Completion Timeout Disable Supported Indicates the Completion Timeout Disable function support status. 0: The Completion Timeout Disable function is not supported. 1: The Completion Timeout Disable function is supported.
3 to 0	Completion Timeout Range Supported	H'0	R	R	Completion Timeout Range Supported Indicates the Completion Timeout Range support status. Timeout range specified by the standard: Range A: 50 µs to 10 ms Range B: 10 ms to 250 ms Range C: 250 ms to 4 s Range D: 4 s to 64 s Supported ranges: H'0: Setting the timeout value is prohibited (fixed). H'1: Range A H'2: Range B H'3: Range A and B H'6: Range B and C H'7: Range A, B and C H'E: Range B, C and D H'F: Range A, B, C and D Other than above: Reserved This IP does not support the timeout value setting.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	—	All 0	R	R	Reserved These bits are always read as 0.The write value should always be 0.
15	PCCETPB	0	R	R	End-End TLP Prefix Blocking Controls whether the routing function is permitted to forward TLPs containing an End-End TLP Prefix. 0 : Forwarding Enabled – Function is permitted to send TLPs with End-End TLP Prefixes. 1 : Forwarding Blocked – Function is not permitted to send TLPs with End-End TLP Prefixes.
14, 13	PCOE	H'0	R	R	OBFF Enable This field enables the OBFF mechanism and selects the signaling method. H'0 Disabled H'1 Enabled using Message signaling [Variation A] H'2 Enabled using Message signaling [Variation B] H'3 Enabled using WAKE# signaling This function is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
12	PC10BTRE	0	R	R	10-Bit Tag Requester Enable This bit, in combination with the Extended Tag Field Enable bit in the Device Control register, determines how many Tag field bits a Requester is permitted to use. This function is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
11	—	0	R	R	Reserved This bit si always read as 0.The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
10	PCLE	0	R/W*	R/W*	LTR Mechanism Enable When Set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages. *Note*: RW for function #0 and RsdvP for all other functions.
9	PCICE	0	R	R	IDO Completion Enable If this bit is Set, the Function is permitted to set the ID-Based Ordering (IDO) bit (Attr[2]) of Completions it returns Endpoints, including RC Integrated Endpoints, and Root Ports are permitted to implement this capability. Note: IDO is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
8	PCIRE	0	R	R	IDO Request Enable If this bit is Set, the Function is permitted to set the ID-Based Ordering (IDO) bit (Attr[2]) of Requests it initiates. Note: IDO is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
7	PCAEB	0	R	R	AtomicOp Egress Blocking Applicable and mandatory for Switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability.
6	PCARE	0	R	R	AtomicOp Requester Enable Applicable only to Endpoints and Root Ports This function is not supported. This bit is Reserved, always read as 0, the write value should always be 0.
5	ARIFWDE	0	R	R	ARI Forwarding Enable When set, the Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	CPLTODIS	0	R/W	R/W	Completion Timeout Disable Sets the Completion Timeout Disable function. 0: The Completion Timeout Disable function is disabled. 1: The Completion Timeout Disable function is enabled.
3 to 0	Completion Timeout Value	H'0	RW	RW	Completion Timeout Value Sets the Completion Timeout value. H'0: Default Range 50 µs to 50 ms H'1: 50 µs to 100 µs H'2: 1 ms to 10 ms H'5: 16 ms to 55 ms H'6: 65 ms to 210 ms H'9: 260 ms to 900 ms H'A: 1 s to 3.5 s H'C: 4 s to 13 s H'D: 17 s to 64 s Other than above: Reserved.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	—	0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
30 to 28	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
27, 26	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	PCCR	H'3	R	R	Crosslink Resolution This field indicates the state of the Crosslink negotiation. H'0 Crosslink Resolution is not supported. H'1 Crosslink negotiation resolved as an Upstream Port. H'2 Crosslink negotiation resolved as a Downstream Port. H'3 Crosslink negotiation is not completed.
23	PCTRPD	0	R	R	Two Retimers Presence Detected When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation.
22	PCRPD	0	R	R	Retimer Presence Detected When set to 1b, this bit indicates that a Retimer was present during the most recent Link negotiation.
21	PCLER	0	RW1C	RW1C	Link Equalization Request 8.0 GT/s This bit is Set by hardware to request the 8.0 GT/s Link equalization process to be performed on the Link.
20	PCECP3	0	R	R	Equalization 8.0 GT/s Phase 3 Successful When set to 1b, this bit indicates that Phase 3 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
19	PCECP2	0	R	R	Equalization 8.0 GT/s Phase 2 Successful When set to 1b, this bit indicates that Phase 2 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed.
18	PCECP1	0	R	R	Equalization 8.0 GT/s Phase 1 Successful When set to 1b, this bit indicates that Phase 1 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed.
17	PCEC	0	R	R	cfg_ls2_eq_cmpl
16	CURDEEMLEV	1	R	R	Current De-emphasis Level Indicates the current de-emphasis level during 5-GT/s link operation. 0: -6 dB 1: -3.5 dB The value is undefined during 2.5-GT/s operation.
15 to 12	CMPDEEM	H'0	R/W*	R/W*	Compliance Preset/De-emphasis For 8.0 GT/s and higher Data Rate: This field sets the Transmitter Preset in Polling. H'0: -6 dB H'1: -3.5 dB The value is undefined during 2.5-GT/s operation. *Note: Only function 0 (i = 0) control the component of LINK behavior, In all other functions of that device, this bit is of type RsvdP.
11	CMPSOS	0	*1*2	R/W*2	Compliance SOS(Skip Ordered Sets transmission) When this bit is 1, LTSSM periodically inserts the SKP ordered set between compliance patterns. 0: The SKP ordered set is not periodically inserted. 1: The SKP ordered set is periodically inserted. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only. *2Note: Only function 0 (i = 0) control the component of LINK behavior, In all other functions of that device, this bit is of type RsvdP.
10	ETMDFCMP	0	*1*2	R/W*2	Enter Modified Compliance When this bit is 1, LTSSM transmits modified compliance patterns on transition to the Polling.Compliance state. 0: Normal compliance patterns are used. 1: Modified compliance patterns are used. *2Note: Only function 0 (i = 0) control the component of LINK behavior, In all other functions of that device, this bit is of type RsvdP.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
9 to 7	Transmit Margin	B'000	R/W*	R/W*	Transmit Margin Sets the signal level without de-emphasis. B'000: Normal signal level B'001: 800 to 1200 mV for full swing, 400 to 700 mV for reduced swing B'010-(n-1): n is specified by PHY (3 ≤ n ≤ 7). n-111: Reserved Determine n according to the PHY specification. Do not set the value exceeding the PHY specification. *Note: Only function 0 (i = 0) control the component of LINK behavior, In all other functions of that device, this bit is of type RsvdP.
6	SELDEEM	0	R	R	Selectable De-emphasis Indicates the de-emphasis level during 5-GT/s upstream component operation. • Root Port: Set a value appropriate for the PHY at initialization. 0: -6 dB 1: -3.5 dB • Endpoint: Fixed to 0.
5	HWATSPDIS	0	R	R	Hardware Autonomous Speed Disable Disables autonomous change of link width by hardware except for the cases of poor reliability. 0: Autonomous change of link width by hardware is enabled. 1: Autonomous change of link width by hardware is disabled. According to the standard, fixing this bit to 0 is allowed if hardware does not provide the autonomous link width changing mechanism.
4	ENTCMP	0	RWS*	R/W	Enter Compliance Setting this bit of both ends of the link forcibly places a link into compliance mode at the specified speed. Used to set compliance mode. *Note: Only function 0 (i = 0) control the component of LINK behavior, In all other functions of that device, this bit is of type RsvdP.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
3 to 0	Target Link Speed	B'0010 *	RWS*	R/W	Target Link Speed The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. B'0001 Supported Link Speeds Vector field bit 0 B'0010 Supported Link Speeds Vector field bit 1 B'0011 Supported Link Speeds Vector field bit 2 B'0100 Supported Link Speeds Vector field bit 3 B'0101 Supported Link Speeds Vector field bit 4 B'0110 Supported Link Speeds Vector field bit 5 B'0111 Supported Link Speeds Vector field bit 6 *Note: For a Multi-Function Device associated with an Upstream Port, the field in Function 0 (i = 0) is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of this PCIe, this field is of type RsvdP (intial value = b'0000, attribute RO).

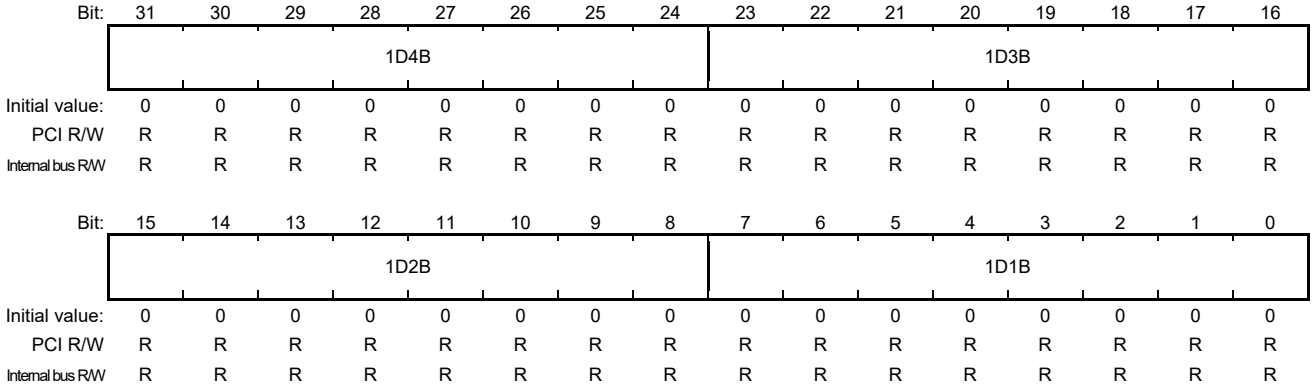
4 to 0	FEP	0	R	R	First Error Pointer

104.2.45 Advanced Error Reporting Capability Register 7 function *i* (AERCAP7F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Header Log Register First

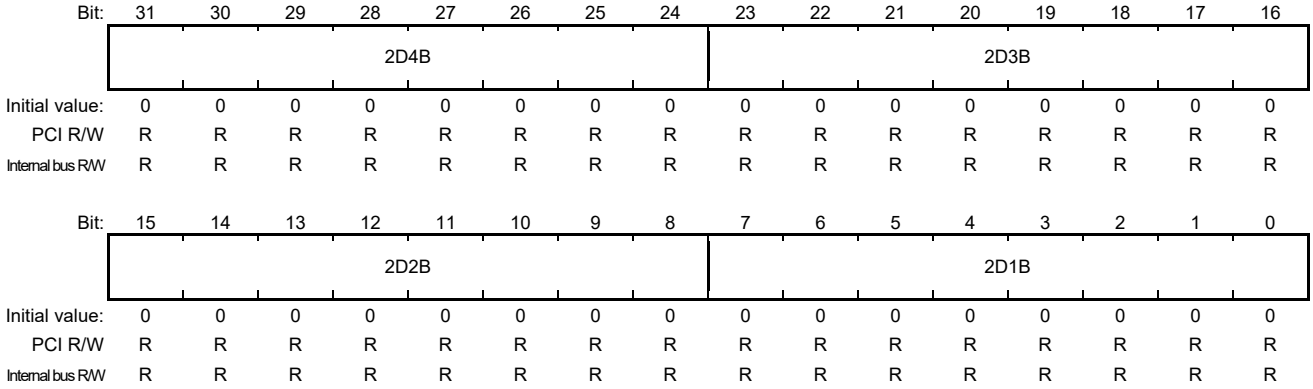


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	1D4B	0	R	R	Byte 3 of Header log register of First 32 bit Data Word
23 to 16	1D3B	0	R	R	Byte 2 of Header log register of First 32 bit Data Word
15 to 8	1D2B	0	R	R	Byte 1 of Header log register of First 32 bit Data Word
7 to 0	1D1B	0	R	R	Byte 0 of Header log register of First 32 bit Data Word

104.2.46 Advanced Error Reporting Capability Register 8 function *i* (AERCAP8F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Header Log Register Second

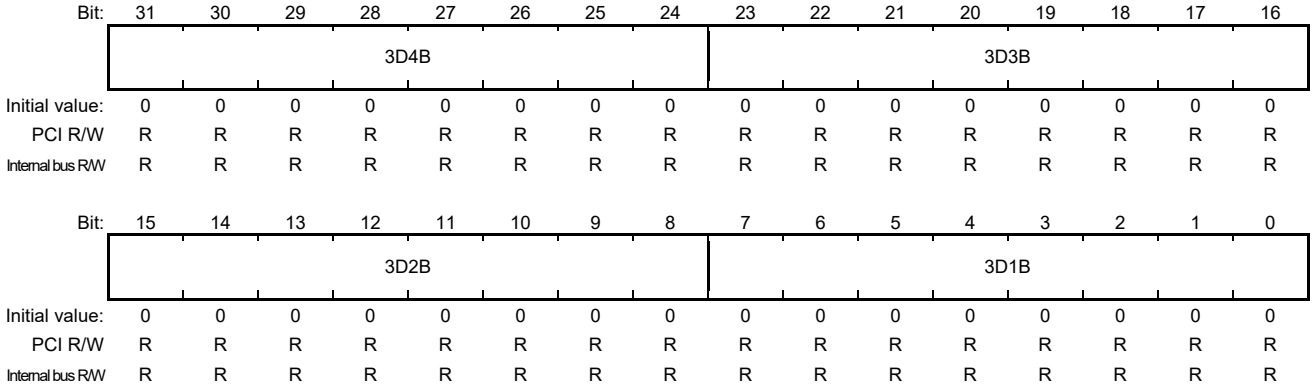


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	2D4B	0	R	R	Byte 3 of Header log register of Second 32 bit Data Word
23 to 16	2D3B	0	R	R	Byte 2 of Header log register of Second 32 bit Data Word
15 to 8	2D2B	0	R	R	Byte 1 of Header log register of Second 32 bit Data Word
7 to 0	2D1B	0	R	R	Byte 0 of Header log register of Second 32 bit Data Word

104.2.47 Advanced Error Reporting Capability Register 9 function *i* (AERCAP9F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Header Log Register Third

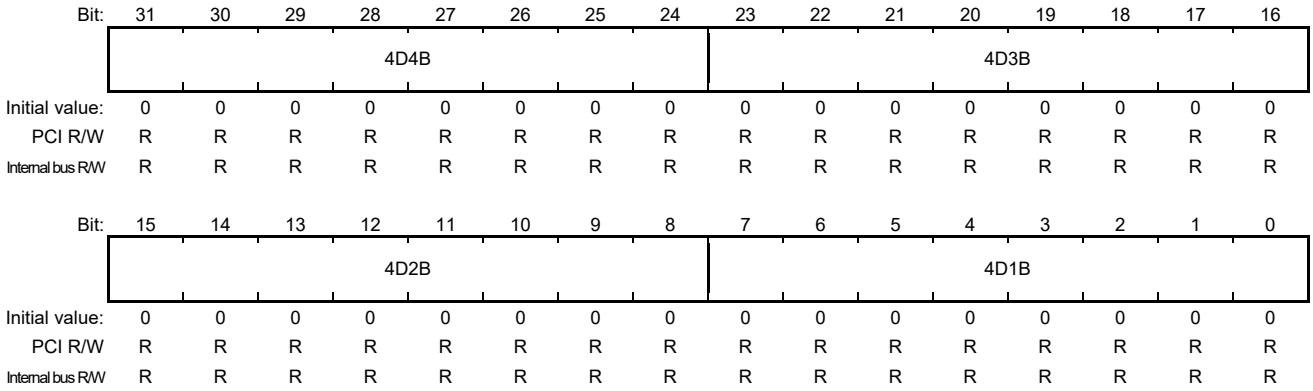


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	3D4B	0	R	R	Byte 3 of Header log register of Third 32 bit Data Word
23 to 16	3D3B	0	R	R	Byte 2 of Header log register of Third 32 bit Data Word
15 to 8	3D2B	0	R	R	Byte 1 of Header log register of Third 32 bit Data Word
7 to 0	3D1B	0	R	R	Byte 0 of Header log register of Third 32 bit Data Word

104.2.48 Advanced Error Reporting Capability Register 10 function *i* (AERCAP10F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Header Log Register Fourth



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	4D4B	0	R	R	Byte 3 of Header log register of Fourth 32 bit Data Word
23 to 16	4D3B	0	R	R	Byte 2 of Header log register of Fourth 32 bit Data Word
15 to 8	4D2B	0	R	R	Byte 1 of Header log register of Fourth 32 bit Data Word
7 to 0	4D1B	0	R	R	Byte 0 of Header log register of Fourth 32 bit Data Word

104.2.49 Advanced Error Reporting Capability Register 11 function *i* (AERCAP11F*i*) *i* = 0

Header TYPE01 only

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
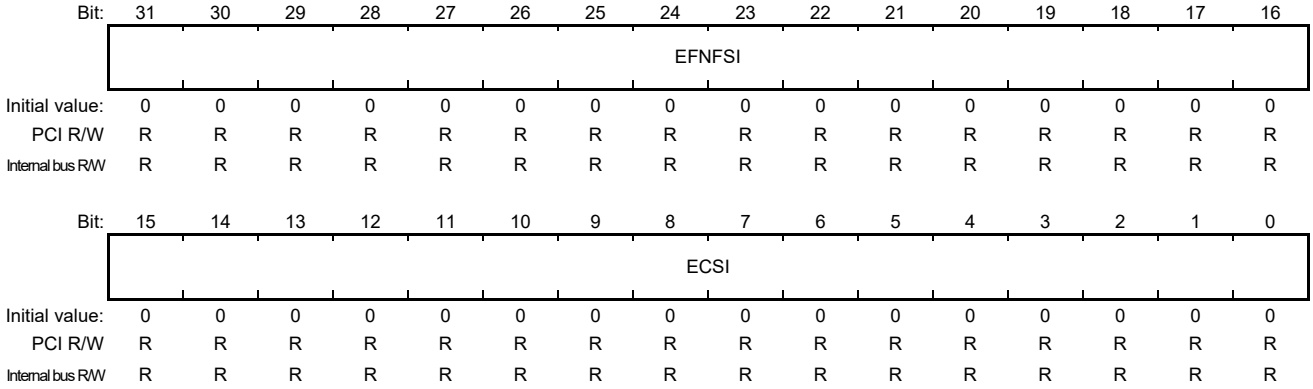
31 to 27	AEIMN	0	—	R	Advanced Error Interrupt Message Number This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability.
26 to 7	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
6	FEMR	0	RW1C	RW1C	One or more Fatal Error Messages Received Set when one or more Fatal Uncorrectable error Messages have been received.
5	NFEMR	0	RW1C	RW1C	One or more Non-Fatal Error Messages Received Set when one or more Non-Fatal Uncorrectable error Messages have been received.
4	FUF	0	RW1C	RW1C	First Uncorrectable Error is Fatal Set when the first Uncorrectable error Message received is for a Fatal error.
3	MEFNF	0	RW1C	RW1C	Multiple Fatal or Non-Fatal Errors Received Set when either a Fatal or a Non-fatal error is received and ERR_FATAL/NONFATAL Received is already Set.
2	EFNFR	0	RW1C	RW1C	Fatal or Non-Fatal Error Received Set when either a Fatal or a Non-fatal error Message is received and this bit is not already Set.
1	MECR	0	RW1C	RW1C	Multiple Correctable Errors Received Set when a Correctable error Message is received and ERR_COR Received is already Set.
0	ECR	0	RW1C	RW1C	Correctable Error Received Set when a Correctable error Message is received and this bit is not already Set.

104.2.51 Advanced Error Reporting Capability Register 13 function *i* (AERCAP13F*i*) *i* = 0

Header TYPE01 only

- Error Source Identification Register

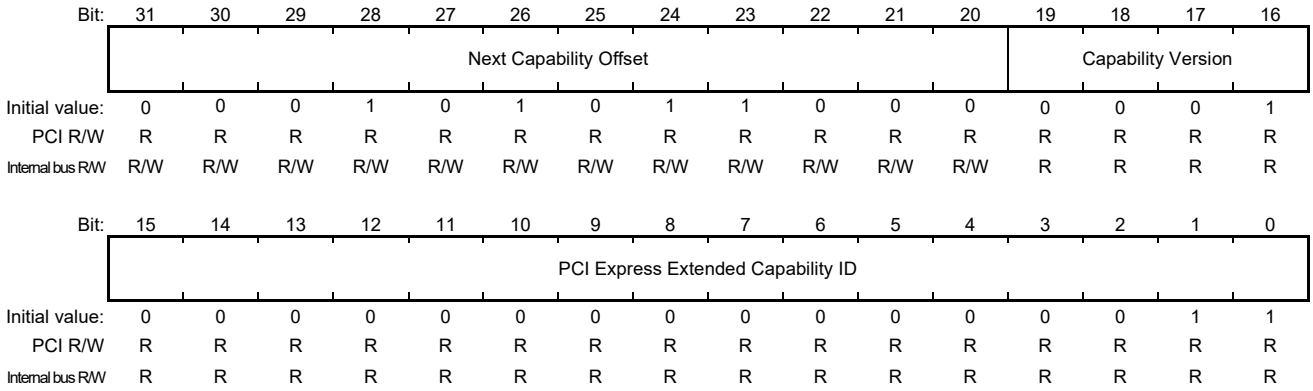


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	EFNFSI	H'0	R	R	Source of Fatal/Non-Fatal Error Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message when the ERR_FATAL/NONFATAL Received bit is not already set.
15 to 0	ECSI	H'0	R	R	Source of Correctable Error Loaded with the Requester ID indicated in the received ERR_COR Message when the ERR_COR Received bit is not already set.

104.2.52 Device Serial Number Capability Register 0 function *i* (SERNUMCAP0F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Device serial number extended capability header



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 20	Next Capability Offset	H'158	R	R/W	Next Capability Offset Pointer to the capability list.
19 to 16	Capability Version	H'1	R	R	Capability Version Indicates the version of this capability.
15 to 0	PCI Express Extended Capability ID	H'3	R	R	PCI Express Extended Capability ID Indicates the ID of this capability.

104.2.53 Device Serial Number Capability Register 1 function *i* (SERNUMCAP1F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Serial Number Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device Serial Number 1st

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
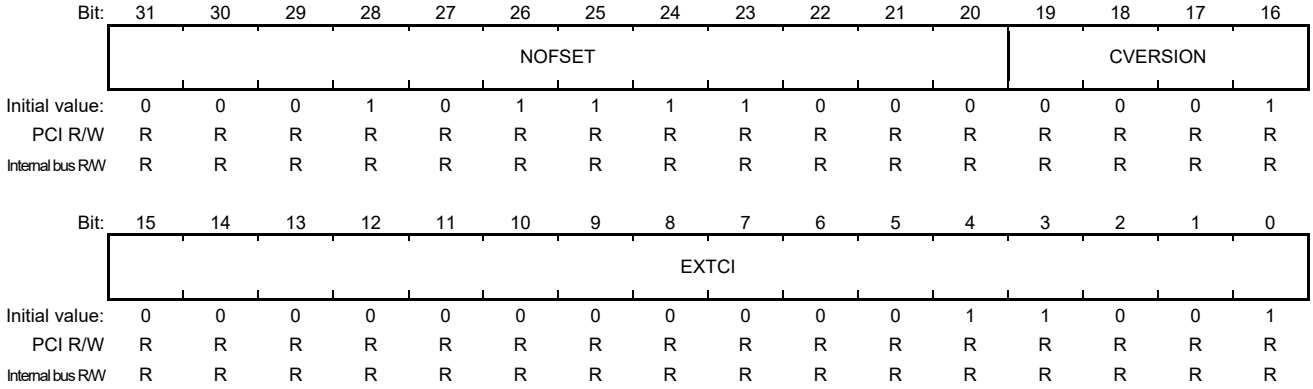
31 to 0	Device Serial Number 2nd	All 0	R	R	Device Serial Number 2nd Indicates the serial number of the device.

104.2.55 Secondary PCI Express Extended Capability Register 0 function 0 (SEXPECAP0F0)

Common to Header TYPE00/01

- Secondary PCI Express Extended Capability Header



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 20	NOFSET	H'178	R	R	Next Capability Offset
19 to 16	CVERSION	H'1	R	R	Capability Version Indicates the version of the capability structure present.
15 to 0	EXTCI	H'19	R	R	Secondary PCI Express Extended Capability ID Indicates the nature and format of the extended capability.

104.2.56 Secondary PCI Express Extended Capability Register 1 function 0 (SEXPECAP1F0)

Common to Header TYPE00/01

- Link Control 3 Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 2	—	All 0	R	R	Reserved These bits are always read as 0.The write value should always be 0.
1	EQRIE	0	R/W	R/W	Link Equalization Request Interrupt Enable When Set, this bit enables the generation of an interrupt to indicate that the Link Equalization 8.0 GT/s Request bit or the Link Equalization Request 16.0 GT/s bit has been set.
0	PEQ	0	R/W	R/W	Perform Equalization When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s or higher, the Downstream Port must perform Link Equalization.

104.2.57 Secondary PCI Express Extended Capability Register 2 function 0 (SEXPECAP2F0)

Common to Header TYPE00/01

- Lane Error Status Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RLES															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RLES												LES			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	RW1C
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	RW1C

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 4	RLES	All 0	R	R	Reserved for future use. These bits are always read as 0.The write value should always be 0.
3 to 0	LES	All 0	RW1C	RW1C	Lane Error Status Bits per Lane. Each bit indicates if the corresponding Lane detected a Lane-based error. A value of 1b indicates that a Lane based-error was detected on the corresponding Lane Number.

104.2.58 Secondary PCI Express Extended Capability Register 3 function 0 (SEXPECAP3F0)

Common to Header TYPE00/01

- Lane Equalization Control Register for lanes 1 and 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	RW1C

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 4	—	All 0	R	R	Reserved for future use These bits are always read as 0.The write value should always be 0.
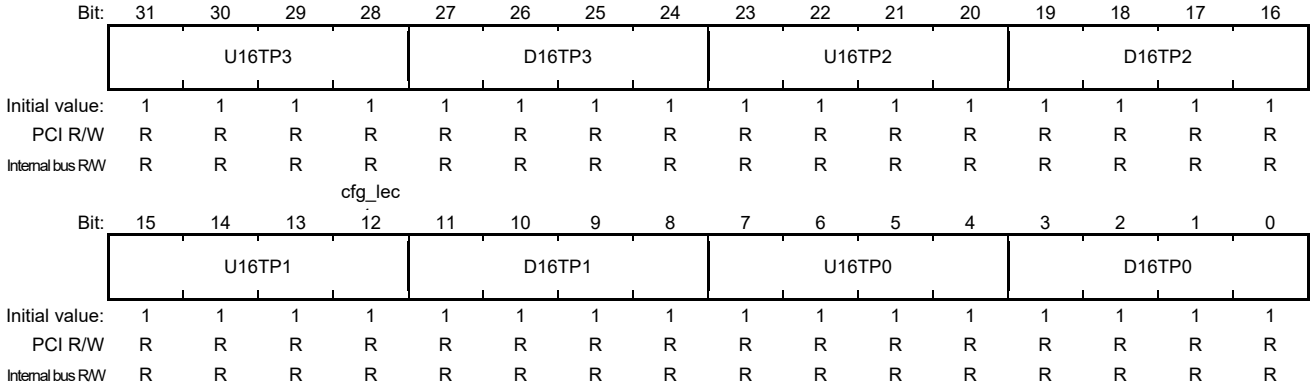
3 to 0	SRDS	All 0	RW1C	RW1C	Second Retimer Data Parity Mismatch Status Each bit indicates if the corresponding Lane detected a Data Parity mismatch. A value of 1b indicates that a mismatch was detected on the corresponding Lane Number.

104.2.67 Physical Layer 16.0 GT/s Extended Capability Register 7 function 0 (PHY16ECAP7F0)

Common to Header TYPE00/01

- 16.0 GT/s Lane Equalization Control Register for Lane 0-3



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 28	U16TP3	H'F	R	R	Upstream Port 16.0 GT/s Transmitter Preset3 Field contains the Transmit Preset value sent or received during 16.0 GT/s Link Equalization.
27 to 24	D16TP3	H'F	R	R	Downstream Port 16.0 GT/s Transmitter Preset3 Transmitter Preset used for 16.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
23 to 20	U16TP2	H'F	R	R	Upstream Port 16.0 GT/s Transmitter Preset2 Field contains the Transmit Preset value sent or received during 16.0 GT/s Link Equalization.
19 to 16	D16TP2	H'F	R	R	Downstream Port 16.0 GT/s Transmitter Preset2 Transmitter Preset used for 16.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15 to 12	U16TP1	H'F	R	R	Upstream Port 16.0 GT/s Transmitter Preset1 Field contains the Transmit Preset value sent or received during 16.0 GT/s Link Equalization.
11 to 8	D16TP1	H'F	R	R	Downstream Port 16.0 GT/s Transmitter Preset1 Transmitter Preset used for 16.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
7 to 4	U16TP0	H'F	R	R	Upstream Port 16.0 GT/s Transmitter Preset0 Field contains the Transmit Preset value sent or received during 16.0 GT/s Link Equalization.
3 to 0	D16TP0	H'F	R	R	Downstream Port 16.0 GT/s Transmitter Preset0 Transmitter Preset used for 16.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

104.2.68 Lane Margining at the Receiver Extended Capability Register 0 function 0 (LNMGNCAP0F0)

Common to Header TYPE00/01

- Margining Extended Capability Header

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
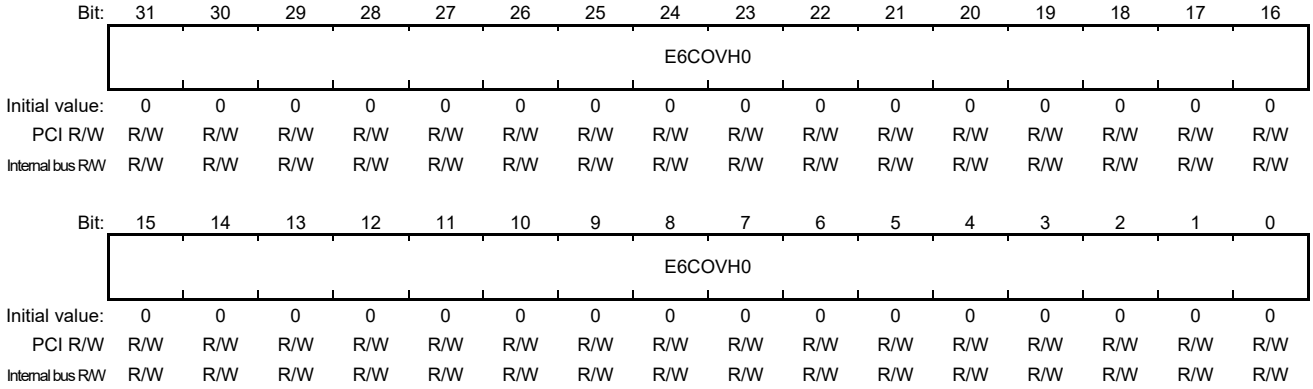
31 to 0	E6COPH3	H'0	R/W	R/W	Packet Compare Point: 4th DWORD. Specifies which Tx TLP header DWORD#3 bits to compare with the corresponding bits in the Packet Compare Value registers (E6CV*). When all specified bits (in the Tx TLP header and E6CV*) match, the controller inserts errors into the TLP.

104.2.97 Vendor-Specific Extended Capability Register 17 function *i* (VSECAP17F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Error Injection Control 6 (Compare Value Header DWORD #0)

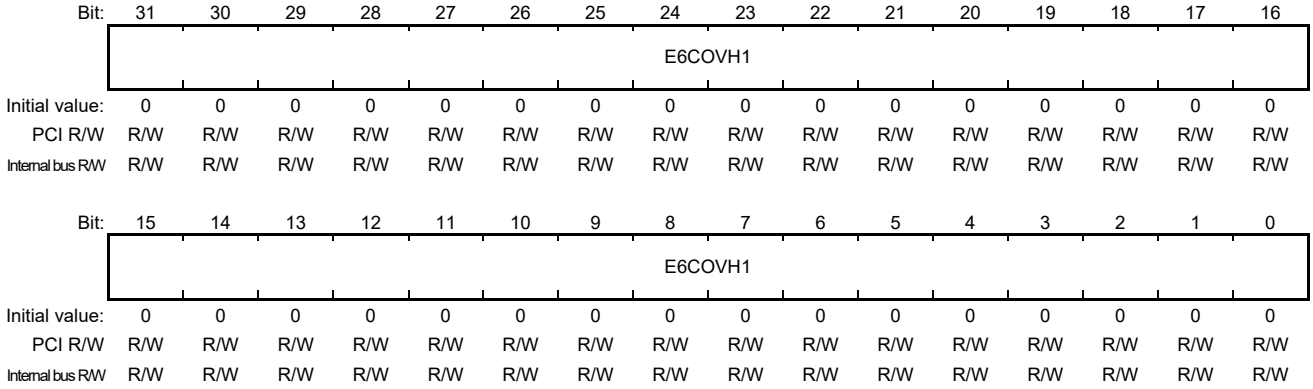


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	E6COVH0	H'0	R/W	R/W	Packet Compare Value: 1st DWORD. Specifies the value to compare against Tx the TLP header DWORD#0 bits specified in the Packet Compare Point registers (E6CP*).

104.2.98 Vendor-Specific Extended Capability Register 18 function *i* (VSECAP18F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Error Injection Control 6 (Compare Value Header DWORD #1)



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	E6COVH1	H'0	R/W	R/W	Packet Compare Value: 2nd DWORD. Specifies the value to compare against Tx the TLP header DWORD#1 bits specified in the Packet Compare Point registers (E6CP*).

104.2.99 Vendor-Specific Extended Capability Register 19 function *i* (VSECAP19F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Error Injection Control 6 (Compare Value Header DWORD #2)

Internal bus R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 17	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FERD	0	R/W	R/W	Framing Error Recovery Disable This bit disables a transition to Recovery state when a Framing Error is occurred.
15 to 11	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
10	DLTE	0	R/W	R/W	Direct Loopback Slave To Exit When this bit is set and the LTSSM is in Loopback Slave Active State, the LTSSM transitions to Loopback Slave Exit state.
9	DPTD	0	R/W	R/W	Direct Polling.Compliance to Detect When this bit is set and the LTSSM is in Polling Compliance State, the LTSSM transitions to Detect state.
8	DRTC	0	R/W	R/W	Direct Recovery.Idle to Configuration. When this bit is set and the LTSSM is in Recovery Idle State, the LTSSM transitions to Configuration state.
7 to 3	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
2	NFL	0	R/W	R/W	Force LinkDown When this bit is set and the controller detects REPLY_NUM rolling ver 4 times, the LTSSM transitions to Detect State.
1	RR	0	W	W	Recovery Request When this bit is set to '1' in L0 or L0s, the LTSSM starts transitioning to Recovery State.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	HL	0	R/W	R/W	Hold and Release LTSSM. For as long as this register is '1', the controller stays in the current LTSSM.

Internal bus R/W	R	R	R	R	R	R	R	R	RW1C	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	LTSSMV	H'0	R	R	LTSSM Variable Indicates internal LTSSM variables defined in the PCI Express Base Specification. ● C-PCIe Mode: 0: directed_speed_change 1: changed_speed_recovery 2: successful_speed_negotiation 3: upconfigure_capable Set to '1' if both ports advertised the UpConfigure capability in the last Config.Complete. 4: select_deemphasis 5: start_equalization_w_preset 6: equalization_done_8GT_data_rate 7: equalization_done_16GT_data_rate 15:8: idle_to_rlock_transitioned ● M-PCIe Mode: 0: idle_to_recovery 1: recovery_to_configuration
15	LANERVSL	0	R	R	Lane Reversal Operation Receiver detected lane reversal. This field is only valid in the L0 LTSSM state.
14 to 11	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	PIPEPDWN	H'2	R	R	PIPE:PowerDown Indicates PIPE PowerDown signal.
7	FRMERR	0	RW1C	RW1C	Framing Error Indicates Framing Error detection status.

6 to 0	FRMERRPTR	0	R	R	First Framing Error Pointer. Identifies the first Framing Error using the following encoding. The field contents are only valid value when FRMERR =1. ● Received Unexpected Framing Token H'01: When non- STP/SDP/IDL Token was received and it was not in TLP/DLLP reception H'02: When current token was not a valid EDB token and previous token was an EDB. (128/256 bit controller only) H'03: When SDP token was received but not expected. (128 bit & (x8 | x16) controller only) H'04: When STP token was received but not expected. (128 bit & (x8 | x16) controller only) H'05: When EDS token was expected but not received or whenever an EDS token was received but not expected. H'06: When a framing error was detected in the deskew block while a packet has been in progress in token_finder. Received Unexpected STP Token H'11: When Framing CRC in STP token did not match H'12: When Framing Parity in STP token did not match. H'13: When Framing TLP Length in STP token was smaller than 5 DWORDs. ■ Received Unexpected Block H'21: When Receiving an OS Block following SDS in Datastream state H'22: When Data Block followed by OS Block different from SKP, EI, EIE in Datastream state H'23: When Block with an undefined Block Type in Datastream state H'24: When Data Stream without data over three cycles in Datastream state H'25: When OS Block during Data Stream in Datastream state H'26: When RxStatus Error was detected in Datastream state H'27: When Not all active lanes receiving SKP OS starting at same cycle time in SKPOS state H'28: When a 2-Block timeout occurs for SKP OS in SKPOS state H'29: When Receiving consecutive OS Blocks within a Data Stream in SKPOS state H'2A: When Phy status error was detected in SKPOS state H'2B: When Not all active lanes receiving EIOS starting at same cycle time in EIOS state H'2C: When At least one Symbol from the first 4 Symbols is not EIOS Symbol in EIOS state. H'2D: When Not all active lanes receiving EIEOS starting at same cycle time in EIEOS state

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
					H'2E: When Not full 16 eieos symbols are received in EIEOS state All other values not listed above are Reserved.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
30	FLTXPE	0	R/W	R/W	Force Local Transmitter Preset Enable. Enables the FLTXP field.
29	FLRXHE	0	R/W	R/W	Force Local Receiver Preset Hint Enable. Enables the FLRXH field.
28	FLTXCE	0	R/W	R/W	Force Local Transmitter Coefficient Enable. Enables the following fields: ■ FLTXPREC ■ FLTXC ■ FLTXPOSTC
27 to 24	FLTXP	H'0	R/W	R/W	Force Local Transmitter Preset. Indicates initial preset value of USP in EQ Slave (EQ Phase2) instead of receiving EQ TS2.
23 to 21	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 18	FLRXH	H'0	R/W	R/W	Force Local Receiver Preset Hint. Indicates the RxPresetHint value of EQ Slave (DSP in EQ Phase2/USP in EQ Phase3), instead of received or set value.
17 to 12	FLTXPSTC	H'0	R/W	R/W	Force Local Transmitter Post-Cursor. Indicates the coefficient value of EQ Slave (DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner.
11 to 6	FLTXC	H'0	R/W	R/W	Force Local Transmitter Cursor. Indicates the coefficient value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
5 to 0	FLTXPREC	H'0	R/W	R/W	Force Local Transmitter Pre-cursor. Indicates the coefficient value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner.

104.2.120 Vendor-Specific Extended Capability Register 40 function *i* (VSECAP40F*i*) *i* = 0, 1

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

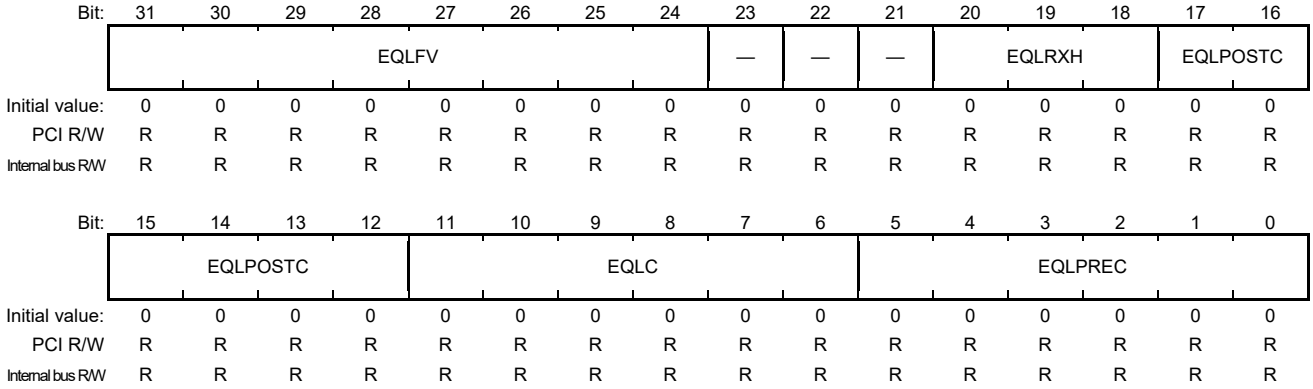
Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 8	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
7	EQRJCTE	0	R	R	EQ Reject Event. Indicates that the controller receives two consecutive TS1 OS w/Reject=1b during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). This bit is automatically cleared when the controller starts EQ Master phase again.
6	EQRLCV	0	R	R	EQ Rule C Violation. Indicates that coefficients rule C violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rule C correspond to the rules c) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again.
5	EQRLBV	0	R	R	EQ Rule B Violation. Indicates that coefficients rule B violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules B correspond to the rules b) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again.
4	EQRLAV	0	R	R	EQ Rule A Violation. Indicates that coefficients rule A violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules A correspond to the rules a) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again.
3	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
2, 1	EQCNVGCI	H’0	R	R	EQ Convergence Info. Indicates equalization convergence information. H'0: Equalization is not attempted H'1: Equalization finished successfully H'2: Equalization finished unsuccessfully H'3: Reserved This bit is automatically cleared when the controller starts EQ Master phase again.
0	EQSEQ	0	R	R	EQ Sequence. Indicates that the controller is starting the equalization sequence.

104.2.122 Vendor-Specific Extended Capability Register 42 function *i* (VSECAP42F*i*) *i* = 0, 1

Common to Header TYPE00/01

- Silicon Debug EQ Status 2



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	EQLFV	H'0	R	R	EQ Local Figure of Merit. Indicates Local maximum Figure of Merit value.
23 to 21	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 18	EQLRXH	H'0	R	R	EQ Local Receiver Preset Hint. Indicates Local Receiver Preset Hint value.
17 to 12	EQLPOSTC	H'0	R	R	EQ Local Post-Cursor. Indicates Local post cursor coefficient value.
11 to 6	EQLC	H'0	R	R	EQ Local Cursor. Indicates Local cursor coefficient value.
5 to 0	EQLPREC	H'0	R	R	EQ Local Pre-Cursor. Indicates Local pre cursor coefficient value.

104.2.123 Vendor-Specific Extended Capability Register 43 function *i* (VSECAP43F*i*) *i* = 0, 1

Common to Header TYPE00/01

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
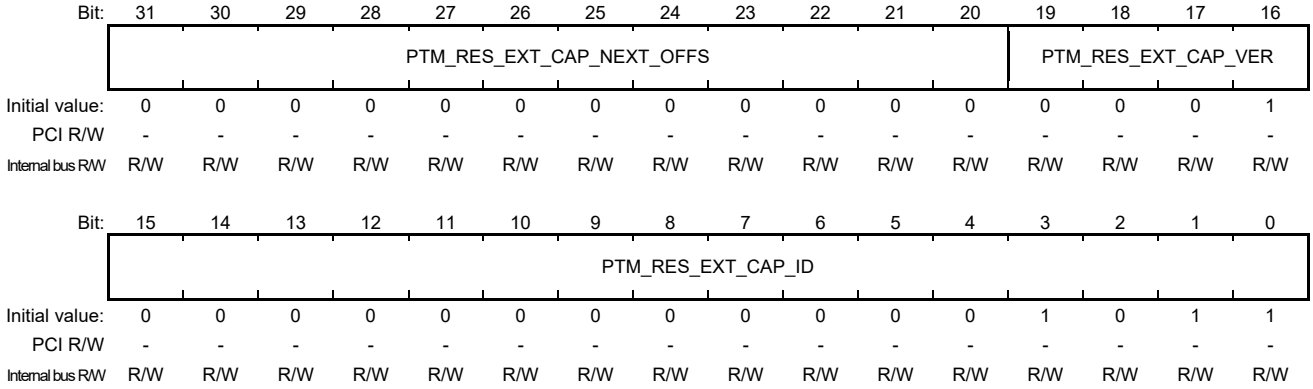
	EFF_GRAN								—	—	—	—	—	—	ROOT_SELECT	PTM_ENABLE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	EFF_GRAN	H'0	R/W	R/W	PTM Effective Granularity For Functions implementing the PTM Requester Role, this field provides information relating to the expected accuracy of the PTM clock, but does not otherwise affect the PTM mechanism. B'0000 0000: Unknown PTM granularity – one or more Switches between this Function and the PTM Root reported a Local Clock Granularity value of B'0000 0000. B'0000 0001 – 1111 1110b: Indicates the effective PTM granularity in ns. B'1111 1111: Indicates the effective PTM granularity is greater than 254 ns.
7 to 2	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
1	ROOT_SELECT	0	R/W	R/W	Root Select When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root.
0	PTM_ENABLE	0	R/W	R/W	PTM Enable When Set, this Function is permitted to participate in the PTM mechanism according to its selected role(s).

104.2.144 PTM Responder Capability Structure (VSEC) Register 0 function 0 (PTMRSCAP0F0)

Header TYPE01 only

- Precision Time Measurement Responder Capability Header (VSEC)

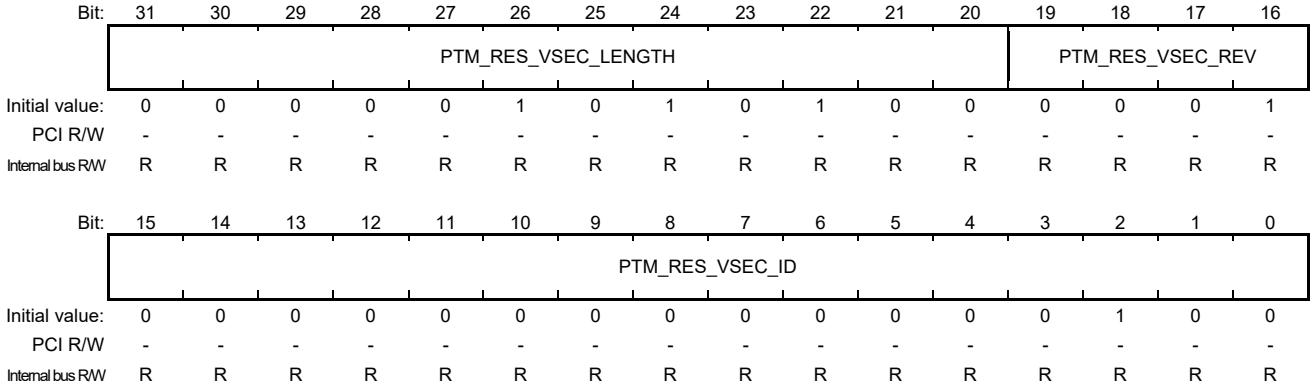


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 20	PTM_RES_EXT_CAP_NEXT_OFFS	H'000	—	R/W	Precision Time Measurement Responder VSEC Next Pointer
19 to 16	PTM_RES_EXT_CAP_VER	H'1	—	R/W	Precision Time Measurement Responder VSEC Version
15 to 0	PTM_RES_EXT_CAP_ID	H'B	—	R/W	Precision Time Measurement Responder VSEC ID

104.2.145 PTM Responder Capability Structure (VSEC) Register 1 function 0 (PTMRSCAP1F0)

Header TYPE01 only

- Precision Time Measurement Responder Vendor Specific Header



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 20	PTM_RES_ VSEC_LENGTH	H'54	—	R	PTM Responder VSEC Length
19 to 16	PTM_RES_ VSEC_REV	H'1	—	R	PTM Responder VSEC Revision
15 to 0	PTM_RES_ VSEC_ID	H'4	—	R	PTM Responder VSEC ID

Header TYPE00 only

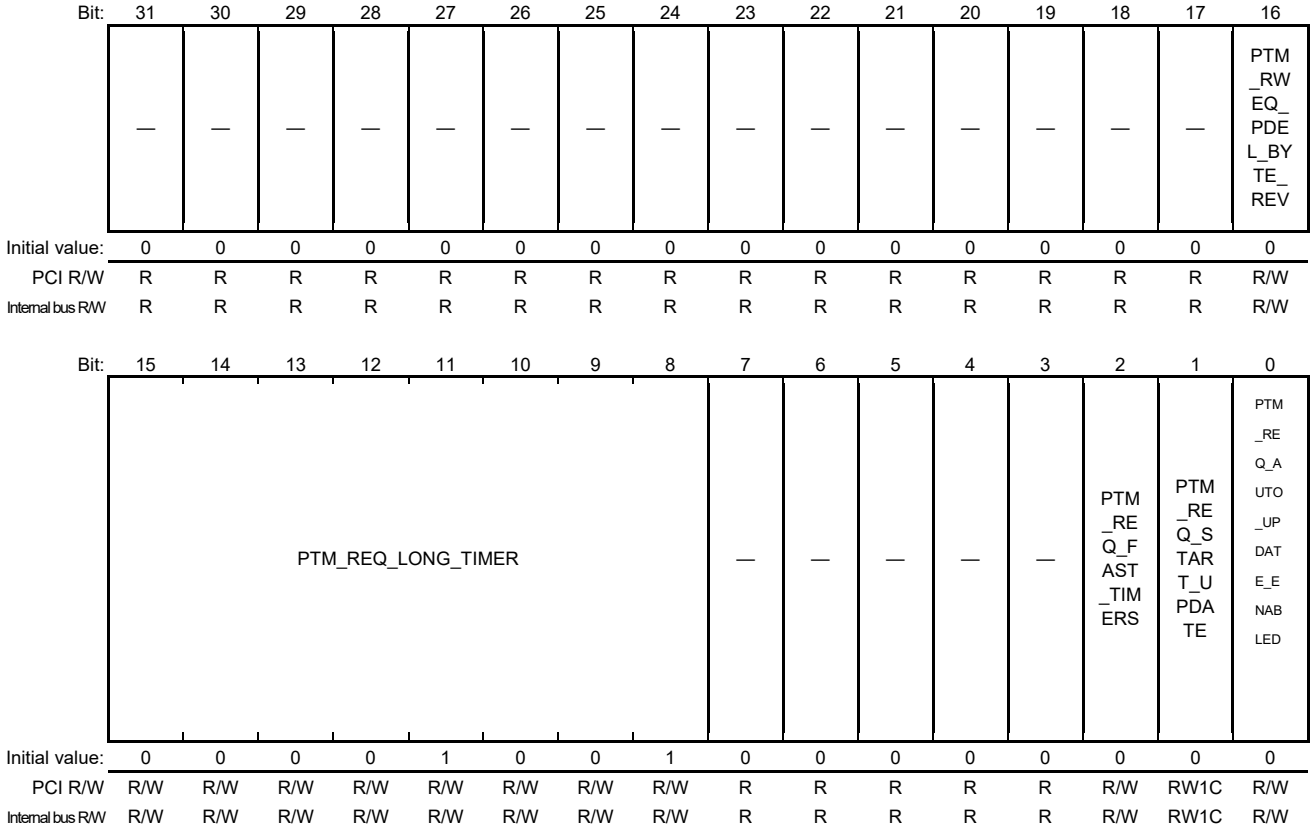
- PTM Requester Vendor Specific Control Register



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 17	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
16	PTM_RWEQ_PDEL_BYTE_REV	0	R/W	R/W	PTM Requester Propagation Delay Byte Reversal - Reverse the order of bytes in the PTM Propagation Delay data word of the PTM ResponseD Message, for compatibility with previous revisions.
15 to 8	PTM_REQ_ LONG_TIMER	H'9	R/W	R/W	PTM Requester Long Timer Determines the period between each auto update PTM Dialogue in miliseconds. Update period is the register value +1 milisecond. For the Switch product this value must not be set larger than 0x9 for spec compliance.
7 to 3	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
2	PTM_REQ_FAST_TIMERS	0	R/W	R/W	PTM Fast Timers Debug mode for PTM Timers. The 100us timer output will go high at 30us and the 10ms timer output will go high at 100us (The Long Timer Value is ignored).
1	PTM_REQ_ START_UPDATE	0	RW1C	RW1C	PTM Requester Start Update When set the PTM Requester will attempt a PTM Dialogue to update it's context; This bit is self clearing.
0	PTM_REQ_AUTO_ UPDATE_ENABLED	0	R/W	R/W	PTM Requester Auto Update Enabled When enabled PTM Requester will automatically atempt to update it's context every 10ms.

Bit	Bit Name	Initial Value	PCI R/W	Internal bus R/W	Description
17	RESBAR_CTRL_REG_0_512TB	H'0	R	R	Up to 512TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 512 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 512 TB.
16	RESBAR_CTRL_REG_0_256TB	H'0	R	R	Up to 256TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 256 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 256 TB.
15 to 14	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	RESBAR_CTRL_REG_BAR_SIZE	H'8	R/W	R/W	BAR0 Size. The default value of this field is equal to the default size of the address space that the BAR0 resource is requesting via the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. Note: 0x0 MIN_VAL: 1MB(2^20 bytes) 0x2b MAX_VAL: 8EB(2^63 bytes)
7 to 5	RESBAR_CTRL_REG_NUM_BARS	H'3	R	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR0 Control register (0) (at offset 008h), and is RsvdP for all others. Note: This register field is sticky. 0x1 BAR1: one resizable BAR for the function 0x2 BAR2: two resizable BARs for the function. 0x3 BAR3: three resizable BARs for the function. 0x4 BAR4: four resizable BARs for the function. 0x5 BAR5: five resizable BARs for the function. 0x6 BAR6: six resizable BARs for the function.
4 to 3	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	RESBAR_CTRL_REG_IDX_0	H'0	R	R	BAR Index. This encoded value points to the beginning of the BAR0. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. Note: This register field is sticky. 0x0 BAR_10h: BAR located at offset 10h. 0x1 BAR_14h: BAR located at offset 14h. 0x2 BAR_18h: BAR located at offset 18h. 0x3 BAR_1Ch: BAR located at offset 1Ch. 0x4 BAR_20h: BAR located at offset 20h. 0x5 BAR_24h: BAR located at offset 24h.

18	RESBAR_CTRL_REG_2_1PB	H'0	R	R	Up to 1PB BAR Supported. When Set, indicates that the Function supports operating with the BAR2 sized to 1 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 1 PB.

Bit	Bit Name	Initial Value	PCI R/W	Internal bus R/W	Description
17	RESBAR_CTRL_REG_2_512TB	H'0	R	R	Up to 512TB BAR Supported. When Set, indicates that the Function supports operating with the BAR2 sized to 512 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 512 TB.
16	RESBAR_CTRL_REG_2_256TB	H'0	R	R	Up to 256TB BAR Supported. When Set, indicates that the Function supports operating with the BAR2 sized to 256 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 256 TB.
15 to 14	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	RESBAR_CTRL_REG_BAR_SIZE	H'8	R/W	R/W	BAR2 Size. The default value of this field is equal to the default size of the address space that the BAR2 resource is requesting via the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. Note: 0x0 MIN_VAL: 1MB(2^20 bytes) 0x2b MAX_VAL: 8EB(2^63 bytes)
7 to 5	RESBAR_CTRL_REG_NUM_BARS	H'0	R	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR2 Control register (0) (at offset 008h), and is RsvdP for all others. Note: This register field is sticky. 0x1 BAR1: one resizable BAR for the function 0x2 BAR2: two resizable BARs for the function. 0x3 BAR3: three resizable BARs for the function. 0x4 BAR4: four resizable BARs for the function. 0x5 BAR5: five resizable BARs for the function. 0x6 BAR6: six resizable BARs for the function.
4 to 3	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	RESBAR_CTRL_REG_IDX_2	H'2	R	R	BAR Index. This encoded value points to the beginning of the BAR2. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. Note: This register field is sticky. 0x0 BAR_10h: BAR located at offset 10h. 0x1 BAR_14h: BAR located at offset 14h. 0x2 BAR_18h: BAR located at offset 18h. 0x3 BAR_1Ch: BAR located at offset 1Ch. 0x4 BAR_20h: BAR located at offset 20h. 0x5 BAR_24h: BAR located at offset 24h.

Bit	Bit Name	Initial Value	PCI R/W	Internal bus R/W	Description
31	RESBAR_CTRL_REG_5_8EB	H'0	R	R	Up to 8EB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 8 EB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 8 EB.
30	RESBAR_CTRL_REG_5_4EB	H'0	R	R	Up to 4EB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 4 EB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 4 EB.
29	RESBAR_CTRL_REG_5_2EB	H'0	R	R	Up to 2EB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 2 EB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 2 EB.
28	RESBAR_CTRL_REG_5_1EB	H'0	R	R	Up to 1EB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 1 EB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 1 EB.
27	RESBAR_CTRL_REG_5_512PB	H'0	R	R	Up to 512PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 512 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 512 PB.

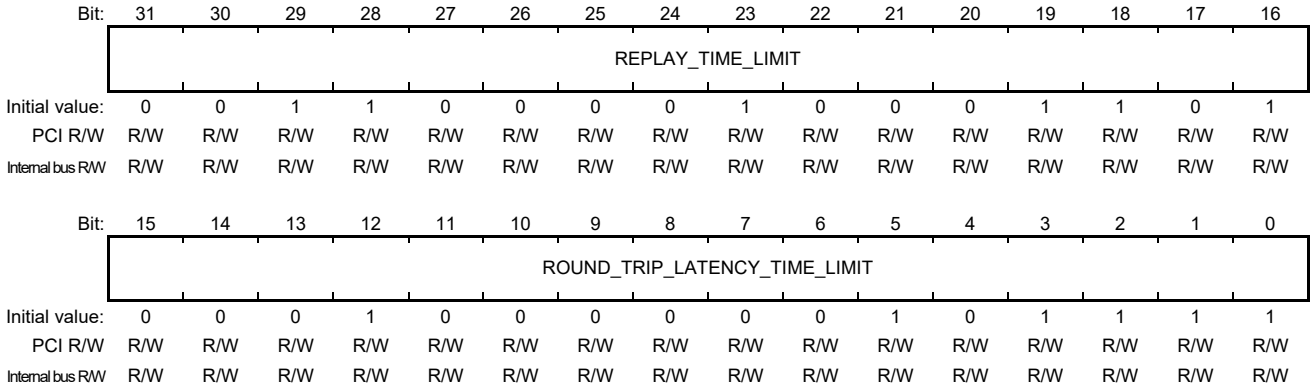
Bit	Bit Name	Initial Value	PCI R/W	Internal bus R/W	Description
26	RESBAR_CTRL_REG_5_256PB	H'0	R	R	Up to 256PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 256 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 256 PB.
25	RESBAR_CTRL_REG_5_128PB	H'0	R	R	Up to 128PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 128 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 128 PB.
24	RESBAR_CTRL_REG_5_64PB	H'0	R	R	Up to 64PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 64 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 64 PB.
23	RESBAR_CTRL_REG_5_32PB	H'0	R	R	Up to 32PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 32 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 32 PB.
22	RESBAR_CTRL_REG_5_16PB	H'0	R	R	Up to 16PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 16 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 16 PB.
21	RESBAR_CTRL_REG_5_8PB	H'0	R	R	Up to 8PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 8 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 8 PB.
20	RESBAR_CTRL_REG_5_4PB	H'0	R	R	Up to 4PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 4 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 4 PB.
19	RESBAR_CTRL_REG_5_2PB	H'0	R	R	Up to 2PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 2 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 2 PB.
18	RESBAR_CTRL_REG_5_1PB	H'0	R	R	Up to 1PB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 1 PB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 1 PB.

Bit	Bit Name	Initial Value	PCI R/W	Internal bus R/W	Description
17	RESBAR_CTRL_REG_5_512TB	H'0	R	R	Up to 512TB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 512 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 512 TB.
16	RESBAR_CTRL_REG_5_256TB	H'0	R	R	Up to 256TB BAR Supported. When Set, indicates that the Function supports operating with the BAR5 sized to 256 TB. Note: This register field is sticky. 0x1 SET: If Set, function supports operating with BAR sized to 256 TB.
15 to 14	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	RESBAR_CTRL_REG_BAR_SIZE	H'0	R/W	R/W	BAR5 Size. The default value of this field is equal to the default size of the address space that the BAR5 resource is requesting via the BAR's read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. Note: 0x0 MIN_VAL: 1MB(2^20 bytes) 0x2b MAX_VAL: 8EB(2^63 bytes)
7 to 5	RESBAR_CTRL_REG_NUM_BARS	H'0	R	R	Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR5 Control register (0) (at offset 008h), and is RsvdP for all others. Note: This register field is sticky. 0x1 BAR1: one resizable BAR for the function 0x2 BAR2: two resizable BARs for the function. 0x3 BAR3: three resizable BARs for the function. 0x4 BAR4: four resizable BARs for the function. 0x5 BAR5: five resizable BARs for the function. 0x6 BAR6: six resizable BARs for the function.
4 to 3	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	RESBAR_CTRL_REG_IDX_5	H'5	R	R	BAR Index. This encoded value points to the beginning of the BAR0. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. Note: This register field is sticky. 0x0 BAR_10h: BAR located at offset 10h. 0x1 BAR_14h: BAR located at offset 14h. 0x2 BAR_18h: BAR located at offset 18h. 0x3 BAR_1Ch: BAR located at offset 1Ch. 0x4 BAR_20h: BAR located at offset 20h. 0x5 BAR_24h: BAR located at offset 24h.

104.2.192 Port Logic Registers 0 (PRTLGC0)

Common to Header TYPE00/01

- Ack Latency Timer and Replay Timer Register

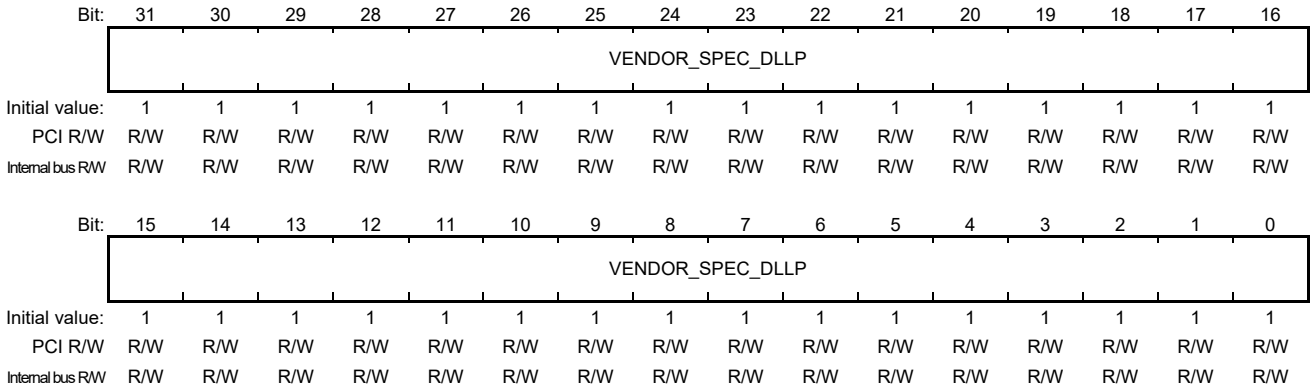


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	REPLAY_TIME_LIMIT	H'308D	R/W	R/W	Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires.
15 to 0	ROUND_TRIP_LATENCY_TIME_LIMIT	H'102F	R/W	R/W	Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed.

104.2.193 Port Logic Registers 1 (PRTLGC1)

Common to Header TYPE00/01

- Vendor Specific DLLP Register



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	VENDOR_SPEC_ DLLP	H'FFF FFFFF	R/W	R/W	Vendor Specific DLLP Register. Used to send a specific PCI Express DLLP. Your application writes the 8-bit DLLP Type and 24-bits of Payload data into this register, then sets the field VENDOR_SPECIFIC_DLLP_REQ of PRTLGC4 to send the DLLP. ■ [7:0] = Type ■ [31:8] = Payload (24 bits) The dllp type is in bits [7:0] while the remainder is the vendor defined payload.

104.2.194 Port Logic Registers 2 (PRTLGC2)

Common to Header TYPE00/01

- Port Force Link Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DO_DESKEW_FOR_SR	—	LINK_STATE					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FORCE_EN	—	—	—	FORCED_LTSSM				LINK_NUM							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
23	DO_DESKEW_FOR_SRIS	0	R/W	R/W	Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew for SRIS instead of using received SKP OS if DO_DESKEW_FOR_SRIS is set to 1.
22	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
21 to 16	LINK_STATE	H'0	R/W	R/W	Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link).
15	FORCE_EN	0	W	W	Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: ■ Forces the LTSSM to the state specified by the Forced LTSSM State field. ■ Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a "0".
14 to 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
11 to 8	FORCED_LTSSM	H'0	R/W	R/W	Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link).
7 to 0	LINK_NUM	H'0	R/W	R/W	Link Number. Not used for endpoint. Not used for M-PCIe.

104.2.195 Port Logic Registers 3 (PRTLGC3)

Common to Header TYPE00/01

- Ack Frequency and L0-L1 ASPM Control Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ENTER_ASPM	L1_ENTRANCE_LATENCY			L0S_ENTRANCE_LATENCY			COMMON_CLK_N_FTS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Internal bus R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACK_N_FTS								ACK_FREQ							
Initial value:	1	0	1	1	1	1	1	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
30	ENTER_ASPM	0	R/W	R/W	ASPM L1 Entry Control. 1: Core enters ASPM L1 after a period in which it has been idle. 0: Core enters ASPM L1 only after idle period during which both receive and transmit are in L0s.
29 to 27	L1_ENTRANCE_LATENCY	H'0	R/W	R/W	L1 Entrance Latency. Value range is: 000: 1 us 001: 2 us 010: 4 us 011: 8 us 100: 16 us 101: 32 us 110 or 111: 64 us Note: Programming this timer with a value greater that 32us has no effect unless extended sync is used, or all of the credits are infinite.
26 to 24	L0S_ENTRANCE_LATENCY	H'0	R/W	R/W	L0s Entrance Latency. Values correspond to: 000: 1 us 001: 2 us 010: 3 us 011: 4 us 000: 5 us 101: 6 us 110 or 111: 7 us This field is applicable to STALL while in L0 for M-PCIe.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
23 to 16	COMMON_CLK_N_FTS	H'0	R	R	Common Clock N_FTS. This is the N_FTS when common clock is used. Define by parameter CX_COMM_NFTS.
15 to 8	ACK_N_FTS	H'BE	R/W	R/W	N_FTS. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe.
7 to 0	ACK_FREQ	H'0	R/W	R/W	Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. ■ 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. ■ 1-255: Indicates that the controller will schedule a highpriority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting.

104.2.196 Port Logic Registers 4 (PRTLGC4)

Common to Header TYPE00/01

- Port Link Control Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	LINK_RATE				FAST_LINK_MODE	LINK_DISABLE	DLL_LINK_EN	—	RESET_ASSERT	LOOPBACK_ENABLE	SCRAMBLE_DISABLE	VENDOR_SPECIFIC_DLLP_REQ
Initial value:	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0	0
PCI R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	RW1C
Internal bus R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	RW1C

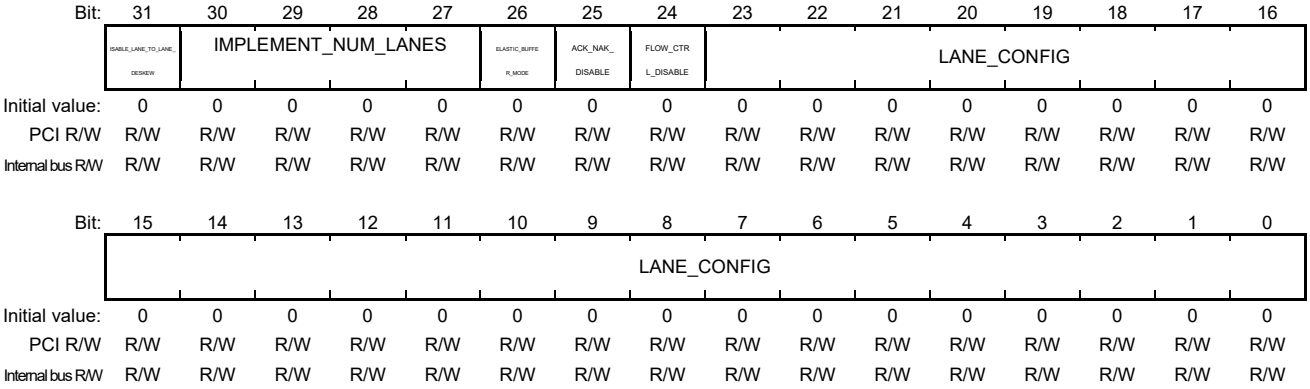
Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 28	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
27	TRANSMIT_LANE_REVERSALE_ENABLE	0	R	R	TRANSMIT_LANE_REVERSALE_ENABLE is an internally reserved field. Do not use
26	EXTENDED_SYNCH	0	R	R	EXTENDED_SYNCH is an internally reserved field. Do not use.
25	CORRUPT_LCRC_ENABLE	0	R	R	CORRUPT_LCRC_ENABLE is an internally reserved field.Do not use.
24	BEACON_ENABLE	0	R	R	BEACON_ENABLE is an internally reserved field. Do not use.
23	CROSS_LINK_ACTIVE	0	R	R	Crosslink Active. Indicates a change from upstream to downstream or downstream to upstream. This field is reserved (fixed to '0') for M-PCIe.
22	CROSS_LINK_EN	1	R/W	R/W	Crosslink Enable. This field is reserved (fixed to '0') for M-PCIe.
21 to 16	LINK_CAPABLE	H'0	R/W	R/W	Link Mode Enable. Sets the number of lanes in the link that you want to connect to the link partner. 000001: x1 000011: x2 000111: x4 001111: x8 011111: x16 111111: x32 (not supported) This field is reserved (fixed to '0') for M-PCIe.
15 to 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
11 to 8	LINK_RATE	H'1	R/W	R/W	LINK_RATE is an internally reserved field. Do not use.
7	FAST_LINK_MODE	0	R/W	R/W	Fast Link Mode. Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation.
6	LINK_DISABLE	0	R/W	R/W	LINK_DISABLE is an internally reserved field. Do not use.
5	DLL_LINK_EN	1	R/W	R/W	DLL Link Enable. Enables link initialization. When DLL Link Enable =0, the controller does not transmit InitFC DLLPs and does not establish a link.
4	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
3	RESET_ASSERT	0	R/W	R/W	Reset Assert. Triggers a recovery and forces the LTSSM to the hot reset state (downstream port only).
2	LOOPBACK_ENABLE	0	R/W	R/W	Loopback Enable. Turns on loopback. For more details, see "Loopback".
1	SCRAMBLE_DISABLE	0	R/W	R/W	Scramble Disable. Turns off data scrambling.
0	VENDOR_SPECIFIC_ DLLP_REQ	0	RW1C	RW1C	Vendor Specific DLLP Request. When software writes a '1' to this bit, the controller transmits the DLLP contained in the VENDOR_SPEC_DLLP field of PRTLGC1.

104.2.197 Port Logic Registers 5 (PRTLGC5)

Common to Header TYPE00/01

- Lane Skew Register



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	ISABLE_LANE_TO_ LANE_DESKEW	0	R/W	R/W	Disable Lane-to-Lane Deskew. Causes the controller to disable the internal Lane-to-Lane deskew logic.
30 to 27	IMPLEMENT_NUM_ LANES	H’0	R/W	R/W	Implementation-specific Number of Lanes. Set the implementation-specific number of lanes. Allowed values are: H’0: 1 lane H’1: 2 lanes H’3: 4 lanes H’7: 8 lanes H’F: 16 lanes
26	ELASTIC_BUFFER_ MODE	0	R/W	R/W	Selects Elasticity Buffer operating mode: 0: Nominal Half Full Buffer mode 1: Nominal Empty Buffer Mode
25	ACK_NAK_DISABLE	0	R/W	R/W	Ack/Nak Disable. Prevents the controller from sending ACK and NAK DLLPs.
24	FLOW_CTRL_ DISABLE	0	R/W	R/W	Flow Control Disable. Prevents the controller from sending FC DLLPs.
23 to 0	LANE_CONFIG	H’0	R/W	R/W	LANE_CONFIG field H’00_0000: Quad lane mode H’00_0040: Dual lane mode Others: Setting prohibited

104.2.198 Port Logic Registers 6 (PRTLGC6)

Common to Header TYPE00/01

- Timer Control and Max Function Number Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	FAST_LINK_SCALING_FACTOR		UPDATE_FREQ_TIMER					TIMER_MOD_ACK_NAK					TIMER_MOD_REPLAY_TIMER

PCI R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIMER_MOD_REPLAY_TIMER		—	—	—	—	—	—	MAX_FUNC_NUM							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 29	FAST_LINK_SCALING_FACTOR	H'0	R/W	R/W	Fast Link Timer Scaling Factor. Sets the scaling factor of LTSSM timer when FAST_LINK_MODE field in PRTLGC4 is set to '1'. H'0: Scaling Factor is 1024 (1ms is 1us *a) H'1: Scaling Factor is 256 (1ms is 4us) H'2: Scaling Factor is 64 (1ms is 16us) H'3: Scaling Factor is 16 (1ms is 64us) Default is set by the hidden configuration parameter DEFAULT_FAST_LINK_SCALING_FACTOR which defaults to '0'. *a. When the LTSSM is in Config or L12 Entry State, 1ms timer is 2us, 2ms timer is 4us and 3ms timer is 6us. Not used for M-PCIe.
28 to 24	UPDATE_FREQ_TIMER	H'0	R/W	R/W	UPDATE_FREQ_TIMER is an internally reserved field. Do not use.
23 to 19	TIMER_MOD_ACK_NAK	H'0	R/W	R/W	Ack Latency Timer Modifier. Increases the timer value for the Ack latency timer in increments of 64 clock cycles. A value of "0" represents no modification to the timer value.
18 to 14	TIMER_MOD_REPLAY_TIMER	H'0	R/W	R/W	Replay Timer Limit Modifier. Increases the time-out value for the replay timer in increments of 64 clock cycles at Gen1 or Gen2 speed, and in increments of 256 clock cycles at Gen3 speed.
13 to 8	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	MAX_FUNC_NUM	H'0	R/W	R/W	Maximum function number that can be used in a request. Configuration requests targeted at function numbers above this value are returned with UR (unsupported request).

104.2.199 Port Logic Registers 7 (PRTLGC7)

Common to Header TYPE00/01

- Symbol Timer Register and Filter Mask 1 Register

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	CX_FLT_MASK_RC_CFG_DISCARD	0	R/W	R/W	0: For RADM RC filter to not allow CFG transaction being received 1: For RADM RC filter to allow CFG transaction being received
30	CX_FLT_MASK_RC_IO_DISCARD	0	R/W	R/W	0: For RADM RC filter to not allow IO transaction being received 1: For RADM RC filter to allow IO transaction being received
29	CX_FLT_MASK_MSG_DROP	0	R/W	R/W	0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. 1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII.
28	CX_FLT_MASK_CPL_ECRC_DISCARD	0	R/W	R/W	Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. 0: Discard completions with ECRC errors 1: Allow completions with ECRC errors to be passed up Reserved field for SW.
27	CX_FLT_MASK_ECRC_DISCARD	0	R/W	R/W	0: Discard TLPs with ECRC errors 1: Allow TLPs with ECRC errors to be passed up
26	CX_FLT_MASK_CPL_LEN_MATCH	0	R/W	R/W	0: Enforce length match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err 1: MASK length match for completions
25	CX_FLT_MASK_CPL_ATTR_MATCH	0	R/W	R/W	0: Enforce attribute match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask attribute match for completions

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
24	CX_FLT_MASK_CPL_ TC_MATCH	0	R/W	R/W	0: Enforce Traffic Class match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Traffic Class match for completions
23	CX_FLT_MASK_CPL_ FUNC_MATCH	0	R/W	R/W	0: Enforce function match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask function match for completions
22	CX_FLT_MASK_CPL_ REQID_MATCH	0	R/W	R/W	0: Enforce Req. Id match for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Req. Id match for completions
21	CX_FLT_MASK_CPL_ TAGERR_MATCH	0	R/W	R/W	0: Enforce Tag Error Rules for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Tag Error Rules for completions
20	CX_FLT_MASK_ LOCKED_RD_AS_UR	0	R/W	R/W	0: Treat locked Read TLPs as UR for EP; Supported for RC 1: Treat locked Read TLPs as Supported for EP; UR for RC
19	CX_FLT_MASK_CFG_ TYPE1_REQ_AS_UR	0	R/W	R/W	0: Treat CFG type1 TLPs as UR for EP; Supported for RC 1: Treat CFG type1 TLPs as Supported for EP; UR for RC
18	CX_FLT_MASK_ UR_OUTSIDE_BAR	0	R/W	R/W	0: Treat out-of-bar TLPs as UR 1: Do not treat out-of-bar TLPs as UR
17	CX_FLT_MASK_ UR_POIS	0	R/W	R/W	0: Treat poisoned request TLPs as UR 1: Do not treat poisoned request TLPs as UR
16	CX_FLT_MASK_UR_ FUNC_MISMATCH	0	R/W	R/W	0: Treat Function MisMatched TLPs as UR 1: Do not treat Function MisMatched TLPs as UR
15	DISABLE_FC_WD_ TIMER	0	R/W	R/W	Disable FC Watchdog Timer
14 to 11	EIDLE_TIMER	H'0	R/W	R/W	EIDLE_TIMER is an internally reserved field. Do not use.
10 to 0	SKP_INT_VAL	H'0	R/W	R/W	SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. For M-PCIe configurations, if the 2K_PPM_DISABLED field in the M-PCIe Configuration Attribute is changed, then this field is changed automatically as follows. ■ 2K_PPM_DISABLED=1: 1280 / CX_NB ■ 2K_PPM_DISABLED=0: 228/CX_NB You need to set this field again if necessary when 2K_PPM_DISABLED is changed.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 20	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
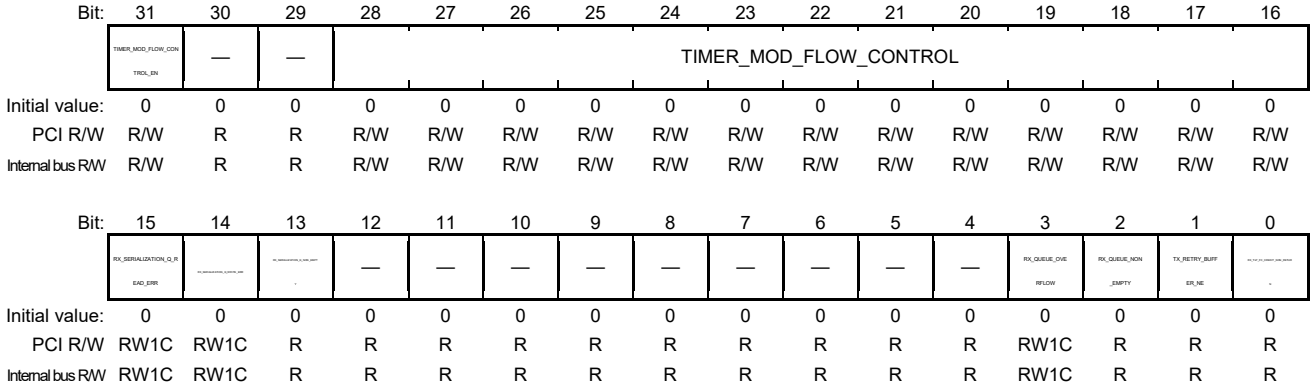
19 to 12	TX_CPL_HEADER_FC_CREDIT	H'0	R	R	Transmit Completion Header FC Credits. The Completion Header credits advertised by the receiver at the other end of the link, updated with each UpdateFC DLLP.
11 to 0	TX_CPL_DATA_FC_CREDIT	H'0	R	R	Transmit Completion Data FC Credits. The Completion Data credits advertised by the receiver at the other end of the link, updated with each UpdateFC DLLP.

104.2.207 Port Logic Registers 15 (PRTLGC15)

Common to Header TYPE00/01

- Queue Status



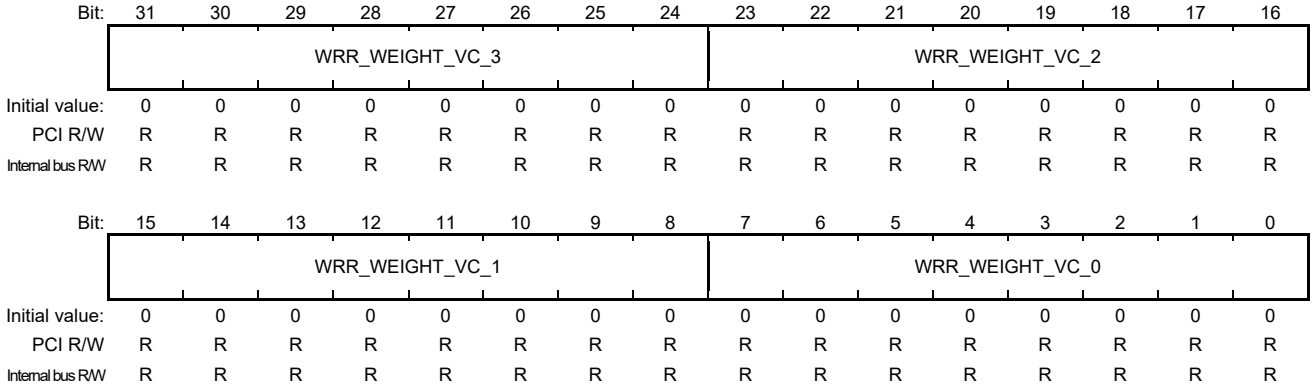
Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	TIMER_MOD_FLOW_CONTROL_EN	0	R/W	R/W	FC Latency Timer Override Enable. When this bit is set, the value from the "FC Latency Timer Override Value" field in this register will override the FC latency timer value that the controller calculates according to the PCIe specification.
30 to 29	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	TIMER_MOD_FLOW_CONTROL	H'0	R/W	R/W	FC Latency Timer Override Value. When you set the "FC Latency Timer Override Enable" in this register, the value in this field will override the FC latency timer value that the controller calculates according to the PCIe specification.
15	RX_SERIALIZATION_Q_READ_ERR	0	RW1C	RW1C	Receive Serialization Read Error. Indicates the serialization queue has attempted to read an incorrectly formatted TLP.
14	RX_SERIALIZATION_Q_WRITE_ERR	0	RW1C	RW1C	Receive Serialization Queue Write Error. Indicates insufficient buffer space available to write to the serialization queue.
13	RX_SERIALIZATION_Q_NON_EMPTY	0	R	R	Receive Serialization Queue Not Empty. Indicates there is data in the serialization queue.
12 to 4	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RX_QUEUE_OVERFLOW	0	RW1C	RW1C	Receive Credit Queue Overflow. Indicates insufficient buffer space available to write to the P/NP/CPL credit queue.
2	RX_QUEUE_NON_EMPTY	0	R	R	Receive Credit Queue Not Empty. Indicates there is data in one or more of the receive buffers.
1	TX_RETRY_BUFFER_NE	0	R	R	Transmit Retry Buffer Not Empty. Indicates that there is data in the transmit retry buffer.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	RX_TLP_FC_CREDIT_NON_RETURN	0	R	R	Received TLP FC Credits Not Returned. Indicates that the controller has received a TLP but has not yet sent an UpdateFC DLLP indicating that the credits for that TLP have been restored by the receiver at the other end of the link.

104.2.208 Port Logic Registers 16 (PRTLGC16)

Common to Header TYPE00/01

- VC Transmit Arbitration Register 1



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	WRR_WEIGHT_VC_3	H'0	R	R	WRR Weight for VC3
23 to 16	WRR_WEIGHT_VC_2	H'0	R	R	WRR Weight for VC2
15 to 8	WRR_WEIGHT_VC_1	H'0	R	R	WRR Weight for VC1
7 to 0	WRR_WEIGHT_VC_0	H'0	R	R	WRR Weight for VC0

104.2.209 Port Logic Registers 17 (PRTLGC17)

Common to Header TYPE00/01

- VC Transmit Arbitration Register 2

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRR_WEIGHT_VC_7								WRR_WEIGHT_VC_6

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

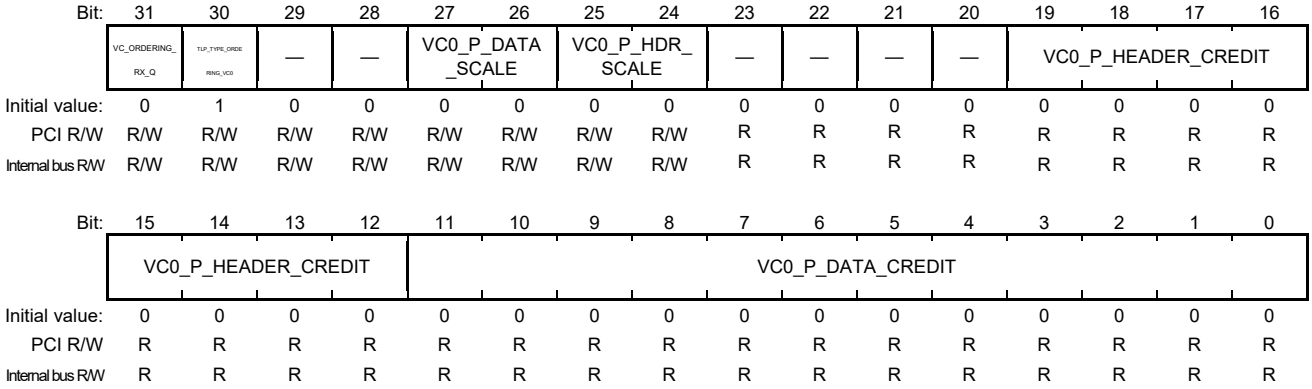
Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	WRR_WEIGHT_VC_7	H'0	R	R	WRR Weight for VC7
23 to 16	WRR_WEIGHT_VC_6	H'0	R	R	WRR Weight for VC6
15 to 8	WRR_WEIGHT_VC_5	H'0	R	R	WRR Weight for VC5
7 to 0	WRR_WEIGHT_VC_4	H'0	R	R	WRR Weight for VC4

104.2.210 Port Logic Registers 18 (PRTLGC18)

Common to Header TYPE00/01

- Segmented-Buffer VC0 Posted Receive Queue Control



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	VC_ORDERING_RX_Q	0	R/W	R/W	VC Ordering for Receive Queues. Determines the VC ordering rule for the receive queues, used only in the segmented-buffer configuration: 1: Strict ordering, higher numbered VCs have higher priority 0: Round robin
30	TLP_TYPE_ORDERING_VC0	1	R/W	R/W	TLP Type Ordering for VC0. Determines the TLP type ordering rule for VC0 receive queues, used only in the segmented-buffer configuration: 1: PCIe ordering rules (recommended) 0: Strict ordering: posted, completion, then non-posted
29 to 28	—	All 0	R/W	R/W	Reserved These bits are always read as 0. The write value should always be 0.
27 to 26	VC0_P_DATA_SCALE	H'0	R/W	R/W	VC0 Scale Posted Data Credites.
25 to 24	VC0_P_HDR_SCALE	H'0	R/W	R/W	VC0 Scale Posted Header Credites.
23 to 20	—	All 0	R	R	Reserved. This bit is always read as 0. The write value should always be 0.
19 to 12	VC0_P_HEADER_CREDIT	H'0	R	R	VC0 Posted Header Credits. The number of initial posted header credits for VC0, used only in the segmented-buffer configuration.
11 to 0	VC0_P_DATA_CREDIT	H'0	R	R	VC0 Posted Data Credits. The number of initial posted data credits for VC0, used only in the segmented-buffer configuration.

104.2.211 Port Logic Registers 19 (PRTLGC19)

Common to Header TYPE00/01

- Segmented-Buffer VC0 Non-Posted Receive Queue Control

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VC0_NP_DATA_SCALE		VC0_NP_HDR_SCALE		—	—	—	—	VC0_NP_HEADER_CREDIT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VC0_NP_HEADER_CREDIT				VC0_NP_DATA_CREDIT											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 28	—	All 0	R/W	R/W	Reserved These bits are always read as 0. The write value should always be 0.
27to 26	VC0_NP_DATA_SCALE	H'0	R/W	R/W	VC0 Scale Non-Posted Data Credites.
25 to 24	VC0_NP_HDR_SCALE	H'0	R/W	R/W	VC0 Scale Non-Posted Header Credites.
23 to 20	—	All 0	R	R	Reserved. This bit is always read as 0. The write value should always be 0.
19 to 12	VC0_NP_HEADER_CREDIT	H'0	R	R	VC0 Non-Posted Header Credits. The number of initial nonposted header credits for VC0, used only in the segmentedbuffer configuration.
11 to 0	VC0_NP_DATA_CREDIT	H'0	R	R	VC0 Non-Posted Data Credits. The number of initial nonposted data credits for VC0, used only in the segmented-buffer configuration.

104.2.212 Port Logic Registers 20 (PRTLGC20)

Common to Header TYPE00/01

- Segmented-Buffer VC0 Completion Receive Queue Control.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VC0_CPL_HEADER_CREDIT				VC0_CPL_DATA_CREDIT											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 28	—	All 0	R/W	R/W	Reserved These bits are always read as 0. The write value should always be 0.
27 to 26	VC0_CPL_ DATA_SCALE	H'0	R/W	R/W	VC0 Scale CPL Data Credites.
25 to 24	VC0_CPL_HDR_ SCALE	H'0	R/W	R/W	VC0 Scale CPL Header Credites.
23 to 20	—	All 0	R	R	Reserved. This bit is always read as 0. The write value should always be 0.
19 to 12	VC0_CPL_HEADER_ CREDIT	H'0	R	R	VC0 Completion Header Credits. The number of initial Completion header credits for VC0, used only in the segmented-buffer configuration.
11 to 0	VC0_CPL_DATA_ CREDIT	H'0	R	R	VC0 Completion Data Credits. The number of initial Completion data credits for VC0, used only in the segmented-buffer configuration.

104.2.213 Port Logic Registers 21 (PRTLGC21)

Common to Header TYPE00/01

- Link Width and Speed Change Control Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	GEN1_EI_INFERENCE	SEL_DEEMPHASIS	CONFIG_TX_COMP_RX	CONFIG_PHY_TX_CHANGE	DIRECT_SPEED_CHANGE	AUTO_LANE_FLIP_CTRL_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRE_DET_LANE			NUM_OF_LANES					FAST_TRAINING_SEQ							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 22	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
21	GEN1_EI_INFERENCE	0	R/W	R/W	Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery. 0: Use RxElecIdle signal to infer Electrical Idle 1: Use RxValid signal to infer Electrical Idle
20	SEL_DEEMPHASIS	0	R/W	R/W	Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. 0: -6 dB 1: -3.5 dB This field is reserved (fixed to '0') for M-PCIe.
19	CONFIG_TX_COMP_ RX	0	R/W	R/W	Config Tx Compliance Receive Bit. When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to "1"). This field is reserved (fixed to '0') for M-PCIe.
18	CONFIG_PHY_TX_ CHANGE	0	R/W	R/W	Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. 0: Full Swing 1: Low Swing This field is reserved (fixed to '0') for M-PCIe.
17	DIRECT_SPEED_ CHANGE	0	R/W	R/W	Directed Speed Change. Writing "1" to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed.
16	AUTO_LANE_ FLIP_CTRL_EN	0	R/W	R/W	Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
15 to 13	PRE_DET_LANE	H'0	R/W	R/W	Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. H'0: Connect logical Lane0 to physical lane 0 or CX_NL-1 or CX_NL/2-1 or CX_NL/4-1 or CX_NL/8-1, depending on which lane is detected H'1: Connect logical Lane0 to physical lane 1 H'2: Connect logical Lane0 to physical lane 3 H'3: Connect logical Lane0 to physical lane 7 H'4: Connect logical Lane0 to physical lane 15
12 to 8	NUM_OF_LANES	H'0	R/W	R/W	Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. H'1: 1 lane H'2: 2 lanes H'3: 3 lanes
7 to 0	FAST_TRAINING_SEQ	H'0	R/W	R/W	Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training.

104.2.214 Port Logic Registers 22 (PRTLGC22)

Common to Header TYPE00/01

- PHY Status Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PHY_STATUS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PHY_STATUS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	PHY_STATUS	H'0	R	R	PHY Status. Data received directly from the phy_cfg_status bus.

104.2.215 Port Logic Registers 23 (PRTLGC23)

Common to Header TYPE00/01

- PHY Control Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PHY_CONTROL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PHY_CONTROL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	PHY_CONTROL	H'0	R/W	R/W	PHY Control. Data sent directly to the cfg_phy_control bus. These is a GPIO register driving the values on the static cfg_phy_control output signals.

104.2.216 Port Logic Registers 24 (PRTLGC24)

Common to Header TYPE00/01

- Programmable Target Map Control Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	TARGET_MAP_INDEX				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TARGET_MAP_VF						TARGET_MAP_ROM	TARGET_MAP_PF					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 21	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	TARGET_MAP_INDEX	H'0	R/W	R/W	The number of the PF Function on which the Target Values are set. This register does not respect the Byte Enable setting. any write will affect all register bits.
15 to 13	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 7	TARGET_MAP_VF	H'0	R	R	Target Values for each BAR on the VF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits. Not support virtual channel capability structure. Read value must be H'0.
6	TARGET_MAP_ROM	0	R/W	R/W	Target Value for the ROM page of the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.
5 to 0	TARGET_MAP_PF	H'0	R/W	R/W	Target Values for each BAR on the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.

104.2.217 Port Logic Registers 25 (PRTLGC25)

Header TYPE00 Only

- Integrated MSI Reception Module (iMRM) Address Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI_CTRL_ADDR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

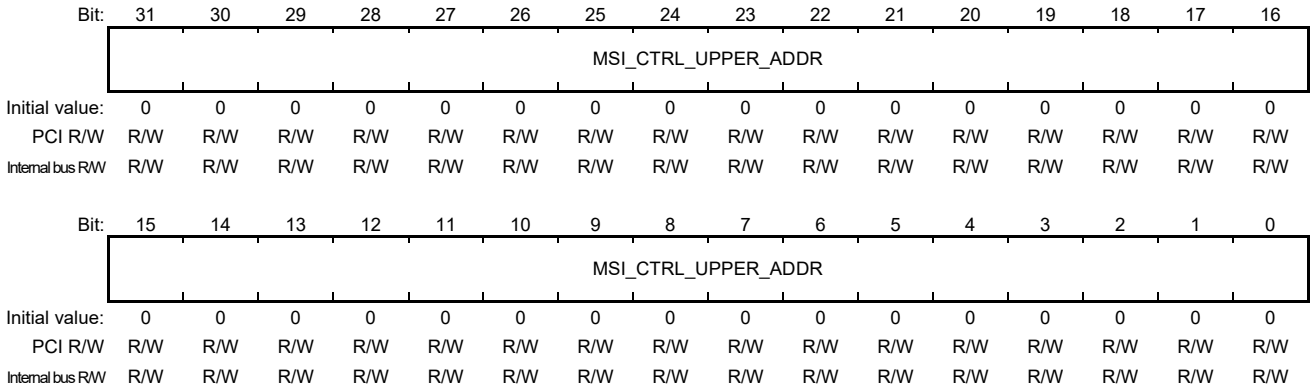
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI_CTRL_ADDR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_CTRL_ADDR	H'0	R/W	R/W	Integrated MSI Reception Module Address. System specified address for MSI memory write transaction termination.

104.2.218 Port Logic Registers 26 (PRTLGC26)

Header TYPE00 Only

- Integrated MSI Reception Module Upper Address Register



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_CTRL_UPPER_ ADDR	H'0	R/W	R/W	Integrated MSI Reception Module Upper Address. System specified upper address for MSI memory write transaction termination.

104.2.219 Port Logic Registers 27+3*i* (PRTLGC27+3*i*) (*i* = 0 to 7)

Header TYPE00 Only

- Integrated MSI Reception Module Interrupt#i Enable Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI_CTRL_INT_0_EN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

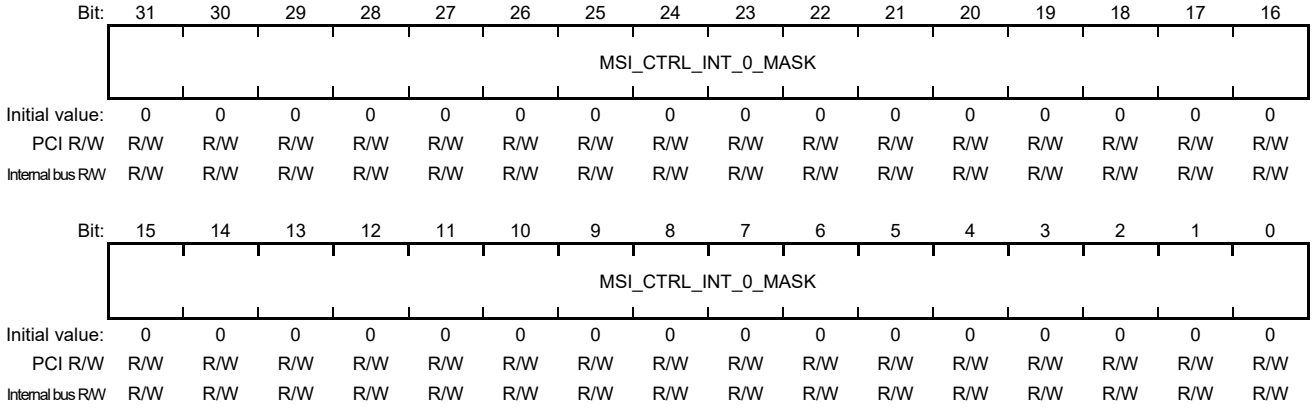
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI_CTRL_INT_0_EN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_CTRL_INT_0_EN	H'0	R/W	R/W	MSI Interrupt#i Enable. Specifies which interrupts are enabled. Note: i = 0 to 7

104.2.220 Port Logic Registers 28+3*i* (PRTLGC28+3*i*) (*i* = 0 to 7)

Header TYPE00 Only

- Integrated MSI Reception Module Interrupt#i Mask Register.



Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_CTRL_INT_0_ MASK	H'0	R/W	R/W	MSI Interrupt#i Mask. Allows enabled interrupts to be masked. Note: i = 0 to 7

104.2.221 Port Logic Registers 29+3*i* (PRTLGC29+3*i*) (*i* = 0 to 7)

Header TYPE00 Only

- Integrated MSI Reception Module Interrupt#i Status Register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI_CTRL_INT_0_STATUS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
Internal bus R/W	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI_CTRL_INT_0_STATUS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C
Internal bus R/W	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_CTRL_INT_0_STATUS	H'0	RW1C	RW1C	MSI Interrupt#i Status. When an MSI is detected for EP#i, one bit in this register is set. Note: i = 0 to 7

104.2.222 Port Logic Registers 51 (PRTLGC51)

Header TYPE00 Only

- Integrated MSI Reception Module General Purpose IO Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI_GPIO_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI_GPIO_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	MSI_GPIO_REG	H'0	R/W	R/W	MSI GPIO Register. The contents of this register drives the top-level GPIO msi_ctrl_io[31:0]

104.2.223 Port Logic Registers 52 (PRTLGC52)

Common to Header TYPE00/01

- RADM clock gating enable control register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: *1: R/W changes by the TYPE. TYPE00: R/W, TYPE01: -

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 26	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 24	RATE_SHADOW_SEL	H'0	R/W	R/W	Rate Shadow Select. This register value decide the Data Rate of shadow register. H'0: Gen3 Data Rate is selected for shadow register. H'1: Gen4 Data Rate is selected for shadow register. H'2: Gen5 Data Rate is selected for shadow register. H'3: Reserved.
23	GEN3_EQ_INVREQ_EVAL_DIFF_DISABLE	0	R/W	R/W	Eq InvalidRequest and RxEqEval Different Time Assertion Disable. Disable the assertion of Eq InvalidRequest and RxEqEval at different time.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
22	USP_SEND_8GT_EQ_ TS2_DISABLE	1	*1	R/W	Upstream Port Send 8GT/s or 16GT/s EQ TS2 Disable. The base spec defines that USP can optionally send 8GT or 16GT EQ TS2 and it means USP can set DSP TxPreset value in Gen4 or Gen5 Data Rate. If this register set to 0, USP sends 8GT or 16GT EQ TS2. If this register set to 1, USP does not send 8GT or 16GT EQ TS2. This applies to upstream ports only. If RATE_SHADOW_SEL==00b, this register is RSVD. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate.
21	AUTO_EQ_DISABLE	0	*1	R*	Autonomous Equalization Disable. When the controller is in L0 state at Gen3 data rate and equalization was completed successfully in Autonomous EQ Mechanism, setting this bit in DSP will not direct the controller to Recovery state to perform Gen4 equalization. Note *: If RATE_SHADOW_SEL==00b, this register is RSVD. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate.
20 to 19	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
18	GEN3_DC_BALANCE_ DISABLE	0	R/W	R/W	DC Balance Disable. Disable DC Balance feature.
17	GEN3_DLLP_XMT_ DELAY_DISABLE	0	R/W	R/W	DLLP Transmission Delay Disable. Disable delay transmission of DLLPs before equalization.
16	GEN3_EQUALIZATION_ DISABLE	0	R/W	R/W	Equalization Disable. Disable equalization feature. This bit cannot be changed once the LTSSM starts link training.
15 to 14	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RXEQ_RGRDLESS_ RXTS	0	*1	R/W	When set to '1', the controller as Gen3 EQ master asserts RxEqEval to instruct the PHY to do Rx adaptation and evaluation after a 500ns timeout from a new preset request. 0: mac_phy_rxeqeval asserts after 1us and 2 TS1 received from remote partner. 1: mac_phy_rxeqeval asserts after 500ns regardless of TS's received or not

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
12	RXEQ_PH01_EN	0	*1	R/W	Rx Equalization Phase 0/Phase 1 Hold Enable. When this bit is set the upstream port holds phase 0 (the downstream port holds phase 1) for 10ms. The programmable bits [RXEQ_PH01_EN, EQ_PHASE_2_3] can be used to obtain the following variations of the equalization procedure: 00: Tx equalization only in phase 2/3 01: No Tx equalization, no Rx equalization 10: Tx equalization in phase 2/3, Rx equalization in phase 0/1 11: No Tx equalization, Rx equalization in phase 0/1 If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate.
11	EQ_REDO	0	R/W	R/W	Equalization Redo Disable. Disable autonomous mechanism for requesting to redo the equalization process.
10	EQ_EIEOS_CNT	0	R/W	R/W	Equalization EIEOS Count Reset Disable. Disable requesting reset of EIEOS count during equalization.
9	EQ_PHASE_2_3	0	*1	R/W	Equalization Phase 2 and Phase 3 Disable. This applies to downstream ports only. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate.
8	DISABLE_ SCRAMBLER_GEN_3	0	R/W	R/W	Disable Scrambler for Gen3 and Gen4 Data Rate. The Gen3 and Gen4 scrambler/descrambler within the controller needs to be disabled when the scrambling function is implemented outside of the controller (for example within the PHY).
7 to 1	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	GEN3_ZRXDC_ NONCOMPL	1	R/W	R/W	Gen3 Receiver Impedance ZRX-DC Not Compliant. Receivers that operate at 8.0 GT/s with an impedance otherthan the range defined by the ZRX-DC parameter for 2.5GT/s (40-60 Ohms) must meet additional behavior requirements in the following LTSSM states: Polling, Rx_L0s, L1, L2, and Disabled. 0: The receiver complies with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. 1: The receiver does not comply with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher.

31 to 27	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
26	GEN3_REQ_SEND _CONSEC_EIEOS_ FOR_PSET_MAP	1	R/W	R/W	Request controller to send back-to-back EIEOS in Recovery.RcvrLock state until presets to coefficients mapping is complete. ■ 0: Do not request ■ 1: request Note: Gen3 and Gen4 share the same register bit and have the same feature.
25	—	0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
24	GEN3_EQ_FOM_INC_INITIAL_EVAL	0	R/W	R/W	Include Initial FOM. Include or not the FOM feedback from the initial preset evaluation performed in the EQ Master, when finding the highest FOM among all preset evaluations. ■ 0: Do not include ■ 1: Include
23 to 8	GEN3_EQ_PSET_REQ_VEC	All 0	R/W	R/W	Preset Request Vector. Requesting of Presets during the initial part of the EQ Master Phase. Encoding scheme is as follows: Bit [15:0] =H'0000: No preset is requested and evaluated in EQ Master Phase. Bit [i] =1: "Preset=i" is requested and evaluated in EQ Master Phase. ■ 0000000000000000: No preset be requested and evaluated in EQ Master Phase ■ 000000xxxxxxxxx1: Preset 0 is requested and evaluated in EQ Master Phase ■ 000000xxxxxxxx1x: Preset 1 is requested and evaluated in EQ Master Phase ■ 000000xxxxxxx1xx: Preset 2 is requested and evaluated in EQ Master Phase ■ 000000xxxxxx1xxx: Preset 3 is requested and evaluated in EQ Master Phase ■ 000000xxxxx1xxxx: Preset 4 is requested and evaluated in EQ Master Phase ■ 000000xxxx1xxxxx: Preset 5 is requested and evaluated in EQ Master Phase ■ 000000xxx1xxxxxx: Preset 6 is requested and evaluated in EQ Master Phase ■ 000000xx1xxxxxxx: Preset 7 is requested and evaluated in EQ Master Phase ■ 000000x1xxxxxxxx: Preset 8 is requested and evaluated in EQ Master Phase ■ 00000x1xxxxxxxxx: Preset 9 is requested and evaluated in EQ Master Phase ■ 000001xxxxxxxxxx: Preset 10 is requested and evaluated in EQ Master Phase ■ All other encodings: Reserved
7	—	0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
6	GEN3_LOWER_RATE_EQ_REDO_ENABLE	0	R/W	R/W	Support EQ redo and lower rate change: ■ 0: not support ■ 1: support Note: Gen3 and Gen4 share the same register bit and have the same feature.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
5	GEN3_EQ_EVAL_2MS_DISABLE	0	R/W	R/W	Phase2_3 2 ms Timeout Disable. Determine behavior in Phase2 for USP (Phase3 if DSP) when the PHY does not respond within 2ms to the assertion of RxEqEval: ■ 0: abort the current evaluation, stop any attempt to modify the remote transmitter settings, Phase2 is terminated by the 24ms timeout ■ 1: ignore the 2ms timeout and continue as normal. This is used to support PHYs that require more than 2ms to respond to the assertion of RxEqEval.
4	GEN3_EQ_PHASE23_EXIT_MODE	0	R/W	R/W	Behavior After 24 ms Timeout (when optimal settings are not found). For a USP: Determine next LTSSM state from Phase2 after 24ms Timeout ■ 0: Recovery.Speed ■ 1: Recovery.Equalization.Phase3 When optimal settings are not found then: ■ Equalization Phase 2 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 ■ Equalization Phase 2 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 ■ Equalization Phase 2 Complete status bit is set in the "Link Status Register 2" For a DSP: Determine next LTSSM state from Phase3 after 24ms Timeout ■ 0: Recovery.Speed ■ 1: Recovery.Equalization.RcvrLock When optimal settings are not found then: ■ Equalization Phase 3 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 ■ Equalization Phase 3 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 ■ Equalization Phase 3 Complete status bit is set in the "Link Status Register 2"
3 to 0	GEN3_EQ_FB_MODE	All 0	R/W	R/W	Feedback Mode. ■ 0000b: Direction Change ■ 0001b: Figure Of Merit ■ 0010b – 1111b: Reserved

104.2.226 Port Logic Registers 55 (PRTLGC55)

Common to Header TYPE00/01

- Gen3 EQ Direction Change Feedback Mode Control Register.

Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 18	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 14	GEN3_EQ_FMDC_MAX_POST_CUSROR_DELTA	H'0	R/W	R/W	Convergence Window Aperture for C+1. Post-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15.
13 to 10	GEN3_EQ_FMDC_MAX_PRE_CUSROR_DELTA	H'0	R/W	R/W	Convergence Window Aperture for C-1. Pre-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15.
9 to 5	GEN3_EQ_FMDC_N_EVALS	H'2	R/W	R/W	Convergence Window Depth. Number of consecutive evaluations considered in Phase 2/3 when determining if optimal coefficients have been found. Allowed range: 0,1,2,..16 up to a maximum of CX_GEN3_EQ_COEFQ_DEPTH. When set to 0, EQ Master is performed without sending any requests to the remote partner in Phase 2 for USP and Phase 3 for DSP. Therefore, the remote partner will not change its transmitter coefficients and will move to the next state.
4 to 0	GEN3_EQ_FMDC_T_MIN_PHASE23	H'0	R/W	R/W	Minimum Time (in ms) To Remain in EQ Master Phase. The LTSSM stays in EQ Master phase for at least this amount of time, before starting to check for convergence of the coefficients. Allowed values 0,1,...,24.

Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 7	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
6	CPLQ_MNG_EN	1	R/W	R/W	This field enables the Completion Queue Management feature. Default value is 1.
5	ARI_DEVICE_NUM	0	R/W	R/W	When ARI is enabled, this field enables use of the device ID.
4	DISABLE_AUTO_LTR_CLR_MSG	0	R/W	R/W	Disable the autonomous generation of LTR clear message in upstream port. ■ 0: Allow the autonomous generation of LTR clear message. ■ 1: Disable the autonomous generation of LTR clear message.
3	SIMPLIFIED_REPLAY_TIMER	1	R/W	R/W	Enables Simplified Replay Timer (Gen4). For more details, see "Transmit Replay" in the Controller Operations chapter. Simplified Replay Timer Values are: ■ A value from 24,000 to 31,000 Symbol Times when Extended Synch is 0b. ■ A value from 80,000 to 100,000 Symbol Times when Extended Synch is 1b. Must not be changed while link is in use.
2	UR_CA_MASK_4_TRGT1	0	R/W	R/W	This field only applies to request TLPs (with UR filtering status) that you have chosen to forward to the application (when you set DEFAULT_TARGET in this register). ■ When you set this field to '1', the core suppresses error logging, Error Message generation, and CPL generation (for non-posted requests). ■ You should set this if you have set the Default Target port logic register to '1'.
1	DEFAULT_TARGET	0	R/W	R/W	Default target a received IO or MEM request with UR/CA/CRS is sent to by the controller. ■ 0: The controller drops all incoming I/O or MEM requests (after corresponding error reporting). A completion with UR status will be generated for non-posted requests. ■ 1: The controller forwards all incoming I/O or MEM requests with UR/CA/CRS status to your application.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 8	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
7	UPCONFIGURE_SUPPORT	1	R/W	R/W	Upconfigure Support. The controller sends this value as the Link Upconfigure Capability in TS2 Ordered Sets in Configuration.Complete state.
6	DIRECT_LINK_WIDTH_CHANGE	0	R/W	R/W	Directed Link Width Change. The controller always moves to Configuration state through Recovery state when this bit is set to '1'. ■ If the upconfigure_capable variable is '1' and the HWAUTOWDIS bit in EXPCAP4F*i* is '0', the controller starts upconfigure or autonomous width downsizing (to the TARGET_LINK_WIDTH value) in the Configuration state. ■ If TARGET_LINK_WIDTH value is 0x0, the controller does not start upconfigure or autonomous width downsizing in the Configuration state. The controller self-clears this field when the controller accepts this request.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
5 to 0	TARGET_LINK_WIDTH	H'00	R/W	R/W	Target Link Width. Values correspond to: ■ 6'b000000: Core does not start upconfigure or autonomous width downsizing in the Configuration state. ■ 6'b000001: x1 ■ 6'b000010: x2 ■ 6'b000100: x4 ■ 6'b001000: x8 ■ 6'b010000: x16 ■ 6'b100000: x32

104.2.231 Port Logic Registers 60 (PRTLGC60)

Common to Header TYPE00/01

- PHY Interoperability Control Register. This register is reserved for internal use. You should not write to this register and change the default unless specifically instructed by vendor support.

Internal bus R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 12	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
11	P2NOBEACON_ENABLE	1	R/W	R/W	P2.NoBeacon Enable bit.
10	L1_CLK_SEL	0	R/W	R/W	L1 Clock control bit. ■ 1: Controller does not request aux_clk switch and core_clk gating in L1. ■ 0: Controller requests aux_clk switch and core_clk gating in L1.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
9	L1_NOWAIT_P1	1	R/W	R/W	L1 entry control bit. ■ 1: Core does not wait for PHY to acknowledge transition to P1 before entering L1. ■ 0: Core waits for the PHY to acknowledge transition to P1 before entering L1. Note: The access attributes of this field are as follows: ■ Wire: No access. ■ Dbi: R/W (sticky)
8	L1SUB_EXIT_MODE	1	R/W	R/W	L1 Exit Control Using phy_mac_pclkack_n. ■ 1: Core exits L1 without waiting for the PHY to assert phy_mac_pclkack_n. ■ 0: Core waits for the PHY to assert phy_mac_pclkack_n before exiting L1.
7	—	0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	RXSTANDBY_CONTROL	All 0	R/W	R/W	Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/RxStandbyStatus handshake. ■ [0]: Rx EIOS and subsequent T TX-IDLE-MIN ■ [1]: Rate Change ■ [2]: Inactive lane for upconfigure/downconfigure ■ [3]: PowerDown=P1orP2 ■ [4]: RxL0s.Idle ■ [5]: EI Infer in L0 ■ [6]: Execute RxStandby/RxStandbyStatus Handshake

104.2.232 Port Logic Registers 61 (PRTLGC61)

Common to Header TYPE00/01

- The target completion LUT(TRGT_CPL_LUT) Delete Entry Control register. Using this register you can delete one entry in the TRGT_CPL_LUT. You should only use this register when you know that your application will never send the completion because of an FLR or any other reason.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DELETE_EN	LOOK_UP_ID														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 24	—	H'FF	R	R	Reserved These bits are always read as 0. The write value should always be H'FF.
23 to 1	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
0	AUTO_FLUSH_EN	1	R/W	R/W	Enables automatic flushing of pending requests before sending the reset request to the application logic to reset PCIEC. The flushing process is initiated if any of the following events occur: ■ Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. ■ Warm (Soft) reset request. Generated when exiting from D3 to D0. ■ Link down reset request. The link has gone down and the controller is requesting a reset. If you disable automatic flushing, you are responsible for resetting PCIEC.

104.2.234 Port Logic Registers 63 (PRTLGC63)

Common to Header TYPE00/01

- AXI Bridge Slave Error Response Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AMBA_ERROR_RESPONSE_MAP						—	—	—	—	—	AMBA_ERROR_RESPONSE_CRS			—	
Initial value:	1	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0
PCI R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 16	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 10	AMBA_ERROR_RESPONSE_MAP	H'27	R/W	R/W	AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for nonposted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. ■ [0] - 0: UR (unsupported request) -> DECERR - 1: UR (unsupported request) -> SLVERR ■ [1] - 0: CRS (configuration retry status) -> DECERR - 1: CRS (configuration retry status) -> SLVERR ■ [2] - 0: CA (completer abort) -> DECERR - 1: CA (completer abort) -> SLVERR ■ [3]: Reserved ■ [4]: Reserved ■ [5]: - 0: Completion Timeout -> DECERR - 1: Completion Timeout -> SLVERR The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read data bus to 0xFFFF for all error responses.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
9 to 5	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 3	AMBA_ERROR_RESPONSE_CRS	All 0	R/W	R/W	CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. For more details see "Error Handling" in the “AXI Bridge Module” chapter of the Databook. AXI: ■ 00: OKAY ■ 01: OKAY with all FFFF_FFFF data for all CRS completions ■ 10: OKAY with FFFF_0001 data for CRS completions to vendor ID read requests, OKAY with FFFF_FFFF data for all other CRS completions ■ 11: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping)
2	AMBA_ERROR_RESPONSE_VENDORID	0	R/W	R/W	Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. For more details see "Error Handling" in the “AXI Bridge Module” chapter of the Databook. ■ 1: ERROR AXI: ■ 0: OKAY (with FFFF data). ■ 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping)
1	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
0	AMBA_ERROR_RESPONSE_GLOBAL	0	R/W	R/W	Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. For more details see "Error Handling" in the "AXI Bridge Module” chapter of the Databook. ■ 1: ERROR for normal link (data) accesses and look at bit [2] for other scenarios. AXI: ■ 0: OKAY (with FFFF data for non-posted requests) ■ 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) The error response mapping is not applicable to Nonexistent Vendor ID register reads.

104.2.235 Port Logic Registers 64 (PRTLGC64)

Common to Header TYPE00/01

- Link Down AXI Bridge Slave Timeout Register

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LINK_TIMEOUT_ENABLE_DEFAULT	LINK_TIMEOUT_PERIOD_DEFAULT							
Initial value:	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1	0

Internal bus R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 9	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
8	LINK_TIMEOUT_ENABLE_DEFAULT	1	R/W	R/W	Disable Flush. You can disable the flush feature by setting this field to "1".
7 to 0	LINK_TIMEOUT_PERIOD_DEFAULT	H'32	R/W	R/W	Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by PIPE clock.

104.2.236 Port Logic Registers 65 (PRTLGC65)

Common to Header TYPE00/01

- AMBA Ordering Control

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 8	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

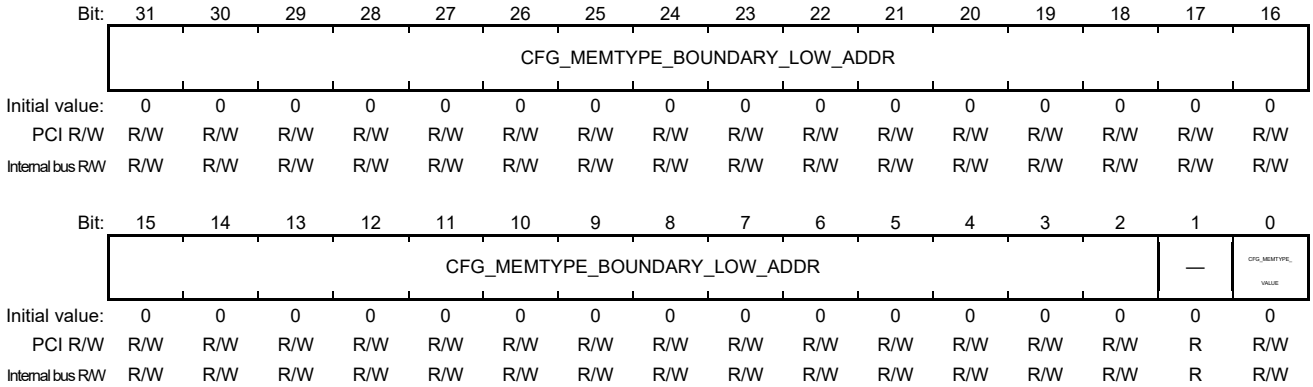
Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
7	AX_MSTR_ZEROL READ_FW	0	R/W	R/W	AXI Master Zero Length Read Forward to the application. The PCIEC AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions. ■ 0x0: The zero length Read is terminated at the PCIe AXI bridge master ■ 0x1: The zero length Read is forward to the internal bus.
6 to 5	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 3	AX_MSTR_ORDR_ P_EVENT_SEL	All 0	R/W	R/W	AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. ■ 00: B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). ■ 01: AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. ■ 10: W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. ■ 11: Reserved Note 2: This setting will not affect: ■ MSI interrupt catcher and P data ordering. This is always driven by the B'last event. ■ DMA read engine TLP ordering. This is always driven by the B'last event. ■ NP write transactions which are always serialized with P write transactions.
2	—	0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
1	AX_SNP_EN	0	R/W	R/W	AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
0	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.

104.2.237 Port Logic Registers 66 (PRTLGC66)

Common to Header TYPE00/01

- ACE Cache Coherency Control Register 1

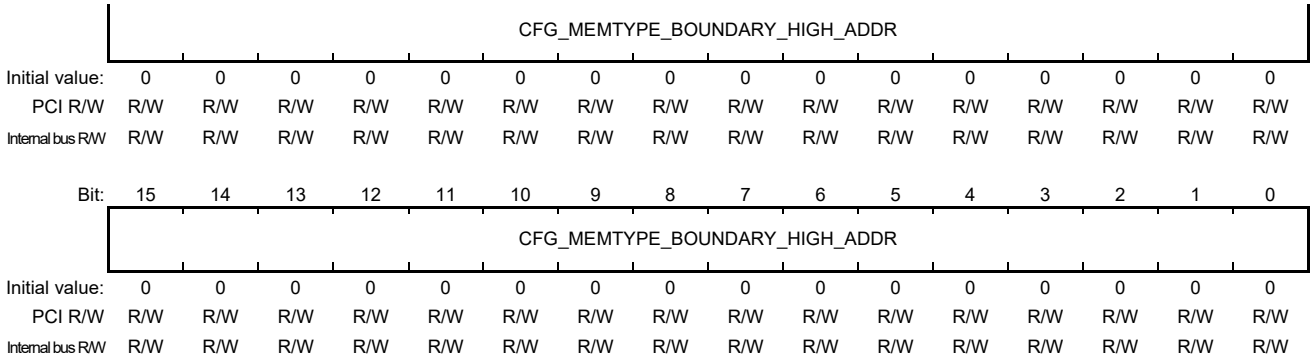


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 2	CFG_MEMTYPE_BOUNDARY_LOW_ADDR	All 0	R/W	R/W	Boundary Lower Address For Memory Type. Bits [31:0] of dword-aligned address of the boundary for Memory type. The two lower address LSBs are "00". Addresses up to but not including this value are in the lower address space region; addresses equal or greater than this value are in the upper address space region.
1	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CFG_MEMTYPE_VALUE	0	R/W	R/W	Sets the memory type for the lower and upper parts of the address space: ■ 0: lower = Peripheral; upper = Memory ■ 1: lower = Memory type; upper = Peripheral

104.2.238 Port Logic Registers 67 (PRTLGC67)

Header TYPE01 Only

- ACE Cache Coherency Control Register 2

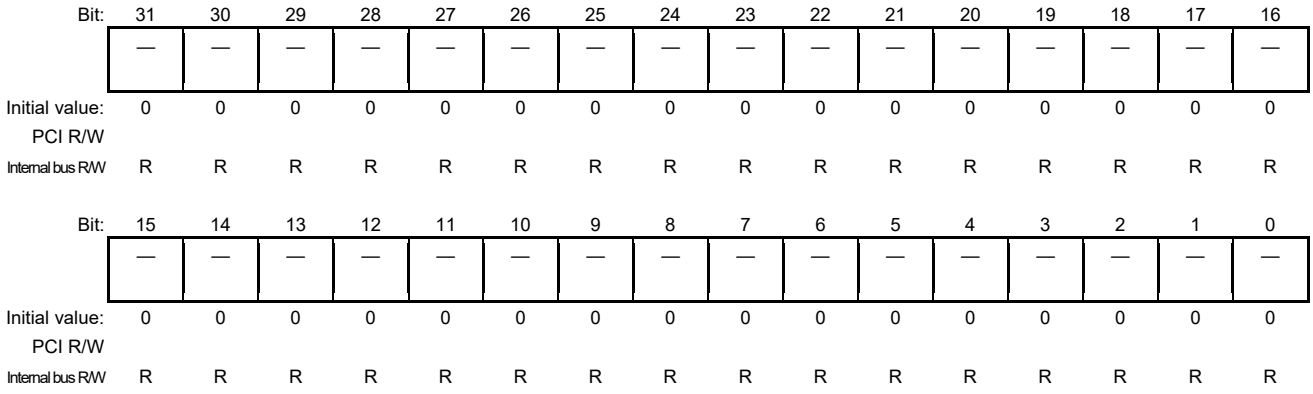


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	CFG_MEMTYPE_BOUNDARY_HIGH_ADDR	All 0	R/W	R/W	Boundary Upper Address For Memory Type. Bits [63:32] of the 64-bit DWORD-aligned address of the boundary for Memory type.

104.2.239 Port Logic Registers 68 (PRTLGC68)

Common to Header TYPE00/01

- ACE Cache Coherency Control Register 3 (V4H/V4M does not support ACE Lite)

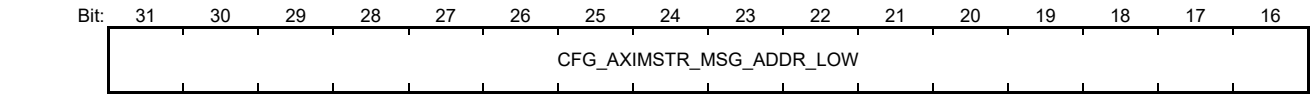


Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

104.2.240 Port Logic Registers 69 (PRTLGC69)

Common to Header TYPE00/01

- Lower 20 bits of the programmable AXI address where Messages coming from wire are mapped to.



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	_	_	_	_	_	_	AUX_CLK_FREQ									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
PCI R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 10	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	AUX_CLK_FREQ	H'00A	R/W	R/W	The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON).

104.2.253 Port Logic Registers 88 (PRTLGC88)

Common to Header TYPE00/01

- L1 Substates Timing Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	1	0	1	0	0	0	0	0	0	1	0	0	1
PCI R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31 to 30	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	MARGINING_MAX_VOLTAGE_OFFSET	H'5	R/W	R/W	M(MaxVoltageOffset) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
23	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	MARGINING_NUM_VOLTAGE_STEPS	H'20	R/W	R/W	M(NumVoltageSteps) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
15 to 14	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
13 to 8	MARGINING_MAX_TIMING_OFFSET	H'14	R/W	R/W	M(MaxTimingOffset) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
7 to 6	—	All 0	R	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	MARGINING_NUM_TIMING_STEPS	H'9	R/W	R/W	M(NumTimingSteps) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.

104.2.255 Port Logic Registers 92 (PRTLGC92)

Common to Header TYPE00/01

- Gen4 Lane Margining 2 Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	MARGINING_SAMPLE_RATE_TIMING						–	–	MARGINING_SAMPLE_RATE_VOLTAGE					
Initial value:	0	0	1	1	1	1	1	1	0	0	0	0	0	0	0	0
PCI R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Internal bus R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
31	MARGINING_RATE_MODE	0	R/W	R/W	Margining Rate Mode. ■ 0: Base Spec compliant mode: Lane Margining at Receiver is available at Gen4 data rate only. ■ 1: Special PHY Support mode: Lane Margining at Receiver is available at Gen4 data rate and at Gen1,Gen2 and Gen3 data rate for debug.
30 to 29	—	All 0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
28	MARGINING_IND_ERROR_SAMPLER	0	R/W	R/W	M(IndErrorSampler) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.

Bit	Bit Name	Initial Value	PCI R/W	Internal Bus R/W	Description
27	MARGINING_SAMPLE_REPORTING_METHOD	1	R/W	R/W	M(SampleReportingMethod) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
26	MARGINING_IND_LEFT_RIGHT_TIMING	1	R/W	R/W	M(IndLeftRightTiming) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
25	MARGINING_IND_UP_DOWN_VOLTAGE	0	R/W	R/W	M(IndUpDownVoltage) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
24	MARGINING_VOLTAGE_SUPPORTED	0	R/W	R/W	M(VoltageSupported) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
23 to 21	—	All 0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
20 to 16	MARGINING_MAXLANES	H'4	R/W	R/W	M(MaxLanes) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.
15 to 14	—	All 0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
13 to 8	MARGINING_SAMPLE_RATE_TIMING	H'3F	R/W	R/W	M(SamplingRateTiming) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter , see the PCI Express Base Specification 4.0.Note: This value is not used when MARGINING_IND_ERROR_SAMPLER is 0b. The M(SamplingRateTiming) is fixed to 63 internally.
7 to 6	—	0	R	R	Reserved This bit is always read as 0. The write value should always be 0.
5 to 0	MARGINING_SAMPLE_RATE_VOLTAGE	All 0	R/W	R/W	M(SamplingRateVoltage) for Lane Margining at the Receiver. This parameter is defined in 9 Electrical Sub-Block of PCI Express Base Specification 4.0. For a description of this standard PCIe parameter, see the PCI Express Base Specification 4.0.Note: This value is not used when MARGINING_IND_ERROR_SAMPLER is 0b. The M(SamplingRateVoltage) is fixed to 63 internally.

Internal bus R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	INCR EAS	–	–	ATTR		TD	TC			TYPE				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
22 to 20	CTRL_1_FUNC_NUM	All 0	R/W	Function Number. ■ When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "ATU Capabilities Registers [1+i*18]" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. ■This field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used.
19 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	INCREASE_REGION_SIZE	0	R/W	Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default).
12	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 9	ATTR	All 0	R/W	When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register.
8	TD	0	R/W	This is a reserved field. Do not use.
7 to 5	TC	All 0	R/W	When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register.
4 to 0	TYPE	All 0	R/W	When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register.

104.2.264 ATU Capabilities Registers [1+*i**18] (ATUCAP[1+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Region Control 2 Register for outbound

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	REGION_EN	_	INVERT_	CFG_SHI	DMA_BY	_	_	_	HEADER	INHIBIT_	TLP_HEA	SNP	FUNC_B	MSB2BITS_TAG		TAG_SU
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAG								MSG_CODE							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

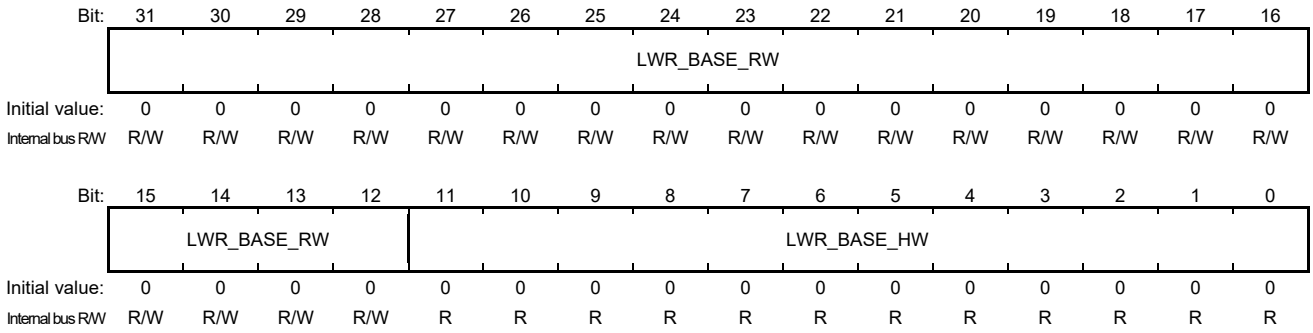
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	REGION_EN	0	R/W	Region Enable. This bit must be set to '1' for address translation to take place.
30	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	INVERT_MODE	0	R/W	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address).
28	CFG_SHIFT_MODE	0	R/W	CFG Shift Mode. The ATU uses bits [27:12] of the untranslated address (on the AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 4.0 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space.
27	DMA_BYPASS	0	R/W	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the ATU untranslated.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	HEADER_SUBSTITUTE_EN	0	R/W	Header Substitute Enable. When enabled and region address is matched, the ATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in ATU Capabilities Registers [5+i*18]. ■ 1: LWR_TARGET_RW in the ATU Capabilities Registers [5+i*18] is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. ■ 0: LWR_TARGET_RW in the ATU Capabilities Registers [5+i*18] forms the new address of the translated region.
22	INHIBIT_PAYLOAD	0	R/W	Inhibit TLP Payload Data for TLP's in Matched Region; assign ATU region to be TLP without data. When enabled and region address is matched, the ATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0. ■ 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. ■ 0: Fmt[1] =0/1 so that TLPs with or without data can be sent.
21	TLP_HEADER_FIELDS_BYPASS	0	R/W	TLP Header Fields Translation Bypass. In this mode header fields of the translated TLP is taken from your application transmit interface.
20	SNP	0	R/W	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
19	FUNC_BYPASS	0	R/W	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken you're your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "ATU Capabilities Registers [0+i*18]".
18 to 17	MSB2BITS_TAG	All 0	R/W	TAG. Two most significant bits of the substituted TAG field in the outgoing TLP header when TAG_SUBSTITUTE_EN is set.
16	TAG_SUBSTITUTE_EN	0	R/W	TAG Substitute Enable. When enabled and region address is matched, the ATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD.
15 to 8	TAG	All 0	R/W	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set.
7 to 0	MSG_CODE	All 0	R/W	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register.

104.2.265 ATU Capabilities Registers [2+*i**18] (ATUCAP[2+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Lower Base Address Register for outbound

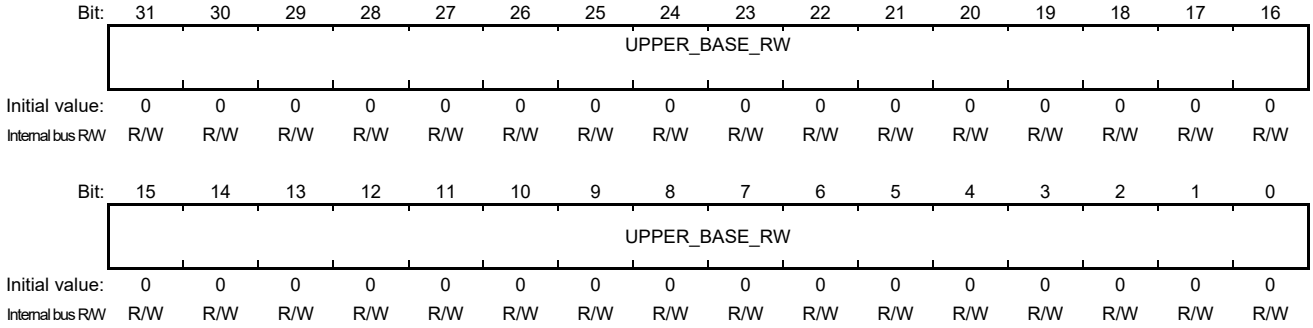


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	LWR_BASE_RW	All 0	R/W	Forms bits [31:12] of the start address of the address region to be translated.
11 to 0	LWR_BASE_HW	All 0	R	Forms bits [11:0] of the start address of the address region to be translated. The start address must be aligned to a 4 kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller.

104.2.266 ATU Capabilities Registers [3+*i**18] (ATUCAP[3+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Upper Base Address Register for outbound

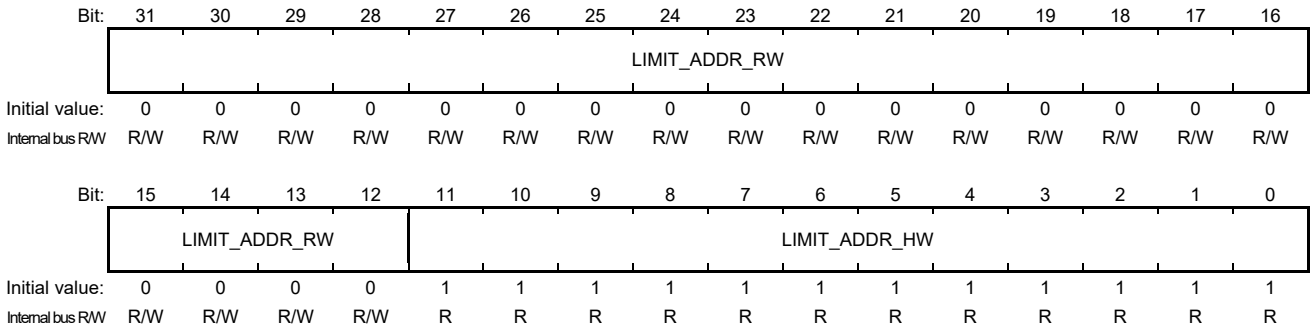


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPER_BASE_RW	All 0	R/W	Forms bits [63:32] of the start (and end) address of the address region to be translated. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect.

104.2.267 ATU Capabilities Registers [4+*i**18] (ATUCAP[4+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Limit Address Register for outbound

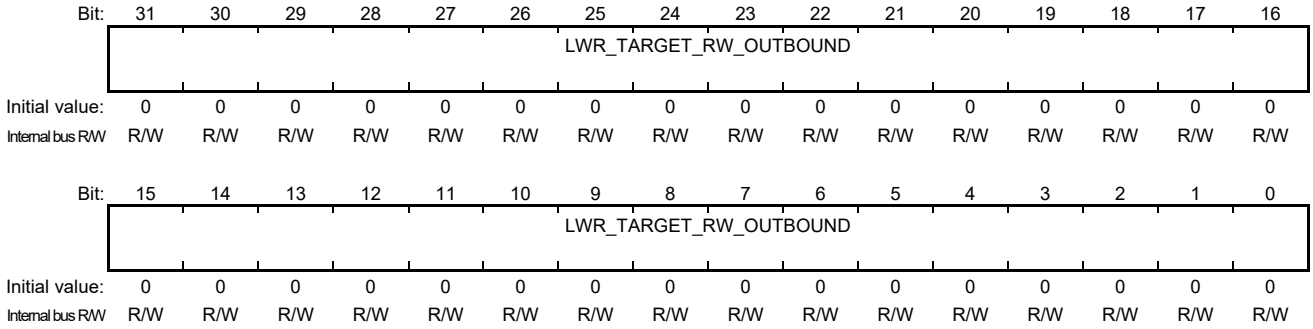


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	LIMIT_ADDR_RW	All 0	R/W	Forms upper bits of the end address of the address region to be translated.
11 to 0	LIMIT_ADDR_HW	All H'FFF	R	Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a 4 kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIEC.

104.2.268 ATU Capabilities Registers [5+*i**18] (ATUCAP[5+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Lower Target Address Register for outbound

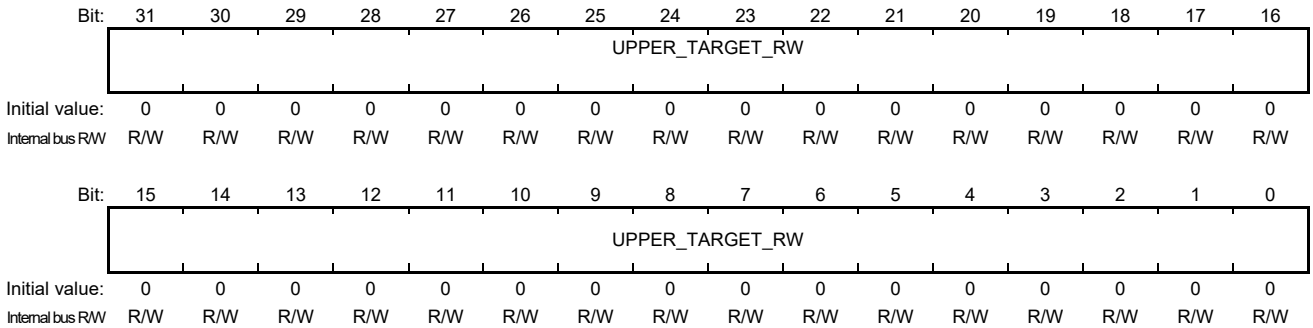


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	LWR_TARGET_RW_OUTBOUND	All 0	R/W	When HEADER_SUBSTITUTE_EN in ATU Capabilities Registers [1+i*18] is '0 (normal operation): ■ LWR_TARGET_RW[31:12] forms MSB's of the Lower Target part of the new address of the translated region; ■ LWR_TARGET_RW[11:0] are not used. (The start address must be aligned to a 4 kB boundary, so the lower bits of the start address of the new address of the translated region (bits 11:0) are always '0'). When HEADER_SUBSTITUTE_EN in ATU Capabilities Registers [1+i*18] is '1': ■ LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header.

104.2.269 ATU Capabilities Registers [6+*i**18] (ATUCAP[6+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Upper Target Address Register for outbound



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPER_TARGET_RW	All 0	R/W	Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region.

104.2.270 ATU Capabilities Registers [7+*i**18] (ATUCAP[7+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Region Control 3 Register for outbound (setting for virtual function)

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

104.2.271 ATU Capabilities Registers [8+*i**18] (ATUCAP[8+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Upper Limit Address Register for outbound

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UPPR_LIMIT_ADDR_HW															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

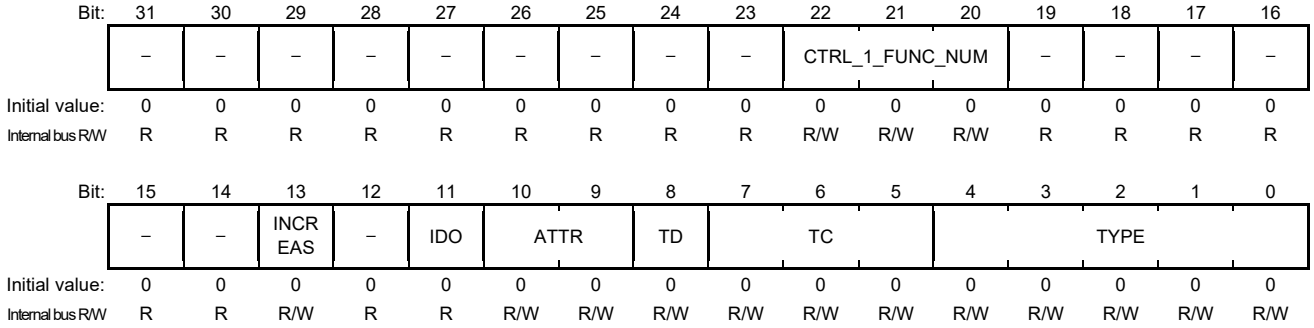
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UPPR_LIMIT_ADDR_HW															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPR_LIMIT_ADDR_HW	All 0	R	Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in ATU Capabilities Registers [0+i*18] is '1'. These bits are always '0'.

104.2.272 ATU Capabilities Registers [9+*i**18] (ATUCAP[9+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Region Control 1 Register for inbound



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	CTRL_1_FUNC_NUM	All 0	R/W	Function Number. ■ MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set. ■ CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set.
19 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	INCREASE_REGION_ SIZE	0	R/W	Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default).
12	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	IDO	0	R/W	When the IDO field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set. Note: This function is not supported.
10 to 9	ATTR	All 0	R/W	When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set.
8	TD	0	R/W	When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
7 to 5	TC	All 0	R/W	When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set.
4 to 0	TYPE	All 0	R/W	When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful).

104.2.273 ATU Capabilities Registers [10+*i**18] (ATUCAP[10+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Region Control 2 Register for inbound

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	REGION_EN	MATCH_MODE	INVERT_MODE	CFG_SHIFT_MODE	FUZZY_TYPE_MATCH_CODE	–	RESPONSE_CODE		SINGLE_ADDR_LOC_TRANS_EN	–	MSG_CODE_MATCH_EN	–	FUNC_NUM_MATCH_EN	–	–	ATTR_MATCH_EN

	TD_MATCH_EN	TC_MATCH_EN	MSG_TYPE_MATCH_MODE	–	–	BAR_NUM			MSG_CODE							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	REGION_EN	0	R/W	Region Enable. This bit must be set to '1' for address translation to take place.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
30	MATCH_MODE	0	R/W	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The ATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. ■ 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: ■ 0: Routing ID Match Mode. The ATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the ATU region for matching to proceed. ■ 1: Accept Mode. The ATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: ■ 0: Address Match Mode. The ATU treats the third DWORD and fourth DWORD of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. ■ 1: Vendor ID Match Mode. This mode is relevant for ID routed Vendor Defined Messages. The ATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third DWORD of the TLP header, but matches against the Vendor ID in bits [15:0] of the third DWORD of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth DWORD of the TLP header. -If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored.
29	INVERT_MODE	0	R/W	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address).
28	CFG_SHIFT_MODE	0	R/W	CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
27	FUZZY_TYPE_MATCH_CODE	0	R/W	Fuzzy Type Match Mode. When enabled, the ATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that ■ CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. ■ MWr, MRd and MRdLk TLPs are seen as identical ■ The Routing field of Msg/MsgD TLPs is ignored ■ FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "ATU Capabilities Registers [9+i*18]" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP.
26	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
25 to 24	RESPONSE_CODE	All 0	R/W	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled.
23	SINGLE_ADDR_LOC_TRANS_EN	0	R/W	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the ATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

21	MSG_CODE_MATCH_EN	0	R/W	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "ATU Capabilities Registers [10+i*18]") occurs (in MSG transactions) for address translation to proceed.
20	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
19	FUNC_NUM_MATCH_EN	0	R/W	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "ATU Capabilities Registers [9+i*18]") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed.
18 to 17	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	ATTR_MATCH_EN	0	R/W	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "ATU Capabilities Registers [9+i*18]") occurs for address translation to proceed.
15	TD_MATCH_EN	0	R/W	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "ATU Capabilities Registers [9+i*18]") occurs for address translation to proceed.

14	TC_MATCH_EN	0	R/W	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "ATU Capabilities Registers [9+i*18]") occurs for address translation to proceed.
13	MSG_TYPE_MATCH_ MODE	0	R/W	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the ATU Capabilities Registers [9+i*18] register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM.
12 to 11	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	BAR_NUM	0	R/W	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "ATU Capabilities Registers [10+i*18]" is set. ■ 000b - BAR0 ■ 001b - BAR1 ■ 010b - BAR2 ■ 011b - BAR3 ■ 100b - BAR4 ■ 101b - BAR5 ■ 110b - ROM ■ 111b - reserved ■ IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR.
7 to 0	MSG_CODE	0	R/W	MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled fieldmatches are successful). This check is only performed if the "Message Code Match Enable" bit of the "ATU Capabilities Registers [10+i*18]" is set.

104.2.274 ATU Capabilities Registers [11+*i**18] (ATUCAP[11+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Lower Base Address Register for inbound

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LWR_BASE_RW

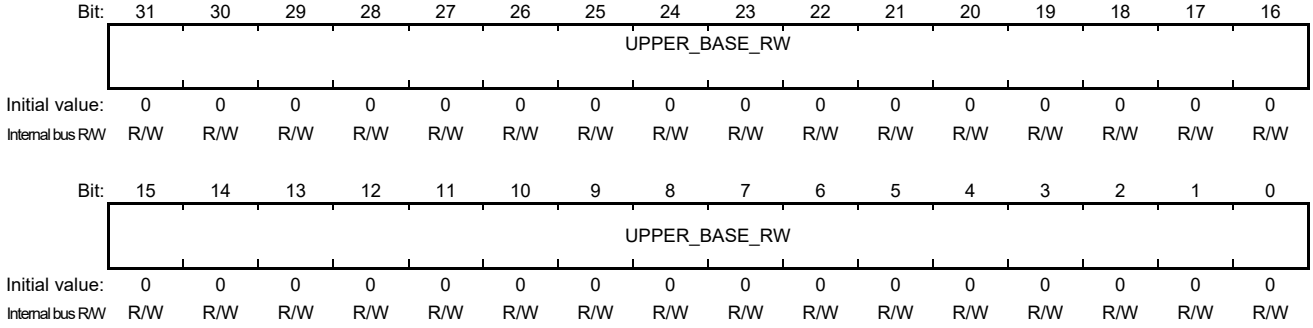
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LWR_BASE_RW				LWR_BASE_HW											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	LWR_BASE_RW	All 0	R/W	Forms bits [31:12] of the start address of the address region to be translated.
11 to 0	LWR_BASE_HW	All 0	R	Forms bits [11:0] of the start address of the address region to be translated. The start address must be aligned to a 4 kB boundary, so these bits are always 0. A write to this location is ignored by the PCIEC.

104.2.275 ATU Capabilities Registers [12+*i**18] (ATUCAP[12+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Upper Base Address Register for inbound

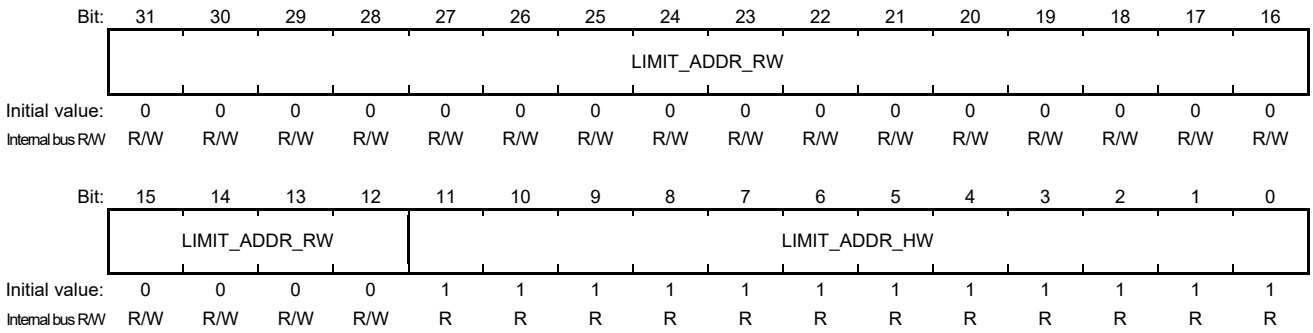


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPER_BASE_RW	All 0	R/W	Forms bits [63:32] of the start (and end) address of the address region to be translated.

104.2.276 ATU Capabilities Registers [13+*i**18] (ATUCAP[13+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Limit Address Register for inbound

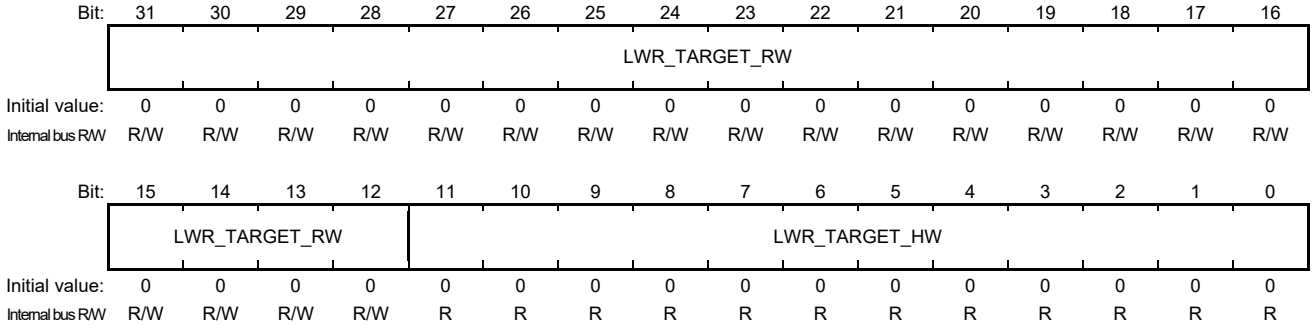


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	LIMIT_ADDR_RW	All 0	R/W	Forms upper bits of the end address of the address region to be translated.
11 to 0	LIMIT_ADDR_HW	H'FFF	R	Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a 4 kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIEC.

104.2.277 ATU Capabilities Registers [14+*i**18] (ATUCAP[14+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Lower Target Address Register for inbound

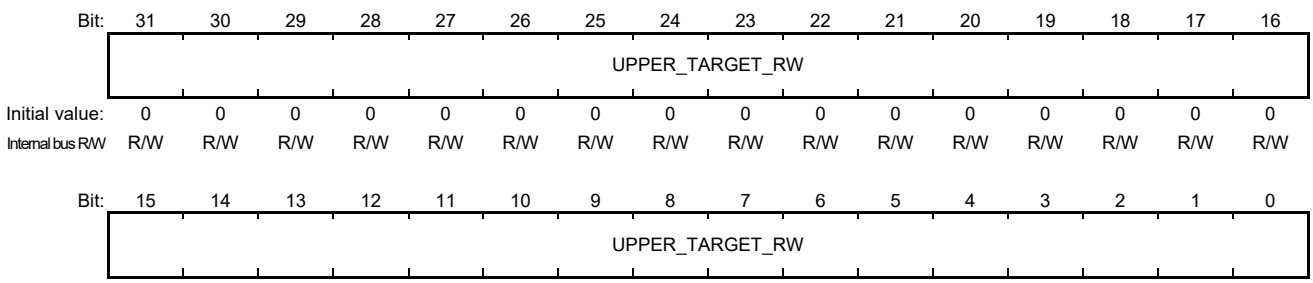


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	LWR_TARGET_RW	All 0	R/W	Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'.
11 to 0	LWR_TARGET_HW	All 0	R	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to a 4 kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the ATU region size, then the ATU target address must align to the ATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIEC.

104.2.278 ATU Capabilities Registers [15+*i**18] (ATUCAP[15+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Upper Target Address Register for inbound



Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPER_TARGET_RW	All 0	R/W	Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect.

104.2.279 ATU Capabilities Registers [16+*i**18] (ATUCAP[16+*i**18]) (*i* = 0 to 15)

Common to Header TYPE00/01

- ATU Region Control 3 Register for inbound (Setting for VF)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	UPPR_LIMIT_ADDR_HW	0	R	Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in ATU Capabilities Registers 9 is '1'. These bits are always '0'.

104.2.281 DMA Capabilities Registers 0 (DMACAP0)

Common to Header TYPE00/01

- DMA Arbitration Scheme for TRGT1 Interface
- This register is used to control traffic priorities among various sources that are delivered to internal bus where H’0 represents the highest priority. Concurrent traffic from channels with same priority are sorted according to Round-Robin arbitration rules. The arbitration priority defaults to Non-DMA requests (highest), Write Channel MRd, Read Channel MRd, Read Channel MWr.

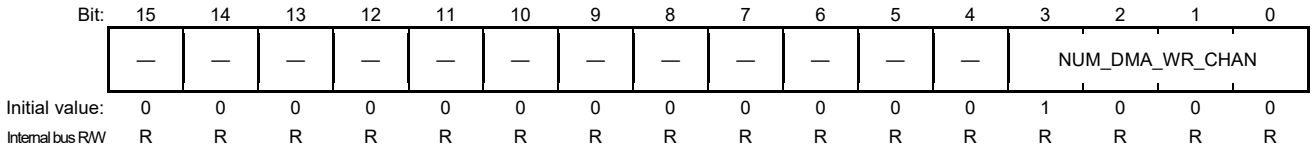
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 9	RDBUFF_TRGT_WEIGHT	H’3	R/W	DMA Read Channel MWr Requests.
8 to 6	RD_CTRL_TRGT_WEIGHT	H’2	R/W	DMA Read Channel MRd Requests. For LL element/descriptor access.
5 to 3	WR_CTRL_TRGT_WEIGHT	H’1	R/W	DMA Write Channel MRd Requests. For DMA data requests and LL element/descriptor access.
2 to 0	RTRGT1_WEIGHT	All 0	R/W	Non-DMA Rx Requests.

104.2.282 DMA Capabilities Registers 1 (DMACAP1)

Common to Header TYPE00/01

- DMA Number of Channels Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DIS_C2W_CACHE_RD	DIS_C2W_CACHE_WR	—	—	—	—	NUM_DMA_RD_CHAN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
Internal bus R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R



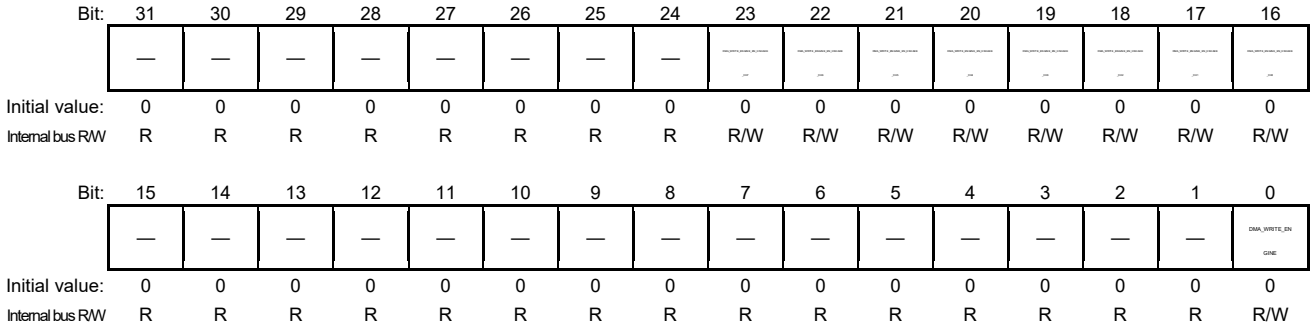
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	NUM_DMA_WR_CHAN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DIS_C2W_CACHE_RD	0	R/W	Disable DMA Read Channels "completion to memory write" context cache pre-fetch function. Note: For internal debugging only.
24	DIS_C2W_CACHE_WR	0	R/W	Disable DMA Write Channels "completion to memory write" context cache pre-fetch function. Note: For internal debugging only.
23 to 20	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
19 to 16	NUM_DMA_RD_CHAN	H'8	R	Number of Read Channels. You can read this register to determine the number of read channels the DMA controller has been configured to support.
15 to 4	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
3 to 0	NUM_DMA_WR_CHAN	H'8	R	Number of Write Channels. You can read this register to determine the number of write channels the DMA controller has been configured to support.

104.2.283 DMA Capabilities Registers 2 (DMACAP2)

Common to Header TYPE00/01

- DMA Write Engine Enable Register



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—

Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA_WRITE_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	DMA_WRITE_ENGINE_EN_HSHAKE_CH7	0	R/W	Enable Handshake for DMA Write Engine Channel 7.
22	DMA_WRITE_ENGINE_EN_HSHAKE_CH6	0	R/W	Enable Handshake for DMA Write Engine Channel 6.
21	DMA_WRITE_ENGINE_EN_HSHAKE_CH5	0	R/W	Enable Handshake for DMA Write Engine Channel 5.
20	DMA_WRITE_ENGINE_EN_HSHAKE_CH4	0	R/W	Enable Handshake for DMA Write Engine Channel 4.
19	DMA_WRITE_ENGINE_EN_HSHAKE_CH3	0	R/W	Enable Handshake for DMA Write Engine Channel 3.
18	DMA_WRITE_ENGINE_EN_HSHAKE_CH2	0	R/W	Enable Handshake for DMA Write Engine Channel 2.
17	DMA_WRITE_ENGINE_EN_HSHAKE_CH1	0	R/W	Enable Handshake for DMA Write Engine Channel 1.
16	DMA_WRITE_ENGINE_EN_HSHAKE_CH0	0	R/W	Enable Handshake for DMA Write Engine Channel 0.
15 to 1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	DMA_WRITE_ENGINE	0	R/W	DMA Write Engine Enable. ■ 1: Enable ■ 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to "0" when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: ■ The "Abort Interrupt Status" bit is set in the "DMA Capabilities Registers 10" (DMACAP10), and any of the bits is in the " DMA Capabilities Registers 13" (DMACAP13) are set. Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. ■ You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the Channel Status field (CS) of the DMA write "DMA Capabilities Registers [37+i*16]" (DMACAP[37+i*16]) is set to "Stopped." Resetting the DMA controller write logic reinitializes the control logic ensuring that the next DMA write transfer is executed successfully. ■ During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: ■ De-assert the DMA write engine enable bit. ■ Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a "0". ■ Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the " DMA Capabilities Registers 3" (DMACAP3).

104.2.284 DMA Capabilities Registers 3 (DMACAP3)

Common to Header TYPE00/01

- DMA Write Doorbell Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WR_STOP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

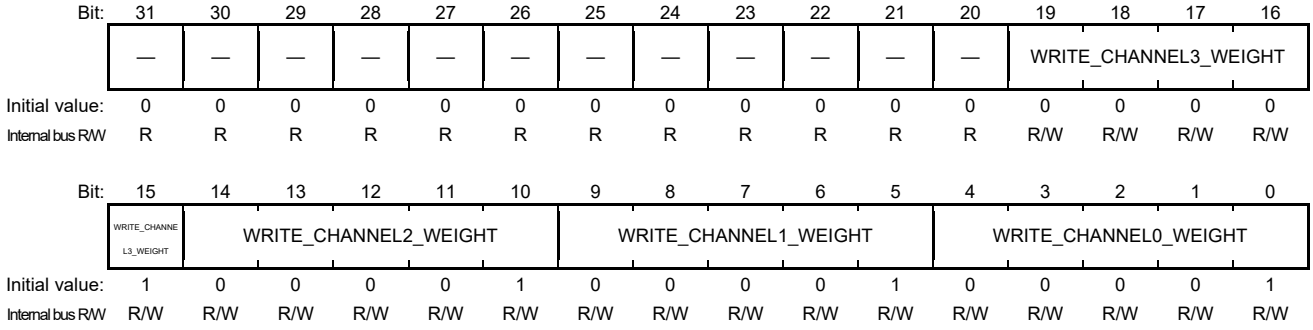
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WR_DOORBELL_NUM		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	WR_STOP	0	R/W	Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the " DMA Capabilities Registers 59" (DMACAP59) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)."
30 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	WR_DOORBELL_NUM	All 0	R/W	Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, and 0x0 corresponds to channel 0. Also note that a write to this field triggers the controller to exit L1 substates.

104.2.285 DMA Capabilities Registers 4 (DMACAP4)

Common to Header TYPE00/01

- DMA Write Engine Channel Arbitration Weight Low Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 15	WRITE_CHANNEL3_WEIGHT	H'1	R/W	Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.
14 to 10	WRITE_CHANNEL2_WEIGHT	H'1	R/W	Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
9 to 5	WRITE_CHANNEL1_WEIGHT	H'1	R/W	Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.
4 to 0	WRITE_CHANNEL0_WEIGHT	H'1	R/W	Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.

104.2.286 DMA Capabilities Registers 5 (DMACAP5)

Common to Header TYPE00/01

- DMA Write Engine Channel Arbitration Weight High Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	WRITE_CHANNEL7_WEIGHT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WRITE_CHAN	WRITE_CHANNEL6_WEIGHT					WRITE_CHANNEL5_WEIGHT					WRITE_CHANNEL4_WEIGHT				
Initial value:	1	0	0	0	0	1	0	0	0	0	1	0	0	0	0	1
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 15	WRITE_CHANNEL7_WEIGHT	H'1	R/W	Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.
14 to 10	WRITE_CHANNEL6_WEIGHT	H'1	R/W	Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.
9 to 5	WRITE_CHANNEL5_WEIGHT	H'1	R/W	Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
4 to 0	WRITE_CHANNEL4_WEIGHT	H'1	R/W	Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel write request. A value of '0' means that one TLP is issued before moving to the next channel.

104.2.287 DMA Capabilities Registers 6 (DMACAP6)

Common to Header TYPE00/01

- DMA Read Engine Enable Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	_____	_____	_____	_____	_____	_____	_____	_____

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA_READ_ENGINE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	DMA_READ_ENGINE_EN_HSHAKE_CH7	0	R/W	Enable Handshake for DMA Read Engine Channel 7.
22	DMA_READ_ENGINE_EN_HSHAKE_CH6	0	R/W	Enable Handshake for DMA Read Engine Channel 6.
21	DMA_READ_ENGINE_EN_HSHAKE_CH5	0	R/W	Enable Handshake for DMA Read Engine Channel 5.
20	DMA_READ_ENGINE_EN_HSHAKE_CH4	0	R/W	Enable Handshake for DMA Read Engine Channel 4.
19	DMA_READ_ENGINE_EN_HSHAKE_CH3	0	R/W	Enable Handshake for DMA Read Engine Channel 3.
18	DMA_READ_ENGINE_EN_HSHAKE_CH2	0	R/W	Enable Handshake for DMA Read Engine Channel 2.
17	DMA_READ_ENGINE_EN_HSHAKE_CH1	0	R/W	Enable Handshake for DMA Read Engine Channel 1.
16	DMA_READ_ENGINE_EN_HSHAKE_CH0	0	R/W	Enable Handshake for DMA Read Engine Channel 0.
15 to 1	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	DMA_READ_ENGINE	0	R/W	DMA Read Engine Enable. ■ 1: Enable ■ 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this field to "0" when you want to "Soft Reset" the DMA controller read logic. There are three possible reasons for resetting the DMA controller read logic: ■ The "Abort Interrupt Status" bit is set (in the "DMA Capabilities Registers 23" (DMACAP23), and any of the bits in the ""DMA Capabilities Registers 26" (DMACAP26) is set. Resetting the DMA controller read logic re-initializes the control logic, ensuring that the next DMA read transfer is executed successfully. ■ You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the channel Status field (CS) of the DMA read "DMA Capabilities Registers [45+i*16]" (DMACAP[45+i*16]) is set to "Stopped". Resetting the DMA controller read logic reinitializes the control logic ensuring that the next DMA read transfer is executed successfully. ■ During software development, when you incorrectly program the DMA read engine. To "Soft Reset" the DMA controller read logic, you must: ■ De-assert the DMA read engine enable bit. ■ Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA read engine enable bit returns a "0". ■ Assert the DMA read engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA read transfer does not start until you write to the " DMA Capabilities Registers 7" (DMACAP7).

104.2.288 DMA Capabilities Registers 7 (DMACAP7)

Common to Header TYPE00/01

- DMA Read Doorbell Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RD_STOP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RD_DOORBELL_NUM		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	RD_STOP	0	R/W	Stop. Set in conjunction with the Doorbell Number field. The DMA read channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the "DMA Capabilities Registers 68" (DMACAP68) to ensure that the read channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)".
30 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	RD_DOORBELL_NUM	All 0	R/W	Doorbell Number. You must write 0x0 to this register to start the DMA read transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. The range of this field is 0x0 to 0x7, and 0x0 corresponds to channel 0. Also note that a write to this field triggers the controller to exit L1 substates.

104.2.289 DMA Capabilities Registers 8 (DMACAP8)

Common to Header TYPE00/01

- Description: DMA Read Engine Channel Arbitration Weight Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	READ_CHANNEL3_WEIGHT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	READ_CHANNEL3_WEIGHT	READ_CHANNEL2_WEIGHT					READ_CHANNEL1_WEIGHT					READ_CHANNEL0_WEIGHT				
Initial value:	1	0	0	0	0	1	0	0	0	0	1	0	0	0	0	1
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

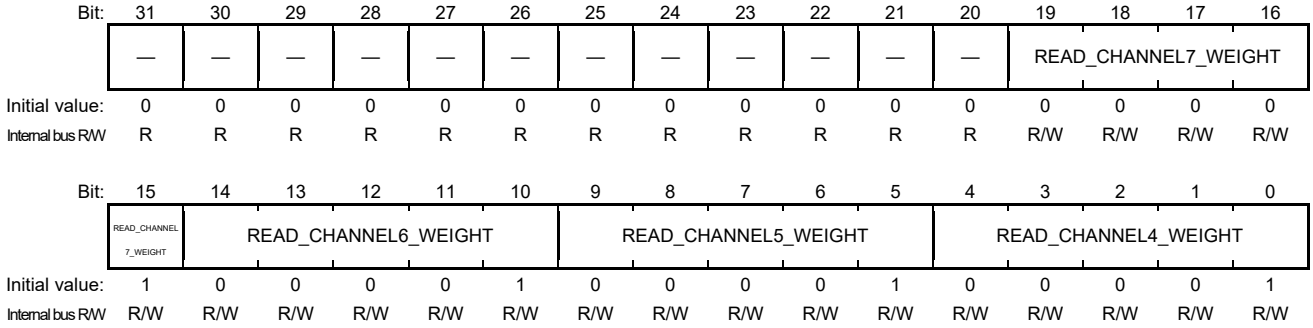
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 15	READ_CHANNEL3_WEIGHT	H'1	R/W	Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.
14 to 10	READ_CHANNEL2_WEIGHT	H'1	R/W	Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.
9 to 5	READ_CHANNEL1_WEIGHT	H'1	R/W	Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
4 to 0	READ_CHANNEL0_WEIGHT	H'1	R/W	Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.

104.2.290 DMA Capabilities Registers 9 (DMACAP9)

Common to Header TYPE00/01

- DMA Read Engine Channel Arbitration Weight High Register

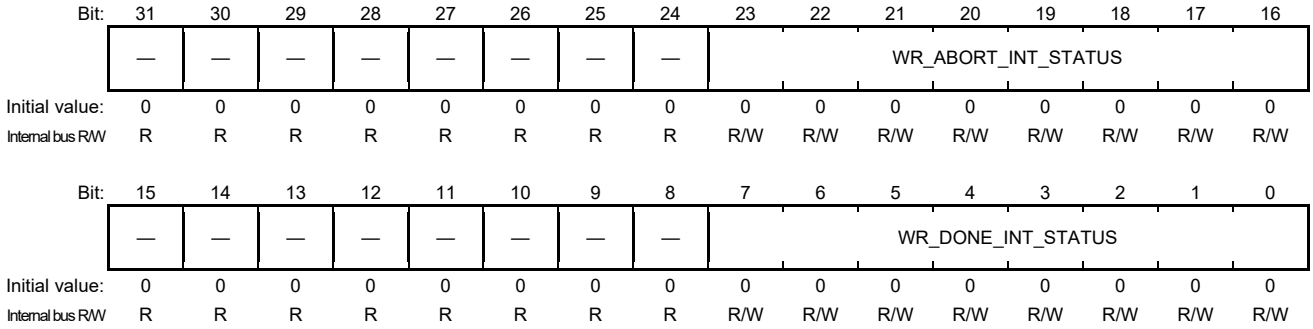


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 15	READ_CHANNEL7_WEIGHT	H'1	R/W	Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.
14 to 10	READ_CHANNEL6_WEIGHT	H'1	R/W	Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.
9 to 5	READ_CHANNEL5_WEIGHT	H'1	R/W	Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.
4 to 0	READ_CHANNEL4_WEIGHT	H'1	R/W	Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request.

104.2.291 DMA Capabilities Registers 10 (DMACAP10)

Common to Header TYPE00/01

- DMA Write Interrupt Status Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	WR_ABORT_INT_STATUS	All 0	R/W	Abort Interrupt Status. The DMA write channel has detected an error, or you manually stopped the transfer as described in "Error Handling Assistance by Remote Software". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA write interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA write interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	WR_DONE_INT_STATUS	All 0	R/W	Done Interrupt Status. The DMA write channel has successfully completed the DMA transfer. For more details, see "Interrupts and Error Handling". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA write interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA write interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register.

104.2.292 DMA Capabilities Registers 11 (DMACAP11)

Common to Header TYPE00/01

- DMA Write Interrupt Mask Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WR_ABORT_INT_MASK							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	WR_DONE_INT_MASK							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	WR_ABORT_INT_MASK	H'FF	R/W	Abort Interrupt Mask. Prevents the Abort interrupt status field in the DMA write interrupt status register from asserting the intreq_pci*m*_dma_p output. Each bit corresponds to a DMA channel. (*m* = 0, 1, 2, 3) Bit [0] corresponds to channel 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	WR_DONE_INT_MASK	H'FF	R/W	Done Interrupt Mask. Prevents the Done interrupt status field in the DMA write interrupt status register from asserting the intreq_pci*m*_dma_p output. Each bit corresponds to a DMA channel. (*m* = 0, 1, 2, 3) Bit [0] corresponds to channel 0.

104.2.293 DMA Capabilities Registers 12 (DMACAP12)

Common to Header TYPE00/01

- DMA Write Interrupt Clear Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	WR_ABORT_INT_CLEAR

Internal bus R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

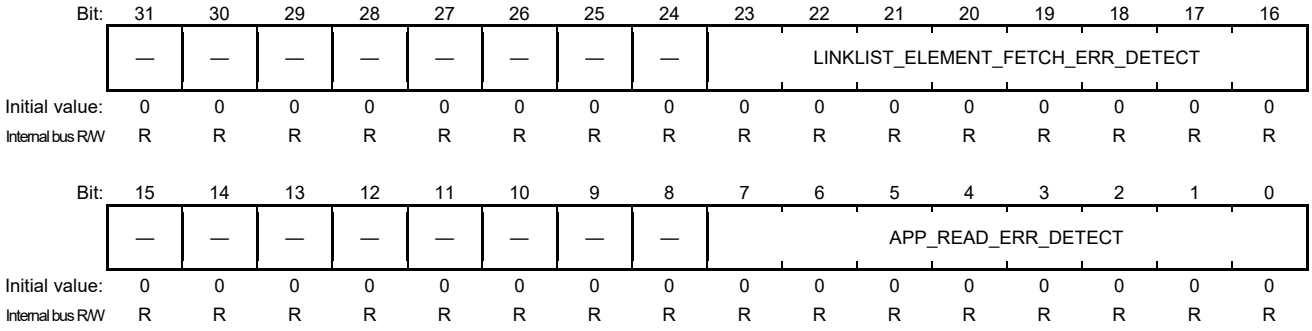
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
23 to 16	WR_ABORT_INT_CLEAR	All 0	W	Abort Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Abort interrupt status field of the DMA write interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	WR_DONE_INT_CLEAR	All 0	W	Done Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Done interrupt status field of the DMA write interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".

104.2.294 DMA Capabilities Registers 13 (DMACAP13)

Common to Header TYPE00/01

- DMA Write Error Status Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LINKLIST_ELEMENT_FETCH_ERR_DETECT	All 0	R	Linked List Element Fetch Error Detected. The DMA write channel has received an error response from the AXI bus while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA write interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 12" (DMACAP12) to clear this error bit.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	APP_READ_ERR_DETECT	All 0	R	Application Read Error Detected. The DMA write channel has received an error response from the AXI bus while reading data from it. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA write interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 12" (DMACAP12) to clear this error bit.

104.2.295 DMA Capabilities Registers 14 (DMACAP14)

Common to Header TYPE00/01

- DMA Write Done IMWr Address Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_WRITE_DONE_LOW_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_WRITE_DONE_LOW_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_WRITE_DONE_LOW_REG	All 0	R/W	The DMA uses this field to generate bits [31:0] of the address field for the Done IMWr TLP. Bits [1:0] must be "00" as this address must be DWORD aligned.

104.2.296 DMA Capabilities Registers 15 (DMACAP15)

Common to Header TYPE00/01

- DMA Write Done IMWr Interrupt Address High Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_WRITE_DONE_HIGH_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_WRITE_DONE_HIGH_REG															

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_WRITE_DONE_HIGH_REG	All 0	R/W	The DMA uses this field to generate bits [63:32] of the address field for the Done IMWr TLP.

104.2.297 DMA Capabilities Registers 16 (DMACAP16)

Common to Header TYPE00/01

- DMA Write Abort IMWr Address Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_WRITE_ABORT_LOW_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_WRITE_ABORT_LOW_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_WRITE_ABORT_LOW_REG	All 0	R/W	The DMA uses this field to generate bits [31:0] of the address field for the Abort IMWr TLP it generates. Bit [1:0] must be "00" as this address must be DWORD aligned.

104.2.298 DMA Capabilities Registers 17 (DMACAP17)

Common to Header TYPE00/01

- DMA Write Abort IMWr Address High Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_WRITE_ABORT_HIGH_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

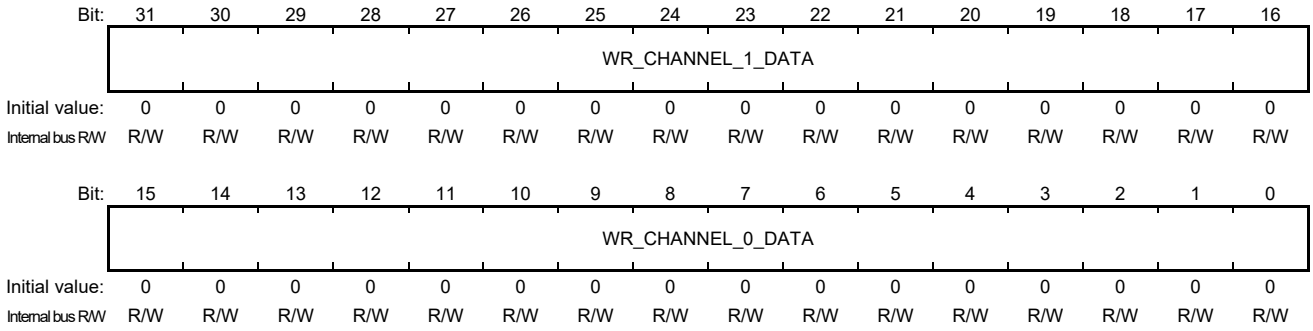
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMA_WRITE_ABORT_HIGH_REG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_WRITE_ABORT_HIGH_REG	All 0	R/W	The DMA uses this field to generate bits [63:32] of the address field for the Abort IMWr TLP.

104.2.299 DMA Capabilities Registers 18 (DMACAP18)

Common to Header TYPE00/01

- DMA Write Channel 1 and 0 IMWr Data Register

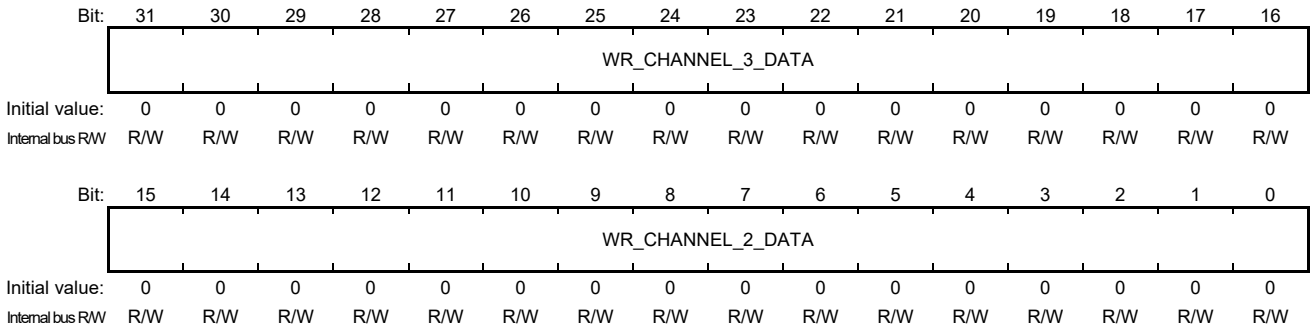


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	WR_CHANNEL_1_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 1.
15 to 0	WR_CHANNEL_0_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 0.

104.2.300 DMA Capabilities Registers 19 (DMACAP19)

Common to Header TYPE00/01

- DMA Write Channel 3 and 2 IMWr Data Register



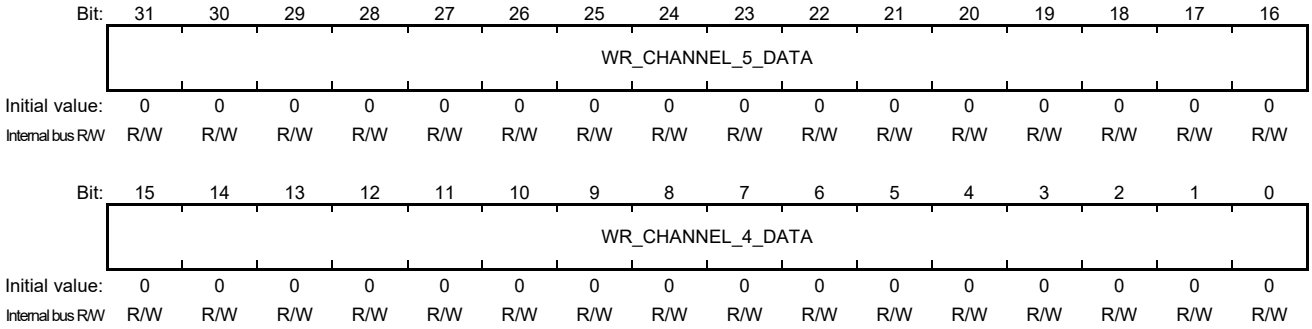
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	WR_CHANNEL_3_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 3.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 0	WR_CHANNEL_2_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 2.

104.2.301 DMA Capabilities Registers 20 (DMACAP20)

Common to Header TYPE00/01

- DMA Write Channel 5 and 4 IMWr Data Register

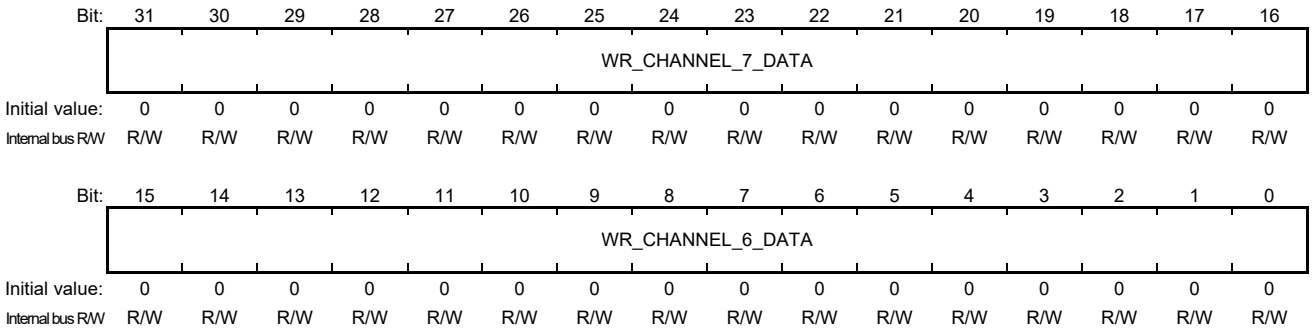


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	WR_CHANNEL_5_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 5.
15 to 0	WR_CHANNEL_4_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 4.

104.2.302 DMA Capabilities Registers 21 (DMACAP21)

Common to Header TYPE00/01

- DMA Write Channel 7 and 6 IMWr Data Register



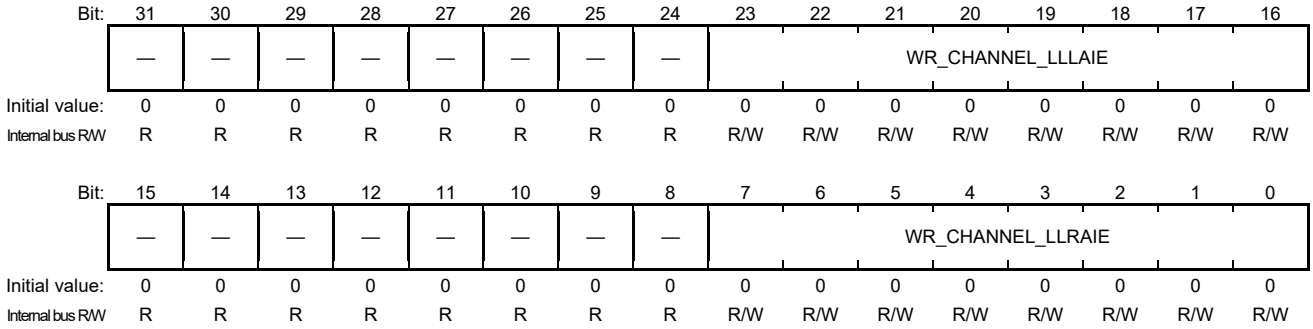
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	WR_CHANNEL_7_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 7.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 0	WR_CHANNEL_6_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 6.

104.2.303 DMA Capabilities Registers 22 (DMACAP22)

Common to Header TYPE00/01

- DMA Write Linked List Error Enable Register

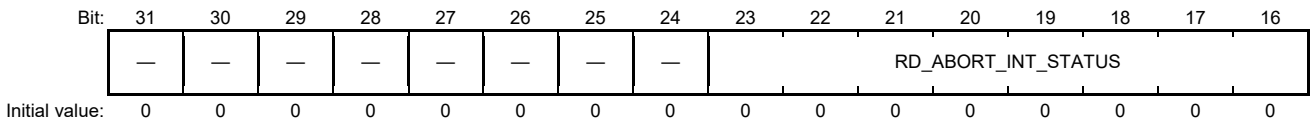


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	WR_CHANNEL_LLLAIE	All 0	R/W	Write Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the write channel local abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling".
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	WR_CHANNEL_LLRAIE	All 0	R/W	Write Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the write channel remote abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling".

104.2.304 DMA Capabilities Registers 23 (DMACAP23)

Common to Header TYPE00/01

- DMA Read Interrupt Status Register



Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RD_DONE_INT_STATUS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	RD_ABORT_INT_STATUS	All 0	R/W	Abort Interrupt Status. The DMA read channel has detected an error, or you manually stopped the transfer as described in "Stopping the DMA Transfer (Software Stop)". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. You can read the "DMA Capabilities Registers 26" (DMACAP26) and "DMA Capabilities Registers 27" (DMACAP27) to determine the source of the error. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RD_DONE_INT_STATUS	All 0	R/W	Done Interrupt Status. The DMA read channel has successfully completed the DMA read transfer. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register.

104.2.305 DMA Capabilities Registers 24 (DMACAP24)

Common to Header TYPE00/01

- DMA Read Interrupt Mask Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	RD_ABORT_INT_MASK							

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RD_DONE_INT_MASK							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	RD_ABORT_INT_MASK	H'FF	R/W	Abort Interrupt Mask. Prevents the Abort interrupt status field in the DMA read interrupt status register from asserting the intreq_pci*m*_dma_p. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. (*m* = 0, 1, 2, 3)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RD_DONE_INT_MASK	H'FF	R/W	Done Interrupt Mask. Prevents the Done interrupt status field in the DMA read interrupt status register from asserting the intreq_pci*m*_dma_p output. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. (*m* = 0, 1, 2, 3)

104.2.306 DMA Capabilities Registers 25 (DMACAP25)

Common to Header TYPE00/01

- DMA Read Interrupt Clear Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	RD_ABORT_INT_CLEAR							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RD_DONE_INT_CLEAR							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
23 to 16	RD_ABORT_INT_CLEAR	All 0	W	Abort Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Abort interrupt status field of the DMA read interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RD_DONE_INT_CLEAR	All 0	W	Done Interrupt Clear. You must write a 1'b1 to clear the corresponding bit in the Done interrupt status field of the DMA read interrupt status register. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Note: Reading from this self-clearing register field always returns a "0".

104.2.307 DMA Capabilities Registers 26 (DMACAP26)

Common to Header TYPE00/01

- DMA Read Error Status Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	LINK_LIST_ELEMENT_FETCH_ERR_DETECT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	APP_WR_ERR_DETECT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

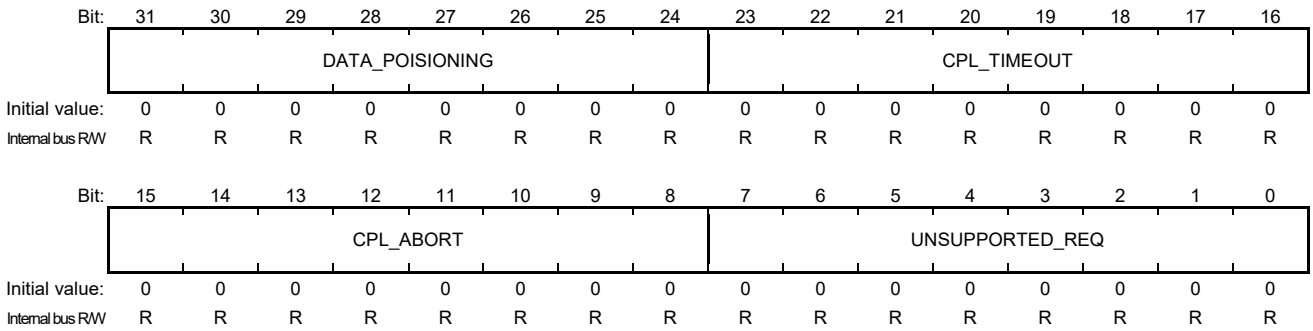
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LINK_LIST_ELEMENT_FETCH_ERR_DETECT	All 0	R	Linked List Element Fetch Error Detected. ■ The DMA read channel has received an error response from the AXI bus while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this clears all bits in this register, and also the DMA Capabilities Registers 27 (DMACAP27).

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	APP_WR_ERR_DETECT	All 0	R	Application Write Error Detected. The DMA read channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while writing data to it. This error is fatal. You must restart the transfer from the beginning, as the channel context is corrupted, and the transfer is not rolled back. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this clears all bits in this register, and also the DMA Capabilities Registers 27 (DMACAP27).

104.2.308 DMA Capabilities Registers 27 (DMACAP27)

Common to Header TYPE00/01

- DMA Read Error Status High Register



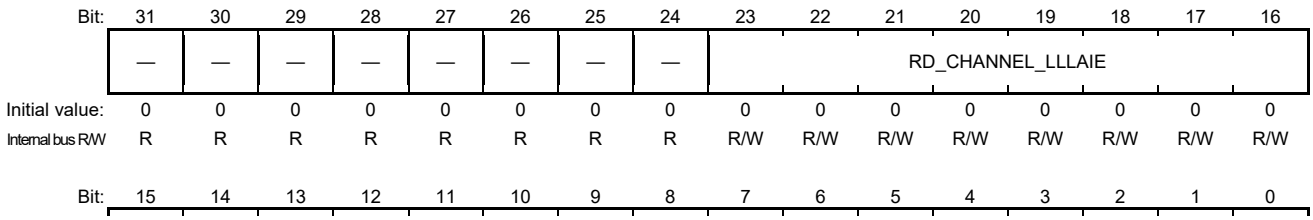
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	DATA_POISIONING	All 0	R	Data Poisoning. The DMA read channel has detected data poisoning in the completion from the remote device (in response to the MRd request). The DMA read channel will drop the completion and then be halted. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Capabilities Registers 26.

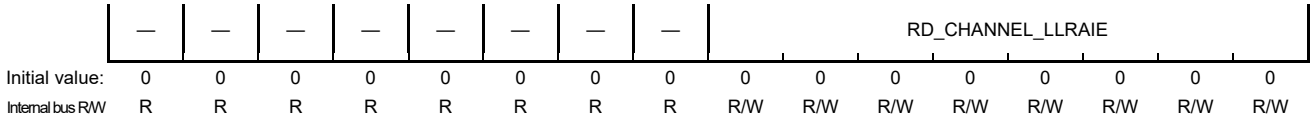
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
23 to 16	CPL_TIMEOUT	All 0	R	Completion Time Out. The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Capabilities Registers 26.
15 to 8	CPL_ABORT	All 0	R	Completer Abort. The DMA read channel has received a PCIe completer abort completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the " DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Capabilities Registers 26.
7 to 0	UNSUPPORTED_REQ	All 0	R	Unsupported Request. The DMA read channel has received a PCIe unsupported request completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. ■ Enabling: For details, see "Interrupts and Error Handling". ■ Masking: The DMA read interrupt Mask register has no effect on this register. ■ Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Capabilities Registers 25" (DMACAP25) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Capabilities Registers 26.

104.2.309 DMA Capabilities Registers 28 (DMACAP28)

Common to Header TYPE00/01

- DMA Read Linked List Error Enable Register



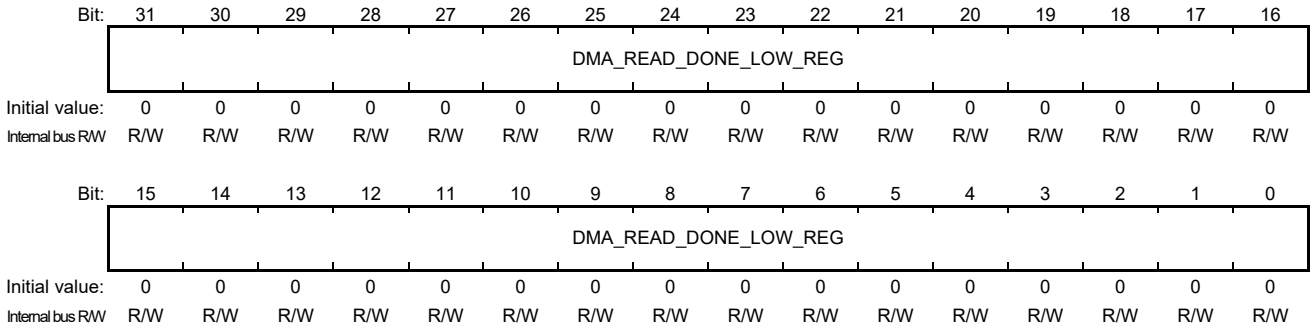


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	RD_CHANNEL_LLLAIE	All 0	R/W	Read Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the read channel Local Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling".
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RD_CHANNEL_LLRAIE	All 0	* R/W	Read Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the read channel Remote Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling".

104.2.310 DMA Capabilities Registers 29 (DMACAP29)

Common to Header TYPE00/01

- DMA Read Done IMWr Address Low Register

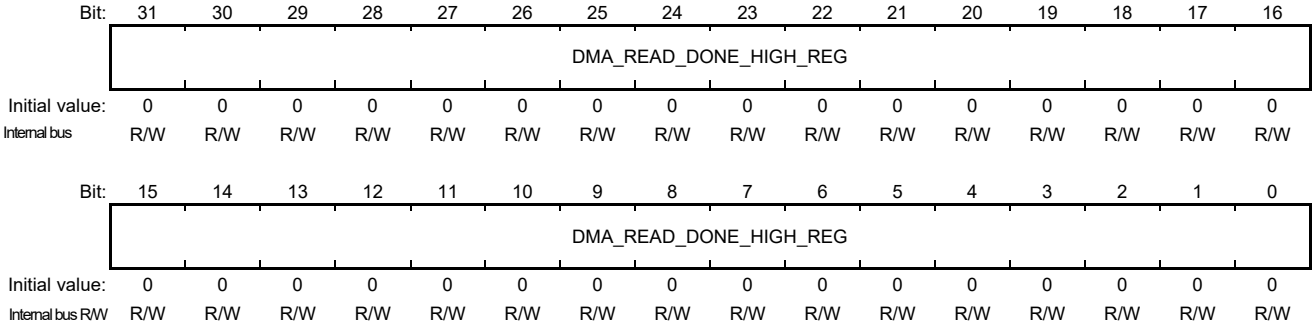


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_READ_DONE_LOW_REG	All 0	R/W	The DMA uses this field to generate bits [31:0] of the address field for the Done IMWr TLP. Bits [1:0] must be "00" as this address must be DWORD aligned.

104.2.311 DMA Capabilities Registers 30 (DMACAP30)

Common to Header TYPE00/01

- DMA Read Done IMWr Address High Register

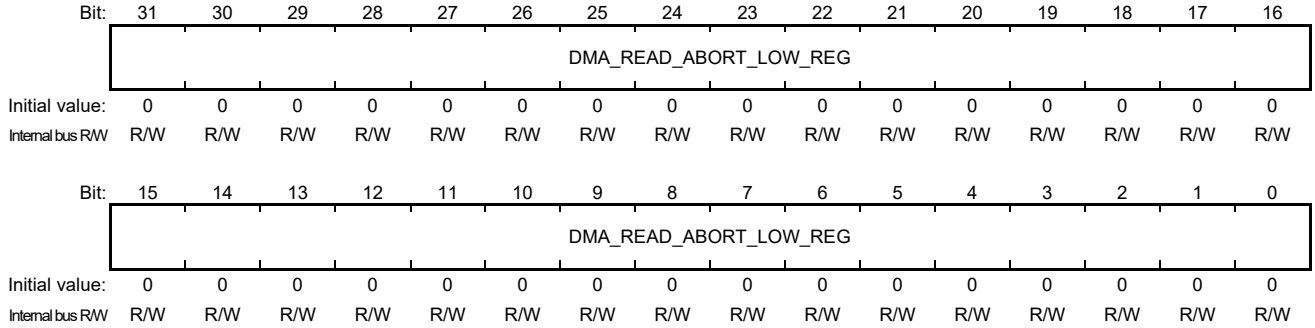


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_READ_DONE_HIGH_REG	All 0	R/W	The DMA uses this field to generate bits [63:32] of the address field for the Done IMWr TLP.

104.2.312 DMA Capabilities Registers 31 (DMACAP31)

Common to Header TYPE00/01

- DMA Read Abort IMWr Address Low Register

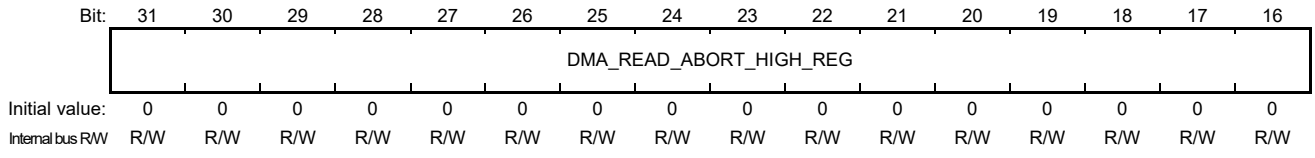


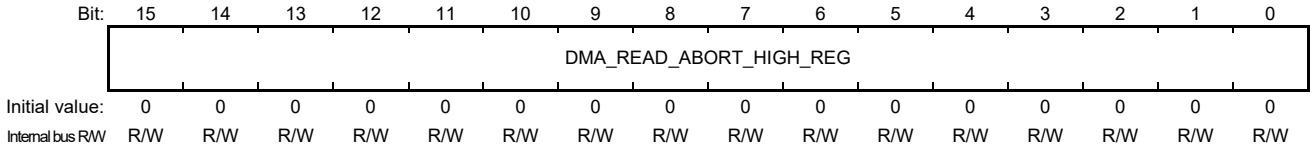
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_READ_ABORT_LOW_REG	All 0	R/W	The DMA uses this field to generate bits [31:0] of the address field for the Abort IMWr TLP. Bits [1:0] must be "00" as this address must be DWORD aligned.

104.2.313 DMA Capabilities Registers 32 (DMACAP32)

Common to Header TYPE00/01

- DMA Read Abort IMWr Address High Register



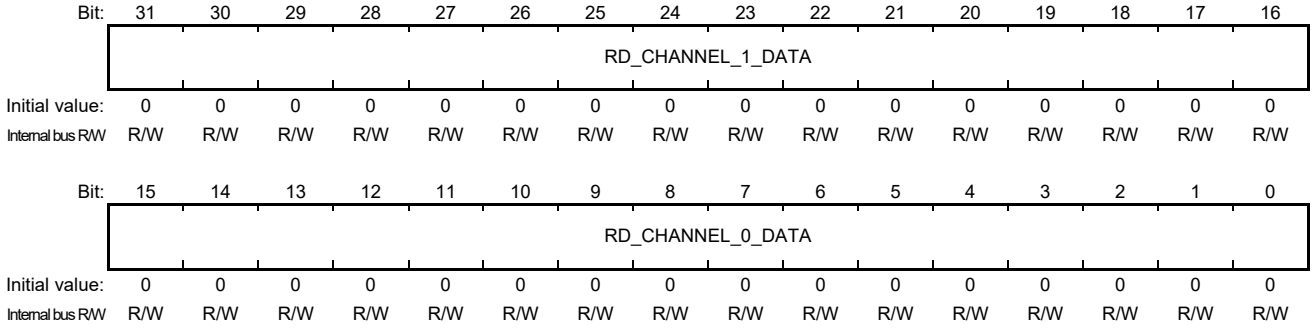


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_READ_ABORT_ HIGH_REG	All 0	R/W	The DMA uses this field to generate bits [63:32] of the address field for the Abort IMWr TLP.

104.2.314 DMA Capabilities Registers 33 (DMACAP33)

Common to Header TYPE00/01

- DMA Read Channel 1 and 0 IMWr Data Register

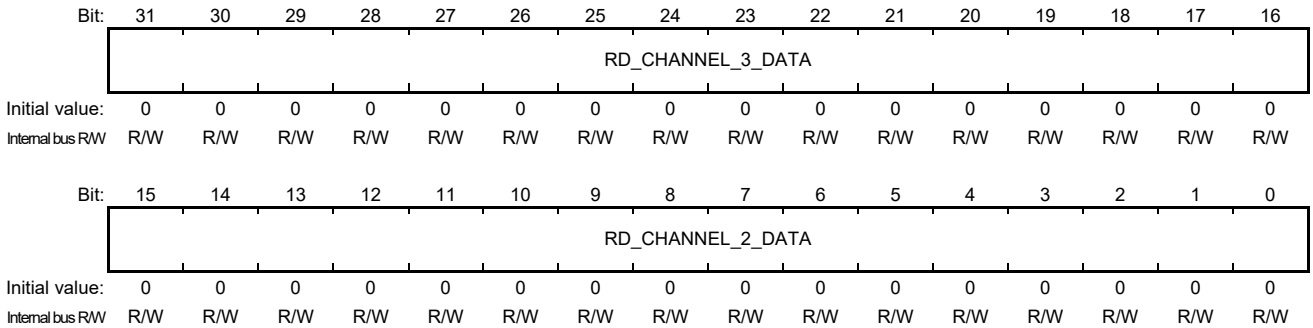


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	RD_CHANNEL_1_DAT A	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 1.
15 to 0	RD_CHANNEL_0_DAT A	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 0.

104.2.315 DMA Capabilities Registers 34 (DMACAP34)

Common to Header TYPE00/01

- DMA Read Channel 3 and 2 IMWr Data Register

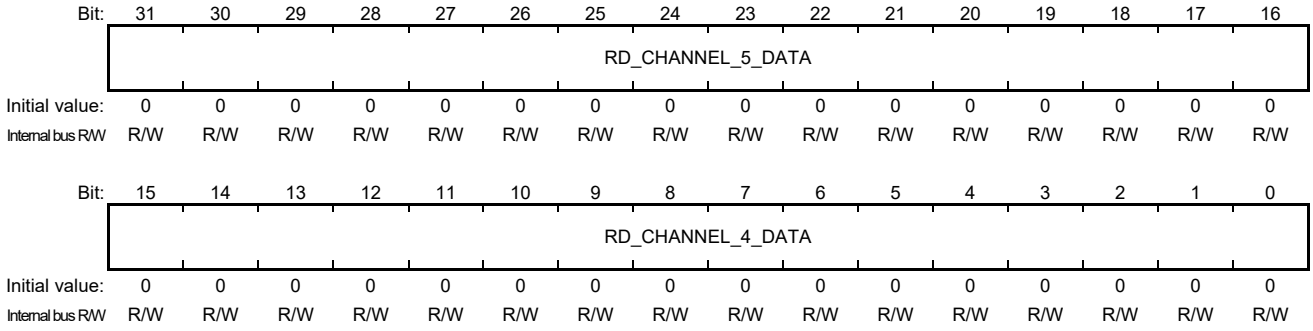


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	RD_CHANNEL_3_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 3.
15 to 0	RD_CHANNEL_2_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 2.

104.2.316 DMA Capabilities Registers 35 (DMACAP35)

Common to Header TYPE00/01

- DMA Read Channel 5 and 4 IMWr Data Register

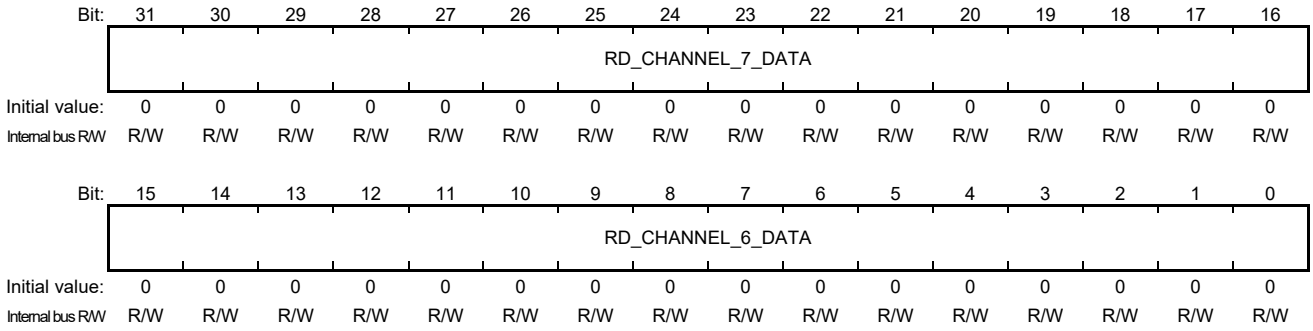


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	RD_CHANNEL_5_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 5.
15 to 0	RD_CHANNEL_4_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 4.

104.2.317 DMA Capabilities Registers 36 (DMACAP36)

Common to Header TYPE00/01

- DMA Read Channel 7 and 6 IMWr Data Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	RD_CHANNEL_7_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 7.
15 to 0	RD_CHANNEL_6_DATA	All 0	R/W	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 6.

104.2.318 DMA Capabilities Registers [37+*i**16] (DMACAP[37+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write Channel Control 1 Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Internal bus R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 30	DMA_AT	All 0	R/W	Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
29 to 27	DMA_TC	All 0	R/W	Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
26	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMA_RO	0	R/W	Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
24	DMA_NS_SRC	0	R/W	Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs.
23	DMA_NS_DST	0	R/W	Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs.
22	DMA_MEM_TYPE	0	R/W	Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: ■ 0x0:peripheral type ■ 0x1:memory type

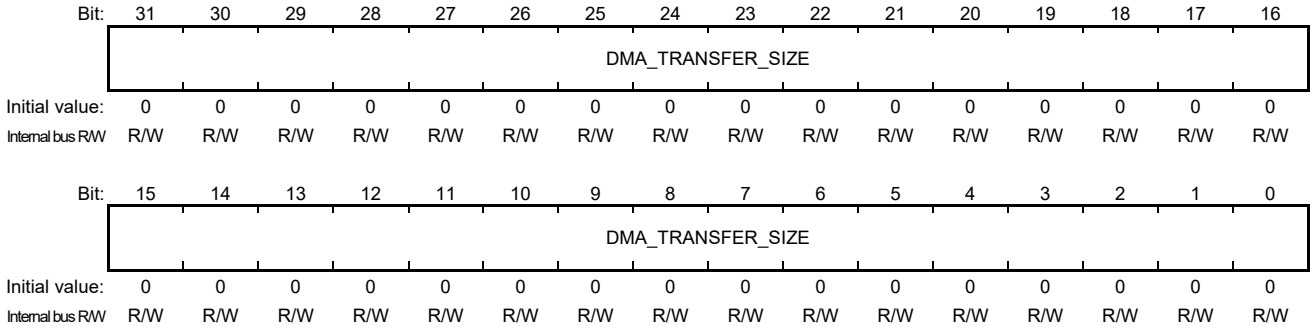
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
21 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16 to 12	DMA_FUNC_NUM	All 0	R/W	DMA Channel Physical Function Number. This field indicates the physical function associated with the DMA channel. The controller uses this field to form the requester ID of the generated MRd/MWr DMA TLPs.
11 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	LLE	0	R/W	Linked List Enable (LLE). ■ 0: Disable linked list operation ■ 1: Enable linked list operation
8	CCS	0	R/W	Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation.
7	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 5	CS	All 0	R	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: ■ 00: Reserved ■ 01: Running. This channel is active and transferring data. ■ 10: Halted. An error condition has been detected, and the DMA has stopped this channel. ■ 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Capabilities Registers 3" (DMACAP3) or "DMA Capabilities Registers 7" (DMACAP7).
4	RIE	0	R/W	Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element.
3	LIE	0	R/W	Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element.
2	LLP	0	R/W	Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (noncontiguous) element. The DMA loads this field with the LLP of the linked list element.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
1	TCB	0	R/W	Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element.
0	CB	0	R/W	Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element.

104.2.319 DMA Capabilities Registers [38+*i**16] (DMACAP[38+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write Transfer Size Register

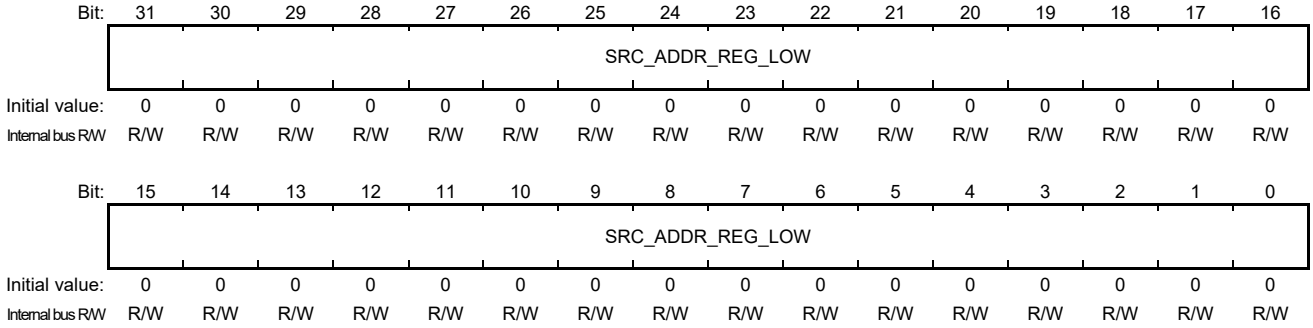


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_TRANSFER_SIZE	0	R/W	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes (linked list mode), or the transfer ends (non-linked list mode).

104.2.320 DMA Capabilities Registers [39+*i**16] (DMACAP[39+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write SAR Low Register

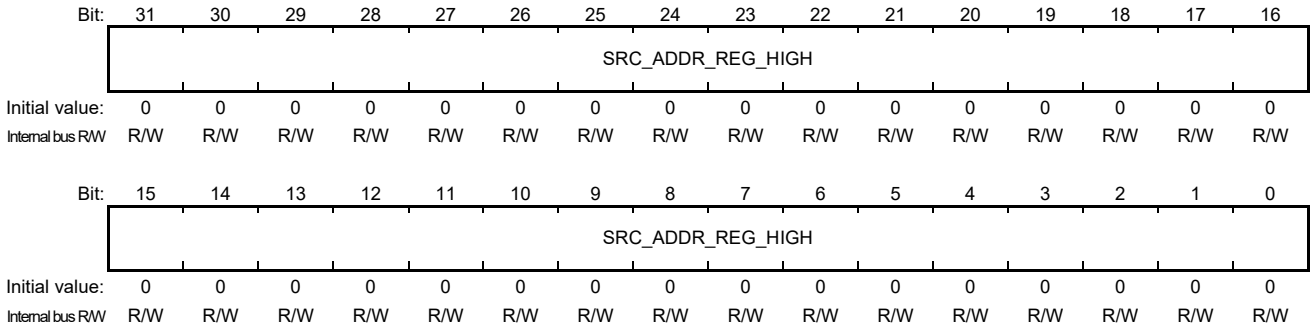


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	SRC_ADDR_REG_LOW	0	R/W	Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element. ■ DMA Read: The SAR is the address of the remote memory. ■ DMA Write: The SAR is the address of the local memory.

104.2.321 DMA Capabilities Registers [40+*i**16] (DMACAP[40+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write SAR High Register

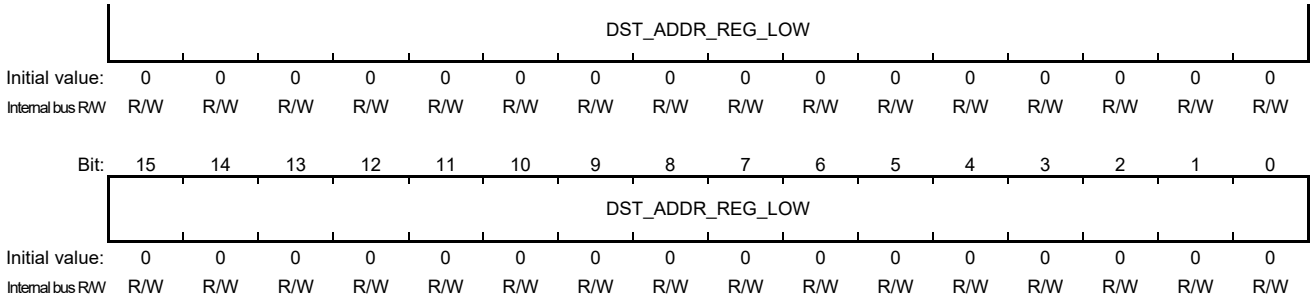


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	SRC_ADDR_REG_HIGH	All 0	R/W	Source Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element.

104.2.322 DMA Capabilities Registers [41+*i**16] (DMACAP[41+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write DAR Low Register

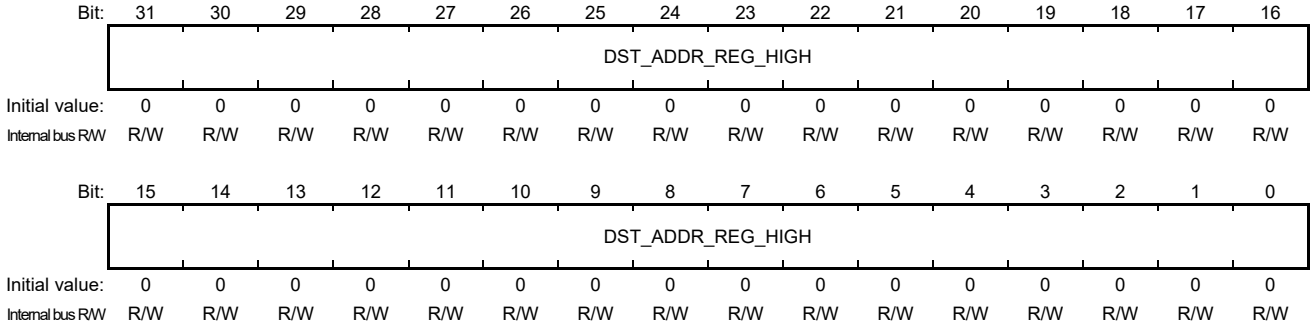


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DST_ADDR_REG_LOW	All 0	R/W	Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. ■ DMA Read: The DAR is the address of the local memory. ■ DMA Write: The DAR is the address of the remote memory.

104.2.323 DMA Capabilities Registers [42+*i**16] (DMACAP[42+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write DAR High Register

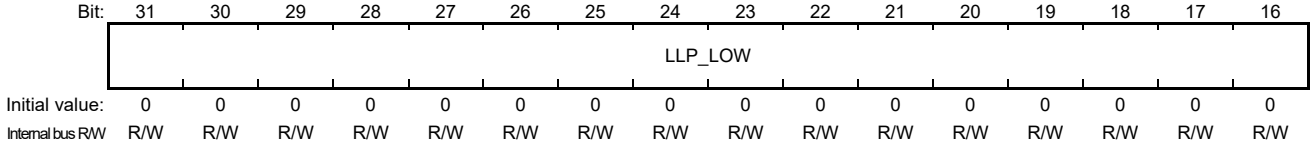


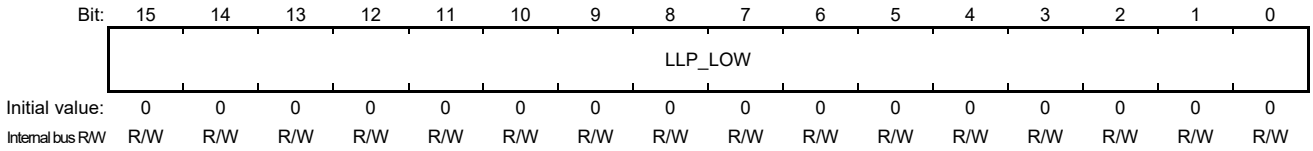
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DST_ADDR_REG_HIGH	All 0	R/W	Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element.

104.2.324 DMA Capabilities Registers [43+*i**16] (DMACAP[43+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write Linked List Pointer Low Register



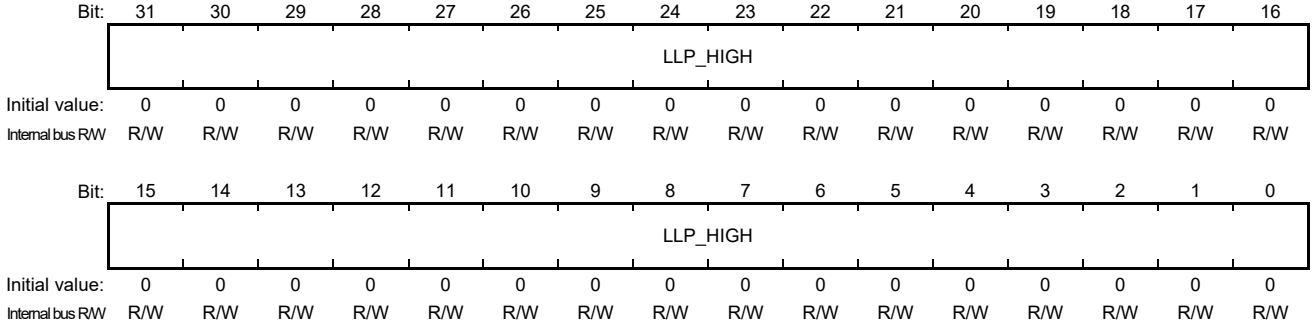


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	LLP_LOW	All 0	R/W	Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. ■ When the current element is a data element; this field is incremented by 6 DWORDS. ■ When the current element is a link element; this field is overwritten by the LL Element Pointer of the element.

104.2.325 DMA Capabilities Registers [44+*i**16] (DMACAP[44+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Write Linked List Pointer High Register

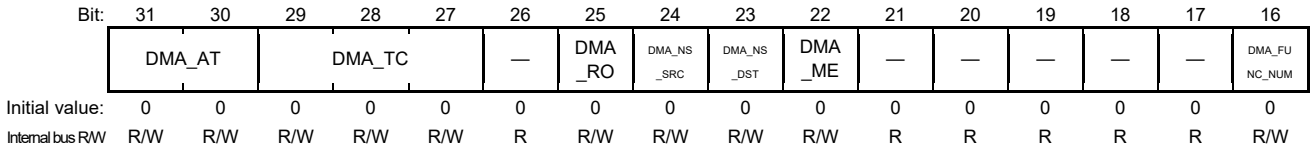


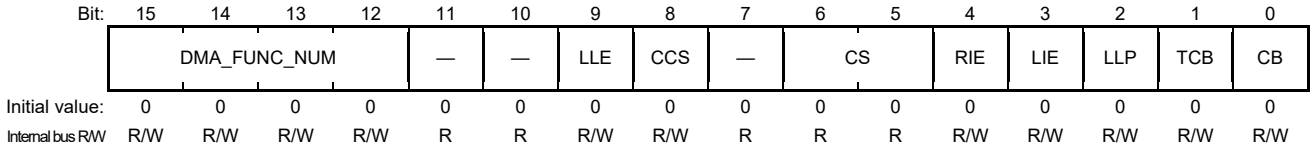
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	LLP_HIGH	All 0	R/W	Upper 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed.

104.2.326 DMA Capabilities Registers [45+*i**16] (DMACAP[45+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read Channel Control 1 Register





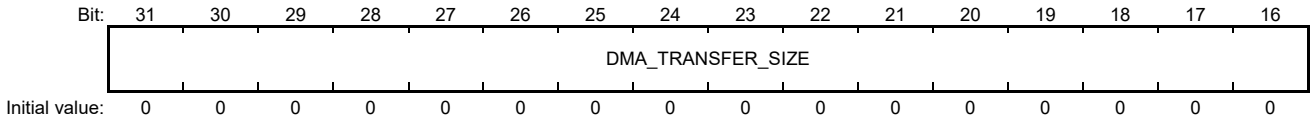
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 30	DMA_AT	All 0	R/W	Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
29 to 27	DMA_TC	All 0	R/W	Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
26	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMA_RO	0	R/W	Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs.
24	DMA_NS_SRC	0	R/W	Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs.
23	DMA_NS_DST	0	R/W	Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs.
22	DMA_MEM_TYPE	0	R/W	Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: ■ 0x0:peripheral type ■ 0x1:memory type
21 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16 to 12	DMA_FUNC_NUM	All 0	R/W	DMA Channel Physical Function Number. This field indicates the physical function associated with the DMA channel. The controller uses this field to form the requester ID of the generated MRd/MWr DMA TLPs.
11 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	LLE	0	R/W	Linked List Enable (LLE). ■ 0: Disable linked list operation ■ 1: Enable linked list operation
8	CCS	0	R/W	Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation.
7	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

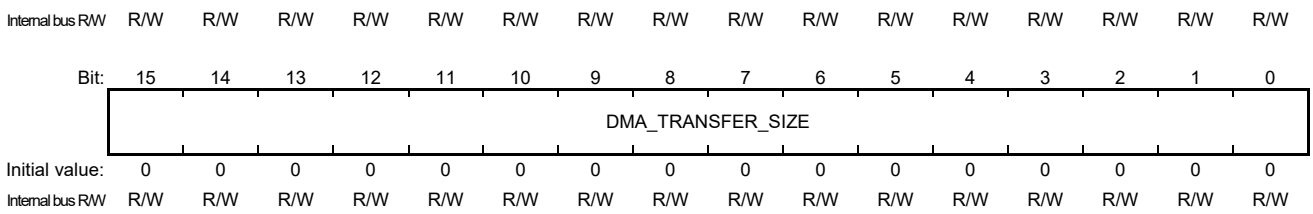
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
6 to 5	CS	0	R	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: ■ 00: Reserved ■ 01: Running. This channel is active and transferring data. ■ 10: Halted. An error condition has been detected, and the DMA has stopped this channel. ■ 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Capabilities Registers 3" (DMACAP3) or "DMA Capabilities Registers 7" (DMACAP7).
4	RIE	0	R/W	Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element.
3	LIE	0	R/W	Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element.
2	LLP	0	R/W	Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer DWORDs are pointing to the next (noncontiguous) element. The DMA loads this field with the LLP of the linked list element.
1	TCB	0	R/W	Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element.
0	CB	0	R/W	Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element.

104.2.327 DMA Capabilities Registers [46+*i**16] (DMACAP[46+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read Transfer Size Register



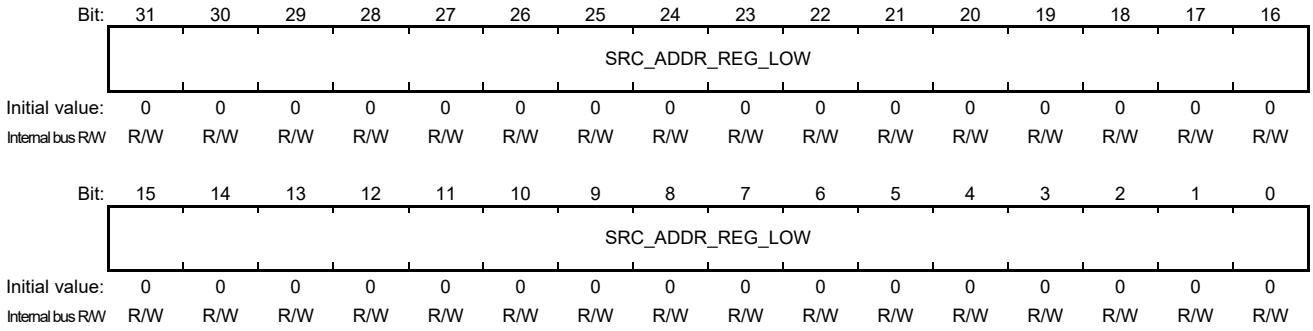


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DMA_TRANSFER_SIZE	All 0	R/W	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding DWORD of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes (linked list mode), or the transfer ends (non-linked list mode).

104.2.328 DMA Capabilities Registers [47+*i**16] (DMACAP[47+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read SAR Low Register



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	SRC_ADDR_REG_LOW	All 0	R/W	Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element. ■ DMA Read: The SAR is the address of the remote memory. ■ DMA Read: The SAR is the address of the local memory.

104.2.329 DMA Capabilities Registers [48+*i**16] (DMACAP[48+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read DAR Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRC_ADDR_REG_HIGH

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	SRC_ADDR_REG_HIGH	All 0	R/W	Source Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element.

104.2.330 DMA Capabilities Registers [49+*i**16] (DMACAP[49+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read DAR Low Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DST_ADDR_REG_LOW															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DST_ADDR_REG_LOW															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

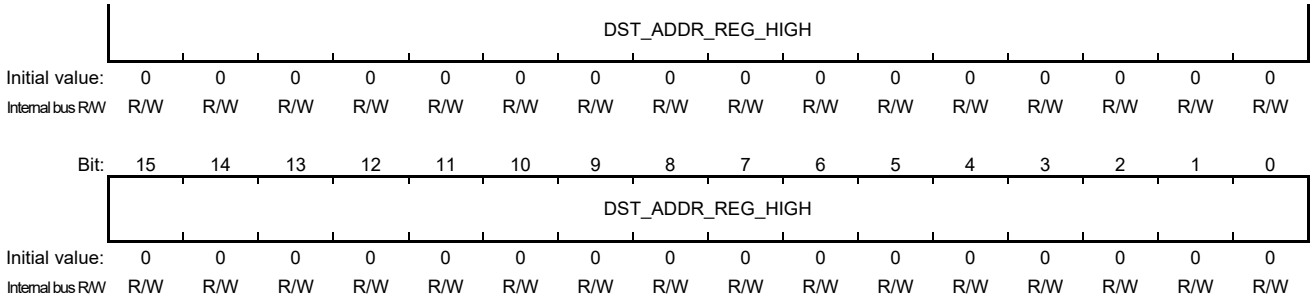
Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DST_ADDR_REG_LOW	All 0	R/W	Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element. ■ DMA Read: The DAR is the address of the local memory. ■ DMA Read: The DAR is the address of the remote memory.

104.2.331 DMA Capabilities Registers [50+*i**16] (DMACAP[50+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read DAR High Register

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

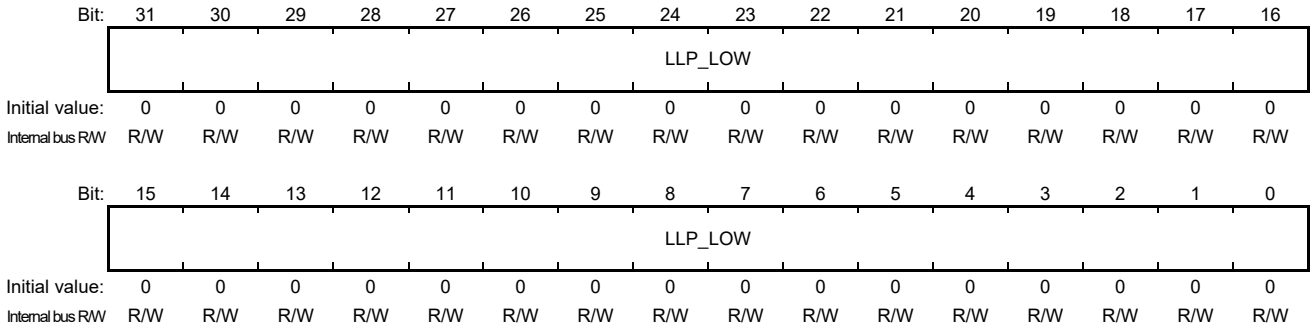


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	DST_ADDR_REG_HIGH	All 0	R/W	Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding DWORD of the LL element.

104.2.332 DMA Capabilities Registers [51+*i**16] (DMACAP[51+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read Linked List Pointer Low Register

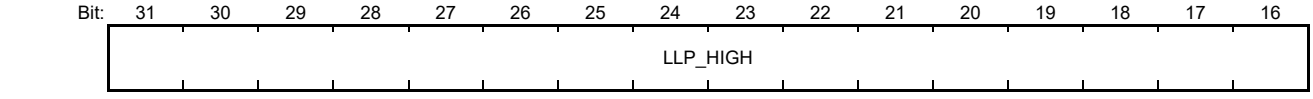


Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	LLP_LOW	All 0	R/W	Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. ■ When the current element is a data element; this field is incremented by 6 DWORDS. ■ When the current element is a link element; this field is overwritten by the LL Element Pointer of the element.

104.2.333 DMA Capabilities Registers [52+*i**16] (DMACAP[52+*i**16]) (*i* = 0 to 7)

Common to Header TYPE00/01

- DMA Read Linked List Pointer High Register



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	ELBI_MODE		app_ sris_	device_type				BFRCTNST	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 9	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
8 to 7	ELBI_MODE	H'0	R/W	Handshake between lbc_ext_cs and ext_lbc_ack 0: return an error response (per bit) 1: do not return an error response (per bit)
6	app_sris_mode	H'0	R/W	SRIS operating mode. 0: non-SRIS mode 1: SRIS mode

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
5 to 2	device_type	H'0	R/W	Device/port type. Indicates the specific type of this PCI Express function. It is also used to set the 'Device/Port Type' field of the 'PCI Express Capabilities Register'. The controller uses this input to determine the operating mode of the controller at run time. 4'b0000: PCI Express endpoint 4'b0001: Legacy PCI Express endpoint 4'b0100: Root port of PCI Express root complex Others: Setting prohibited Note: Set device_type before deasserting software reset by CPG SRSTCLR6[24].
1 to 0	BFRCTNST	H'0	R/W	Bifurcation mode setting. 00: 1x Quad lane mode (Bifurcation off) 01: 2x Dual lanes mode (Bifurcation on) Others: Setting prohibited

104.2.335 PCIe Mode Setting Register 1 (PCIEMSR1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	tx_lane_flip_en	rx_lane_flip_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1	tx_lane_flip_en	H'0	R/W	Performs manual lane reversal for transmit lanes. For use when automatic lane reversal does not occur because lane 0 is not detected. In most cases, tx_lane_flip_en should be wired to a static value at the chip level. For more details, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_tx_lane_flip_en is used.
0	rx_lane_flip_en	H'0	R/W	Performs manual lane reversal for receive lanes. For use when automatic lane reversal does not occur because lane 0 is not detected. In most cases, rx_lane_flip_en should be wired to a static value at the chip level. For more details, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_rx_lane_flip_en is used.

104.2.336 PCIe Mode Setting Register 2 (PCIEMSR2)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_dbi_ro_wr_dis	app_req_retry_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1	app_dbi_ro_wr_disable	H'0	R/W	DBI Read-only Write Disable. 0: PRTLGC58.DBI_RO_WR_EN register field is read-write 1: PRTLGC58.DBI_RO_WR_EN register field is forced to 0 and is read-only.
0	app_req_retry_en	H'0	R/W	Provides a capability to defer incoming configuration requests until initialization is complete. When app_req_retry_en is asserted, the controller completes incoming configuration requests with a configuration request retry status. Other incoming requests complete normally. When the Readiness Notification mechanism is supported, DRS messaging is blocked when app_req_retry_en=1. When app_req_retry_en=0 and app_drs_ready=1, the controller autonomously transmits a DRS message when the link transitions from DL_Down to DL_Up.

104.2.337 PCIe Mode Setting Register 3 (PCIEMSR3)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	APB2DBITOSET															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APB2DBITOSET															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	APB2DBITOSET	All 0	R/W	APB2DBI timeout setting

104.2.338 PCIe Reset Control Register 0 (PCIERSTCTRL0)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	refclk_share_prop_en	—	—	—	—	—	—	—	perst_n
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	refclk_share	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 25	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
24	refclk_share_prop_en	H'0	R/W	pcie_clkreq_dis_in propagation enable. 0: Disable 1: Enable
23 to 17	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
16	perst_n	H'1	R/W	Indicates when the main power supply is within its tolerated voltage range and is stable. This signal is syncronized using aux_clk and can be driven/supplied asynchronously to the controller in certain low-power modes
15 to 9	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
8	refclk_share	H'0	R/W	Reference clock share bit. When shared, previous CLKREQ# is invalid 0: Not Shared 1: Shared
7 to 0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.339 PCIe Reset Control Register 1 (PCIERSTCTRL1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_hold_phy_rst

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_ltssm_enable
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 17	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
16	app_hold_phy_rst	H'1	R/W	Set this signal to 1 during the power on reset sequence to hold the PHY in reset while the PHY is configured through the PHY viewport.
15 to 1	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
0	app_ltssm_enable	H'0	R/W	To do otherwise (that is, de-assert it outside of the Detect LTSSM state) causes the controller to be reset and the LTSSM moves immediately back to the Detect state. This transition is outside of the PCIe Specification and it might cause a PIPE protocol violation.

104.2.340 PCIe Reset Control Register 2 (PCIERSTCTRL2)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_init_rst
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 1	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
0	app_init_rst	H'0	R/W	Request from your application to send a hot reset to the upstream port. The hot reset request is sent when a single cycle pulse is applied to this pin. In an upstream port, you should set this input to '0'. Note: This signal is not used by the controller to set the SBR field in the PCICONF15F*i* register. During the transition from DL_Active to DL_inactive, assertion of app_init_rst signal indicates a Surprise Down Error, but setting of SBR field in the PCICONF15F*i* register through DBI does not trigger a Surprise Down Error.

104.2.341 PCIe Reset Control Register 3 (PCIERSTCTRL3)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_flr_pf_done	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1 to 0	app_flr_pf_done	H'0	R/W	Assert 1 when your application has stopped / reset the PFx application to initiate FLR of PFx. After PCIERSTSTS.cfg_flr_pf_active is cleared, this bit is automatically cleared to 0. Note : After writting 1 during the PCIERSTSTS.cfg_flr_pf_active =1, do not write "0" until it changes to "0" by the automatic clear.

104.2.342 PCIe Reset Status Register (PCIERSTSTS)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	cfg_flr_pf_active		training_rst_n	smlh_req_rst_not	link_req_rst_not	cfg_2nd_reset
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 6	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
5 to 4	cfg_flr_pf_active	H'0	R	Set when the software initiates FLR a physical function by writing to the "Initiate FLR" register bit of that function. This signal is held asserted until reset of both the application and controller logic has been completed.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
3	training_rst_n	H'0	R	Hot reset from upstream component. When the controller LTSSM receives two consecutive TS1 ordered sets with the hot_reset bit asserted, it asserts training_rst_n for one clock cycle. This signal is only kept for legacy purposes. You should use the link_req_rst_not signal to reset the controller after a 'hot reset' request.
2	smlh_req_rst_not	H'0	R	Early version of the link_req_rst_not signal. A low level indicates that the controller is requesting external logic to reset the controller because the PHY link is down. When the AXI bridge module is enabled the link reset request is delayed until all pending AXI transfers have completed. When the AXI Bridge module is not enabled the link reset request is sent immediately.
1	link_req_rst_not	H'0	R	Reset request because the link has gone down or the controller received a hot-reset request. A low level indicates that the controller is requesting external logic to reset the controller because the PHY link is down. When the AXI bridge module is enabled the link reset request is delayed until all pending AXI transfers have completed. When the AXI Bridge module is not enabled the link reset request is sent immediately.
0	cfg_2nd_reset	H'0	R	Secondary Bus Reset. Indicates that your application has requested this downstream port to start Link hot reset. This signal is asserted when your application writes to the Secondary Bus Reset field (bit 6) of the Bridge Control Register (Offset 0x3E) in the Type 1 Configuration Space header. Setting this bit triggers a hot reset the corresponding PCI Express port.

104.2.343 MSI Control Register 0 (MSICTRL0)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

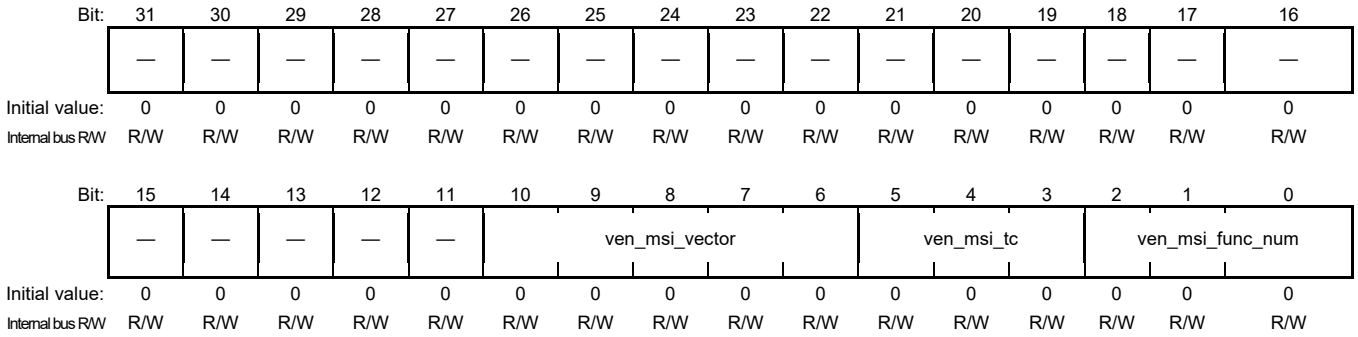
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ven_msi_req
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 1	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	ven_msi_req	H'0	R/W	Request from your application to send an MSI when MSI is enabled. When MSI-X is enabled instead of MSI, assertion of ven_msi_req causes the controller to generate an MSI-X message. Once asserted, ven_msi_req must remain asserted until the controller asserts ven_msi_grant.

104.2.344 MSI Control Register 1 (MSICTRL1)

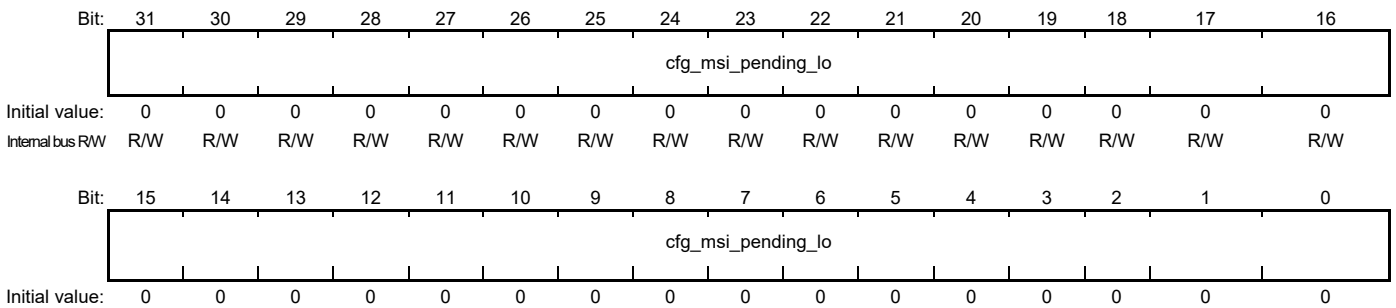
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 11	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
10 to 6	ven_msi_vector	H'0	R/W	Used to modulate the lower five bits of the MSI Data register when multiple message mode is enabled.
5 to 3	ven_msi_tc	H'0	R/W	Traffic Class of the MSI request, valid when ven_msi_req is asserted
2 to 0	ven_msi_func_num	H'0	R/W	The function number of the MSI request. Function numbering starts at '0'.

104.2.345 MSI Control Register 2 (MSICTRL2)

Common to Header TYPE00/01



Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	cfg_msi_pending_lo	All 0	R/W	Lower bits [31:0]. Indication from application about which functions have a pending associated message. Used to determine the value of the Vector Interrupt Pending register in the MSI Capability structure.

104.2.346 MSI Control Register 3 (MSICTRL3)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	cfg_msi_pending_hi															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	cfg_msi_pending_hi															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	cfg_msi_pending_hi	All 0	R/W	Upper bits [63:32]. Indication from application about which functions have a pending associated message Used to determine the value of the Vector Interrupt Pending register in the MSI Capability structure.

104.2.347 MSI Control Register 4 (MSICTRL4)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	cfg_msi_en		msi_ctrl_int_vec							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ven_m
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 26	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
25 to 24	cfg_msi_en	H'0	R	Indicates that MSI is enabled (INTx message is not sent), one bit per configured function.
23 to 16	msi_ctrl_int_vec	H'0	R	DSP AXI MSI Interrupt Vector. Asserted when an MSI interrupt is pending. De-asserted when there is no MSI interrupt pending.
15 to 1	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
0	ven_msi_grant	H'0	R	Indicates that the controller has accepted the request to send an MSI. After asserting ven_msi_grant for one cycle, the controller does not wait for ven_msi_req to be de-asserted then reasserted to generate another MSI. When ven_msi_req remains asserted after the controller asserts ven_msi_grant for one cycle, the controller generates another MSI.

104.2.348 MSI Control Register 5 (MSICTRL5)

Common to Header TYPE00/01

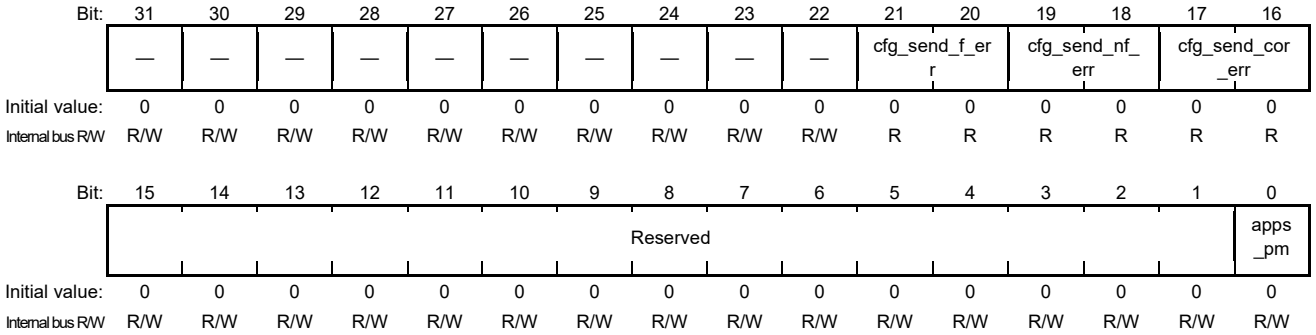
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	msi_ctrl_io															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	msi_ctrl_io															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	msi_ctrl_io	All 0	R	DSP AXI iMRM: Integrated MSI Reception Module GPIO. General purpose IO driven by the MSI interrupt controller GPIO register

104.2.349 PCIe Message Transmission (PCIEMSGTX)

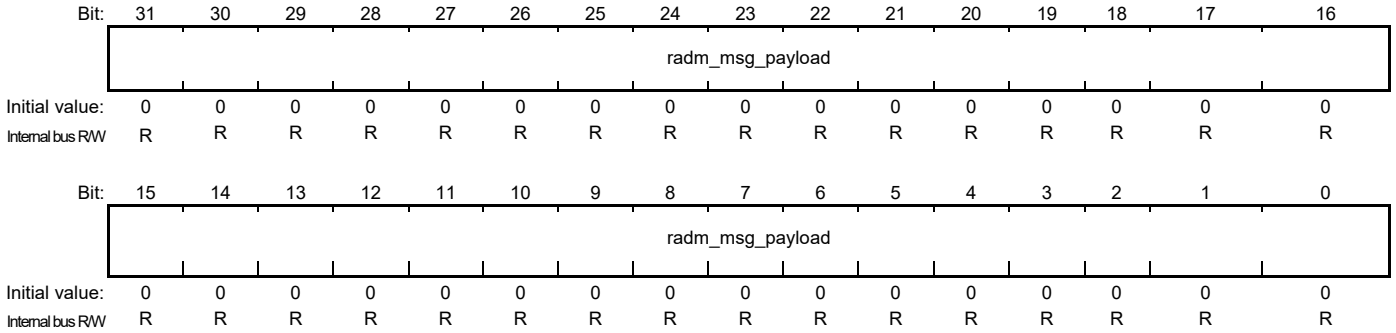
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 22	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
21 to 20	cfg_send_f_err	H'0	R	Sent Fatal Error. Core has sent a message towards the Root Complex indicating that an Rx TLP that contained a fatal error, and that cannot be corrected, was received by the EndPoint
19 to 18	cfg_send_nf_err	H'0	R	Sent Non-Fatal Error. Core has sent a message towards the Root Complex indicating that an Rx TLP that contained an non-fatal error, and that cannot be corrected, was received by the EndPoint
17 to 16	cfg_send_cor_err	H'0	R	Sent Correctable Error. Core has sent a message towards the Root Complex indicating that an Rx TLP that contained an error, and that can be corrected, was received by the EndPoint
15 to 1	Reserved	H'0	R/W	These bits are read as 0. The write value must be 0.
0	apps_pm_xmt_turnoff	H'0	R/W	Request from your application to generate a PM_Turn_Off message. You must assert this signal for one clock cycle. The controller does not return an acknowledgment or grant signal. You must not pulse the same signal again, until the previous message has been transmitted.

104.2.350 PCIe Message Reception 0 (PCIEMSGRX0)

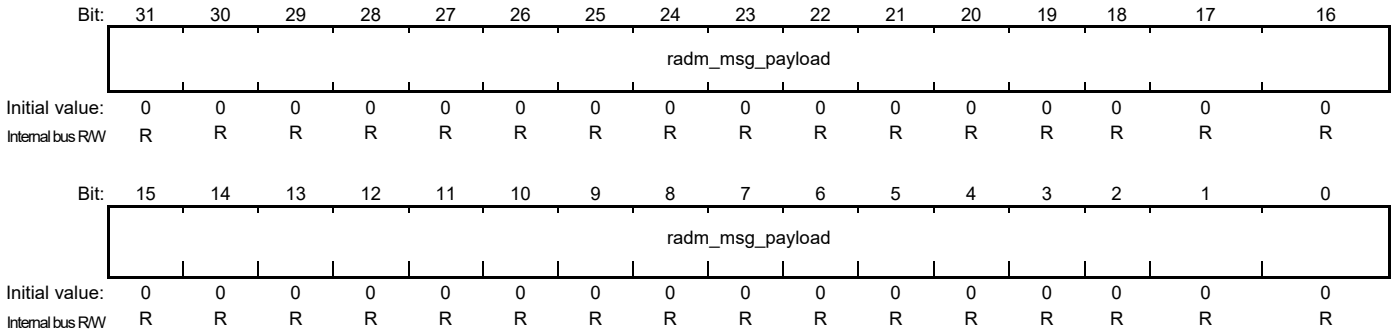
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	radm_msg_payload	All 0	R	Lower bits [31:0]. Received message header information. When a vendor-defined or ltr message is received (radm_vendor_msg=1 or radm_ltr_msg=1), the controller maps radm_msg_payload to the Rx TLP header dwords as follows: ■ [31:0] = bytes 12-15 (4th dword), where [7:0] =byte 15 ■ [63:32] = bytes 8-11 (3rd dword) When any other type of message is received, the controller maps radm_msg_payload to the Rx TLP header dwords as follows: ■ [31:0] = DW Data of Message ■ [63:32] = '0'

104.2.351 PCIe Message Reception 1 (PCIEMSGRX1)

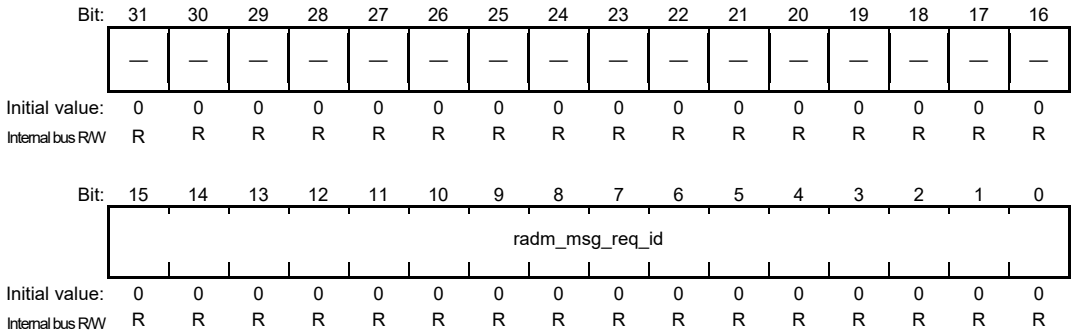
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	radm_msg_payload	All 0	R	Upper bits [63:32]. Received message header information.Received message header information. When a vendor-defined or ltr message is received (radm_vendor_msg=1 or radm_ltr_msg=1), the controller maps radm_msg_payload to the Rx TLP header dwords as follows: ■ [31:0] = bytes 12-15 (4th dword), where [7:0] =byte 15 ■ [63:32] = bytes 8-11 (3rd dword) When any other type of message is received, the controller maps radm_msg_payload to the Rx TLP header dwords as follows: ■ [31:0] = DW Data of Message ■ [63:32] = '0'

104.2.352 PCIe Message Reception 2 (PCIEMSGRX2)

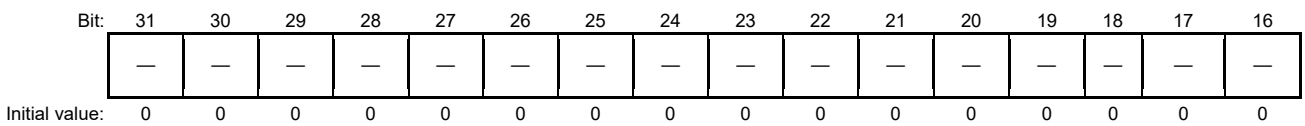
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
15 to 0	radm_msg_req_id	H'0	R	The requester ID of the received Message. ■ [15:8]: Bus number ■ [7:3]: Device number ■ [2:0]: Function number

104.2.353 PCIe Message Reception Status (PCIEMSGRCPSTS)

Common to Header TYPE00/01



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	radm_msg	radm_ven	radm_pm	radm_pm	radm_pm	radm_fatal	radm_	radm_correc	radm_ms
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 9	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
8	radm_msg_unlock	H'0	R	Indicates that the controller received an Unlock message. When two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message.
7	radm_vendor_msg	H'0	R	Indicates the controller received a vendor-defined message. The controller makes the message header available the radm_msg_payload output. When FX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then both bits are asserted.
6	radm_pm_turnoff	H'0	R	Indicates that the controller received a PME Turnoff message. When two messages of the same type are received in the same clock cycle (back-to-back), then no indication is given for the second message.
5	radm_pm_to_ack	H'0	R	Indicates that the controller received a PME_TO_Ack message. Upstream port: Reserved.
4	radm_pm_pme	H'0	R	Indicates that the controller received a PM_PME message
3	radm_fatal_err	H'0	R	Indicates that the controller received an ERR_FATAL message
2	radm_nonfatal_err	H'0	R	Indicates that the controller received an ERR_NONFATAL message
1	radm_correctable_err	H'0	R	Indicates that the controller received an ERR_COR message. The controller makes the message header available the radm_msg_payload output.
0	radm_msg_ltr	H'0	R	Indicates that the controller received an LTR message. The controller makes the message header available the radm_msg_payload output. It is also available the app_ltr_latency output. When two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message.

104.2.354 PCIe LTR Message Control 0 (PCIELTRMSGCTRL0)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	app_ltr	app_ltr_msg_func_num			app_ltr_msg_req
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 5	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
4	app_ltr_msg_grant	H'0	R	Indicates that the controller has accepted your request to send an LTR message.
3 to 1	app_ltr_msg_func_num	H'0	R/W	Function number in your application that is requesting to send an LTR message. Function numbering starts at '0'.
0	app_ltr_msg_req	H'0	R/W	Indicates that your application is requesting to send an LTR message. Once asserted, app_ltr_msg_req must remain asserted until the controller asserts app_ltr_msg_grant

104.2.355 PCIe LTR Message Control 1 (PCIELTRMSGCTRL1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	app_ltr_msg_latency															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	app_ltr_msg_latency															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	app_ltr_msg_latency	All 0	R/W	LTR message that your application is requesting to send. The message format is defined in the PCI Express Specification.

104.2.356 PCIe PTM Control (PCIEPTMCTRL)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ptm_man	ptm_auto_update_sign
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1	ptm_manual_update_pulse	H'0	R/W	Indicates that the controller should update the PTM Requester Context and Clock now.
0	ptm_auto_update_signal	H'0	R/W	Indicates that the controller should update the PTM Requester Context and Clock automatically every 10ms.

104.2.357 PCIe PTM Status 0 (PCIEPTMSTS0)

Common to Header TYPE00/01

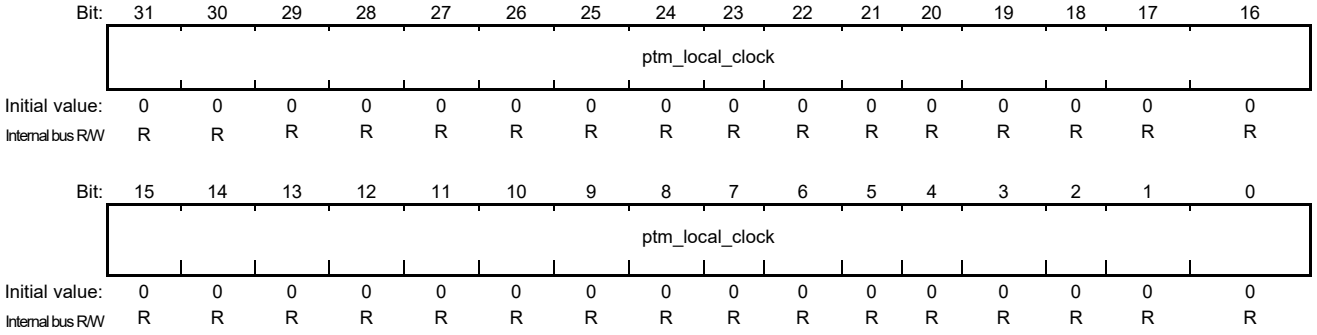
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ptm_req_replay_tx	ptm_req_dup_rx	ptm_req_response_timeout	—	—	ptm_updating	ptm_trigger_allowed	—	ptm_clock_updated	ptm_responder_rdy_to_validate	ptm_context_valid
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 11	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
10	ptm_req_replay_tx	H'0	R	PTM Requester Replay Sent.
9	ptm_req_dup_rx	H'0	R	PTM Requester Duplicate Received.
8	ptm_req_response_timeout	H'0	R	PTM Requester Response Timeout.
7 to 6	Reserved	All 0	R	These bits are read as 0. The write value is ignored.
5	ptm_updating	H'0	R	Indicates that a PTM update is in progress
4	ptm_trigger_allowed	H'0	R	Indicates that a PTM Requester manual update trigger is allowed
3	Reserved	H'0	R	These bits are read as 0. The write value is ignored.
2	ptm_clock_updated	H'0	R	Indicates that the controller has updated the Local Clock.
1	ptm_responder_rdy_to_validate	H'0	R	PTM Responder Ready to Validate.
0	ptm_context_valid	H'0	R	Context Valid

104.2.358 PCIe PTM Status 1 (PCIEPTMSTS1)

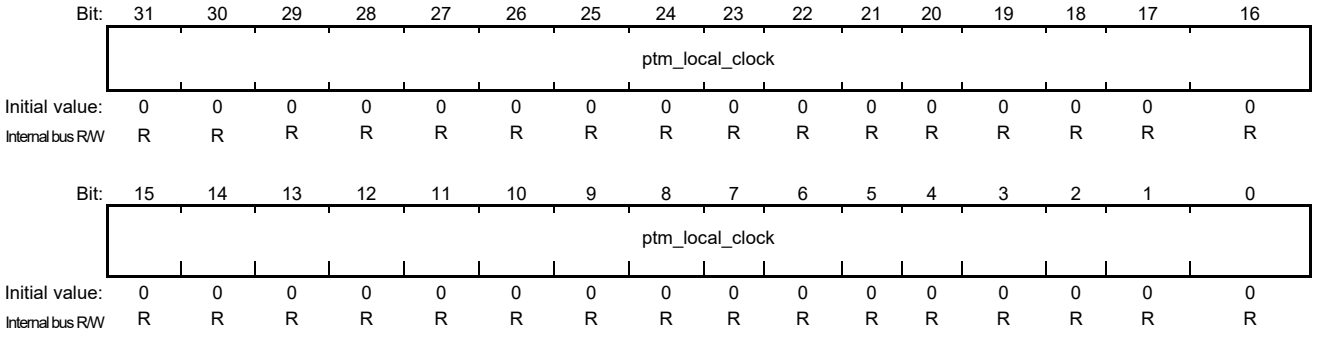
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	ptm_local_clock	All 0	R	Lower bits [31:0] Local Clock value

104.2.359 PCIe PTM Status 2 (PCIEPTMSTS2)

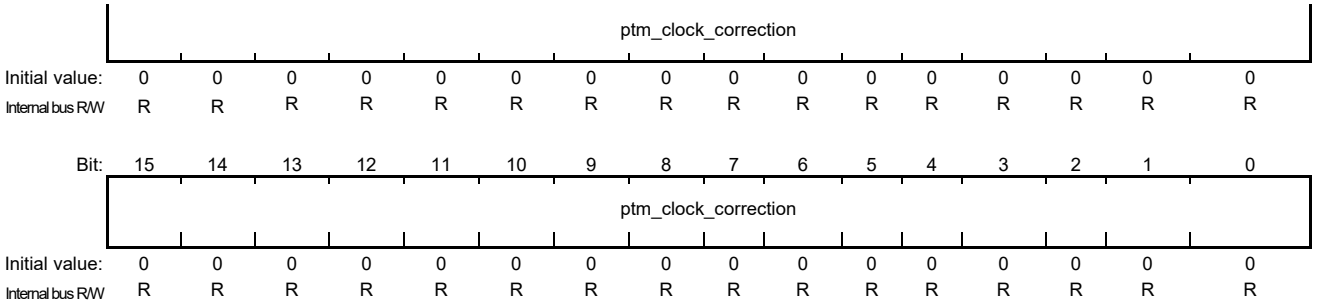
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	ptm_local_clock	All 0	R	Upper bits [63:32] Local Clock value

104.2.360 PCIe PTM Status 3 (PCIEPTMSTS3)

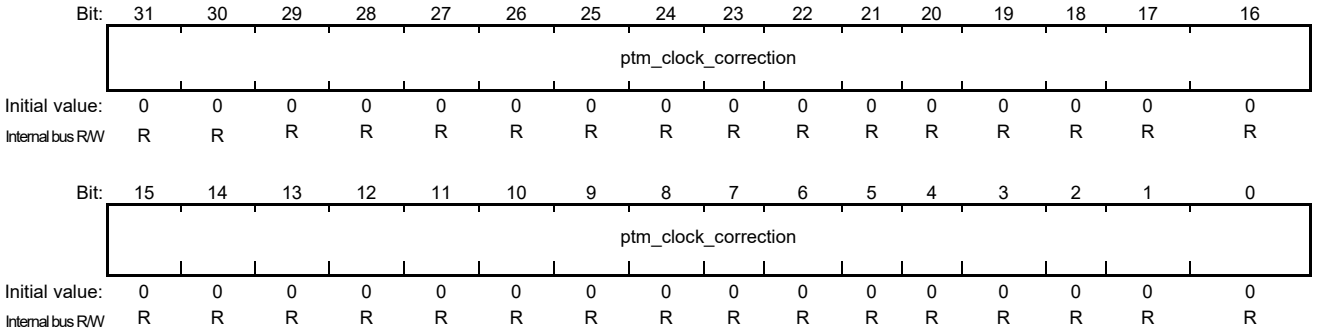
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	ptm_clock_correction	All 0	R	Lower bits [31:0] Amount by which Local Clock has been corrected.

104.2.361 PCIe PTM Status 4 (PCIEPTMSTS4)

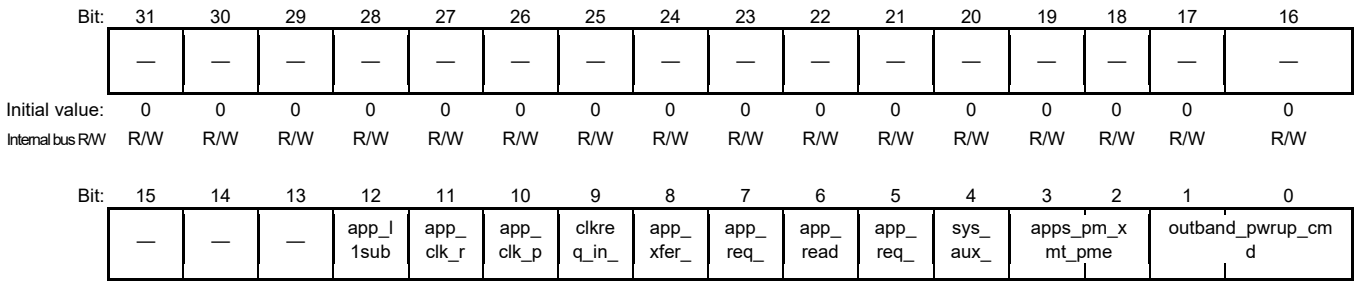
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 0	ptm_clock_correction	All 0	R	Upper bits [63:32] Amount by which Local Clock has been corrected.

104.2.362 PCIe Power Management Control (PCIEPWRMNGCTRL)

Common to Header TYPE00/01



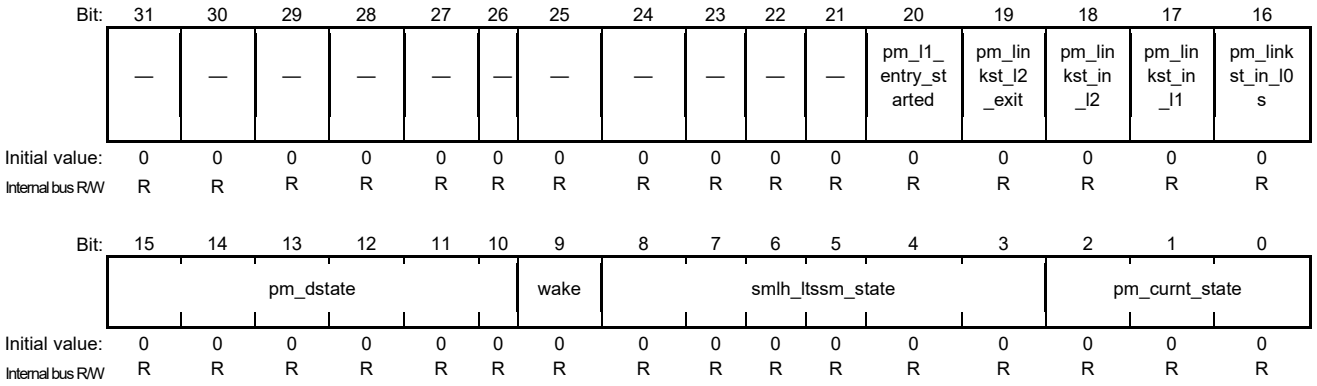
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 13	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
12	app_l1sub_disable	H'0	R/W	The application can set this input to 1'b1 to prevent entry to L1 Sub-states. This pin is used to gate the L1 sub-state enable bits from the L1 PM Substates Control 1 Register
11	app_clk_req_n	H'0	R/W	Indicates that the application logic is ready to have reference clock removed In designs which support reference clock removal through either L1 PM Sub-states or L1 CPM, the application should set this signal to 1'b when it is ready to have reference clock removed. If the application does not want to remove reference clock it should set this signal to 1'b0.
10	app_clk_pm_en	H'0	R/W	Clock PM feature enabled by application. Used to inhibit the programming of the Clock PM in Link Control Register
9	clkreq_in_n	H'0	R/W	Status of the CLKREQ# bidirectional CMOS board-level signal. Used by the controller to determine when to enter and exit L1 Substates when using the CLKREQ#-based mechanism.
8	app_xfer_pending	H'0	R/W	Indicates that your application has transfers pending and prevents the controller from entering L1. This is a level signal used to inform the controller about the state of external queues and pipeline stages that contain transactions to be transmitted by the controller. The controller uses this information to determine when to enter/exit L1. When this signal is asserted, it indicates that there are transactions outside the controller that the controller needs to transmit. When de-asserted, it indicates that there are no transactions outside the controller. The controller responds to an assertion on this signal as follows: ■ Upstream Ports: Prevents generation of requests to enter L1. Triggers exit if already in L1. ■ Downstream Ports: Triggers exit if already in L1. You can instruct the controller to exit L1 by asserting either or both of app_xfer_pending and app_req_exit_l1. The controller only samples app_req_exit_l1 when the controller is already in the L1 state.
7	app_req_exit_l1	H'0	R/W	Application request to Exit L1. Request from your application to exit L1. It is only effective when L1 is enabled

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
6	app_ready_entr_l23	H'0	R/W	Application Ready to Enter L23. Indication from your application that it is ready to enter the L23 state. The app_ready_entr_l23 signal is provided for applications that must control L23 entry (in case certain tasks must be performed before going into L23). The controller delays sending PM_Enter_L23 (in response to PM_Turn_Off) until this signal becomes active. When this signal has been asserted by the application, it must be kept asserted until L2 entry has completed. Hardwire to 1 for applications that do not require this feature. Note: The controller ignores this input in RC mode.
5	app_req_entr_l1	H'0	R/W	Application request to Enter L1 ASPM state. The app_req_entr_l1 signal is for use by applications that need to control L1 entry instead of using the L1 entry timer as defined in the PCI Express Specification. It is only effective when L1 is enabled. The controller latches this request when in L0 or L0s; to be acted upon later. Note: The controller ignores this input in RC mode.
4	sys_aux_pwr_det	H'1	R/W	Auxiliary Power Detected. Used to report to the host software that auxiliary power (Vaux) is present. For a configuration where the auxiliary power is not available (sys_aux_pwr_det =0), the controller cannot exit from L23 Ready with beacon or PERST# de-assertion when main power is not removed.
3 to 2	apps_pm_xmt_pme	H'0	R/W	Wake Up. If PME is enabled and PME support is configured for current PMCSR D-state asserting this signal will cause the controller to wake from either L1 or L2 state. When the controller has transitioned back to the L0 state it will transmit a PME message and set the PME_Status. Upon receiving the PME message the root complex should clear the PME_Status and change the D-state back to D0.
1 to 0	outband_pwrup_cmd	H'0	R/W	Wake Up. If PME is enabled and PME support is configured for current PMCSR D-state asserting this signal will cause the controller to wake from either L1 or L2 state. When the controller has transitioned back to the L0 state it will transmit a PME message and set the PME_Status. There is a separate outband_pwrup_cmd input bit for each function in your controller configuration. This port is functionally identical to apps_pm_xmt_pme. Upon receiving the PME message the root complex should clear the PME_Status and change the D-state back to D0.

104.2.363 PCIe Power Management Status 0 (PCIEPWRMNGSTS0)

Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 21	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
20	pm_l1_entry_started	H'0	R	L1 entry process is in progress
19	pm_linkst_l2_exit	H'0	R	Power management is exiting L2 state
18	pm_linkst_in_l2	H'0	R	Power management is in L2 state
17	pm_linkst_in_l1	H'0	R	Power management is in L1 state
16	pm_linkst_in_l0s	H'0	R	Power management is in L0s state
15 to 10	pm_dstate	H'0	R	The current power management D-state of the function. ■ 000b: D0 ■ 001b: D1 ■ 010b: D2 (not support D2 Power Management State, Read/write value B'10 always read as 0. The write value should always be 0.) ■ 011b: D3 ■ 100b: Uninitialized ■ Other values: Not applicable There are 3 bits of pm_dstate for each configured function.
9	wake	H'0	R	Wake Up. Wake up from power management unit. The controller generates wake to request the system to restore power and clock when a wakeup event has been detected such as apps_pm_xmt_pme, apps_pm_vf_xmt_pme, or outband_pwrup_cmd. The wake signal is an active high signal and its rising edge should be detected to drive the WAKE# the connector. Assertion of wake could be for a single clock cycle or multiple clock cycles. Not used in RC mode.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
8 to 3	smlh_ltssm_state	H'0	R	Current state of the LTSSM. Encoding is defined as follows: ■ 6'h00: S_DETECT_QUIET ■ 6'h01: S_DETECT_ACT ■ 6'h02: S_POLL_ACTIVE ■ 6'h03: S_POLL_COMPLIANCE ■ 6'h04: S_POLL_CONFIG ■ 6'h05: S_PRE_DETECT_QUIET ■ 6'h06: S_DETECT_WAIT ■ 6'h07: S_CFG_LINKWD_START ■ 6'h08: S_CFG_LINKWD_ACEPT ■ 6'h09: S_CFG_LANENUM_WAI ■ 6'h0A: S_CFG_LANENUM_ACEPT ■ 6'h0B: S_CFG_COMPLETE ■ 6'h0C: S_CFG_IDLE ■ 6'h0D: S_RCVRY_LOCK ■ 6'h0E: S_RCVRY_SPEED ■ 6'h0F: S_RCVRY_RCVRCFG ■ 6'h10: S_RCVRY_IDLE ■ 6'h11: S_L0 ■ 6'h12: S_L0S ■ 6'h13: S_L123_SEND_EIDLE ■ 6'h14: S_L1_IDLE ■ 6'h15: S_L2_IDLE ■ 6'h16: S_L2_WAKE ■ 6'h17: S_DISABLED_ENTRY ■ 6'h18: S_DISABLED_IDLE ■ 6'h19: S_DISABLED ■ 6'h1A: S_LPBK_ENTRY ■ 6'h1B: S_LPBK_ACTIVE ■ 6'h1C: S_LPBK_EXIT ■ 6'h1D: S_LPBK_EXIT_TIMEOUT ■ 6'h1E: S_HOT_RESET_ENTRY ■ 6'h1F: S_HOT_RESET ■ 6'h20: S_RCVRY_EQ0 ■ 6'h21: S_RCVRY_EQ1 ■ 6'h22: S_RCVRY_EQ2 ■ 6'h23: S_RCVRY_EQ3
2 to 0	pm_curnt_state	H'0	R	Indicates the current power state. The pm_curnt_state output is intended for debugging purposes, not for system operation.

104.2.364 PCIe Power Management Status 1 (PCIEPWRMNGSTS1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cfg_l1sub

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 17	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
16	cfg_l1sub_en	H'0	R	Indicates that any of the L1 Substates are enabled in the L1 Substates Control 1 Register. Could be used by your application in a downstream port to determine when not to drive CLKREQ# such as when L1 Substates are not enabled.
15	pm_linkst_in_l1sub	H'0	R	Power management is in L1 substate. Indicates when the link has entered L1 substates.For L1.2 this signal is deasserted at the end of the L1.2.Exit state, after the t_power_on constraint has been satisfied. External logic can use the transition high to low on this signal to initiate REFCLK restore.
14 to 13	pm_status	H'0	R	PME Status bit from the PMCSR. There is 1 bit of pm_status for each configured function.
12 to 10	pm_l1sub_state	H'0	R	Power management L1 sub-states FSM state
9 to 5	pm_slave_state	H'0	R	Power management slave FSM state
4 to 0	pm_master_state	H'0	R	Power management master FSM state

104.2.365 PCIe Error Status 0 (PCIEERRSTS0)

Common to Header TYPE00/01

Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

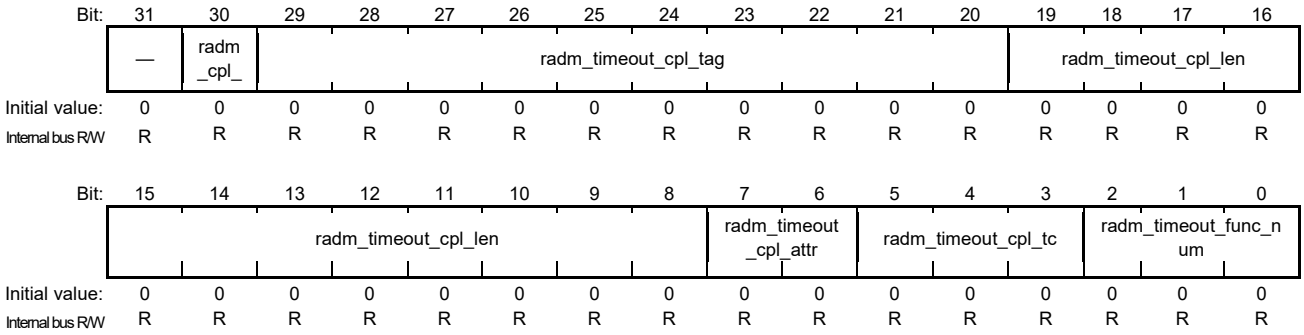
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cdm_reg_ch	cdm_reg
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1	cdm_reg_chk_cmplt	H'0	R	Signal to indicate that a Register Checking Sequence has Completed.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	cdm_reg_chk_test_en	H'0	R/W	Signal to enter test mode in the Register Checking Logic. u_cdm_b will not be written to when this signal is high. Allows a value to be written to u_cdm to compare against the previous value in u_cdm_b

104.2.371 PCIe Receive CPL Timeout Status (PCIERCVCPLTOSTS)

Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
30	radm_cpl_timeout	H'0	R	Indicates that the completion TLP for a request has not been received within the expected time window.
29 to 20	radm_timeout_cpl_tag	H'0	R	The Tag field of the timed out completion
19 to 8	radm_timeout_cpl_len	H'0	R	Length (in bytes) of the timed out completion. For a split completion, it indicates the number of bytes remaining to be delivered when the completion timed out.
7 to 6	radm_timeout_cpl_attr	H'0	R	The Attributes field of the timed out completion
5 to 3	radm_timeout_cpl_tc	H'0	R	The Traffic Class of the timed out completion
2 to 0	radm_timeout_func_num	H'0	R	The function Number of the timed out completion. Function numbering starts at '0'.

104.2.372 PCIe Transmit Control 0 (PCIETXCNTRL0)

Common to Header TYPE00/01

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_hdr_valid
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 1	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
0	app_hdr_valid	H'0	R/W	Indicates that the data app_hdr_log, app_err_bus, app_err_func_num, and app_tlp_prfx_log is valid.

104.2.373 PCIe Transmit Control 1 (PCIETXCNTRL1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_err_func_num
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

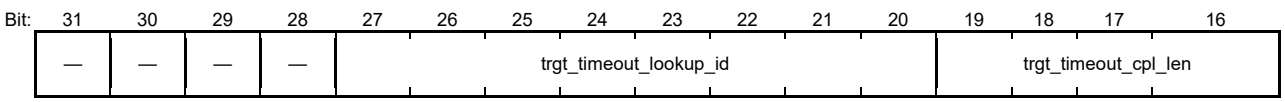
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	app_err_func_num		app_err_a	app_err_bus												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 17	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
16 to 14	app_err_func_num	H'0	R/W	The number of the function that is reporting the error indicated app_err_bus, valid when app_hdr_valid is asserted. Correctable and Uncorrected Internal errors (app_err_bus[10:9]) are not function specific, and are recorded for all physical functions, regardless of the value this bus. Function numbering starts at '0'.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
13	app_err_advisory	H'0	R/W	Indicates that your application error is an advisory error.. Your application should assert app_err_advisory under either of the following conditions: ■ The controller is configured to mask completion timeout errors, your application is reporting a completion timeout error app_err_bus, and your application intends to resend the request. In such cases the error is an advisory error, as described in PCI Express Specification. When your application does not intend to resend the request, then your application must keep app_err_advisory de-asserted when reporting a completion timeout error. ■ The controller is configured to forward poisoned TLPs to your application and your application is going to treat the poisoned TLP as a normal TLP, as described in PCI Express Specification. Upon receipt of a poisoned TLP, your application must report the error app_err_bus, and either assert app_err_advisory (to indicate an advisory error) or de-assert app_err_advisory (to indicate that your application is dropping the TLP).
12 to 0	app_err_bus	H'0	R/W	The type of error that your application detected. The controller combines the values the app_err_bus bits with the internally-detected error signals to set the corresponding bit in the Uncorrectable or Correctable Error Status Registers: ■ app_err_bus[0]: Malformed TLP ■ app_err_bus[1]: Receiver Overflow ■ app_err_bus[2]: Unexpected completion ■ app_err_bus[3]: Completer abort ■ app_err_bus[4]: Completion Timeout ■ app_err_bus[5]: Unsupported request ■ app_err_bus[6]: ECRC Check Failed ■ app_err_bus[7]: Poisoned TLP received ■ app_err_bus[8]: AtomicOp Egress Blocked: only valid when CX_ATOMIC_ROUTING_EN =1 ■ app_err_bus[9]: Uncorrectable Internal Error ■ app_err_bus[10]: Corrected Internal Error ■ app_err_bus[11]: TLP Prefix Blocked Error Status: only valid for RC and when CX_NPRFX >0 ■ app_err_bus[12]: ACS Violation: only valid when CX_ACS_ENABLE =1

104.2.374 PCIe Target Completion LUT 0 (PCIETRGTCMPLUT0)

Common to Header TYPE00/01



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	trgt_timeout_cpl_len								trgt_timeout_cpl_attr		trgt_timeout_cpl_tc			trgt_timeout_cpl_func_num		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 28	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
27 to 20	trgt_timeout_lookup_id	H'0	R	The target completion LUT lookup ID of the timed out completion.
19 to 8	trgt_timeout_cpl_len	H'0	R	The Length of the timed out completion
7 to 6	trgt_timeout_cpl_attr	H'0	R	The Attributes value of the timed out completion. ■ Width is three bits when CX_IDO_ENABLE =1 ■ Width is two bits when CX_IDO_ENABLE =0
5 to 3	trgt_timeout_cpl_tc	H'0	R	The TC of the timed out completion.
2 to 0	trgt_timeout_cpl_func_num	H'0	R	The function number of the timed out completion. Function numbering starts at '0'.

104.2.375 PCIe Target Completion LUT 1 (PCIETRGTCMPLUT1)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	trgt_looku	trgt_cpl_ti	trgt_lookup_id							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 10	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
9	trgt_lookup_empty	H'0	R	When this signal is asserted with radm_trgt1_hv, it indicates that the target completion LUT is not full. The application can use this signal to determine a back-pressure mechanism to the controller so that there is not an overflow condition when the number of outstanding non-posted transactions received is more than expected. Your application logic must drive trgt1_radm_halt with the logical OR of your application halt signal and the inverse of this output.
8	trgt_cpl_timeout	H'0	R	Indicates that the application has not generated a completion for an incoming request within the required time interval. Information about the timed out completion is available the trgt_timeout_* outputs listed later. When a completion timeout occurs, the controller does not clear the corresponding entry from the completion lookup table. The default completion timeout value is approximately 10 ms.
7 to 0	trgt_lookup_id	H'0	R	The target completion LUT lookup ID for the incoming request TLP. When using the optional target completion lookup table feature, the application must save the lookup ID and assert the same lookup ID client0/1/2_cpl_lookup_id when generating a completion for the request.

104.2.376 PCIe Mode Information (PCIEMODEINFO)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

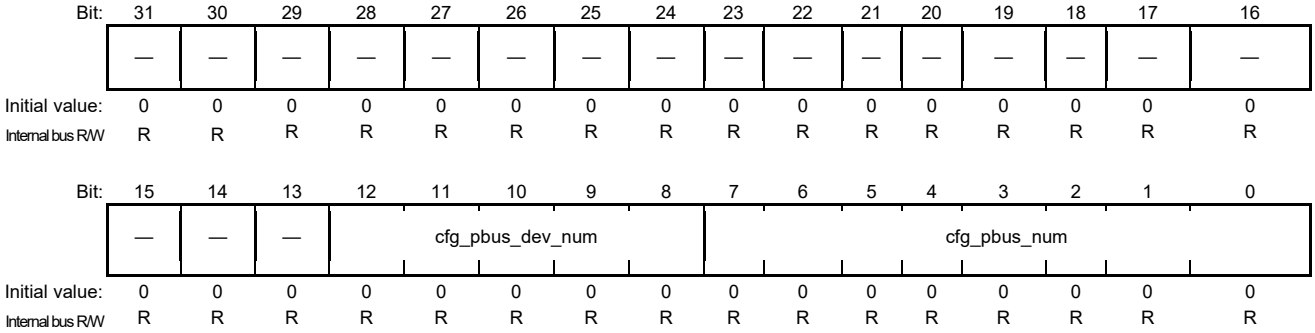
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	slv_rasdp_e	mstr_rasdp_err_mod
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
1	slv_rasdp_err_mode	H'0	R	Indication (slv_aclk version) from the controller that it has entered RASDP error mode. The controller enters RASDP error mode (if the ERROR_MODE_EN register field =1) upon detection of the first uncorrectable error. During this mode: ■ Core sets mstr_rasdp_error_mode=1 ■ Core sets slv_rasdp_error_mode=1 ■ Rx TLPs that are forwarded to your application are not guaranteed to be correct; you must discard them.
0	mstr_rasdp_err_mode	H'0	R	Indication (mstr_aclk version) from the controller that it has entered RASDP error mode. The controller enters RASDP error mode (if the ERROR_MODE_EN register field =1) upon detection of the first uncorrectable error. During this mode: ■ Core sets slv_rasdp_err_mode=1 ■ Core sets mstr_rasdp_err_mode=1 ■ Rx TLPs that are forwarded to your application are not guaranteed to be correct; you must discard them.

104.2.377 PCIe Configuration Information 0 (PCIECNFGINFO0)

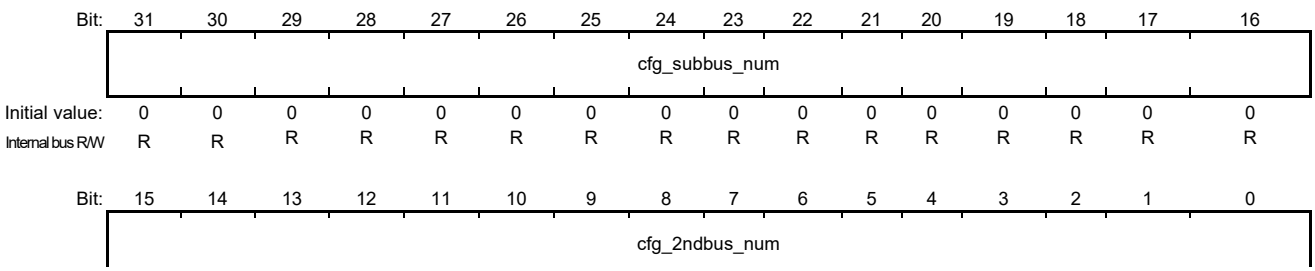
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 13	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
12 to 8	cfg_pbus_dev_num	H'0	R	The device number assigned to the function. The number of bits depends the value of MULTI_DEVICE_AND_BUS_PER_FUNC_EN: ■ If MULTI_DEVICE_AND_BUS_PER_FUNC_EN =0, there are five bits of cfg_pbus_dev_num ([4:0]), regardless of the number of functions. ■ If MULTI_DEVICE_AND_BUS_PER_FUNC_EN =1, there are five bits of cfg_pbus_dev_num for each configured function.
7 to 0	cfg_pbus_num	H'0	R	The primary bus number assigned to the function. The number of bits depends the value of MULTI_DEVICE_AND_BUS_PER_FUNC_EN: ■ If MULTI_DEVICE_AND_BUS_PER_FUNC_EN =0, there are eight bits of cfg_pbus_num ([7:0]), regardless of the number of functions. ■ If MULTI_DEVICE_AND_BUS_PER_FUNC_EN =1, there are eight bits of cfg_pbus_num for each configured function.

104.2.378 PCIe Configuration Information 1 (PCIECNFGINFO1)

Common to Header TYPE00/01



Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	cfg_subbus_num	H'0	R	Configured Subordinate Bus Number. When the switch controller receives a configuration request from the upstream port, it must see the secondary and subordinate bus number fields from the downstream ports to route the request.
15 to 0	cfg_2ndbus_num	H'0	R	Configured Secondary Bus Number. The secondary bus number assigned to the device. When the host software detects the upstream switch port, it assigns a secondary bus number. This bus number is then used in configuration requests to detect the downstream ports. The switch controller must see this so that it can route configuration requests.

104.2.379 PCIe Margining Control (PCIEMARGINGCTRL)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

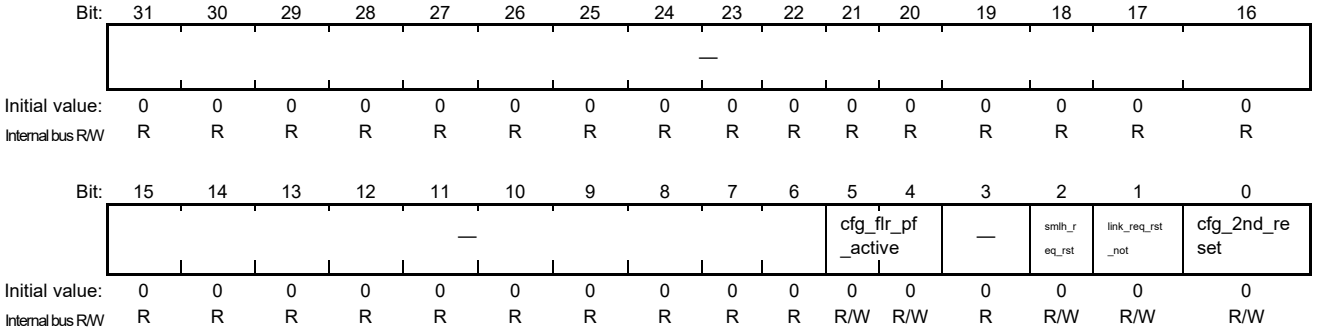
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	app_marg	app_margining_ready
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 2	Reserved	All 0	R/W	These bits are read as 0. The write value must be 0.
1	app_margining_software_ready	H'0	R/W	Margining Software Ready. Indicates that the required margining software has performed the required initialization when margining is partially implemented using Device Driver software. This signal is reflected in Margining Software Ready field of Margining Port Status register. If MARGINING_USES_DRIVER_SOFTWARE field of Margining Port Capabilities Register is '0', you can set this signal to a fixed value of '0'. This signal should be tied to '0'.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
0	app_margining_ready	H'0	R/W	Margining Ready. Indicates when the PHY or Margining software is ready to accept margining commands. This signal is reflected in Margining Ready field of Margining Port Status register. If the PHY can accept margining commands when the current link speed is 16GT/s, you can set this signal to a fixed value of '1'. This signal should be tied to '1'.

104.2.380 PCIe Reset Status Enable Register (PCIERSTSTSEN)

Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 6	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
5 to 4	cfg_flr_pf_active	H'0	R/W	Status cfg_flr_pf_active enable 0: Disable 1: Enable
3	Reserved	0	R	These bits are read as 0. The write value must be 0.
2	smlh_req_rst_not	0	R/W	Status smlh_req_rst_not enable 0: Disable 1: Enable
1	link_req_rst_not	0	R/W	Status link_req_rst_not enable 0: Disable 1: Enable
0	cfg_2nd_reset	0	R/W	Status cfg_2nd_reset enable 0: Disable 1: Enable

104.2.381 PCIe Message Reception Status Enable (PCIEMSGRCPSTSEN)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
30 to 29	cfg_aer_rc_err_msi	H'0	R/W	Interrupt cfg_aer_rc_err_msi enable 0: Disable 1: Enable
28 to 27	cfg_aer_rc_err_int	H'0	R/W	Interrupt cfg_aer_rc_err_int enable 0: Disable 1: Enable

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
26	msi_ctrl_int	0	R/W	Interrupt msi_ctrl_int enable 0: Disable 1: Enable
25	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
24	cfg_link_eq_req_int	0	R/W	Interrupt cfg_link_eq_req_int enable 0: Disable 1: Enable
23	cfg_bw_mgt_msi	0	R/W	Interrupt cfg_bw_mgt_msi enable 0: Disable 1: Enable
22	cfg_bw_mgt_int	0	R/W	Interrupt cfg_bw_mgt_int enable 0: Disable 1: Enable
21	cfg_link_auto_bw_msi	0	R/W	Interrupt cfg_link_auto_bw_msi enable 0: Disable 1: Enable
20	cfg_link_auto_bw_int	0	R/W	Interrupt cfg_link_auto_bw_int enable
19 to 18	hp_msi	H'0	R/W	Interrupt hp_msi enable 0: Disable 1: Enable
17 to 16	hp_int	H'0	R/W	Interrupt hp_int enable 0: Disable 1: Enable
15 to 14	hp_pme	H'0	R/W	Interrupt hp_pme enable 0: Disable 1: Enable
13 to 12	cfg_pme_msi	H'0	R/W	Interrupt cfg_pme_msi enable 0: Disable 1: Enable
11 to 10	cfg_pme_int	H'0	R/W	Interrupt cfg_pme_int enable 0: Disable 1: Enable
9 to 8	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
7	smlh_link_up	0	R/W	Interrupt smlh_link_up enable 0: Disable 1: Enable
6	rdlh_link_up	0	R/W	Interrupt rdlh_link_up enable 0: Disable 1: Enable
5 to 4	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
3 to 2	cfg_mem_space_en	H'0	R/W	Interrupt cfg_mem_space_en enable 0: Disable 1: Enable
1 to 0	cfg_bus_master_en	H'0	R/W	Interrupt cfg_bus_master_en enable 0: Disable 1: Enable

104.2.385 PCIe DMA Interrupt Status Enable (PCIEDMAINTSTSEN)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	edma_int															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 16	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
15 to 0	edma_int	0	R/W	Interrupt edma_int enable 0: Disable 1: Enable [15:8] : read channel 7-0 [7:0] : write channel 7-0

104.2.386 PCIe INTx Interrupt Status Enable (PCIEINTXSTSEN)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	radm_intd_de	radm_intc_deas	radm_intb_de	radm_inta_de	radm_intd_asse	radm_intc_asse	radm_intb_ass	radm_inta_asse
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 8	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
7	radm_intd_deasserted	0	R/W	Interrupt radm_intd_deasserted enable 0: Disable 1: Enable
6	radm_intc_deasserted	0	R/W	Interrupt radm_intc_deasserted enable 0: Disable 1: Enable
5	radm_intb_deasserted	0	R/W	Interrupt radm_intb_deasserted enable 0: Disable 1: Enable
4	radm_inta_deasserted	0	R/W	Interrupt radm_inta_deasserted enable 0: Disable 1: Enable
3	radm_intd_asserted	0	R/W	Interrupt radm_intd_asserted enable 0: Disable 1: Enable
2	radm_intc_asserted	0	R/W	Interrupt radm_intc_asserted enable 0: Disable 1: Enable
1	radm_intb_asserted	0	R/W	Interrupt radm_intb_asserted enable 0: Disable 1: Enable
0	radm_inta_asserted	0	R/W	Interrupt radm_inta_asserted enable 0: Disable 1: Enable

104.2.387 PCIe Interrupt Status 1 Enable (PCIEINTSTS1EN)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	lbc_ext_cs		—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 22	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
21 to 20	lbc_ext_cs	H'0	R/W	Interrupt lbc_ext_cs enable 0: Disable 1: Enable
19 to 0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.388 PCIe Target Completion LUT 1 Enable (PCIETRGTCMPLUT1EN)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	trgt_cpl_timeout	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 9	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
8	trgt_cpl_timeout	0	R/W	Status trgt_cpl_timeout enable 0: Disable 1: Enable
7 to 0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.389 PCIe Reset Status Clear Register (PCIERSTSTSCLR)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	—	—	—	—	—	—	—	—	—	—	—	—	training_rst_n	smlh_req_rst_not	link_req_rst_not	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 4	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
3	training_rst_n	0	RW1C	Status training_rst_n clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
2	smlh_req_rst_not	0	RW1C	Status smlh_req_rst_not clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
1	link_req_rst_not	0	RW1C	Status link_req_rst_not clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.390 PCIe Message Reception Status Clear (PCIEMSGRCPSTSCLR)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	radm_msg_un	radm_vendor_	radm_pm_turn	radm_pm_to_a	radm_pm	radm_fatal_err	radm_nonfatal_	radm_correcta	radm_msg_ltr
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C	RW1C

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 9	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
8	radm_msg_unlock	0	RW1C	Status radm_msg_unlock clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
7	radm_vendor_msg	0	RW1C	Status radm_vendor_msg clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
6	radm_pm_turnoff	0	RW1C	Status radm_pm_turnoff clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
5	radm_pm_to_ack	0	RW1C	Status radm_pm_to_ack clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
4	radm_pm_pme	0	RW1C	Status radm_pm_pme clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
3	radm_fatal_err	0	RW1C	Status radm_fatal_err clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
2	radm_nonfatal_err	0	RW1C	Status radm_nonfatal_err clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
1	radm_correctable_err	0	RW1C	Status radm_correctable_err clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
0	radm_msg_ltr	0	RW1C	Status radm_msg_ltr clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.

104.2.391 PCIe Power Management Status 0 Clear (PCIEPWRMNGSTS0CLR)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	RW1C	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 10	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
9	wake	0	RW1C	Status wake clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
8 to 0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.392 PCIe Error Status 0 Clear (PCIEERRSTS0CLR)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

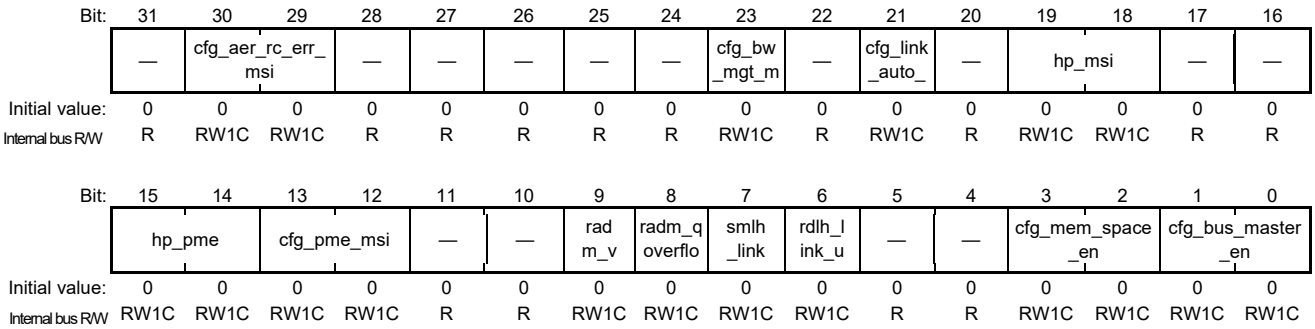
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	cfg_sys_err_rc		—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus R/W	R	R	R	R	R	RW1C	RW1C	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31 to 11	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
10 to 9	cfg_sys_err_rc	H'0	RW1C	Status cfg_sys_err_rc clear. [Writing] 0: Ignored 1: Status is cleared This bit is read as 0.
8 to 0	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

104.2.393 PCIe Interrupt Status 0 Clear (PCIEINTSTS0CLR)

Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal Bus R/W	Description
31	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
30 to 29	cfg_aer_rc_err_msi	H'0	RW1C	Interrupt cfg_aer_rc_err_msi clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.
28 to 24	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
23	cfg_bw_mgt_msi	0	RW1C	Interrupt cfg_bw_mgt_msi clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
22	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
21	cfg_link_auto_bw_msi	0	RW1C	Interrupt cfg_link_auto_bw_msi clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
20	Reserved	All 0	R	These bits are read as 0. The write value must be 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
19 to 18	hp_msi	H'0	RW1C	Interrupt hp_msi clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.
17 to 16	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
15 to 14	hp_pme	H'0	RW1C	Interrupt hp_pme clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.
13 to 12	cfg_pme_msi	H'0	RW1C	Interrupt cfg_pme_msi clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.
11 to 10	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
9	radm_vendor_msg	0	RW1C	Interrupt radm_vendor_msg clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
8	radm_qoverflow	0	RW1C	Interrupt radm_qoverflow clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
7	smlh_link_up	0	RW1C	Interrupt smlh_link_up clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
6	rdlh_link_up	0	RW1C	Interrupt rdlh_link_up clear [Writing] 0: Ignored 1: Interrupt is cleared This bit is read as 0.
5 to 4	Reserved	All 0	R	These bits are read as 0. The write value must be 0.
3 to 2	cfg_mem_space_en	H'0	RW1C	Interrupt cfg_mem_space_en clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.

Bit	Bit Name	Initial Value	Internal Bus R/W	Description
1 to 0	cfg_bus_master_en	H'0	RW1C	Interrupt cfg_bus_master_en clear [Writing] 0: Ignored 1: Status is cleared These bits are read as 0.

104.2.394 PCIe INTx Interrupt Status Clear (PCIEINTXSTSCLR)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	pm_current_data_rate	All 0	R	The current link operating rate.

104.2.400 SII: BDF Signals (SIIBDF)

Common to Header TYPE00/01

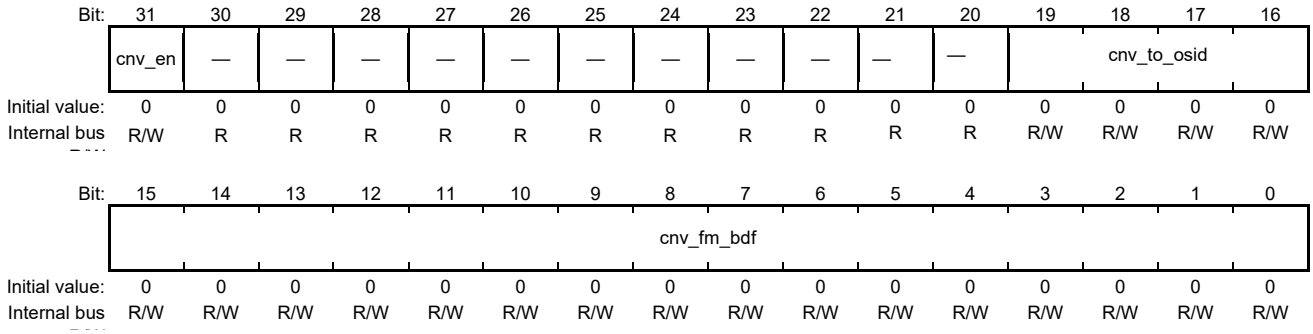
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	app_bus_num								—	—	—	app_dev_num				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	app_bus_num	H'0	R/W	Bus number
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	app_dev_num	H'0	R/W	Device number.

104.2.401 Convert Requester ID to OSID Register *i* (CNVID*i*)(*i* = 0 to 15)

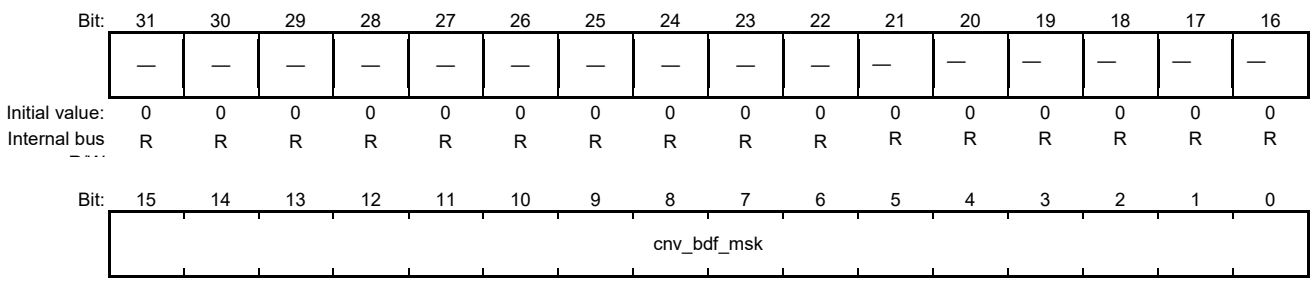
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal bus R/W	Description
31	cnv_en	H'0	R/W	Conversion enabled
30 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	cnv_to_osid	H'0	R/W	OSID value when matched
15 to 0	cnv_fm_bdf	H'0	R/W	Value to compare with BDF

104.2.402 Convert Requester ID to OSID Mask Register *i* (CNVIDMSK*i*)(*i* = 0 to 15)

Common to Header TYPE00/01



Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	cnv_bdf_msk	H'0	R/W	Mask used for matching

104.2.403 Convert Requester ID to OSID Control Register (CNVOSIDCTRL)

Common to Header TYPE00/01

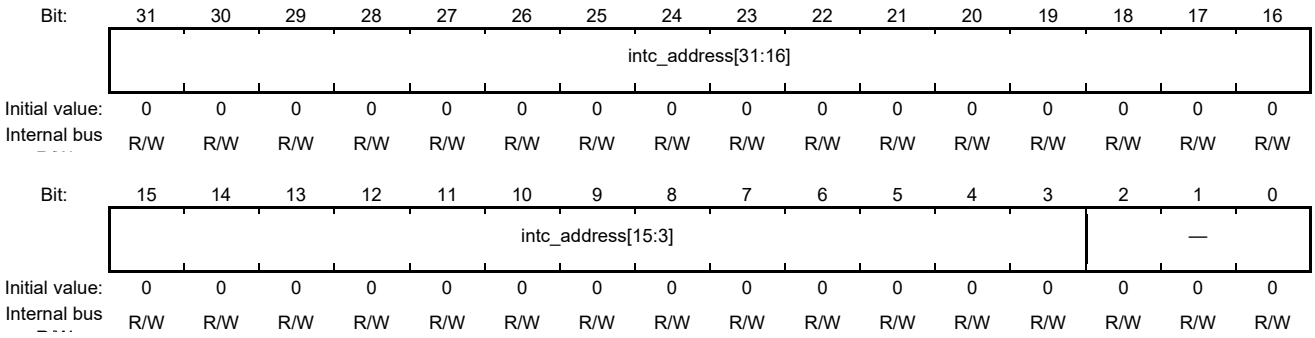
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	elsosid			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	elsosid	H'0	R/W	OSID value to use when none hit
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

104.2.404 INTC address(AXIINTCADDR)

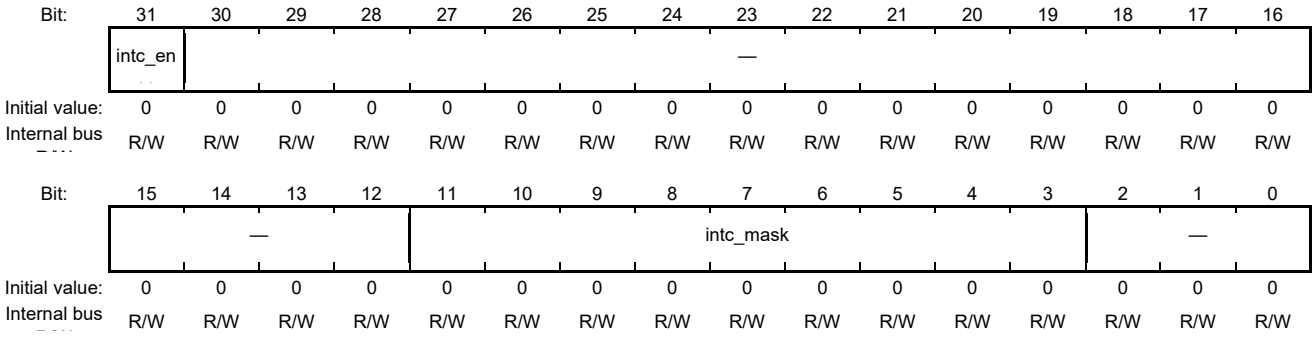
Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 3	intc_address	H'0	R/W	Address judged as INTC area
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

104.2.405 INTC control & mask(AXIINTCCONT)

Common to Header TYPE00/01



Bit	Bit Name	Initial Value	Internal bus R/W	Description
31	intc_enable	H'0	R/W	INTC judgment enable
30 to 12	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
11 to 3	intc_mask	H'0	R/W	Mask used for INTC judgment

Bit	Bit Name	Initial Value	Internal bus R/W	Description
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

104.2.406 Reference Clock Control Signals PHY0 Register (REFCLKCTRLP0)

Common to Header TYPE00/01

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	phy0	—	—	—			—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
Internal bus	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	phy0_ref_repeat_clk_en	H'0	R/W	Repeat reference clock enable
8 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	—	H'1	R	Reserved These bits are always read as 1. The write value should always be 1.
1 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

104.2.407 Reference Clock Control Signals PHY1 Register (REFCLKCTRLP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—		—		—	phy1 _ref_	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Internal bus	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Bit	Bit Name	Initial Value	Internal bus R/W	Description
31 to 3	—	H'0	R	Reserved These bits are read as 0. The write value must be 0.
2	phy1_ref_use_pad	H'0	R/W	Select reference clock connected to ref_pad_clk_p/ref_pad_clk_m
1 to 0	—	H'0	R	Reserved These bits are read as 0. The write value must be 0.

104.3 Operation

The following describes the operation of this module.

Note: The following operation flowcharts are each divided in two parts and described. One part covers the H/W, hardware operation of this module and the other covers the S/W, software operation to control this module. The arrows originating from the outside of the figure frame indicate that the event arises from the user program.

In the explanation of the operation flows, interrupt sources are described in the H/W part. The S/W should first verify a given interrupt flag and then clear it.

If generation of interrupt sources is expected, enable each of the interrupt sources referring to Figure 104.41, Figure 104.42, Figure 104.43 and Figure 104.44.

104.3.1 Clocks

The following describes the clocks specification for PCIEC.

104.3.1.1 Overview

PCIEC uses the clocks outlined in Table 104.7.

Table 104.7 Clocks list in PCIEC

Clock Name	Frequency[MHz]	Descrition
S0D2_HSCφ	Refer to section 8(CPG)	This clock is used for AXI bus I/F.
S0D4_HSCφ	Refer to section 8(CPG)	This clock is used for APB bus I/F.
core_clk@ Gen{1,2,3,4}	{62.5, 125, 250, 500}	This clock is the primary clock for the PCIe Controller module
PCIE*m*_CLK_P/M (*m* = 0)	100	Reference clock for the PLL incorporated in the PCIe Controller module (differential inputs).

104.3.1.2 Reference Clock

PCIEC physical unit is able to repeat the input reference clocks. A reference clock repeater is provided to propagate the reference clock through PCIEC physical unit pins. This is called reference clock repeat mode.

Figure 104.2 shows connection of reference repeat mode.

Reference clock repeat mode is enabled by setting PCIEC0 Local register REFCLKCTRLP0. phy0_ref_use_pad = 1 and REFCLKCTRLP0. phy0_ref_repeat_clk_en = 1, PCIEC1 Local register REFCLKCTRLP*i*. phy*i*_ref_use_pad = 0 and REFCLKCTRLP0. phy*i*_ref_repeat_clk_en= 1 (*i* = 0,1). Starting point of reference clock is only PCIE0_CLK_P/M supported.

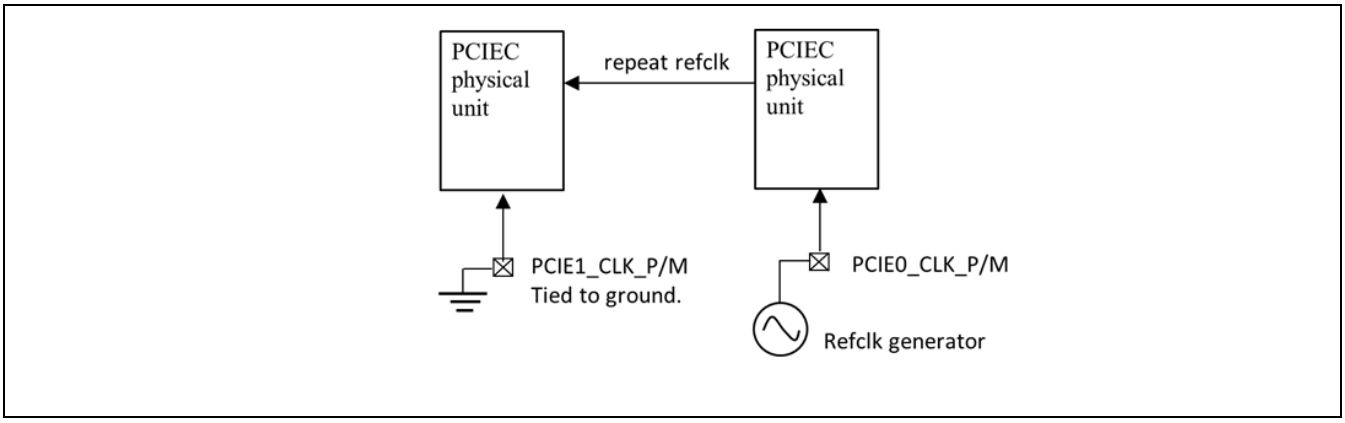


Figure 104.2 Connection of reference repeat mode

PCIEC supports the Separate Reference clock with Independent Spread Spectrum Clocking (SRIS) feature as defined by the PCI-SIG. SRIS is enabled by setting PCIEMSR0. app_sris_mode = 1. When SRIS is enabled, then L0s is not supported and must not be advertised in the ASPM Support Capability Registers.

104.3.2 Resets

The following describes the resets specification for PCIEC.

PCIEC uses the resets outlined in Table 104.8. These resets are implemented per link.

Cold-reset (power_up_rst_n) is controlled by CPG registers, Warm-reset (perst_n) and Hot-reset (app_init_rst) are controlled by PCIEC control register (PCIERSTCTRL0 / PCIERSTCTRL2) in PCIEC module.

Table 104.8 Resets list in PCIEC

Reset level	Description
Cold-reset	power_up_rst_n. This reset is used as PCIEC fundamental reset. Assertion of this reset resets all registers in PCIEC.
Warm-reset	PCIERSTCTRL0.perst_n. This reset is used as same as PERST#. Assertion of this reset resets registers except PCIEC control registers partial.
Hot-reset	PCIERSTCTRL2.app_init_rst. This reset is used as Hot-reset. Assertion of this reset resets non-sticky registers.

104.3.3 Endian

The ordering of AXI/APB address and data is a little endian.

104.3.4 Initialization

(1) Standby State Cancellation

- After canceling a reset, cancel the module standby state. For the module standby state, refer to section “8A. Module Standby and Software Reset”. This module is in the module standby state after a power-on reset is canceled.

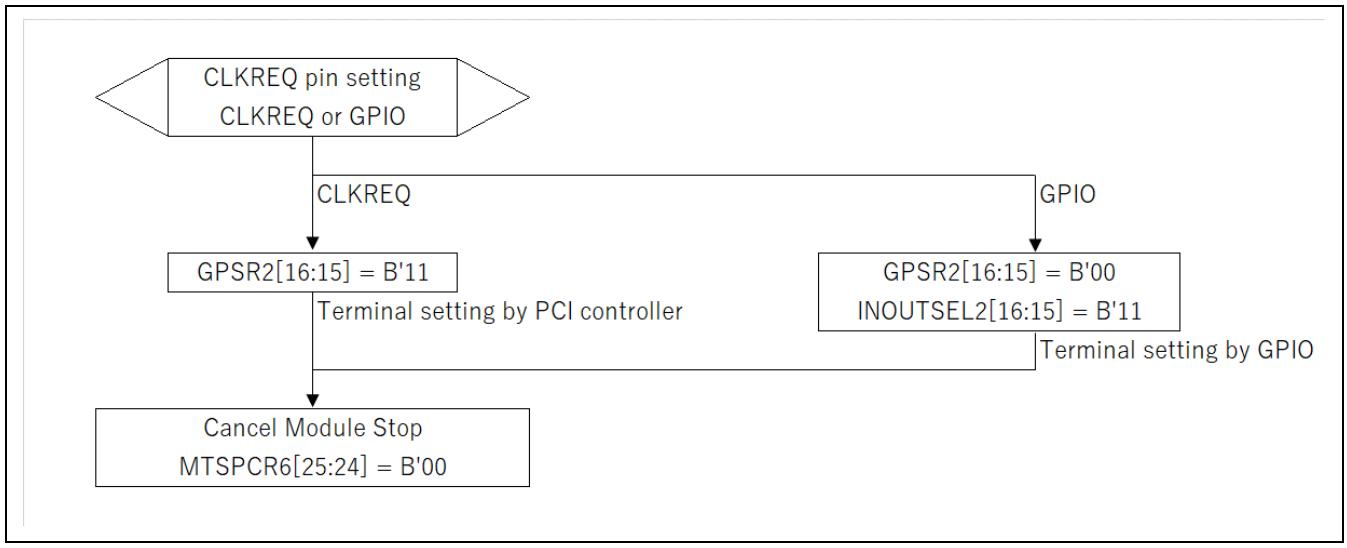

Figure 104.3a Initial Setting of PCIEC

(2) Initial Setting of PCI Express

- Figure 104.3 shows the PCIEC operation in initial setting example.
- After start-up processing for the PCIe control register access is completed, the initial setting is executed to start operation as a PCI Express. Until the initial setting is completed, this module cannot work correctly as a PCI Express device. Therefore, a link is not established immediately after a reset is canceled. When the initial setting is completed, set the PCIERSTCTRL1.app_ltssm_enable=1 and PCIERSTCTRL1. app_hold_phy_rst =0 to start operation.
- Set the bits in the configuration registers as directed in the related register description, if there is a direction on initialization.
- When a register is used with the default setting, setting the register is not required.
- Set PRTLGC5.LANE_CONFIG =H'00_0040.

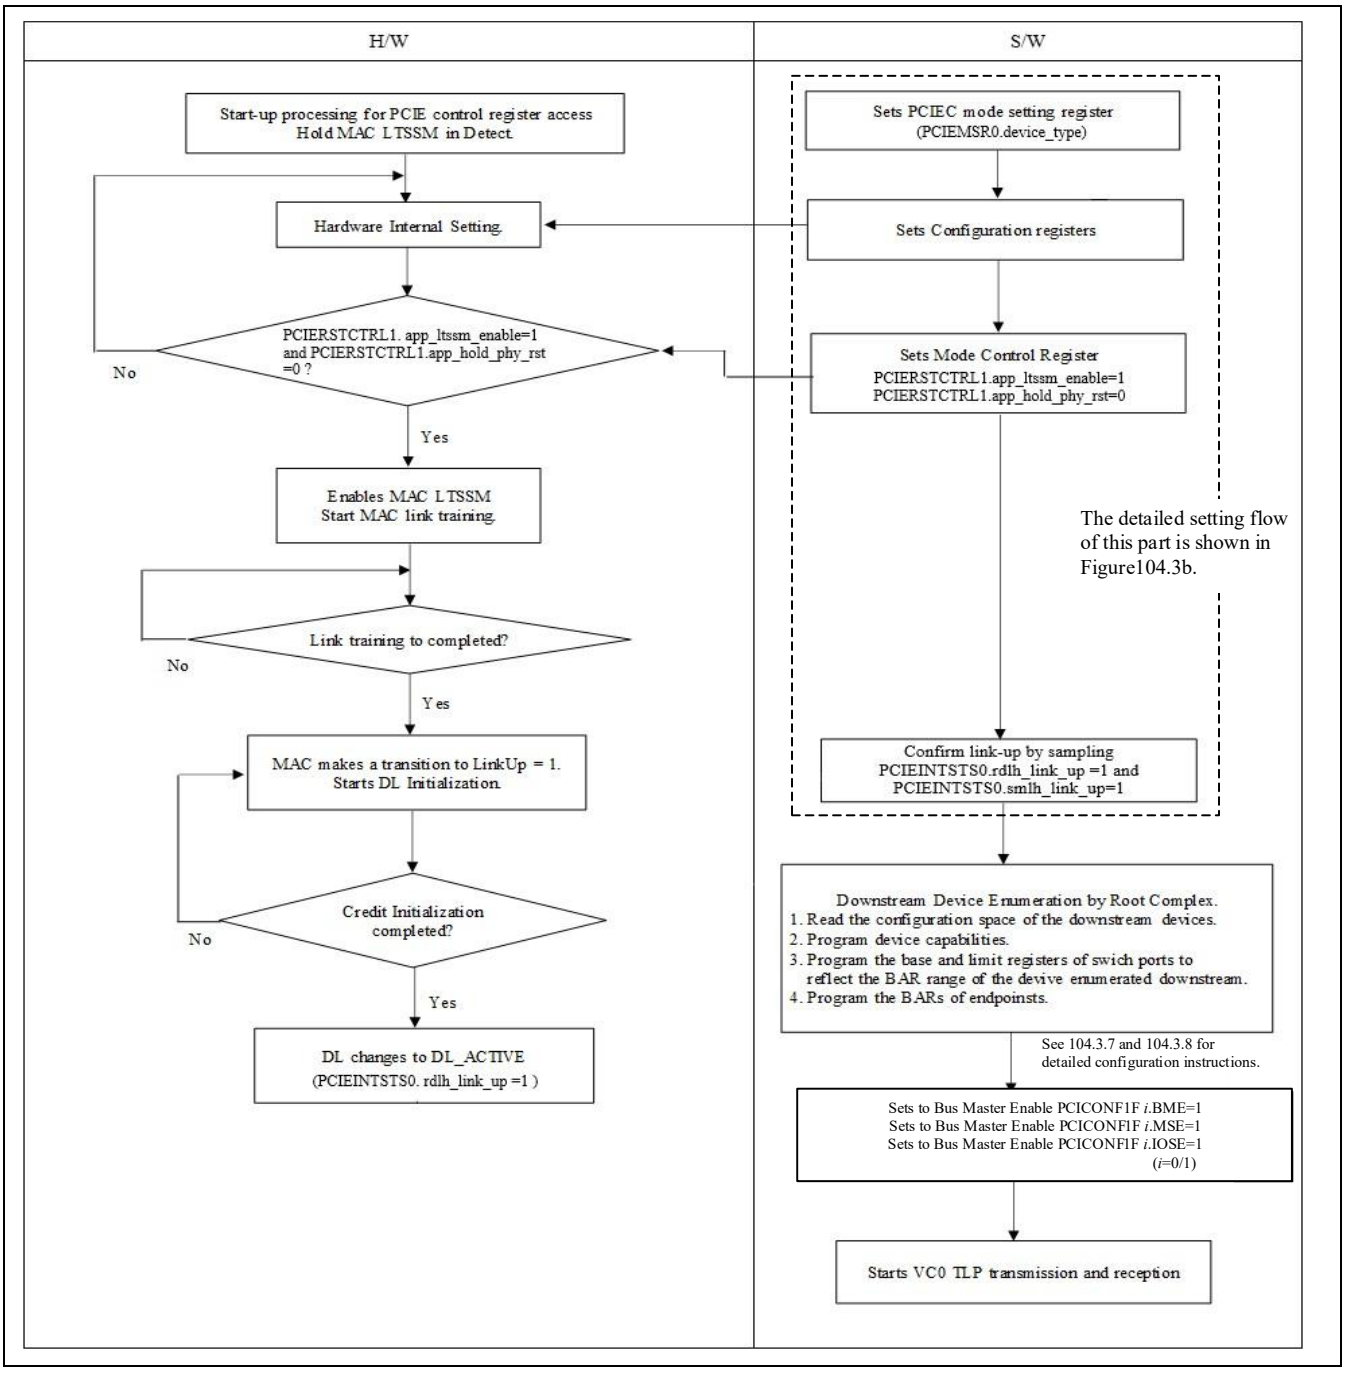

Figure 104.3 Initial Setting of PCIEC(example)

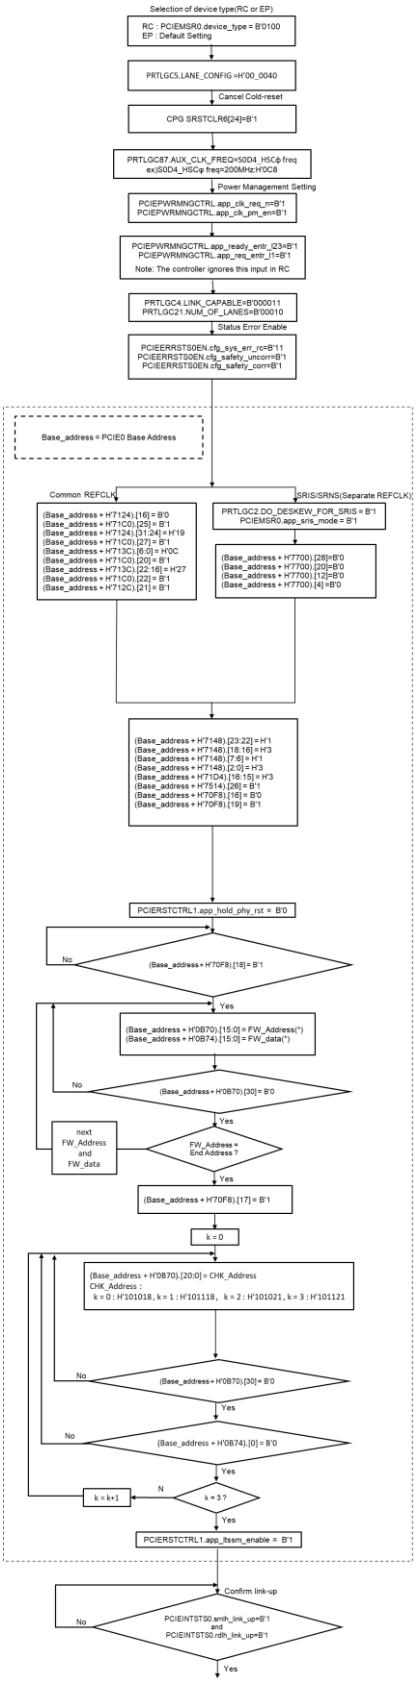

(*): FW_Address(ADDR) and FW_data(DATA) refer to attachment File "104_PCIe_fw_addr_data_ver1.05.txt"

Figure 104.3b Initial Setting of PCIEC(example)

(3) DL_Down Operation

Figure 104.4 shows the operation when a link goes down (LinkUP = 0) in the state where a link is established, thus causing DL_Down. When DL_Down is caused, PCIERSTCTRL1.app_ltssm_enable is set to 0. Since the current data is invalidated, all the resources of the data transmitter/receiver of this module are initialized.

- Upon DL_Down, a write to the transmission buffer is disabled thus stopping transmission.
- Upon DL_Down, the receive buffer is forcibly cleared.
- If a link goes down, transmission and reception are suspended; therefore, data before and after DL_Down becomes illegal. Since the specific process here differs depending on the application, the operation is simply indicated as “Processes errors.” in the flowchart shown in Figure 104.4.

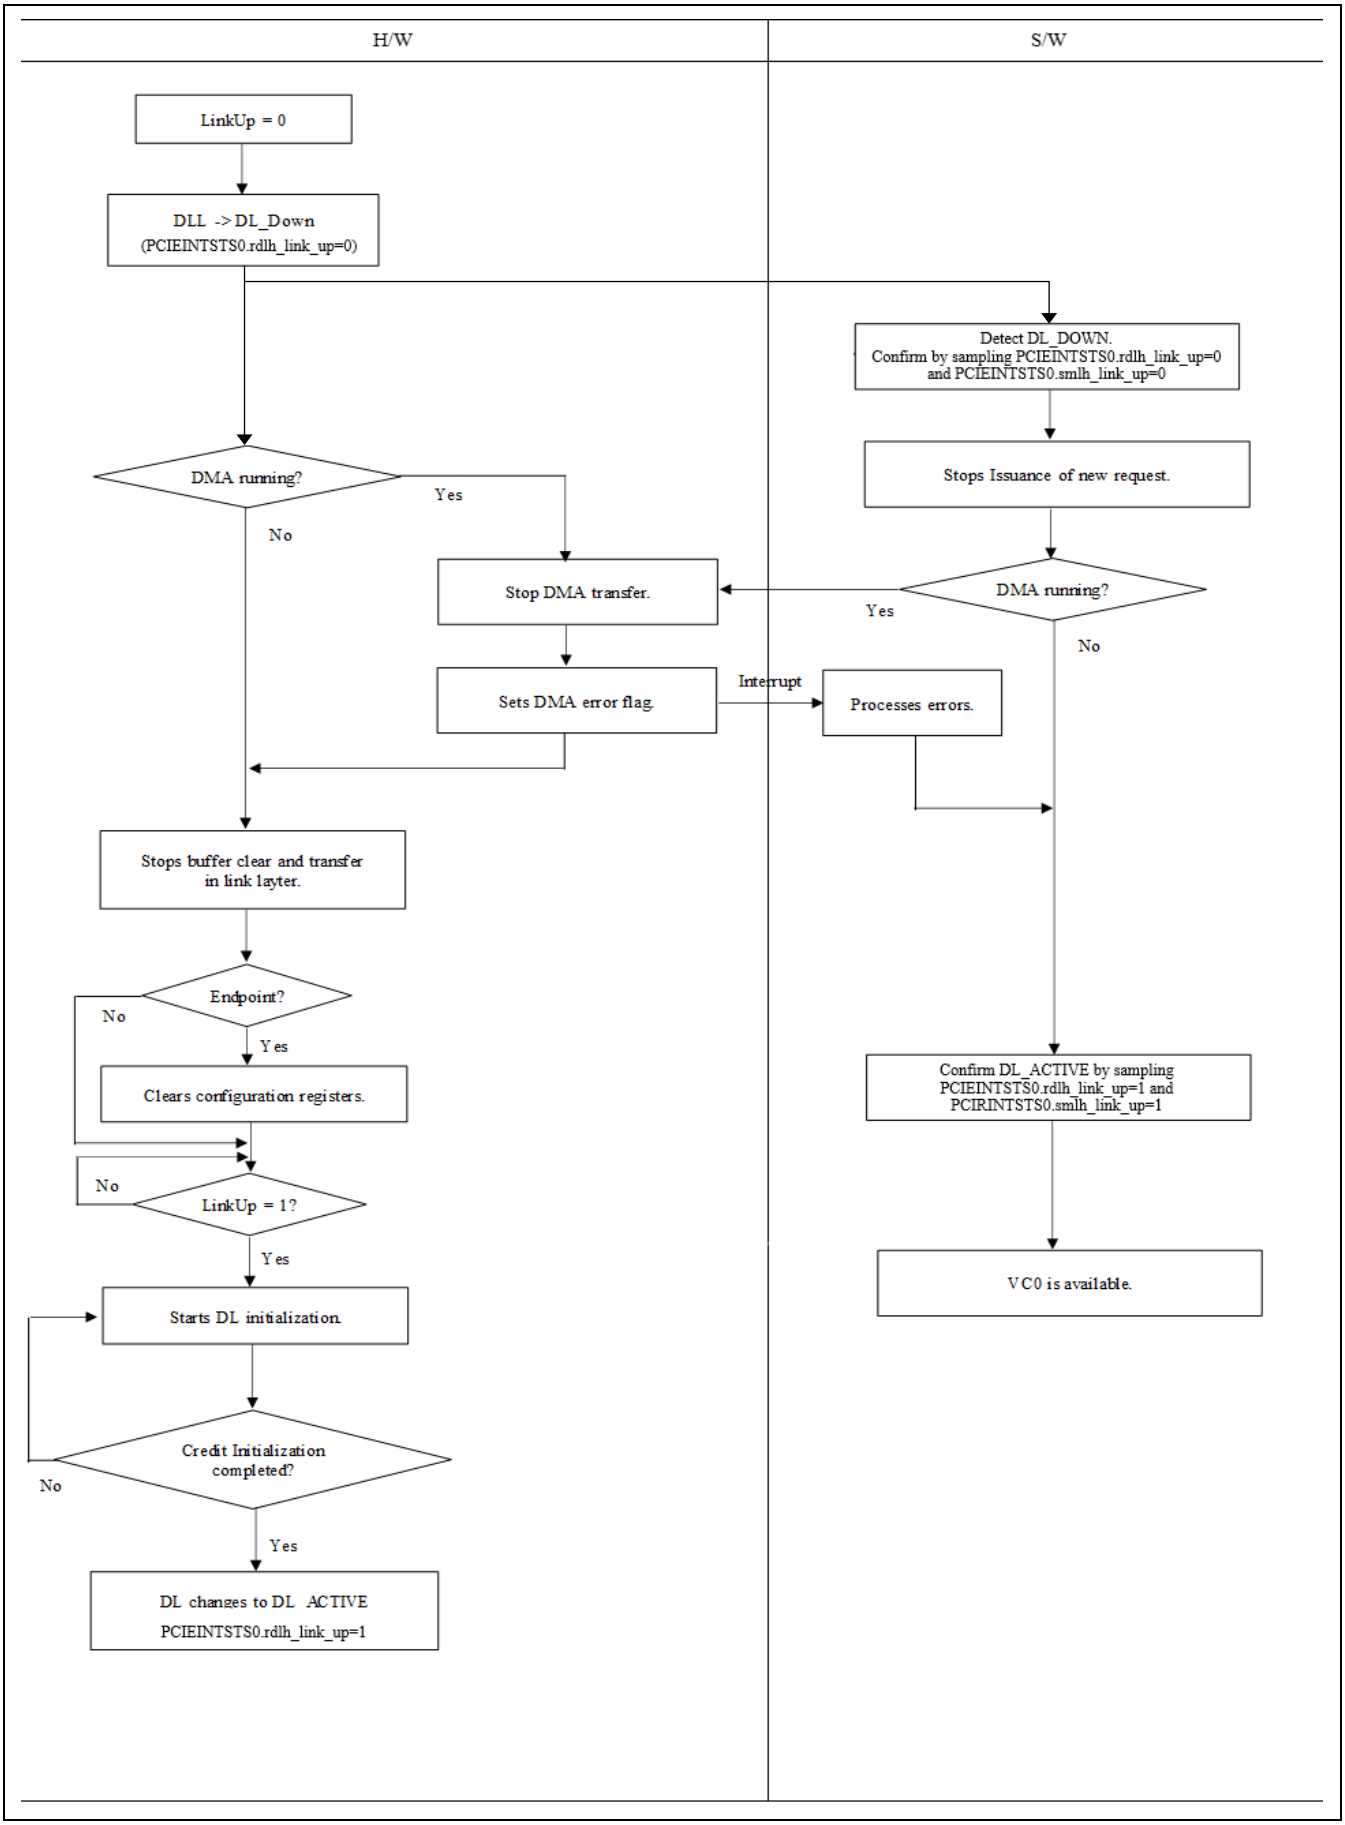

Figure 104.4 DL_Down Operation

(4) Hot Reset Operation

(a) Hot Reset Transmission

In Root Port mode, to send a hot reset to a downstream port, write 1 to the secondary bus reset bit in the configuration register. Before issuing a hot reset, confirm that this module has completed transfer.

(b) Hot Reset Reception

In Endpoint mode, when a hot reset is received from a downstream port, the LTSSM on the link layer makes a transition to the hot reset state. This causes LinkUp = 0 and then DL_Down = 1. After this, the same operation is performed as the operation upon the DL_Down.

104.3.5 Configuration Cycle

When using this module as a Root Port, a configuration cycle must be generated to configure the connection-target device. A configuration cycle refers to the process of checking the status of the configuration register of the connection-target Endpoint, switch, or bridge through the use of configuration access, and assigning values to the configuration registers of the Root Port itself and the Endpoint according to the result of the checking. When the Root Port accesses its own configuration register, such access is normally made through the internal bus.

This section describes the transmission (write) and reception (read) operations of the configuration access, and the items to be specified during a configuration cycle.

When this module is used as an Endpoint, it receives a configuration access from a Root Port, and accepts the initialization processing.

(1) Initialization of PCIEC in Root Port Mode

In Root Port mode, set all the Endpoints (indicated as system in the flow chart) connected to the PCIEC after link establishment.Figure 104.5 shows a sample setting flowchart.

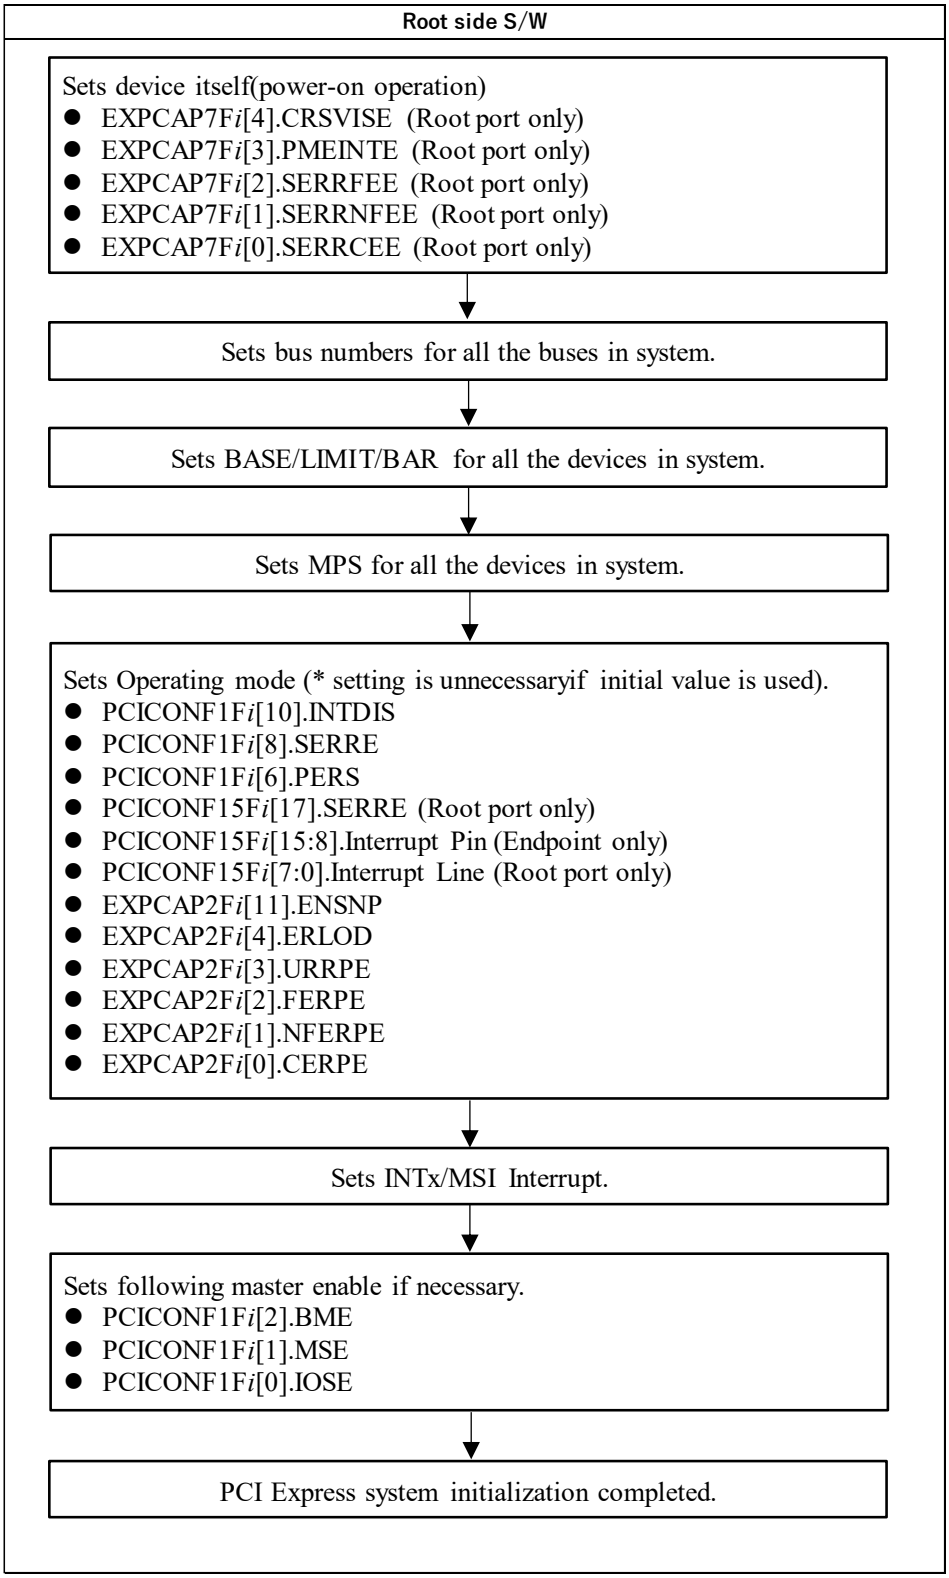

Figure 104.5 PCIEC Initialization in Root Port Mode

104.3.6 Overview of Transmission and Reception

PCI Express transfers are classified into two types of requests and one type of completion.

The following three methods are provided for PCI Express transactions. For details on each transfer, refer to the following sections.

1. Outbound: A request is issued from the internal bus side to a device on the PCI Express.
2. Inbound: A request is received by the internal bus side from the PCI Express.
3. DMA transfer: A great quantity of data is automatically written and read between the PCI Express and the internal bus without intervention of the CPU.

Table 104.9 shows the relationship between two types of requests and PCI Express transactions and shows the transaction issuance methods with this module.

Table 104.9 Relationship between Posted/Non-Posted Requests and PCI Express Transactions

Transaction Type	Transfer Type	Completion	Device Type that can Issue Transaction	Transaction Issuance Method with This Module	Operation
Memory Write	Posted	Not provided	Root Port &Endpoint	PIO, DMA, (MSI Endpoint only)	Data is written to the memory of the communication peer. 1 byte to 4 Kbytes of data not exceeding MPS*1 can be written.
Memory Read	Non-Posted	Provided	Root Port &Endpoint	PIO, DMA	A quantity of data not exceeding MRRS*2 is read from the memory of the communication peer. The read data is returned with a completion separately from this request; no data is included in this request.
I/O Write	Non-Posted	Provided	Root Port only	PIO	Data is written to I/O. Data size is 1 DW. A completion is necessary that indicates whether this request has succeeded.
I/O Read	Non-Posted	Provided	Root Port only	PIO	Data is read from I/O. No data is included. The read data and a completion that indicates whether this request has succeeded are necessary.
Configuration Write	Non-Posted	Provided	Root Port only	PCI Express transfer control register	Configuration write is performed. Data size is 1 DW. A completion is necessary that indicates whether this request has succeeded.
Configuration Read	Non-Posted	Provided	Root Port only	PCI Express transfer control register	Configuration read is performed. No data is included. The read data and a completion that indicates whether this request has succeeded are necessary.
Message	Posted	Not provided	Root Port & Endpoint	Issued by this IP, message transmit register, message transmit module	A message request is transmitted. This is used for power management and interrupt control.

Notes: 1. MPS: Max Payload Size
2. MRRS: Max Read Request Size

In Table 104.9, the transactions for which “Provided” is indicated in the “Completion” column, make a response with a completion. The data returned with a completion differs depending on the transaction. Table 104.10 shows the particulars of the completion contents returned. Specifically, the table shows whether

completion data for each type of transactions is included or not, the devices that can issue the transaction, and some other related information.

Table 104.10 Relationship between Completion and PCI Express Transactions

Transaction Type	Completion Data	Device Type that can Issue Transaction	Transaction Issuance Method with This Module	Operation
Memory Read	Included	Root Port & Endpoint	Automatically issued by this module.	Data requested by memory read request and status are returned.
I/O Write	Not included	Root Port only	Automatically issued by this module.	No data is included. Status in response to I/O write is returned.
I/O Read	Included	Root Port only	Automatically issued by this module.	Data size is 1 DW. The read data and a completion that indicates whether this request has succeeded are returned.
Configuration Write	Not included	Root Port only	Automatically issued by this module.	No data is included. Status in response to configuration write is returned.
Configuration Read	Included	Root Port only	Automatically issued by this module.	Data size is 1 DW. The read data and a completion that indicates whether this request has succeeded are returned.

104.3.7 Outbound (Data Transfer from Internal Bus → PCIEC → External Device)

This section describes Outbound. Outbound here refers to the transfer method to create a PCI Express packet by accessing the memory space assigned to the PCI Express via the internal bus.

(1) Outbound Features

Number of Outbound Address Translation Regions is 16.

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The iATU also supports type translation. Without address translation, your application address is passed unmodified to the TLPs directly through the Tx application interface. You can program the iATU to implement your own outbound address translation scheme without external logic.

Outbound Features:

- Address Match mode operation for MEM and I/O, CFG, and MSG TLPs. No translation for completions.
- Supports type translation through TLP type header field replacement for MEM or I/O types to MSG/CFG types.
  - Includes posted to non-posted translation (for example, MWr to CfgWr0)
  - No translation from completions.
- Programmable TLP header field replacement.
  - TYPE/TC/AT/ATTR/MSG-Code.
  - Function Number
- Multiple (up to 256) address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.

■ Invert Address Matching mode to translate accesses outside of a successful address match.

■ Configuration Shift mode. Optimizes the memory footprint of CFG accesses destined for the Rx application interface in a multifunction device.

■ Response code which defines the completion status to return for accesses matching a region.

■ Supports regions from 4 KB to 16 ZB in size.The minimum and maximum region sizes are determined by CX_ATU_MIN_REGION_SIZE and CX_ATU_MAX_REGION_SIZE. Smaller region sizes consume extra decode logic.

For AXI, this feature is applicable only when SLAVE_BUS_ADDR_WIDTH = 64; If SLAVE_BUS_ADDR_WIDTH < 64, CX_ATU_MAX_REGION_SIZE is restricted to 4GB. For AHB, this features is not applicable.

■ Payload Inhibit marks all TLPs as having no payload data.

■ Header Substitution replaces bytes 8 to 11 (for 3 DWORD header) or bytes 12 to 15 (for 4 DWORD header), inclusive, of the outbound TLP header.

■ Tag Substitution of the outbound TLP tag field.

■ Function number bypass mode to allow function number information to be supplied from your application transmit interface while translating the address and other attributes of the TLP.

■ DMA bypass mode to allow TLPs which are initiated by the embedded DMA engine, to pass through the iATU untranslated.

■ TLP Header fields bypass mode to allow header information to be supplied from your application transmit interface or, if AMBA is configured, from the AMBA sideband bus while translating the address and Type of the TLP.

***Note:** The default behavior of the ATU when there is no address match in the outbound direction or no TLP attribute match in the inbound direction, is to pass the transaction through.

(2) Outbound Limitations

■ Generation of ATS requests and messages not supported (no facility to insert NW and iTAG fields).

(3) Outbound Basic Operation (Address Match Mode)

The address field of each request MEM and I/O TLP is checked to see if it falls into any of the enabled address regions defined by the Start and End addresses as defined in Figure 104.6. When an address match is found, then the TLP address field is modified as follows:

Translated Address = Original Address - Base Address + Target Address

and the TYPE, TC, AT, TH, PH, ST, Function Number, and ATTR header fields are replaced with the corresponding fields in the ATUCAP[0+i*18] register. When your application (XALI0/1/2) address field matches more than one of the CX_ATU_NUM_OUTBOUND_REGIONS address regions, then the first (lowest of the numbers from 0 to CX_ATU_NUM_OUTBOUND_REGIONS-1) enabled region to be matched is used. For details on what happens when there is no address match, see “No Address Match Result”. This operational mode (called Address Match Mode) is always used for outbound translation. Figure 104.6 to Figure 104.7 provide more details on this translation process.

***Note:** The iATU does not translate DBI requests.

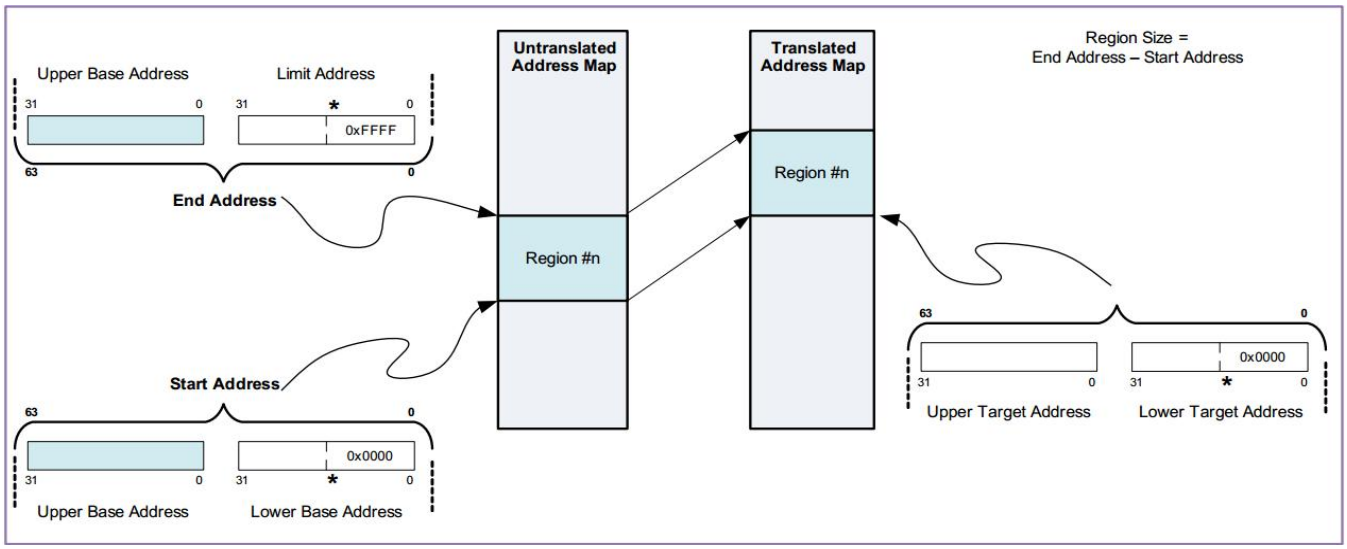

Figure 104.6 64-bit Region Mapping: Outbound and Inbound (Address Match Mode); INCREASE_REGION_SIZE=0

Note: * is log2(CX_ATU_MIN_REGION_SIZE)

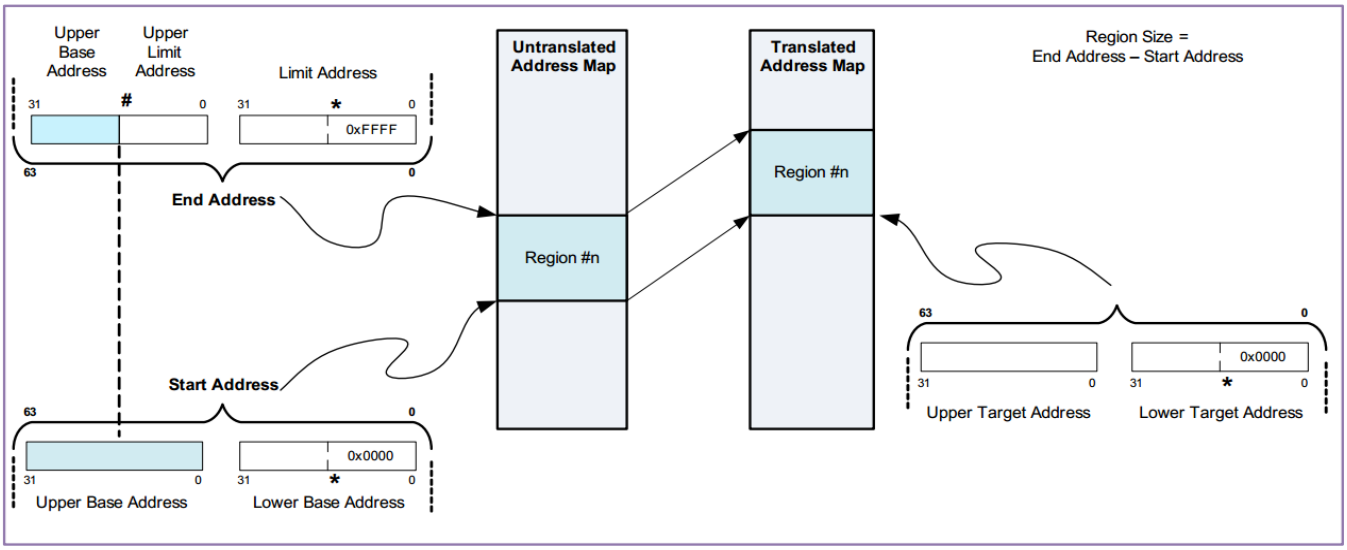

Figure 104.7 64-bit Region Mapping: Outbound and Inbound (Address Match Mode); INCREASE_REGION_SIZE=1

Note: * is log2(CX_ATU_MIN_REGION_SIZE)

The CX_ATU_MIN_REGION_SIZE configuration parameter (4 kB - 64 kB) specifies the minimum size of an address translation region. For example, when set to 64 kB, the lower 16 bits of the Base and Target registers are zero, the lower 16 bits of the Limit register is 0xFFFF, and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(CX_ATU_MIN_REGION_SIZE) bits are zero. In Figure 104.8, # is CX_ATU_MAX_REGION_SIZE; if =0, Upper Limit Address register does not exist.
The INCREASE_REGION_SIZE field in ATUCAP[0+i*18] determines if the maximum region size is 4 GB or is set by the CX_ATU_MAX_REGION_SIZE configuration parameter. This only applies to 64-bit addressing.

***Caution**: *The combination of region size and number of regions must not consume the maximum space that is addressable with your 32-bit or 64-bit system address*.

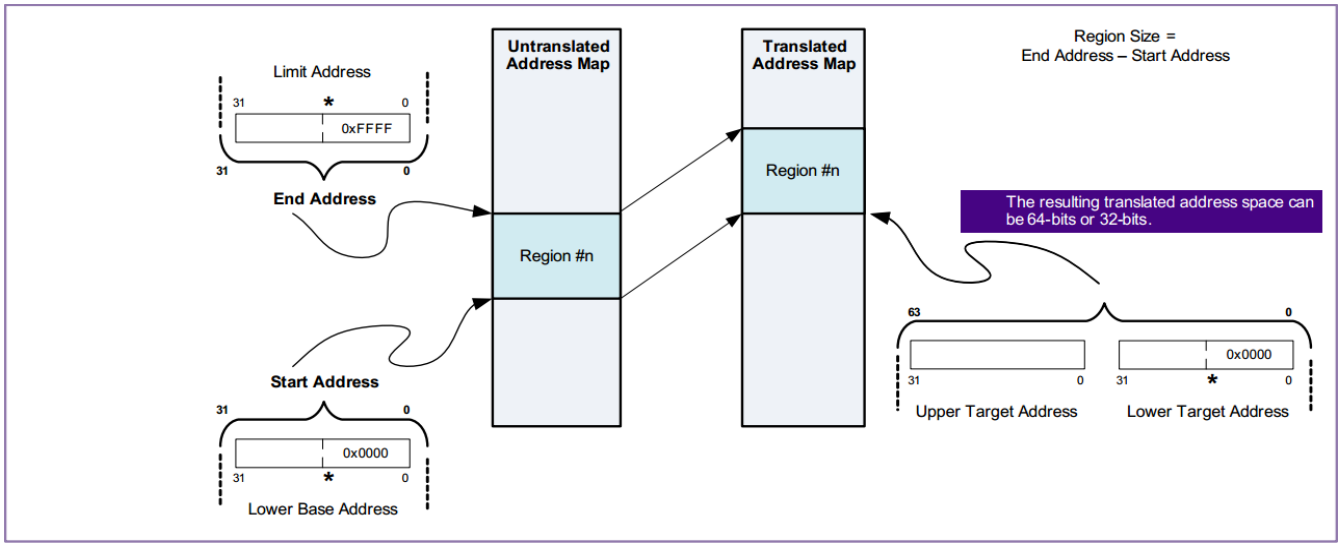

Figure 104.8 32-bit Region Mapping: Outbound and Inbound (Address Match Mode)

Note: * is log2(CX_ATU_MIN_REGION_SIZE)

(4) Outbound Detailed Operation

The following advanced topics are discussed:

Default Operation:

- RID BDF Number Replacement.
- IO/MEM to Msg/MsgD Type Translation.
- IO/MEM to CFG Type Translation.
- FMT Translation.
- Writing to a MRdLk Region.
- No Address Match Result

Optional Features:

- CFG Shift.
- Address Match Invert.
- General Bypass.
- DMA Bypass.
- Function Number Translation Bypass.
- TLP Header Field Translation Bypass.
- Payload Inhibit.

- Header Substitution.
- Tag Substitution.

(a) RID BDF Number Replacement:

Overview: When there is a successful address match on an outbound TLP, then the function number used in generating the function part of the requester ID field of the TLP is taken from the 3-bit Function Number field of the ATUCAP[0+i*18] register. The value in this field must be 0x0 unless multifunction operation in the controller is enabled. To override this behavior, use the “Function Number Translation Bypass”.

(b) IO/MEM to Msg/MsgD Type Translation:

Overview: The iATU supports TYPE translation/conversion of MEM and I/O TLPs to Msg/MsgD TLPs.
When there is a successful address match on an outbound MEM TLP, and the translated TLP type field is MSG (that is, the type field of the ATUCAP[0+i*18] register is 10xxx), then the message code field of the TLP is set to the value in the Message Code field of the
ATUCAP[1+i*18] register. A MWr with an effective length of ‘0’ is converted to Msg and all other MWr TLPs are converted to MsgD. For more information on generating messages, see “Message Generation”.

***Caution:** *The iATU does not translate outbound messages.*

Usage Scenario: This is useful for applications that are unable to generate Msg/MsgD TLPs.

(c) IO/MEM to CFG Type Translation:

Overview: The iATU supports translation of I/O and MEM TLPs to CFG TLPs. The 16-bit BDF is located at bits [31:16] of the translated address where:

Translated Address = Original Address - Base Address + Target Address

As an example

Original Address[31:16] = {13h0,function_no[2:0]}

Base Address[31:16] = 16h0

Target Address[31:16] = {bus_no[7:0],device_no[4:0],3h0}

Then

Translated Address[31:16] = BDF ={bus_no[7:0],device_no[4:0],function_no[2:0]}

To handle eight functions (as the previous example indicates), you should use a 19-bit wide region size.
For CFG transactions created directly by your application (as opposed to the iATU), you must ensure that the BDF field does not match any programmed iATU address region or else unintentional type translation could occur.
Usage Scenario: This is useful for applications that are unable to generate CFG TLPs.

(d) FMT Translation:

Overview: The iATU automatically sets the TLP format field for three DWORDs when it detects all zeros in the upper 32 bits of the translated address. Otherwise, it sets it to four DWORDs when it detects a 64-bit address (that is, when there is a ‘1’ in the upper 32 bits of the translated address). When the original address and the translated address are of different format, the iATU ensures that the TLP header size matches the translated address format.

(e) Writing to a MRdLk Region:

Overview: When there is a successful address match for an outbound write and the type header field in the ATUCAP[0+i*18]_i register is “00001” indicating a locked MEM transfer, then the controller sets the type field to “00000” (MEM).

(f) No Address Match Result:

Overview: When there is no address match then the address is untranslated but the TLP header information (for fields that are programmable) comes from the relevant fields on the application transmit interface XALI* or AXI slave.

(g) CFG Shift:

Overview: The iATU uses bits [27:12] of the original address to form bits [31:16] (BDF location) of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the *PCI Express Base Specification, Revision 4.0, Version 1.0*) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space.
Usage Scenario: This is useful for applications that implement Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the *PCI Express Base Specification, Revision 4.0, Version 1.0*).
Feature Configuration: To enable CFG shift feature, set the CFG_SHIFT_MODE field of the ATUCAP[1+i*18] register to ‘1’.

(h) Address Match Invert:

Overview: In normal operation an address match on an outbound TLP occurs when the untranslated address is in the region bounded by the base address and limit address. When the invert feature is enabled, an address match occurs when the untranslated address is not in the region bounded by the base address and limit address.
Feature Configuration: To enable Invert feature, set the INVERT_MODE field of the ATUCAP[1+i*18] register to ‘1’.

(i) General Bypass:

Not supported.

(j) DMA Bypass:

Overview: When you do not want the iATU to translate outbound requests that are generated by the DMA, you must implement one of the following approaches:

■ Ensure that the combination of DMA channel address programming and iATU control register programming causes no translation of DMA traffic to be done in the iATU, or (see below)

■ Enable the DMA bypass mode to allow request TLPs which are initiated by the embedded DMA controller to pass through the iATU untranslated.
Feature Configuration: To enable DMA bypass, set the DMA_BYPASS field of the ATUCAP[1+*i**18] register to '1'.

(k) Function Number Translation Bypass:

Overview: When function number translation bypass is enabled and region address is matched, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the ATUCAP[0+*i**18] register.

Feature Configuration: To enable function number translation bypass, set the FUNC_BYPASS field of the ATUCAP[1+*i**18] register to '1'.

(l) TLP Header Field Translation Bypass:

Overview: When TLP header field bypass is enabled and region address is matched, header fields of the translated TLP are taken from your application transmit interface or, if AMBA is configured, from the AMBA sideband bus and not from the corresponding fields of the ATUCAP[0+*i**18] or ATUCAP[1+*i**18] registers. The header fields are TC, ATTR *(RO and NS)* fields.
Feature Configuration: To enable TLP header field bypass, set the TLP_HEADER_FIELDS_BYPASS field of the ATUCAP[1+*i**18] register to '1'.

(m) Payload Inhibit:

Overview: When payload inhibit is enabled and region address is matched, the iATU converts transactions with data payload to TLPs without payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs.
***Note**:* This feature is not supported for MemWr/IOWr with data payload greater than 1DW.

***Caution:** This feature must not be used for outbound transactions with data poisoning, because the EP bit will be set for TLPs without data payload, this is a violation of data poisoning rules defined in section "2.7.2.2. Rules For Use of Data Poisoning" of the PCI Express Base Specification.

Usage Scenario: This is useful for Vendor Defined Msg (without data); your application sends a MWr over the AXI interface but does not set the byte write enables to 0.
Feature Configuration: To enable payload inhibit, set the the INHIBIT_PAYLOAD field of ATUCAP[1+*i**18] _i to '1'.

(n) Header Substitution:

Overview: When header substitution is enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the of LWR_TARGET_RW_OUTBOUND field in ATUCAP[5+*i**18].
***Note:** For a Vendor Defined Msg/MsgD having 4 DWORD header, when HEADER_SUBSTITUTE_EN =1, the 4th DWORD (bytes 12-15) is replaced with the contents of LWR_TARGET_RW_OUTBOUND field in the ATUCAP[5+*i**18] register. But regardless of the value of HEADER_SUBSTITUTE_EN, the 3rd DWORD is replaced with the contents of UPPER_TARGET_RW field in the ATUCAP[6+*i**18] register. So for a Vendor Defined Msg, BDF (or reserved) and Vendor ID must be programmed in UPPER_TARGET_RW.
Usage Scenario: This is useful for Vendor Defined Msg/MsgD and ATS transactions over the AXI bridge which is normally inefficient requiring a very large iATU region.

Feature Configuration: To enable header substitution, set the HEADER_SUBSTITUTE_EN field in ATUCAP[1+*i**18] register to '1'.

(o) Tag Substitution:

Overview: When tag substitution is enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in ATUCAP[1+*i**18].
ST substitution can still take place using the MSG_CODE field in ATUCAP[1+*i**18]. Your application must not attempt to perform TAG substitution for outgoing non-posted TLPs.
Usage Scenario: This is useful for translation from AXI MWr to Vendor Defined Msg/MsgD.
Feature Configuration: To enable tag substitution, set the TAG_SUBSTITUTE_EN field of the ATUCAP[1+*i**18] register to '1'.

(5) Outbound Programming

This section discusses the register programming interface and provides details of programming examples.

(a) iATU Outbound Programming Overview

You can access the iATU registers through the DBI interface or through BAR Matched Mem/IO requests.
The following registers are used for programming the iATU.

Table 104.11 iATU Register Map

Address	Label (i = 0 to CX_ATU_NUM_OUTBOUND_REGIONS-1)	Description
0x000	ATUCAP[0+*i**18]	Region Control 1
0x004	ATUCAP[1+*i**18]	Region Control 2
0x008	ATUCAP[2+*i**18]	Lower Base Address
0x00C	ATUCAP[3+*i**18]	Upper Base Address
0x010	ATUCAP[4+*i**18]	Limit Address
0x014	ATUCAP[5+*i**18]	Lower Target Address
0x018	ATUCAP[6+*i**18]	Upper Target Address
0x01C	ATUCAP[7+*i**18]	Region Control 3
0x020	ATUCAP[8+*i**18]	Upper Limit Address

Table 104.12 iATU Register Address Bus Layout

Register Bit	31-20	19	18-17	16-9	8	7-2	1	0
Value	Not used	0	Reserved	Region	Inbound/Outbound	Register Address	0	1

Table 104.13 Example: Address Table for Accessing iATU Outbound Region 1 Configuration Register

Address	Register	Register Bit Value							
		31-20	**19**	**18-17**	**16-9**	**8**	**7-2**	**1**	**0**

0x200	Region Control 1	0	0	0	1	001
0x204	Region Control 2	0	0	0	1	005
0x208	Lower Base Address	0	0	0	1	009
0x20C	Upper Base Address	0	0	0	1	00D
0x210	Limit Address	0	0	0	1	011
0x214	Lower Target Address	0	0	0	1	015
0x218	Upper Target Address	0	0	0	1	019

(b) Outbound iATU Programming Example

Define Outbound Region 1 as:
64 kB I/O region from 0x80000000_d0000000 to 0x80000000_d000ffff, to be mapped to 0x00010000 in the PCIe I/O space.

1. Setup the Region Base and Limit Address Registers.
   Write 0xd0000000 to Address {0x208} to set the Lower Base Address.
   Write 0x80000000 to Address {0x20C} to set the Upper Base Address.
   Write 0xd000ffff to Address {0x210} to set the Limit Address.
2. Setup the Target Address Registers.
   Write 0x00010000 to Address {0x214} to set the Lower Target Address.
   Write 0x00000000 to Address {0x218} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
   Write 0x00000002 to Address {0x200} to define the type of the region to be I/O.
4. Enable the region.
   Write 0x80000000 to Address {0x204} to enable the region.

104.3.8 Inbound (Data Transfer from External Device → PCIEC → Internal Bus)

This section describes Inbound. With Inbound, the device on the PCI Express accesses the device on the internal bus of this module through a PCI Express request packet.

(1) Inbound Features

Number of Inbound Address Translation Regions is 16.

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The iATU supports type translation. Without address translation, your application address is passed from the TLPs directly through the TRGT1 application interface. You can program the iATU to implement your own inbound address translation scheme without external logic.

- Programmable Match mode operation for MEM, I/O, CFG, and MSG TLPs. No translation for completions.
- Selectable BAR Match mode operation for I/O and MEM TLPs.
  - ❑ TLPs destined for the internal CDM (or ELBI) in an upstream port are not translated.
  - ❑ TLPs that are not error-free (ECRC, malformed and so on) are not translated.
- Selectable VF BAR Match mode operation for I/O and MEM TLPs which target VF BARs.
  - ❑ The VF BAR match mode enables all VFs in a PF which match a BAR to be matched with a single ATU region instead of an ATU region per VF.
- Programmable TLP header field matching.
  - ❑ TYPE/TD/TC/AT/ATTR/MSG-Code.
  - ❑ Function Number.
- Multiple (up to 256) address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.
- Invert Address Matching mode to translate accesses outside of a successful address match.
- ECAM Configuration Shift mode to allow a 256 MB CFG1 space to be located anywhere in the 64-bit address space.
- Supports regions from 4 KB to 16 ZB in size. The minimum and maximum region sizes are determined by CX_ATU_MIN_REGION_SIZE and CX_ATU_MAX_REGION_SIZE. Smaller region sizes consume extra decode logic.
  For AXI, this feature is applicable only when SLAVE_BUS_ADDR_WIDTH =64; If SLAVE_BUS_ADDR_WIDTH <64, CX_ATU_MAX_REGION_SIZE is restricted to 4GB.
- Single Address Location to allow all TLPs to be translated to a single address location.
- Msg Type Match Mode to allow matching of any TLP of type Message.

***Note:** The default behavior of the ATU when there is no address match in the outbound direction or no TLP attribute match in the inbound direction, is to pass the transaction through.

(2) Inbound Limitations

- Generation of ATS requests and messages not supported (no facility to insert NW and iTAG fields).

(3) Inbound Basic Operation

This section discusses how the iATU processes inbound requests. The topics are:

■ “Overview”

■ “I/O and MEM Match Modes”.

(a) Overview

***Note:** ■ The main difference between inbound and outbound iATU operation is that the TLP type is never changed in the inbound direction. Instead, the type field is used for more precise matching. Other fields can also be optionally used to further refine the matching process.

■ Another difference is that for MEM and I/O TLPs, you can select between address matching (as used in outbound operation) or BAR matching. Normally, an endpoint uses BAR match mode, and a root complex uses address mode as a root complex normally does not implement BARs.

The following translation rules and limitations apply:

■ When there is no match, then the address is untranslated. In addition

■ TLPs destined for the internal CDM or ELBI in an upstream port are not translated.

■ TLPs that are not error-free (ECRC, malformed and so on) are not translated.

■ Address translation of all TLP types (MEM, I/O, CFG, and MSG) except completion is supported in Address Match mode. In BAR Match mode, only translation of I/O and MEM is supported.

The setting of the MATCH_MODE field in ATUCAP[10+I*18] determines how iATU inbound matching is done for each TLP type.

Table 104.14 Determination of Match Mode

TLP Type	MATCH_MODE=0	MATCH_MODE=1
MEM or I/O	Address Match Mode	BAR Match Mode
CFG0	Routing ID Match Mode	Accept Mode
MSG/MSGD	Address Match Mode	Vendor ID Match Mode

(b) I/O and MEM Match Modes

Inbound address translation for I/O and MEM TLPs operates in one of two matching modes as determined by the “Inbound Match Mode” field in the ATUCAP[10+I*18] register.

Address Match Mode: The operation is similar to “Outbound Basic Operation (Address Match Mode)”. The address field of each request TLP is checked to see if it falls into any of the enabled address regions as shown in Figure 104.9. When an address match is found then the TLP address field is modified as follows:

Address = Address - Base Address + Target Address

When the TLP address field matches more than one of the CX_ATU_NUM_INBOUND_REGIONS address regions, then the first (lowest of the numbers from 0 to CX_ATU_NUM_INBOUND_REGIONS -1)enabled region to be matched is used.

BAR Match Mode

Looking for an address match is a two-step process.

1. The standard internal PCI Express BAR Matching Mechanism checks if the address field of any MEM and I/O request TLP falls into any address region defined by the enabled BAR addresses and masks.

2. When a matched BAR is found, then the iATU compares the BAR ID to the BAR Number field in the ATUCAP[10+I*18] register for all enabled regions. Figure 104.9 and Figure 104.10 below provide more details on inbound translation in BAR Match Mode.

***Attention:** BAR Match Mode can only be used for MEM and I/O transactions.*

When the PCIe controller is operating with 64-bit BARs, the operation is defined as in Figure 104.9 on where * is log2(BAR_MASK+1).

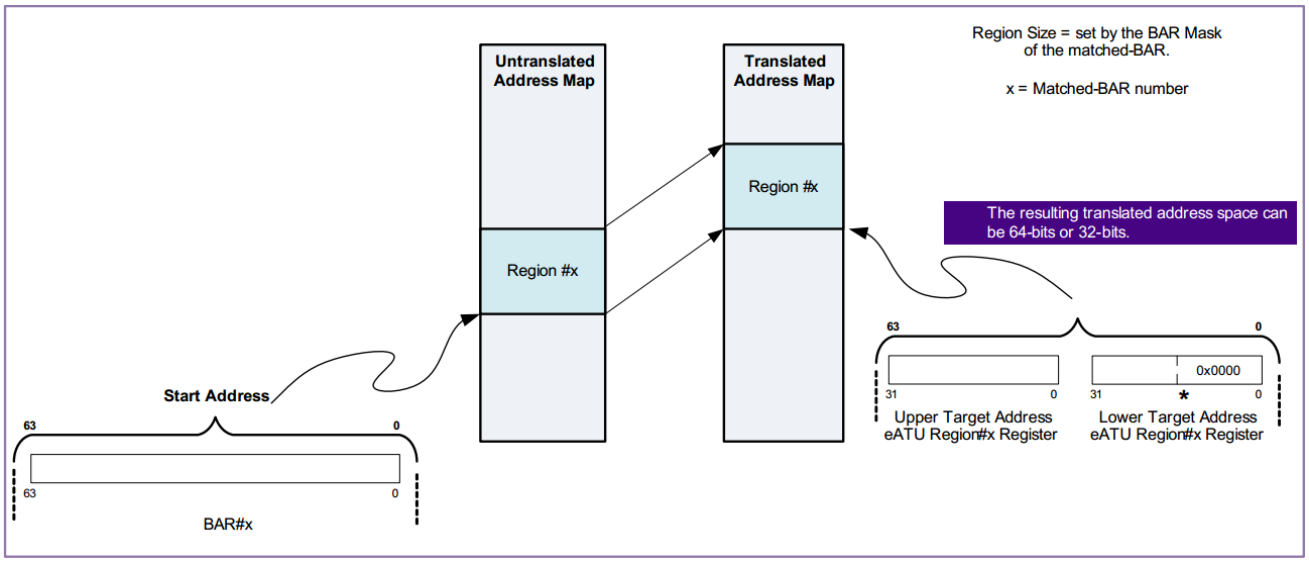

Figure 104.9 iATU Address Region Mapping: Inbound (BAR Match Mode), 64-bit BAR

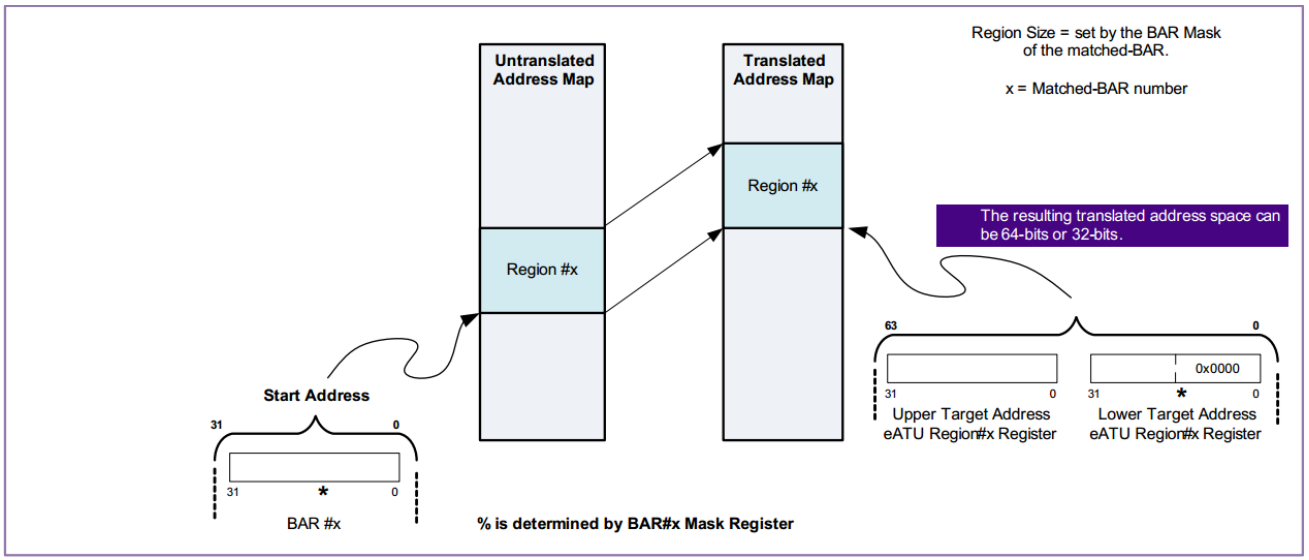
In address match mode, when the address range does not match one of its BAR ranges in an upstream port, then the device rejects the request with unsupported request (UR) completion status and no translation occurs. When the PCIe controller is operating with 32-bit BARs, the operation is defined as in Figure 104.10

Figure 104.10 iATU Address Region Mapping: Inbound (BAR Match Mode), 32-bit BAR



(4) Inbound Detailed Operation

The following advanced topics are discussed:

- “Single Address Location”.
- “CFG Handling (Upstream Port)”.
- “Optional Matching Fields”.
- “Response Code Feature”.
- “iATU Inbound MSG Handling”.

- “Msg Type Match Mode”.
- “Fuzzy Type Match Mode”.
- “FMT Translation”.
- “Invert Feature”.

(a) Single Address Location

When enabled and region address is matched, the TLPs can be translated to a single address location as determined by the target address register of the iATU region. This feature can be enabled using the SINGLE_ADDR_LOC_TRANS_EN field in ATUCAP[10+i*18]. This feature is useful for translating messages when AXI bridge is enabled.

Received Message TLP Header Bytes 8 - 15 at TRGT1 Interface

Bytes 8 to 15 of the received TLPs header destined for TRGT1 are made available on radm_trgt1_hdr_uppr_bytes irrespective of TLP translation. When radm_trgt1_hdr_uppr_bytes_valid is asserted your application should use radm_trgt1_hdr_uppr_bytes along with radm_trgt1_data.The radm_trgt1_hdr_uppr_bytes_valid is set only when an ATU match occurs for Single Address Location enabled region.
For example, if a received MsgD matches a Single Address Location enabled ATU region, bytes 8 to 15 of the MsgD header are available on radm_trgt1_hdr_uppr_bytes when radm_trgt1_hdr_uppr_bytes_valid is asserted, and radm_trgt1_hv is true. The available radm_trgt1_hdr_uppr_bytes can be concatenated with radm_trgt1_data and used by your application.

*Note: The width of radm_trgt1_ hdr_uppr_bytes is FLT_Q_ADDR_WIDTH bits. For radm_trgt1_hdr_uppr_bytes[63:32] to exist FLT_Q_ADDR_WIDTH must be 64. If 32 < FLT_Q_ADDR_WIDTH < 64, radm_trgt1_hdr_uppr_bytes[FLT_Q_ADDR_WIDTH-1:32] = 0.

(b) CFG Handling (Upstream Port)

The controller normally routes CFG TLPs (to the internal CDM or ELBI) without translation. The iATU only translates CFG0 TLPs that the controller has routed to the TRGT1. Inbound address translation for CFG0 TLPs operates in one of two matching modes as determined by the Inbound CFG0 MATCH_MODE field in the ATUCAP[10+i*18] register.

Accept Mode

The controller always accepts CFG0 TLPs even when the CFG bus number does not match the current bus number of the device. This mode follows that behavior. The routing ID of received CFG0 TLPs are ignored when determining a match.

Routing ID Match Mode

The operation is similar to “Outbound Basic Operation (Address Match Mode)”. The routing ID of the inbound CFG0 TLP must fall within the Base and Limit of the defined iATU region for matching to proceed. The iATU interprets the routing ID (Bytes1 8-11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM and I/O transactions.

CFG Shift Feature

Inbound CFG transactions routed to the Rx application interface can exist anywhere in address space, because the PCIe controller filter processes the routing ID (BDF) as bits [31:16] of an address. This BDF changes according on the PCIe bus topology. A compressor feature (CFG Shift Feature) can be enabled by setting the CFG Shift bit in the ATUCAP[10+i*18] register. Bits [15:12] of the third DWORD1 of CFG TLPs are reserved. The compressor feature uses this fact to reduce the memory requirement. This shifts/maps the BDF (bits [31:16] of the third header DWORD, which would be matched against the Base and Limit addresses) of the incoming CfgRd0/CfgWr0 down

to bits[27:12]of the translated address.

CFG1 Transactions

For CfgRd1/CfgWr1 transactions, the base and limit addresses could enclose the entire 32-bit 4GB memory space with the routing ID forming the upper 16 bits. The target address maps these CFG transactions to anywhere in application address space.

(c) Optional Matching Fields

In address and BAR match modes, a successful address/BAR match can be optionally gated by successful matching of the following programmable TLP header fields (per region):

- TD/TC/AT/ATTR/TH/PH/ST.
- MSG Code (MSG TLPs only).
- Function number (MEM, I/O, or CFG TLPs only).
- Virtual function number (MEM or I/O TLPs only).

For each of the previous fields in the ATUCAP[9+i*18] register, there is an associated Match Enable bit in the ATUCAP[10+i*18] register. Address translation only proceeds when compares on all enabled field are successful.

(d) Response Code Feature

When the Response Code field of the ATUCAP[10+i*18] register is set to a value other than 00, the controller uses it to determine the completion status field of completion TLPs sent in response to successfully matched non-posted TLPs. This can be set to unsupported request (UR) or completer abort (CA). When the error response field is set to 2b00, then the normal receive filter response for this TLP is used.

***Note:** Response Code feature is not available in regions where Single Address Location Enable is set.

(e) iATU Inbound MSG Handling

Inbound message (Msg/MsgD) transactions can use one of two matching modes:

- **Address Match Mode**

  The third and fourth header DWORDs are treated as an address and are compared against the iATU Region Base and Limit Address registers. For vendor defined messages this allows specific messages to be filtered into memory at the target address. The Upper Base address should be set to Bus Device Function (BDF) and Vendor ID. The Lower Base address can be used as a filter for specific messages.

- **Vendor ID Match Mode**

  This mode is relevant for ID-routed vendor defined messages. The iATU ignores the routing ID (BDF) in bits [31:16] of the third DWORD of the TLP header1, but compares it against the vendor ID in bits [15:0] of the third DWORD of the TLP header (bytes1 10 and 11). This allows vendor defined messages to be filtered against specific vendor IDs without needing to know the BDF number which might vary depending on the PCI topology. Bits [15:0] of the Region Upper Base register should be programmed with the required vendor ID as follows:

  Region Upper Base[15:8] =byte 10

  Region Upper Base[7:0] =byte 11

  The lower base and limit register should be programmed to translate TLPs based on vendor-specific information in the fourth DWORD of the TLP header.

■ For a proper understanding of messages, you should be familiar with Section 2.2.8, Message Request Rules of the PCI Express Base Specification.

(f) Msg Type Match Mode

Inbound message (Msg/MsgD) transactions can also use Msg Type matching mode. When this mode is enabled and “Single Address Location” is enabled, the iATU matches Msg TLP Type field with TYPE field of ATUCAP[9+i*18] register.
If “Fuzzy Type Match Mode” is also enabled, then any Msg received is matched (that is, Msg Type's sub-field r[2:0], which specifies the Message routing mechanism, is ignored).

****Caution:** The Message should be consumed by your application before the next message arrives as all messages go to the same address.

***Note:** If SINGLE_ADDR_LOC_TRANS_EN is set for any region, then you must ensure that the same TLP cannot be matched in any other region where SINGLE_ADDR_LOC_TRANS_EN is not set. If this *happens* *radm_trgt1_hdr_uppr_bytes* could have incorrect data.

(g) Fuzzy Type Match Mode

When enabled, the iATU relaxes the matching of the TLP type field against the expected type field so that:

- CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1.
- MWr, MRd and MRdLk TLPs are seen as identical.
- The routing field of MsgD TLPs is ignored.
- Atomic Ops TLPs - FetchAdd, Swap, and CAS are seen as identical.

For example, CFG0 in the type field in ATUCAP[9+*i**18] register matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. To enable this feature, set the Fuzzy Type Match Mode bit of the ATUCAP[10+i*18] register.

(h) FMT Translation

The iATU automatically sets the TLP format field for three DWORDs when it detects all zeroed in the upper 32 bits of the translated address. Otherwise it sets it to four DWORDs when it detects a 64-bit address (when there is a 1 in the upper 32 bits of the translated address). When the original address and the translated address are of a different format then the iATU ensures that the TLP header size matches the translated address format.

(i) Invert Feature

Normally an address match on an inbound TLP occurs when the untranslated address is in the region bounded by the Base address and Limit address. When the Invert feature is activated, an address match occurs when the untranslated address is not in the region bounded by the Base address and Limit address. This feature is activated by setting the INVERT_MODE field of the ATUCAP[10+i*18] register.

(5) Inbound Programming

This section discusses the register programming interface and provides details of programming examples.

(a) iATU Inbound Programming Overview

You can access the iATU registers through the DBI interface or through BAR Matched Mem/IO requests.
The following registers are used for programming the iATU.

Table 104.15 iATU Register Map

Address	Label (i=0 to CX_ATU_NUM_INBOUND_REGIONS-1)	Description
0x100	ATUCAP[9+*i**18]	Region Control 1
0x104	ATUCAP[10+*i**18]	Region Control 2
0x108	ATUCAP[11+*i**18]	Lower Base Address
0x10c	ATUCAP[12+*i**18]	Upper Base Address
0x110	ATUCAP[13+*i**18]	Limit Address
0x114	ATUCAP[14+*i**18]	Lower Target Address
0x118	ATUCAP[15+*i**18]	Upper Target Address
0x11C	ATUCAP[16+*i**18]	Region Control 3
0x120	ATUCAP[17+*i**18]	Upper Limit Address

Table 104.16 iATU Register Address Bus Layout

Register	31-20	19	18-17	16-9	8	7-2	1	0
Value	Not used	0	Reserved	Region	Inbound/Outbound	Register Address	0	1

Table 104.17 Example: Address Table for Accessing iATU Inbound Region 1 Configuration Registers

Address	Register	Register Bit Value							
		31-20	19	18-17	16-9	8	7-2	1	0
0x300	Region Control 1	0	0	0	1	101			
0x304	Region Control 2	0	0	0	1	105			
0x308	Lower Base Address	0	0	0	1	109			
0x30C	Upper Base Address	0	0	0	1	10D			
0x310	Limit Address	0	0	0	1	111			
0x314	Lower Target Address	0	0	0	1	115			
0x318	Upper Target Address	0	0	0	1	119			
0x31C	Region Control 3	0	0	0	1	11D			
0x320	Upper Limit Address	0	0	0	1	121			

(b) Inbound Programming Examples

Address Match Mode Example

Define Inbound Region 0 as, MEM region matching TLPs with addresses in the range 0x00010000 to 0x0005ffff mapped to 0x1000_0000_2000_0000 - 0x1000_0000_2004_ffff in your application memory space.

1. Setup the Region Base and Limit Address Registers.
   Write 0x00010000 to Address {0x108} to set the Lower Base Address.
   Write 0x00000000 to Address {0x10C} to set the Upper Base Address.
   Write 0x0005ffff to Address {0x110} to set the Limit Address
2. Setup the Target Address Registers.
   Write 0x20000000 to Address {0x114} to set the Lower Target Address.
   Write 0x10000000 to Address {0x118} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
   Write 0x00000000 to Address {0x100} to define the type of the region to be MEM.
4. Enable the region.
   Write 0x80000000 to Address {0x104} to enable the region in address match mode.

BAR Match Mode Example

Define Inbound Region 2 as MEM region matching BAR4 (BAR match mode) mapping to 0x8000_0000_2000_0000 in your application memory space.

1. Setup the Target Address Registers.
   Write 0x20000000 to Address {0x514} to set the Lower Target Address.
   Write 0x80000000 to Address {0x518} to set the Upper Target Address.

2. Configure the region through the Region Control 1 Register.
   Write 0x00000000 to Address {0x500} to define the type of the region to be MEM.

3. Enable the region for BAR Match Mode.
   Write 0xC0000400 to Address {0x504} to enable the region for BAR match mode for BAR#4.

Note: Default number of inbound regions is 2 (CX_ATU_NUM_INBOUND_REGIONS), so region 2 is not accessible by default.

***Attention:* EP port**: Defined MEM or I/O regions must be inside an enabled BAR range.
RC port: Defined MEM or I/O regions must either match a BAR or be outside of the base and limit ranges defined for the port in the Type 1 configuration header.

104.3.9 DMA Transfer

This section describes the DMA transfer using the DMAC (PCIEC-DMAC) incorporated in this module.

(1) Overview of DMA Transfer

The RC system CPU, or the EP application CPU, can offload the transferring of large blocks of data to the embedded DMA controller, leaving the CPU free to perform other tasks. You can configure the DMA to have one to eight read channels and one to eight write channels. It can simultaneously perform the following types of memory transactions (as shown in Figure 104.12):

- **DMA write**
  Transfer (copy) of a block of data from local (application) memory to remote (link partner) memory.

- **DMA read**
  Transfer (copy) of a block of data from remote (link partner) memory to local (application) memory.

Therefore the DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (IMWr) to the remote CPU. The DMA is highly configurable and you can program it using the local DBI or over the PCIe wire.

In linked list mode, the DMA fetches the transfer control information (called channel context) for each transfer (block), from a list of DMA elements that you have constructed in local memory.

Table 104.18 identifies the limitations when using the DMA module.

PCIEC-DMAC has features shown in Table 104.18.

Table 104.18 DMA Module Features

No	DMA Module Feature	Support	Note
1	Number of Read Channels	8 ch	
2	Number of Write Channels	8 ch	
3	AXI Support	Y	
4	Native Controller Support (no AXI)	N	Not support
5	Linked List Mode	Y	Independent on implementation setting.
6	Linked List Descriptor Alignment	DWORD	Independent on implementation setting.
7	Scatter Gather Support (by using Linked Lists)	Y	Independent on implementation setting. Perform Scatter Gather using Linked lists function.
8	Full Duplex Read/Write Channel Operation	Y	Independent on implementation setting. Read channel and Write channel are independent
9	Separate Tag Pool For DMA Traffic	Y	Independent on implementation setting. In the packet of DMA, use the managed tag separately from PCIe tag. (There is no need to be aware of tag duplication)
10	SAR/DAR Address Alignment	BYTE	Independent on implementation setting.
11	Transfer Size	1byte - 4 GB	Independent on implementation setting.
12	AXI Address Bus Width	32	
13	AXI Databus Width	256	

14	Independent Internal, Master and Slave Databus Widths	Y	Internal bus data width and Master/Slave data width are independent. Data width of Master and Slave is the same.
15	Independent Controller and AXI Clocks	Y	Clocks of AXI and DMA are independent. (AXI S0D2_HSCφ, DMA module 500MHz(pclk))
16	Multifunction Support	Y	Independent on implementation setting. Support 2 function.
17	DMA	Y	
18	ARI	N	Not support
19	SR-IOV	N	Not support
20	Latency Tolerance Reporting (LTR) Support	Y	
21	OBFF Support	N	Not support
22	Address Translation Services (ATS) Support	N	Not support
23	Atomic Ops Support	-	Not support
24	TLP Processing Hints (TPH) Support	N	Not support
25	TLP Prefix Support (Including PASID)	-	Not support
26	Programmable Interrupt Generation	Y	Independent on implementation setting. Function to generate interrupt with MWr after DMA transfer completed.
27	Reordering Of DMA Read Transfer Completions	Y	Independent on implementation setting. Function to re-order and return it on the AXI bus even if Completion for Read Request is returned out of bound.
28	ID Based Ordering (IDO) Signaling Support	N	Not support
29	Datapath and RAM Protection	N	Not support
30	RAM Read Enable for Low-power Optimization	Y	Independent on implementation setting.
31	Automatic Flushing/Reset of Bridge (AXI Configurations) When Link Goes Down	Y	Independent on implementation setting.
32	Automatic Flushing of Slave (AXI Configurations) When Link is Not Up	Y	Independent on implementation setting.

Table 104.19 DMA Module Limitations

Limitation	Note
Memory DMA Traffic Only	I/O and Type 0 or Type 1 configuration DMA transfers are not supported.

(2) Architecture Overview

A DMA write and read channel operate independently to maximize the performance of the DMA read and write data transfers over the PCIe link. When you configure the DMA with multiple read channels, then it uses a weighted round robin (WRR) arbitration scheme to select the next read channel to be serviced. The same applies when you have multiple write channels.

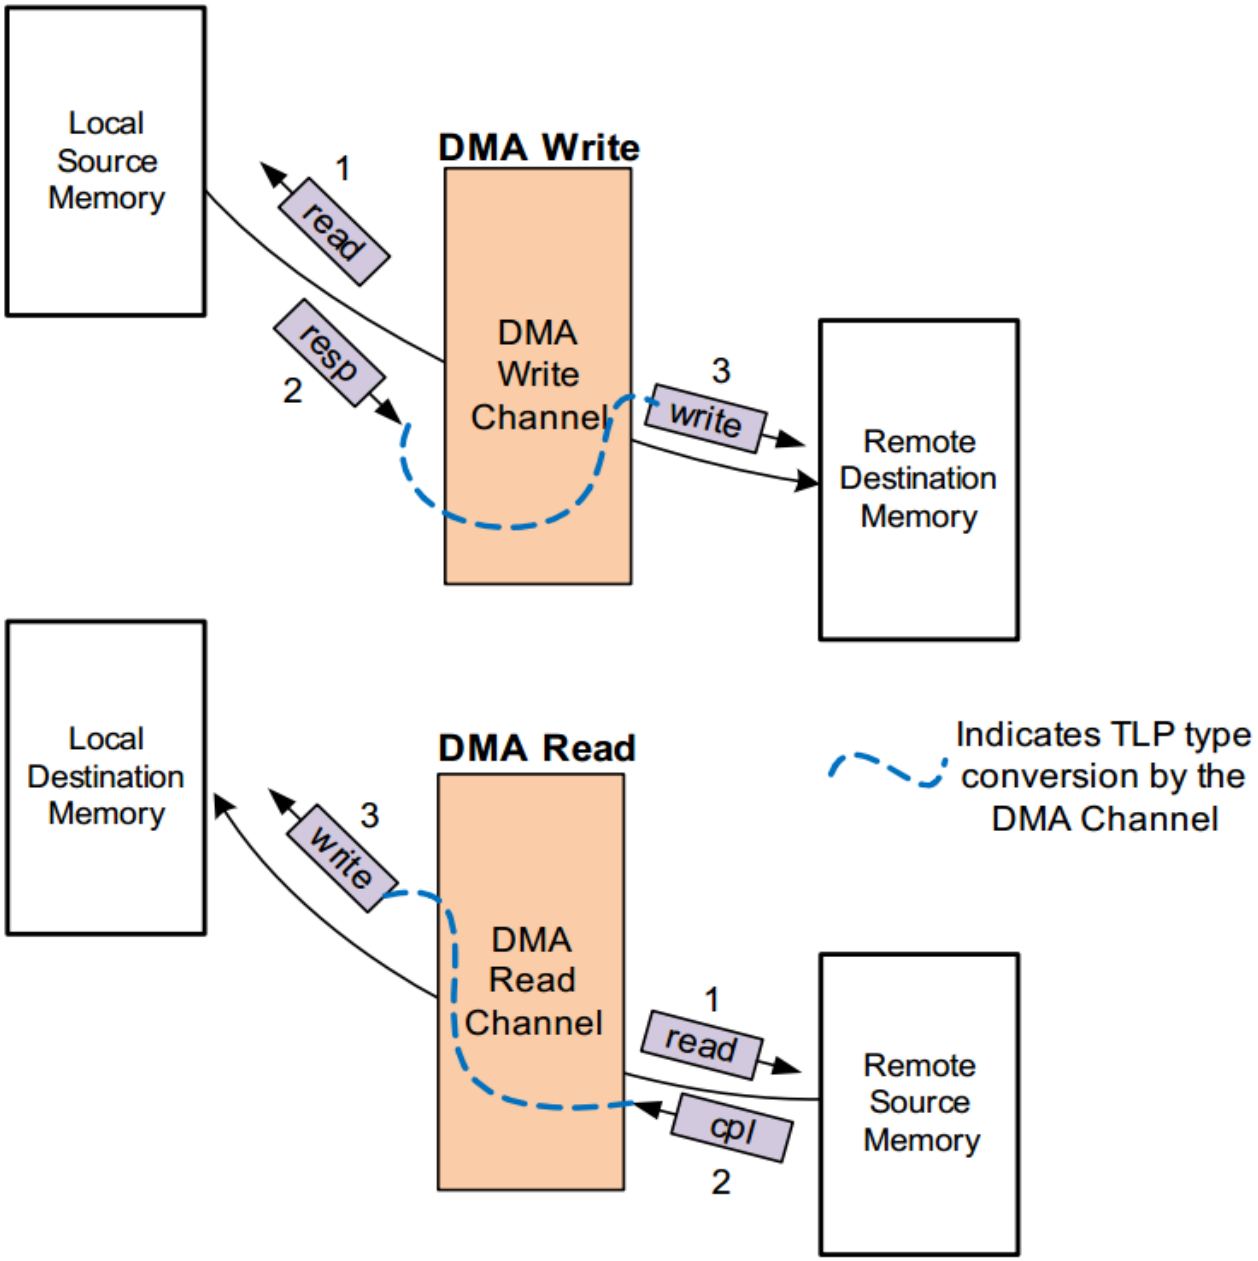


Figure 104.12 System Level View of DMA

DMA Write Transfer

The DMA injects multiple MRd requests of size less than or equal to Max_Payload_Size into the inbound request path, directed toward the local application. The DMA converts the read responses into MWr TLPs that it then transmits to the remote link partner. When the DMA data transfer is complete the CPU is notified. For more details, see “Interrupts and Error Handling”. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory.

DMA Read Transfer

The DMA injects multiple MRd requests of size less than or equal to the minimum of {Max_Read_Request_Size, Max_Payload_Size} into the outbound request path, directed toward the remote link partner. The DMA converts the read responses into write requests that it then transmits to the local application. When the DMA data transfer is complete, the CPU is notified. For more details, see “Interrupts and Error Handling”. For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory.

RAM Requirements

The DMA requires two RAMs.

Registers and Context Memory

You program each DMA transfer (channel) using the registers described in “DMA Software Register Map”. The registers that are specific to each channel are called the channel context registers. As the transfer progresses, the DMA updates these registers. You program the channel context information and other DMA control registers directly with the local CPU through the DBI or remotely over the PCIe link.

Some of the registers are implemented in a high-speed wide interface context RAM. If you implement your RAMs external to the PCIe controller, you must connect this RAM through the external RAM interfaces.

(3) Interrupts and Error Handling

The registers referenced in Figure 104.13 and Figure 104.14 that are related to error and interrupt handling are described in “DMA Software Register Map”.
The DMA generates two interrupts per channel:

- **Done**: The DMA successfully completes the transfer.
- **Abort**: The DMA fails to complete the transfer, or an error occurs during the transfer.

The interrupts are signaled to the software on your CPU, using one or both of the following mechanisms:

- Locally through the edma_int[CC_NUM_DMA_RD_CHAN+CC_NUM_DMA_WR_CHAN-1:0] bus.
- Remotely using a posted memory write (IMWr), which can be interpreted as an MSI when directed toward the RC.
  - There are two programmable IMWr addresses per channel, one each for the done and abort interrupts. For MSI, you must program all IMWRr address registers with the same MSI address, as PCIe only supports a single MSI address per function.
  - A single IMWr data register is used for both types of interrupts, so you must read DMACAP23 (or DMACAP10) to identify the interrupt type.
- The relaxed ordering (RO) bit is automatically set to zero in the TLP header of all IMWr’s so that subsequent MWr TLPs do not arrive at the remote device before the IMWr.

The interrupt handling mechanism is different for linked list (LL) mode (than non LL mode), and there are also some differences between the read and write channels.

Non Linked List Mode Interrupt Handling

You enable the local and remote interrupts through the local and remote interrupt enable (LIE and RIE) bits: DMACAP[37+i*16].LIE and DMACAP[37+i*16].RIE.

In the write channel, there is only one error condition that results in an abort interrupt. For more details, see “Linked List Mode”. You mask, clear, and read the status of each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in Figure 104.13.
In the read channel, there are five error conditions that results in an abort interrupt. For more details, see “Linked List Mode”. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in Figure 104.14. However, you can read the status of each of the five abort errors (that contribute to the abort interrupt) through DMACAP26 and DMACAP27.

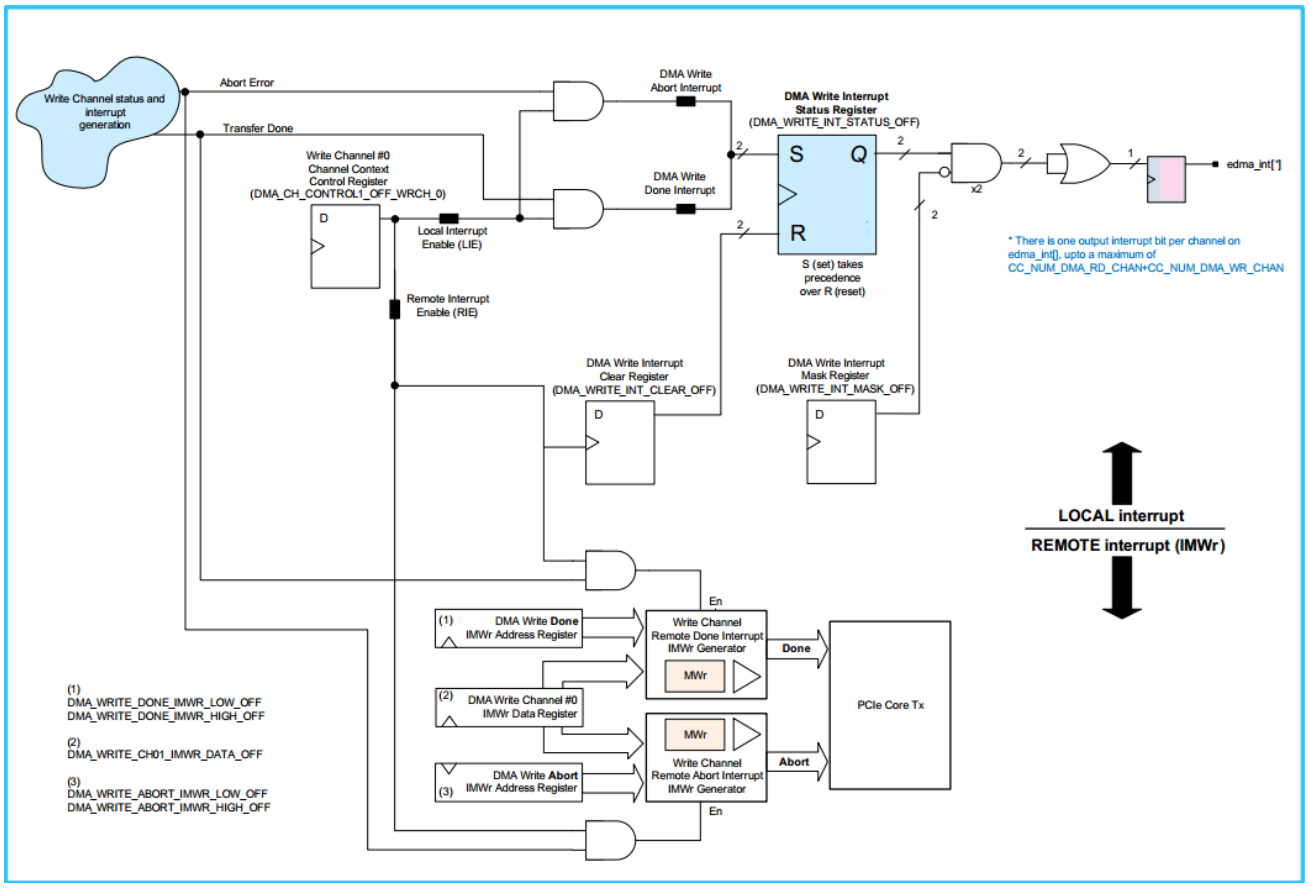

Figure 104.13 Write Interrupt Generation - Non Linked List Mode - Shown For Write Channel #0

****Hint:** If you want a remote interrupt and not a local interrupt then:

- Set LIE and RIE
- Mask the local interrupt using the mask register

This allows you to poll the status register to distinguish a DONE from an ABORT.

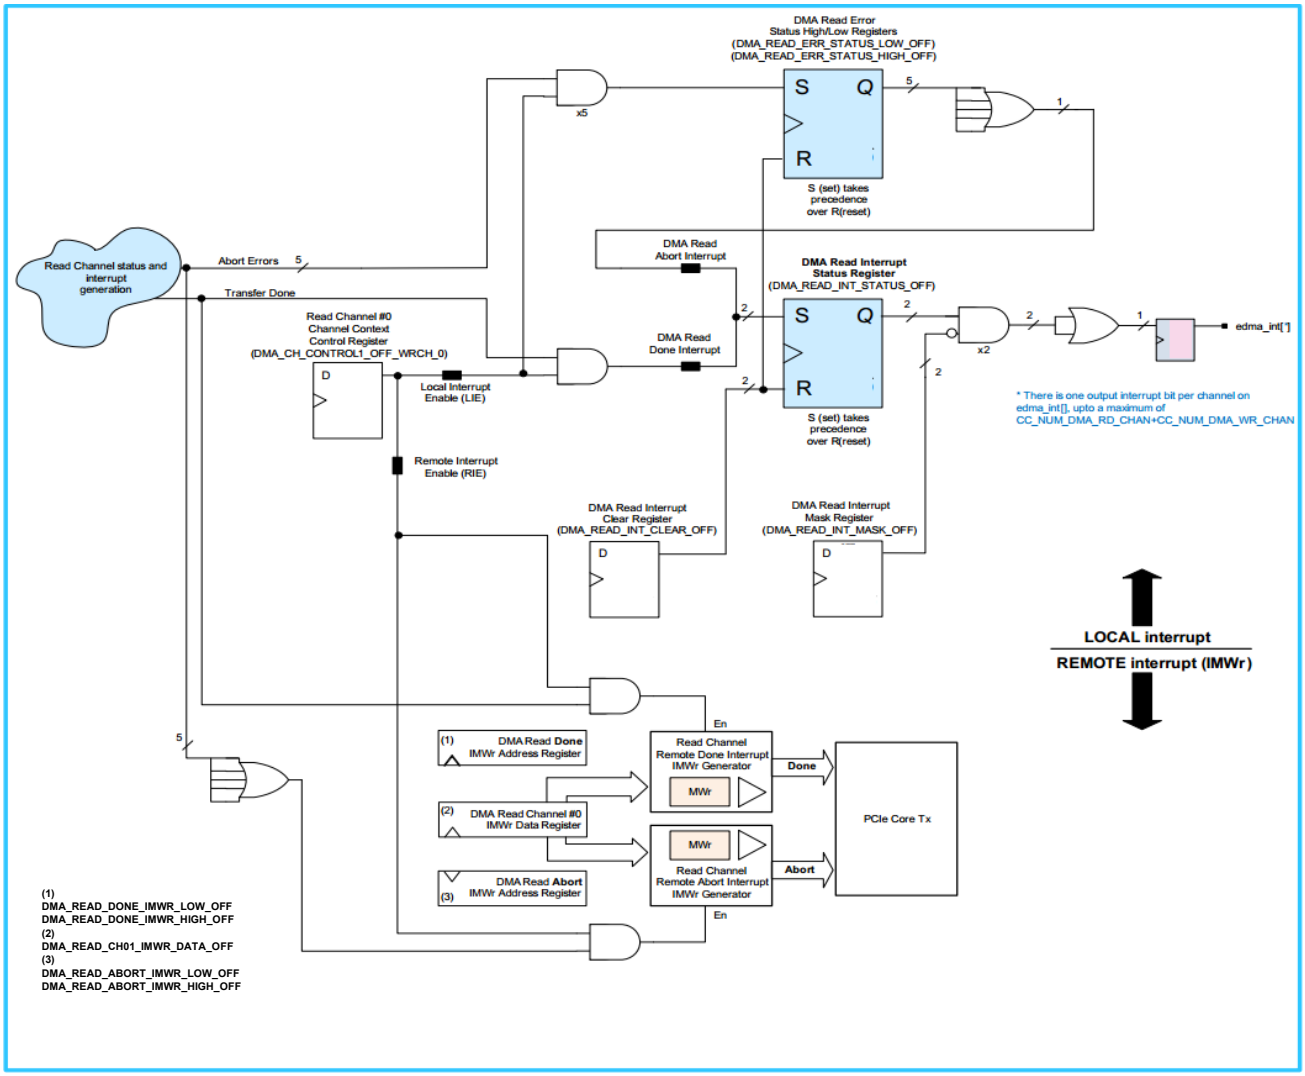

Figure 104.14 Read Interrupt Generation - Non Linked List Mode - Shown For Read Channel #0

Linked List Mode Interrupt Handling

The LIE and RIE bits in the LL element enable the channel done interrupts (local and remote). The LLLAIE and LLRAIE bits of the DMACAP22/ DMACAP28 registers enable the channel abort interrupts (local and remote). In the write channel, there are two error conditions that results in an abort interrupt. For more details, see “Linked List Mode”. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in Figure 104.15. You can read the status of each of the two abort errors (that contribute to the abort interrupt) through the DMACAP13 register.

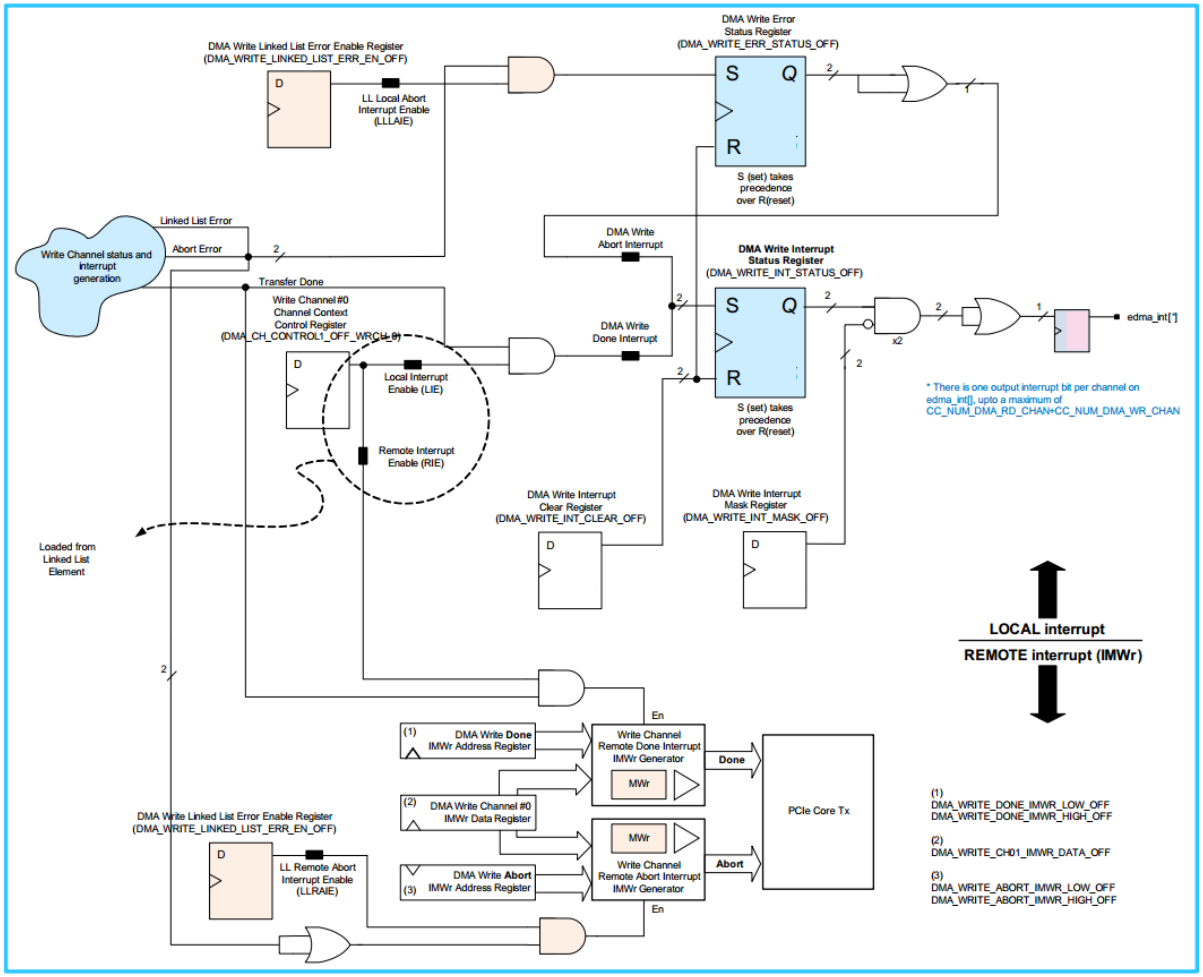

Figure 104.15 Write Interrupt Generation - Linked List Mode - Shown For Write Channel #0

In the read channel, there are six error conditions that results in an abort interrupt. For more details, see “Linked List Mode. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in Figure 104.16. You can read the status of each of the six abort errors (that contribute to the abort interrupt) through the DMACAP26 and DMACAP27 registers.

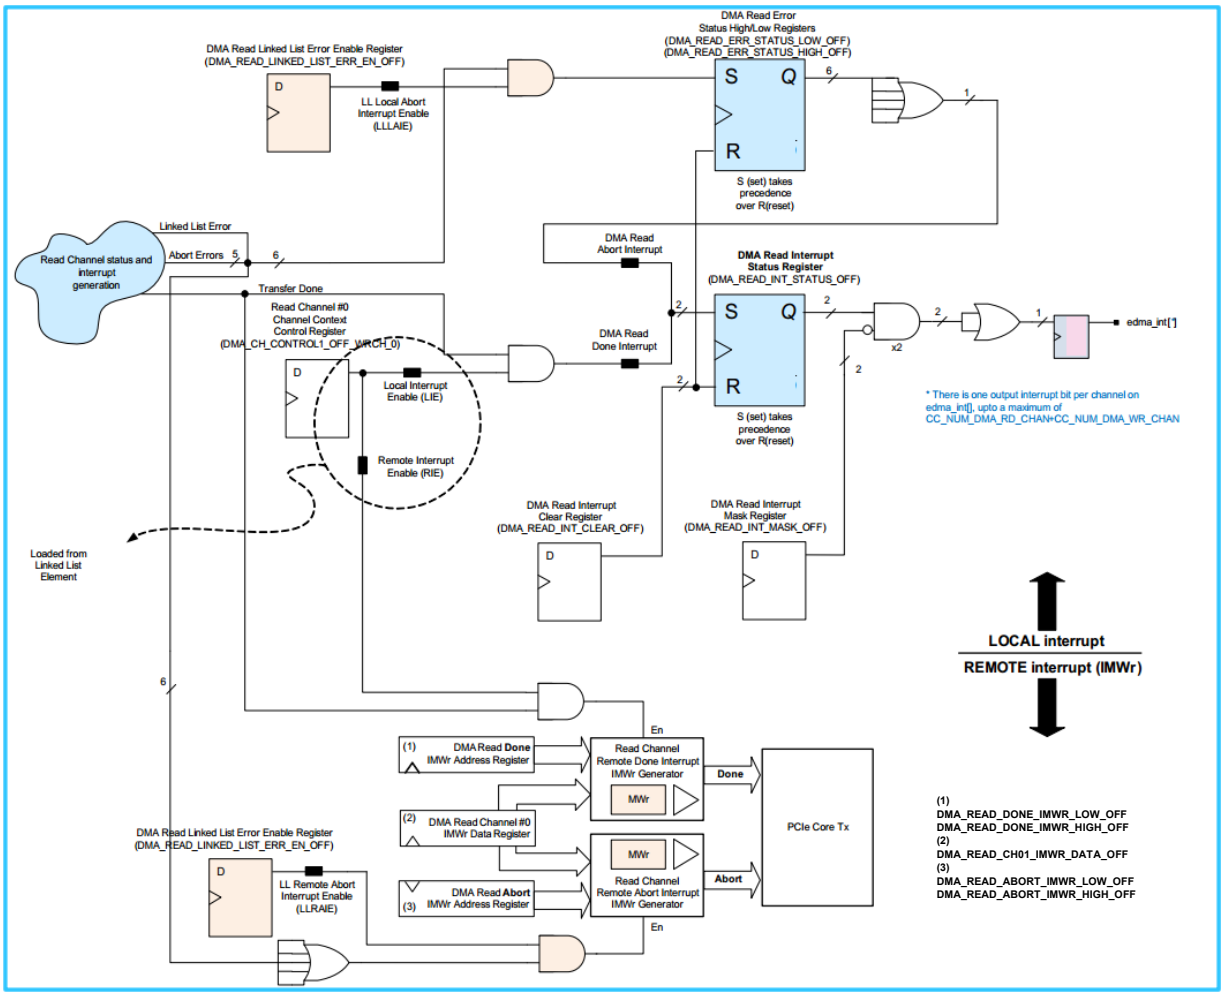

Figure 104.16 Read Interrupt Generation - Linked List Mode - Shown For Read Channel #0

***Note:** In non-linked list mode, LIE acts as a global switch. However when in linked list mode, LIE is just local to the current linked list element and the global switch is LLLAIE.

****Attention: Software Programming of an Endpoints LIE and RIE Bits for Linked List Transfers.** If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

(4) Linked List Mode

The DMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. This mode provides an alternative to programming the DMA multiple times to transfer multiple blocks of data. The programming information (address, size, and so on) for each block of memory is pre-programmed by your software into a LL element (also known as a descriptor) in local memory. Each element (called a data element) in the LL structure (called a transfer list) can transfer up to 4GB of data.

You enable LL operation for a channel, by setting the LLE field of the DMACAP[37+*i*16] register to 1. You can enable LL mode independently for each channel. When you enable LL for more than one channel, then you must have a separate LL structure in local memory for each channel. Your application must produce the LL element structure in local memory as shown in Figure 104.17. Normally, all of the elements are contiguous (one after the other) in memory, and each element has six DWORDs containing the information about the block of data to be transferred. You program the channel context

registers (DMACAP[43+i*16] and DMACAP[44+i*16]) with the location of where you have placed the LL element structure in local memory.

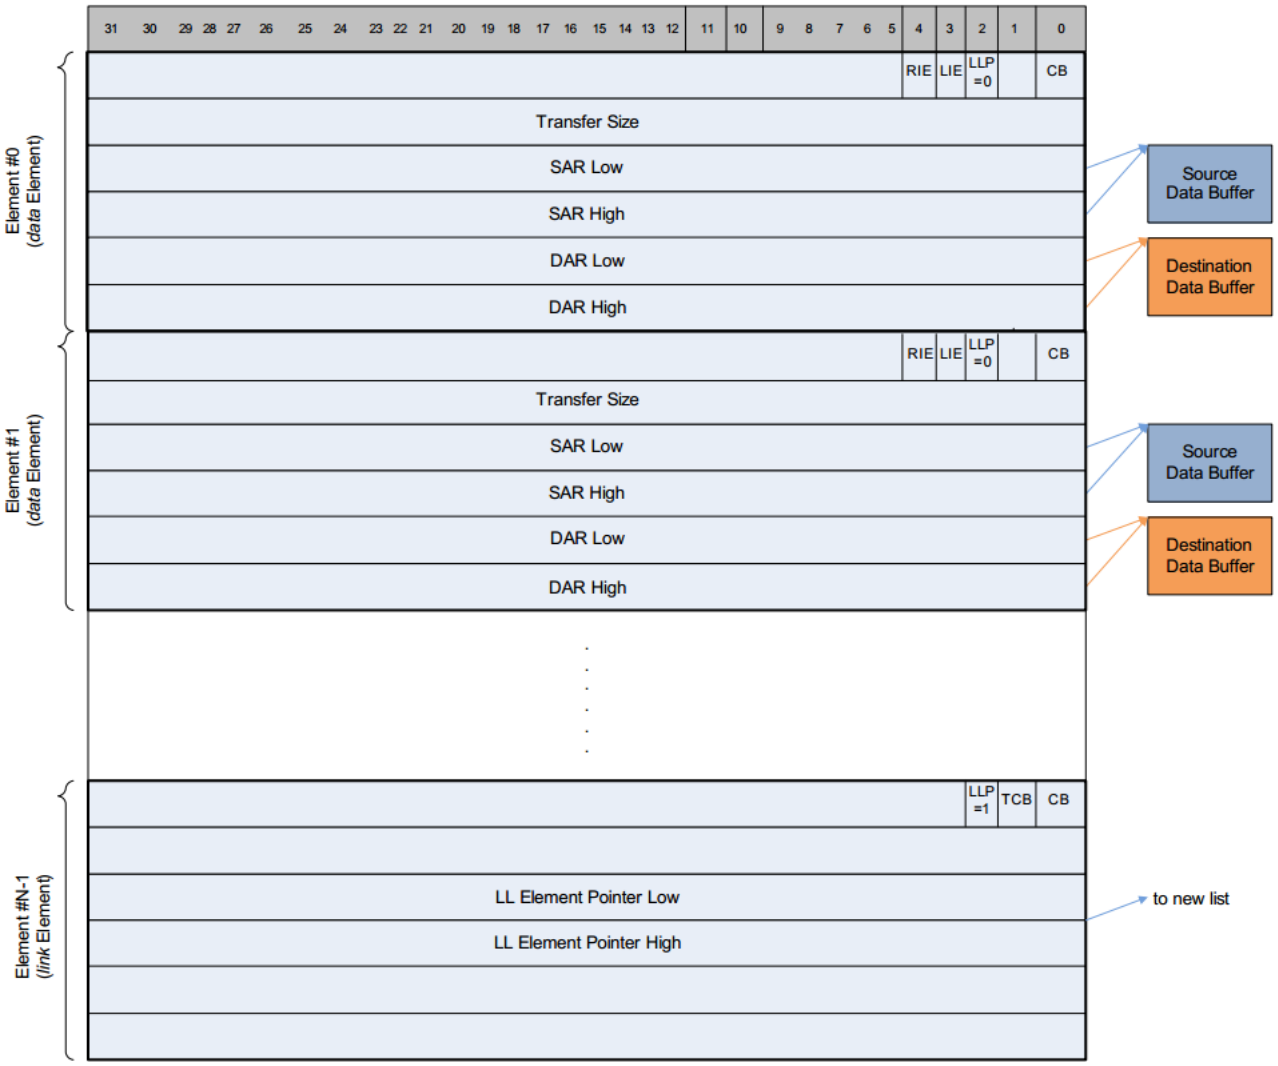

Figure 104.17 Linked List Element/Descriptor Structure in Local Memory with N Elements.

When you start the DMA transfer (by writing to the DMA Write Doorbell Register DMACAP3 or DMA Read Doorbell Register DMACAP7), the DMA read (consumes) each element from local memory, and loads the information (SAR, DAR, size, and so on) from that element into the channel context registers in the DMA. These channel context registers determine the operation of the channel that the DMA controller is currently servicing. The DMA then proceeds to transfer the block of data (as defined by the element), and when it is finished, reads the next element from local memory. Normally, all of the elements are contiguous (one after the other) in memory, with the starting address defined in the channel context DMA Linked List Pointer Low Register DMACAP[43+i*16].

When you want to jump in local memory to another element list (or recycle the consumed elements), then you set the LLP bit in the element (for example, link element #N-1 in Figure 104.17), specify the location of the next element structure using the LL Element Pointer DWORDs (as indicated in Figure 104.17), and, set TCB to 1 (for recycling) or to 0 (to jump to another list).

Relationship Between Element DWORDs and Channel Context Registers

Notice the similarity between a data element and the DMA Channel Context registers for each channel. Each element has six DWORDs as in Figure 104.17. There are eight channel context registers (DWORDs) for a channel. The DMA loads the six element DWORDs into the following channel context:

- CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.

- DMA Transfer Size.
- DMA SAR Low and DMA SAR High.
- DMA DAR Low and DMA DAR High

The definitions of the element DWORD bit fields are the same as the DMA Channel Context registers described in the “DMA Software Register Map”, with the exception of the LIE and RIE bits. The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits (in the channel context registers) enable the done and abort interrupts.

When the LLP field of the first DWORD in the element is set to 1, the element is a link element. The DMA only loads the following information into the channel context registers:

- CB, TCB, and LLP bits of the first DWORD. The LIE and RIE bits are not defined in a link element.
- LL Element Pointer (3rd and 4th DWORDs) into the DMA Linked List Pointer registers (DMACAP[43+i*16] and DMACAP[44+i*16]).

***Caution:* Linked List Operation**

When you enable linked list operation (DMACAP[37+i*16].LLE=1’b1), the DMA overwrites the following DMA channel context registers with information from linked list data elements:

- ☐ The CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.
- ☐ DMA Transfer Size.
- ☐ DMA SAR Low & High.
- ☐ DMA DAR Low & High

The structure of a link element is different to that of the data element. A data element has no TCB field. A link element has no LIE or RIE fields. It has no SAR, DAR, or Transfer Size DWORDs, but has LL Element Pointer DWORDs instead of the SAR DWORDs.
The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits enable the done and abort interrupts. For more information, see “Interrupts and Error Handling”.

Descriptor Early Fetch (AXI Bridge Configuration)

In AXI bridge configuration, the DMA serializes the next descriptor fetch with the previous descriptor’s last data fetch. This allows the next descriptor to be loaded into DMA’s context memory just in time. Early descriptor fetch reduces the number of idle cycles between subsequent descriptor fetches introduced because of high round-trip read-to-completion latencies in scenarios where the descriptor’s transfer size is small.

The descriptor is fetched and loaded into AXI Bridge’s master completion buffer. While the previous descriptor’s CPL and MWr transactions are in progress, DMA back-pressures the descriptor loaded in the master completion buffer. It is recommended to have the configuration respecting the following relationship to avoid any potential performance issues:

CC_MAX_MSTR_TAGS_AXI > (CC_NUM_DMA_RD_CHAN + CC_NUM_DMA_WR_CHAN)

The early fetched descriptor completes concurrently with previous descriptor’s data completion. If previous descriptor transfer aborts due to an error in any data completion, the early-fetched descriptor is flushed. Figure 104.18 and Figure 104.19 describe Read/Write channel operation example for a scenario where each descriptor transfer size is 1 TLP.

***Note:** You can revert to legacy descriptor fetch by setting the hidden parameter CC_DMA_EFETCH_EN to 0.

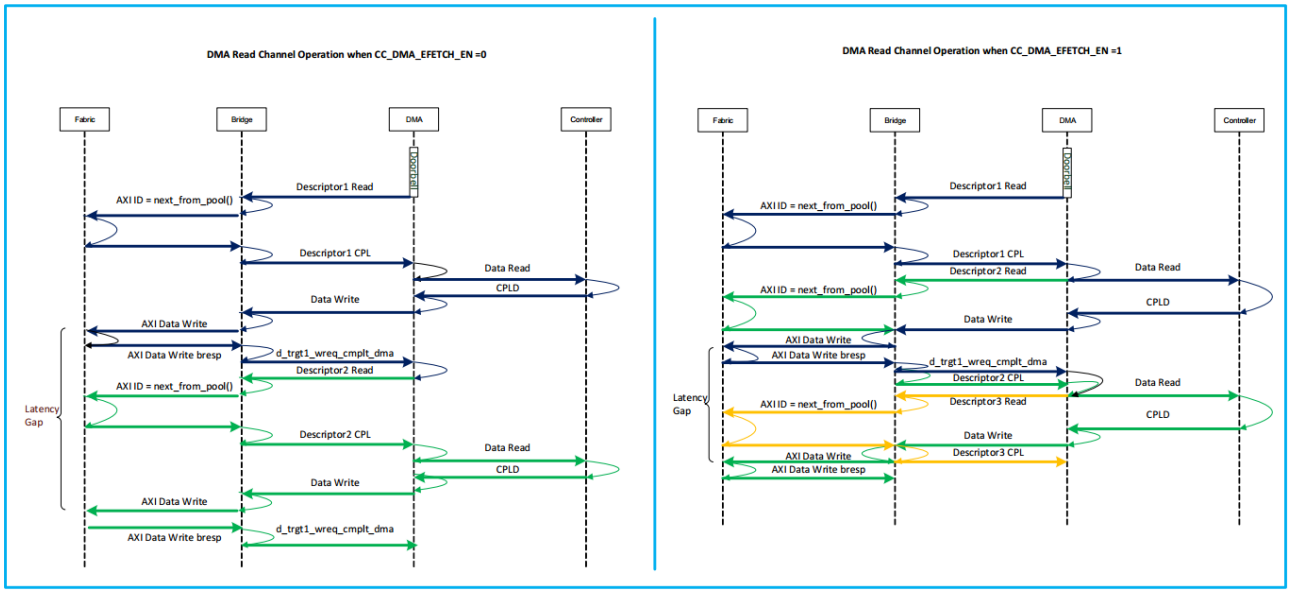

Figure 104.18 Read Channel Operation Example: Before and After Early Fetch Optimization

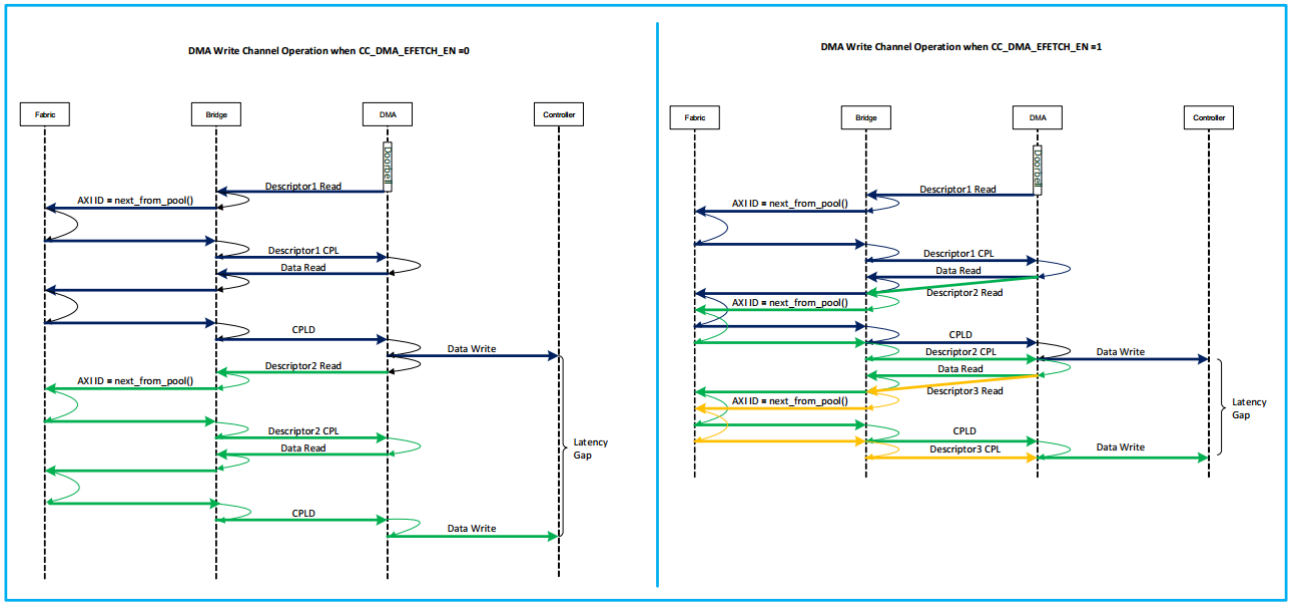

Figure 104.19 Write Channel Operation Example: Before and After Early Fetch Optimization

(5) Using the DMA

This section describes how to use the DMA. The topics for this section are:

- "Source and Destination Address Registers (SAR, DAR)".
- "DMA Transfer Size Register".
- "Starting The DMA Transfer".
- "Detecting the End of The DMA Transfer".
- "Stopping the DMA Transfer (Software Stop)".

- “TLP Generator Header Control”.
- “DMA Software Register Map”.
- “Programming Examples”.

You can configure the DMA to have from one to eight read channels and one to eight write channels. It can simultaneously perform the following types of memory transactions:

- DMA write
  Transfer (copy) of a block of data from local memory to remote memory.
- DMA read
  Transfer (copy) of a block of data from remote memory to local memory.

The DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (IMWr) to the remote CPU. The DMA is highly configurable and you can program it using the local DBI, or over the PCIe wire.
The channels are named read channel 7…0 and write channel 7...0. Each channel is programmed using a number of registers.

(a) Source and Destination Address Registers (SAR, DAR)

The DMA channel context SAR and DAR registers (DMACAP[39+*i**16]/ DMACAP[40+*i**16]/ DMACAP[41+*i**16]/ DMACAP[42+*i**16]) provide support for remote-to-local, and local-to-remote PCIe address mapping. You program the start of the local and remote data buffers using these registers, and the DMA increments the SAR and DAR as the DMA transfer progresses. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in Figure 104.20.

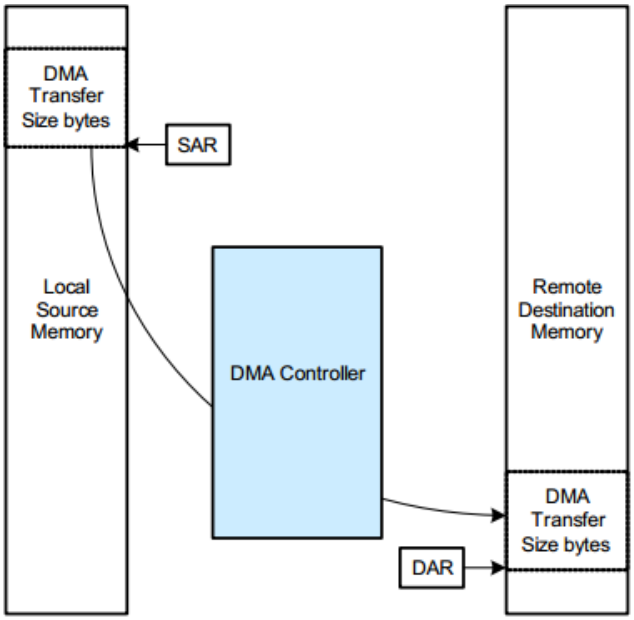

Figure 104.20 Write Transfer: SAR and DAR for Write Channel 0

For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in Figure 104.21.

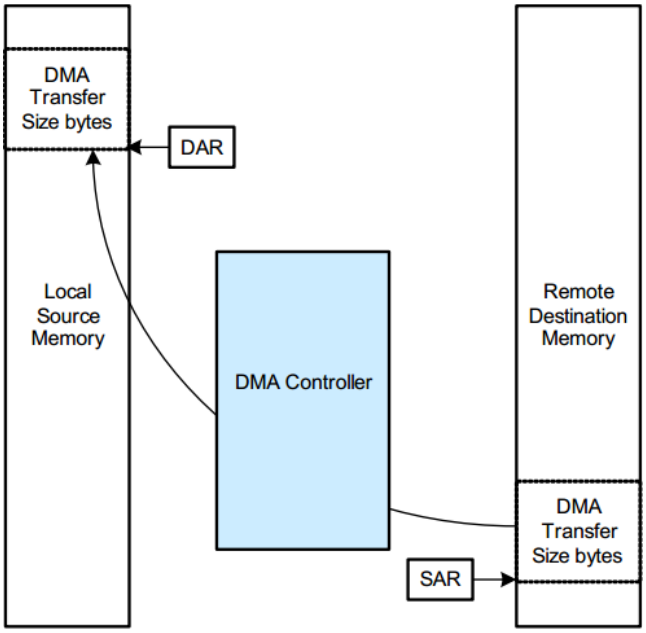

Figure 104.21 Read Transfer: SAR and DAR for Read Channel 0

The presence of the DMA controller does not affect:

- Normal filtering rules for inbound TLPs (for example, BAR checking in an Endpoint, as described in “Internal Address Translation Unit (iATU)”).
- The operation of any internal or external address translation, as described in “Receive Filtering”.

****Caution:** When you do not want the iATU to translate outbound requests that are generated by the internal DMA module, then you must implement one of the following approaches:

- Ensure that the combination of DMA channel programming and iATU control register programming, causes no translation of DMA traffic to be done in the iATU.
- Activate the DMA bypass mode to allow request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. You can activate DMA bypass mode by setting the DMA Bypass field of the iATU Control 2 Register (ATUCAP[1+*i**18]).

(b) DMA Transfer Size Register

You program the DMA transfer size using the DMA Transfer Size Register (DMACAP[38+*i**16] or DMACAP[46+*i**16]). The maximum DMA transfer size is 4GB, and the minimum transfer size is one byte (0x1). The DMA decrements the value in this register as the DMA transfer progresses. When all bytes are successfully transferred, the value in this register is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element.

You can read this register to monitor the transfer progress. However, in some scenarios there is a delay before the controller updates this register. For example, when less than three channels are doorbelled, this register is only updated after a descriptor finishes (LL mode), or the transfer ends (non-LL mode).

(c) Starting The DMA Transfer

After you program the DMA controller registers (including writing to the DMA Read Engine Enable or DMA Write Engine Enable register), you start a DMA transfer by writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMACAP3) or DMA Read Doorbell Register (DMACAP7). You can program and start both a read and a write transfer at the same time. The DMA supports full duplex operation, processing read and write transfers at the same time and in parallel with normal (non-DMA) traffic. You can program and start any number of channels in the DMA controller sequentially or simultaneously.

- **Sequentially**: configure and start a channel, and then configure and start another channel
- **Simultaneously**: configure multiple channels, and then start multiple channels

****Caution:** You must not write to any of the context registers for a particular channel after you start the channel by writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMACAP3) or DMA Read Doorbell Register (DMACAP7).

(d) Detecting the End of The DMA Transfer

If a DMA transfer proceeds without any errors, it stops automatically when finished.

Detecting End of Transfer without Errors
The normal end of a DMA transfer is detected by any of the following methods:

- Done local interrupt (pin) asserted.
- Done remote interrupt (IMWr) received.
- Channel status field of the Channel Control 1 register is stopped, and the DMA Transfer Size register is 0x0.
- Polling of the DMA Write Interrupt Status Register (DMACAP10) or DMA Read Interrupt Status Register (DMACAP23).

Detecting End of Transfer with Errors

The abnormal end of a DMA transfer is detected by any of the following methods:

- Abort local interrupt (pin) asserted.
- Abort remote interrupt (IMWr) received.
- Polling of the DMA Write Interrupt Status Register (DMACAP10) or DMA Read Interrupt Status Register (DMACAP23).
- Channel Status field of the Channel Control 1 register is Halted. When the DMA controller detects an error, it forces the DMA to stop issuing requests for the channel. It also sets the channel status field of the Channel Control 1 register to Halted, generates an abort interrupt (if enabled), and sends an abort IMWr (if enabled). The DMA Transfer Size register indicates the remaining number bytes to be transferred, except when there is an AXI write error during a DMA read transfer.
- Channel Status field of the Channel Control 1 register is stopped, and the DMA Transfer Size register is not 0x0. You have prematurely stopped this channel as described in “Stopping the DMA Transfer (Software Stop)”.

(e) Stopping the DMA Transfer (Software Stop)

You can manually abort (stop) the DMA transfer by writing the channel number to the Doorbell Number field and writing 1 to the Stop field in DMACAP3. This causes the DMA to:

- Place the channel in a Stopped state.
  The channel Status field in DMACAP[37+*i**16] is stopped and the value in DMACAP[38+*i**16]0 is not 0x0.
- Wait for all outstanding pending transactions.
- Assert the abort interrupt (if it is enabled) in DMACAP10.

You might do this as part of error handling which is described in “Error Handling Assistance by Remote Software”, which is only necessary during software development if you incorrectly program the DMA write channel DAR.

You might also do this as part of a function level reset (FLR). FLR does not directly affect the DMA transfer so you must manually stop the DMA transfer before initiating an FLR.

***Caution:* Use This Feature With Caution**
You should not use the STOP feature in operational mode. It is only a debug feature and has associated hazards.

- Before setting the Stop bit.
  - You must read the channel status field (CS) of the DMA Channel Control 1 register to ensure that the corresponding channel is running (transferring data).
  - To eliminate the possibility of a race condition between these two actions (read and write), you should confirm the presence of the abort bit in the DMA Write Interrupt Status Register (DMACAP10) or DMA Read Interrupt Status Register (DMACAP23) and check the status of any fatal error if some other event has occurred.
- After a Stop event, you cannot seamlessly resume the transfer again because the DMA does not resume operation exactly from the point it stopped. Therefore, you must setup and start the complete channel context again, including the
  - Linked list pointer.
  - Linked list structure in memory.
  - Related PCS and CCS values.
  - When operating in non-linked list mode, setup channel context registers

(f) TLP Generator Header Control

You must program bits [31:12] of the DMA Channel Control 1 Register (DMACAP[37+*i**16]/ DMACAP[45+*i**16), so that the DMA TLP generator correctly sets the TC, RO, NS, and FN TLP header fields for any TLPs that it generates.

(g) DMA Software Register Map

This section discusses the grouping and access methods of the DMA registers. The following registers are present when the DMA is enabled.

- DMA Global Registers: these registers control global settings

Table 104.20 DMA Global Register

	Description
base address + 0x000	DMA Arbitration Scheme for TRGT1 Interface
+0x008	Number of DMA Channels
+0x00C	DMA Write Engine Enable
+0x010	DMA Write Doorbell
+0x018	DMA Write Engine Channel Arbitration Weight Low
+0x01C	DMA write Engine Channel Arbitration Weight High
+0x02C	DMA Read Engine Enable

+0x030	DMA Read Doorbell
+0x038	DMA Read Engine Channel Arbitration Weight Low
+0x03C	DMA Read Engine Channel Arbitration Weight High

- DMA Interrupt Registers: these registers control the generation of local interrupts and remote IMWr. The IMWr addresses and data are stored in RAM.

Table 104.21 DMA Interrupt Register

Byte Offset	Description
Base address + 0x4C	DMA Write Interrupt Status
+0x50	Not Used (RsvdP)
+0x54	DMA Write Interrupt Mask
+0x58	DMA Write Interrupt Clear
+0x5C	DMA Write Error Status
+0x60	DMA Write Done IMWr Address Low
+0x64	DMA Write Done IMWr Address High
+0x68	DMA write Abort IMWr Address Low
+0x6C	DMA Write Abort IMWr Address High
+0x70	DMA Write Channels 1 and 0 IMWr Data
+0x74	DMA Write Channels 3 and 2 IMWr Data
+0x78	DMA Write Channels 5 and 4 IMWr Data
+0x7c	DMA Write Channels 7 and 6 IMWr Data
+0x90	DMA Write Linked List Error Enable
Up to + 0x9C	Not Used (RsvdP)
+0xA0	DMA Read Interrupt Status
+0xA4	Not Used (RsvdP)
+0xA8	DMA Read Interrupt Mask
+0xAC	DMA Read Interrupt Clear
+0xB0	Not Used (RsvdP)
+0xB4	DMA Read Error Status Low
+0xB8	DMA Read Error Status High

Up to + 0xC0	Not Used (RsvdP)
+0xC4	DMA Read Linked List Error Enable
+0xc8	Not Used (RsvdP)
+0xCC	DMA Read Done IMWr Address Low
+0xD0	DMA Read Done IMWr Address High
+0xD4	DMA Read Abort IMWr Address Low
+0xD8	DMA Read Abort IMWr Address High
+0xDC	DMA Read Channels 1 and 0 IMWr data
+0xE0	DMA Read Channels 3 and 2 IMWr data
+0xE4	DMA Read Channels 5 and 4 IMWr data
+0xE8	DMA Read Channels 7 and 6 IMWr data

- DMA Channel Context Registers: these registers (which are stored in RAM) are for the control and status information that is specific to each channel. There is a set of registers for each channel. The number of channels in the DMA is configurable in each direction (write and read) from 1 to 8 using the CC_NUM_DMA_WR_CHAN and CC_NUM_DMA_RD_CHAN configuration parameters.

Byte Offset	**Description**
DMA Channel Context	
Base Address + 0x200*(i+1) + 0x100*(WR|RD)	DMA Channel Control 1 Register
+0x004*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA Channel Control 2 Register
+0x008*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA Transfer Size
+0x00C*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA SAR Low
+0x010*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA SAR High
+0x014*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA DAR Low
+0x018*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA DAR High
+0x01C*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA Linked List Pointer Low
+0x020*i + 0x200*(i+1) + 0x100*(WR|RD)	DMA Linked List Pointer High

***Caution:* Implementation of Channel Context Registers**

- The channel context registers are stored in RAM whose contents are automatically initialized after power-on.

- You must not write to any of the context registers for a particular channel after you start the channel by writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMACAP3) or DMA Read Doorbell Register (DMACAP7).

Linked List Operation
When you enable linked list operation (Linked List Enable field of DMA Channel Control 1 Register DMACAP[37+*i**16] to 1b1, the DMA overwrites the following DMA channel context registers with the following information from linked list data elements:

- The CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.
- DMA Transfer Size.
- DMA SAR Low.
- DMA SAR High.
- DMA DAR Low.
- DMA DAR High

Note:

- The structure of a link element is different to that of the data element. A data element has no TCB field. A link element has no LIE or RIE fields. It has no SAR, DAR, or Transfer Size DWORDs, but has LL Element Pointer DWORDs instead of the SARDWORDs. For more details, see Relationship Between Element DWORDs and Channel Context Registers.
- The LIE and RIE bits in a LL element, only enable the Done interrupt. In non-LL mode, the RIE and LIE bits enable the Done and Abort interrupts.

(h) Programing Examples

****Attention:** You must enable the DMA before you start a DMA channel. Therefore you must write ‘1’ to DMA Read Engine Enable or DMA Write Engine Enable register before you write ‘1’ to the DMA Read Doorbell or DMA Write Doorbell register.

1 MB Write Transfer On Write Channel #0 Initiated by Local CPU (Non LL mode)

In this example, the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the edma_int bus. The SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in Figure 104.22. Table 104.22 provides the programming details for this example transfer.

Figure 104.22 1 MB Write DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

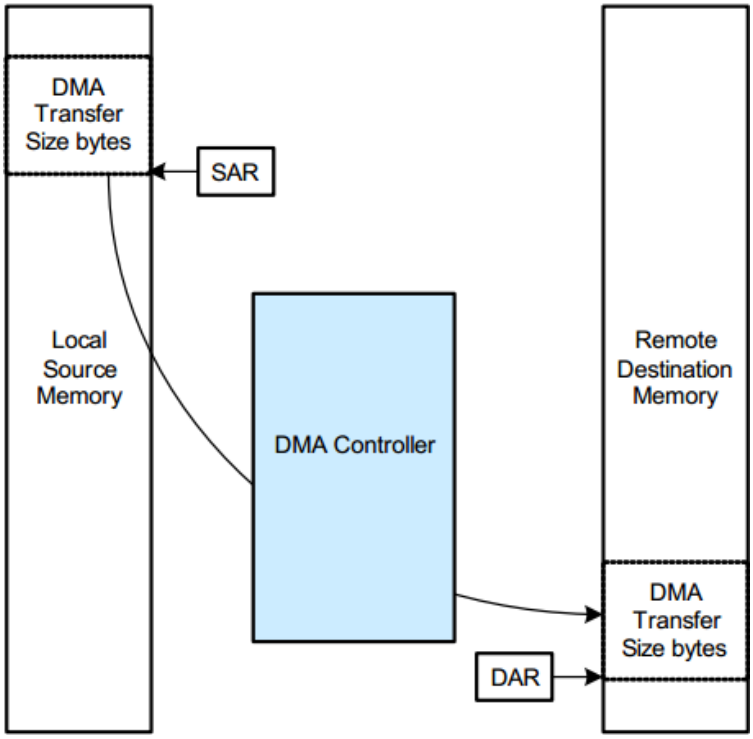

Table 104.22 1 MB Write DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

Address (0x5000+)	Name	Value
0x00C	DMA Write Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic. For more detail, see DMA Write Engine Enable Register (DMACAP2).	0x1
0x054	DMA Write Interrupt Mask	0x0
0x200	DMA Channel Control 1 register ■ Local Interrupt Enable (LIE) =1 ■ Remote Interrupt Enable (RIE) =0 ■ RO, NS, TC, Function Number =0	0x04000008

0xD18	DMA DAR High	0x0000_0000
0x030	DMA Read Doorbell	0x5

Linked List Mode Programming Example (Write Channel #0)

This write channel example with the following features:

- Recycled linked list (LL) of nine data elements and one link element.
- Transfer is initiated by local CPU.
- Each data element corresponds to a 1 MB (0x0010_0000) write transfer.
- The SARs for each element are separated by 2 MB (0x0020_0000). The DAR for each element are separated by 16 MB (0x0100_0000). The SAR is the address of the local memory, and the DAR is the address of the remote memory.
- The LL transfer list is located at address 0x0000_0200 in local memory.
- No remote interrupt is generated so the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the edma_int bus.
- There is a Watermark interrupt at element #5, and an Empty interrupt at element #8. Both of these interrupts are done interrupts (as opposed to abort interrupts).

You should familiarize yourself with the Linked List Flow for Producer and Consumer. These are the main steps for this process in this example:

Step 1: Create TL in local memory

- Create the 10 elements:
  - For elements 0, 1, 2, 3, 4, 6, 7: RIE, LIE, LLP, CB =0, 0, 0, 1.
  - For element 5: RIE, LIE, LLP, CB =0, 1, 0, 1.
  - For element 8: RIE, LIE, LLP, CB =0, 1, 0, 1.
  - For element 9: LLP, TCB, CB =1, 1, 0.

Step 2: Program and Start DMA

- Configure and start the DMA registers.

Step 3: Wait for done interrupt and recycle TL

****Attention: Software Programming of an Endpoints LIE and RIE Bits for Linked List Transfers.**
If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

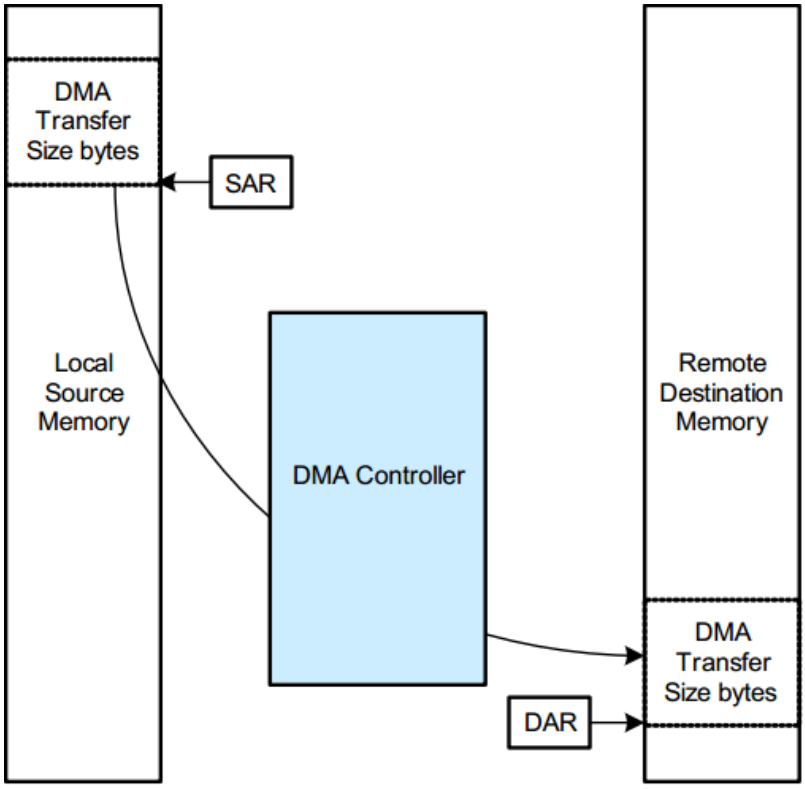

Figure 104.26 1 MB Write DMA Transfer from SAR to DAR

Table 104.26 Linked List Element Initial Setup

Element#	Address	Data	Label
0	0x0000_0200	0x0000_0001	Channel Control

104.3.10 Peer to Peer Transfer

The PCIEC does not support the Peer-to-Peer Transfer features defined in the PCI Express Base Specification, Revision 4.0, Version 1.0. (The Peer-to-Peer in this section means that TLP is routed from one channel to another channel like PCIe switch.)

104.3.11 Transfer Priority

This section describes the transfer priority.

(1) Arbitration (Transmission to PCI Express)

Accesses to transmit packets to the PCI Express include: DMA transfer, response processing to Inbound transfer, Outbound transfer, and Message transfer. The DMAC and the modules controlling Outbound transfer output posted and non-posted requests, respectively.

Arbitration between these accesses is performed according to the priority shown below Table 104.28.

Table 104.28 TLP Arbitration Priority (1= Highest, 6= Lowest)

Priority	TLP Type
1	Completion of any TLP currently in progress
2	Retry buffer retransmissions
3	Messages generated by PCIEC (including MSI generated by register write)
4	TLPs from the transaction layer: (When Root port mode) Completions generated by PCIEC for UR or CA (When End port mode) Completions generated by PCIEC for Type0 configuration read and write requests (including UR responses)
5	TLPs on the internal bus
6	DMA transfer

(2) Arbitration (Reception from PCI Express)

The PCIEC receiver receive packets from the PCI Express and filter into three separate FIFO queues: posted, non-posted, and completion. When more than one queue has a TLP that is allowed to proceed, it uses a priority arbitration algorithm to select a transaction. This prevents that delivery rate for a particular TLP type to internal bus is unfairly reduced.

(3) PCI Express Transmit/Receive Ordering

The following describes the transaction ordering rules of PCIEC.

Table 104.29 shows the transmit transaction ordering rules of this module.

Table 104.29 Transmit Transaction Ordering Rules of This Module

Row Pass Column?	1st Posted	1st Non-Posted	1st Completion
2nd posted	No	Yes	Yes
2nd non-posted	No	No	Yes
2nd completion	No	Yes	No

Note: Yes: The second transaction can pass the first transaction.
No: The second transaction cannot pass the first transaction.

Table 104.30 shows the receive transaction ordering rules of this module.

Table 104.30 Receive Transaction Ordering Rules of This Module

Row Pass Column?	1st Posted	1st Non-Posted	1st Completion
2nd posted	No[a]	Yes	Yes
2nd non-posted	No	No	Yes
2nd completion	No	Yes	No

Note: Yes: The second transaction can pass the first transaction.
No: The second transaction cannot pass the first transaction.
a: A non MSI P request can pass previously-received MSI P request.

PCIEC applies the ordering rules conforming to the standard to the transmission and reception sides. According to the rules, some packets cannot be passed by (to prevent an undesired influence on the order of sequential processing and such). Therefore, depending on the packet transfer order or combination, processing of a packet may be delayed until the previous packet processing is completed.

(4) Arbitration (Bus Master Request)

Accesses to output a master request to the internal bus include: DMA transfer, Inbound transfer, and message transfer.

Arbitration between these accesses is performed according to the priority shown below.

(High priority)
- Inbound transfer (reception of memory request and IO request)
- DMA Write Channel (transmission of memory write and command read)
- DMA Read Channel (command read)
- DMA Read Channel (transmission of memory write)

(Low priority)

104.3.12 Link Function

The following sections describe Changing Speed, Lane Resizing and Lane Reversal and Flipping.

(1) Changing Speed

PCIEC supports all of the non-optional Gen1 2.5 GT/s features, Gen2 5.0 GT/s features, Gen3 8.0 GT/s features and Gen4 16.0 GT/s features defined in the PCI Express Base Specification, Revision 4.0, Version 1.0.

PCIEC initiates the speed change automatically after link up according to EXPCAP12F*i*[3:0]. cfg_target_link_speed and clears PRTLGC21. cfg_directed_speed_change bit. The default of EXPCAP12[3:0]. int_target_link_speed value is ‘B0100 (16.0 GT/s). Therefor the first link up speed is 16.0 GT/s. If you want to link up in another speed, then write a target speed value to EXPCAP12F0[3:0]. int_target_link_speed before link up.

To manually initiate the speed change then:

- Write to EXPCAP12F0[3:0]. int_target_link_speed in the local device.
- Deassert PRTLGC21. cfg_directed_speed_change in the local device.
- Assert PRTLGC21. cfg_directed_speed_change in the local device.

If you want to change speed from Gen4 rate to Gen2 or Gen3 rate,
Request speed change from Gen4 rate to Gen1 rate. Then change speed from Gen1 rate to any higher rate.

(2) Gen3 8.0 GT/s , Gen4 16.0 GT/s Transmitter Equalization

PCIEC performs link equalization during link training to improve signal quality by adjusting the transmitter and receiver equalization parameters for each lane on each side of the link. There are two feedback modes for determining the optional equalization settings, programmable using PRTLGC54.

- Figure of merit (FOM)
- Direction change with optional convergence support

(3) Gen4 Lane Margining

The controller supports all mandatory PIPE message bus interface features specified in PIPE Specification for PCI Express, Version 4.4.1, except for elastic buffer depth control and generation of read command form the controller to PHY.

(4) Lane Resizing

Initially, the controller tries to linkup at maximum width. You can restrict the maximum width as follows:

- Program PRTLGC4. cfg_link_capable
- Program PRTLGC21. cfg_lane_en[4:0]

The link partners can change the link width after the link is up. Resizing option are show in Table 104.31.

Table 104.31 Link Resizing Options

	Remote Partner Initiates (L0 -> Recovery -> Configuration)	**Software Initiates Localy (L0 -> Recovery -> Configuration)**
Upsizing (Upconfugure)	Yes	Yes
Downsizing	Yes	Yes

Resizing only occurs if both link partners advertised the Upconfigure Capability bit (except link reliability case). PCIEC has the Upconfigure Capability bit in PRTLGC59. cfg_pl_multilane_control[7] and default setting is 1.

The following steps show how you can initiate link resizing:

- Ensure the link is in the L0 LTSSM state.
- Program PRTLGC59.cfg_pl_multilane_control[5:0]
- Program PRTLGC59.cfg_pl_multilane_control[6]

Limitation:

If your system has reversed lanes in Gen3 or Gen4 speed mode, then you should perform upsizing at Gen1 or Gen2 speed only to avoid link-down caused by LFSR mismatching.

If the lanes are reversed, software must manually flip the lanes to achieve downsizing for some configuration. See 104.3.12(5) for more details.

(5) Lane Reversal and Flipping

PCIEC supports lane reversal, lane flipping and polarity inversion Depending on the configuration of the link partners and the topology of link between them, the controller will attempt to reverse and / or flip lanes to form a link in any of the following scenarios:

- The lanes are reversed by the physical layout of the PCIe link
- When connecting a narrower link partner into upper lanes of a wide controller
- A lane is non-operational (broken)
  - Non-operational means that a lane cannot be detected in Detect LTSSM state or it cannot receive in Polling LTSSM state.

Lane auto flip occurs in Detect when physical Lane0 cannot be detected.

Lane auto reverse occurs in Configuration and is useful to from a link when logical Lane0 receives TS Ordered Sets from the link partner with the Lane Number field different from 0.

To enable lane auto flip and lane auto reverse, set PRTLGC21[16]. cfg_lane_en[8]= 1 and PRTLGC21[15:13]. cfg_lane_en[7:5] = 0.

You can also perform lane flip manually. To enable manual lane flip, set PRTLGC21[16]. cfg_lane_en[8] =1, PCIEMSR1[1]. tx_lane_flip_en =1 for transmission lanes and set PCIEMSR1[0]. rx_lane_flip_en =1 for reception lanes.

Figure 104.27, Figure 104.28, Figure 104.29, Figure 104.30 and Figure 104.31 show Reversing and Flipping Lanes structures.

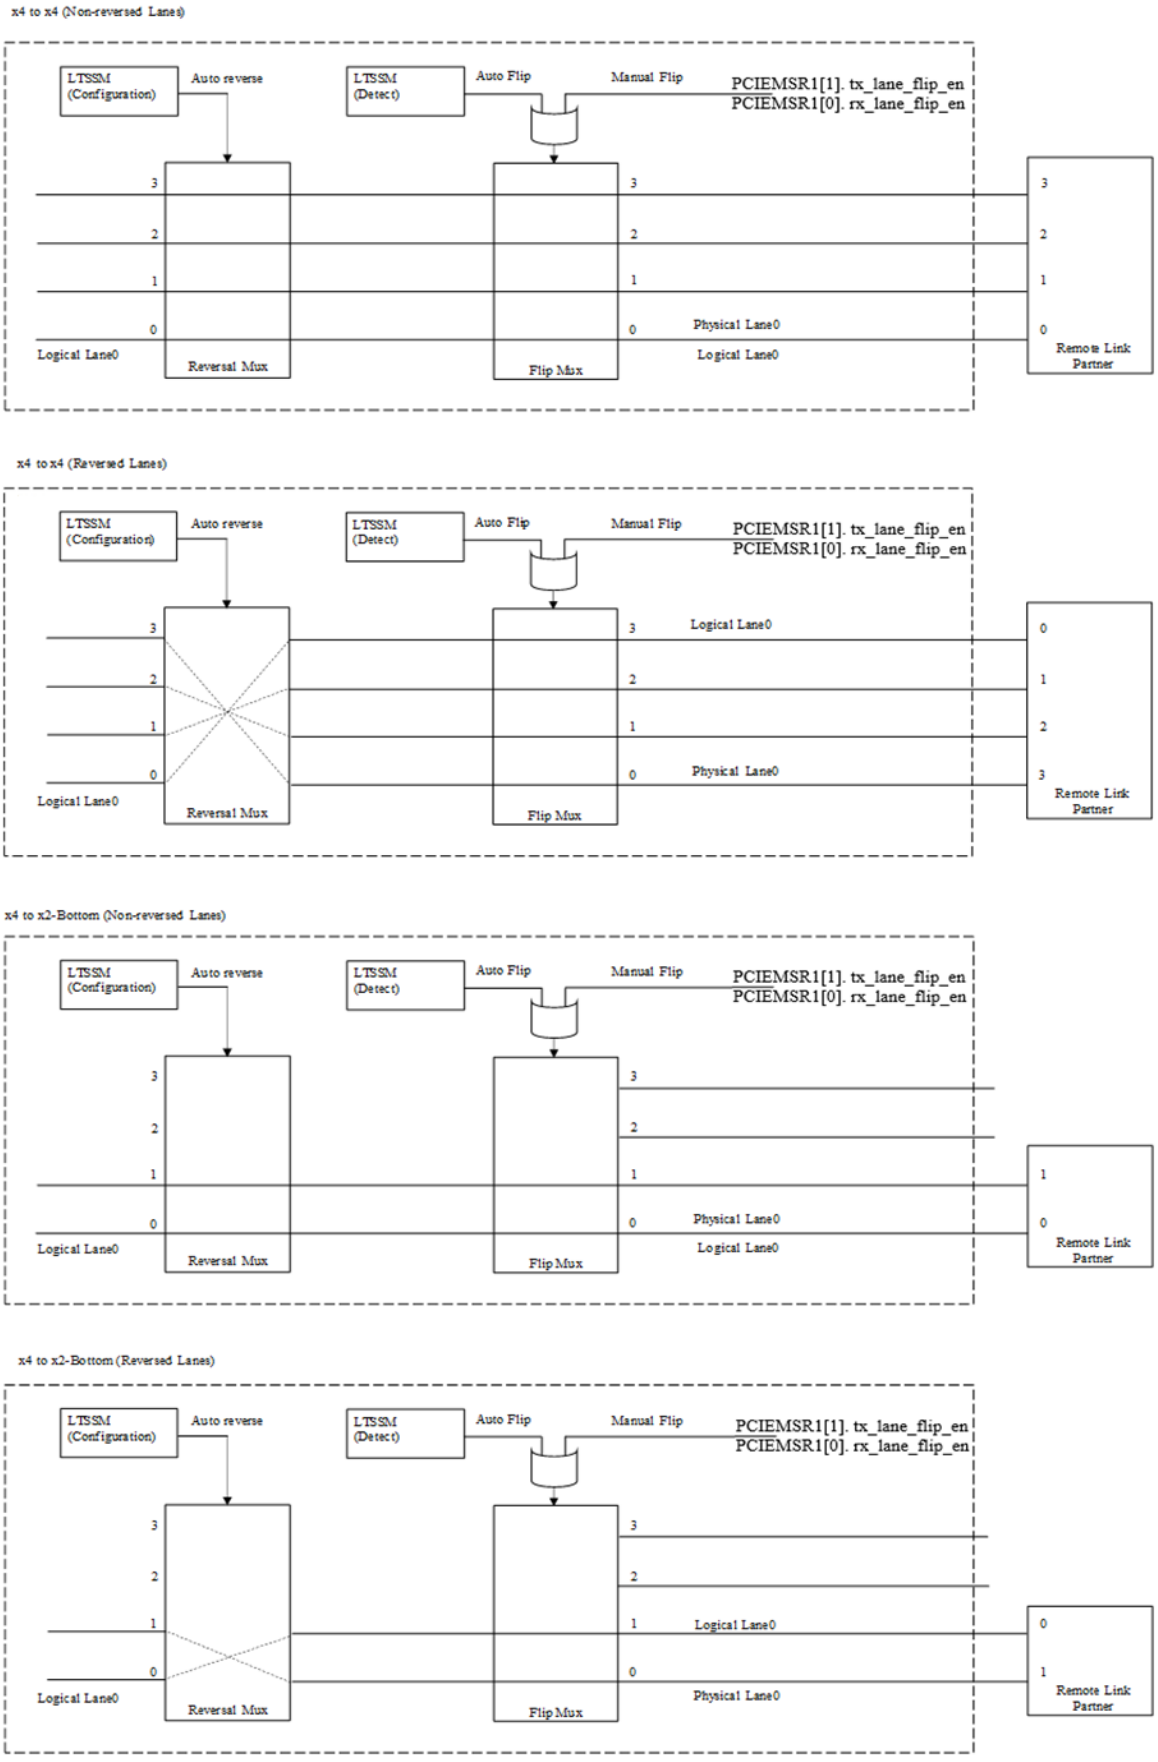

Figure 104.27 Reversing and Flipping Lanes (1)

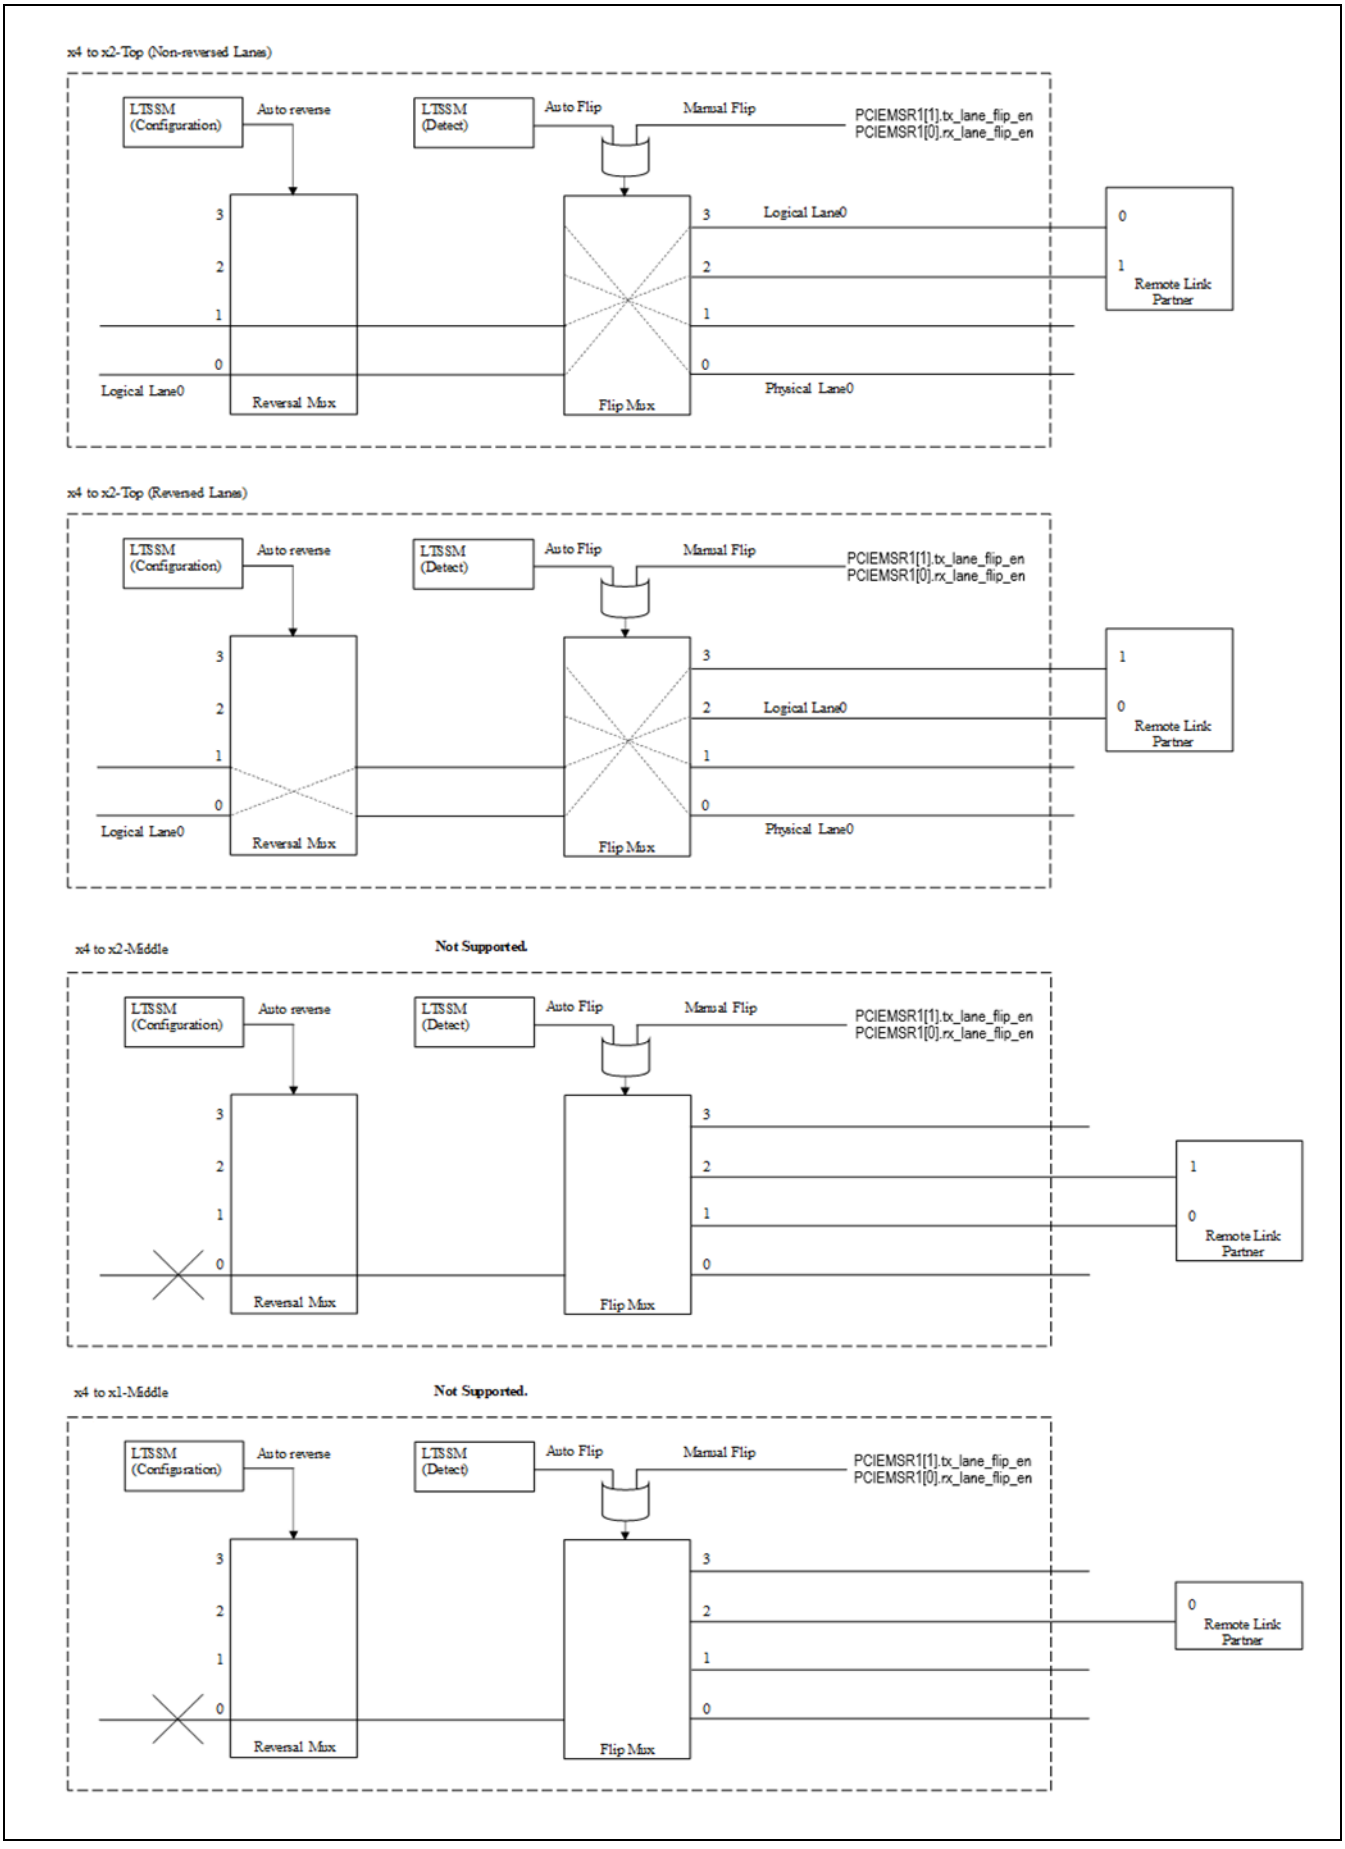

Figure 104.28 Reversing and Flipping Lanes (2)

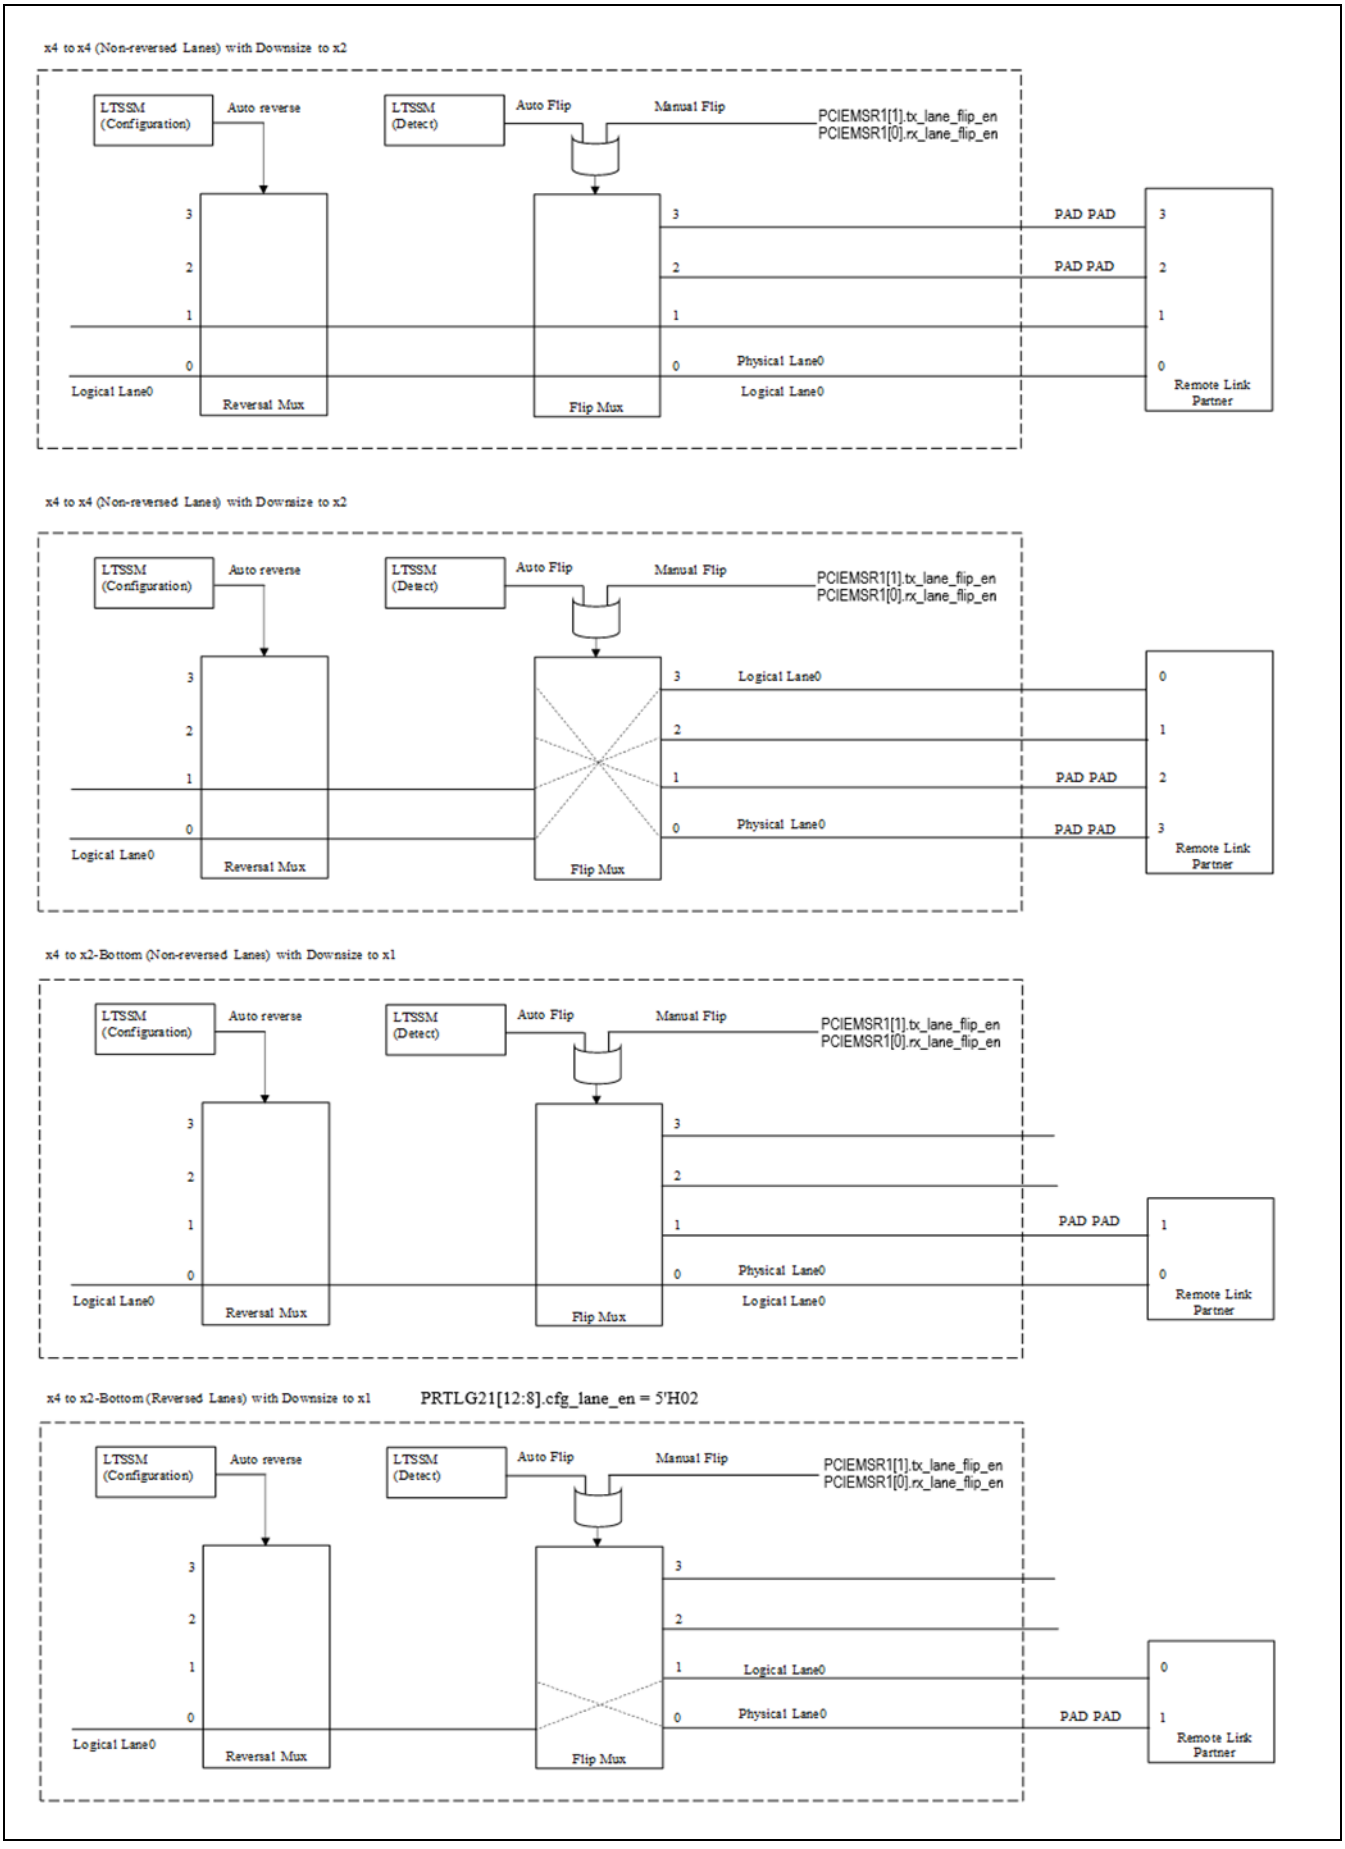

Figure 104.29 Reversing and Flipping Lanes (3)

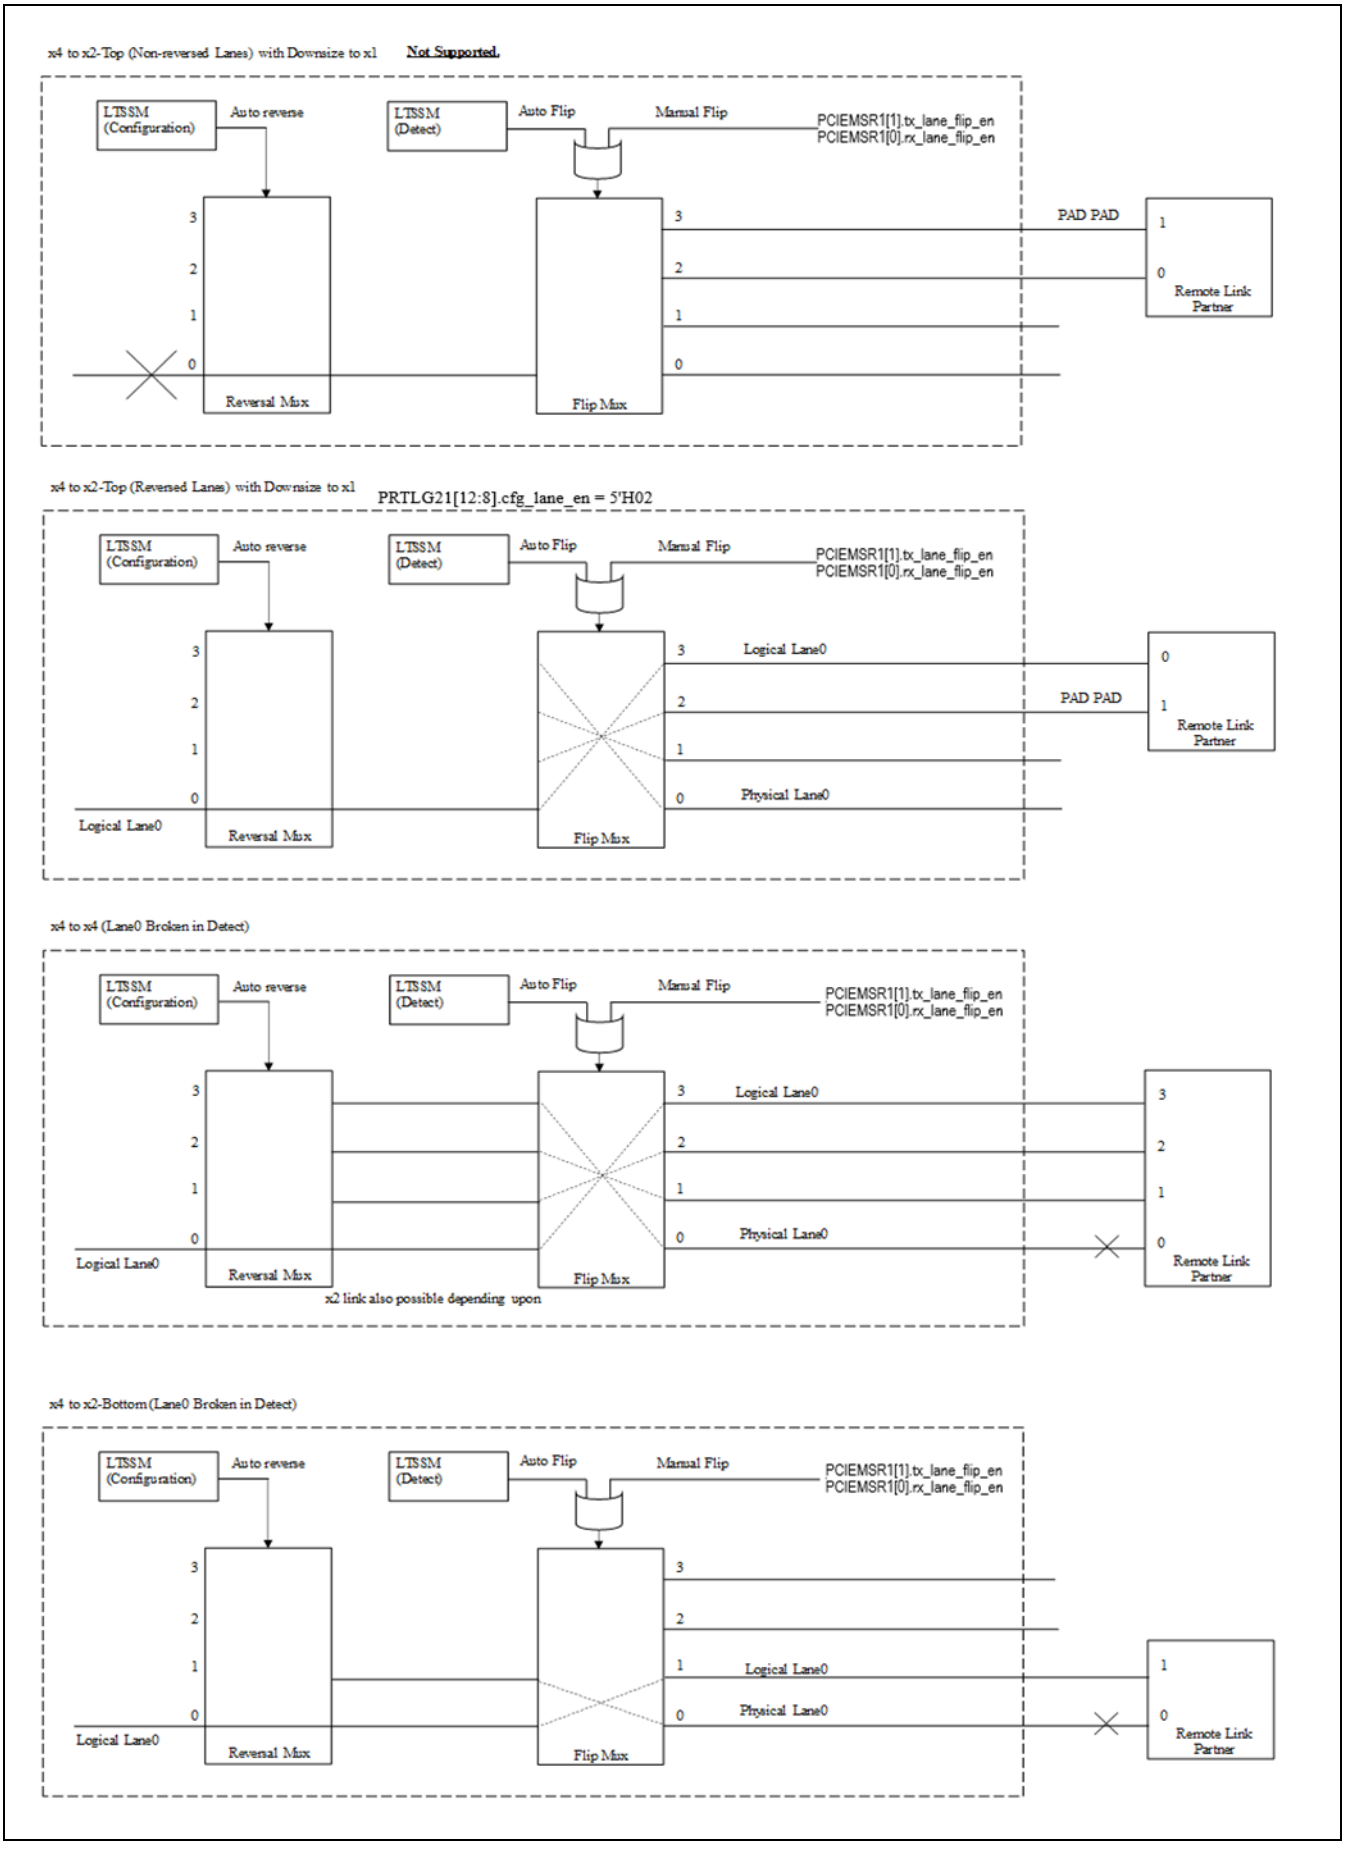

Figure 104.30 Reversing and Flipping Lanes (4)

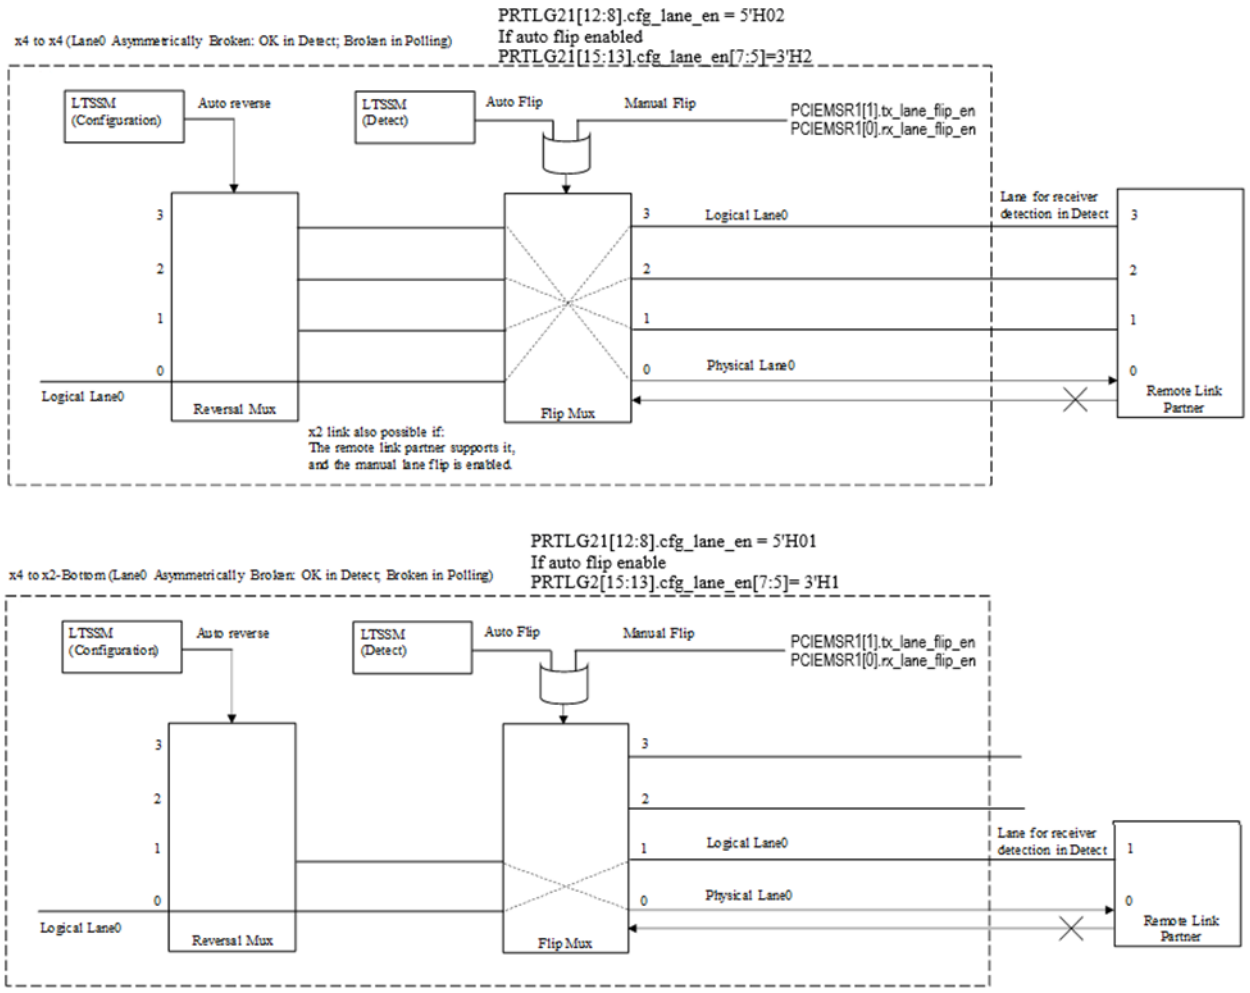

Figure 104.31 Reversing and Flipping Lanes (5)

104.3.13 Lane Bifurcation

PCIEC's channel 0 which has the quad lanes supports lane bifurcation. The channel 0 can be bifurcated to two dual lanes which are called as channel 0 and channel 1 respectively. The channel 0 and channel 1 which are bifurcated lanes have the independent link function, power management and reset architecture. Therefore, you can control each channel without effect to the other working channel.

To enable the lane bifurcation, set PCIEMSR0.BFRCTNST = H'1 before PCIEC reset de-assert. It is forbidden to change the lane bifurcation mode during PCIEC operation.

104.3.14 Power Management

This section discusses the power management (PM) features of the controller. For a proper understanding of PCIe power management, you should read Chapter 5, Power Management of the PCI Express Base Specification, Revision 4.0, Version 1.0. The following topics are discussed:

■ "Overview"

■ "L1 Substates"

■ "L0s Entry and Exit Conditions"

■ "L1 Operation (Non-substates)"

■ "L2 and L3 Power Down Entry and Exit Conditions (USP)"

■ "Advanced Power Management and Power Domain Gating"

(1) Overview

The controller supports two categories of PM operations to control the device state (D-state) and link state.

- **Software PCI Compatible PM (PCI-PM)**
  - **D-state PM of Function.** The host software can direct the function to enter any of the D1 or D3 low-power states. It does this by writing to the Power Management Control and Status Register (PMCAP1Fi) in the PCI-PM capability structure.
  - **D-state PM of Link.** Link states are not visible to PCI-PM legacy compatible software, and are derived from the power management D-states of the components connected to that link. The action of changing the D-state in the PMCAP1Fi indirectly causes a change in the link power state. The L1 state is entered whenever all functions of a USP on a link are programmed to a non-D0 state. The entry into L2 and L3 states is initiated by the DSP.
  - **Clock PM (L1 with REFCLK removal/PLL Off).** This is an optional feature that enables components on a link to further reduce idle power consumption while the link is in L1, by turning off the PLL.
- **Native PCIe PM Mechanisms**
  - **Active State PM (ASPM).** When the USP is in L0 and detects idleness on the link for a specific amount of time, it automatically transitions the link to the L0s or L1 (optional) power state.

- **L1 Substates.** This is an optional PCIe feature that enables components on a link to further reduce idle power consumption while the link is in L1, including almost complete removal of power for the high speed PHY circuits.

Relationship Between D-state, Link State, and PHY State

The link state and D-state determine what power and clock supplies are on or off. For implementation details of low-power clocking logic.

Table 104.32 Power/Clock Supply Status in Low-Power States of Interest (DSP or Single Function non-ARI USP)

D-State	Permissible Quiescent Link States	Link State Change Trigger	Active Power Supplies	Active Clock Supplies	pipe_clk core_clk	PHY State
$D0_{unitialize}$	L0	n/a	V_{main} V_{aux}	REFCLK AUXCLK	ON	P0, P0s
$D0_{active}$	L0	ASPM				
	L0s					
	L1				ON	P1
D1, $D3_{hot}$	L1	PCI-PM				
$D3_{cold}$	L2	PCI-PM	V_{aux}	AUXCLK	OFF	P2/OFF
	L3		None	None		

****Note: $D0_{active}$ and $D0_{uninitialized}$**

D0 is divided into two distinct sub-states, the uninitialized sub-state and the active sub-state. When a component comes out of conventional reset or FLR, it defaults to the D0 uninitialized state. A function enters the $D0_{active}$ state whenever any of the functions Memory Space Enable, I/O Space Enable, or Bus Master Enable bits have been enabled by system software.

Table 104.33 Link-State-Change Trigger Capabilities for Each Port Type

Port Type	Can Trigger L0/L0s Entry	Can Trigger L1 Entry	Can Trigger L2/L3 Entry
USP	Yes	Yes, on any of these trigger. Software program non-D0 state (PCI-PM) USPs idle timer expires (ASPM) Application requests the USP to Enter L1	No
DSP	Yes	No	Yes

Table below indicates the different levels of power savings (obtained by switching off circuits outside the controller) that can be expected from executing L1 in different ways. Higher exit latencies are associated with higher power savings. Power saving and latency are PHY implementation specific, and may be determined by consulting your PHY documentation.

Table 104.34 – L1 Execution Modes and Permissible Power States of PHY Circuits

L1 Execution Mode	Permissible Power States for PHY Circuits		
	PLL/REFCLK	Rx Electrical Idle Detector	TX common mode
L1 without clock PM	ON	ON	ON
L1 with clock PM	OFF	ON	ON
L1.1	OFF	OFF	ON
L1.2	OFF	OFF	OFF

Device State (D-state) Power Management of a Function (USP)

The host software can direct the downstream device function to enter any of the low-power states:

- D1 (light sleep).
- D2 (deep sleep). (not support D2 Power Management State)
- $D3_{hot}$ (full of; reference clock optionally removed; V_{main} normally available).
- $D3_{cold}$ (full of; reference clock removed; V_{main} removed; V_{aux} optionally available).

It does this by writing to the PMCAP1F*i* in the PCI-PM capability structure. This action also indirectly causes the downstream component (USP) to change the link power state. The controller negotiates with the link partner using PM TLPs and DLLPs before entering the corresponding low-power link state. The controller exits the device low-power state (and returns to D0) when it detects a CFG access to a device function, or when it detects a PME such as an event on the outband_pwrup_cmd input signal. For a function in device power states D1 and $D3_{hot}$, the controller only accepts CFG and MSG requests TLPs for that function. All other incoming request types for that function are treated as unsupported requests (UR). For more details see Section 5.3.3, “Power Management Event Mechanisms” of the *PCI Express Base Specification, Revision 4.0, Version 1.0.*

Active State Power Management (ASPM)

You must enable ASPM through the ASPM Control field in the Link Control register. When the USP is in L0 and detects idleness on the link for a specific amount of time (determined by the L0s Entrance Latency field in the “Ack Frequency and L0-L1 ASPM Control Register” PRTLGC3), it automatically transitions the link to the L0s power state. Each link direction (TX and RX) is processed separately. The controller exits L0s when there is traffic waiting to be sent. When the USP is in L0 or L0s and it detects idleness on the link (both directions) for a specific amount of time (determined by the L1 Entrance Latency field in PRTLGC3), it automatically transitions the link to the L1 power state. The link partners must negotiate entry into the L1 link power state using PM TLPs and DLLPs. The L1 state achieves greater power savings but the exit latency from this state is higher than from L0s. You can also instruct an USP controller (only) to enter L1 by asserting the app_req_entr_l1 input. The USP exits L1 when there is traffic waiting to be sent or when a PME (such as an event on the app_req_exit_l1 input) is received. If the ASPM exit latencies from L0s or L1 are too high for the overall PCIe system data latency requirements, then the host software can disable ASPM using the ASPM Control Field of the Link Control register. The controller reports the exit latencies using the Link Capability registers. You set these by writing to these registers or by setting the DEFAULT_L0S_EXIT_LATENCY and DEFAULT_L1_EXIT_LATENCY parameters.

Registers Shadowed in Power Management Controller

Table below lists the registers shadowed in the power management controller (PMC) and the reason for shadowing them.

Table 104.35 Registers Shadowed in PMC

Register	Field	Description	Reason for Shadowing
Device Control Register (EXPCAP2Fi)	Aux Power PM Enable (aux_pm_en)	Enable aux_power support for a function	The PCI Express Base Specification, Revison4.0, Version 1.0 specifies that the value of this bit must be preserved in the $D3_{cold}$ state. In L2 when power is removed the CDM loses its context. This bits is preserved in the PM under AUX power and fed back to the CDM.
PMCSR (PMCAP1F*i*)	PME_EN (pm_pme_en)	Indicates if a function is permitted to generate a PME	PME message request, if enable, can trigger a wakeup from L2 if main power has been removed.
PMCSR_BSE (PMCAP1F*i*)	PowerState (pmstate)	Indicates the D-state of a function	Use for entry to low power states.
Link Capabilities Register (EXPCAP3F*i*)	Clock power Management (cfg_clk_pm_cap)	If set to 1 this indicates that an upstream port tolerates the removal of reference clock when the link is in L1 or L2/L3 ready	Used for the removal of reference clock in L1 or L2/L3 ready.
AUX_CLK_FREQ_OFF (PRTLGC87)	AUX_CLK_FREQ	The frequency of the aux_clk in MHz	This field is use to scale certain timers in the power management block. It needs to be shadowed because the CDM is reset when power is removed in L2.
GEN3_RELATED_OFF (PRTLGC53)	GEN3_ZRXDC_NONCOMPL (cfg_pl_gen3_zrxdc_noncompl)	GEN3 receiver impedance zrx-dc not compliant	This bit enable a 100ms timer which can trigger exit from L1

Note:
Temporarily interrupt the stream of back-to-back TLPs for one or more clock cycles on the client interfaces when low power mode entry is requested. This causes performance degradation.

Implement the note 1 (if possible), or
Implement the note 2
1. The application can monitor PCIEPWRMNGSTS1.pm_master_state and PCIEPWRMNGSTS1.pm_slave_state to know when the controller is in L1 entering negotiation.
2. Disable ASPM and do not force the controller into a low power mode through PCI-PM.

(2) L1 Substates

This section discusses the L1 link substates. The following topics are discussed:

■ “L1.1 and L1.2 Entry and Exit Conditions”

■ “L1 Exit Latency”

The L1 substates are applicable in both the ASPM and PCI-PM L1 link states. L1 substates management utilizes a per-link sideband signal called CLKREQ#. The controller supports this feature (with the additional I/O as shown in “Removing the Reference Clock” on page 69) when you set CX_L1_SUBSTATES_ENABLE =1.

Assumptions and Limitations

- The CLKREQ# signal is not directly controlled by the controller. You must implement external logic to do so.
- During L1 substates it is assumed that core_clk is turned off and that aux_clk is active. It is required that your application switches aux_clk to a low frequency free running clock on entry into L1.
- The controller uses aux_clk for counting time during L1 substates. You must program the frequency of this clock into the PRTLGC87 register with a value in the range 1…1000MHz to count real time. Frequencies lower than 1 MHz are possible, but with a loss of accuracy in the time counted.
- When the electrical idle detection circuitry is disabled it is assumed that the PHY holds the signal phy_mac_rxelecidle to 1.
- Access the L1 PM Substates Extended Capability register.
  System Usage Note:
  Software should not attempt to write to the mentioned fields in the L1 PM Substates Extended Capability register.

(a) L1.1 and L1.2 Entry and Exit Conditions

Overview

After the link has entered L1 through the normal L1 negotiation, the USP can initiate the sequence for entering the target L1 substate (L1.1 or L1.2) by tri-stating its CLKREQ# output buffer. The entry sequence can only proceed if the DSP is also tri-stating its CLKREQ# output buffer, resulting in the bidirectional CLKREQ# signal being pulled up to 1. Otherwise CLKREQ# remains asserted at 0 and the link state stays in L1. The exit sequence can be initiated by either ports by asserting CLKREQ# to 0. For each port there are two cases to consider, the first where the exit is initiated locally, the second where the exit is initiated remotely. The following sections provide details on the signaling that occurs between the PCIe controller as the MAC, the PHY, and the CLKREQ# output buffer, for entering and exiting L1 substates. L1 substates management utilizes a per-link sideband signal called CLKREQ#. After all of the entry conditions for a L1 substate are met, the controller asserts the mac_phy_rxelecidle_disable output. When the target L1 substate is L1.2, it also asserts the mac_phy_txcommonmode_disable output.

L1 Substates Entry

1. MAC transitions the PHY to P1.
2. PHY asserts phy_mac_phystatus for P1 entry.
3. Controller transitions the PHY to P1.CPM and asserts pm_sel_aux_clk to turn off core_clk.
4. PHY asserts phy_mac_phystatus for P1.CPM entry and CLK_RST asserts aux_clk_active.

5. Controller de-asserts mac_phy_pclkreq_n[1].
6. CLKREQ# output buffer tri-stated.
7. Controller waits for clkreq_in_n to de-assert.
8. Controller transitions the PHY to P1.1 (or P1.2).
9. PHY asserts phy_mac_phystatus for P1.1 (or P1.2).
10. Controller asserts mac_phy_asyncpowerchangeack.
11. PHY de-asserts phy_mac_phystatus.
12. Controller de-asserts mac_phy_asyncpowerchangeack.

L1 Substates Exit (Locally Initiated)

1. Any of the normal L1 exit conditions in “L1-PM/L1-ASPM Exit” on page 278 are met
2. Controller asserts mac_phy_pclkreq_n[1].
3. CLKREQ# output buffer is asserted.
4. Controller transitions the PHY to P1.CPM.
5. PHY asserts phy_mac_phystatus for P1.1 (or P1.2).
6. Controller asserts mac_phy_asyncpowerchangeack.
7. PHY de-asserts phy_mac_phystatus.
8. Controller de-asserts mac_phy_asyncpowerchangeack.
9. Controller transitions the PHY to P1 and de-asserts pm_sel_aux_clk to turn on core_clk.
10. PHY asserts phy_mac_phystatus for P1 entry and CLK_RST de-asserts aux_clk_active.
11. Controller transitions the PHY to P0 in the usual way.

L1 Substates Exit (Remotely Initiated)

1. The remote link partner asserts CLKREQ#.
2. Controller input clkreq_in_n asserts.
3. Controller asserts mac_phy_pclkreq_n[1].
4. Controller transitions the PHY to P1.CPM.
5. PHY asserts phy_mac_phystatus for P1.1 or (P1.2).
6. Controller asserts mac_phy_asyncpowerchangeack.
7. PHY de-asserts phy_mac_phystatus.
8. Controller de-asserts mac_phy_asyncpowerchangeack.

9. Controller transitions the PHY to P1 and de-asserts pm_sel_aux_clk to turn on core_clk.
10. PHY asserts phy_mac_phystatus for P1 entry and CLK_RST de-asserts aux_clk_active.
11. Controller transitions the PHY to P0 in the usual way.

L1 Substates Software Control

When the controller enters L1, the target L1 substate depends on several programming bits:

- PM Control/Status Register
  - USP: The current D-state
  - DSP: The DLLP type that is used by USP to request L1
- L1 Substates Control 1 Register
  - ASPM PM L1.1 Enabled.
  - ASPM PM L1.2 Enabled.
  - PCI PM L1.1 Enabled.
  - PCI PM L1.2 Enabled.

After the USP controller enters L1, it uses the D-state of the device to determine if L1 is entered in ASPM mode or PCI-PM mode. After the DSP controller enters L1, it uses the USPs DLLP L1 request type to determine if L1 is entered in ASPM mode or PCI-PM mode. Table 104.36 and Table 104.37 (below) show the target L1 substate as a function of the relevant programming bits.

Table 104.36 Target L1 Substate as a Function of Software Controls (USP)

D-State	ASPM PM L1.1 Enabled	ASPM PM L1.2 Enabled	Reported LTR >= L1.2 Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
!D0	-	-	-	0	0	L1
!D0	-	-	-	1	-	L1.1
!D0	-	-	-	-	1	L1.2
D0	0	0	-	-	-	L1
D0	1	0	-	-	-	L1.1
D0	0	1	0	-	-	L1
D0	1	1	0	-	-	L1.1
D0	-	1	1	-	-	L1.2

Table 104.37 Target L1 Substate as a Function of Software Controls (DSP)

DLLP Received	ASPM PM L1.1 Enabled	ASPM PM L1.2 Enabled	Reported LTR >= L1.2 Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
PM_Enter_L1	-	-	-	0	0	L1
	-	-	-	1	0	L1.1
	-	-	-	-	1	L1.2
PM_Active_State_Request_L1	0	0	-	-	-	L1
	1	0	-	-	-	L1.1
	0	1	0	-	-	L1
	1	1	0	-	-	L1.1
	-	1	1	-	-	L1.2

The Reported LTR is the maximum of the snoop/no-snoop latency values embedded in LTR messages transmitted by the upstream ports or received by the downstream port. The controller stores these values in the port logic LTR Latency Register (PRTLGC86). When the requirement bit in the message is 0, the latency value is considered infinite (that is, the check with the threshold always pass).

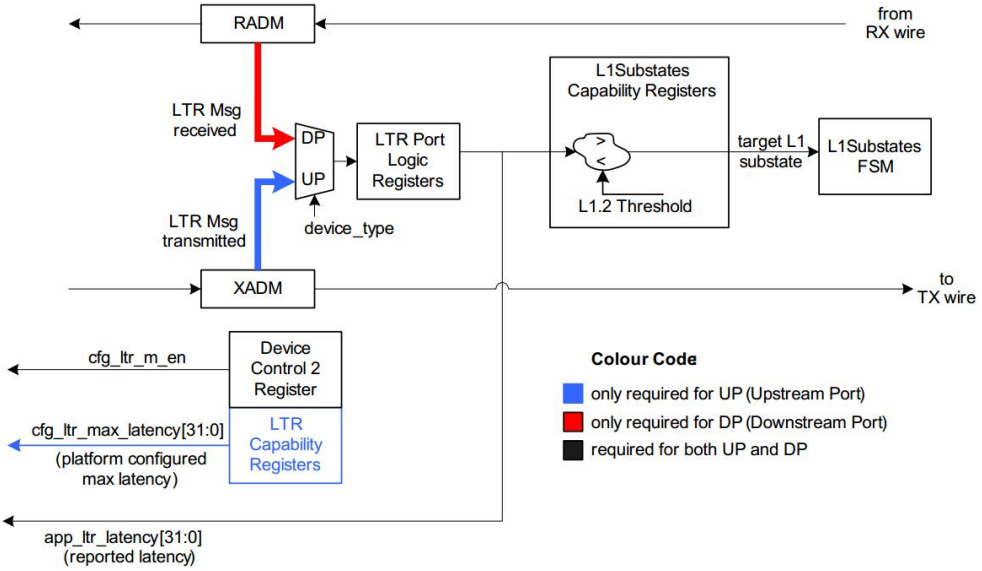

Figure 104.36 Role of LTR in L1 Substates.

(b) L1 Exit Latency

This section provides a breakdown of the L1 exit latency when CX_L1_SUBSTATES_ENABLE is enabled for L1 substates or L1 Clock PM.

Table 104.38 L1 Substates and L1 Clock PM Exit Latency Component Values

	A	B	C	D	E
Event in Figure 104.38	CLKREQ# -> mac_phy_p	mac_phy_powerdown -> phy_mac_phystatus (pipe_clk_ stable)	pipe_clk stable -> mac_phy_powe	mac_phy_powerdown -> phy_mac_phystatus & LTSSM change	Recovery -> L0

	owerdown		rdown		
Description	0	Time requires to produce a stable pipe_clk	Includes time to switch aux_clk back to pipe_clk and ungating of core_clk.	Time required after pipe_clk is stable to power up circuit for P0	-
Values when exiting L1.1	0	400ns to reactivate REFCLK + 15us	Estimate: 3aux_clk cycles (slow freq) + 3 core_clk cycles	Time to P0, ~ 2us	Time to execute Recovery
Values when exiting L1.2	0	T_power_on to reactivate REFCLK + 15us			T_common mode (~55us) + time to execute Recovery

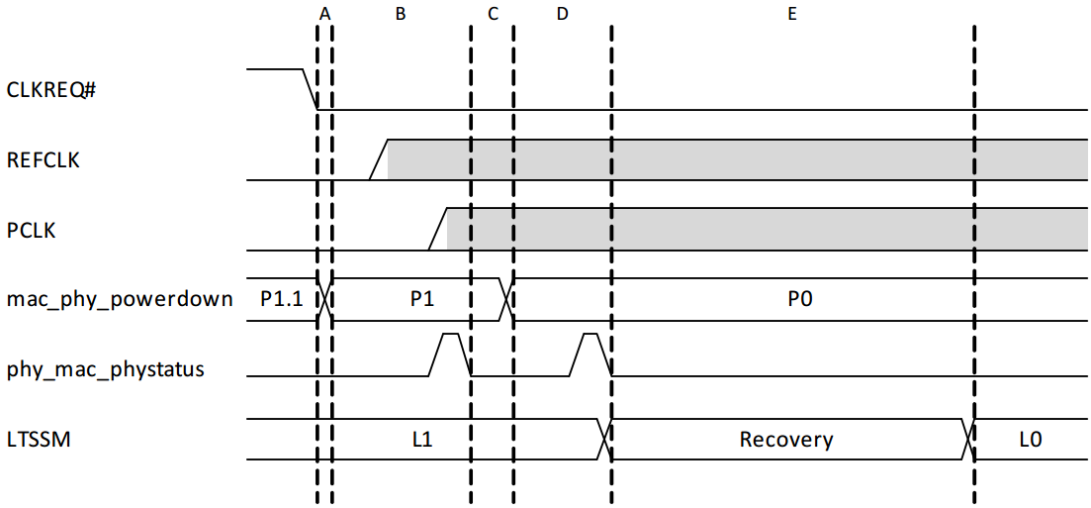

Figure 104.38 L1 Exit Latency Components

(3) L0s Entry and Exit Conditions

This section discusses the L0s link state. The following topics are discussed:

■ “Overview”

■ “L0s Entry”

■ “L0s Exit”**Overview**

L0s is a low-power state enabled by ASPM. ASPM controls entry into L0s for the transmitter. The remote device controls entry into L0s for the receiver.

L0s Entry

All of these condition must be met:

- ASPM L0s is enabled through the ASPM Control field in the Link Control register.
- L0s entry conditions as defined in Section 5.4.1.1.1, “Entry into the L0s State” of the *PCI Express Base Specification, Revision 4.0, Version 1.0*, exist for a duration of time (determined by the cfg_l0s_entr_latency_timer field in PRTLGC3).
- No higher stage of power-down requested.

L0s Exit

Any of these condition can be met:

- A DLLP or TLP is pending to be sent.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the *PCI Express Base Specification, Revision 4.0, Version 1.0* are satisfied.
- PCIe link partner requests to enter into link recovery.

(4) L1 Operation (Non-substates)

The following topics are discussed:

■ “L1 (ASPM/PM) Entry and Exit Conditions”

■ “L1 Clock PM (L1 with REFCLK Removal/PLL Off) Overview”

■ “L1 Clock PM (L1 with REFCLK Removal/PLL Off); Entry and Exit Conditions”

(a) L1 (ASPM/PM) Entry and Exit Conditions

L1-ASPM Overview

The L1-ASPM entry negotiation handshake uses PM_Active_State_Request_L1 DLLPs, PM_Request_Ack DLLPs, and PM_Active_State_Nak MSG TLPs. There are three scenarios that cause the controller to enter L1 under ASPM conditions.

L1-ASPM Entry (Scenario 1): L1 Idle Timeout in L0s

The controller enters L1-ASPM when all of these conditions are met in the USP:

- ASPM L1 and L0s are enabled through the ASPM Control field in the Link Control register.
- The cfg_l1_entr_wo_rl0s field of PRTLGC3 is set to ‘0’ and the link state is L0s for both link partners, or the cfg_l1_entr_wo_rl0s field of PRTLGC3 is set to ‘1’.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the *PCI Express Base Specification, Revision 4.0, Version 1.0*, exist for a duration of time (determined by the cfg_l1_entr_latency_timer field in PRTLGC3).
- No higher stage of power-down requested.
- Your USP application is not asserting the app_xfer_pending input.
- There are no in-progress transactions1 in the controller such as:
  - Rx queue P/NP Request TLPs.

- Rx queue CPL TLPs.
- Outstanding/expected wire completions.
- Outstanding/expected application (at the AXI master interface when present) completions.

- There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
- There are no pending DMA transfers.

L1-ASPM Entry (Scenario 2): L1 Idle Timeout In L0

The controller enters L1-ASPM when all of these conditions are met in the USP:

- ASPM L1 is enabled and L0s is not enabled through the ASPM Control field in the Link Control register.
- Link state is L0.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the *PCI Express Base Specification, Revision 4.0, Version 1.0*, exist for a duration of time (determined by the cfg_l1_entr_latency_timer field in PRTLGC3).
- No higher stage of power down-requested.
- Your USP application is not asserting the app_xfer_pending input.
- There are no in-progress transactions in the controller such as:
  - Rx queue P/NP Request TLPs.
  - Rx queue CPL TLPs.
  - Outstanding/expected wire completions.
  - Outstanding/expected application (at the AXI master interface when present) completions.
- There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
- There are no pending DMA transfers.

L1-ASPM Entry (Scenario 3): Application Controlled (USP only)

The controller enters L1-ASPM when all of these conditions are met in the USP:

- ASPM L1 is enabled through the ASPM Control field in the Link Control register.
- Your application logic pulses the app_req_entr_l1 input.
- Your USP application is not asserting the app_xfer_pending input.
- There are no in-progress transactions1 in the controller such as:
  - Rx queue P/NP Request TLPs.
  - Rx queue CPL TLPs.
  - Outstanding/expected wire completions.
  - Outstanding/expected application (at the AXI master interface when present) completions.

- There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
- There are no pending DMA transfers.

L1-PM Entry

The power management state of a link is determined by the D-state of the USP. When you change the device state of the USP to D1 or $D3_{hot}$ by writing to the PMCAP1F*i*, the controller must initiate a link state transition to L1. The USP of a non-ARI multi-function device must not initiate a link state transition to L1 until all of its functions have been programmed to a non-D0 D-state. L1 state is a bi-directional link low-power state. Both link partners must negotiate to go this state. The L1-PM negotiation handshake uses the following DLLPs:

- PM_Enter_L1.
- PM_Request_Ack.

All of these condition must be met:

- L1 entry conditions are satisfied as defined in Section 5.3.2.1, “Entry into the L1 State” of the *PCI Express Base Specification, Revision 4.0, Version 1.0*.

Note: An USP application asserting the app_xfer_pending input does not prevent L1-PM entry, but causes immediate exit from L1-PM.

L1-PM/L1-ASPM Exit

The controller exits L1-PM/L1-ASPM if any of these conditions is met:

- A DLLP or TLP is pending to be sent.
- Your application asserts the app_req_exit_l1 input.
- Link partner is requesting exit from L1.
- Your application asserts the app_xfer_pending input.
- Your application asserts the apps_pm_xmt_pme input. When the USP is programmed with capability to support PME; it sends a PME message to the RC which calls the PM software to transition the USP to the D0 state. Therefore, you should only use apps_pm_xmt_pme for L1-PM exit.
- PM software (RC) requests a higher stage of power-down by writing to the PMCAP1F*i* in the USP.
- Your application (USP) requests transmission of VDM, MSI, or LTR message.
- Your application is requesting to send traffic by asserting client0_tlp_hv (non-AXI)
- Your application enables a DMA read or write channel, or DMA controller is requesting data.
- Your application (DSP) initiates link disable, or link retrain (by setting cfg_link_dis or cfg_link_retrain field in EXPCAP4Fi to 1).
- Your application (DSP) initiates hot reset by either:
  - setting cfg_plreg_reset field in PRTLGC4 to 1, or
  - setting cfg_2nd_reset field in PCICONF15F*i* to 1, or
  - toggling app_init_rst
- Your application (DSP) requests transmission of Unlock message.

- Your application requests a speed change (by setting cfg_directed_speed_change field in PRTLGC21 to 1).
- Your application requests link width change (by setting cfg_pl_multilane_control[6] field in PRTLGC59 is set to 1).
- Any activity in the RADM, as indicated by radm_idle being set to 1'b0.
- Clearing r_radm_clk_gating_en field in PRTLGC52 register.

***Note:** The CDM space is accessible in L1, but some CDM register bits do not produce the desired results. Writing to CDM register bits which trigger LTSSM state transitions in L1 does not have the desired effect because the LTSSM clock is not running in L1. radm_idle is set to 1'b0 if AERCAP6F*i*.ECE is set to 1'b1 during L1.

****Caution:**
DMA Doorbell L1
- Any DMA register can be accessed in L1 because the DMA registers are clocked on aux_clk_g.
- When core_clk is removed in L1 substates or L1 clock power management, aux_clk_g is used.

DMA Doorbell L1 Exit
- Doorbelling any DMA read/write channel triggers L1 exit.
- Writing to other DMA registers does not trigger L1 exit.

(b) L1 Clock PM (L1 with REFCLK Removal/PLL Off) Overview

This feature allows you to shut down the PLL and the reference clock during standard (non-substates) L1. Table 104.39 lists the inputs and outputs that are considered for L1 Clock PM.

Table 104.39 Inputs and Outputs to Consider for L1 Clock PM

CX_L1_SUBSTATES_ENABLE	CX_PIPE_VER	I/O SIGNALS
0	0	clk_req_n phy_clk_req_n
	1	clk_req_n mac_phy_powerdown[3:0] = CX_PIPE43_P1CPM_ENCODING phy_mac_phystatus
1	0	mac_phy_pclkreq_n[0] phy_mac_pclkack_n
	1	mac_phy_pclkreq_n[0] mac_phy_powerdown[3:0]= CX_PIPE43_P1CPM_ENCODING phy_mac_phystatus

For PIPE 4.3 (CX_PIPE_VER =1),

- The controller and PHY use mac_phy_powerdown[3:0] to indicate the PHY power state.
- You can specify the power-down encodings using the CX_PIPE43_P1CPM_ENCODING parameter.

- You can specify P1.CPM entry sequence using the CX_PIPE43_P0_P1CPM parameter.

For an USP, host software uses the Enable Clock Power Management bit in the Link Control register to enable this feature. For a DSP, this register bit is hard coded to '0' and cannot be used to control this behavior. Your application can use the app_clk_pm_en input to dynamically control whether to execute L1 with or without Clock PM. The CLKREQ# signal is not directly controlled by the controller.

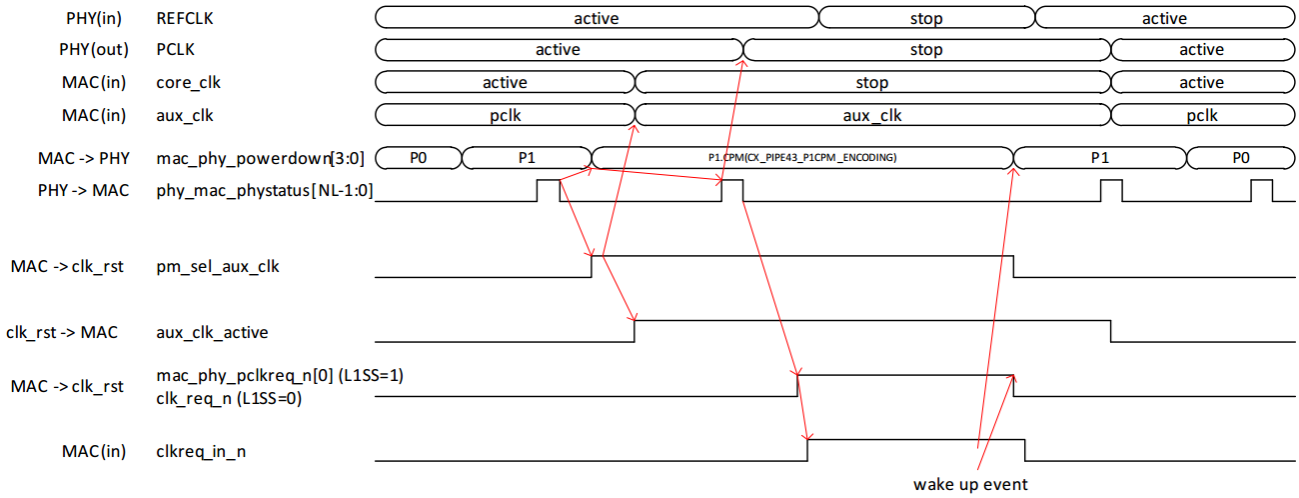

Figure 104.39 PIPE 4.3 L1 CPM Operation (CX_PIPE43_P0_P1CPM=0)

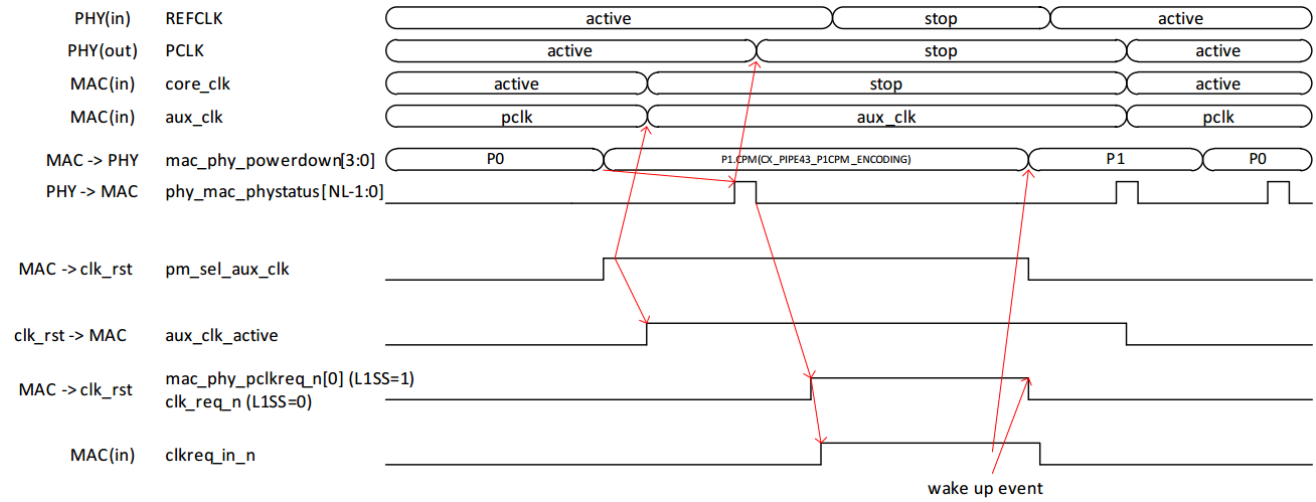

Figure 104.40 PIPE 4.3 L1 CPM Operation (CX_PIPE43_P0_P1CPM=1)

(c) L1 Clock PM (L1 with REFCLK Removal/PLL Off); Entry and Exit Conditions

To enable the controller (upstream port only) to execute L1 with Clock PM:

- The Support Clock Power Management bit in the Link Capabilities register must be set. The default value of this register is controlled by the DEFAULT_CLK_PM_CAP parameter. For downstream ports it is hardcoded to 0, for upstream ports it can be accessed through the DBI.
- The Enable Clock Power Management bit in the Link Control register must be set.
- You must set the app_clk_pm_en input to 1. The controller only samples app_clk_pm_en when L1 is entered.

L1 with Clock PM and L1 substates work orthogonal to each other. L1 with Clock PM uses the mac_phy_pclkreq_n[0] signaling, and L1 substates uses the mac_phy_pclkreq_n[1]signaling. However, L1 substates takes precedence over Clock PM within the cores PM state machine. This means that when the entry conditions for any L1 substate are satisfied then the controller's LTSSM executes the corresponding L1 substate protocol.

For details on L1 exit latency, see “L1-PM/L1-ASPM Exit”.

(5) L2 and L3 Power Down Entry and Exit Conditions (USP)

This section discusses the L2 and L3 link states. The following topics are discussed:

- “Overview”
- “L2/L3 Entry”
- “L2/L3 Exit”

Overview

L2 entry is initiated(1) after the RC calls power management software to initiate the removal of power and clocks. USPs of devices in D0, D1 and $D3_{hot}$ must respond to the receipt of a PME_Turn_Off MSG TLP by transmitting a PME_TO_Ack MSG TLP. The device must then request a link transition to L2_Ready. L2_Ready is a bi-directional link power down state. If your application is not ready to be shut-down, it must keep the app_ready_entr_l23 input de-asserted. This causes the controller to delay sending the PM_Enter_L23 DLLP and thereby stalling the negotiation handshake that uses the following DLLPs:

- PM_Enter_L23.
- PM_Request_Ack

When your application is eventually ready for transitioning to $D3_{cold}$, that is, loss of main power and reference clock, L2_Ready is entered and the downstream device begins preparation for the power and clock removal. After main power has been removed, the link transitions to L2 if Vaux is provided, or it transitions to L3 if no Vaux is provided.

***Note: PCIe does not support L3.**

L2 Entry

All of these condition must be met:

- PME_Turn_Off/PME_TO_Ack handshake has been completed.
- Your USP application is ready to be turned off; app_ready_entr_l23 =1.
- After sending the PME_TO_Ack, the USP initiates the L2 Ready transition protocol by sending the PM_Enter_L23 DLLP. The RC responds with the PM_Request_Ack.

Note:
When PCIEPWRMNGSTS0.smlh_ltssm_state is set to '6'h0D' (RCVRY_LOCK) and PCIEPWRMNGSTS1.pm_master_state is set to '5'h18' (Wait for PM DLLP flush), the application should trigger the perst_n (warm reset)

L2 Exit

Any of these condition can be met:

- When the USP is programmed(2) with capability to support PME, your application can assert the apps_pm_xmt_pme input to request the controller to wakeup. The USP then sends a PM_PME MSG TLP to the RC which calls the PM software to transition the USP out of the D3 state.
- Device is programmed with capability to support PME and your application requests the controller to wakeup by triggering a native hot-plug event.
- Link partner is requesting exit from L2/L3.

The controller directs the PHY to generate beacon signaling when a PCIe device initiates a wake-up event.

Note :

1. In preparation for removing the main power source, your RC application asserts the apps_pm_xmt_turnoff input which causes the RC to broadcast the PME_Turn_Off MSG TLP to all USPs.

2. pm_pme_en bit is set in PMCAP1Fi, and the cfg_pme_support RT bit is set in PMCAP0Fi for the corresponding D-state for which the function is currently in.

PCIE controller is stuck in L2.IDLE during L2 exit by Electrical Idle.
Note #1:
Set the P2NOBEACON_ENABLE field of the PRTLGC60 register to '1'.
Note #2:
Always use warm reset (perst_n) to exit L2 state.
Note #3:
Upstream port can use WAKE# to exit L2 state.
System Usage note: Beacon is not available as a method for L2 exit.

104.3.15 Data Protection

This section discusses how the controller maintains the integrity of the link using different methods at different points.

(1) Overview

PCIEC RAS consists of three fundamental components:

- Reliable protocol architecture involving LCRC, ACK/NAK handshake, and Replay mechanisms.
- Internal device-level Datapath and RAM protection (RAS DP) of data, header, and RAM control signals from application I/F to LCRC extraction/generation points.
- Debug, Error Injection, and Statistic gathering (RAS DES).

(2) RAS Data Protection (DP)

- For the parts of the PCIEC outside of LCRC protection, PCIEC has the RAS DP feature consisting of:
- RAM Protection (ECC on data and Parity on address)
- An ECC checksum is calculated and added to data that is written to the RAM. When the data is read from the RAM, then the PCIEC recalculates the ECC and compares it against the value read from RAM. RAM ECC protection is provided for all of the RAMs in the PCIEC, except for the RAS-DES RAM. ECC corrects single-bit errors and reports (without correction) multi-bit errors.
- Datapath Protection (Parity)
- For Tx traffic, PCIEC adds parity protection codes to AXI bus address and data.
- For Rx traffic, PCIEC checks the protection codes on AXI bus address and data.

(3) Uncorrectable Error Handling

Upon detection of first Uncorrectable error (RAM and Datapath/Interface Protection), depending on value of cfg_rasdp_linkdown_en field of the VSE2CAP10, the PCIEC takes one of the two actions:

- Forces the PCIe link to go down (cfg_rasdp_linkdown_en =1), or
- Enters RASDP Error Mode (cfg_rasdp_linkdown_en =0)

(a) PCIe Link Down

- If the PCIEC is configured to cause the link to go down upon detection of an Uncorrectable error, the controller resets and resumes normal operation.

(b) RASDP Error Mode

On entering RASDP error mode, the PCIEC sets

slv_rasdp_error_mode/mstr_rasdp_error_mode.

Wire access to CDM registers is suspended to prevent corruption of the register configuration space.

TLP handling in RAS DP Error mode:

- Rx TLP Handling
  - Rx Errored TLPs are Forwarded to AXI bus.
  - Subsequent Rx TLPs not Guaranteed to be Correct; you Must Discard all TLPs.
- Tx TLP Handling for Dual lane link
  - Bad TLP is Nullified (EDB Inserted and LCRC Inverted) and Transmitted.
  - Subsequent TLPs are Nullified and Transmitted.
  - In-progress Replay is Nullified and Transmitted.
  - Subsequent Replays are Silently Dropped.
- Tx TLP Handling for Quad Lane link
  - Bad TLP is Silently Dropped.
  - Subsequent TLPs are Silently Dropped.
  - In-progress Replay is Nullified and Transmitted.
  - Subsequent Replays are Silently Dropped.

Credits accuracy is not retained under uncorrectable error conditions.

Error Logging:

- Uncorrectable Error (2-bit ECC and all parity errors.) is Logged
- Uncorrectable Internal Error Reported (AER)

(4) Correctable Error Handling

The PCIEC takes the following action to handle correctable (RAM and Datapath/Interface Protection) errors:

- Correctable Error(1-bit ECC errors) is Logged
- Correctable Internal Error Reported (AER)
- TLP is Modified/Corrected
- Errors Reported When Detected (Immediately)
- Error Correction Enable/Disable Control (Per TX/RX Direction and Per-Layer)
- If the PCIEC is capable of single bit error correction, disabling ECC error correction does not change the nature of the errors and their reporting. A single-bit error is reported as a correctable error although correction might be disabled.

(5) RAS Debug, Error Injection, and Statistics (DES)

(a) Debug

To facilitate system level debugging the PCIEC provides the following features:

- General Diagnostic Support (Legacy Internal Probe Points).
- Silicon Debug Support (Control and Status of PIPE, Deskew, Ack/Nak, Reversal, FC, EQ, LTSSM, Replay)

(b) Error Injection

The PCIEC provides support to inject the following types of errors:

- CRC Error
- Sequence Number Error

- DLLP Error
- Symbol DataK Mask Error or Sync Header Error
- FC Credit Update Error
- TLP Duplicate/Nullify Error
- Specific TLP Error

(c) Statistics

To facilitate collection of statistics the PCIEC provides the following features:

- Time Based Analysis (RX/TX data throughput and time spent in each low-power LTSSM state)
- Event counters (Error and Non-Error)

104.3.16 Error Handling

This section describes handling of the errors detected by this module.

(1) Error Types

This module classifies detected errors into four types: three types defined in the PCI Express standard (correctable errors, non-fatal errors, and fatal errors), and DMA controller error. It reports each type of error through the corresponding interrupt. About Error Types classification, refer to 104.3.17.

(a) Correctable Error

Correctable errors are defined as the type of errors from which recovery is possible through the PCI Express protocol. Recovery from the errors is performed by hardware.

When the conditions described later are satisfied, occurrence of a correctable error is signaled by the intreq_pci*m*_corerr interrupt. (m = 0)

(b) Non-Fatal Error

Non-fatal errors are defined as the type of errors from which recovery is impossible through the PCI Express protocol but which is not fatal. After this error, a single packet is discarded but the subsequent data communication can be continued. In most cases, error processing such as retransmission of the discarded packet is needed.

When the conditions described later are satisfied, occurrence of a non-fatal error is signaled by the intreq_pci*m*_nonfaterr interrupt. (m = 0)

(c) Fatal Error

Fatal errors are defined as the type of errors from which recovery is impossible through the PCI Express protocol and which is fatal. Specifically, the errors that require resetting the communication path or other appropriate processing fall into this type. In most cases, PCIEC must be initialized.

When the conditions described later are satisfied, occurrence of a fatal error is signaled by the intreq_pci*m*_faterr interrupt. (m = 0)

(d) DMA Controller Error

DMA controller Errors are defined that the DMA fails to complete the transfer, or an error occurs during the transfer. After this error, issuing new requests are stopped and the DMA channel is placed in a halted state.

When the conditions described later are satisfied, occurrence of a fatal error is signaled by the intreq_pci*m*_dma interrupt. (m = 0)

(2) Priority of Errors (in A Single Packet)

Upon detecting multiple errors during reception of a single packet, PCIEC reports only one error that it determines as the most important according to the following priority among errors. About Errors, refer to Table 104.40.

(High Priority)

Uncorrectable Internal Error

Receiver Overflow

Flow Control Protocol Error

Malformed TLP

ECRC Check Failed

Unsupported request (UR), Completer Abort (CA) or unexpected completion

Poisoned TLP received

(Low Priority)

(3) Error Factor

(a) Correctable Error

Correctable errors are defined as the type of errors from which recovery is possible without loss of transfer data through hardware processing such as automatic retransmission request.

If a correctable error occurs, the EXPCAP2F*i*[16].CEDTCD and any bit of register AERCAP4F*i* is set to 1. If a correctable error occurs when the EXPCAP2F*i*[0].CERPE bit is 1 and the corresponding bit of register AERCAP5F*i* is 0 in Endpoint mode, the ERR_COR message is transmitted to the Root Port to notify occurrence of an error. Both Root Port mode and End Port mode, the intreq_pci*m*_corerr interrupt is generated if PRTLGC80[4]. masked_safety_int[PCIE_CORR_INDEX] is 1.

In Root Port mode, if the ERR_COR message is received from an Endpoint when all of the PCICONF15F*i*[17].SERRE, EXPCAP2F*i*[0].CERPE, and EXPCAP7F*i*[0].SERRCEE bits are 1, the intreq_pci*m*_sub interrupt is generated. (*m* = *0*, *i* = 0, 1)

PCIE controller begins to exit the LTSSM state L0 to Recovery.Lock due to receiving TS1 Ordered Sets from the remote partner, while operating in the 4s mode at Gen1 or Gen2 data rate. If a Skip Ordered Set, with a Skip symbol removed is received, it may disrupt the deskew logic to cause an unexpected deskew alignment error (RAS D.E.S register), bad TLP or bad DLLP(correctable errors).
Not any needed, as the controller recovers itself.

The following errors are classified as correctable errors.

(a-1) Receiver Error

8b/10b or 128b/130b decode error

Disparity error

Elastic buffer overflow

Elastic buffer underflow

(a-2) BAD TLP

LCRC error

Sequence number error

(a-3) BAD DLLP

16-bit CRC error

(a-4) Replay Timeout

Ack/Nak timeout

(a-5) Replay Num Rollover

Replay Num rollover

(a-6) RAM 1-bit ECC Errors

RAM Protection ECC 1-bit errors.

(a-7) Header Log Overflow

Multiple Error Header Log overflow.

(b) Non-Fatal Error

A non-fatal error cannot be corrected through hardware control and one packet of data will be lost. Therefore, recovery processing by software, such as retransmission processing, is needed.

If a non-fatal error occurs, the EXPCAP2F*i*[17].NFEDTCD bit and the corresponding bit inside of register AERCAP1F*i* is set to 1. If a non-fatal error occurs when PCICONF1F*i* [8].SERRE is 1, the PCICONF1F*i* [30].SSE bit is set to 1. If a non-fatal error occurs when the corresponding bit in register AERCAP2F*i* is 0, the EXPCAP2F*i*[1].NFERPE bit or PCICONF1F*i* [8].SERRE bit is 1 in Endpoint mode, the ERR_NONFATAL message is transmitted to the Root Port to notify occurrence of an error. Both Root Port mode and End Port mode, the intreq_pci*m*_nonfaterr interrupt is generated if PRTLGC80 [3].masked_safety_int[PCIE_UNCORR_INDEX] is 1. However, if the error source is an unsupported request (described later), this module does not send the message or generate an interrupt when the conditions described later are satisfied.

In Root Port mode, if the ERR_NONFATAL message is received, PCICONF7F*i* [30].RSE is set to 1. If the ERR_NONFATAL message is received when the PCICONF15F*i*[17].SERRE and PCICONF1F*i*[8].SERRE bits are 1, the PCICONF1F*i*[30].SSE bit is set to 1. If the ERR_NONFATAL message is received from an Endpoint when the PCICONF15F*i*[17].SERRE bit is 1, the EXPCAP2F*i*[1].NFERPE or PCICONF1F*i*[8].SERRE bit is 1, and the EXPCAP7F*i*[1].SERRNFEE bit is 1, the intreq_pci*m*_sub interrupt is generated. However, if the error source is an unsupported request (described later), this module does not generate an interrupt when the conditions described later are satisfied. In addition, if the non-fatal error comes under the advisory non-fatal error cases described later, separately defined processing is performed. (*m* = *0*, *i* = 0, 1)

The following errors are classified as non-fatal errors.

(b-1) Poisoned TLP Reception

If a packet with the Poisoned attribute is written, it is handled as a non-fatal error.

This module does not transfer a write request of a packet from the PCI Express side to the internal bus side if the packet has the Poisoned attribute. If a request with the Poisoned attribute is received, the packet is discarded.

If the completion responding to the request issued by this module has the Poisoned attribute, the data in the completion is not transferred to the internal bus side.

If ConfigrationWrite Type0, I/O Write, or MSI has the Poisoned attribute, it is handled also as an unsupported request.

(b-2) Unsupported Request (UR) Reception

The following requests are handled as unsupported requests.

- Access to the area other than the PCI address area specified with BAR
- Reception of memory/IO request in Root Port mode when PCICONF1F*i*[2].BME = 0
- Access to memory space when PCICONF1F*i*[1].MSE = 0
- Access to IO space when PCICONF1F*i*[0].IOSE = 0
- Reception of a message with an undefined message code
- Reception of MsgD with message code Msg
- Reception of a message to be received only by an Endpoint in Root Port mode
- Reception of a message to be received only by a Root/Switch in Endpoint mode
- Reception of TLP other than configuration access and message in the Non-D0 state
- Access to a configuration register not implemented
- Reception of a Type1 Configuration Request

- Reception of a Configuration Request in Root Port mode
- Reception of a MRdLk request

If an unsupported request is received, the EXPCAP2F*i*[19].URDTCD bit is set to 1.

If an unsupported request is received when both the EXPCAP2F*i*[3].URRPE and PCICONF1F*i*[8].SERRE bits are 0, neither transmission of a message nor generation of an interrupt is performed.

If an unsupported request is received, the packet is discarded.

(b-3) Completer Abort (CA)

If an error occurs on the internal bus when the packet is transferred from the PCI Express to the internal bus, this module considers it as a Completer Abort and performs error handling. When the packet received from the PCI Express is a Non-Posted request, PCIEC returns a completion with the Completer Abort (CA)– Completion Status thus setting the PCICONF1F*i*[27].STA bit to 1.

If the packet received by PCIEC from the PCI Express side violates the PCI Express standard or is considered to be damaged, it is handled as an unsupported request or malformed TLP, not as a Completer Abort.

(b-4) Unexpected Completion Reception

If the completion not corresponding to the request issued by PCIEC is received, it is considered as an unexpected completion and error handling is performed.

Reception of an unexpected completion falls into the advisory non-fatal error cases described later.

(b-5) ECRC Check Failed

If the packet received by PCIEC from the PCI Express side violates ECRC check, it is considered as ECRC Check Failed. When the packet received from the PCI Express is a Non-Posted request, PCIEC returns a completion with the Completer Abort (CA)– Completion Status thus setting the PCICONF1F*i*[27].STA bit to 1.

(c) Fatal Error

Fatal errors are defined as the type of errors from which recovery is impossible through hardware and which usually require system-level error recovery processing such as initialization of the PCI Express.

If a fatal error occurs, the EXPCAP2F*i*[18].FEDTCD and the corresponding bit in register AERCAP1F*i* is set to 1. If a fatal error occurs when the PCICONF1F*i*[8].SERRE bit is 1, the PCICONF1F*i*[30].SSE bit is set to 1. If a fatal error occurs when the corresponding bit in register AERCAP2F*i* is 0, the EXPCAP2F*i*[2].FERPE or PCICONF1F*i*[8].SERRE bit is 1, in Endpoint mode the ERR_FATAL message is transmitted to the Root Port to notify occurrence of an error. Both Root Port mode and End Port mode, the intreq_pci*m*_faterr interrupt is generated if PRTLGC80[3].masked_safety_int[PCIE_UNCORR_INDEX] is 1.

In Root Port mode, if the ERR_FATAL message is received, PCICONF7F*i*[30].RSE is set to 1. If the ERR_FATAL message is received when both of the PCICONF15F*i*[17].SERRE and PCICONF1F*i*[8].SERRE bits are 1, the PCICONF1F*i*[30].SSE bit is set to 1. If the ERR_FATAL message is received from an Endpoint when the PCICONF15F*i*[17].SERRE bit is 1, the EXPCAP2F*i*[2].FERPE or PCICONF1F*i*[8].SERRE bit is 1, and the EXPCAP7Fi[2].SERRFEE bit is 1, the intreq_pci*m*_sub interrupt is generated. (*m* = *0*, *i* = 0, 1)

The following errors are classified as fatal errors.

(c-1) Data Link Layer Protocol Error
(c-2) Reception of malformed TLP
(c-3) Receiver Overflow
(c-4) Flow Control Protocol Error
(c-5) RAM 2-bit ECC errors

(c-6) CDM Register Check Error
(c-7) Tx Interface Progression Detection Error

The following packets are considered as malformed TLPs, which cause a fatal error when received. These packets are discarded when received.

- Reception of a packet with data size exceeding the Max Payload Size
- Reception of a packet with data of different length from the length specified in the size field
- Reception of a TLP with TD field in header = 0 and with the digest field
- Reception of a TLP with TD field in header = 1 and without the digest field
- Reception of a power management message of non TC0
- Reception of an error signal message of non TC0
- Reception of an unlock message of non TC0
- Reception of a Set_Slot_Power_Limit message of non TC0
- Reception of a Set_Slot_Power_Limit message without data
- Reception of a completion with data of different size from the size specified in the Length field
- Reception of a completion with data size exceeding the Max Payload Size
- Reception of a TLP of undefined type or fmt
- Reception of a TLP of the unassigned TC
- Reception of an IO request of TC!=0, Attr[1:0]!=0, Length[9:0]!=1, or Last DWBE[3:0]!=0
- Reception of a configuration request of TC!=0, Attr[1:0]!=0, Length[9:0]!=1, or Last DWBE[3:0]!=0
- Reception of a memory request with illegal DWBE
- Reception of a memory request crossing a 4-Kbyte boundary

(d) DMA Controller Error

DMA controller errors are defined that the DMA fails to complete the transfer, or an error occurs during the transfer.

PCIEC can signal the following events as the DMA controller errors by setting the corresponding registers. See 54.17 for more information.

For DMA Read transfer:

- Application Write Error Detected
- Unsupported Request (UR)
- Completer Abort (CA)
- Completion Timeout
- Data Poisoning
- Linked List Element Fetch Error Detected

For DMA Write transfer:

- Application Read Error Detected
- Linked List Element Fetch Error Detected

If any DMA controller error occurs, the intreq_pci*m*_dma interrupt is generated.

(e) Advisory Non-Fatal Error Case

The PCI Express standard prescribes that some of non-fatal errors should not be processed when the applicable packet is received because the errors should be judged in terms of cause and significance by the packet transmission source, software, or system. These non-fatal errors are called advisory non-fatal error

cases, which include the cases described in the following sections. If such a case is detected, general non-fatal error processing is not performed but processing prescribed individually is performed instead.

(e-1) Return of Completion with Unsupported Request/Completer Abort Status

If a completion with unsupported request/Completer Abort status is returned, PCIEC does not perform non-fatal error processing defined in the PCI Express standard. PCIEC records occurrence of an error in EXPCAP2F*i*[16].CEDTCD, the corresponding AERCAP1F*i* bit, and generates the ERR_COR message and the intreq_pci*m*_corerr interrupt if the corresponding bit set to 1.

(e-2) Completion Timeout

If a completion timeout occurs, PCIEC performs non-fatal error processing (recovery from software) defined in the PCI Express standard, does not handle this case as an Advisory Non-Fatal Error.

(e-3) Reception of Unexpected Completion

If this module receives an unexpected completion, it does not perform non-fatal error processing defined in the PCI Express standard. PCIEC records occurrence of an error in EXPCAP2F*i*[16].CEDTCD, the corresponding AERCAP1F*i* bits/AERCAP4F*i* bits, and generates the ERR_COR message and the intreq_pci*m*_corerr interrupt if the corresponding bit set to 1.

(e-4) Reception of Unsupported Request/Completer Abort Completion

If this module receives a completion of unsupported request/Completer Abort, it does not perform non-fatal error processing defined in the PCI Express standard. PCIEC records occurrence of an error in EXPCAP2F*i*[16].CEDTCD, the corresponding AERCAP1F*i* bits/ERCAP4F*i* bits, and generates the intreq_pci*m*_corerr interrupt if the corresponding bit set to 1.

(e-5) Reception of Poisoned TLP

According to the PCI Express standard, the case in which a Poisoned TLP is received and reception is continued is also defined as an advisory non-fatal error case; however, an advisory non-fatal error of such a case does not occur with this module since PCIEC prohibits continuation of Poisoned data processing. Although the cases related to the intermediate receiver are also defined by the standard, the corresponding processing is not performed since PCIEC not operate as an intermediate receiver.

104.3.17 Interrupts

Table 104.40 shows the interrupt signals of this module, definition, and the conditions under which interrupts are generated. The interrupt signals are synchronized with the internal bus clock(S0D4_HSCφ).

Table 104.40 List of Interrupt Signals

Name	Definition	Conditions of Generation	Related Registers
intreq_pci*m*_corerr	PCI Express Correctable Error interrupt	Occurrence of a correctable error • Receiver Error • Bad DLLP • Bad TLP • Replay Timer Timeout • RAM 1-bit ECC errors • Header Log Overflow	• PCIEERRSTS0[4]
intreq_pci*m*_nonfaterr	PCI Express Uncorrectable Error interrupt	Occurrence of an uncorrectable (fatal & non-fatal) error • Reception of Malformed TLP • Data Link Layer Protocol Error • Receiver Overflow • Flow Control Protocol Error • RAM 2-bit ECC errors • CDM Register Check Error • Tx Interface Progression Detection Error • Unsupported request • Poisoned TLP • ECRC Check Failed • Completion Timeout • Completer Abort • Unexpected Completion	• PCIEERRSTS0[5]
intreq_pci*m*_faterr	PCI Express Uncorrectable Error interrupt	Same as intreq_pci*m*_nonfaterr	• PCIEERRSTS0[5]
intreq_pci*m*_lperr	PCI Express error message reception interrupt	Reception of an ERR message from link partner. • RC Error Interrupt is received. • RC Error MSI is received. • System Error (RC only) is received.	• PCIEINTSTS0[28:27] • PCIEINTSTS0[30:29] • PCIEERRSTS0[10:9]

Name	Definition	Conditions of Generation	Related Registers
intreq_pci*m*_sub	PCI Express message reception interrupt	Reception of a message • PM_PME is received. • Unlock message is received. • LTR is received. • PME Turnoff is received. • PME_TO_Ack is received. • ERR_FATAL message is received. • ERR_NONFATAL message is received. • ERR_COR message is received. Indicate LTSSM status: • Data link layer is up. • PHY link is up Caused by Power Management Event (PME): • MSI caused by PME • Interrupt caused by PME	• PCIEMSGRCPSTS[4] • PCIEMSGRCPSTS[8] • PCIEMSGRCPSTS[0] • PCIEMSGRCPSTS[6] • PCIEMSGRCPSTS[5] • PCIEMSGRCPSTS[3] • PCIEMSGRCPSTS[2] • PCIEMSGRCPSTS[1] • PCIEINTSTS0[7] • PCIEINTSTS0[6] • PCIEINTSTS0[13:12] • PCIEINTSTS0[11:10]
intreq_pci*m*_sub	PCI Express link bandwidth change interrupt	Following conditions are true • MSICAP0Fi[16]=1 and EXPCAP4Fi[14]=1 and EXPCAP4Fi[10]=1 • PCICONF1Fi[10]=0 and EXPCAP4Fi[10]=1 and EXPCAP4Fi[30]=1 • MSICAP0Fi[16]=1 and EXPCAP4Fi[15]=1 and EXPCAP4Fi[11]=1 • PCICONF1Fi[10]=0 and EXPCAP4Fi[11]=1 and EXPCAP4Fi[31]=1	• PCIEINTSTS0[23] • PCIEINTSTS0[22] • PCIEINTSTS0[21] • PCIEINTSTS0[20]
intreq_pci*m*_sub	PCI Express reset status interrupt	Change of the following status • Link has gone down or Controller received a hot-reset request. • Same condition as above and after all pending AXI transfers have completed. • Application request downstream port to start Link hot reset. • FLR	• PCIERSTSTS[2] • PCIERSTSTS[1] • PCIERSTSTS[0] • PCIERSTSTS[5:4]
intreq_pci*m*_sub	PCI Express-IP power management interrupt	Detection of PM status • Wake Up from power management unit.	• PCIEPWRMNGSTS0[9]

Name	Definition	Conditions of Generation	Related Registers
intreq_pci*m*_sub	PCI Express IP Hot-plug logic interrupt	Detection of hot-plug events • INTx interrupt mode. • PME mode. • MSI hot-plug events.	• PCIEINTSTS0[19:18] • PCIEINTSTS0[17:16] • PCIEINTSTS0[15:14]
intreq_pci*m*_sub	MSI	MSI Detected	• PCIEINTSTS0[26]
intreq_pci*m*_sub	Legacy interrupt	PCI Legacy Interrupts • Assert_INTx is received (radm_int*i*_asserted) . • Deassert_INTx is received radm_int*i*_deasserted (*i* = a,b,c,d).	• PCIEINTXSTS[0:3] • PCIEINTXSTS[4:7]
intreq_pci*m*_sub	Local bus controller external access interrupt	Detection of local bus controller to external register access.	• PCIEINTSTS1[21:20]
intreq_pci*m*_sub	Configuration information interrupt	Change of the following • State of bus master enable bit in the PCI-compatible Command register. • State of the Memory Space Enable bit in the PCI-compatible Command register.	• PCIEINTSTS0[1:0] • PCIEINTSTS0[3:2]
intreq_pci*m*_sub	Link Equalization Request	Detection of Link Equalization Request	• PCIEINTSTS0[24]
intreq_pci*m*_sub	Target completion timeout	Detection of Target completion timeout	• PCIETRGTCMPLUT1[8]
intreq_pci*m*_dma	PCIEC DMA Interrupt	Occurrence of PCIEC DMA event • Done: The DMA successfully completes the transfer. • Abort: The DMA fails to complete the transfer, or an error occurs during the transfer.	• PCIEDMAINTSTS[15:0]
intreq_pci*m*_vndmsg	PCIEC Vendor Defined Message Interrupt	Occurrence of reception of Vendor defined message from remote device	• PCIEMSGRCPSTS[7]

m = 0

Figure 104.41, Figure 104.42, Figure 104.43 and Figure 104.44 show the interrupts whose corresponding interrupt status and enable bits are located in the multiple registers.

104.3.18 Messages and MSI

PCIEC supports transmission and reception of the messages and MSI (Message Signaled Interrupt) defined in the PCI Express standard. The messages allow interrupt signaling, power management, error information notification. The MSI is used instead of INTx to signal interrupts. The following sections describe transmission and reception of the messages and MSI.

(1) Overview of Messages

PCIEC has the three types of message transmission and reception method.

The first type is automatically message transmission and receptions (Figure 104.45 (a) and Figure 104.46 (a)). The second type is message transmission and receptions by writing and reading the registers of PCIEC (Figure 104.45 (b) and Figure 104.46 (b)). The third types is message transmission and receptions by ATU conversion and received by reading the registers of PCIEC (Figure 104.45 (c) and Figure 104.46 (c)).

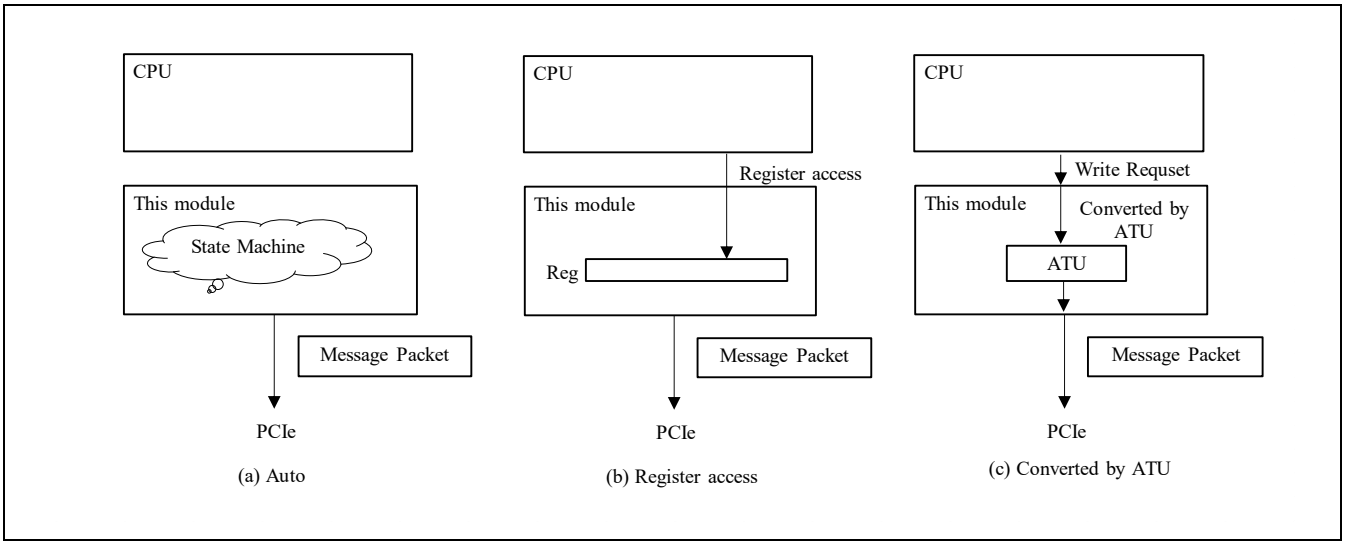

Figure 104.45 Message Transmission Methods

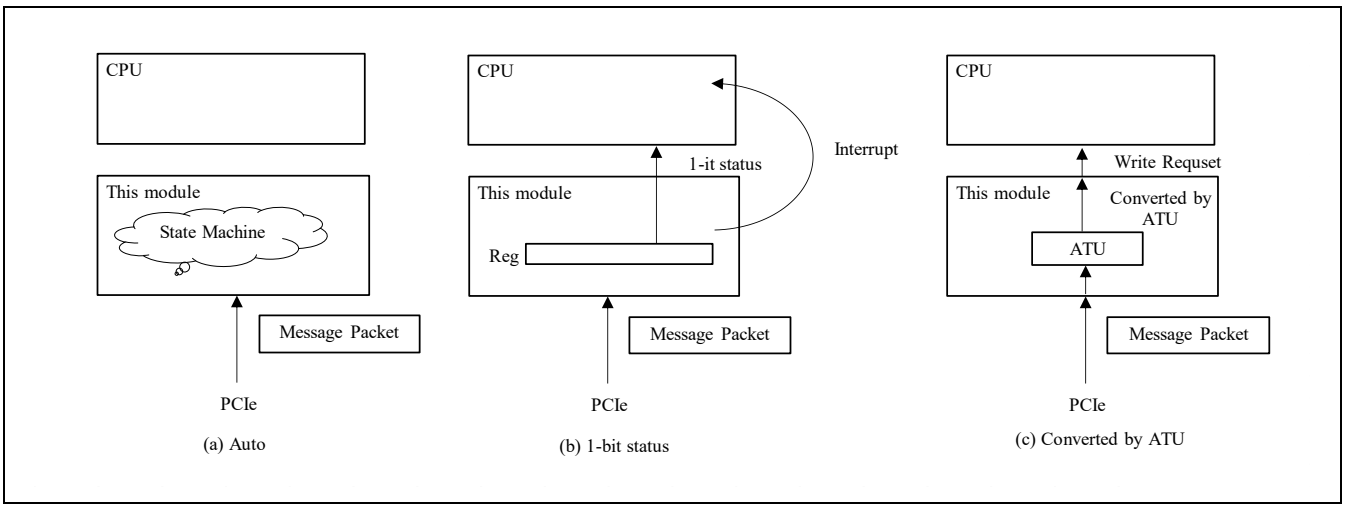

Figure 104.46 Message Reception Methods

(2) Message Transmission

Messages can be transmitted by either of the following three methods.

(a) Automatic Message Transmission By Hardware

PCIEC automatically sends a necessary message when an error occurs, LTR clear event occur and PTM event occurs. A part of PM related messages (PME_TO_Ack) is also automatically sent. The following messages are automatically sent.

- ERR_COR: When transmission of the correctable error message is enabled, PCIEC is automatically sent if a correctable error occurs.
- ERR_NONFATAL: When transmission of the non-fatal error message is enabled, PCIEC is automatically sent if a non-fatal error occurs.
- ERR_FATAL: When transmission of the fatal error message is enabled, PCIEC is automatically sent if a fatal error occurs.
- PME_TO_Ack: When PME_Turn_Off message are received by EPs, PME_TO_Ack is automatically sent as response.
- Latency Tolerance Reporting (LTR) clear message: PCIEC automatically sends LTR message with the Requirement bits set to 0 for both Snoop and No-Snoop latencies (LTR clear message) when:
  - A function is directed to a non-D0 state through a write to PMCAP1F*n*[1:0]. Power State, and the LTR mechanism is active since the last DL_Down to DL_Up

  or
  - The LTR mechanism is disabled by clearing EXPCAP10[10].ltr_m_en_r. This field is cleared though a CFG write or function level reset (FLR).
  - By setting cfg_disable_ltr_clr_msg field of the PRTLGC58 register to 1, the automatic generation of the LTR clear message in the above situations can be disabled.

- PTM Request/Response/ResponseD: When PTMCAP2F0[0]. cfg_ptm_enable is set, PCIEC is automatically sent.

(b) Initiation of Message Transmission By Writing Through Software

PCIEC sends the PM related message, Vendor_Defined message type0. To send these messages, access the following registers.

- Power management message transmission (PME_* message transmission): Writing 1 to the bits corresponding to the messages in the power management message transmission control register allows transmission of the messages given below: PME_TOFF, and PM_PME.
- LTR message can be generated by writing to PCIELTRMSGCTRL0[0].app_ltr_msg_req to 1. Only use for application where the LTR is changing slowly or static.
- Set_Slot_Power_Limit message, triggered by writing to the Slot Capabilities (EXPCAP5F*i*) register through the DBI, or when LTSSM enters L0.
- Error signaling from the application (Msg). The controller generates error signaling message in response to application requests on the app_err* signal.

(c) Initiation of Message Transmission By ATU Conversion

PCIEC sends the LTR request message by ATU conversion. The PM related message, Vendor_Defined message type0 and INTx interrupt message can be transmitted by using this method. To send these message, program the ATU register and issue Write Request from internal bus(AXI). See 54.3.5 for more detail.

(3) Message Reception

In PCIEC, reception of some messages is automatically handled by hardware. For the message reception processes not performed through hardware, refer to the status and process reception through software. Note that the messages except Vendor_Defined Message are required by the PCI Express standard to be transmitted and received with TC0. If such a message is received with the other TC, the PCIEC considers it as a malformed TLP (fatal error) thus performing error processing automatically.

(a) Automatic Message Reception By Hardware

A DSP must automatically send a Set_Slot_Power_Limit message when it enters L0, so the message is sent

and is received by the port itself.

- Set_Slot_Power_Limit

(b) Set 1-bit Status and Generating Interrupt

The module hardware detects reception of the following messages but does not automatically process them. Reception of these messages must be checked and processed by software as described below.

- PM_PME: when this message is received, PCIEMSGRCPSTS[4].radm_pm_pme is set. And corresponding enable bit PCIEMSGRCPSTSEN[4].radm_pm_pme is set. The intreq_pci*m*_sub is generated.
- Vendor_Defined Type0: when this message is received, PCIEMSGRCPSTS[7].radm_vendor_msg is set. And corresponding enable bit PCIEMSGRCPSTSEN[7].radm_vendor_msg is set. The intreq_pci*m*_vndmsg is generated.
- LTR request: when this message is received PCIEMSGRCPSTS[0].radm_msg_ltr is set. And corresponding enable bit PCIEMSGRCPSTSEN[0].radm_msg_ltr is set. The intreq_pci*m*_sub is generated.
- Assert_INTx (x is A to D): When this message is received in Root Port mode, PCIEINTXSTS[0,1,2,3].radm_intx_asserted are set (x = a,b,c,d). And the corresponding enable bit PCIEINTXSTSEN[0,1,2,3].radm_intx_asserted are set (x = a,b,c,d). The intreq_pci*m*_sub interrupt is generated. When received in Endpoint mode, this message is considered as a malformed TLP and error processing is performed.
- Deassert_INTx (x is A to D): When this message is received in Root Port mode, PCIEINTXSTS[4,5,6,7].radm_intx_dasserted are set (x = a,b,c,d) are set. And the corresponding enable bit PCIEINTXSTSEN[4,5,6,7].radm_intx_dasserted are set (x = a,b,c,d). The intreq_pci*m*_sub interrupt is generated. When received in Endpoint mode, this message is considered as a malformed TLP and error processing is performed.
- ERR_COR: When this message is received, the appropriate value is set to the configuration register to indicate reception of a correctable error PCIEMSGRCPSTS[1].radm_correctable_err and the corresponding enable bit PCIEMSGRCPSTSEN[1].radm_correctable_err is set. The intreq_pci*m*_sub interrupt is generated.
- ERR_NONFATAL: When this message is received, the appropriate value is set to the configuration register to indicate reception of a correctable error PCIEMSGRCPSTS[2].radm_nonfatal_err and the corresponding enable bit PCIEMSGRCPSTSEN[2].radm_nonfatal_err is set. The corresponding bit the intreq_pci*m*_sub interrupt is generated.
- ERR_FATAL: When this message is received, the appropriate value is set to the configuration register to indicate reception of a correctable error PCIEMSGRCPSTS[3].radm_fatal_err and the corresponding enable bit PCIEMSGRCPSTSEN[3].radm_fatal_err is set. The corresponding bit the intreq_pci*m*_sub interrupt is generated.

STATUS bits are defined for each specified message and 1 is set to the bit correcsponding to the received when a message is received. If the corresponding bit in the ENABLE and STATUS are set to 1, an interrupt will be generated.

(c) Converted By ATU

PCIEC converts the received message to Write Request (MEM or IO) and pass to internal bus (AXI) by ATU conversion. This method can be used for message cannot generated by software. All error-free MSG requests are decoded internally, signaled to the application logic..

(4) Overview of MSI

This section describes the MSI interrupt.

PCIEC supports MSI interrupt. Whether the PCI Express system should use INTx or MSI interrupts is determined by the Root Port during a configuration cycle. When PCIEC is to be used as a Root Port, whether INTx or MSI interrupt is used should be determined during a configuration cycle, and the results of the determination must be set in the configuration register.

When PCIEC is used as a Root Port, a maximum of 32 interrupt vectors can be used as MSI interrupts.

PCIEC supports both Per Vector Masking and the transmission of 64-bit address messages MSI.

(5) MSI Transmission

MSI can be transmitted only in Endpoint mode. Figure 104.47 shows an MSI transmission flow.

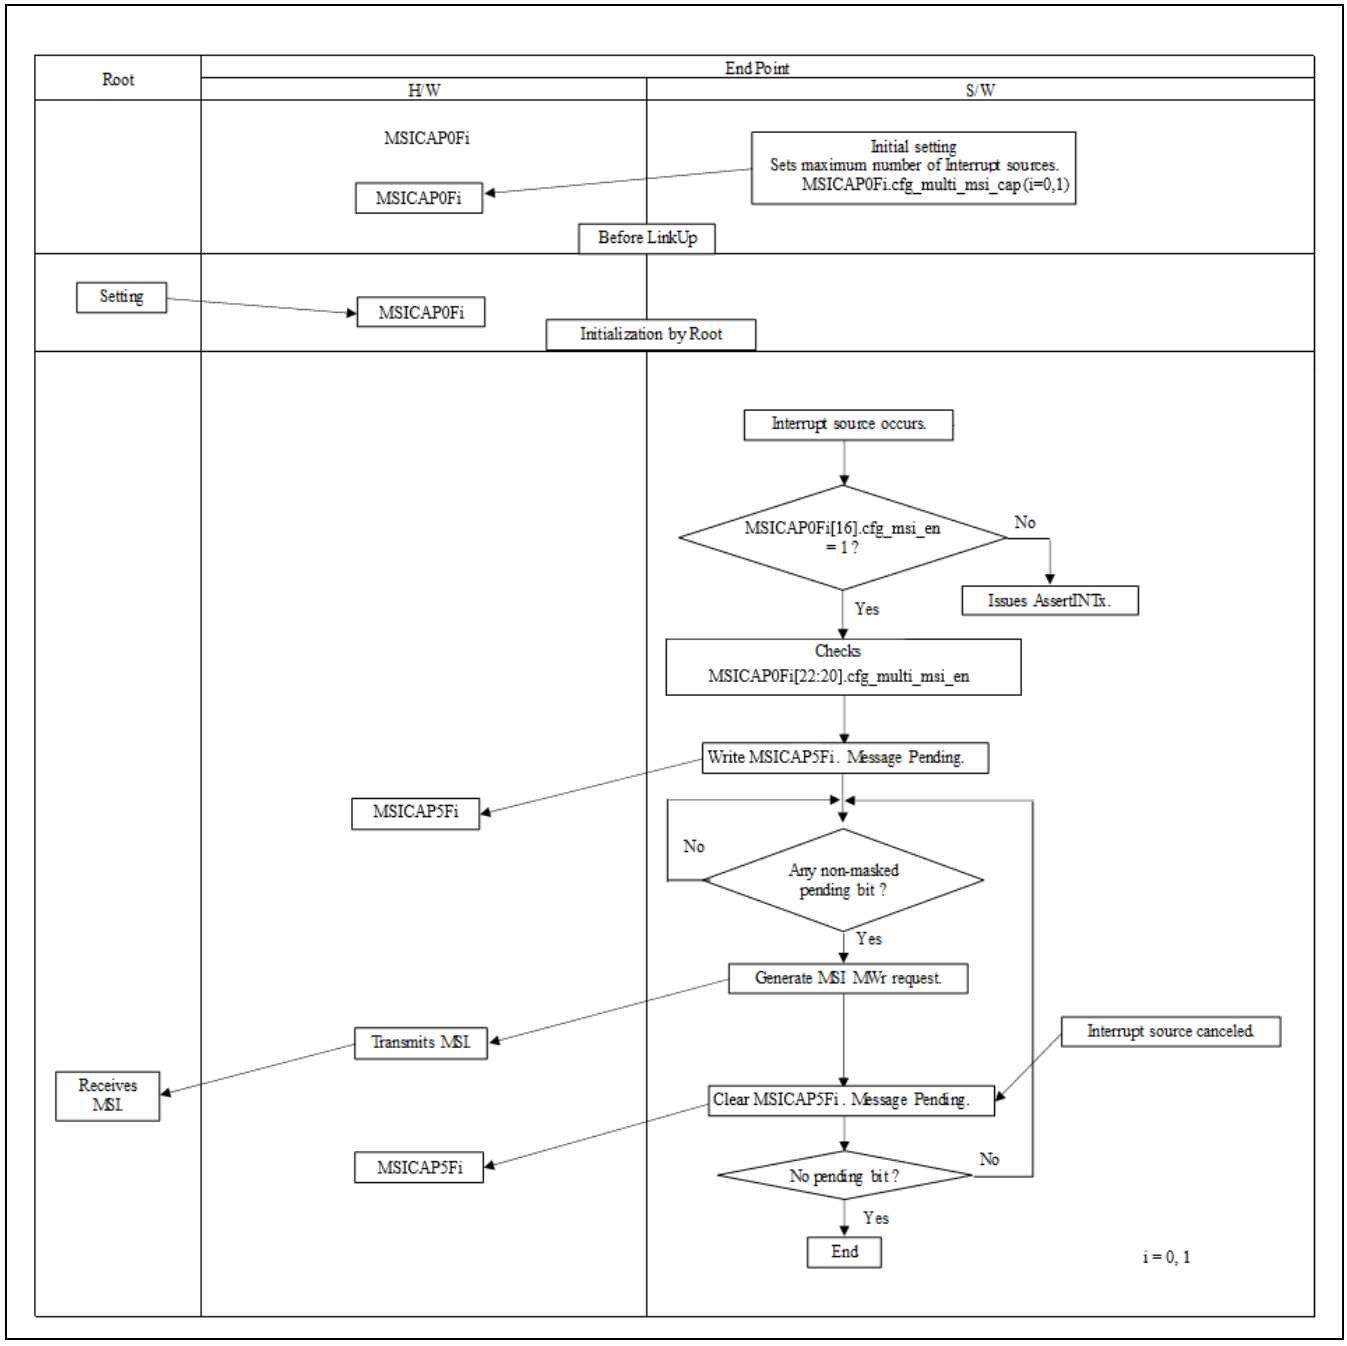

Figure 104.47 MSI Transmission

(6) MSI Reception

MSI can be received only in Root Port mode. The following describes a MSI reception flow.

(a) Overview of MSI Reception

When PCIEC is used as a Root Port, whether INTx or MSI interrupts are used should be determined during a configuration cycle. If MSI interrupts are selected, PCIEC has MSI reception module to detect and terminate inbound MSI requests. Rather than propagating MSI MWr TLPs onto the AXI bus through the master interface, the MSI packets are captured, terminated in the AXI bridge, and an interrupt is signaled locally through intreq_pci*m*_sub. This interrupt remains asserted when any MSI interrupt is pending. It is only de-asserted when there is no MSI interrupt pending. PCIEC also can pass the MSI MWr request TLPs to the AXI bus by deactivating MSI reception module.

MSI reception module features are:

- Provides support for up to eight EPs. Each supported EP has a set of interrupt enable(PRTLGC27+3*i*), mask (PRTLGC28+3*i*), and status registers (PRTLGC29+3*i*).
- A maximum of 32 interrupts are supported per EP.

(b) Setting for MSI Reception Module

If MSI reception module is activated, the following setting should be performed.

Flow-1) The host CPU configures the MSI capabilities of all endpoints through CFG requests.

— Program the MSI Data Register (MSICAP3F*i* in the MSI capability) as follows to allow the MSI reception module to decode the interrupt source. Table 104.41 shows MSI Data Register Programming format.

Table 104.41 MSI Data Register Programming

Bit	15:8	7:5	4:0
Description	Not Used	EP Number: Allows each EP to be identified within the system. For example, EP#5 is programmed with B'101.	Interrupt Vector Number: Identifies the interrupt source within each EP. Programmed to B'00000. Set by MSI generation logic to identify each interrupt source in real time. Supports up to 32 Vectors.

—

Flow-2) Program the MSI Capability Lower 32 Bits Address Register (MSICAP1F*i*) of every EP with one common MSI address.

Flow-3) The host CPU configures the MSI reception module regiseters through APB bus.

— Program the MSI reception module registers PRTLGC25 and PRTLGC26 with the same value as in MSICAP1F*i*.

— Read the MSI capability of each EP to determine the number of vectors enabled in each EP and uses this information to program the MSI reception module's interrupt enable register (PRTLGC27+3*i*) which allows up to 32 MSI interrupt vectors to be enabled for a given EP. (*i* = 0, 1, 2, 3, 4, 5, 6, 7)

— The host CPU should program EPs Interrupt Enable register in the MSI reception module appropriately according to the Multiple Message Enable field in an EPs MSI capability structure. For example, when the Multiple Message Enable is 3B'100 for EP#0 (it mean 16 interrupt vectors enabled), the host CPU should program PRTLGC27 with H'0000_FFFF.

(c) Processing of Detected Interrupts

The MSI controller decodes the MSI MWr data payload to determine which EP sent the MSI and to which interrupt vector it corresponds. When the decoded interrupt vector is enabled and not masked, then PCIEC sets the corresponding bit in PRTLGC29+3*i* and asserts intreq_pci*m*_sub. This signal remains asserted until the host CPU clears the status bit by writing 1 to the status bit. Writing 0 has no effect. When the decoded interrupt vector is enabled but is masked, then PCIEC sets the corresponding bit in interrupt status register but

it does not assert intreq_pci*m*_sub. This masking is local to the MSI reception module and is not part of Per Vector Masking (PVM) in any of the EPs. When no interrupt have been enabled in any of PRTLGC29+3*i*, then all MSI detection is disabled and valid MSI MWr request TLPs are not terminated in the bridge but are passed to the AXI bus. (*m* = 0, *i* = 0 to 7)

104.3.19 Compliance Test

Test compliance according to the PCI Express standard.

104.3.20 Precision Time Measurement (PTM)

Precision Time Measurement (PTM) enables precise coordination of events across multiple components with independent local time clocks. Ordinarily, such precise coordination would be difficult given that individual time clocks have differing notions of the value and rate of change of time. To work around this limitation, PTM enables components to calculate the relationship between their local times and a shared PTM Master Time: an independent time domain associated with a PTM Root.

The controller supports the optional PTM feature (CX_PTM_ENABLE =1) as defined in Section 6.22, Precision Time Measurement (PTM) Mechanism of the PCI Express Base Specification, Revision 4.0, Version 1.0. This enables the coordination of timing information across multiple devices with independent local time-bases.

The PTM synchronization is initiated from a downstream requester (USP) to an upstream responder (DSP).

The controller handles the entire timestamp update process without software intervention. Each current (t#n) and previous timestamp (t#n-1) value as well as other context information (clock) can be read from the VSEC registers (PTMRQCAP*/PTMRSCAP*) by software.

Transmit and Receive Latencies

A key operational goal of PTM is to stamp the time at which a message is transmitted from the physical boundary of the PCIe device. The Tx latency is the time that it takes a message to travel from the boundary of the controller to the boundary of the PCIe device. It is added to the time at which the message left the controller. The Rx latency is the time that it takes a message to travel from the boundary of the PCIe device to the boundary of the controller. It is subtracted from the time at which the message reaches the controller. The Latency registers may be written to at any time with a more accurate value if required.

For example:

- t1, t3 = Local PTM Clock time when message leaves controller + PTMRQCAP19F*i*.PTM_REQ_TX_LATENCY

- t2, t4 = Local PTM Clock time when message received by controller - PTMRQCAP20F*i*.PTM_REQ_RX_LATENCY

Note: The Tx latency includes all delays from the moment timestamp is captured, to the time the message reaches the port pins. The Rx latency includes all delays from the time the message reaches the port pins, to the time the timestamp is captured. These delays depend on the characteristics of the PHY used, skew on the link, and deviation between the reference clocks of the two ports. There may be a dependency on link width and the current link speed also.

The average latencies for all speeds and link widths may be used for Tx and Rx latency calculation. For best accuracy the Tx and Rx latency values should be updated whenever the link parameters change.

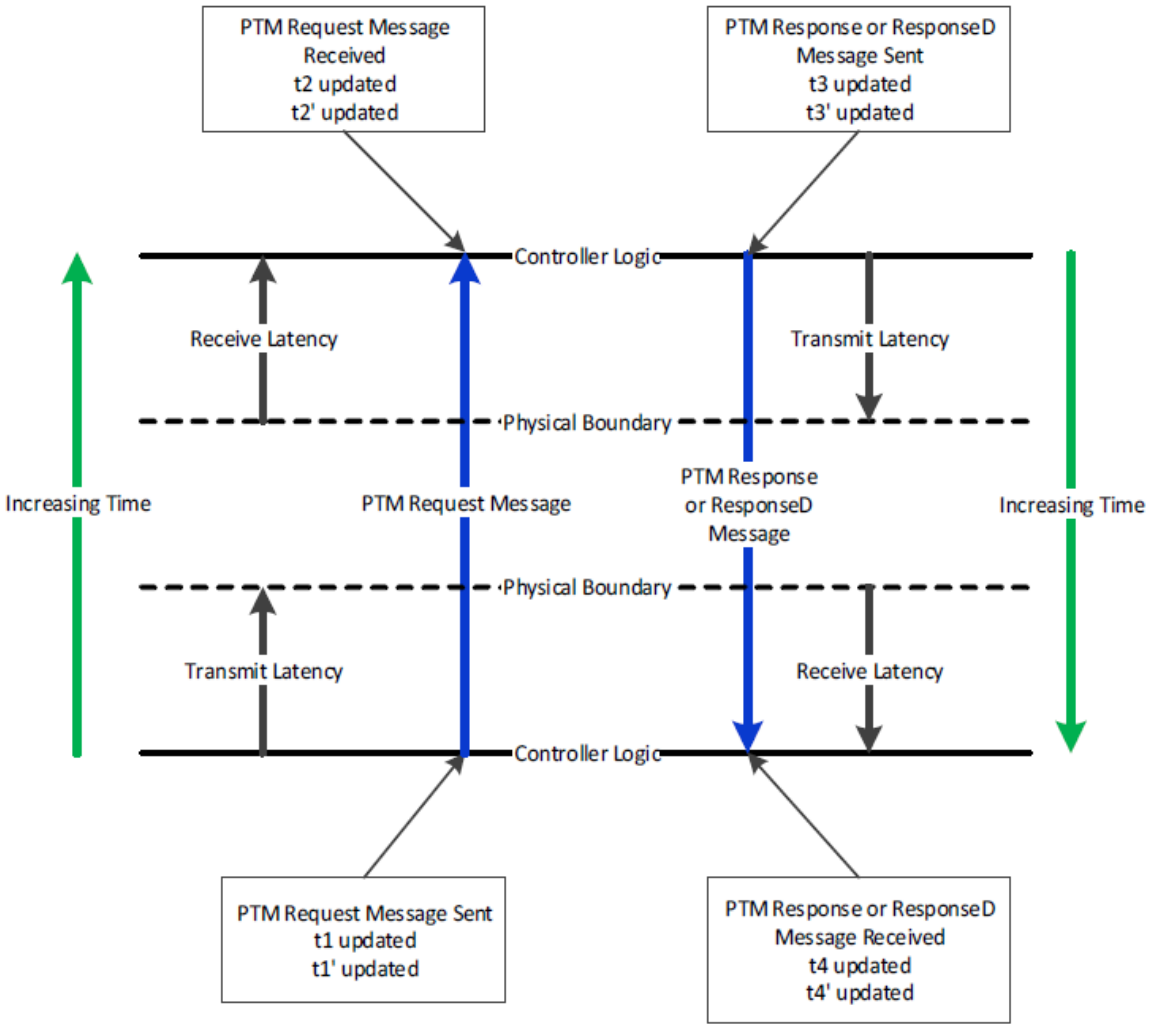

Figure 104.48 Tx and Rx Latencies

PTM Timers

The controller implements 1us and 100us timers as per the requirements of the PCI Express Base Specification,

Revision 4.0, Version 1.0. The controller also implements a 10 ms timer which is used for automatic update of PTM context by the Requester.

The controller implements 1us, 100us, and 10ms (used to invalidate local context) timers as per the requirements of the PCI Express Base Specification, Revision 4.0, Version 1.0. The 10 ms timer is also used for automatic update of PTM context by the Requester (USP).

(1) Requester (USP) Features

■ Integrated hardware for scheduling of requests to start PTM dialogs

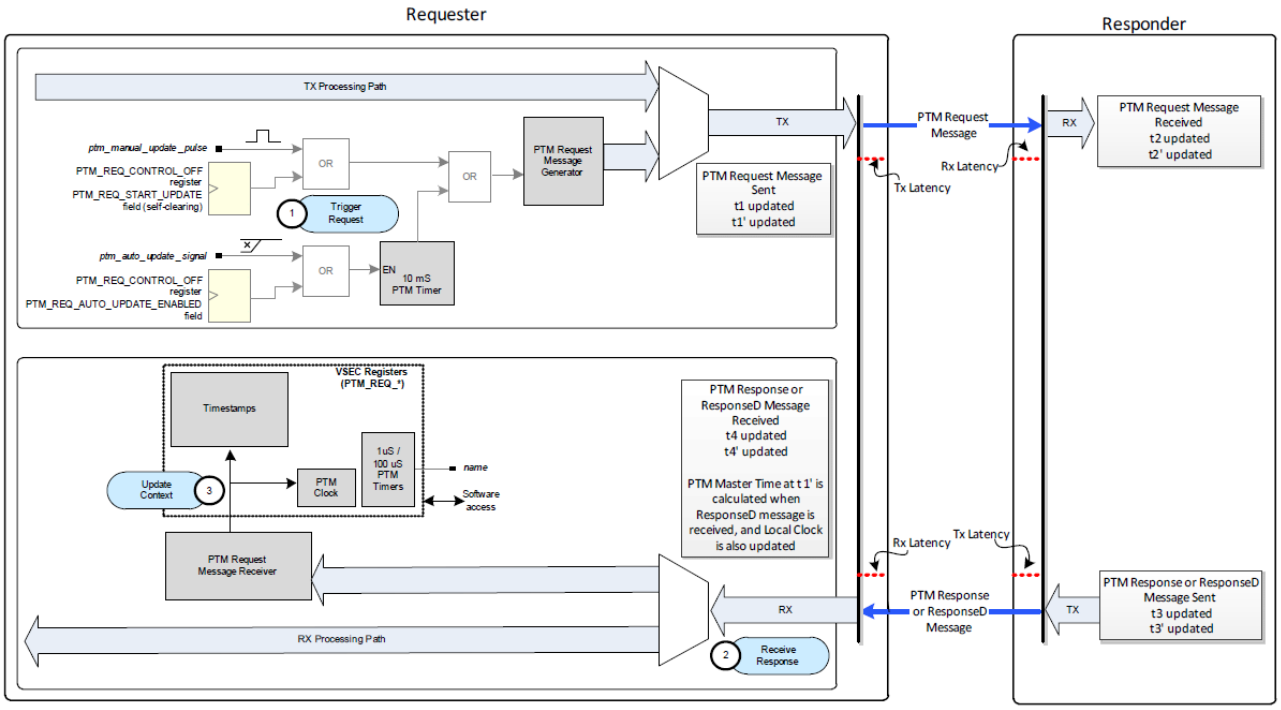

Figure 104.49 PTM Requester (USP)

■ Requester automatically updates PTM context (starting dialogs) when enabled using any or all of:

❑ Automatic trigger every 10ms (can be enabled through top-level pin or through a register)

❑ Manual trigger through top-level pin

❑ Manual trigger through a register write

■ Local PTM Clock

❑ Runs on core_clk, counts time in non-integer nanosecond, and its minimum granularity is defined by the core_clk frequency

❑ Auto-updated on PTM context refresh

❑ Can also be updated by software

❑ Can be read by software

❑ Available through top-level port

■ Context automatically invalidated when core_clk stops, or runs at the wrong frequency (for example, in L1 substates or when the link speed is changing), or when PTM is disabled by clearing the PTM_ENABLE bit in the PTMCAP2F0 register.

■ Context information stored in PTM Requester VSEC (PTMRQCAP*); one instance shared across all functions)

❑ Provides access to timestamps of most recent context refresh

❑ Provides notification when context is valid

❑ Programmable Tx and Rx latency values

(2) Responder (DSP) Features

■ Integrated hardware for scheduling of PTM responses to dialog requests when context is valid

■ Timestamp generation when PTM Messages are detected

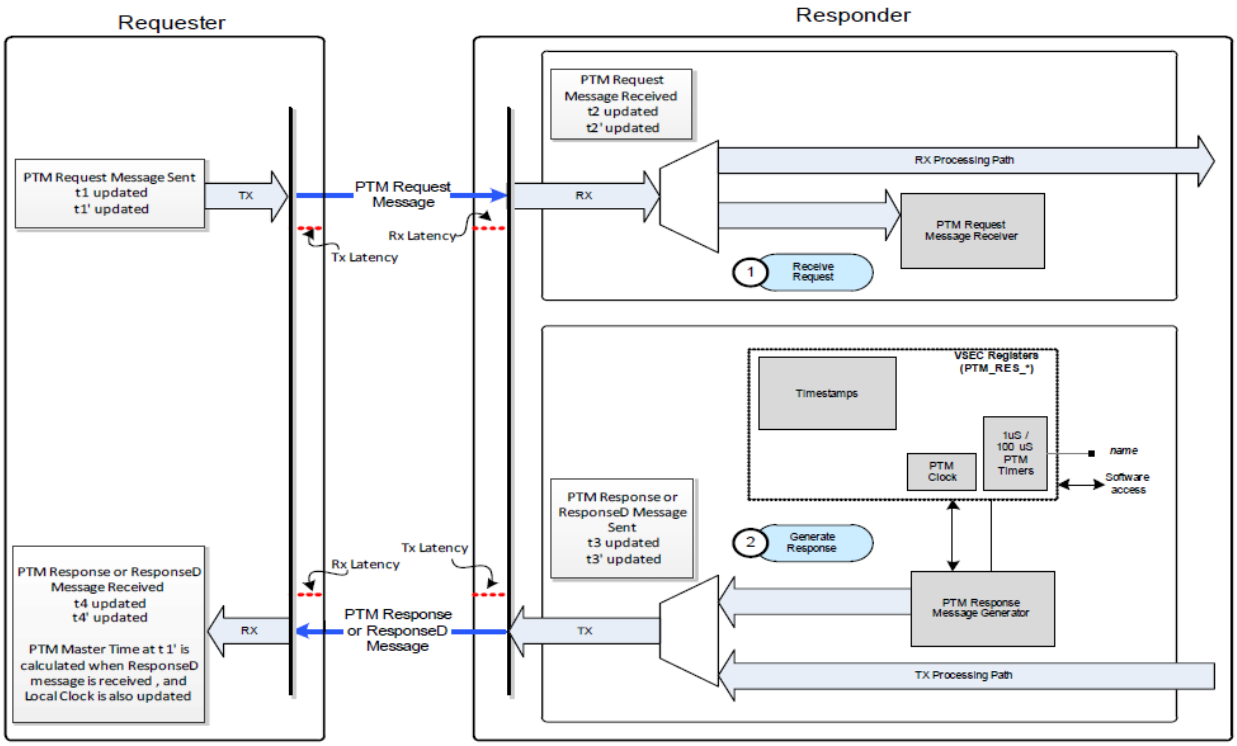

Figure 104.50 PTM Responder (DSP)

■ Local PTM Clock

❑ if CX_PTM_EXTERNAL_MASTER_TIME =1 an external master time can be used to set the clock value

Note: The external master time is latched when ptm_external_master_strobe signal is set to 1.

❑ Can also be updated by software

❑ Can be read by software

❑ Available through top-level port

■ Context automatically invalidated when core_clk stops, or runs at the wrong frequency (for example, in L1 substates or when the link speed is changing), or when PTM is disabled by clearing the PTM_ENABLE bit in the PTMCAP2F0 register. When the controller asserts ptm_responder_ rdy_to_validate signal, your application can re-validate the context by either,

❑ [CX_PTM_EXTERNAL_MASTER_TIME =1]: Updating the local PTM clock using the ptm_external_

master_time and ptm_external_master_strobe signals, which automatically asserts the ptm_context_valid signal.

❑ [DBI Access]: Updating the local PTM clock by writing to PTMRSCAP4F0 and PTMRSCAP5F0 registers, and then setting the PTM_RES_CCONTEXT_VALID field of PTMRSCAP2F0 to 1, which automatically asserts ptm_context_valid signal.

■ Root Support

❑ Ideally a PTM root behaves like a responder with permanently valid context. However,

- If the PTM root enters low power modes or changes link frequency, PTM context is invalidated (indicated by ptm_context_valid =0).

- Following PTM context invalidation, the application must re-validate PTM context, by using either the PTM master time interface signals or the PTM responder VSEC registers, as described in the previous list item.

❑ PTM messages must not contain TLP prefixes

■ Context information stored in PTM Responder VSEC (PTMRSCAP*)

❑ Provides access to timestamps of most recent context refresh

❑ Provides notification when context is valid

❑ Programmable Tx and Rx latency values.

(3) Local PTM Clock Scaling

PTM clock scaling feature allows the local PTM clock to increment a programmable non-integer nanosecond amount in each controller clock period. This allows the PTM local time to remain coherent if there is a frequency deviation between PTM Requester and Responder. PTM clock scaling also allows the controller to use PTM when the clock period is a non-integer nanosecond multiple, for example when running at CCIX ESM data rates.

PTM Requester

To enable this feature set the PTM_REQ_SCALED_CLOCK_T_EN field of PTM Requestor Capability Structure (VSEC) Register 22 function i *i = 0, 1* register to ‘1’ (this bit can be set only when ptm_context_valid is set). You can set a 24-bit value

consisting of an 8-bit integral part (nanoseconds) and 16-bit fractional part (1/216 nanoseconds) using

PTM_REQ_SCALED_CLOCK_T_INT and PTM_REQ_SCALED_CLOCK_T_FRAC fields of the

PTM Requestor Capability Structure (VSEC) Register 22 function i *i = 0, 1* register, which represents the scaled local PTM clock period.

The clock scaling procedure is as follows:

■ Following the second and subsequent assertions of the ptm_clock_updated output signal, while

ptm_context_valid remains asserted, your application may read the PTM Requester Clock Correction

register (PTM Requestor Capability Structure (VSEC) Register 21 function i *i = 0, 1*).

■ If the correction is below a threshold expected by your the application, your application may calculate

a scaled local PTM clock period value, based on the current default clock period value, the

programmed auto-update interval, and the contents of the PTM Clock Correction register (PTM Requestor Capability Structure (VSEC) Register 21 function i *i = 0, 1*).

■ Your application may write the scaled PTM clock period to PTM Requester's Scaled PTM Clock Period

register (PTM Requestor Capability Structure (VSEC) Register 22 function i *i = 0, 1*), which represents the scaled local PTM clock period. This

should happen as quickly as possible after the ptm_clock_updated pulse to avoid error accumulation.

PTM Responder

For the PTM Responder, your application fully controls PTM local clock updates. If the external master

clock runs from the same source clock as the PCIe controller, clock scaling is not needed. However, for applications where the external master and PCIe controller run on unrelated clock sources, it may be necessary to scale the local PTM clock period.

To enable this feature set the PTM_RES_SCALED_CLOCK_T_EN field of PTM Responder Capability Structure (VSEC) Register 17 function 0
register to ‘1’ (this bit can only be set when ptm_context_valid is set). You can set a 24-bit value consisting of an 8-bit integral part (nanoseconds) and 16-bit fractional part ($1/2^{16}$ nanoseconds) using PTM_RES_SCALED_CLOCK_T_INT and PTM_RES_SCALED_CLOCK_T_FRAC fields of the PTM Responder Capability Structure (VSEC) Register 17 function 0 register, which represents the scaled local PTM clock period.
The clock scaling procedure is as follows:

- Your application initializes the PTM Responder with a known time from an external master.
- The PTM Responder counts local PTM time using the Nominal PTM Clock Period, which your application
can read from the PTM Responder Capability Structure (VSEC) Register 16 function 0 register.
- Your application waits for a known time and reads the local PTM clock value again.
- Your application calculates the scaled PTM clock period using the deviation between the external master clock and the local PTM clock, and writes the scaled PTM clock period to PTM Responder's Scaled PTM Clock Period register (PTM Responder Capability Structure (VSEC) Register 17 function 0), which represents the scaled
local PTM clock period.

If the PTM context becomes invalid your application must reiterate the steps listed above.

104.3.21 Master interfaces of AXI

Based on the BDF information, the OSID is generated using the CNVIDn register as a conversion table. When comparing the BDF information, bits with 1 set in the CNVIDMSKn register are compared as don't cares. If none of the BDF information matches, assign the value of the CNVOSIDCTRL register as the OSID.

104.3.22 BAR Settings

The BAR settings for this product are shown below:
- BAR0:64-bit Resizable Memory BAR(default size:256MByte), Target_1
- BAR1:- (BAR1 cannot be used because BAR0 is set to 64bit.)
- BAR2:64-bit Resizable Memory BAR(default size:256MByte), Target_1
- BAR3:- (BAR3 cannot be used because BAR2 is set to 64bit.)
- BAR4:32-bit Fixed Mask I/O BAR 256Byte, Target_1
- BAR5: 32-bit Resizable Memory BAR(default size:1MByte), Target_0

Set the size of Resizable BAR in the following registers.
RESBAR_CTRL_REG_0_REG_F*i*.RESBAR_CTRL_REG_BAR_SIZE
RESBAR_CTRL_REG_2_REG_F*i*.RESBAR_CTRL_REG_BAR_SIZE
RESBAR_CTRL_REG_5_REG_F*i*.RESBAR_CTRL_REG_BAR_SIZE

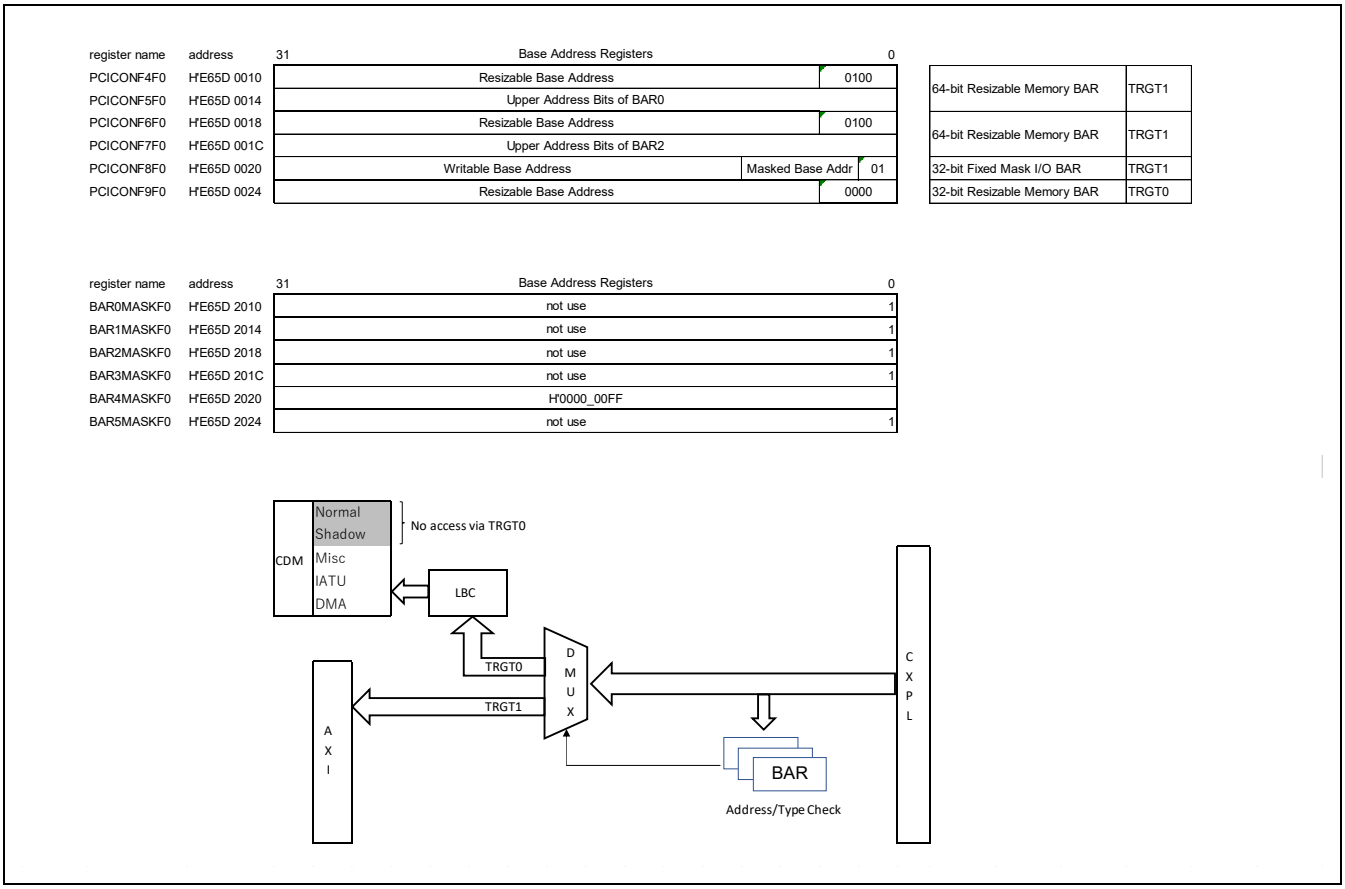

Figure 104.51 Example Base Address Register Configuration

104.3.23 FLR Signal Interface Timing

The PCI Express Base Specification requires the entire reset process to be completed within 100ms. The controller requires (4* 256 * core_clk) to reset the function. Figure 104.52 shows the timing flow for FLR of physical function x (PFx).

1. The host software writes to the Initiate FLR bit of PFx using a CfgWr request. It cannot use a local DBI write. The controller asserts the PCIERSTSTS.cfg_flr_pf_active[x] in response.
2. Your application terminates TLP transmission from PFxs application logic. During this time, your receive application logic should not halt the receive interface for TLPs directed to PFx.
3. When your application has stopped/reset the PFx application logic, set the PCIERSTCTRL3.app_flr_pf_done[x].
4. When the controller detects 1 on PCIERSTCTRL3.app_flr_pf_done[x], it initiates FLR of PFx.
5. When the reset is complete, the controller de-asserts PCIERSTSTS.cfg_flr_pf_active[x].

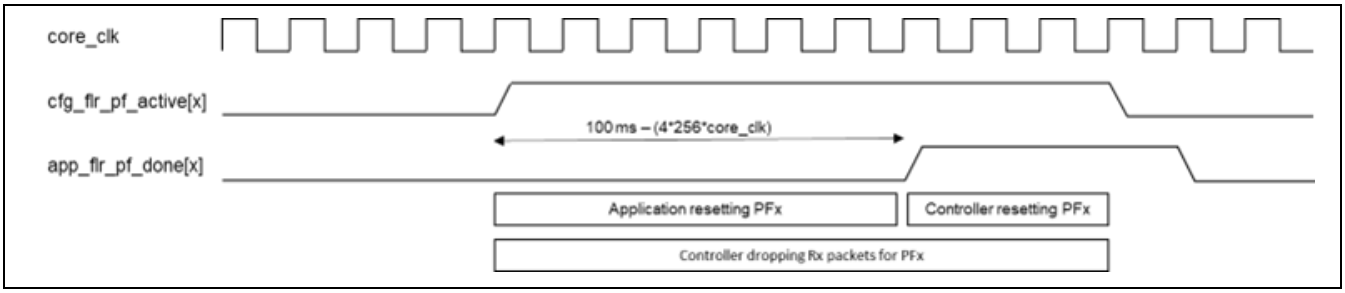

Figure 104.52 FLR Timing Flow

104.3.24 MSI-X by INTC

The PCIe controller recognizes the MSI/MSI-X interrupt from the AWADDR(AXI write address) of the PCIe/AXI 16 or 32bit Single Write transaction from each VF(Virtual Function) of EP(End Point).
In the case of the MSI/MSI-X interrupt, the PCIe controller overwrite the BDF(RequesterID) in WDATA[47:32] of AXI bus and notifies the INTC in AXI bus.
The INTC allocates the interrupt to the appropriate virtual OS from the BDF which received.

Address judgment method:

AXIINTCCONT.intc_enable & ((AWADDR[31:12],AWADDR[11:3]&AXIINTCCONT.intc_mask) == AXIINTCADDR.intc_address[31:3])

0: Normal Access
1: The MSI/MSI-X interrupt Access

104.4 Usage Notes

104.4.1 Write/Read Attributes of Configuration Registers

Although the registers in the configuration space have the register attributes defined by the PCI Express standard, these registers have different attributes when accessed by the internal bus. This section shows the attributes required for control.

Table 104.42 Write/Read Attributes

Attributes of PCI Express Registers	Description	Attributes of PCIEC Registers	Example
HWInit	Hardware initialized bit. Initialized by hardware or software.	R for fields initialized by hardware.	EXPCAP0F*i*[24].SLTIMP (*i* = 0, 1)
		RW for fields initialized by software.	EXPCAP3F*i*[31:24].Port Number (*i* = 0, 1)
RO	Read-only bit. Cannot be modified by software.	R for fields initialized by hardware.	PCICONF0F*i*[31:16].Device ID (*i* = 0, 1)
		RW for fields initialized by software.	EXPCAP0F*i*[23:20].Device Port Type (*i* = 0, 1)
RW	Read/Write bit. Can be modified by software.	RW	PCICONF1F*i*[2].BME (*i* = 0, 1)
RW1C	Read-only status bit. Writing 1 clears the bit. Writing 0 has no effect.	RW1C	PCICONF1F*i*[24].MDPE (*i* = 0, 1)
ROS	Sticky-read-only bit. Cannot be modified by software. Not initialized by hot reset.	Applies to no PCIEC registers.	—
RWS	Sticky-read write bit. Can be modified by software. Not initialized by hot reset.	RWS	EXPCAP2F*i*[10].AUXPPME (*i* = 0, 1)
RW1CS	Sticky-read-only status bit. Writing 1 clears the bit. Writing 0 has no effect. Not initialized by hot reset.	RW1CS	PMCAP1F*i*[15].PMEST (*i* = 0, 1)
RsvdP	Reserved bit. Read-only. May be used as a RW bit in the future. Reading the bit returns 0.	R	EXPCAP4F*i*[13:12] (*i* = 0, 1)
RsvdZ	Reserved bit. Read-only. May be used as a RW1C bit in the future. Reading the bit returns 0.	R	EXPCAP2F*i*[31:22] (*i* = 0, 1)

The following shows which PCI Configuration Capability is supported by PCIEC.

		Offset		Capability	Spec Requirements	Root Port Type01	Endpoint Type00
PCI Configuration Space	PCI3.0 Compatible Configuration Space	H'000 H'03F		PCI Compatible Configuration Registers	Required	√	√
		H'040		PCI Power Management Capability Structure	Required	√	√
				MSI Capability Structure	Required if an interrupt resource is required	x	√

104.4.2 Notes on Accessing Configuration Registers

- In Endpoint mode, writing to the configuration registers of this IP is prohibited except at initialization.
- ”PCI RW” in the column header of the table in the description section of each register indicates the attribute of configuration access from the PCI Express bus in Endpoint mode; it is invalid in Root Port mode. For the registers with the same attribute shared in Endpoint mode and Root Port, “—“ is indicated.
- Since the Endpoint configuration space may be accessed by the peer Root Port, it should be set appropriately. The registers implemented according to the Root Port configuration space are not accessed by Endpoint. Therefore, in Root Port mode, the user should appropriately set the registers. For details on register setting, refer to description of each register.

104.4.3 Power Management States

Do not stop inputting the reference clock signal in the power management states (L0s/L1/L2). Transition to the power management states (L0s/L1/L2) is made from L0.

The reference clock signal is stopped by PCIE*m*_CLKREQ_N (m = 0)in the power management states (L1 PM Substates). Transition to the power management states (L1 PM Substates) is made from L0.

104.4.4 Root Port Signaled Target Abort

When a function other than Function 0 in a Multi-function Device sends a request to the Root Port and the Root Port replies with Completion (CPL) whose status is Completer Abort (CA), the Signaled Target Abort in the Secondary Status Register is mistakenly generated with respect to the Requester ID rather than the Completer ID. Since the Root Port is a single function device where it only contains Function 0, a problem will occur if the Requester ID presents a function other than 0.

To make sure the problem does not occur, the Signaled Target Abort should be asserted with respect to the Function 0 and the Completer ID should be checked rather than the Requester ID.

104.4.5 Access DMA Configuration Registers

Feature Usage Note:

Ensure driver software does not generate TLPs with TPH/PH set when accessing DMA configuration registers.

104.4.6 Master Data Parity Error and Signaled System Error

・The controller does not correctly set the Master Data Parity Error field when the application reports a Poisoned TLP completion received error through PCIETXCNTRL1. app_err_bus[7].
・The controller sets the Signaled System Error register field to '1' for all PFs. It is only susceptible to the defect when a non-function-specific fatal or non-fatal error is detected.

Host Software Overhead

Instead of using the legacy error reporting method (The Master Data Parity Error), use the Advanced Error Reporting (AER) feature.

104.4.7 PM_PME message in L1 sub-state

The PCIe specification defines that the PM_PME messages must be retransmitted every 100ms +50%/-5%. The PCIe controller does not meet this requirement when the link is in the L1 sub-state.
Note, Assert PCIEPWRMNGCTRL.app_xfer_pending when a PME message is triggered to exit L1 substate. And de-assert PCIEPWRMNGCTRL.app_xfer_pending only after PCIEPWRMNGSTS1.pm_status is clear.

104.4.8 Usage notes for MRRS (Max Read Request Size)

Please set "Max Read Request Size" to 128 bytes or 256 bytes.
If "Max Read Request Size" is set to anything other than the above, the transferred data will not match the expected value.
[Target register]
PCI Express Capability Register 2 function i (EXPCAP2Fi) i = 0, 1 Register
bit14 to 12: Max Read Request Size

104.4.9 Usage notes for DMA transfer address

In DMA transfer, if the address is not 32byte aligned, it will not match the expected value.
To ensure correct transfer data, please set either A or B below:

A: The data size of a DMA transfer must be 480 bytes or less.
Non-Linked List Mode:
[Target register]
DMA Capabilities Registers [38+i*16] (DMACAP[38+i*16]) (i = 0 to 7) DMA_TRANSFER_SIZE (for write)
DMA Capabilities Registers [46+i*16] (DMACAP[46+i*16]) (i = 0 to 7) DMA_TRANSFER_SIZE (for read)

Linked List Mode:
Set "Transfer size" to 480 bytes or less, in the Linked List Descriptor in Local Memory.
For more details see Section 104.3.9 DMA Transfer (4) Linked List Mode.

B: Both the source address and destination address must be 32 bytes aligned.
Non-Linked List Mode:
[Target register]

DMA Capabilities Registers [39+i*16] (DMACAP[39+i*16]) (i = 0 to 7) SRC_ADDR_REG_LOW (for write)
DMA Capabilities Registers [41+i*16] (DMACAP[41+i*16]) (i = 0 to 7) DST_ADDR_REG_LOW (for write)
DMA Capabilities Registers [47+i*16] (DMACAP[47+i*16]) (i = 0 to 7) SRC_ADDR_REG_LOW (for read)
DMA Capabilities Registers [49+i*16] (DMACAP[49+i*16]) (i = 0 to 7) DST_ADDR_REG_LOW (for read)

Linked List Mode:
Set "SAR Low" and "DAR Low" to 32 bytes aligned address, in the Linked List Descriptor in Local Memory.
For more details see Section 104.3.9 DMA Transfer (4) Linked List Mode.

104.4.10 PCIE_CAP_LINK_TRAINING Register note

When LTSSM is in L1 state and software enables the RTRNLK field, the controller sets the EXPCAP4Fi register field after a delay.
System Usage Note:
Firmware to monitor both 'LTSSM' states on smlh_ltssm_state field of PCIEPWRMNGSTS0 and RTRNLK field of EXPCAP4Fi register bit and interrupt software when RTRNLK field of EXPCAP4Fi register bit is asserted before LTSSM enters recovery state and till it exits recovery state.

104.4.11 The L1 Exit Timer note

The L1 exit timer in L1.Idle expires in less than 100ms when GEN3_ZRXDC_NONCOMPL register field is set to one and L1 Substate/CPM is disabled.
System Usage Note:
Program the ECLKPM field in the EXPCAP4Fi register to '1'.

104.4.12 FLR Leads to Missing AXI Subordinate Responses in Multi-Function Devices When Operating in 5-Bit Tag Mode

System Usage Note:
When completing an FLR, stop AXI subordinate traffic to all functions and not only the one(s) being reset and wait for all outstanding requests to complete; after the FLR is complete, set the extended tag enable bit to 0 on the function(s) that was (were) reset before resuming AXI subordinate traffic and re-enabling HDMA channels (if present). If the HDMA is enabled, wait for any pending transaction to complete, and then disable all channels.

104.4.13 Incorrect Tag Generation in the Controller After Updating Extended Tag Requester Enable

System Usage Note:
After programming the ETAGE field of the EXPCAP2Fi register, issue AXI slave tags Non-Posted requests making sure only one request is outstanding at any given time; this flushes out any duplicate tags. The number of available tags after this procedure might be less than 32.

104.4.14 The Controller Drops TLP with ECRC Error when ECRC Check is Disabled

Feature Usage Note:
Program the ECRC check enable bit (ECRC_CHECK_EN) of the Advanced Error Capabilities and Control Register (AERCAP6Fi) to '0' before link-up.

104.5 Safety Mechanisms

PCIEC has no logics for FuSa into itself.

PCIEC applies End-to-End and SRAM ECC Protection as chip FuSa policy.

105. Serial Communication Interface with FIFO(SCIF)

105.1 Overview

This LSI has serial communication interfaces with FIFO buffers (SCIF) that handles asynchronous communication and clock synchronous serial communication. The SCIF has two 16-stage FIFO buffers separately for transmission and reception, which enables fast, efficient, and uninterrupted communication. The following table lists the functions of each interface.

The presence of the SCKn, RTSm#, and CTSm# pins depends on the product or channel. The synchronous mode and mode control functions are supported in the interface channel which has the pins related to these functions.

n = 0, 1, 3, 4
m = 0, 1, 3, 4

Table 105.1 Channel Information

Name	Function	Pin	Base Address	Remarks
SCIF-0	Asynchronous mode (modem control is enabled) Clock synchronous mode	RX0, TX0, SCK0, RTS0#, and CTS0#	H'E6E6 0000	Transmission/reception clock can be supplied externally from SCK0 pin.
	Asynchronous mode Clock synchronous mode	RX0, TX0 and SCK0		
SCIF-1	Asynchronous mode (modem control is enabled) Clock synchronous mode	RX1, TX1, SCK1, RTS1#, and CTS1#	H'E6E6 8000	Transmission/reception clock can be supplied externally from SCK1 pin.
	Asynchronous mode Clock synchronous mode	RX1, TX1 and SCK1		
SCIF-3	Asynchronous mode (modem control is enabled) Clock synchronous mode	RX3, TX3, SCK3, RTS3#, and CTS3#	H'E6C5 0000	Transmission/reception clock can be supplied externally from SCK3 pin.
	Asynchronous mode Clock synchronous mode	RX3, TX3 and SCK3		
SCIF-4	Asynchronous mode (modem control is enabled) Clock synchronous mode	RX4, TX4, SCK4, RTS4#, and CTS4#	H'E6C4 0000	Transmission/reception clock can be supplied externally from SCK4 pin.
	Asynchronous mode Clock synchronous mode	RX4, TX4 and SCK4		

105.1.1 Features

The SCIF has the following features.

- Asynchronous serial communication mode

  The SCIF performs serial data communication based on a character-by-character asynchronous system. This feature enables serial data communication with standard asynchronous communication chips that support Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). There is a choice of eight serial data transfer formats.

  — Data length: 7 or 8 bits
  — Stop bit length: 1 or 2 bits
  — Parity: Even/odd/none
  — Receive error detection: Parity, framing, and overrun errors
  — Break detection:

  A break is detected when a framing error lasts for more than 1 frame length at Space 0 (low level).

  When a framing error occurs, a break can also be detected by reading the RX pin level directly from the serial port register (SCSPTR).
- Clock synchronous serial communication mode

  The SCIF performs serial data communication synchronized with a clock. This feature enables serial data communication with other LSIs that support synchronous communication. There is a single serial data communication format for clock synchronous serial communication.

  — Data length: 8 bits
  — Receive error detection: Overrun errors
- Full-duplex communication capability

  The SCIF has an independent transmitter and receiver that enable simultaneous transmission and reception. The transmitter and receiver both have a 16-stage FIFO buffer structure, enabling continuous serial data transmission and reception.
- On-chip baud rate generator, enabling any bit rate to be selected

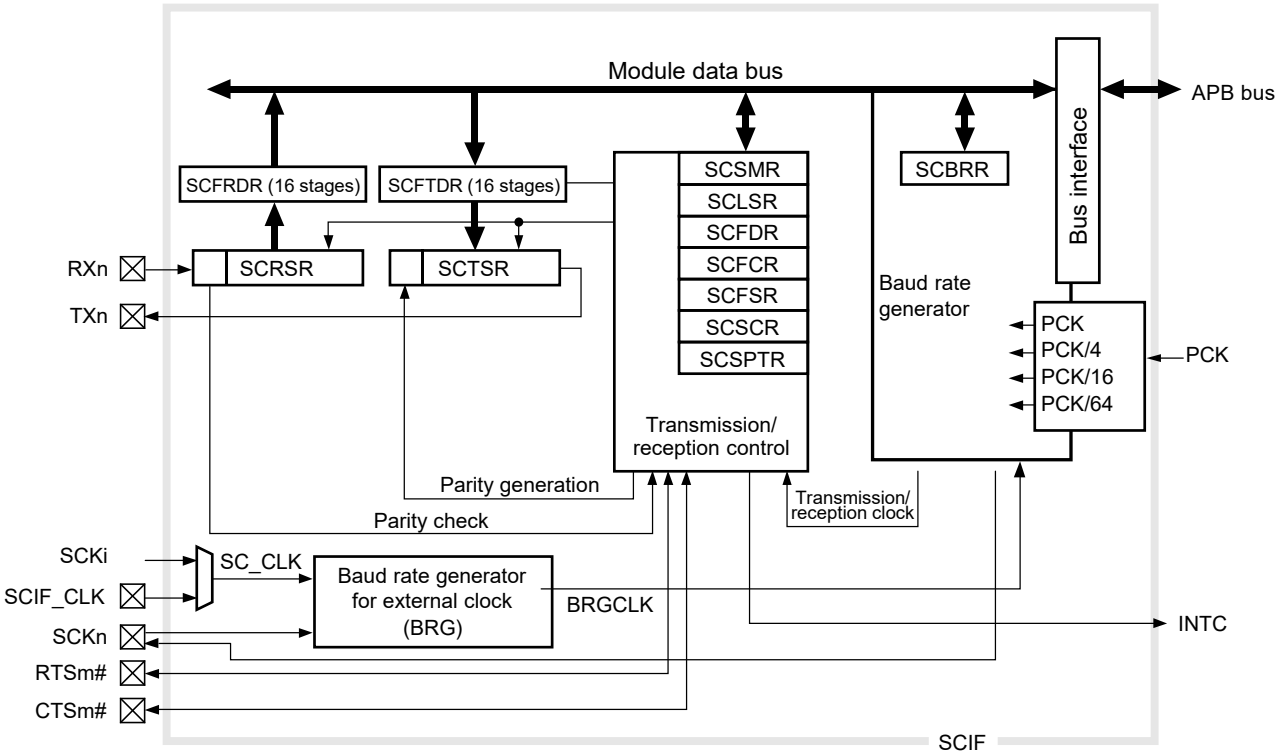
  The SCIF enables choice of a clock source for transmission/reception: a clock from the on-chip baud rate generator based on the internal clock or an external clock.
- Eight interrupt sources

  The SCIF has eight types of interrupt sources – receive-data-ready, receive-FIFO-data-full, break, transmit-FIFO-data-empty, transmit-end, receive-error, overrun-error and time-out and enables any of them to be requested independently.
- DMA data transfer

  When the transmit FIFO register is empty or the receive FIFO register has received data, issuing a DMA transfer request activates the DMA controller (DMAC) to execute a data transfer.
- The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available.
- In asynchronous mode, a receive data ready (DR) or a timeout error (TO) can be detected during reception.

105.1.2 Block Diagram

Figure 105.1 shows the SCIF block diagram.



[Legend]

SCRSR: Receive shift register	SCFSR: Serial status register
SCFRDR: Receive FIFO data register	SCBRR: Bit rate register
SCTSR: Transmit shift register	SCSPTR: Serial port register
SCFTDR: Transmit FIFO data register	SCFCR: FIFO control register
SCSMR: Serial mode register	SCFDR: FIFO data count register
SCSCR: Serial control register	SCLSR: Line status register

n = 0, 1, 3, 4
m = 0, 1, 3, 4

Figure 105.1 SCIF Block Diagram

Clock for “Bus interface” = SASYNCPERD4φ
PCK = SASYNCPERD4φ
SCKi = SASYNCPERD1φ

105.1.3 External Pins

Table 105.2 shows the SCIF pin configuration. Pin functions can differ with the interface number. Other functions are also multiplexed on the same pins, so the multiplexed pin settings may restrict usage of the pins.

Table 105.2 Pin Configuration

Name	Abbreviation	I/O	Function
Serial clock pin	SCK	I/O	Synchronous clock I/O
Receive data pin	RX	Input	Receive data input
Transmit data pin	TX	Output	Transmit data output
Modem control pin	CTS#	I/O	Transmission enabled
Modem control pin	RTS#	I/O	Transmission request
Baud rate generation clock pin*	SCIF_CLK	Input	Clock for input to the baud rate generator for the external clock

These pins are made to function as serial pins by setting up SCIF operation using bit C/A# in SCSMR, bits TE, RE, CKE[1:0] in SCSCR, and bit MCE in SCFCR. SCSPTR of the SCIF can be used to handle the transmission and detection of break states.

Note: ch0/1/3 can use SCIF_CLK pin, ch4 can use SCIF_CLK2 pin.

105.1.4 Register Configuration

(include Safety Mechanism related registers)

Table 105.3 shows the registers in the SCIF.

Table 105.3 Register Configuration

	Abbreviation	R/W	Offset from Base Address	Initial Value	Size
Serial mode register	SCSMR	R/W	H'00	H'0000	16
Bit rate register	SCBRR	R/W	H'04	H'FF	8
Serial control register	SCSCR	R/W	H'08	H'0000	16
Transmit FIFO data register	SCFTDR	—/WB	H'0C	Undefined	8
Serial status register	SCFSR	R/WC0*1	H'10	H'0060	16
Receive FIFO data register	SCFRDR	R	H'14	Undefined	8
FIFO control register	SCFCR	R/W	H'18	H'0000	16
FIFO data count register	SCFDR	R	H'1C	H'0000	16
Serial port register	SCSPTR	R/W	H'20	H'00XX*3	16
Line status register	SCLSR	R/WC0*2	H'24	H'0000	16
Frequency division register	DL	R/W	H'30	H'0000	16
Clock Select register	CKS	R/W	H'34	H'0000	16

Notes: 1. Only 0 can be written to bits 7 to 4, 1, and 0 to clear the flags. Bits 15 to 8, 3, and 2 are read-only bits and cannot be modified.
2. Only 0 can be written to bits 2 and 0 to clear the flags. Bits 15 to 3, and 1 are read-only bits and cannot be modified.
3. The initial values of SCSPTR bits 6, 4, 2, and 0 are undefined.

The table below lists the registers used in asynchronous mode, asynchronous mode with modem control, and clock synchronous mode. When setting up the registers, set the bits related to unsupported modes in each interface to their initial values. Otherwise, the SCIF may malfunction. Do not write to any registers other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from registers other than listed below are undefined.

Table 105.4 Register Settings in Each Mode

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DL	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*
CKS	*	*	0	0	0	0	0	0	0	0	0	0	0	0	0	0

[Legend]
* : Used in any mode.
A : Used in asynchronous mode.
M : Used in asynchronous mode (modem control is enabled) (in addition to A).
C : Used in clock synchronous mode.
0 : Reserved (the write value should always be 0.)
— : Undefined

105.1.5 Connected Module

Table 105.5 shows the connected modules to the SCIF.

Table 105.5 Connected modules

Module name	Connected module name	Function of connected module
SCIF	AP-System Core	Access the Register
	CPG	Output Clocks
	PFC	Select External pins
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC	Control to interrupt
	SYS-DMAC	Control Direct Memory Access

105.2 Register Description

(include Safety Mechanism related register description)

105.2.1 Receive Shift Register (SCRSR)

SCRSR is a register that receives serial data.

The SCIF sets serial data input to the SCRSR from the RX pin in the order received, starting with the LSB (bit 0), and converts it to parallel data. When one byte of data has been received, it is transferred to the receive FIFO data register SCFRDR, automatically.

SCRSR cannot be read from and written to by the CPU.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	—	—	—	—	—	—	—	—

105.2.2 Receive FIFO Data Register (SCFRDR)

SCFRDR is a 16-stage FIFO register that stores received serial data.

When the SCIF has received one byte of serial data, it transfers the received data from the receive shift register (SCRSR) to SCFRDR for storage, and reception is thus completed. SCRSR is then ready for reception, and is capable of receiving up to 16 consecutive bytes of data before SCFRDR is full.

SCFRDR is a read-only register and cannot be modified by the CPU. Note that the read value will be undefined while there is no receive data in SCFRDR. When SCFRDR is full of receive data, subsequent serial data is lost.

SCFRDR is read as an undefined value after a power-on reset.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R

105.2.3 Transmit Shift Register (SCTSR)

SCTSR is a register that transmits serial data.

To perform serial data transmission, the SCIF first transfers transmit data from the transmit FIFO data register (SCFTDR) to SCTSR, then sends the data to the TX pin starting with the LSB (bit 0). When transmission of one byte is completed, the SCIF transfers the next transmit data from SCFTDR to SCTSR automatically, then starts transmission.

SCTSR cannot be read from and written to directly by the CPU.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	—	—	—	—	—	—	—	—

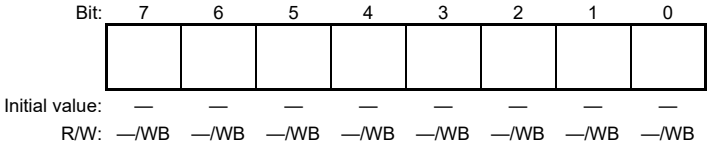
105.2.4 Transmit FIFO Data Register (SCFTDR)

SCFTDR is an 8-bit FIFO register of 16 stages that stores data for serial transmission.

If SCTSR is empty after transmit data has been written to SCFTDR, the SCIF transfers the data from SCFTDR to SCTSR and starts serial transmission.

SCFTDR is a write-only register and cannot be read from by the CPU. Writing further data to SCFTDR is no longer possible when it is full (contains 16 bytes of transmit data). Attempts at writing data to the register in this situation are ignored.

SCFTDR is read as an undefined value on a power-on reset.



105.2.5 Serial Mode Register (SCSMR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	C/A#	CHR	PE	O/E#	STOP	—	CKS[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

SCSMR is a 16-bit register that sets the SCIF's serial transfer format and selects the baud rate generator clock source.

SCSMR can always be read from and written to by the CPU.

SCSMR is initialized to H'0000 by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	C/A#	0	R/W	Communication Mode Selects asynchronous mode or clock synchronous mode for the SCIF operation. 0: Asynchronous mode 1: Clock synchronous mode Note: Whether clock synchronous mode can be selected or not depends on the interface.
6	CHR	0	R/W	Character Length Selects 7 or 8 bits for asynchronous mode data length. In clock synchronous mode, the data length is fixed at 8 bits regardless of the CHR bit setting. 0: 8 bits 1: 7 bits* Note: * When the 7-bit data is selected, the MSB (bit 7) in the transmit FIFO data register (SCFTDR) is not transmitted.
5	PE	0	R/W	Parity Enable Determines whether parity bit is added in transmission or not, and parity bit is checked in reception in asynchronous mode or not. In clock synchronous mode, the parity bit is not added and checked regardless of the PE bit setting. When bit PE is set to 1, the parity (even or odd) specified by bit O/E# is added to transmit data. In reception, the parity bit is checked for the parity (even or odd) specified by bit O/E#. 0: Disables parity bit addition and check. 1: Enables parity bit addition and check.

Bit	Bit Name	Initial Value	R/W	Description
4	O/E#	0	R/W	Parity Mode Selects either even or odd parity to use in parity addition and check. In asynchronous mode, the O/E# bit setting is valid only when bit PE is set to 1, enabling parity bit addition and check. In clock synchronous mode or when parity addition or check is disabled in asynchronous mode, the O/E# bit setting is invalid. 0: Even parity*1 1: Odd parity*2 Notes: 1. When even parity is set, the parity bit is added in transmission so that the total number of 1-bits in the transmit character plus the parity bit is even. In reception, a check is performed to see if the total number of 1-bits in the receive character plus the parity bit is even. 2. When odd parity is set, the parity bit is added in transmission so that the total number of 1-bits in the transmit character plus the parity bit is odd. In reception, a check is performed to see if the total number of 1-bits in the receive character plus the parity bit is odd.
3	STOP	0	R/W	Stop Bit Length Selects 1 bit or 2 bits as the stop bit length in asynchronous mode. The stop bit setting is valid only in asynchronous mode. Since the stop bit is not added in clock synchronous mode, the STOP bit setting is invalid in this mode. In reception, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit. If it is 0, it is treated as the start bit of the next transmit character. 0: 1 stop bit*1 1: 2 stop bits*2 Notes: 1. In transmission, high level of 1 bit (stop bit) is added to the end of a transmit character before it is sent. 2. In transmission, high level of 2 bits (stop bits) are added to the end of a transmit character before it is sent.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	CKS[1:0]	00	R/W	Clock Select 1 and 0 These bits select the clock source for the on-chip baud rate generator. The clock source can be selected from PCK, PCK /4, PCK /16, and PCK /64, according to the setting of bits CKS1 and CKS0. 00: PCK 01: PCK /4 10: PCK /16 11: PCK /64

105.2.6 Serial Control Register (SCSCR)

SCSCR is a register that enables or disables transmission/reception by the SCIF, enables or disables interrupt requests, and selects transmission/reception clock source for the SCIF.

SCSCR can always be read from and written to by the CPU.

SCSCR is initialized to H'0000 by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TEIE	—	—	—	TIE	RIE	TE	RE	REIE	TOIE	CKE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	TEIE	0	R/W	Transmit End Interrupt Enable When a transmit-end request is enabled by the TIE bit, the TEIE bit selects the source of the transmit end interrupt request from the following: • Setting the TDFE flag in SCFSR Setting the TEND flag in SCFSR 0: The transmit FIFO data empty (TDFE) interrupt request is used. 1: The transmit end (TEND) interrupt request is used.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	TIE	0	R/W	Transmit Interrupt Enable Enables or disables a transmit-FIFO-data-empty interrupt (TDFE) request when the TEIE bit in SCSCR is pulled 0, if all of the following conditions are satisfied: • Serial transmit data has been transferred from SCFTDR to SCTSR. • The number of data bytes in SCFTDR is equal to or less than the transmit trigger count. • The TDFE flag in SCFSR is set to 1. Enables or disables a transmit-end interrupt (TEND) request when the TEIE bit of SCSCR is set to 1, if both of the following conditions are satisfied: • Transmission was ended because there is no valid data in SCFTDR when the last bit of the transmit character in SCTSR was transmitted. • The TEND flag of SCFSR is set to 1. 0: When the TEIE bit is 0, disables transmit-FIFO-data-empty interrupt (TDFE) request. When the TEIE bit is 1, disables transmit-end interrupt (TEND) request. 1: When the TEIE bit is 0, enables transmit-FIFO-data-empty interrupt (TDFE) request. When the TEIE bit is 1, enables transmit-end interrupt (TEND) request.
6	RIE	0	R/W	Receive Interrupt Enable Enables or disables a receive-FIFO-data-full interrupt request when the RDF flag in SCFSR is set to 1, a receive-data-ready interrupt request when the DR flag in SCFSR is set to 1, a receive-error interrupt request when the ER flag in SCFSR is set to 1, a break interrupt request when the BRK flag in SCFSR is set to 1, and an overrun error interrupt request when the ORER flag in SCLSR is set to 1. 0: Disables receive-FIFO-data-full interrupt (RDF) requests, receive-data-ready interrupt (DR) requests, receive-error interrupt (ER) requests, break interrupt (BRK) requests, and overrun error interrupt (ORER) requests. 1: Enables receive-FIFO-data-full interrupt (RDF) requests, receive-data-ready interrupt (DR) requests, receive-error interrupt (ER) requests, break interrupt (BRK) requests, and overrun error interrupt (ORER) requests.
5	TE	0	R/W	Transmit Enable Enables or disables the start of SCIF serial transmission. The SCIF starts serial transmission when transmit data is written to the SCFTDR while TE is 1. Before setting TE to 1, set SCSMR and SCFCR to specify the transmission format and reset the transmit FIFO. 0: Disables transmission. 1: Enables transmission.

Bit	Bit Name	Initial Value	R/W	Description
4	RE	0	R/W	Receive Enable Enables or disables the start of SCIF serial reception. When RE is 1, the SCIF starts serial reception by detecting a start bit in asynchronous mode or by detecting a synchronization clock input in clock synchronous mode. Before setting RE to 1, set SCSMR and SCFCR to specify the reception format and reset the receive FIFO. 0: Disables reception.* 1: Enables reception. Note: Even if RE is cleared to 0, the DR, ER, BRK, RDF, FER, PER, TO and ORER flags are not affected, and retain their states.
3	REIE	0	R/W	Receive Error Interrupt Enable Enables or Disables generation of receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests. 0: Disables receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests.* 1: Enables receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests. Note: * When REIE is 1, ER, BRK or ORER interrupt requests will occur even if RIE is cleared to 0. This setting is used to notify the interrupt controller of ER, BRK, and ORER interrupt requests during DMAC transfer.
2	TOIE	0	R/W	Timeout Interrupt Enable Enables or disables generation of timeout interrupt (TO) requests when the TO flag in SCLSR is set to 1. 0: Disables timeout interrupts (TO). 1: Enables timeout interrupts (TO).
1, 0	CKE[1:0]	00	R/W	Clock Enable 1 and 0 These bits select the SCIF clock source and enables or disables the clock output from the SCK pin. Whether the SCK pin functions as a serial clock output pin or a serial clock input pin is determined by combination of the CKE [1:0] bits settings. To specify synchronization clock output in clock synchronous mode, set C/A# to 1 in SCSMR then set CKE [1:0]. See Table 105.6 for the bit settings.

Table 105.6 Clock Selection

CKE[1:0]	Mode	Clock Source	SCK Pin
00	Asynchronous mode	Internal clock (PCK, PCK /4, PCK/16, PCK/64)	The SCK pin is not used. The SCK pin functions as an input pin (Input signals are ignored). (Initial value)
	Clock synchronous mode		The SCK pin outputs the synchronization clock. (Initial value)
01	Asynchronous mode		The SCK pin outputs the clock (with a frequency 16 times the bit rate).
	Clock synchronous mode		The SCK pin outputs the synchronization clock.
10	Asynchronous mode	Baud rate generator output for external clock or SCK	When SC_CLK is selected: The SCK pin is an input pin (Input signals are ignored). Set the SC_CLK frequency so that the frequency of BRGCLK is 16 times the bit rate.
			When SCK is selected: The SCK pin inputs the clock (with a frequency 16 times the bit rate).
	Clock synchronous mode	SCK*	The SCK pin inputs the synchronization clock.
11	Prohibited	—	—

Note: * It is not allowed to set synchronous communication using SC_CLK for input.

105.2.7 Serial Status Register (SCFSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PER[3:0]				FER[3:0]				ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R	R	R/WC0	R/WC0

SCFSR is a 16-bit register. The lower 8 bits are a status flag that indicates the operating status of the SCIF, and the upper 8 bits indicate the number of reception errors of data in the receive FIFO register.

SCFSR can always be read from and written to by the CPU. However, the flags ER, TEND, TDFE, BRK, RDF, and DR cannot be written by 1. The FER and PER flags are read-only flags and cannot be modified.

SCFSR is initialized to H'0060 by a power-on reset.

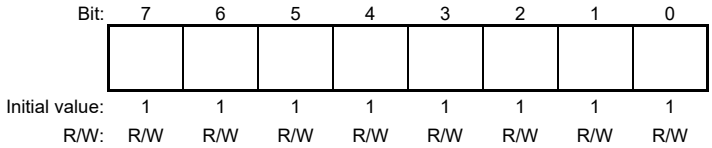
Bit	Bit Name	Initial Value	R/W	Description
15 to 12	PER[3:0]	All 0	R	Parity Error Count These bits indicate the number of parity errors of receive data stored in the receive FIFO data register (SCFRDR). After the ER is set in SCFSR, the value represented by bits 15 to 12 indicates the number of parity errors. If a parity error occurs in all 16-byte receive data in SCFRDR, PER3 to PER0 are cleared to 0.
11 to 8	FER[3:0]	All 0	R	Framing Error Count These bits indicate the number of framing errors of receive data stored in the receive FIFO data register (SCFRDR). After the ER bit is set in SCFSR, the value represented by bits 11 to 8 indicates the number of framing errors. If a framing error occurs in all 16-byte receive data in SCFRDR, FER3 to FER0 are cleared to 0.
7	ER	0	R/WC0	Receive Error Indicates that a framing error or a parity error has occurred in reception.*1 The ER flag is not affected by an error and retains its previous state when the RE bit is 0 in SCSCR. If a receive error occurs, receive data will be transferred to SCFRDR and reception operation will be continued. Whether there is a receive error in data read from SCFRDR can be determined by the FER and PER bits in SCFSR. 0: Indicates that no framing or parity error has occurred in reception. [Clearing conditions] • A power-on reset is executed. • 0 is written to ER. 1: Indicates that a framing error or a parity error has occurred in reception. [Setting conditions] • The SCIF checks whether the stop bit at the end of receive data is 1, but the stop bit is 0.*2 • The number of 1-bits in receive data plus the parity bit does not match the parity setting (even or odd) specified by the O/E# bit in SCSMR during reception. Note: In the 2-stop-bit mode, only the first stop bit is checked that the value is 1; the second stop bit is not checked.

Bit	Bit Name	Initial Value	R/W	Description
6	TEND	1	R/WC0	Indicates that transmission has been ended * because there was no valid data in SCFTDR when the last bit of the transmit character was transmitted. 0: Indicates that transmission is in progress. [Clearing conditions] • Transmit data is written to SCFTDR, and 0 is written to TEND. • Data is written to SCFTDR by the DMAC. 1: Indicates that transmission has been ended. [Setting conditions] • A power-on reset is executed. • The TE bit in SCSCR is 0. • There is no transmit data in SCFTDR when the last bit of a 1-byte serial transmission character is transmitted. Note: When transmit data is written to SCFTDR by the DMAC in clock synchronous mode, the TEND flag may not be cleared. Therefore, if the DMAC is used for transmission in clock synchronous mode, the TEND flag should be read using the following procedure. 1. Check that data transfer is completed in the DMAC. 2. Read the TEND flag. 3. If TEND = 1, clear the TEND flag to 0. 4. Read the TEND flag again. 5. Use the second read TEND flag.
5	TDFE	1	R/WC0	Transmit FIFO Data Empty Indicates that the SCIF has transferred data from SCFTDR to SCTSR, the number of data bytes in SCFTDR becomes equal to or less than the transmit trigger count specified by the TTRG1 and TTRG0 bits in SCFCR, and SCFTDR is ready to be written by new transmit data. SCFTDR is a 16-byte FIFO register. The maximum number of bytes that can be written to when TDFE = 1 is “16 – [the transmit trigger count]”. If data exceeding this value is attempted to be written, the data will be ignored. The number of data bytes in SCFTDR is indicated by the upper bits of SCFDR. If the number of data written in SCFTDR is equal to or less than the transmit trigger count, this bit will be set to 1 even if it is cleared to 0 after it is read as 1. 0: Indicates that the number of transmit data written to SCFTDR exceeds the transmit trigger count. [Clearing conditions] • Transmit data exceeding the specified transmit trigger count have been written to SCFTDR, and 0 is written to TDFE. • Transmit data exceeding the specified transmit trigger count have been written to SCFTDR by the DMAC. 1: Indicates that the number of transmit data in SCFTDR is equal to or less than the transmit trigger count. [Setting conditions] • A power-on reset is executed. • The number of transmit data in SCFTDR is equal to or less than the transmit trigger count after transmission.

Bit	Bit Name	Initial Value	R/W	Description
4	BRK	0	R/WC0	Break Detect Indicates that a receive data break signal has been detected. If a break signal is detected, receive data (H'00) transfer to SCFRDR is stopped. After the break is canceled and the receive signal returns to 1, the receive data transfer resumes. 0: Indicates that no break signal has been received. [Clearing conditions] • A power-on reset is executed. • 0 is written to BRK. 1: Indicates that a break signal has been received. [Setting condition] • Data with a framing error is received, followed by the space "0" (low level) for at least one frame length.
3	FER	0	R	Framing Error Indicates that a framing error has been found in the data that is to be read next from SCFRDR in asynchronous mode. 0: Indicates that there is no framing error in the receive data that is to be read from SCFRDR. [Clearing conditions] • A power-on reset is executed. • There is no framing error in the data that is to be read next from SCFRDR. 1: Indicates that there is a framing error in the receive data that is to be read from SCFRDR. [Setting condition] • There is a framing error in the data that is to be read next from SCFRDR.
2	PER	0	R	Parity Error This bit indicates that a parity error has been found in the data that is to be read next from SCFRDR in asynchronous mode. 0: Indicates that there is no parity error in the receive data that is to be read from SCFRDR. [Clearing conditions] • A power-on reset is executed. • There is no parity error in the data that is to be read next from SCFRDR. 1: Indicates that there is a parity error in the receive data that is to be read from SCFRDR. [Setting condition] • There is a parity error in the data that is to be read next from SCFRDR.

Bit	Bit Name	Initial Value	R/W	Description
1	RDF	0	R/WC0	Receive FIFO Data Full Indicates that the received data has been transferred from SCRSR to SCFRDR, and the number of receive data bytes in SCFRDR becomes equal to or more than the receive trigger count specified by the RTRG1 and RTRG0 bits in SCFCR. SCFRDR is a 16-byte FIFO register. When RDF = 1, data equal to or more than the number of receive trigger data bytes can be read. When SCFRDR is empty, SCFRDR is read as an undefined value. The number of receive data bytes in SCFRDR is indicated by the lower bits of SCFDR. If the number of data in SCFRDR is equal to or more than the trigger count, this bit will be set to 1 even if it is cleared to 0. At this time, read receive data until the number of data in SCFRDR is less than the trigger count, read RDF as 1, and then clear RDF. 0: Indicates that the number of receive data bytes in SCFRDR is less than the specified receive trigger count. [Clearing conditions] • A power-on reset is executed. • SCFRDR is read until the number of receive data bytes in SCFRDR is less than the receive trigger count, and 0 is written to RDF. • SCFRDR is read by the DMAC until the number of receive data bytes in SCFRDR is less than the receive trigger count. 1: Indicates that the number of receive data bytes in SCFRDR is equal to or more than the specified receive trigger count. [Setting condition] • Receive data more than the receive trigger count have been stored in SDFRDR.
0	DR	0	R/WC0	Receive Data Ready Indicates that the number of data bytes in SCFRDR is less than the receive trigger count and that no further data has been received for at least 15 etu after the stop bit of the data received last in asynchronous mode. This bit is not set in clock synchronous mode. 0: Indicates that data is being received or has been successfully received, and there is no receive data in SCFRDR. [Clearing conditions] • A power-on reset is executed. • All the receive data in SCFRDR has been read, and 0 is written to DR. • All the receive data in SCFRDR has been read by the DMAC. 1: Indicates that no further receive data has been received. [Setting condition] • The receive FIFO data register (SCFRDR) has the number of data byte that is below the receive trigger number of data bytes and no further data has arrived for at least 15 etu after the stop bit of the data received last. Note: etu: Elementary Time Unit (time for transfer of 1 bit) Equivalent to 1.5 frames with an 8-bit, 1-stop-bit format.

105.2.8 Bit Rate Register (SCBRR)



SCBRR is an 8-bit register that sets the serial transmission/reception bit rate in accordance with the baud rate generator operating clock selected by the CKS1 and CKS0 bits in SCSMR. This baud rate generator is intended for PCK, PCK/4, PCK/16, and PCK/64. see section 105.3.3, Generation of Internal Clock.

For details on the baud rate generator for external clock, see section 105.3.4, Baud Rate Generator for External Clock (BRG).

SCBRR can always be read from and written to by the CPU except for during transfer.

SCBRR is initialized to H'FF by a power-on reset.

105.2.9 FIFO Control Register (SCFCR)

SCFCR is a register that resets data counts and sets the number of trigger data bytes for the transmit and receive FIFO registers. It also has a loopback test enable bit.

SCFCR can always be read from and written to by the CPU except for during transfer.

SCFCR is initialized to H'0000 by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RSTRG[2:0]			RTRG[1:0]		TTRG[1:0]		MCE	TFRST	RF RST	LOO P
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	RSTRG[2:0]	000	R/W	RTS Output Active Trigger The RTS# signal is high when the number of receive data bytes stored in SCFRDR is equal to or more than the specified trigger number shown below: 000: 15 001: 1 010: 4 011: 6 100: 8 101: 10 110: 12 111: 14
7, 6	RTRG[1:0]	00	R/W	Receive FIFO Data Count Trigger These bits specify the number of receive data bytes that makes the RDF (receive data full) flag to be set in SCFSR. The RDF flag is set when the number of receive data bytes in SCFRDR is equal to or more than the specified trigger number shown below:

RTRG[1:0]	Asynchronous Mode	Clock Synchronous Mode
00	1	1
01	4	2
10	8	8
11	14	14

Bit	Bit Name	Initial Value	R/W	Description
5, 4	TTRG[1:0]	00	R/W	Transmit FIFO Data Count Trigger These bits specify the number of remaining transmit data bytes that makes the transmit FIFO data register empty (TDFE) flag to be set in SCFSR. The TDFE flag is set when the number of transmit data bytes in SCFTDR is equal to or less than the specified trigger count shown below, after transmission: 00: 8 (8) 01: 4 (12) 10: 2 (14) 11: 0 (16) Note: Values in parentheses indicate the empty space in SCFTDR in bytes.
3	MCE	0	R/W	Modem Control Enable Enables or disables modem control signals CTS# and RTS#. This bit should always be set to 0 in clock synchronous mode. Whether modem control can be selected or not depends on the interface. 0: Disables modem signals.* 1: Enables modem signals. Note: CTS# and RTS# control ports.
2	TFRST	0	R/W	Transmit FIFO Data Register Reset Enables or disables a transmit FIFO data register reset that empties the register. 0: Disables the reset.* 1: Enables the reset. Note: The register is reset by a power-on reset.
1	RFRST	0	R/W	Receive FIFO Data Register Reset Enables or disables a receive FIFO data register reset that empties the register. 0: Disables the reset.* 1: Enables the reset. Note: The register is reset by a power-on reset.
0	LOOP	0	R/W	Loopback Test Enables or disables the loopback test by internally connecting the transmit output pin (TX) and receive input pin (RX), and the RTS# pin and CTS# pin. If the loopback test is specified, the signal on the RTS# pin is internally conveyed to CTS# pin, and data transmission is automatically suspended when RTS# is asserted. 0: Disables the loopback test. 1: Enables the loopback test. Even if loopback test is specified by this bit, SCSPTR.RTSDT and SCSPTR.CTSDT bits does not reflect signal on loopback path, because those registers shows signals on RTS#/CTS# pins.

105.2.10 FIFO Data Count Register (SCFDR)

SCFDR is a 16-bit register that indicates the number of data bytes stored in SCFTDR and that in SCFRDR.

The upper 8 bits indicate the number of transmit data bytes in SCFTDR, and the lower 8 bits indicates the number of receive data bytes in SCFRDR.

SCFDR can always be read by the CPU.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	T[4:0]	H'00	R	These bits show the number of data bytes untransmitted and still stored in SCFTDR. H'00 indicates that there is no transmit data in SCFTDR. H'10 indicates that SCFTDR is full of transmit data.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	R[4:0]	H'00	R	These bits show the number of receive data stored in SCFRDR in bytes. H'00 indicates that there is no receive data in SCFRDR. H'10 indicates that SCFRDR is full of receive data.

105.2.11 Serial Port Register (SCSPTR)

SCSPTR controls multiplexed input/output and data on the serial communication interface (SCIF) ports. Bits 1 and 0 control breaks in serial transmission/reception by reading input data from the RX pin and writing output data to the TX pin. Bits 3 and 2 read input data from and write output data to the SCK pin. Bits 5 and 4 read input data from and write output data to the CTS# pin. Bits 7 and 6 read input data from and write output data to the RTS# pin.

SCSPTR is a 16-bit register that can always be read from and written to by the CPU.

All SCSPTR bits except bits 6, 4, 2, and 0 are initialized to 0 by a power-on reset. The values of bits 6, 4, 2, and 0 are undefined.

Note: Whether modem control can be selected or not depends on the interface.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RTSIO	RTSDT	CTSIO	CTSDT	SCKIO	SCKDT	SPB2IO	SPB2DT
Initial value:	0	0	0	0	0	0	0	0	0	—	0	—	0	—	0	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	RTSIO	0	R/W	Serial Port RTS# Pin Input/output Specifies input or output for the serial port RTS# pin. To actually set the RTS# pin as a port output pin to output the value set by the RTSDT bit, the MCE bit in SCFCR should be cleared to 0. 0: Indicates that this bit does not output the value of the RTSDT bit to the RTS# pin. 1: Indicates that this bit outputs the value of the RTSDT bit to the RTS# pin.
6	RTSDT	—	R/W	Serial Port RTS# Pin Data Specifies the input/output data level of the serial port RTS# pin. Whether the pin is set for input or output is determined by the RTSIO bit. When the pin is set for output, the value of the RTSDT bit is output to the RTS# pin. Regardless of the value of the RTSIO bit, the value of the RTS# pin is read from the RTSDT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.
5	CTSIO	0	R/W	Serial Port CTS# Pin Input/output Specifies input or output for the serial port CTS# pin. To actually set the CTS# pin as a port output pin to output the value set by the CTSDT bit, the MCE bit in SCFCR should be cleared to 0. 0: Indicates that the CTSDT bit value is not output to the CTS# pin. 1: Indicates that the CTSDT bit value is output to the CTS# pin.

Bit	Bit Name	Initial Value	R/W	Description
4	CTSDT	—	R/W	Serial Port CTS# Pin Data Specifies the input/output data level of the serial port CTS# pin. Whether the pin is set for input or output is determined by the CTSIO bit. When the pin is set for output, the value of the CTSDT bit is output to the CTS# pin. Regardless of the value of the CTSIO bit, the value of the CTS# pin is read from the CTSDT bit. The initial value of this bit is undefined after a power-on. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.
3	SCKIO	0	R/W	Serial Port Clock Pin Input/output Specifies input or output for the serial port SCK pin. To actually set the SCK pin as a port output pin to output the value set by the SCKDT bit, the CKE [1:0] bits in SCSCR should be cleared to 0. 0: Indicates that the SCKDT bit value is not output to the SCK pin. 1: Indicates that the SCKDT bit value is output to the SCK pin.
2	SCKDT	—	R/W	Serial Port Clock Pin Data Specifies the input/output data level of the serial port SCK pin. Whether the pin is set for input or output is determined by the SCKIO bit. When the pin is set for output, the value of the SCKDT bit is output to the SCK pin. Regardless of the value of the SCKIO bit, the value of the SCK pin is read from the SCKDT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.
1	SPB2IO	0	R/W	Serial Port Break Input/Output Specifies the output condition of the serial port TX pin. To actually set the TX pin as a port output pin to output the value set by the SPB2DT bit, the TE bit in SCSCR should be cleared to 0. 0: Indicates that the SPB2DT bit value is not output to the TX pin. 1: Indicates that the SPB2DT bit value is output to the TX pin.
0	SPB2DT	—	R/W	Serial Port Break Data Specifies the input level of the serial port RX pin and the output level of the TX pin. The TX pin output conditions are determined by the SPB2IO bit. When the TX pin is set for output, the value of the SPB2DT bit is output to the TX pin. Regardless of the value of the SPB2IO bit, the value of the RX pin is read from the SPB2DT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.

Figure 105.2 to 105.6 show the block diagrams of the SCIF I/O ports.

105.2.12 Line Status Register (SCLSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TO	—	ORER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC0	R	R/WC0

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	TO	0	R/WC0	Timeout Indicates that the number of data bytes in SCFRDR is less than the receive trigger count, and that no further data has been received for at least 15 etu after the stop bit of the last receive data in asynchronous mode. This bit is not set in clock synchronous mode. 0: Indicates that data is being received or has been successfully received and that there is no receive data in SCFRDR. [Clearing conditions] • A power-on reset is executed. • All the receive data in the SCFRDR has been read, and 0 is written to TO. 1: Indicates that no further receive data has been received (receive timeout). [Setting condition] • The number of data bytes in SCFRDR is less than the receive trigger count and no further data has been received for at least 15 etu after the stop bit of the last receive data.* Note: etu: Elementary Time Unit (time for transfer of 1 bit) Equivalent to 1.5 frames with an 8-bit, 1-stop-bit format.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	ORER	0	R/WC0	Overrun Error Indicates that an overrun error has occurred in reception and abnormal termination is caused. If an overrun error occurs, the receive data prior to the overrun error is retained in SCFRDR and the data received subsequently is discarded. Any subsequent serial reception is disabled while the ORER flag is 1. To resume data reception after clearing the ORER flag, be sure to first read (or clear) data in the receive FIFO and handle the error, then clear the ORER flag. 0: Indicates that data is being received or has been successfully received. [Clearing conditions] • A power-on reset is executed. • 0 is written to ORER. 1: Indicates that an overrun error has occurred in reception. [Setting condition] • The next serial reception has been completed while SCFRDR is full of 16-byte data. Note: When bit RE in SCSCR is cleared to 0, the ORER flag is not affected and its previous state is retained.

105.2.13 Frequency Division Register (DL)

This register specifies the value of frequency division for the frequency divided clock generated by the BRG.

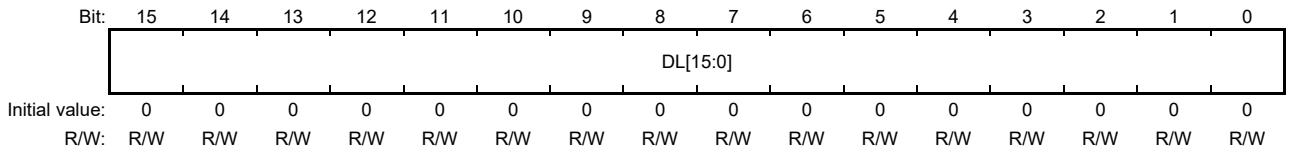
This register supports a 16-bit binary format that allows specifying a value in the rage of 1 to 65535.

Setting all 0s in this register makes the BRG output the frequency divided clock at the low level.

The value of frequency division is given by the following formula:

The value of frequency division = (clock input frequency)/ (required baud rate × 16)

Table 105.9 shows how to use the baud rate generator with a 3.6864-MHz crystal resonator.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	DL[15:0]	All 0	R/W	Specifies a division value of frequency clock generated in BRG. The value settings enabled in the range of 1 to 65535.

105.2.14 Clock Select Register (CKS)

This register switches the output between the frequency divided clock and specifies a source clock for the external baud rate.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CKS	XIN	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	CKS	0	R/W	This bit switches the output between the frequency divided clock (SC_CLK) and external clock (SCK). 0: Selects the frequency divided clock. 1: Selects the external clock.
14	XIN	0	R/W	Selects the baud rate generator clock source for the external clock between SCIF_CLK and SCKi. 0: Selects the external clock (SCIF_CLK). 1: Selects the internal clock (SCKi).
13 to 0	—	All 0	R	Reserved These bits are always read as 0. Only 0 should be written to these bits.

105.3 Operation

105.3.1 Operation in Asynchronous Mode

In asynchronous mode, the SCIF performs serial communication, in which data is transmitted/received in character units using the attached start bit indicating the start of communication and stop bit indicating the end of communication.

Figure 105.7 shows the general format for asynchronous serial communication.

In asynchronous serial communication, the transmission line is usually kept marked (high level). The SCIF monitors the transmission line, and when it finds a space (low level), it regards the space as a start bit and starts serial communication.

One character in serial communication consists of a start bit (low level), followed by transmit/receive data (LSB-first; from the lowest bit), a parity bit (high or low level), and a stop bit (high level).

During reception in asynchronous mode, the SCIF performs synchronization at the falling edge of the start bit. Communication data is acquired at the center of each bit because the SCIF samples data at the eighth pulse of the clock which has a frequency of 16 times the bit rate.

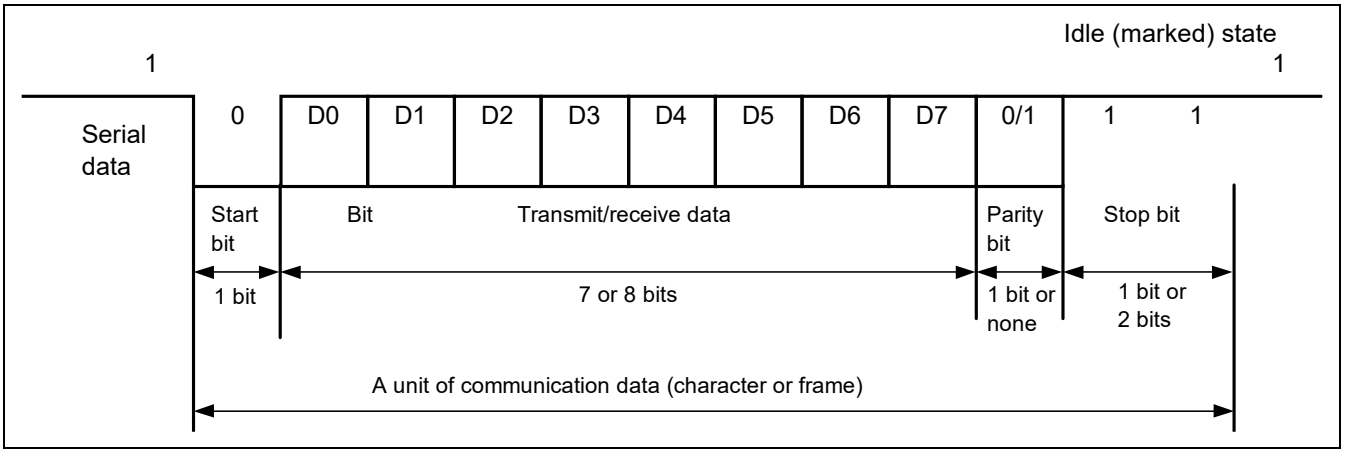


Figure 105.7 Data Format in Asynchronous Mode (Example of 8-Bit Data with Parity and Two Stop Bits)

(1) Transmission/Reception Format

Table 105.7 shows available data transfer formats. The SCIF supports 8 transfer formats, which can be specified by SCSMR.

Table 105.7 Serial Transmission/Reception Formats (Asynchronous Mode)

SCSMR Settings			Serial Transmission/Reception Format and Frame Length											
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	S	8-bit data								STOP		
		1	S	8-bit data								STOP	STOP	
	1	0	S	8-bit data								P	STOP	
		1	S	8-bit data								P	STOP	STOP
1	0	0	S	7-bit data							STOP			
		1	S	7-bit data							STOP	STOP		
	1	0	S	7-bit data							P	STOP		
		1	S	7-bit data							P	STOP	STOP	

[Legend]
S: Start bit
STOP: Stop bit
P: Parity bit

(2) Clock

The transfer clock can be selected from the following two clocks using the CKE [1:0] bits in SCSCR:

- Internal clock generated by the on-chip baud rate generator
- External clock generated by an external clock baud rate generator

(3) Data Transmission/Reception

(a) Initialization of SCIF (Asynchronous Mode)

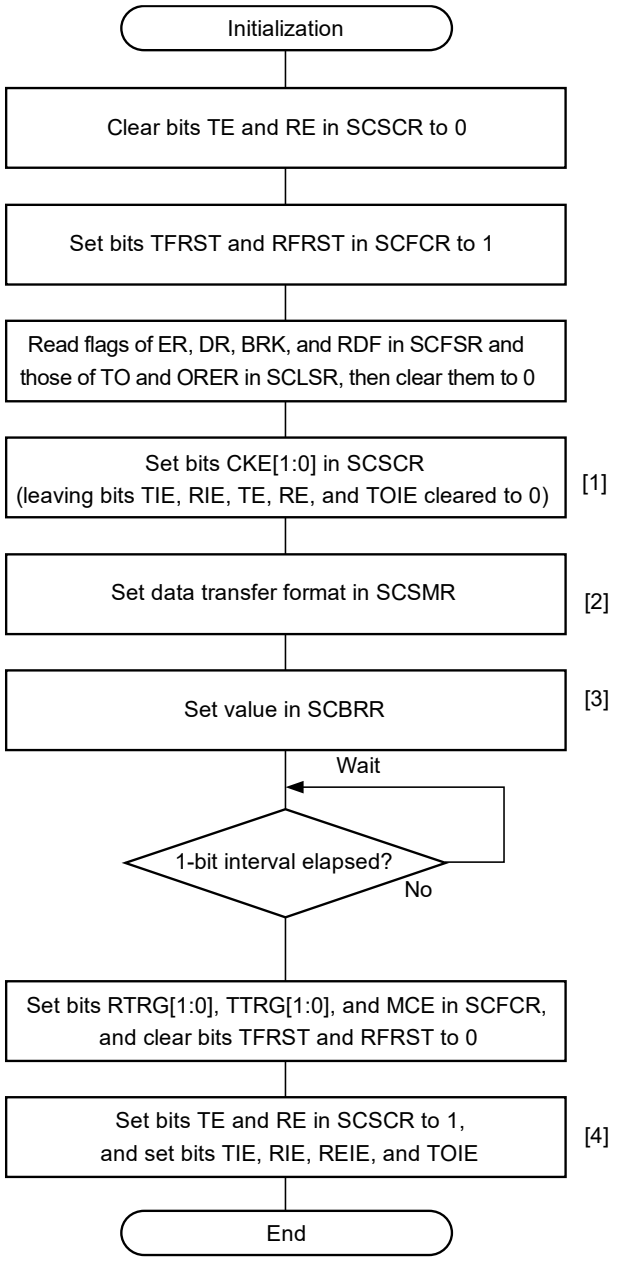
Before transmitting/receiving data or changing the operating mode or communication format, the SCIF should be initialized using the sample flowchart for SCIF initialization shown in Figure 105.8.

[Notes]

Clearing the TE bit to 0 initializes SCTSR. However, SCFSR, SCFTDR, and SCFRDR contents are retained even if the TE and RE bits are cleared to 0.

The TE bit should be cleared to 0 after all transmit data has been sent and the TEND flag has been set in SCFSR. The TE bit can be cleared to 0 during transmission, but the data being transmitted will enter the marked state after clearing. In addition, before setting the TE bit to 1 to restart the transmission, set the TFRST bit to 1 in SCFCR to reset SCFTDR.

When an external clock is used, do not stop the clock during operation or initialization. If stopped, the operation will be unreliable. Furthermore, when the baud rate generator for external clock is also to be used, be sure to make settings for it before starting initialization of the SCIF.



[1] Set the clock selection in SCSCR. Be sure to clear bits TIE, RIE, TE, RE, and TOIE to 0.

[2] Set the data transfer format in SCSMR.

[3] Write a value for the bit rate to SCBRR. (Not necessary if an external clock is used.)

[4] Wait at least one bit interval, then set bit TE or RE in SCSCR to 1. Also, set bits TIE, RIE, REIE, and TOIE. Setting bit TE enables the TX and RX pins to use.
In transmission, the SCIF will go to the mark state, and in reception, it will go to the idle state, waiting for a start bit.

Note: SCBRR and SCFCR registers can only be set while both TE and RE bits of SCSCR are cleared.

Figure 105.8 Sample Flowchart for Initializing the SCIF

(b) Serial Data Transmission (Asynchronous Mode)

Figure 105.9 shows a sample flowchart for serial transmission.

After the SCIF transmission operation is enabled, serial data transmission can be performed using the following procedure:

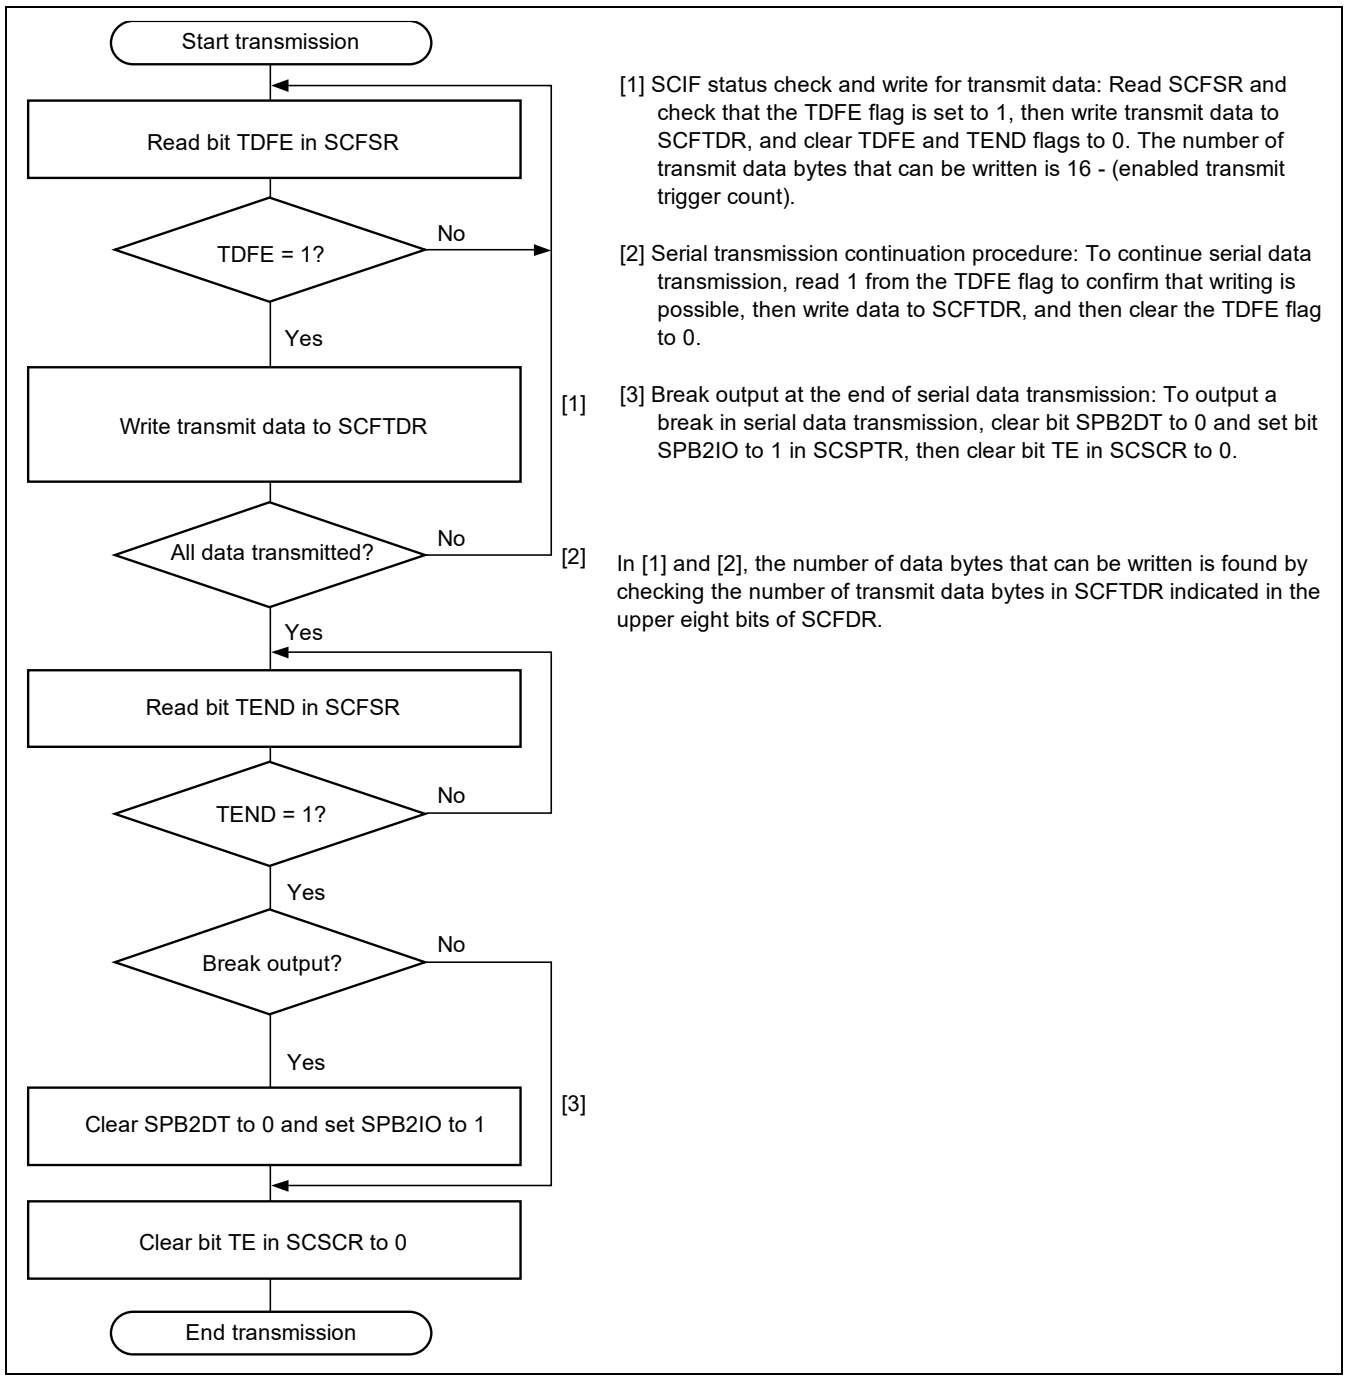


Figure 105.9 Sample Flowchart for Serial Transmission

In serial transmission, the SCIF operates as follows:

1. When data is written to SCFTDR, the SCIF transfers the data from SCFTDR to SCTSR and starts transmitting. Confirm that the TDFE flag in SCFSR is set to 1 before writing transmit data to SCFTDR. The number of data bytes that can be written is at least (16- (transmit trigger count)).
2. When data is transferred from SCFTDR to SCTSR and the SCIF starts transmission, consecutive transmission is performed until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR is equal to or less than the transmit trigger count specified in SCFCR, the TDFE flag is set. If the TIE and TEIE bits in SCSCR are set to 1 and 0, respectively at this time, a transmit-FIFO-data-empty interrupt (TDFE) request occurs. The serial transmit data is sent from the TX pin in the following order:
   A. Start bit: One 0-bit is output.
   B. Transmit data: 8-bit or 7-bit data is output in LSB-first order.
   C. Parity bit: One parity bit (even or odd parity) is output.
      A format that does not output a parity bit can also be selected.
   D. Stop bit(s): One or two stop bits are output.
   E. Marked state: 1 is output continuously until the start bit that starts the next transmission is sent.
3. The SCIF checks transmit data in SCFTDR when sending the stop bit. If there is data in it, the SCIF transfers the data from SCFTDR to SCTSR, sends the stop bit, and then starts serial transmission of the next frame. If there is no transmit data, the SCIF sets the TEND flag to 1 in SCFSR and sends out the stop bit, and then the marked state is entered to output 1 continuously. At this time, if the TIE and TEIE bits in SCSCR are set to 1, a transmit-end interrupt (TEND) request occurs.

Figure 105.10 shows an example of transmission in asynchronous mode.

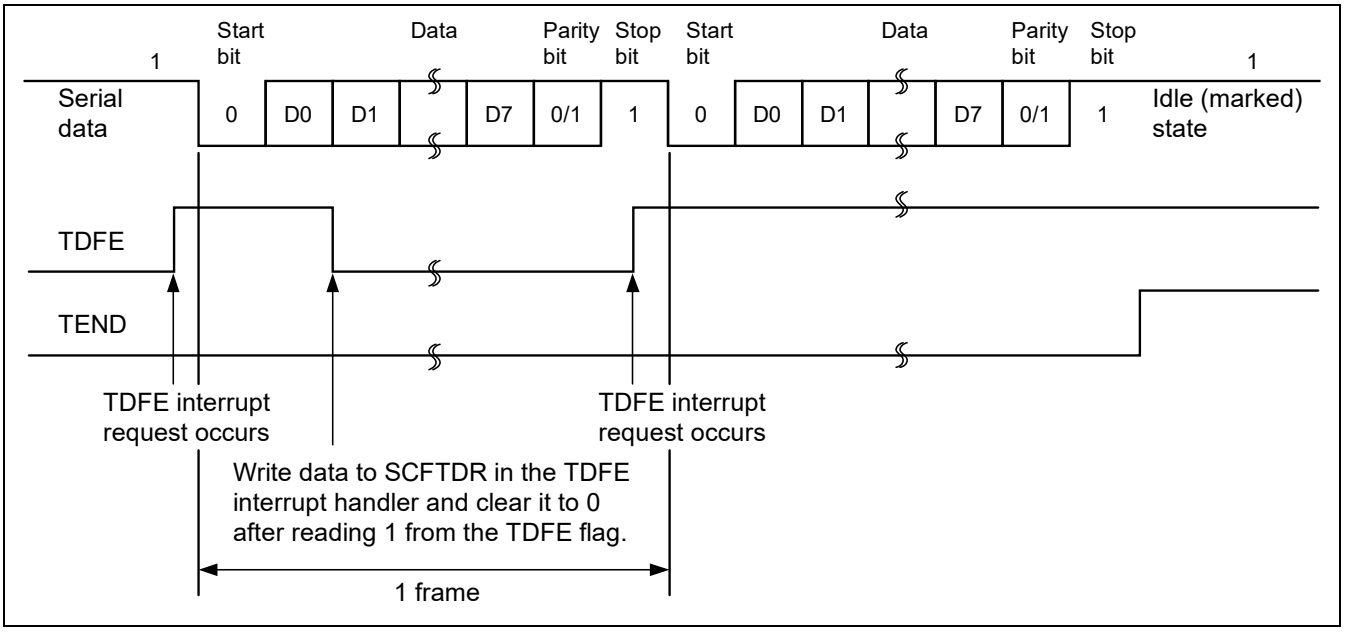

Figure 105.10 Sample SCIF Transmission Operation (Example of 8-Bit Data with Parity and One Stop Bit)

4. When modem control is enabled, transmission can be stopped or resumed in accordance with the CTS# input value. When CTS# is set to 1 during transmission, the marked state is entered after one frame of data transmission is ended. Setting CTS# to 0 restarts outputting the next transmit data from the start bit. Figure 105.11 shows an example of the operation with modem control enabled.

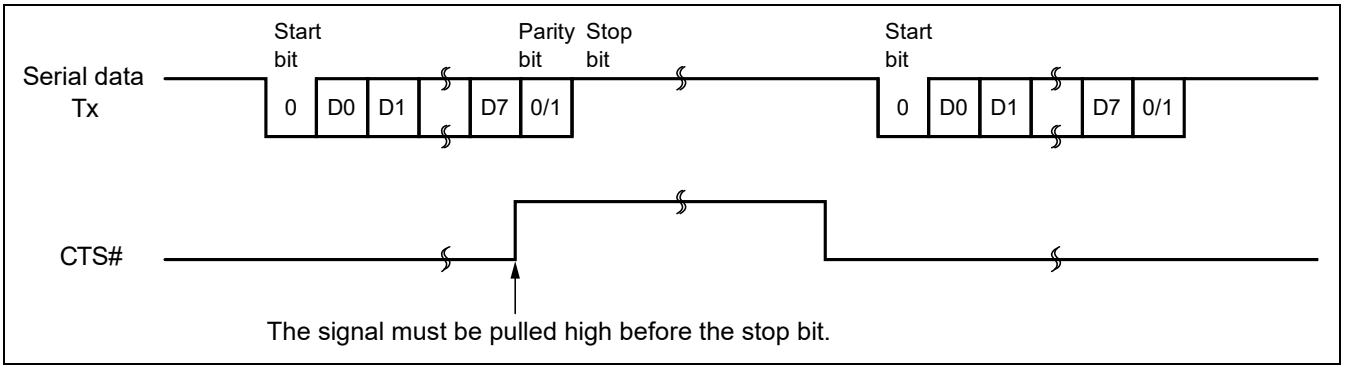

Figure 105.11 Sample Operation with Modem Control Enabled (CTS#)

(c) Serial Data Reception (Asynchronous Mode)

Figure 105.12 and 105.13 show sample flowcharts for serial reception.

After the SCIF reception operation is enabled, serial data reception can be performed using the following procedure:

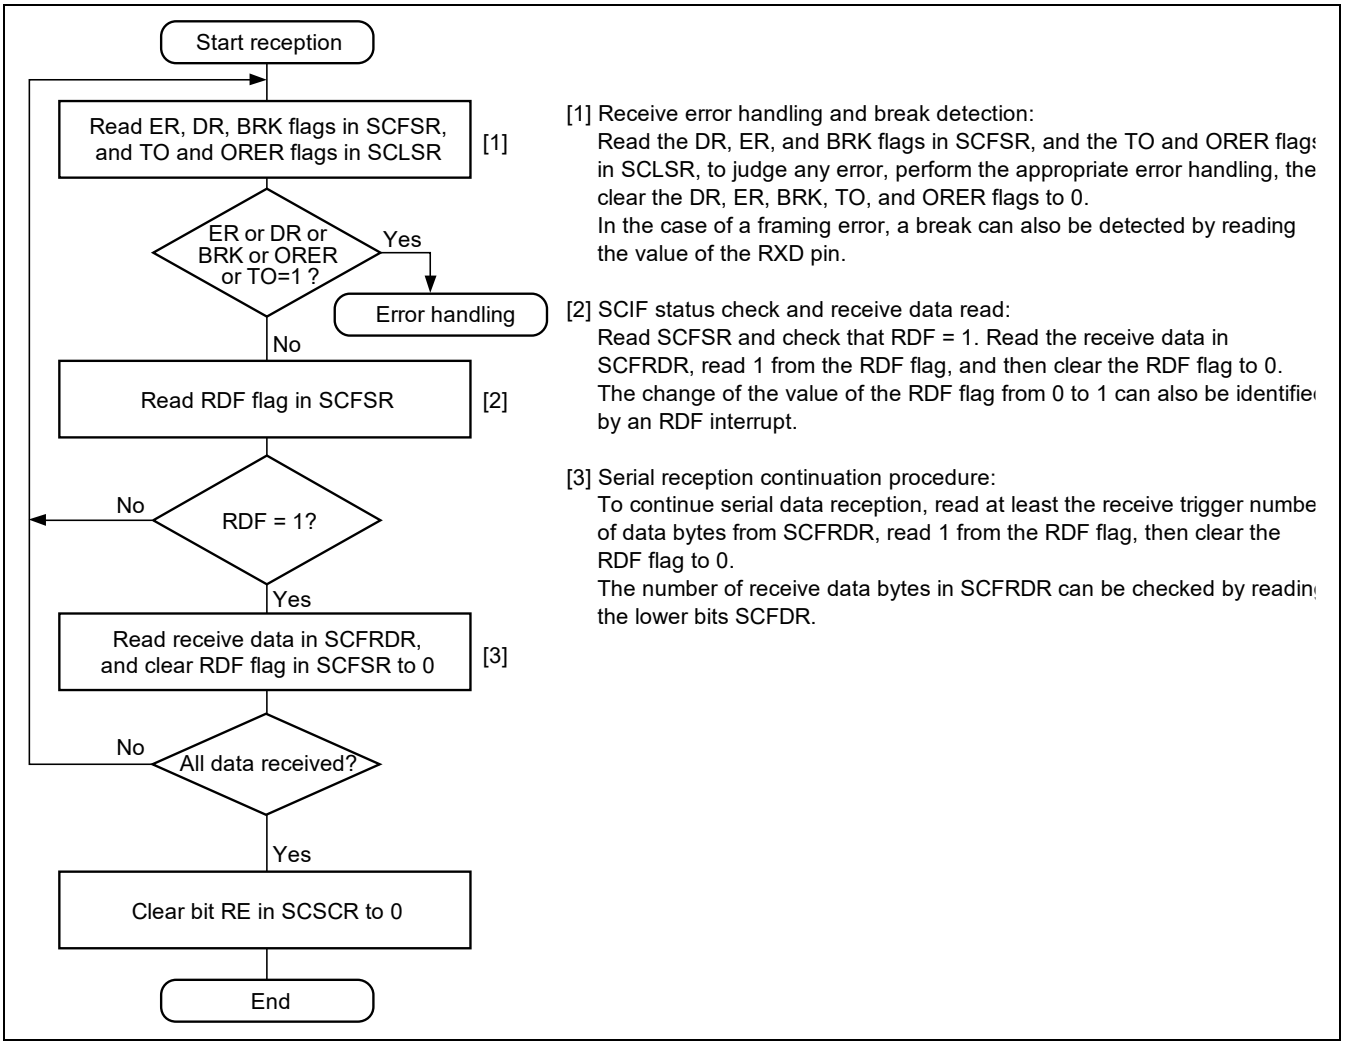

Figure 105.12 Sample Flowchart for Serial Reception (1)

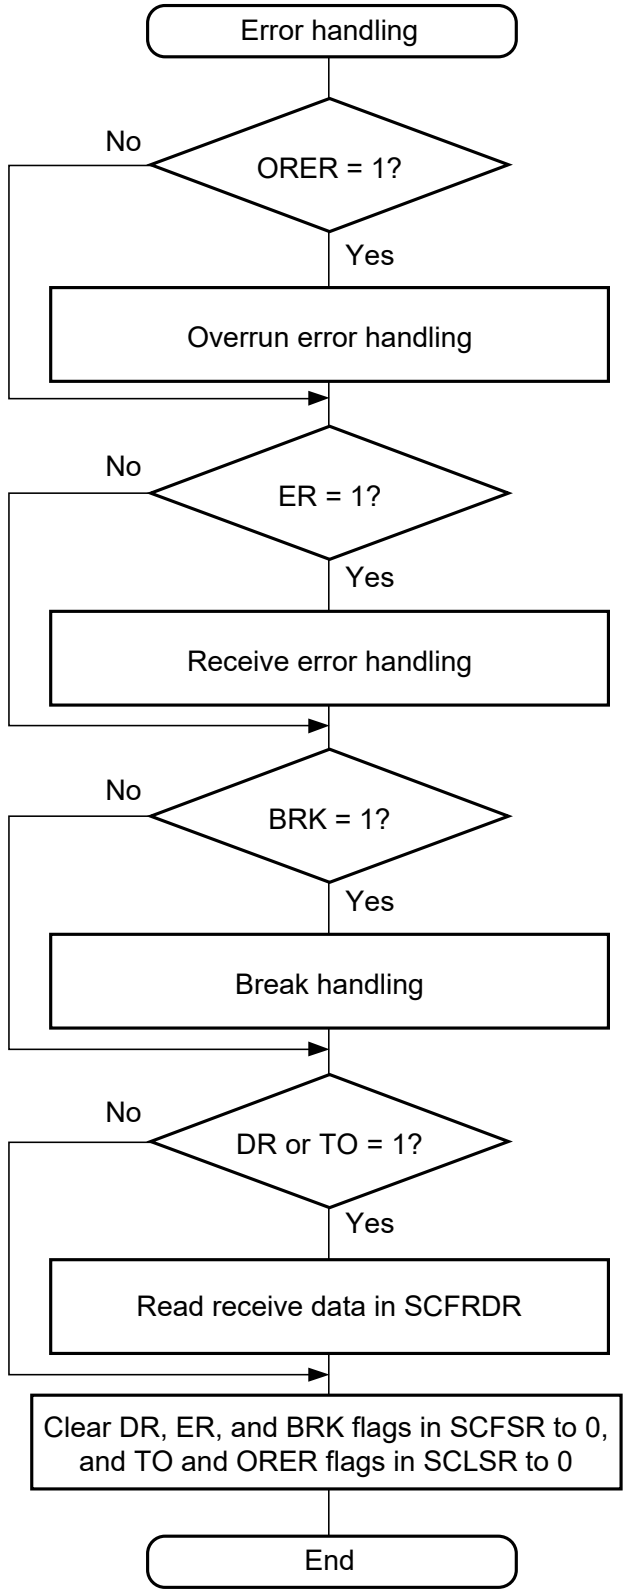

Whether a framing error or parity error has occurred in the receive data that is to be read from SCFRDR can be determined by checking bits FER and PER in SCFSR.

Figure 105.13 Sample Flowchart for Serial Reception (2)

In serial reception, the SCIF operates as follows:

1. The SCIF monitors the transmission line, and when detecting the start bit 0, it performs internal synchronization and starts reception.
2. The SCIF stores the received data in SCRSR in LSB-to-MSB order.
3. The SCIF receives the parity bit and stop bit.
   After receiving these bits, the SCIF performs the following checks:
   A. Stop bit: The SCIF checks whether the stop bit is 1.
      If there are two stop bits, it checks only the first stop bit.
   B. Receive data: The SCIF checks that receive data can be transferred from the receive shift register (SCRSR) to SCFRDR.
   C. Overrun error: The SCIF checks that the ORER flag is 0, indicating that no overrun error has occurred.
   D. Break state: The SCIF checks that the BRK flag is 0, indicating that the break state is not set.
   If the SCIF can confirm the conditions of (b), (c), and (d), it stores the receive data in SCFRDR.

   Note: The SCIF continues to receive data even when a parity error or a framing error occurs.

4. If the RDF flag changes to 1 while the RIE bit in SCSCR is 1, a receive-FIFO-data-full interrupt (RDF) request occurs.
   If the DR flag changes to 1 while the RIE bit in SCSCR is 1, a receive-data-ready interrupt (DR) request occurs.
   If the TO flag changes to 1 while the TOIE bit in SCSCR is 1, a timeout interrupt (TO) request occurs.
   If the ER flag changes to 1 while the RIE or REIE bit in SCSCR is 1, a receive-error interrupt (ER) request occurs.
   If the BRK flag changes to 1 while the RIE or REIE bit in SCSCR is 1, a break interrupt (BRK) request occurs.
   If the ORER flag changes to 1 while the RIE or REIE bit in SCSCR is 1, an overrun-error interrupt (ORER) request occurs.

Figure 105.14 shows an example of reception in asynchronous mode.

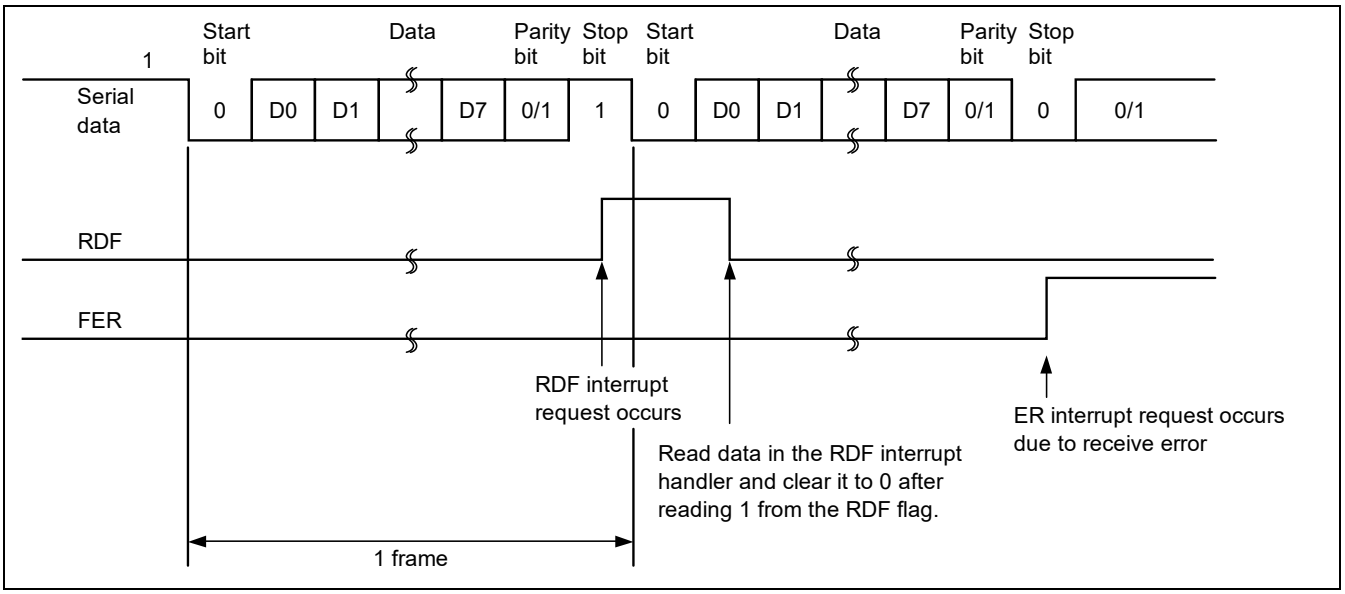

Figure 105.14 Sample SCIF Receive Operation (Example of 8-Bit Data with Parity and One Stop Bit)

5. When modem control is enabled, the RTS# signal is output when SCFRDR is empty. When RTS# is 0, data can be received. When RTS# is set to 1, the number of data bytes in SCFRDR is equal to or more than the RTS# output active trigger count.

Figure 105.15 shows an example of the operation with modem control enabled.

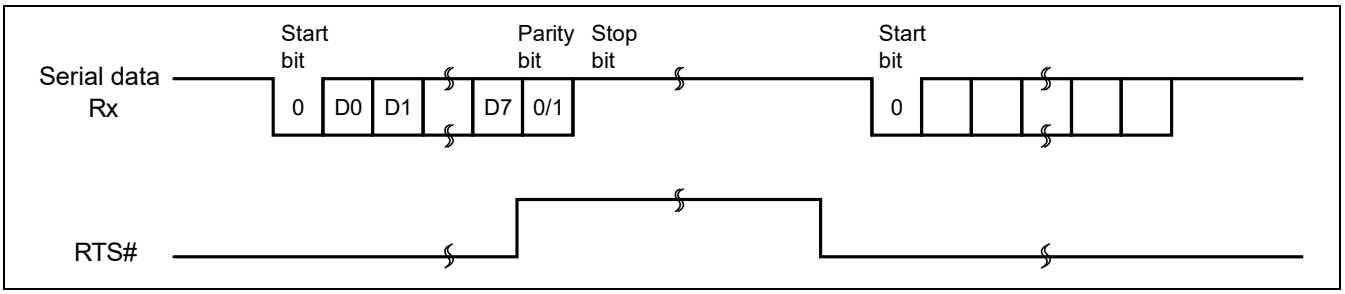

Figure 105.15 Example of the Operation with Modem Control Enabled (RTS#)

105.3.2 Operation in Clock Synchronous Mode

Clock synchronous mode, in which data is transmitted and received in synchronization with clock pulses, is suitable for fast serial communication.

Figure 105.16 shows the general format for clock synchronous serial communication. In the clock synchronous serial communication, data on the communication line is output between one falling edge of the synchronization clock and the next falling edge. The data decision is done at the rising edge of the clock.

In serial communication, each character is output starting with the LSB and ending with the MSB. After the MSB is output, the communication line retains the state of the last data.

In clock synchronous mode, the SCIF receives data in synchronization with a rising edge of the synchronization clock.

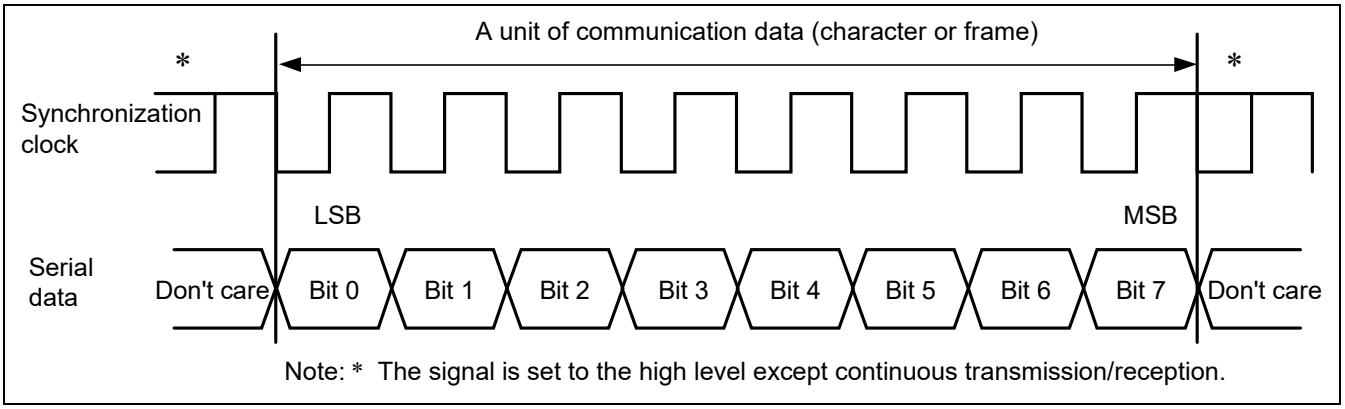

Figure 105.16 Data Format for Clock Synchronous Communication

(1) Data Transfer Format

The data transfer format is fixed to 8 bits. No parity bit can be added.

(2) Clock

The clock can be selected from the following two clocks using the C/A# bit in SCSMR and the CKE [1:0] bits in SCSCR:

- Internal clock generated by the on-chip baud rate generator
- External synchronization clock input at the SCK pin

When the SCIF is operated on an internal clock, the synchronization clock is output from the SCK pin. Eight synchronization clock pulses are output in one-character transfer, and when no transfer is performed the clock is fixed high. When only reception operation is performed, selecting an internal clock outputs clock pulses until the number of data bytes in the receive FIFO reaches the specified receive trigger count, while the RE bit in SCSCR is 1.

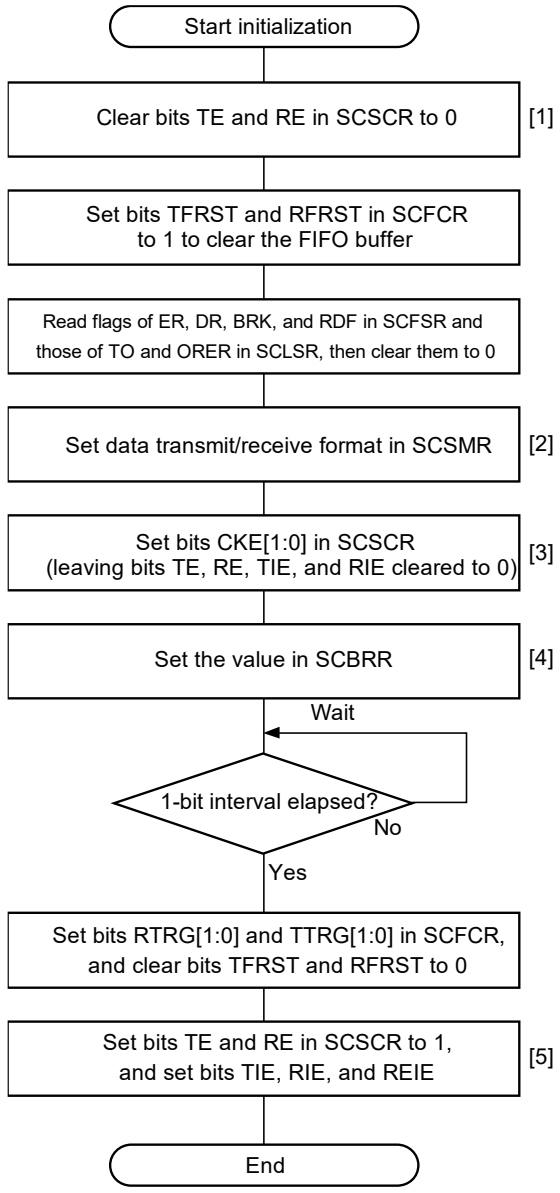
(3) Data Transmission/Reception

(a) Initialization of SCIF (Synchronous Mode)

Before transmitting/receiving data or changing the operating mode or communication format, the TE and RE bits in SCSCR to 0 and then the SCIF should be initialized using the sample flowchart for SCIF initialization shown in Figure 105.17.

[Note]

Clearing the TE bit to 0 initializes SCTSR. However, clearing the RE bit to 0 does not affect the RDF, PER, FER, and ORER flags and SCFRDR contents.



[1] Leave bits TE and RE cleared to 0 until the initialization almost ends.

[2] Set the data transfer format in SCSMR.

[3] Set bits CKE[1:0].

[4] Write the value of the bit rate to SCBRR. This is not required if an external clock is used. Wait at least one-bit interval after writing the value for the bit rate.

[5] Set bit TE or RE in SCSCR to 1. Also set bits TIE, RIE, and REIE to enable the TX, RX, and SCK pins to use.
In transmission, the TX pin will go to the marked state. In reception in clock synchronous mode with the synchronization clock output (clock master) selected, a clock starts to be output from the SCK pin at this point.

Note: SCBRR and SCFCR registers can only be set while both TE and RE bits of SCSCR are cleared.

Figure 105.17 Sample Flowchart for SCIF Initialization

(b) Serial Data Transmission (Clock Synchronous mode)

Figure 105.18 shows a sample flowchart for serial transmission.

After the SCIF transmission operation is enabled, serial data transmission can be performed using the following procedure:

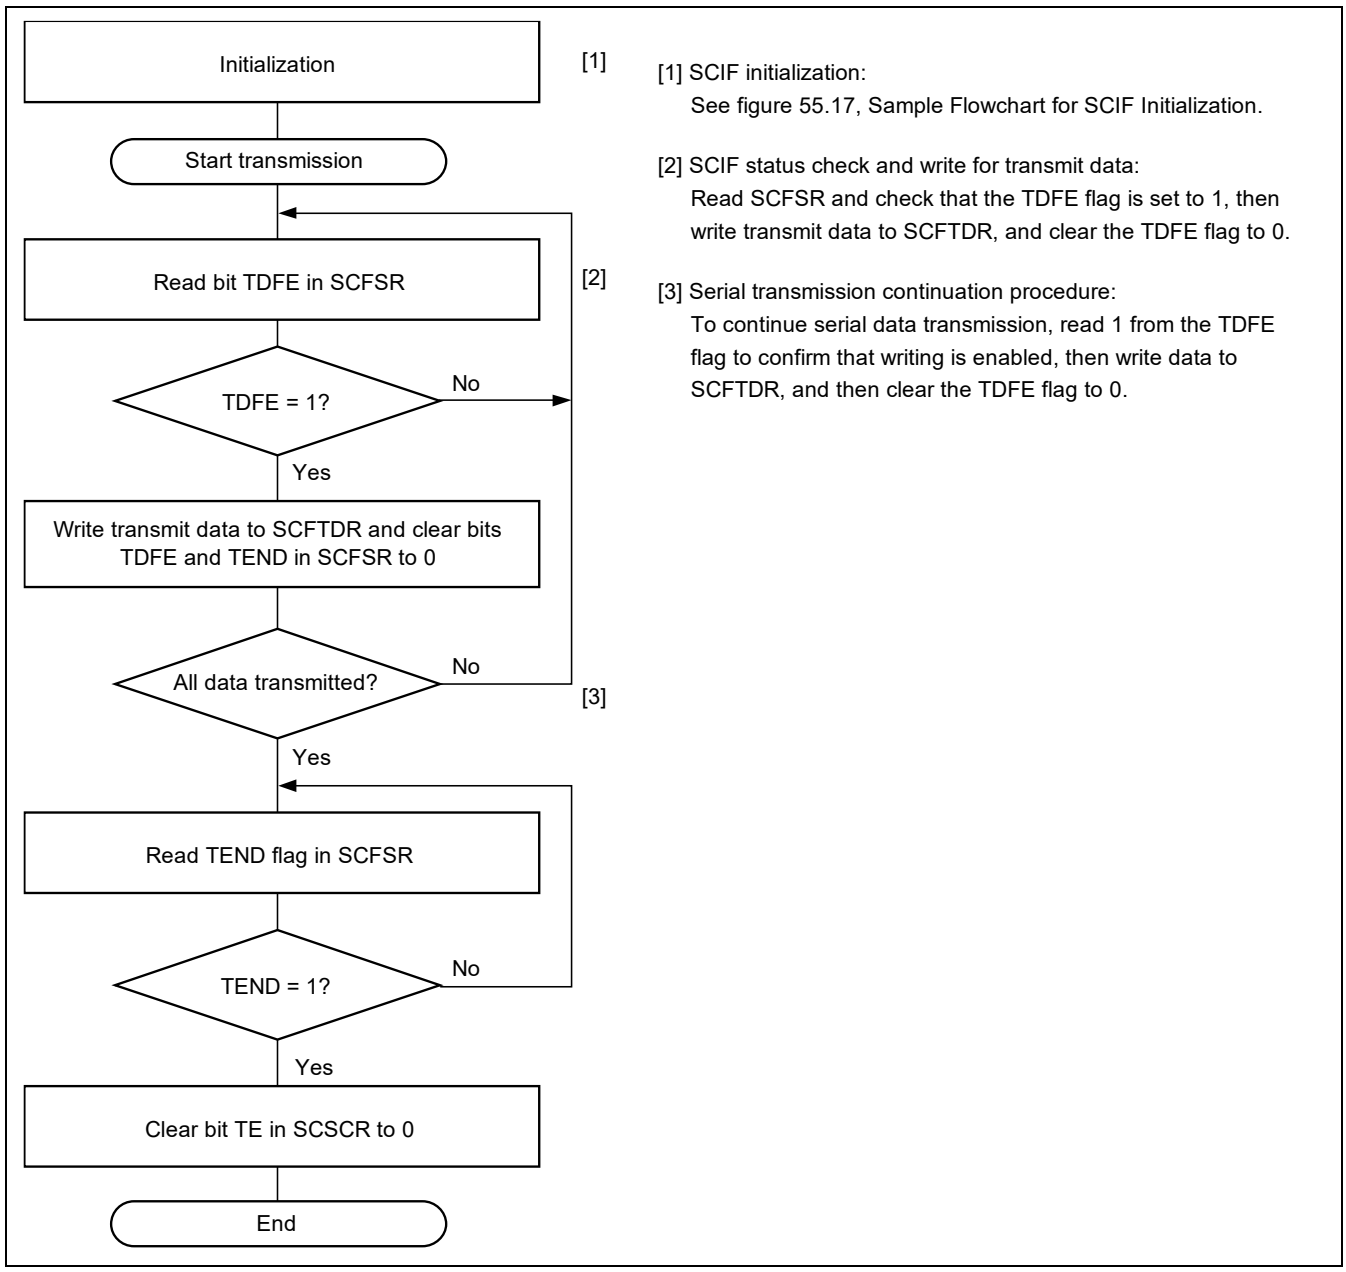


Figure 105.18 Sample Flowchart for Serial Transmission

In serial data transmission, the SCIF operates as described below:

1. When data is written to SCFTDR, the SCIF transfers the data from SCFTDR to SCTSR to start transmission. Confirm that the TDFE flag in SCFSR is set to 1 before writing transmit data to SCFTDR. The number of data bytes that can be written is at least (16- (the transmit trigger count)).
2. After the SCIF transfers data from SCFTDR to SCTSR and starts data serial transmission, the SCIF consecutively transmits it until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR is equal to or less than the transmit trigger count set in SCFCR, the TDFE flag is set. If the TIE and TEIE bits in SCSCR are set to 1 and 0, respectively at this time, a transmit-FIFO-data-empty interrupt (TDFE) request occurs. When the external clock is selected, data is output in synchronization with the input clock. The serial transmit data is output at the TX pin in the LSB-first order.
3. The SCIF checks transmit data in SCFTDR when sending the last bit. If there is transmit data, the SCIF transfers the data to SCTSR, and starts serial transmission of the next frame. If there is no transmit data left, the TEND flag in SCFSR is set to 1, and the transmit data pin (TX pin) retains its state after the last bit is sent. At this time, if the TIE and TEIE bits in SCSCR are set to 1, a transmit-end interrupt (TEND) request occurs.
4. After serial transmission ends, the SCK pin is fixed high.

Note: In clock synchronous mode, when transmit data is written to SCFTDR by the DMAC, the TEND flag may not be cleared. Therefore, if the DMAC is used for transmission in clock synchronous mode, read the TEND flag in the following method.
1. Confirm that data transfer is completed in the DMAC.
2. Read the TEND flag.
3. Clear the TEND flag to 0 if TEND = 1.
4. Read the TEND flag again.
5. Use the second-read TEND flag.

Figure 105.19 shows an example of SCIF serial transmission in clock synchronous mode.

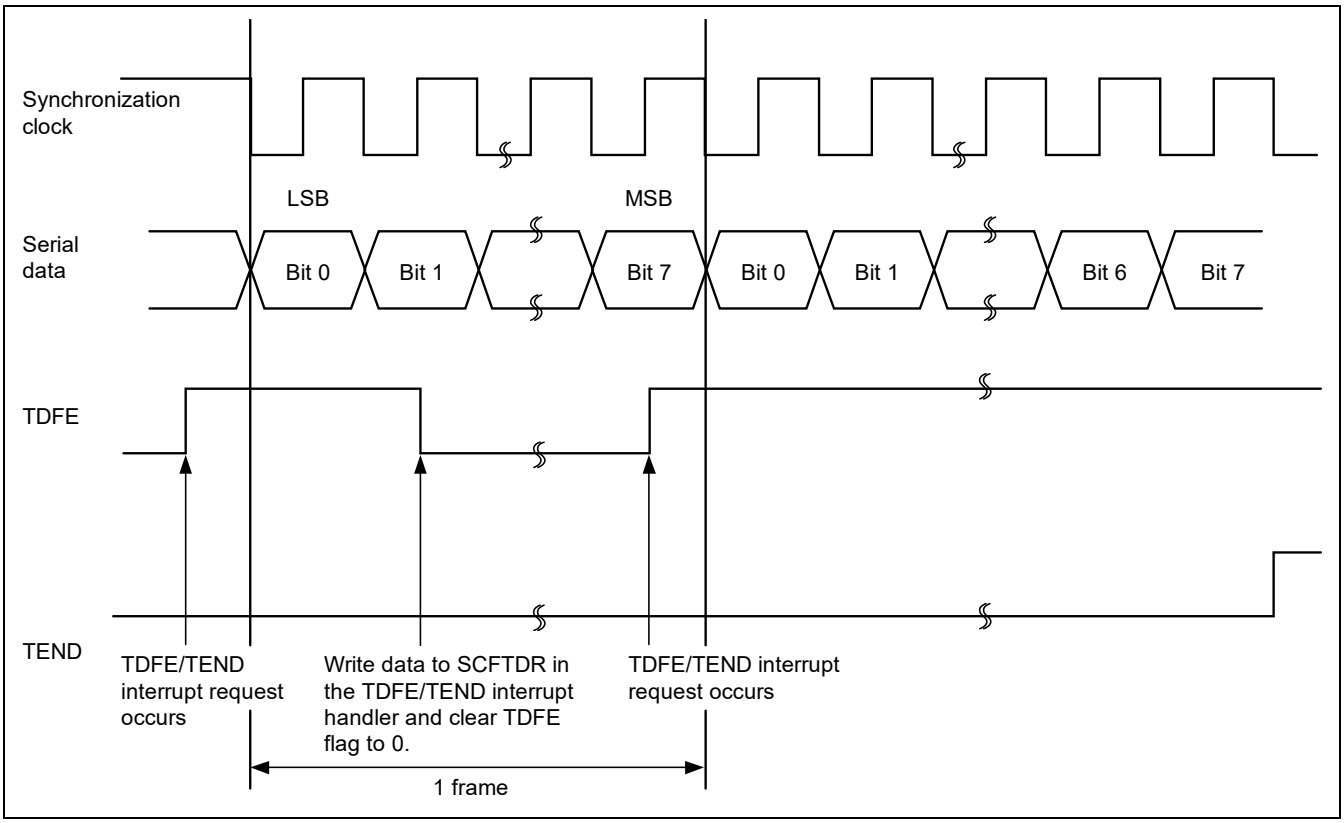

Figure 105.19 Example of SCIF Serial Transmission in Clock Synchronous Mode

(c) Serial Data Reception (Clock Synchronous Mode)

Figure 105.20 and 105.21 show sample flowcharts for serial reception.

The SCIF reception should be enabled before taking the following steps for serial data transmission.

When switching operating mode from asynchronous mode to clock synchronous mode without initializing the SCIF, check that the ORER, PER3 to PER0, and FER3 to FER0 flags are cleared to 0.

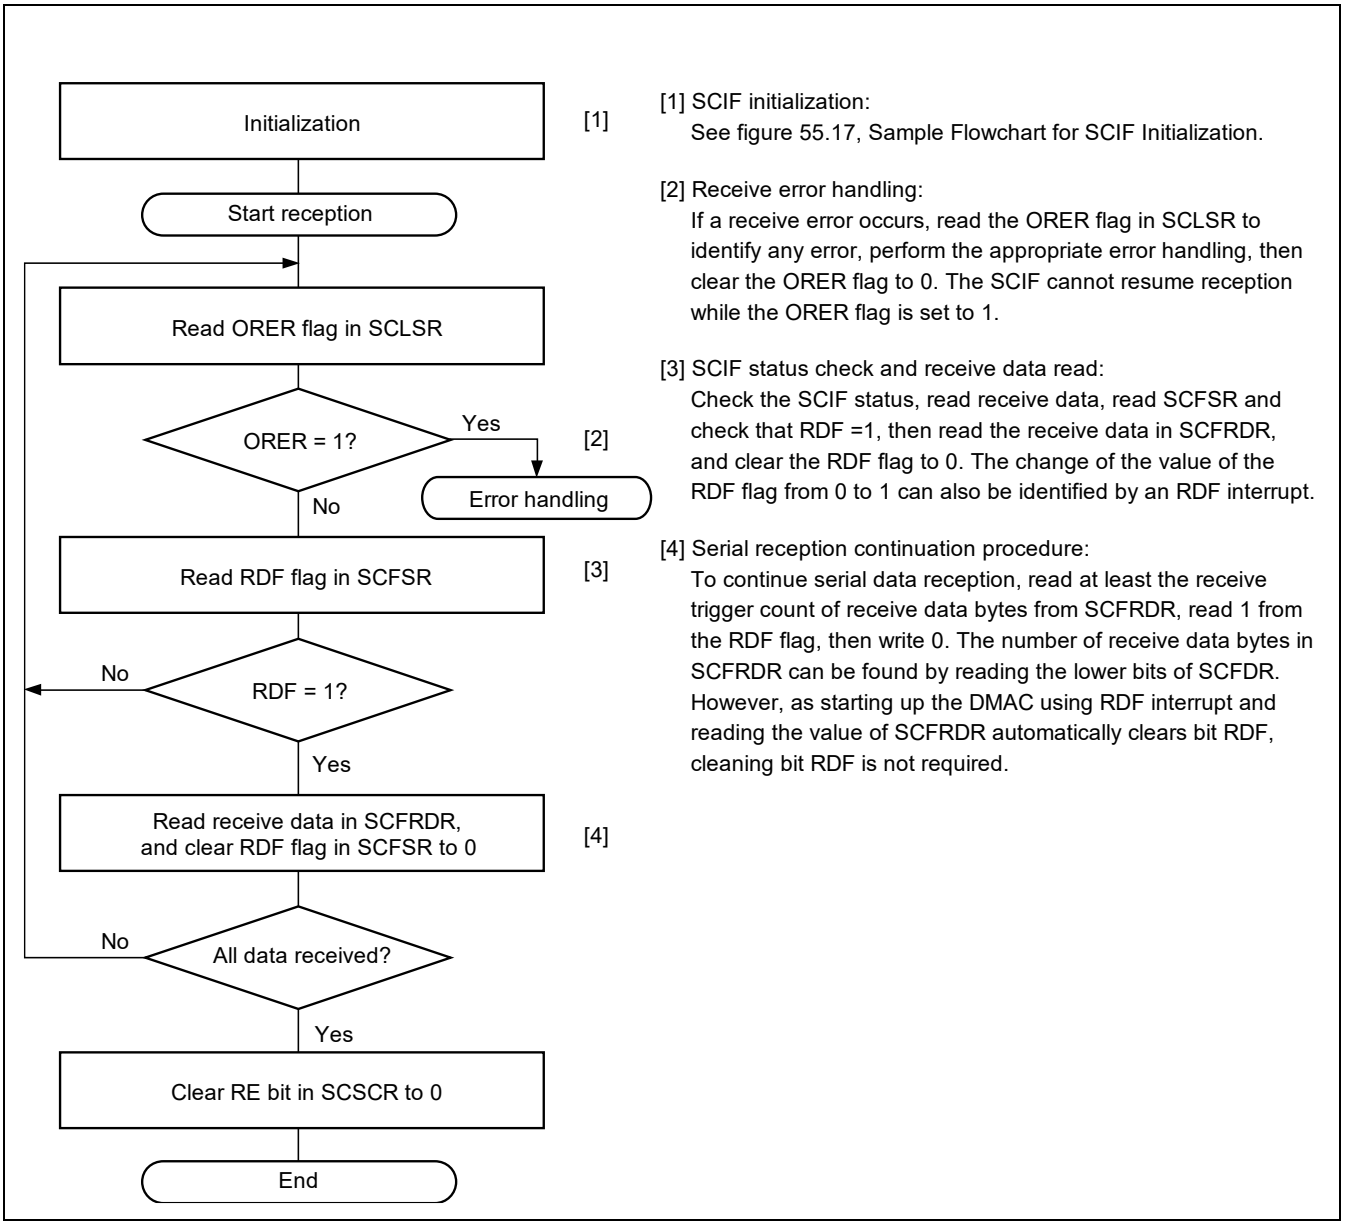

Figure 105.20 Sample Flowchart for Serial Data Reception

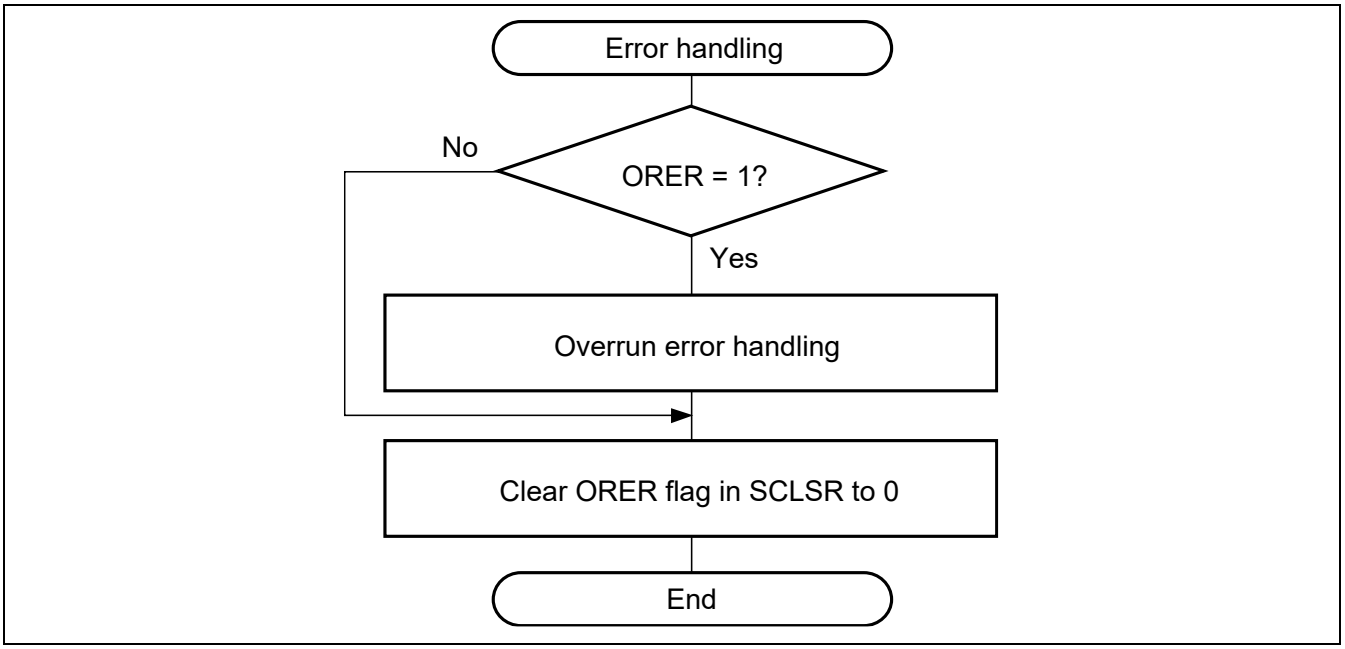

Figure 105.21 Sample Flowchart for Serial Data Reception

In serial data reception, the SCIF operates as described below:

1. The SCIF starts receiving data in synchronization with synchronization clock input or output.
2. The SCIF stores receive data in SCRSR in LSB-to-MSB order.
   After receiving the data, the SCIF first checks if the receive data can be transferred from SCRSR to SCFRDR, then starts storing the receive data in SCFRDR.
   If the SCIF detects an overrun error, the SCIF cannot receive subsequent data.
3. If the RDF flag changes to 1 while the RIE bit in SCSCR is 1, a receive-FIFO-data-full interrupt (RDF) request occurs. If the ORER flag changes to 1 while the RIE or REIE bit in SCSCR is 1, a break interrupt (BRI) request occurs.

Figure 105.22 shows an example of SCIF reception in clock synchronous mode.

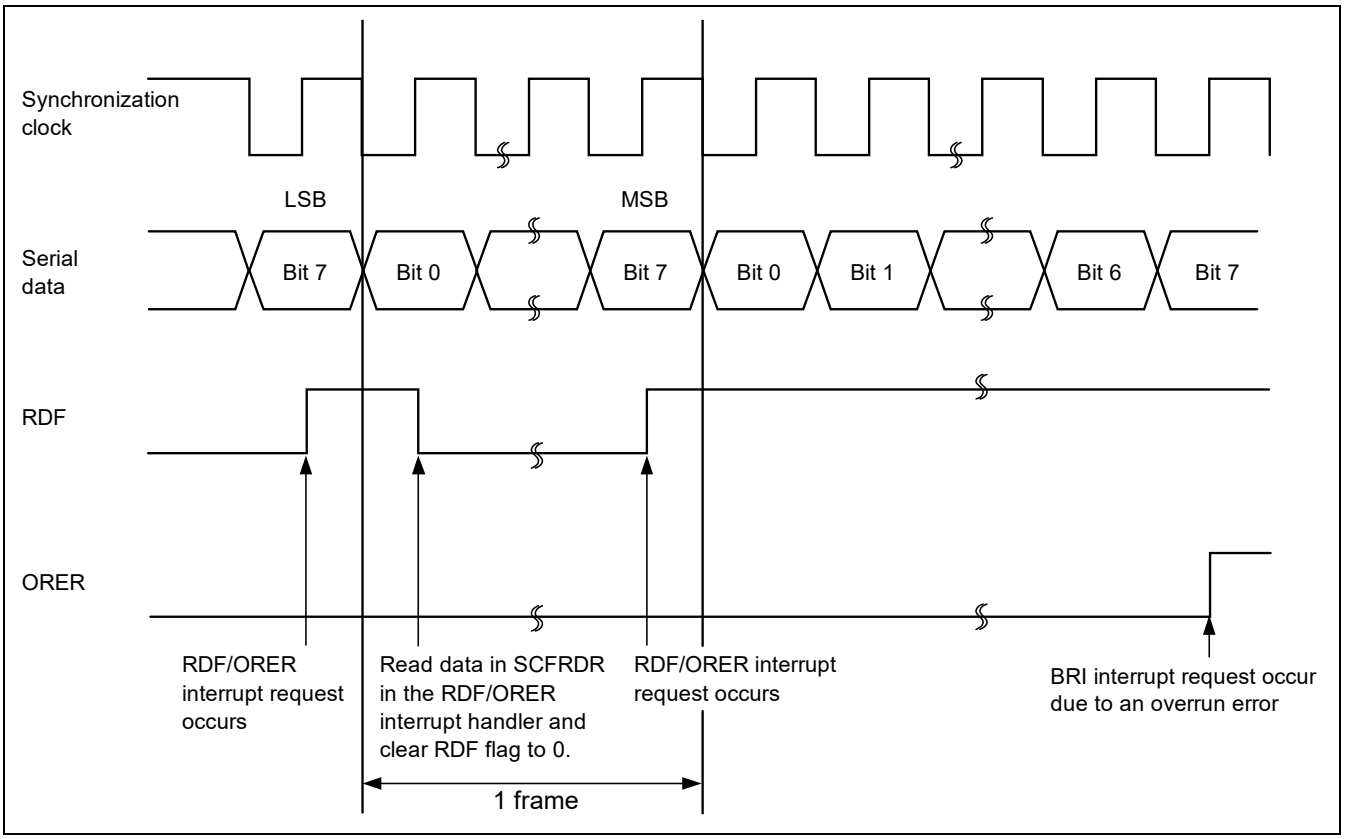

Figure 105.22 Example of SCIF Reception in Clock Synchronous Mode

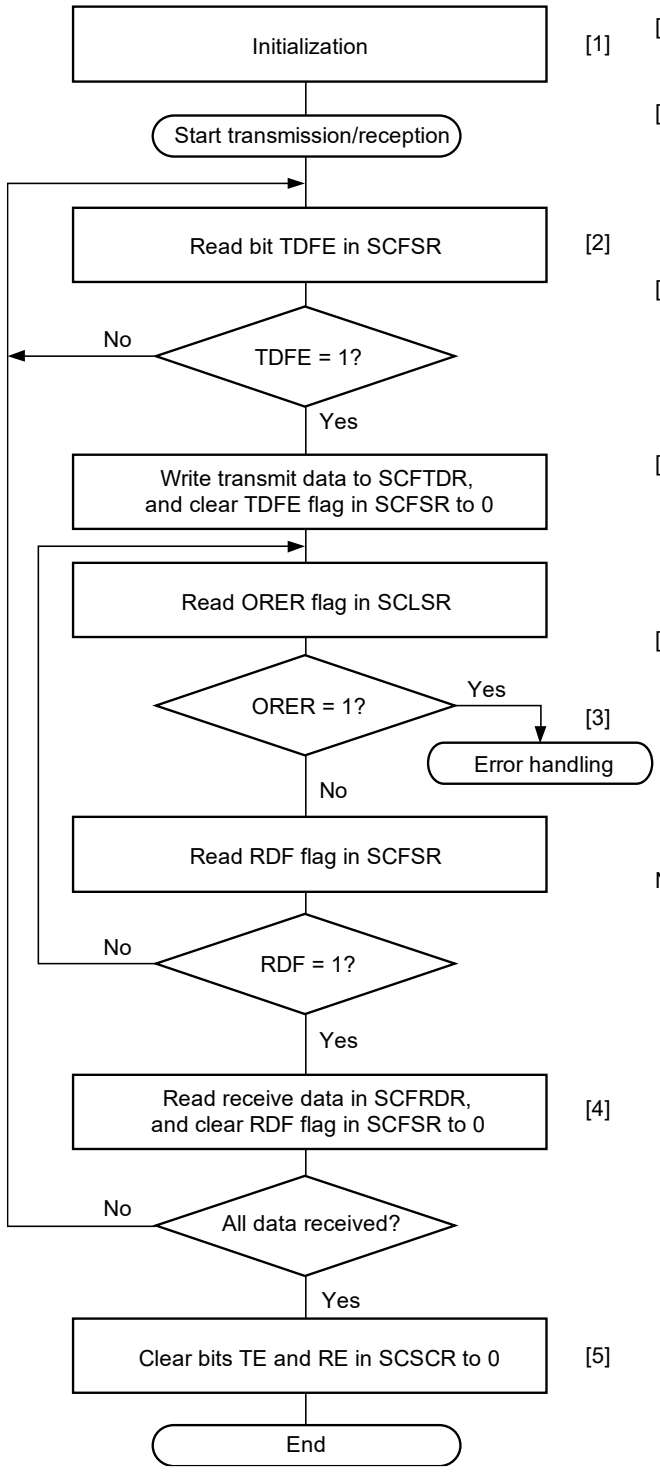
(d) Simultaneous Serial Data Transmission/Reception (Clock Synchronous Mode)

Figure 105.23 shows a sample flowchart for simultaneous serial data transmission/reception.

The SCIF transmission and reception should be enabled before taking the following steps for simultaneous serial data transmission/reception.



[1] SCIF initialization:
See figure 55.17, Sample Flowchart for SCIF Initialization.

[2] SCIF status check and write for transmit data:
Read SCFSR and check that the TDFE flag is set to 1, then write transmit data to SCFTDR, and clear the TDFE flag to 0. The change of the value of the TDFE flag from 0 to 1 can also be identified by a TDFE/TEND interrupt.

[3] Receive error handling:
If a receive error occurs, read the ORER flag in SCLSR, perform the appropriate error handling, then clear the ORER flag to 0. The SCIF cannot resume reception while the ORER flag is set to 1.

[4] SCIF status check and read for receive data:
Read SCFSR and check that RDF =1, then read the receive data in SCFRDR, and clear the RDF flag to 0. The change of the value of the RDF flag from 0 to 1 can also be identified by an RDF interrupt.

[5] Serial transmission and reception continuation procedure:
To continue serial data transmission and reception, read RDF flag and SCFRDR, and finish clearing the RDF flag to 0 before receiving the MSB in the current frame.
Similarly, read 1 from the TDFE flag to confirm that writing is enabled before transmitting the MSB in the current frame.
Then write data to SCFTDR and clear the TDFE flag to 0.

Note : When switching from transmission or reception to simultaneous transmission and reception, clear bits TE and RE to 0, and then set them to 1 simultaneously.

Figure 105.23 Sample Flowchart for Simultaneous Serial Data Transmission/Reception

105.3.3 Generation of Internal Clock

Internal clock generated by the on-chip baud rate generator.
Baud rate is determined by the SCBRR and CKS[1:0] bit in SCSMR.

[Asynchronous mode]

$$N = \frac{PCK}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

[Clock synchronous mode]

$$N = \frac{PCK}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)

N: SCBRR setting for the baud rate generator ($0 \leq N \leq 255$) (which satisfies the electrical characteristics)

PCK: Peripheral module operating frequency (MHz)

n: Baud rate generator input clock (n = 0, 1, 2, 3)
(See the Table 105.8 for the relation between n and the clock.)

Table 105.8 SCSMR Settings

n	Clock	SCSMR.CKS[1:0] Setting
0	PCK	00
1	PCK/4	01
2	PCK/16	10
3	PCK/64	11

The bit rate error in asynchronous mode is determined by the following equation:

$$\text{error (\%)} = \left\{ \frac{PCK \times 10^6}{(N+1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

105.3.4 Baud Rate Generator for External Clock (BRG)

(1) Overview

The SCIF incorporates a baud rate generator for external clock (abbreviated as BRG, hereafter). The BRG supplies a sampling clock (BRGCLK) to the SCIF core by dividing the external clock SC_CLK (selectable between SCIF_CLK and SCKi) by 1 to 216 – 1. In addition, the BRG switches the output between the external clock SCK and divided clock.

Figure 105.24 shows a block diagram of the BRG.

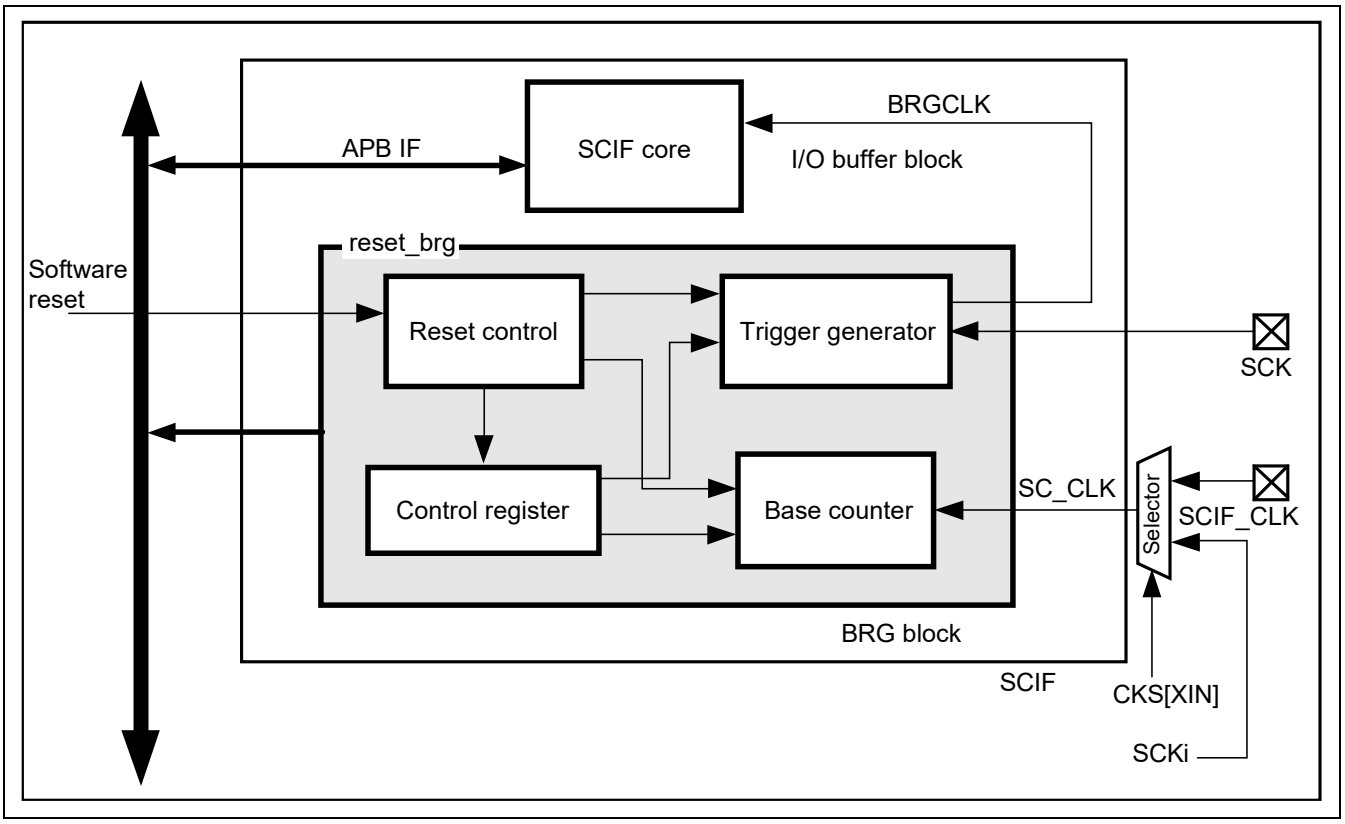


Figure 105.24 BRG Block Diagram

(a) Reset Controller:

The reset controller handles resetting the control register, base counter, and trigger generator.

(b) Control Register:

The control register has the frequency division register and clock select register.

(c) Base Counter:

The base counter is a 16-bit CLK synchronization counter that is used to determine the timing for generating a frequency divided clock.

(d) Trigger Generator:

The trigger generator generates rising-edge/falling-edge triggers for a frequency divided clock with the timing according to values of the frequency division register and base counter. The triggers are used to generate the frequency divided clock. In addition, the trigger generator switches the output between the SCK (external clock input) and frequency divided clock.

(2) Registers

To set baud rate requires setting to Frequency Division Register (DL) and Clock Select Register (CKS).

(3) Frequency Division Register (DL)

To set a division value of frequency requires setting to Frequency Division Register (DL).

Refer to Frequency Division Register (DL).

Table 105.9 shows reference values of Frequency Division Register (DL).

Table 105.9 Baud Rate (3.6864-MHz clock)

Baud Rate	Value of Frequency Division	Error Rate (*)
50	4608	—
75	3072	—
110	2095	–0.022
134.5	1713	0.001
150	1536	—
300	768	—
600	384	—
1200	192	—
1800	128	—
2000	115	0.174
2400	96	—
3600	64	—
4800	48	—
7200	32	—
9600	24	—
14400	16	—
19200	12	—
38400	6	—
76800	3	—
115200	2	—

Note: —: Indicates that the error rate is 0.

(4) Clock Select Register (CKS)

To set output between the frequency divided clock and specifies a source clock for the external baud rate requires setting to Clock Select Register (CKS).

Refer to Clock Select Register (CKS).

(5) Restrictions in BRG

Notes on Setting Frequency Division Register

1. For the initial setting of the register after a reset, at least one bit of waiting period is required to secure the clock stabilization time.
   (Example) One bit period when DL = 2

   $$3.68\ (\text{MHz}) \times 1/2 \times 1/16 = 0.115\ (\text{MHz}) \rightarrow 8695\ (\text{ns})$$

2. For modifying the register value after the setting stated in <1> above, at least one bit of waiting period at the maximum bit rate (DL = '65535') is required.
   The SCIF registers and BRG registers should be set as the following table:

- Asynchronous mode (SC_CLK external input)

SCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
SCSMR.C/A#	B'0	CKS	H'0000
SCSCR.CKE[1:0]	B'10	DL	H'0001 to H'FFFF

- Asynchronous mode (SCK external input)

SCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
SCSMR.C/A#	B’0	CKS	H’8000
SCSCR.CKE[1:0]	B’10	DL	Don’t care

- Clock synchronous mode (external input)

SCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
SCSMR.C/A#	B’1	CKS	H’8000
SCSCR.CKE[1:0]	B’10	DL	Don’t care

- Asynchronous mode (SC_CLK internal input)

SCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
SCSMR.C/A#	B’0	CKS	H’4000
SCSCR.CKE[1:0]	B’10	DL	H’0001 to H’FFFF

3. The register settings for the baud rate generator for external clock should be made before starting initialization of the SCIF.

105.3.5 SCIF Interrupt Sources and the DMAC

If the DMAC is used for transmission/reception, set and enable the DMAC before setting the SCIF.

Transmission Interrupts and DMA Transfer:

If the TDFE/TEND flag in SCFSR is set to 1 when the TDFE/TEND interrupt is enabled by the TIE bit, a TDFE/TEND interrupt request and a transmit-FIFO-data-empty DMA transfer request will occur. If the TDFE/TEND flag is set to 1 when TDFE/TEND interrupt is disabled by the TIE bit, only the transmit-FIFO-data-empty DMA transfer request will occur. (A transmit-FIFO-data-empty DMA transfer request is generated when the TDFE flag is set while TEIE is 0, or when the TEND flag is set while TEIE is 1. DMA transfer requests are not affected by the TEIE bit.)

When TDFE/TEND interrupt requests are enabled, the interrupt requests are cleared by the DMAC regardless of the interrupt handling program.

Reception Interrupts and DMA Transfer:

If the RDF/DR flag in SCFSR is set to 1 when RDF/DR interrupt is enabled by the RIE bit, an RDF/DR interrupt request occurs. If the RDF/DR flag is set to 1, a receive-FIFO-data-full DMA transfer request occurs. If the RDF/DR flag is set to 1 when RDF/DR interrupt is disabled by the RIE bit, and only a receive-FIFO-data-full DMA transfer request occurs and DMAC can be activated to perform data transfer.

Setting the RIE bit in SCSCR to 0 and the REIE it to 1 generates the ER/BRK/ORER interrupt requests without generating RDF/DR interrupt requests. When the BRK flag in SCFSR or the ORER flag in SCLSR is set to 1, BRK/ORER interrupt requests occur.

If the TO flag is set to 1 in SCLSR when TO interrupts are enabled by the TOIE bit, TO interrupt requests occur.

DR/TO interrupt requests generated by setting the DR or TO flag to 1 or receive-FIFO-data-full DMA transfer requests occur only in asynchronous mode.

When DR/TO interrupt requests are enabled to be issued, interrupt requests generated by the DR flag are cleared by the DMAC regardless of the interrupt handling program, however, those generated by the TO flag are not cleared by the DMAC. Therefore, the TO flag interrupt requests need to be cleared with the interrupt handling program. (The DR and TO flags are set at the same time, but cleared separately.)

Table 105.10 SCIF Interrupt Sources

Interrupt Source	DMAC Activation	Priority on Reset Release
Interrupts generated by receive error flag (ER)	Disabled	High
Interrupts generated by receive-FIFO-data-full (RDF), receive-data-ready (DR) or timeout (TO) *	Enabled	↕
Interrupts generated by break (BRK) or overrun error (ORER)	Disabled	
Interrupts generated by transmit FIFO data empty (TDFE)	Enabled	Low

Note: * RXI interrupts by means of the DR or TO flag are available only in asynchronous mode.

105.4 Usage Notes

105.4.1 Break Detection and Operation

Break signals can also be detected by reading the RX pin value directly when a framing error (FER) is detected. In the break state, the input values from the RX pin are all 0s. So, the parity error flag (PER) may be set after the FER flag is set to 1.

Although the SCIF stops receive data transfer to SCFRDR after detecting a break, it continues data reception.

105.4.2 Sending a Break Signal

The input/output condition and level of the TX pin are determined by the SPB2IO and SPB2DT bits in SCSPTR. This enables to send a break signal.

The pin does not function as the TX pin from the initialization of the serial transmitter to setting of the TE bit (enabling transmission). In this period, the marked state is substituted by the value of the SPB2DT bit. Therefore, the SPB2IO and SPB2DT bits should be set to 1 (designating output and high level) beforehand.

To send a break signal during serial transmission, clear the SPB2DT bit to 0 (low level), and then clear the TE bit to 0 (halting transmission). When the TE bit is cleared, the transmitter is initialized regardless of the current transmission state, and the TX pin outputs 0.

105.4.3 Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCIF operates on the base clock with a frequency 16 times the bit rate.

In reception, the SCIF performs the internal synchronization by sampling the fall edge of the start bit using the base clock. In addition, the SCIF takes receive data at the rising edge of the eighth pulse on the base clock.

Figure 105.25 shows the timing of this operation.

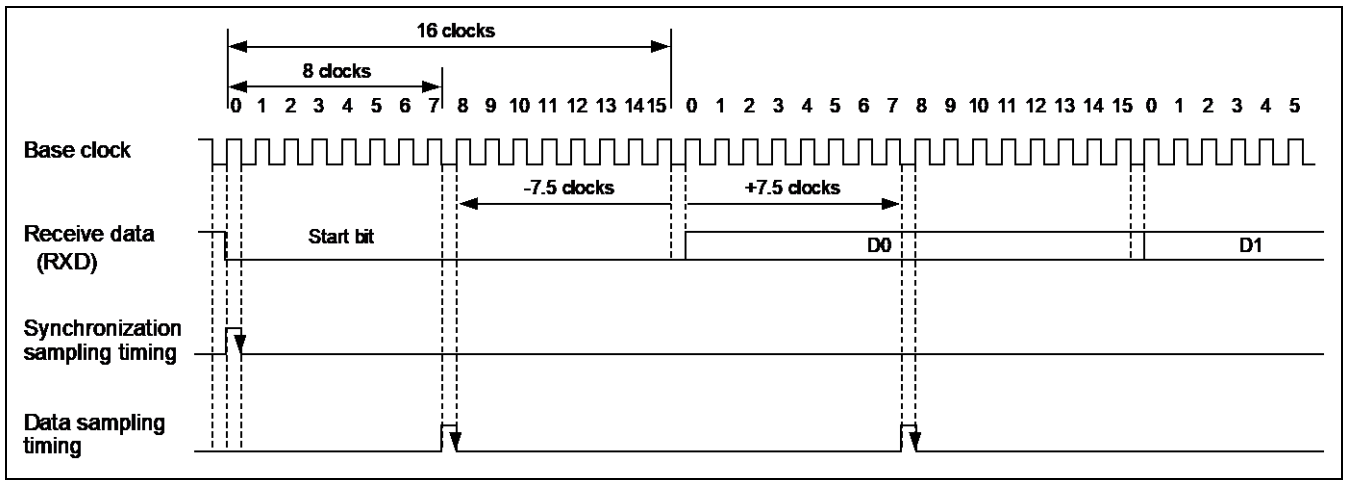

Figure 105.25 Timing Chart of Receive Data Sampling

The reception margin in asynchronous mode is given by formula (1).

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\% \quad \text{..... Expression (1)}$$

M: Receive margin (%)

N: Ratio of bit rate to clock (N = 16)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute value of clock frequency deviation

Assuming F = 0 and D = 0.5 for expression (1), the reception margin obtained with expression (2) is 46.875% as shown below:

Assuming D = 0.5 and F = 0

M = (0.5 − 1/ (2 × 16)) × 100%

= 46.875% ……expression (2)

This is a theoretical value. A reasonable margin allowed in system designs is 20% to 30%.

105.4.4 Reception Margin and Baud Rate Error

The value of 46.875% obtained by the above expression (2) indicates the reception margin when the baud rate error is 0 (F = 0). If there is no error in the reception and transmission baud rates, reception is possible even with misalignment of approx. 1/2 bit. If there is an error in the reception and transmission baud rates, the errors are accumulated up to the stop bit reception, which reduces the reception margin. The allowable baud rate error can be obtained by modifying the F in expression (1). When D= 0.5:

F = {(15/32 − M)/ (L − 0.5)} × 100 (%)……expression (3)

By using expression (3), the relationship between the allowable error and reception margin with the frame length = 12 can be summarized as follows:

Allowed Error (%)	Reception Margin (%)
4.07	0
3.64	5
3.20	10
2.33	20
1.46	30

105.5 Safety Mechanisms

SCIF module has no mechanism of FuSa.

106. High Speed Serial Communication Interface with FIFO (HSCIF)

106.1 Overview

The fourth generation R-Car series products have a high speed serial communication interface with built-in FIFO buffers (high-speed serial communication interface with FIFO: HSCIF) that handles asynchronous communication. The HSCIF has two 128-stage FIFO buffers separately for transmission and reception, which enables fast, efficient, and uninterrupted communication. R-Car V4M has 4 channels of HSCIF. All functions of each channel are same.

106.1.1 Features

The HSCIF has the following features.

- Asynchronous serial communication mode

  The HSCIF performs serial data communication based on a character-by-character asynchronous system. This feature enables serial data communication with standard asynchronous communication chips that support universal asynchronous receiver/transmitter (UART) or asynchronous communication interface adapter (ACIA). There is a choice of eight serial data transfer formats.

  — Data length: 7 or 8 bits
  — Stop bit length: 1 or 2 bits
  — Parity: Even/odd/none
  — Receive error detection: Parity, framing, and overrun errors
  — Break detection:

    A break is detected when a framing error lasts for more than 1 frame length at space 0 (low level).

    When a framing error occurs, a break can also be detected by reading the HRX pin level directly from the serial port register (HSSPTR).
  — Sampling rate: Variable (integer number from 8 to 32)
- Capable of full-duplex communication

  The HSCIF has an independent transmitter and receiver that enable simultaneous transmission and reception. The transmitter and receiver both have a 128-stage FIFO buffer structure, enabling continuous serial data transmission and reception.
- On-chip baud rate generator, enabling any bit rate to be selected

  The HSCIF enables choice of a clock source for transmission/reception: a clock from the on-chip baud rate generator based on the internal clock or an external clock.
- Eight interrupt sources

  The HSCIF has eight types of interrupt sources: receive-data-ready, receive-FIFO-data-full, break detection, transmit-FIFO-data-empty, transmit-end, receive-error, overrun-error and time-out, and enables any of them to be requested independently.
- DMA data transfer

  When the transmit FIFO register is empty or the receive FIFO register has received data, issuing a DMA transfer request activates the DMA controller (DMAC) to execute a data transfer.
- Modem control functions (HRTS# and HCTS#) are stored.
- The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available.

A receive data ready (DR) or a timeout error (TO) can be detected during reception.

Notes: 1. Only 0 can be written to clear the flags. Bits 15 to 8, 3, and 2 are read-only bits and cannot be modified.
2. Only 0 can be written to clear the flags. Bits 15 to 3, and 1 are read-only bits and cannot be modified.
3. The initial values of HSSPTR bits 6, 4, 2, and 0 are undefined.

Channel No.	Base Address
0	H'E654 0000
1	H'E655 0000
2	H'E656 0000
3	H'E66A 0000

106.2 Register Description

(include Safety Mechanism related register description)

106.2.1 Receive Shift Register (HSRSR)

HSRSR is a register that receives serial data.

The HSCIF sets serial data input to the HSRSR from the HRX pin in the order received, starting with the LSB (bit 0), and converts it to parallel data. When one byte of data has been received, it is transferred to the receive FIFO register HSFRDR, automatically.

HSRSR cannot be read from and written to by the CPU.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	—	—	—	—	—	—	—	—

106.2.2 Receive FIFO Data Register (HSFRDR)

HSFRDR is a 128-stage FIFO register that stores received serial data.

When HSCIF has received one byte of serial data, it transfers the received data from the receive shift register (HSRSR) to HSFRDR for storage, and reception is thus completed. HSRSR is then ready for reception, and is capable of receiving up to 128 consecutive bytes of data before HSFRDR is full.

HSFRDR is a read-only register and cannot be modified by the CPU. Note that the read value will be undefined while there is no receive data in HSFRDR. When HSFRDR is full of receive data, subsequent serial data is lost.

HSFRDR is read as an undefined value after a power-on reset.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R

106.2.3 Transmit Shift Register (HSTSR)

HSTSR is a register that transmits serial data.

To perform serial data transmission, the HSCIF first transfers transmit data from the transmit fifo data register (HSFTDR) to HSTSR, and then sends the data to the HTX pin starting with the LSB (bit 0). When transmission of one byte is completed, the HSCIF transfers the next transmit data from HSFTDR to HSTSR automatically, then starts transmission.

HSTSR cannot be read from and written to directly by the CPU.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	—	—	—	—	—	—	—	—

106.2.4 Transmit FIFO Data Register (HSFTDR)

HSFTDR is an 8-bit FIFO register of 128 stages that stores data for serial transmission.

If HSTSR is empty after transmit data has been written to HSFTDR, the HSCIF transfers the data from HSFTDR to HSTSR and starts serial transmission.

HSFTDR is a write-only register and cannot be read from by the CPU. Writing further data to HSFTDR is no longer possible when it is full. Attempts at writing data to the register in this situation are ignored.

HSFTDR is read as an undefined value on a power-on reset.

Bit:	7	6	5	4	3	2	1	0
Initial value:	—	—	—	—	—	—	—	—
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB

106.2.5 Serial Mode Register (HSSMR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHR	PE	O/E#	STOP	—	CKS[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W

HSSMR is a 16-bit register that sets the HSCIF's serial transfer format and selects the baud rate generator clock source.

HSSMR can always be read from and written to by the CPU.

HSSMR is initialized to H'0000 by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	CHR	0	R/W	Character Length Selects 7 or 8 bits for data length. When the 7-bit data is selected, the MSB (bit 7) in the transmit FIFO data register (HSFTDR) is not transmitted. 0: 8 bits 1: 7 bits
5	PE	0	R/W	Parity Enable Determines whether parity bit is added in transmission or not, and parity bit is checked in reception or not. When bit PE is set to 1, the parity (even or odd) specified by bit O/E# is added to transmit data. In reception, the parity bit is checked for the parity (even or odd) specified by bit O/E#. 0: Disables parity bit addition and check. 1: Enables parity bit addition and check.
4	O/E#	0	R/W	Parity Mode Selects either even or odd parity to use in parity addition and check. The O/E# bit setting is valid only when bit PE is set to 1, enabling parity bit addition and check. 0: Even parity 1: Odd parity When even parity is set, the parity bit is added in transmission so that the total number of 1-bit in the transmit character plus the parity bit is even. In reception, a check is performed to see if the total number of 1-bit in the receive character plus the parity bit is even. When odd parity is set, the parity bit is added in transmission so that the total number of 1-bit in the transmit character plus the parity bit is odd. In reception, a check is performed to see if the total number of 1-bit in the receive character plus the parity bit is odd.
3	STOP	0	R/W	Stop Bit Length Selects 1 bit or 2 bits as the stop bit length. In reception, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit. If it is 0, it is treated as the start bit of the next transmits character. 0: 1 stop bit*1 1: 2 stop bits*2 Notes: 1. In transmission, high level of 1 bit (stop bit) is added to the end of a transmit character before it is sent. 2. In transmission, high level of 2 bits (stop bits) are added to the end of a transmit character before it is sent.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CKS[1:0]	00	R/W	Clock Select 1 and 0 These bits select the clock source for the on-chip baud rate generator. The clock source can be selected from Internal clock, Internal clock/4, Internal clock/16, and Internal clock/64, according to the setting of bits CKS [1:0]. 00: Internal clock 01: Internal clock/4 10: Internal clock/16 11: Internal clock/64

106.2.6 Serial Control Register (HSSCR)

HSSCR is a register that enables or disables transmission/reception by the HSCIF, enables or disables interrupt requests, and selects transmission/reception clock source for the HSCIF.

HSSCR can always be read from and written to by the CPU.

HSSCR is initialized to H'0000 by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOT[1:0]		—	—	TEIE	—	—	—	TIE	RIE	TE	RE	REIE	TOIE	CKE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TOT[1:0]	00	R/W	Set the time for a data ready (DR) or a timeout (TO) to be set in asynchronous mode. 00: 15 etu* 01: 31 etu 10: 47 etu 11: 63 etu Note: * ETU: Elementary Time Unit (time for transfer of one bit) Equivalent to 1.5 frames with an 8-bit, 1-stop-bit format.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	TEIE	0	R/W	Transmit End Interrupt Enable When a transmit-end request is enabled by the TIE bit, the TEIE bit selects the source of the transmit end interrupt request from the following: • Setting the TDFE flag in HSFSR • Setting the TEND flag in HSFSR 0: The transmit FIFO data empty (TDFE) interrupt request is used. 1: The transmit end (TEND) interrupt request is used.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	TIE	0	R/W	Transmit Interrupt Enable Enables or disables a transmit-FIFO-data-empty interrupt (TDFE) request when the TEIE bit in HSSCR is pulled 0, if all of the following conditions are satisfied: • Serial transmit data has been transferred from HSFTDR to HSTSR. • The number of data bytes in HSFTDR is equal to or less than the transmit trigger count. • The TDFE flag in HSFSR is set to 1. Enables or disables a transmit-end interrupt (TEND) request when the TEIE bit of HSSCR is set to 1, if both of the following conditions are satisfied: • Transmission was ended because there is no valid data in HSFTDR when the last bit of the transmit character in HSTSR was transmitted. • The TEND flag of HSFSR is set to 1. 0: When the TEIE bit is 0, disables transmit-FIFO-data-empty interrupt (TDFE) request. When the TEIE bit is 1, disables transmit-end interrupt (TEND) request. 1: When the TEIE bit is 0, enables transmit-FIFO-data-empty interrupt (TDFE) request. When the TEIE bit is 1, enables transmit-end interrupt (TEND) request.

Bit	Bit Name	Initial Value	R/W	Description
6	RIE	0	R/W	Receive Interrupt Enable Enables or disables a receive-FIFO-data-full interrupt request when the RDF flag in HSFSR is set to 1, a receive-data-ready interrupt request when the DR flag in HSFSR is set to 1, a receive-error interrupt request when the ER flag in HSFSR is set to 1, a break interrupt request when the BRK flag in HSFSR is set to 1, and an overrun error interrupt request when the ORER flag in HSLSR is set to 1. 0: Disables receive-FIFO-data-full interrupts (RDF) requests, receive-data-ready interrupt (DR) requests, receive-error interrupt (ER) requests, break interrupt (BRK) requests, and overrun error interrupt (ORER) requests. 1: Enables receive-FIFO-data-full interrupt (RDF) requests, receive-data-ready interrupt (DR) requests, receive-error interrupt (ER) requests, break interrupt (BRK) requests, and overrun error interrupt (ORER) requests.
5	TE	0	R/W	Transmit Enable Enables or disables the start of HSCIF serial transmission. The HSCIF starts serial transmission when transmit data is written to the HSFTDR while TE is 1. Before setting TE to 1, set HSSMR and HSFCR to specify the transmission format and reset the transmit FIFO. 0: Disables transmission. 1: Enables transmission.
4	RE	0	R/W	Receive Enable Enables or disables the start of HSCIF serial reception. When RE is 1, the HSCIF starts serial reception by detecting a start bit. Before setting RE to 1, set HSSMR and HSFCR to specify the reception format and reset the receive FIFO. 0: Disables reception.* 1: Enables reception. Note: * Even if RE is cleared to 0, the DR, ER, BRK, RDF, FER, PER, TO and ORER flags are not affected, and retain their states.
3	REIE	0	R/W	Receive Error Interrupt Enable Enables or Disables generation of receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests. 0: Disables receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests.* 1: Enables receive-error interrupt (ER) requests, break interrupt (BRK) requests and overrun-error interrupt (ORER) requests. Note: * When REIE is 1, ER, BRK or ORER interrupt requests will occur even if RIE is cleared to 0. This setting is used to notify the interrupt controller of ER, BRK, and ORER interrupt requests during DMAC transfer.
2	TOIE	0	R/W	Timeout Interrupt Enable Enables or disables generation of timeout interrupt (TO) requests when the TO flag in HSLSR is set to 1. 0: Disables timeout interrupts (TO). 1: Enables timeout interrupts (TO).

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CKE[1:0]	00	R/W	Clock Enable 1 and 0 See Table 106.3 for the bit settings.

Table 106.3 Clock Selection

CKE[1]	CKE[0]	Clock Source	HSCK Pin
0	0	Internal clock (Internal clock, Internal clock/4, Internal clock/16, and Internal clock/64)	The HSCK pin is not used. The HSCK pin functions as an input pin (input signals are ignored). (Initial value)
0	1	Prohibited	—
1	0	Baud rate generator output for external clock or HSCK	When SC_CLK is selected: The HSCK pin is an input pin (input signals are ignored). Set the SC_CLK frequency so that the frequency of BRGCLK is multiplied by the sampling rate.
			When HSCK is selected: The HSCK pin inputs the clock (with the bit rate multiplied by the sampling rate).
	1	Prohibited	

Note: It is not allowed to set synchronous communication using SC_CLK for input.

106.2.7 Serial Status Register (HSFSR)

HSFSR is a 16-bit register. The lower 8 bits are status flags that indicate the operating status of the HSCIF, and the upper 8 bits are all reserved.

HSFSR can always be read from and written to by the CPU. However, the flags ER, TEND, TDFE, BRK, RDF, and DR cannot be written by 1. The FER and PER flags are read-only flags and cannot be modified.

HSFSR is initialized to H'0060 by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R	R	R/WC0	R/WC0

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ER	0	R/WC0	Receive Error Indicates that a framing error or a parity error has occurred in reception. The ER flag is not affected by an error and retains its previous state when the RE bit is 0 in HSSCR. If a receive error occurs, receive data will be transferred to HSFRDR and reception operation will be continued. Whether there is a receive error in data read from HSFRDR can be determined by the FER and PER bits in HSFSR. 0: Indicates that no framing or parity error has occurred in reception. [Clearing conditions] • A power-on reset is executed. • 0 is written to ER. 1: Indicates that a framing error or a parity error has occurred in reception. [Setting conditions] • The HSCIF checks whether the stop bit at the end of receive data is 1, but the stop bit is 0.* • The number of 1-bit in receive data plus the parity bit does not match the parity setting (even or odd) specified by the O/E# bit in HSSMR during reception. Note: * In the 2-stop-bit mode, only the first stop bit is checked that the value is 1; the second stop bit is not checked.
6	TEND	1	R/WC0	Transmit End Indicates that transmission has been ended because there was no valid data in HSFTDR when the last bit of the transmit character was transmitted. 0: Indicates that transmission is in progress. [Clearing conditions] • Transmit data is written to HSFTDR, and 0 is written to TEND. • Data is written to HSFTDR by the DMAC. 1: Indicates that transmission has been ended. [Setting conditions] • A power-on reset is executed. • The TE bit in HSSCR is 0. • There is no transmission data in HSFTDR when the last bit of a 1-byte serial transmission character is transmitted.

Bit	Bit Name	Initial Value	R/W	Description
5	TDFE	1	R/WC0	Transmit FIFO Data Empty Indicates that the HSCIF has transferred data from HSFTDR to HSTSR, the number of data bytes in HSFTDR becomes equal to or less than the transmit trigger count specified by the HSTTRGR, and HSFTDR is ready to be written by new transmit data. HSFTDR is a 128-byte FIFO register. The maximum number of bytes that can be written to when TDFE = 1 is "128 – [the transmit trigger count]". If data exceeding this value is attempted to be written, the data will be ignored. The number of data bytes in HSFTDR is indicated by the upper bits of HSFDR. If the number of data written in HSFTDR is equal to or less than the transmit trigger count, this bit will be set to 1 even if it is cleared to 0 after it is read as 1. 0: Indicates that the number of transmit data written to HSFTDR exceeds the transmit trigger count. [Clearing conditions] • Transmit data exceeding the specified transmit trigger count have been written to HSFTDR, and 0 is written to TDFE. • Transmit data exceeding the specified transmit trigger count have been written to HSFTDR by the DMAC. 1: Indicates that the number of transmit data in HSFTDR is equal to or less than the transmit trigger count. [Setting conditions] • A power-on reset is executed. • The number of transmit data in HSFTDR is equal to or less than the transmit trigger count after transmission.
4	BRK	0	R/WC0	Break Detect Indicates that a receive data break signal has been detected. If a break signal is detected, receive data (H'00) transfer to HSFRDR is stopped. After the break is canceled and the receive signal returns to 1, the receive data transfer resumes. 0: Indicates that no break signal has been received. [Clearing conditions] • A power-on reset is executed. • 0 is written to BRK. 1: Indicates that a break signal has been received. [Setting condition] • Data with a framing error is received, followed by the space "0" (low level) for at least one frame length.

Bit	Bit Name	Initial Value	R/W	Description
3	FER	0	R	Framing Error Indicates that a framing error has been found in the data that is to be read next from HSFRDR. 0: Indicates that there is no framing error in the receive data that is to be read from HSFRDR. [Clearing conditions] • A power-on reset is executed. • There is no framing error in the data that is to be read next from HSFRDR. 1: Indicates that there is a framing error in the receive data that is to be read from HSFRDR. [Setting condition] • There is a framing error in the data that is to be read next from HSFRDR.
2	PER	0	R	Parity Error This bit indicates that a parity error has been found in the data that is to be read next from HSFRDR. 0: Indicates that there is no parity error in the receive data that is to be read from HSFRDR. [Clearing conditions] • A power-on reset is executed. • There is no parity error in the data that is to be read next from HSFRDR. 1: Indicates that there is a parity error in the receive data that is to be read from HSFRDR. [Setting condition] • There is a parity error in the data that is to be read next from HSFRDR.

Bit	Bit Name	Initial Value	R/W	Description
1	RDF	0	R/WC0	Receive FIFO Data Full Indicates that the received data has been transferred from HSRSR to HSFRDR, and the number of receive data bytes in HSFRDR becomes equal to or more than the receive trigger count specified by the HSRTRGR. HSFRDR is a 128-byte FIFO register. When RDF = 1, data equal to or more than the number of receive trigger data bytes can be read. When HSFRDR is empty, HSFRDR is read as an undefined value. The number of receive data bytes in HSFRDR is indicated by the lower bits of HSFDR. If the number of data in HSFRDR is equal to or more than the trigger count, this bit will be set to 1 even if it is cleared to 0. At this time, read receive data until the number of data in HSFRDR is less than the trigger count, read RDF as 1, and then clear RDF. 0: Indicates that the number of receive data bytes in HSFRDR is less than the specified receive trigger count. [Clearing conditions] • A power-on reset is executed. • HSFRDR is read until the number of receive data bytes in HSFRDR is less than the receive trigger count, and 0 is written to RDF. • HSFRDR is read by the DMAC until the number of receive data bytes in HSFRDR is less than the receive trigger count. 1: Indicates that the number of receive data bytes in HSFRDR is equal to or more than the specified receive trigger count. [Setting condition] • Receive data more than the receive trigger count have been stored in HSFRDR.

Bit	Bit Name	Initial Value	R/W	Description
0	DR	0	R/WC0	Receive Data Ready Indicates that the receive FIFO data register (HSFRDR) contains fewer bytes than the trigger number for reception and no further data have arrived over at least the time corresponding to the setting of HSSCR[15:14]* since the stop bit for the byte to have been received. 0: Indicates that data is being received or has been successfully received, and there is no receive data in HSFRDR. [Clearing conditions] • A power-on reset is executed. • All the receive data in HSFRDR has been read, and 0 is written to DR. • All the receive data in HSFRDR has been read by the DMAC. 1: Indicates that no further receive data has been received. [Setting condition] The receive FIFO data register (HSFRDR) contains fewer bytes than the trigger number for reception and no further data have arrived over at least the time corresponding to the setting of HSSCR[15:14]* since the stop bit for the byte to have been received. Note: * When the setting is 00, the time is 15 etu. This is equivalent to 1.5 frames in an 8-bit, 1-stop-bit format. etu: Elementary Time Unit (time for transfer of one bit)

106.2.8 Bit Rate Register (HSBRR)

HSBRR is an 8-bit register that sets the serial transmission/reception bit rate in accordance with the baud rate generator operating clock selected by the CKS [1:0] bits in HSSMR. This baud rate generator is intended for Internal clock, Internal clock/4, Internal clock/16, and Internal clock/64, see section 106.3.2, Generation of Internal Clock.

For details on the baud rate generator for external clock, see section 106.3.3 Baud Rate Generator for External Clock (BRG).

HSBRR can always be read from and written to by the CPU except for during transfer.

HSBRR is initialized to H'FF by a power-on reset.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

106.2.9 Frequency Division Register (DL)

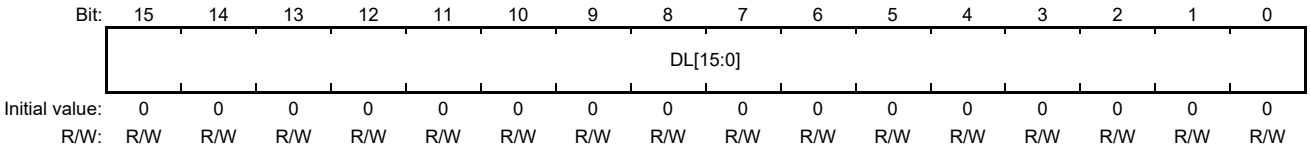
This register specifies the value of frequency division for the frequency divided clock generated by the BRG.

This register supports a 16-bit binary format that allows specifying a value in the range of 1 to 65535.

Setting all 0s in this register makes the BRG output the frequency divided clock at the low level.

The value of frequency division is given by the following formula:

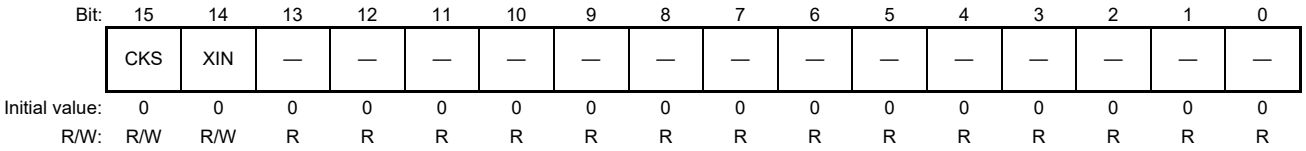
The value of frequency division = (clock input frequency)/ (required baud rate × sampling rate)



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	DL[15:0]	All 0	R/W	Specifies a division value of frequency clock generated in BRG. The setting value is enabled in the range of 1 to 65535.

106.2.10 Clock Select Register (CKS)

This register switches the output between the frequency divided clocks and specifies a source clock for the external baud rate.



Bit	Bit Name	Initial Value	R/W	Description
15	CKS	0	R/W	This bit switches the output between the frequency divided clock (SC_CLK) and external clock (HSCK). 0: Selects the frequency divided clock. 1: Selects the external clock.
14	XIN	0	R/W	Selects the baud rate generator clock source for the external clock between SCIF_CLK and Internal clock. 0: Selects the external clock (SCIF_CLK). 1: Selects the internal clock (Internal clock).
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

106.2.11 FIFO Control Register (HSFCR)

HSFCR is a register that resets data counts for transmit and receive FIFO registers. It also has a modem control and a loopback test enable bit.

HSFCR can always be read from and written to by the CPU except for during transfer.

HSFCR is initialized to H'0000 by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MCE	TFRST	RFRST	LOOP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

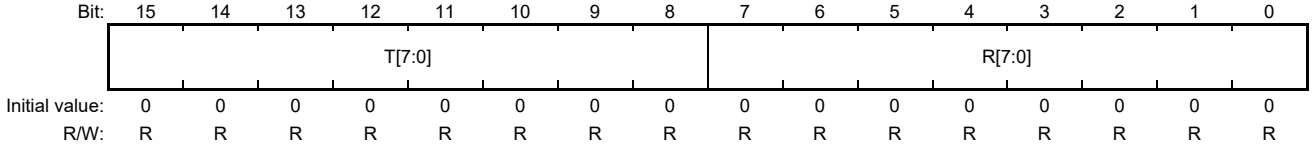
Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	MCE	0	R/W	Modem Control Enable Enables or disables modem control signals HCTS# and HRTS#. 0: Disables modem signals.* 1: Enables modem signals. Note: * HCTS# and HRTS# control ports.
2	TFRST	0	R/W	Transmit FIFO Data Register Reset Enables or disables a transmit FIFO data register reset that empties the register. 0: Disables the reset.* 1: Enables the reset. Note: * The register is reset by a power-on reset.
1	RFRST	0	R/W	Receive FIFO Data Register Reset Enables or disables a receive FIFO data register (HSFRDR) reset that empties the register. 0: Disables the reset.* 1: Enables the reset. Note: * The register is reset by a power-on reset.
0	LOOP	0	R/W	Loopback Test Enables or disables the loopback test by internally connecting the transmit output pin (HTX) and receive input pin (HRX), and the HRTS# pin and HCTS# pin. 0: Disables the loopback test. 1: Enables the loopback test.

106.2.12 FIFO Data Count Register (HSFDR)

HSFDR is a 16-bit register that indicates the number of data bytes stored in HSFTDR and that in HSFRDR.

The upper 8 bits indicate the number of transmit data bytes in HSFTDR, and the lower 8 bits indicates the number of receive data bytes in HSFRDR.

HSFDR can always be read by the CPU.



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	T[7:0]	H'00	R	These bits indicate the number of data bytes un-transmitted and still stored in HSFTDR. H'00 indicates that there is no transmit data in HSFTDR, and H'80 indicates that HSFTDR is full of transmit data.
7 to 0	R[7:0]	H'00	R	These bits indicate the number of receive data stored in HSFRDR. H'00 indicates that there is no receive data in HSFRDR, and H'80 indicates that HSFRDR is full of receive data.

106.2.13 Serial Port Register (HSSPTR)

HSSPTR controls multiplexed input/output and data on the high speed serial communication interface (HSCIF) ports. Bits 1 and 0 control breaks in serial transmission/reception by reading input data from the HRX pin and writing output data to the HTX pin. Bits 3 and 2 read input data from and write output data to the HSCK pin. Bits 5 and 4 read input data from and write output data to the HCTS# pin. Bits 7 and 6 read input data from and write output data to the HRTS# pin.

HSSPTR is a 16-bit register that can always be read from and written to by the CPU.

All HSSPTR bits except bits 6, 4, 2, and 0 are initialized to 0 by a power-on reset. The values of bits 6, 4, 2, and 0 are undefined.

Note: Whether modem control can be selected or not depends on the channel.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RTSIO	RTSDT	CTSIO	CTSDT	SCKIO	SCKDT	SPB 2IO	SPB 2DT
Initial value:	0	0	0	0	0	0	0	0	0	—	0	—	0	—	0	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	RTSIO	0	R/W	Serial Port – RTS Port Input/output Specifies input or output for the serial port HRTS# pin. To actually set the HRTS# pin as a port output pin to output the value set by the RTSDT bit, the MCE bit in HSFCR should be cleared to 0. 0: Indicates that this bit does not output the value of the RTSDT bit to the HRTS# pin. 1: Indicates that this bit outputs the value of the RTSDT bit to the HRTS# pin.
6	RTSDT	—	R/W*	Serial Port – RTS Port Data Specifies the input/output data level of the serial port HRTS# pin. Whether the pin is set for input or output is determined by the RTSIO bit. When the pin is set for output, the value of the RTSDT bit is output to the HRTS# pin. Regardless of the value of the RTSIO bit, the value of the HRTS# pin is read from the RTSDT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.
5	CTSIO	0	R/W	Serial Port – CTS Port Input/output Specifies input or output for the serial port HCTS# pin. To actually set the HCTS# pin as a port output pin to output the value set by the CTSDT bit, the MCE bit in HSFCR should be cleared to 0. 0: Indicates that the CTSDT bit value is not output to the HCTS# pin. 1: Indicates that the CTSDT bit value is output to the HCTS# pin.
4	CTSDT	—	R/W*	Serial Port – CTS Port Data Specifies the input/output data level of the serial port HCTS# pin. Whether the pin is set for input or output is determined by the CTSIO bit. When the pin is set for output, the value of the CTSDT bit is output to the HCTS# pin. Regardless of the value of the CTSIO bit, the value of the HCTS# pin is read from the CTSDT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.
3	SCKIO	0	R	Serial Port – Clock Port Input
2	SCKDT	—	R	Serial Port – Clock Port Data The initial value of this bit is undefined after a power-on reset.
1	SPB2IO	0	R/W	Serial Port – Break Input/output Specifies the output condition of the serial port HTX pin. To actually set the HTX pin as a port output pin to output the value set by the SPB2DT bit, the TE bit in HSSCR should be cleared to 0. 0: Indicates that the SPB2DT bit value is not output to the HTX pin. 1: Indicates that the SPB2DT bit value is output to the HTX pin.

Bit	Bit Name	Initial Value	R/W	Description
0	SPB2DT	—	R/W*	Serial Port – Break Data Specifies the input level of the serial port HRX pin and the output level of the HTX pin. The HTX pin output conditions are determined by the SPB2IO bit. When the HTX pin is set for output, the value of the SPB2DT bit is output to the HTX pin. Regardless of the value of the SPB2IO bit, the value of the HRX pin is read from the SPB2DT bit. The initial value of this bit is undefined after a power-on reset. 0: Indicates that the input/output data is low level. 1: Indicates that the input/output data is high level.

Note: * The value written to these bits can't be read because the value of the pin is read.

106.2.14 Line Status Register (HSLSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TO	—	ORER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC0	R	R/WC0

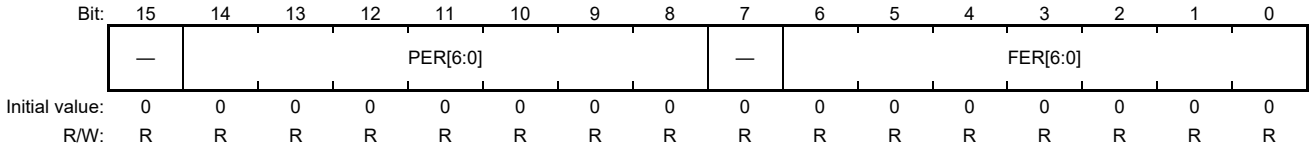
Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	TO	0	R/WC0	Timeout Indicates that the receive FIFO data register (HSFRDR) contains fewer bytes than the trigger number for reception and no further data have arrived over at least the time corresponding to the setting of HSSCR[15:14]* since the stop bit for the byte to have been received. 0: Indicates that data is being received or has been successfully received and that there is no receive data in HSFRDR. [Clearing conditions] • A power-on reset is executed. • All the receive data in the HSFRDR has been read, and 0 is written to TO. 1: Indicates that no further receive data has been received (receive timeout). [Setting condition] • The receive FIFO data register (HSFRDR) contains fewer bytes than the trigger number for reception and no further data have arrived over at least the time corresponding to the setting of HSSCR[15:14]* since the stop bit for the byte to have been received.* Note: * When the setting is 00, the time is 15 etu. This is equivalent to 1.5 frames in an 8-bit, 1-stop-bit format. etu: Elementary Time Unit (time for transfer of one bit)
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	ORER	0	R/WC0	Overrun Error Indicates that an overrun error has occurred in reception and abnormal termination is caused. If an overrun error occurs, the receive data prior to the overrun error is retained in HSFRDR and the data received subsequently is discarded. Any subsequent serial reception is disabled while the ORER flag is 1. To resume data reception after clearing the ORER flag, be sure to first read (or clear) data in the receive FIFO and handle the error, then clear the ORER flag. 0: Indicates that data is being received or has been successfully received. [Clearing conditions] • A power-on reset is executed. • 0 is written to ORER. 1: Indicates that an overrun error has occurred in reception. [Setting condition] • The next serial reception has been completed while HSFRDR is full of 128-byte data. Note: When bit RE in HSSCR is cleared to 0, the ORER flag is not affected and its previous state is retained.

106.2.15 Sampling Rate Register (HSSRR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRE	SRDE	—	—	SRHP[3:0]				—	—	—	SRCYC[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	SRE	0	R/W	Sampling Rate Register Enable (SRE) 0: Set the SRCYC [4: 0] bits to 15 (initial value). 1: Validates the setting of the SRCYC [4:0] bits.
14	SRDE	0	R/W	Sampling Point Register Enable (SRDE) 0: Invalidates the setting of the SRHP [3:0] bits and the sampling point will be (S+1)/2 for an odd sampling rate (S) and S/2 for an even sampling rate. 1: Validates the setting of the SRHP [3: 0] bits.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	SRHP[3:0]	0000	R/W	Sampling Point Register (SRHP) The sampling point can be moved by setting the SDRE bit to 1 and setting a value in these bits. Normally, the sampling point is the point of S/2 or (S+1)/2 for a sampling rate of S. By setting a signed 4-bit integer in these bits, the sampling point can be shifted by the amount of the specified sampling clock cycles. This will improve the receive margin. When setting a value in these bits, take notice that the sampling point does not become a negative value or it does not exceed the sampling rate. The shifted sampling point must satisfy the setup margin and hold margin.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	SRCYC[4:0]	01111	R/W	Bits 4 to 0: Sampling Rate Register (SRCYC) Data transfer at a desired sampling rate can be enabled by setting the SRE bit to 1 and setting a value in these bits. Set a value of "S - 1" in these bits for a sampling rate of S. Note that the sampling rate must be from 8 to 32 (a value from 7 to 31 can be set in these bits). Set these bits to 15 (initial value) when the SRE bit is set to 0.

106.2.16 Serial Error Register (HSRER)



Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	PER[6:0]	H'00	R	Parity Error Count These bits indicate the number of data items in which a parity error occurred in the receive data stored in the receive FIFO data register (HSFRDR). After the ER bit in HSFSR is set, the value in bits 14 to 8 will be the number of data items in which a parity error occurred. If all 128 bytes of receive data in HSFRDR have parity errors, bits PER [6:0] will have the value 0.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	FER[6:0]	H'00	R	Framing Error Count These bits indicate the number of data items in which a framing error occurred in the receive data stored in the receive FIFO data register (HSFRDR). After the ER bit in HSFSR is set, the value in bits 6 to 0 will be the number of data items in which a framing error occurred. If all 128 bytes of receive data in HSFRDR have framing errors, bits FER [6:0] will have the value 0.

106.2.17 RTS Output Active Trigger Register (HSRTGR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RSTRG[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	RSTRG[6:0]	H'0F	R/W	RTS Output Active Trigger Count The HRTS# signal goes high when the number of receive data items stored in the receive FIFO data register (HSFRDR) exceeds the value set in these bits. The initial value is 15.

106.2.18 Receive FIFO Data Count Trigger Register (HSRTRGR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RTRG[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	RTRG[6:0]	H'01	R/W	Receive FIFO Data Count Trigger These bits set the receive data item count at which the receive data full (RDF) flag in the serial status register (HSFSR) is set. The RDF flag is set when the number of receive data items stored in the receive FIFO data register (HSFRDR) equals or exceeds the value set in these bits. The initial value is 1.

106.2.19 Transmit FIFO Data Count Trigger Register (HSTTRGR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TTRG[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	TTRG[6:0]	H'08	R/W	Transmit FIFO Data Count Trigger These bits set the un-transmitted data item count at which the transmit FIFO data register empty (TDFE) flag in the serial status register (HSFSR) is set. The TDFE flag is set when the number of transmit data items in the transmit FIFO data register (HSFTDR) falls under the value set in these bits due to transmit operations. The initial value is 8.

106.3 Operation

106.3.1 Operation in Asynchronous Serial Communication Mode

In asynchronous serial communication mode, the HSCIF performs serial communication, in which data is transmitted or received in character units using the attached start bit indicating the start of communication and stop bit indicating the end of communication.

Figure 106.2 shows the general format for asynchronous serial communication.

In asynchronous serial communication, the transmission line is usually kept marked (high level). The HSCIF monitors the transmission line, and when it finds a space (low level), it regards the space as a start bit and starts serial communication.

One character in serial communication consists of a start bit (low level), followed by transmit/receive data (LSB-first; from the lowest bit), a parity bit (high or low level), and a stop bit (high level).

During reception in asynchronous mode, the HSCIF performs synchronization at the falling edge of the start bit. Transferred data is acquired at the center of each bit because the HSCIF samples on *S/2*th cycles of the clock which has a frequency of S times the bit rate, when the sampling rate as set in the sampling rate register (HSSRR) is S (if the sampling-rate setting is an odd number, the data is sampled on every *(S+1)/2*th pulse).

In addition, when the setting of the SRDE bit makes the setting of the sampling point bits effective, the point where the bits are latched can be intentionally moved from the centers of each bit.

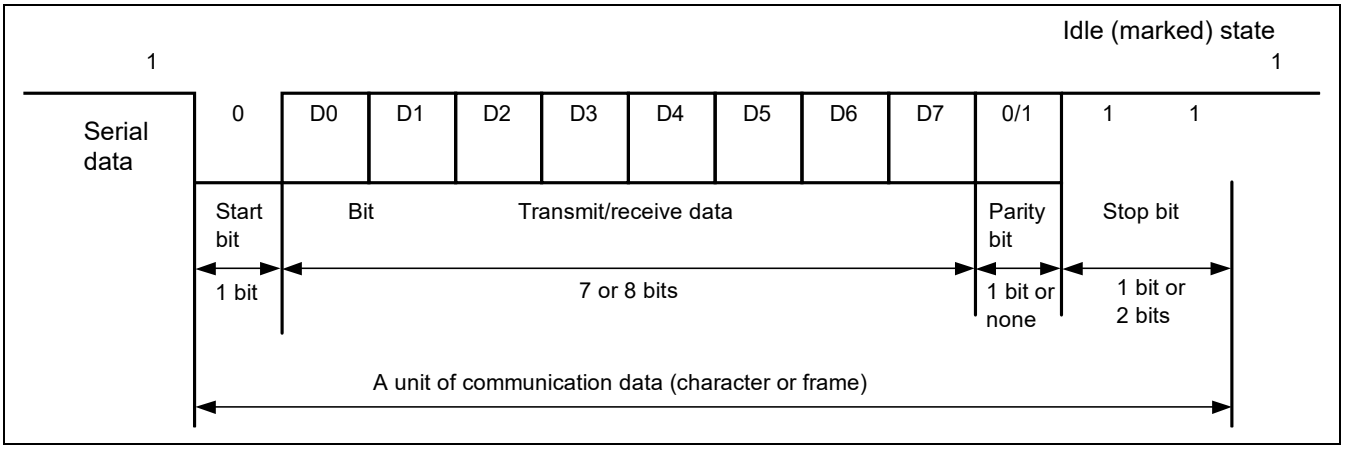


Figure 106.2 Data Format in Asynchronous Mode (Example of 8-Bit Data with Parity and Two Stop Bits)

(1) Transmission/reception format

Table 106.4 shows available data transfer formats. The HSCIF supports 8 transfer formats, which can be specified by HSSMR.

Table 106.4 Serial Transmission/Reception Formats (Asynchronous Mode)

SCSMR settings			Serial transmission/reception format and frame length											
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	S	8-bit data								STOP		
0	0	1	S	8-bit data								STOP	STOP	
0	1	0	S	8-bit data								P	STOP	
0	1	1	S	8-bit data								P	STOP	STOP
1	0	0	S	7-bit data								STOP		
1	0	1	S	7-bit data								STOP	STOP	
1	1	0	S	7-bit data								P	STOP	
1	1	1	S	7-bit data								P	STOP	STOP

[Legend]
S : Start bit
STOP : Stop bit
P : Parity bit

(2) Clock

The transfer clock can be selected from the following two clocks using the CKE[1:0] bits in HSSCR:

- Internal clock generated by the on-chip baud rate generator
- External clock generated by an external clock baud rate generator

(3) Data transmission/reception

(a) Initialization of HSCIF (asynchronous mode)

Before transmitting/receiving data or changing the operating mode or communication format, the HSCIF should be initialized using the sample flowchart for HSCIF initialization shown in Figure 106.3.

[Notes]

Clearing the TE bit to 0 initializes HSTSR. However, HSFSR, HSFTDR, and HSFRDR contents are retained even if the TE and RE bits are cleared to 0.

The TE bit should be cleared to 0 after all transmit data has been sent and the TEND flag has been set in HSFSR. The TE bit can be cleared to 0 during transmission, but the data being transmitted will enter the marked state after clearing. In addition, before setting the TE bit to 1 to restart the transmission, set the TFRST bit to 1 in HSFCR to reset HSFTDR.

When an external clock is used, do not stop the clock during operation or initialization. If stopped, the operation will be unreliable. Furthermore, when the baud rate generator for external clock is also to be used, be sure to make settings for it before starting initialization of the HSCIF.

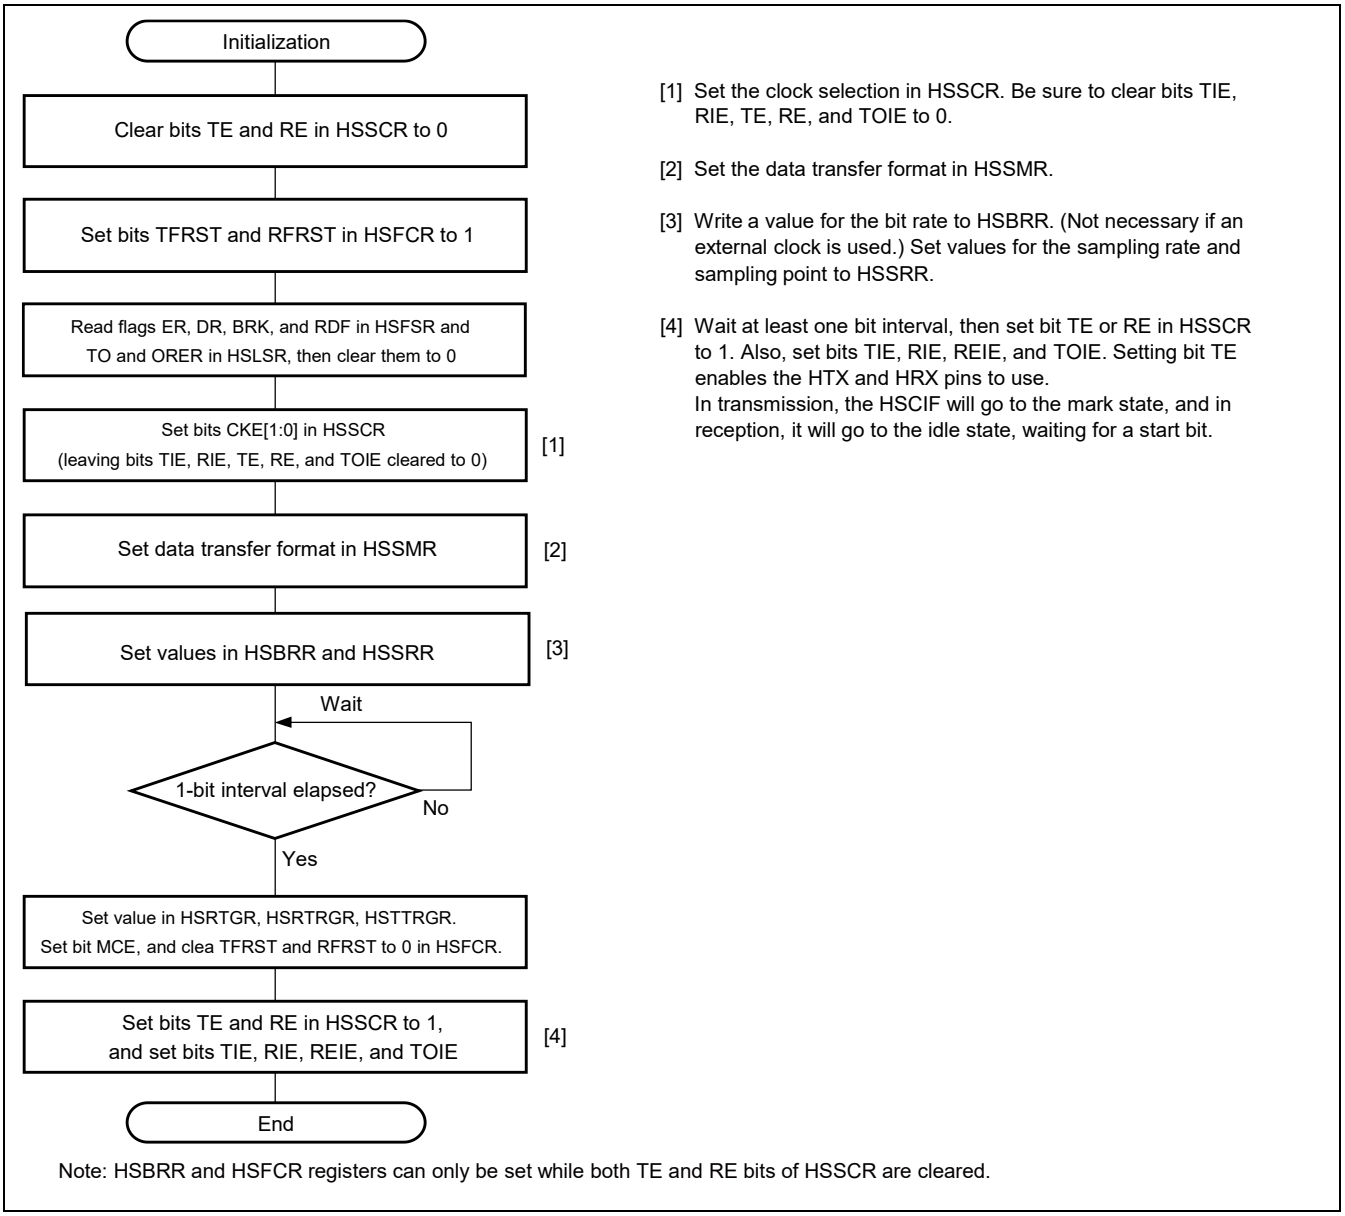

Figure 106.3 Sample Flowcharts for Initializing the HSCIF

(b) Serial data transmission (asynchronous mode)

Figure 106.4 shows a sample flowchart for serial transmission.

After the HSCIF transmission operation is enabled, serial data transmission can be performed using the following procedure:

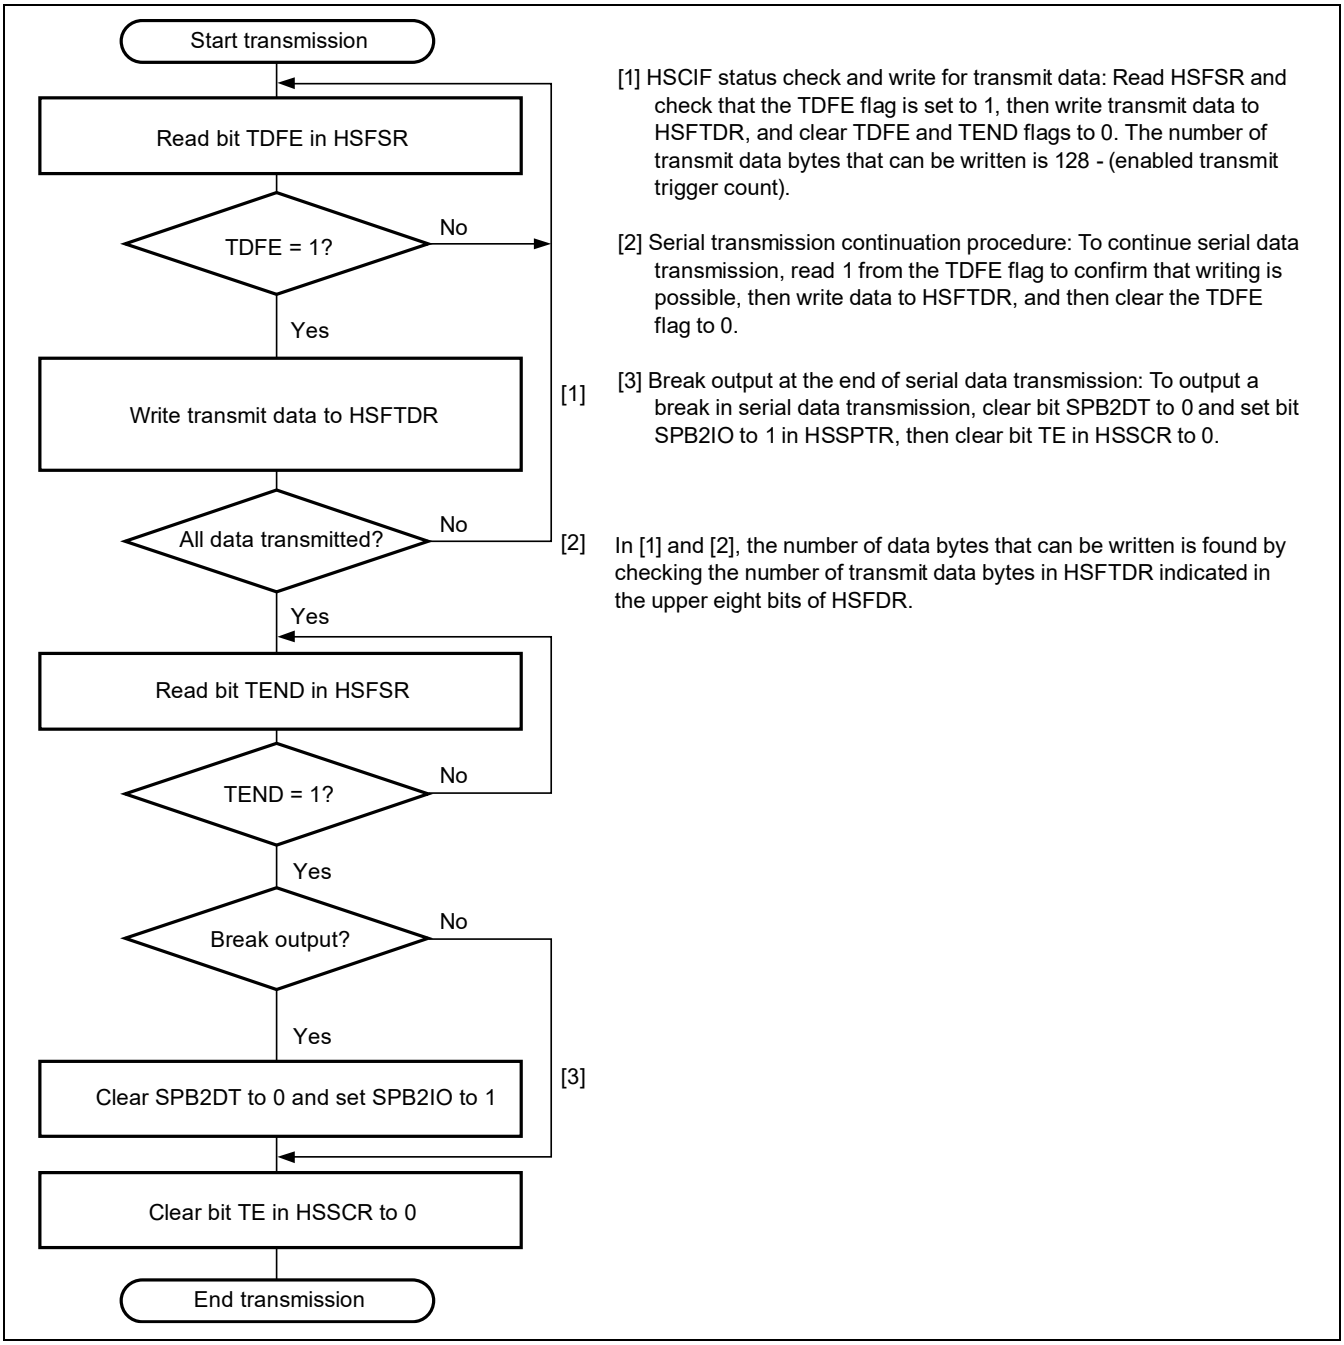

Figure 106.4 Sample Flowcharts for Serial Transmission

In serial transmission, the HSCIF operates as follows:

1. When data is written to HSFTDR, the HSCIF transfers the data from HSFTDR to HSTSR and starts transmitting. Confirm that the TDFE flag in HSFSR is set to 1 before writing transmit data to HSFTDR. The number of data bytes that can be written is at least 128 - (transmit trigger count).

2. When data is transferred from HSFTDR to HSTSR and the HSCIF starts transmission, consecutive transmission is performed until there is no transmit data left in HSFTDR. When the number of transmit data bytes in HSFTDR is equal to or less than the transmit trigger count specified in HSTTRGR, the TDFE flag is set. If the TIE and TEIE bits in HSSCR are set to 1 and 0, respectively at this time, a transmit-FIFO-data-empty interrupt (TDFE) request occurs. The serial transmit data is sent from the HTX pin in the following order:
   A. Start bit: One 0-bit is output.
   B. Transmit data: 8-bit or 7-bit data is output in LSB-first order.
   C. Parity bit: One parity bit (even or odd parity) is output.
      A format that does not output a parity bit can also be selected.
   D. Stop bit(s): One or two stop bits are output.
   E. Marked state: 1 is output continuously until the start bit that starts the next transmission is sent.
3. The HSCIF checks transmit data in HSFTDR when sending the stop bit. If there is data in it, the HSCIF transfers the data from HSFTDR to HSTSR, sends the stop bit, and then starts serial transmission of the next frame. If there is no transmit data, the HSCIF sets the TEND flag to 1 in HSFSR and sends out the stop bit, and then the marked state is entered to output 1 continuously. At this time, if the TIE and TEIE bits in HSSCR are set to 1, a transmit-end interrupt (TEND) request occurs.

Figure 106.5 shows an example of transmission in asynchronous mode.

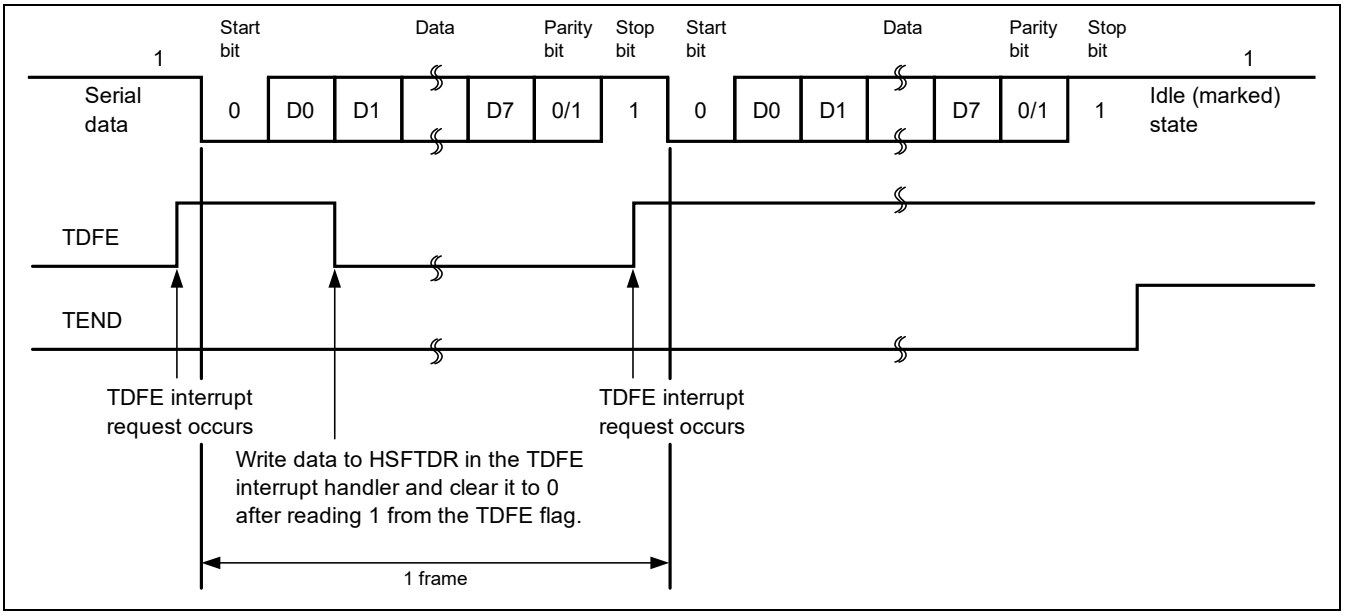

Figure 106.5 Sample HSCIF Transmission Operation (Example of 8-Bit Data with Parity and One Stop Bit)

4. When modem control is enabled, transmission can be stopped or resumed in accordance with the HCTS# input value. When HCTS# is set to 1 during transmission, the marked state is entered after one frame of data transmission is ended. Setting HCTS# to 0 restarts outputting the next transmit data from the start bit. Figure 106.6 shows an example of the operation with modem control enabled.

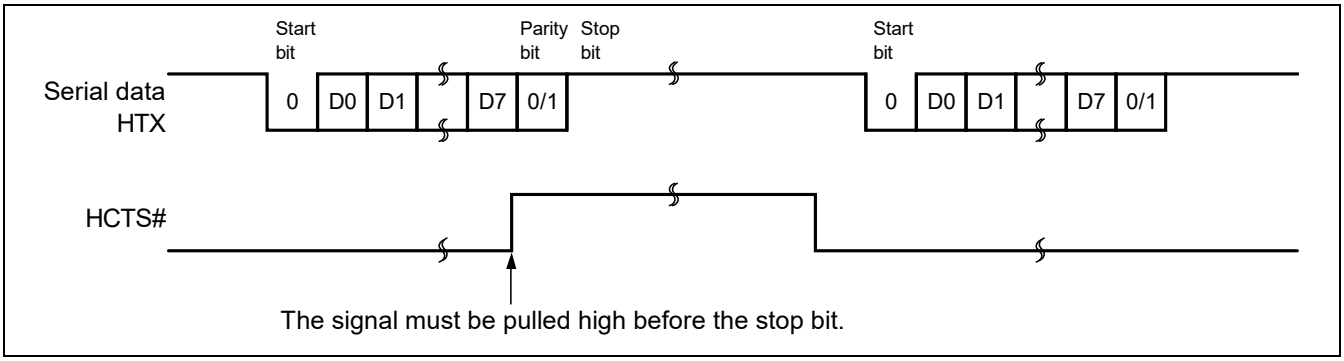

Figure 106.6 Sample Operation with Modem Control Enabled (HCTS#)

(c) Serial data reception (asynchronous mode)

Figure 106.7 and Figure 106.8 show sample flowcharts for serial reception.

After the HSCIF reception operation is enabled, serial data reception can be performed using the following procedure:

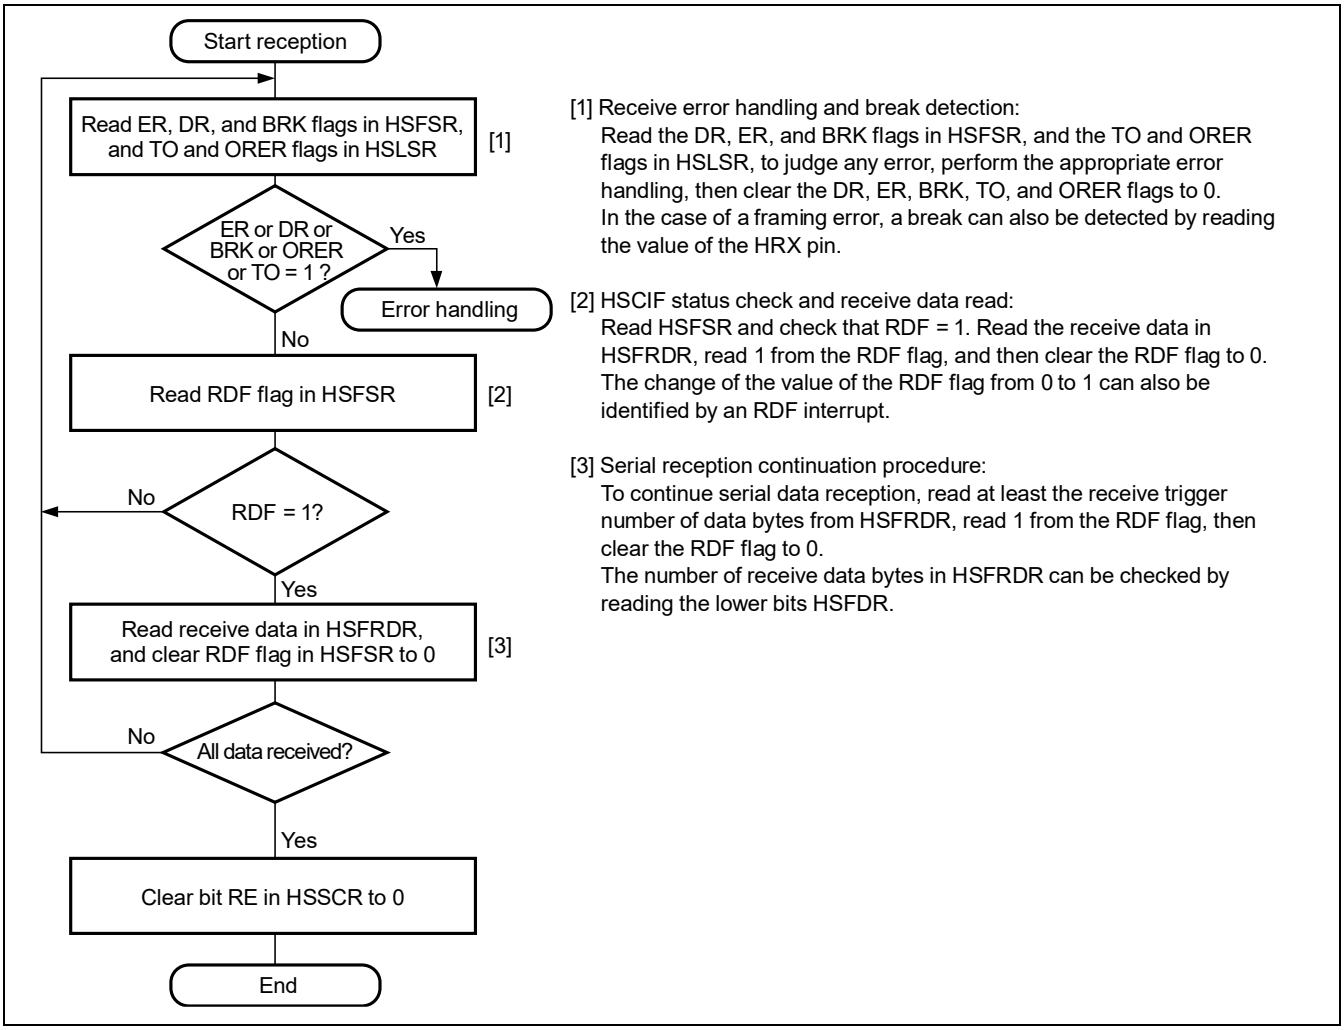

Figure 106.7 Sample Flowcharts for Serial Reception (1)

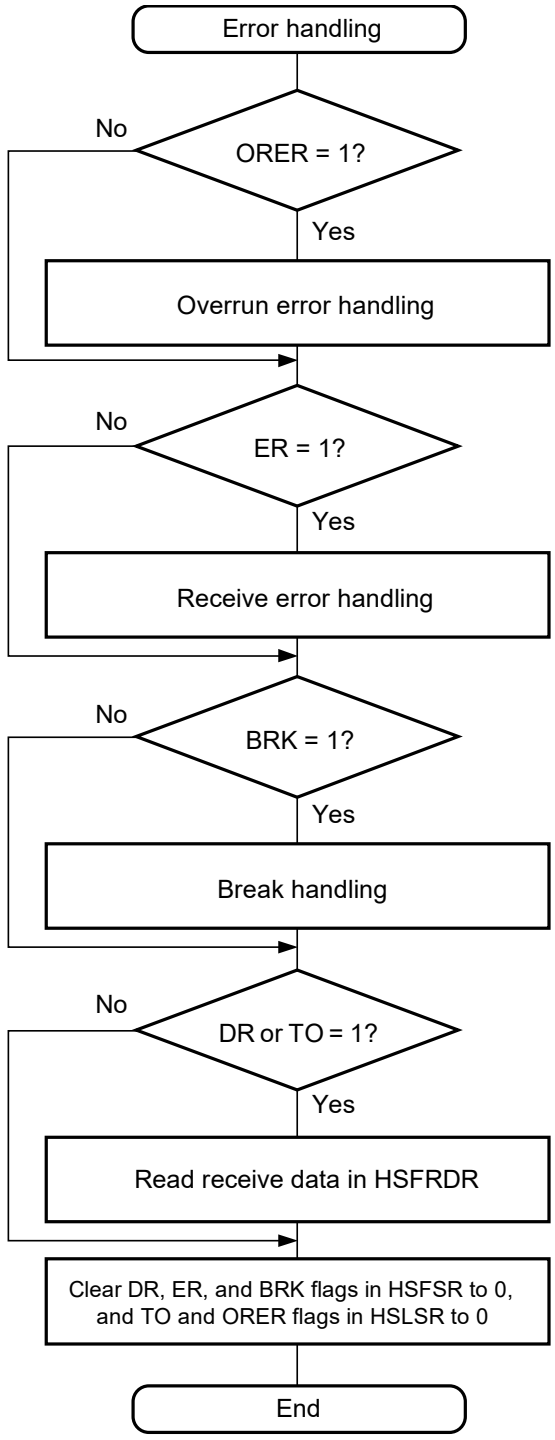

Whether a framing error or parity error has occurred in the receive data that is to be read from HSFRDR can be determined by checking bits FER and PER in HSRER.

Figure 106.8 Sample Flowcharts for Serial Reception (2)

In serial reception, the HSCIF operates as follows:

1. The HSCIF monitors the transmission line, and when detecting the start bit 0, it performs internal synchronization and starts reception.
2. The HSCIF stores the received data in HSRSR in LSB-to-MSB order.
3. The HSCIF receives the parity bit and stop bit.
   After receiving these bits, the HSCIF performs the following checks:

A. Stop bit: The HSCIF checks whether the stop bit is 1.
   If there are two stop bits, it checks only the first stop bit.
B. Receive data: The HSCIF checks that receive data can be transferred from the receive shift register (HSRSR) to HSFRDR.
C. Overrun error: The HSCIF checks that the ORER flag is 0, indicating that no overrun error has occurred.
D. Break state: The HSCIF checks that the BRK flag is 0, indicating that the break state is not set.

If the HSCIF can confirm the conditions of (b), (c), and (d), it stores the receive data in HSFRDR.

Note: The HSCIF continues to receive data even when a parity error or a framing error occurs.

4. If the RDF flag changes to 1 while the RIE bit in HSSCR is 1, a receive-FIFO-data-full interrupt (RDF) request occurs.
   If the DR flag changes to 1 while the RIE bit in HSSCR is 1, a receive-data-ready interrupt (DR) request occurs.
   If the TO flag changes to 1 while the TOIE bit in HSSCR is 1, a timeout interrupt (TO) request occurs.
   If the ER flag changes to 1 while the RIE or REIE bit in HSSCR is 1, a receive-error interrupt (ER) request occurs.
   If the BRK flag changes to 1 while the RIE or REIE bit in HSSCR is 1, a break interrupt (BRK) request occurs.
   If the ORER flag changes to 1 while the RIE or REIE bit in HSSCR is 1, an overrun-error interrupt (ORER) request occurs.

Figure 106.9 shows an example of reception in asynchronous mode.

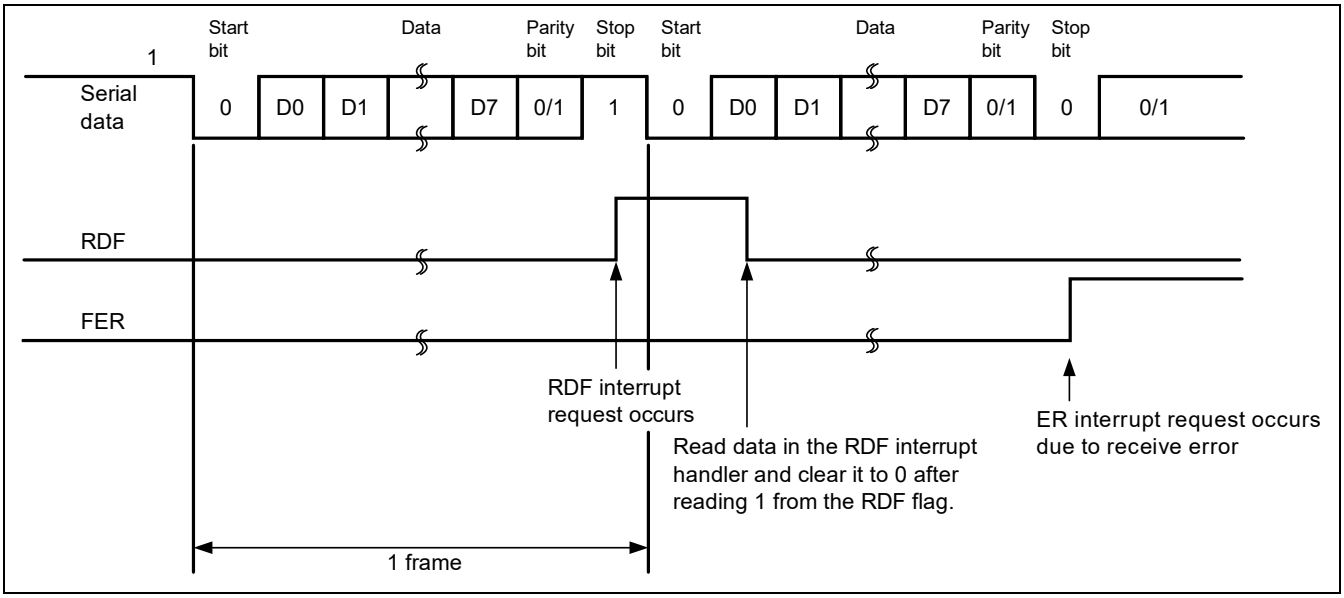

Figure 106.9 Sample HSCIF Receive Operation (Example of 8-Bit Data with Parity and One Stop Bit)

5. When modem control is enabled, the HRTS# signal is output when HSFRDR is empty. When HRTS# is 0, data can be received. When HRTS# is set to 1, the number of data bytes in HSFRDR is equal to or more than the RTS output active trigger count (HSRTGR.RSTRG).

Figure 106.10 shows an example of the operation with modem control enabled.

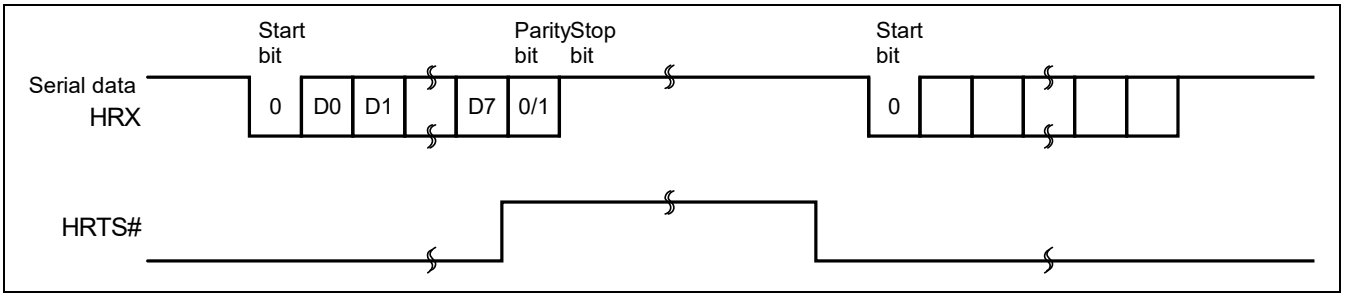

Figure 106.10 Example of the Operation with Modem Control Enabled (HRTS#)

106.3.2 Generation of Internal Clock

Internal clock is generated by the on-chip baud rate generator.
Baud rate is determined by the HSBRR and CKS[1:0] bit in HSSMR.

[Asynchronous mode]

$$N = \frac{\text{Internal clock}}{Sr \times 2^{2n+1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)

N: HSBRR setting for the baud rate generator ($0 \leq N \leq 255$) (which satisfies the electrical characteristics)

Internal clock: AXI bus clock operating frequency (MHz)

n: Baud rate generator input clock (n = 0, 1, 2, 3)
(See the Table 106.5 for the relation between n and the clock.)

Sr: Sampling rate (8 to 32)

Table 106.5 HSSMR Settings

	Baud Rate Generator	HSSMR Setting	
n	Input Clock	CKS[1]	CKS[0]
0	Internal clock	0	0
1	Internal clock/4	0	1
2	Internal clock/16	1	0
3	Internal clock/64	1	1

The bit rate error in asynchronous mode is determined by the following equation:

$$\text{error (\%)} = \left\{ \frac{\text{Internal clock} \times 10^6}{(N+1) \times B \times Sr \times 2^{2n+1}} - 1 \right\} \times 100$$

106.3.3 Baud Rate Generator for External Clock (BRG)

(1) Overview

The HSCIF incorporates a baud rate generator for external clock (abbreviated as BRG, hereafter). The BRG supplies a sampling clock (BRGCLK) to the HSCIF core by dividing the external clock SC_CLK (selectable between SCIF_CLK and Internal clock) by 1 to 216 – 1. In addition, the BRG switches the output between the external clock HSCK and divided clock.

Figure 106.11 shows a block diagram of the BRG.

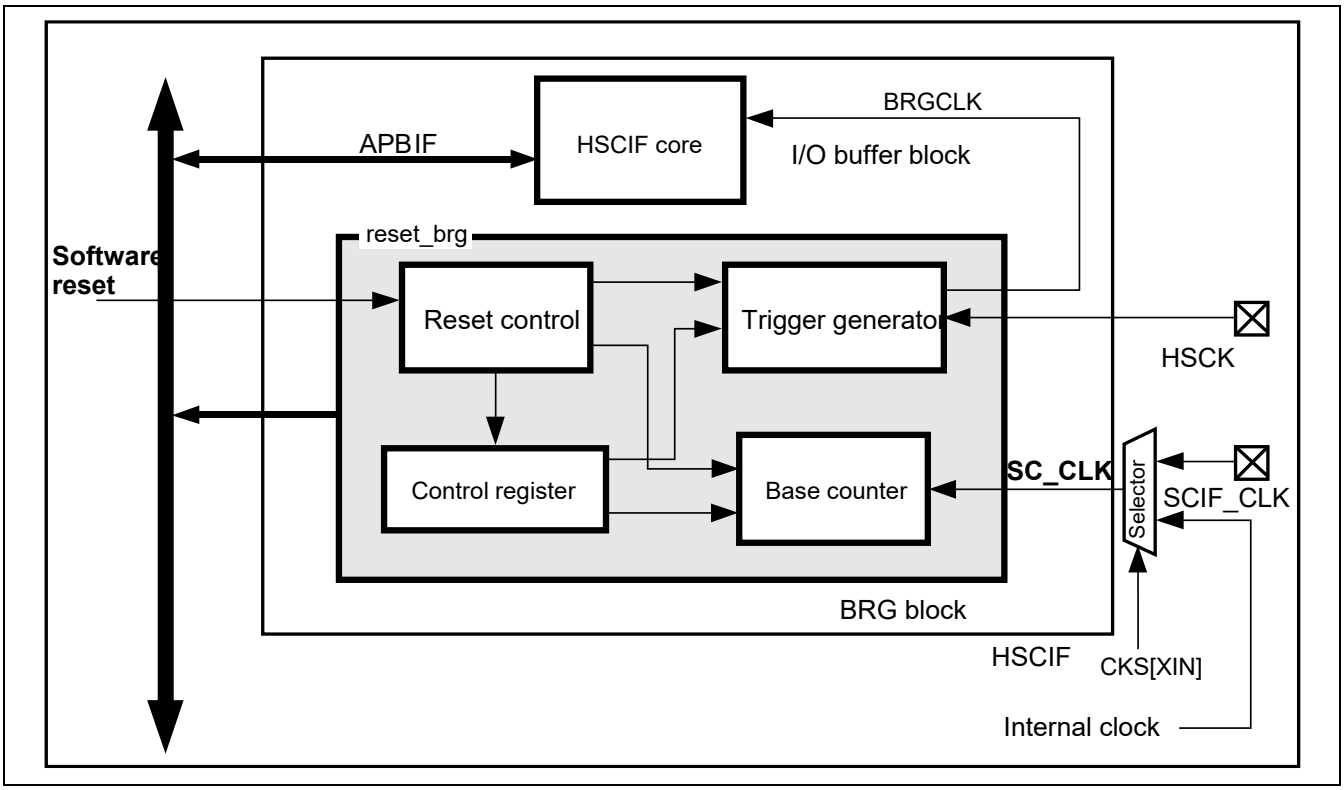

Figure 106.11 BRG Block Diagram

(a) Reset controller:

The reset controller handles resetting the control register, base counter, and trigger generator.

(b) Control register:

The control register has the frequency division register and clock select register.

(c) Base counter:

The base counter is a 16-bit CLK synchronization counter that is used to determine the timing for generating a frequency divided clock.

(d) Trigger generator:

The trigger generator generates rising-edge/falling-edge triggers for a frequency divided clock with the timing according to values of the frequency division register and base counter. The triggers are used to generate the frequency divided clock. In addition, the trigger generator switches the output between the HSCK (external clock input) and frequency divided clock.

(2) Registers

To set baud rate requires setting to Frequency Division Register(DL) and Clock Select Register(CKS)

(3) Frequency Division Register (DL)

To set a division value of frequency requires setting to Frequency-Division-Register(DL).

Refer to Frequency-Division-Register(DL).

Table 106.6 shows reference values of Frequency-Division-Register(DL).

Table 106.6 and Table 106.7 show how to use the baud rate generator with a3.6864-MHz crystal resonator, and a 26-MHz crystal resonator.

Table 106.6 Baud Rate (3.6864-MHz clock)

Baud Rate	Value of Frequency Division	Error Rate (*)
50	4608	—
75	3072	—
110	2095	–0.022
134.5	1713	0.001
150	1536	—
300	768	—
600	384	—
1200	192	—
1800	128	—
2000	115	0.174
2400	96	—
3600	64	—
4800	48	—
7200	32	—
9600	24	—
14400	16	—
19200	12	—
38400	6	—
76800	3	—
115200	2	—

Note: —: Indicates that the error rate is 0.

Table 106.7 Baud Rate (26-MHz clock)

Baud Rate	Value of Frequency Division	Sampling Rate	Error Rate*
9600	129	21	0.025
19200	52	26	-0.160
38400	26	26	-0.160
57600	15	30	-0.309
115200	9	25	-0.309
230400	4	28	-0.756
460800	2	28	-0.756
921600	1	28	-0.756
1843200	1	14	-0.756
3250000	1	8	—

Note: * "—" Indicates that the error rate is 0.

(4) Clock Select Register (CKS)

To set output between the frequency divided clock and specifies a source clock for the external baud rate requires setting to Clock Select Register (CKS).

Refer to Clock Select Register (CKS).

(5) Restrictions in BRG

(a) Notes on setting frequency division register

1. For the initial setting of the register after a reset, at least one bit of waiting period is required to secure the clock stabilization time.

   (Example) One bit period when DL = 2

   3.68 (MHz) × 1/2 × 1/16 = 0.115 (MHz) → 8695 (ns)

2. For modifying the register value after the setting stated in <1> above, at least one bit of waiting period at the maximum bit rate (DL = '65535') is required.

   The HSCIF registers and BRG registers should be set as the following table:

- Asynchronous mode (SC_CLK external input)

HSCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
HSSCR.CKE[1:0]	B'10	CKS	H'0000
		DL	H'1 to H'FFFF

- Asynchronous mode (HSCK external input)

HSCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
HSSCR.CKE[1:0]	B'10	CKS	H'8000
		DL	Don't care

- Asynchronous mode (SC_CLK internal input)

HSCIF		BRG	
Register Name	**Setting Value**	**Register Name**	**Setting Value**
HSSCR.CKE[1:0]	B'10	CKS	H'4000
		DL	H'1 to H'FFFF

3. The register settings for the baud rate generator for external clock should be made before starting initialization of the HSCIF.

106.3.4 HSCIF Interrupt Sources and the DMAC

If the DMAC is used for transmission/reception, set and enable the DMAC before setting the HSCIF.

Transmission interrupts and DMA transfer:

If the TDFE/TEND flag in HSFSR is set to 1 when the TDFE/TEND interrupt is enabled by the TIE bit, a TDFE/TEND interrupt request and a transmit-FIFO-data-empty DMA transfer request will occur. If the TDFE/TEND flag is set to 1 when TDFE/TEND interrupt is disabled by the TIE bit, only the transmit-FIFO-data-empty DMA transfer request will occur. (A transmit-FIFO-data-empty DMA transfer request is generated when the TDFE flag is set while TEIE is 0, or when the TEND flag is set while TEIE is 1. DMA transfer requests are not affected by the TEIE bit.)

When TDFE/TEND interrupt requests are enabled, the interrupt requests are cleared by the DMAC regardless of the interrupt handling program.

Reception interrupts and DMA transfer:

If the RDF/DR flag in HSFSR is set to 1 when RDF/DR interrupt is enabled by the RIE bit, an RDF/DR interrupt request occurs. If the RDF/DR flag is set to 1, a receive-FIFO-data-full DMA transfer request occurs. If the RDF/DR flag is set to 1 when RDF/DR interrupt is disabled by the RIE bit, and only a receive-FIFO-data-full DMA transfer request occurs and DMAC can be activated to perform data transfer.

Setting the RIE bit in HSSCR to 0 and the REIE bit to 1 generates the ER/BRK/ORER interrupt requests without generating RDF/DR interrupt requests. When the BRK flag in HSFSR or the ORER flag in HSLSR is set to 1, BRK/ORER interrupt requests occur.

If the TO flag is set to 1 in HSLSR when TO interrupts are enabled by the TOIE bit, TO interrupt requests occur.

When DR/TO interrupt requests are enabled to be issued, interrupt requests generated by the DR flag are cleared by the DMAC regardless of the interrupt handling program, however, those generated by the TO flag are not cleared by the DMAC. Therefore, the TO flag interrupt requests need to be cleared with the interrupt handling program. (The DR and TO flags are set at the same time, but cleared separately.)

Table 106.8 HSCIF Interrupt Sources

Interrupt Source	DMAC Activation
Interrupts generated by receive error flag (ER)	Disabled
Interrupts generated by receive-FIFO-data-full (RDF), receive-data-ready (DR) or timeout (TO)	Enabled
Interrupts generated by break (BRK) or overrun error (ORER)	Disabled
Interrupts generated by transmit FIFO data empty (TDFE)	Enabled

106.4 Usage Notes

(1) Break detection and operation

Break signals can also be detected by reading the HRX pin value directly when a framing error (FER) is detected. In the break state, the input values from the HRX pin are all 0s. So, the parity error flag (PER) may be set after the FER flag is set to 1.

Although the HSCIF stops receive data transfer to HSFRDR after detecting a break, it continues data reception.

(2) Sending a break signal

The input/output condition and level of the HTX pin are determined by the SPB2IO and SPB2DT bits in HSSPTR. This enables to send a break signal.

The pin does not function as the HTX pin from the initialization of the serial transmitter to setting of the TE bit (enabling transmission). In this period, the marked state is substituted by the value of the SPB2DT bit. Therefore, the SPB2IO and SPB2DT bits should be set to 1 (designating output and high level) beforehand.

To send a break signal during serial transmission, clear the SPB2DT bit to 0 (low level), and then clear the TE bit to 0 (halting transmission). When the TE bit is cleared, the transmitter is initialized regardless of the current transmission state, and the HTX pin outputs 0.

(3) Data sampling timing and reception margin in asynchronous mode

The HSCIF operates on the base clock with a frequency multiplied by the number which is set as a sampling rate for the bit rate.

In reception, the HSCIF performs the internal synchronization by sampling the falling edge of the start bit using the base clock. In addition, the HSCIF takes receive data at the rising edge of the S/2 pulse (when S is an even number) or (S+1)/2 pulse (when S is an odd number) on the base clock when sampling rate is S.

Figure 106.12 shows the timing of this operation when S = 16.

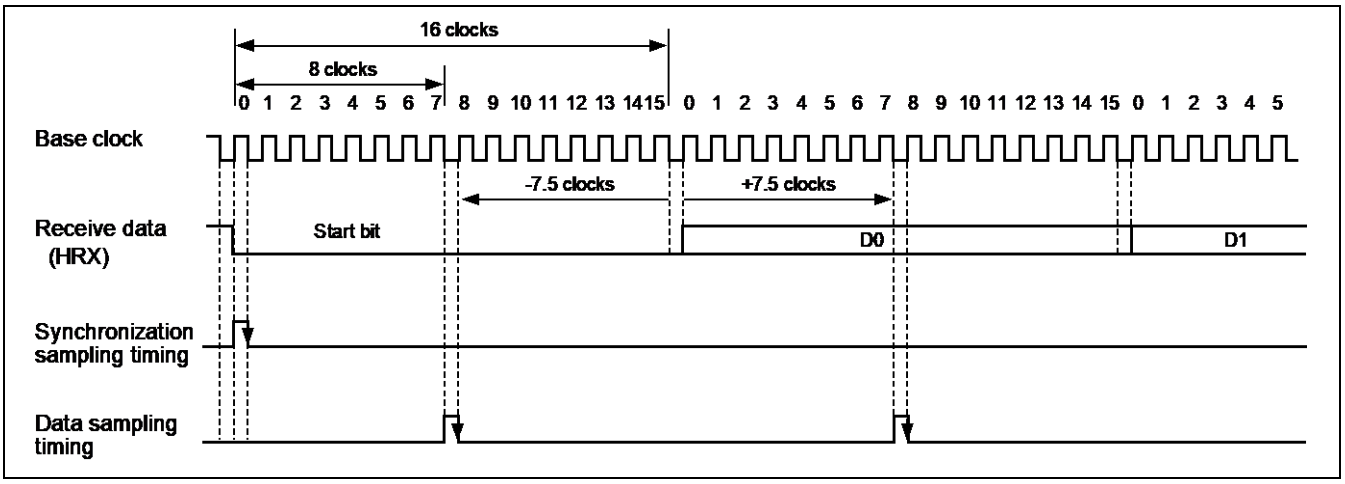

Figure 106.12 Timing Chart of Receive Data Sampling

The reception margin in asynchronous mode is given by formula (1).

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\% \quad \cdots\cdots \text{Expression (1)}$$

M: Receive margin (%)

N: Ratio of bit rate to clock (N = sampling rate)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute value of clock frequency deviation

Assuming F = 0, D = 0.5 and sampling rate = 16 for expression (1), the reception margin obtained with expression (2) is 46.875% as shown below:

Assuming D = 0.5 and F = 0

$$M = (0.5 - 1/(2 \times 16)) \times 100\%$$

$$= 46.875\% \ldots\ldots \text{expression (2)}$$

This is a theoretical value. A reasonable margin allowed in system designs is 20% to 30%.

(4) Reception margin and baud rate error

The value of 46.875% obtained by the above expression (2) indicates the reception margin when the baud rate error is 0 (F = 0). If there is no error in the reception and transmission baud rates, reception is possible even with misalignment of approx. 1/2 bit. If there is an error in the reception and transmission baud rates, the errors are accumulated up to the stop bit reception, which reduces the reception margin. The allowable baud rate error can be obtained by modifying the F in expression (1). When D = 0.5:

$$F = \{(15/32 - M)/(L - 0.5)\} \times 100\ (\%) \ldots\ldots \text{expression (3)}$$

By using expression (3), the relationship between the allowable error and reception margin with the frame length = 12 can be summarized as follows:

Allowed Error (%)	Reception Margin (%)
4.07	0
3.64	5
3.20	10
2.33	20
1.46	30

(5) Usage method of SRHP bits

The method for using the SRHP bits in the sampling rate register is described below.

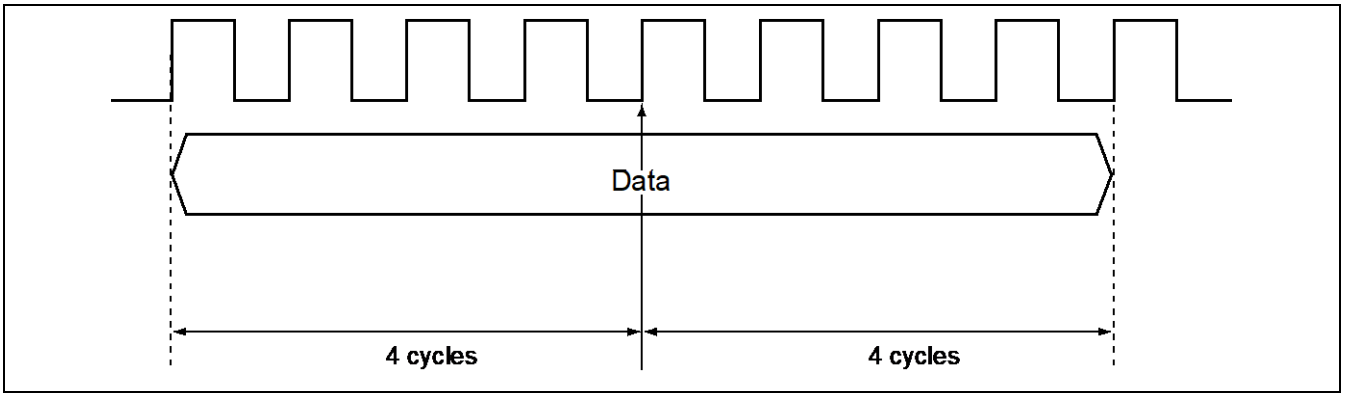

Figure 106.13 Sampling with Invalid SRHP Bits

Figure 106.13 shows a sampling example in which the SRHP bits are invalid (sampling rate = 8). In this case, the HSCIF samples data at half of the sampling rate, which is at the rising edge of the fourth pulse of the clock. This allows a setup margin and hold margin of 50% each to be provided.

However, if the ratio between the baud rate and sampling clock is not 1:1, either the setup margin or hold margin is omitted in data reception of a single frame. If the setup margin is omitted, the hold margin increases. On the other hand, if the hold margin is omitted, the setup margin increases. Figure 106.14 and Figure 106.15 show examples.

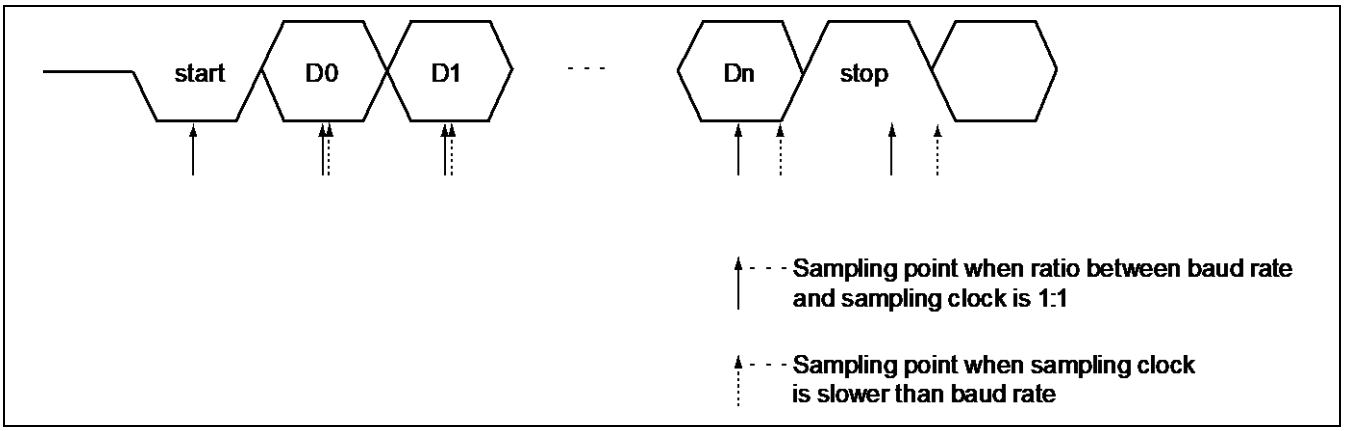

Figure 106.14 Sampling Point with Sampling Clock Slower Than Baud Rate

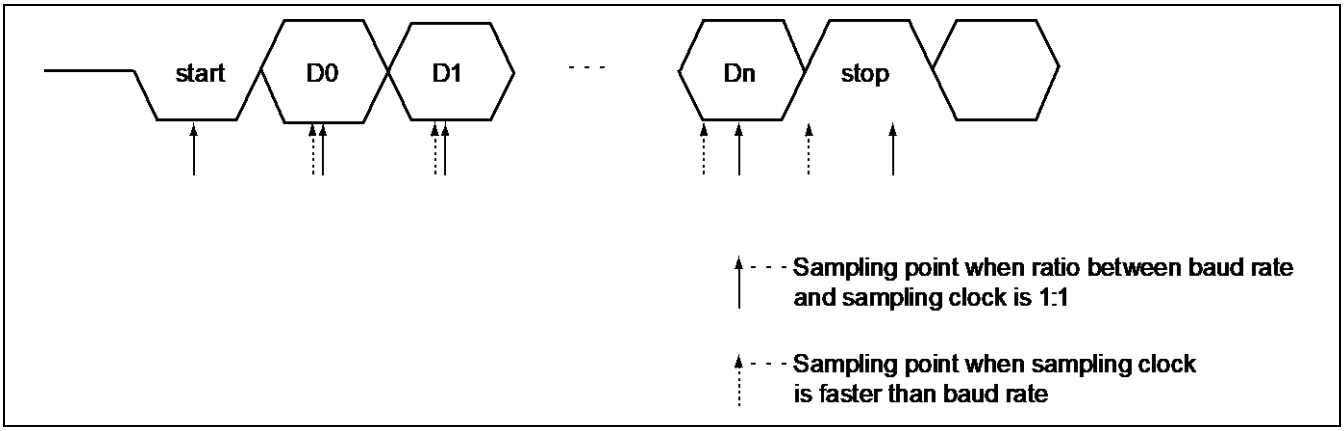

Figure 106.15 Sampling Point with Sampling Clock Faster Than Baud Rate

The ratio between the baud rate and sampling clock can be used to determine which margin among the setup margin and hold margin is to be omitted and which is to be increased. Based on this, the margin within a single frame can be increased by intentionally increasing the margin to be omitted in advance. The sampling point can be moved by setting a value in the SRHP bits. Figure 106.16 shows an example.

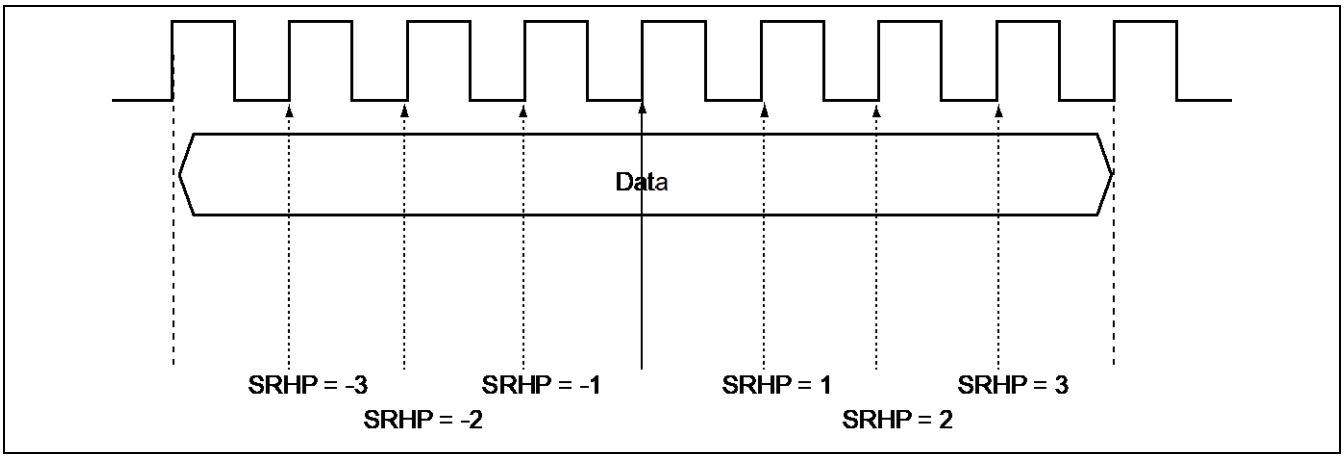

Figure 106.16 Sampling Point Moved by SRHP Bits

(6) Sampling rate and bit rate settings and respective margin

To set the baud rate in the HSCIF, in addition to setting the clock division ratio, the two registers, bit rate register (HSBRR) and sampling rate register (HSSRR), need to be set. These registers must be set so that the margin calculated by expression (1) in section 106.4 (3) will be a sufficient value.

The bit rate error is small when the value obtained by dividing the divided clock frequency used in the HSCIF with the sampling rate is near the desired baud rate. If there are many combinations of bit rate and sampling rate with the same bit rate error, choosing a combination with a large sampling rate provides a large margin. This is because when the bit rate error is constant in expression (1) in section 106.4 (3), that is, when the "absolute value of clock frequency deviation (F)" is constant, the margin (M) increases in accordance with the sampling rate (N).

If the sampling rate is made larger in a combination of bit rate and sampling rate with different bit rate errors, the bit rate error is increased. Accordingly, the "absolute value of clock frequency deviation (F)" on the right side in expression (1) in section 106.4 (3) gets larger and the margin (M) smaller.

Refer to the following procedure when selecting the sampling rate and bit rate settings.

1. Obtain the bit rate with the smallest bit rate error for sampling rates from 8 to 32.

2. Using expression (1) in section 106.4 (3), calculate the margin for each combination of sampling rate and bit rate which was obtained in step 1.
3. Select the combination with the largest margin among the combinations of sampling rate and bit rate.

106.5 Safety Mechanisms

HSCIF module has no mechanism of FuSa.

107. I2C Bus Interface (I2C)

107.1 Overview

107.1.1 Features

Fourth generation R-Car series products have up to four I2C bus interfaces conformant with the Philips Semiconductors (now NXP Semiconductors) I2C bus (Inter-IC bus) specification. However, the configuration of registers that control the I2C bus differs partly from the NXP Semiconductors register configuration. The I2C bus interface has the following features. Note that "module clock (MOD_CLK)" refers to the peripheral module clock in this section.

Module clock is S0D6_PERφ for all channels.

- The I2C interfaces support the I2C bus specification from NXP Semiconductors
- Multi-master compatible
- Seven- or ten-bit address compatible master
- Seven-bit slave address
- Fast mode compatible
- Variable clock frequencies
- DMA transfer support for Master/Slave Transmission Master/Slave Reception.
- Supporting Fast mode+

Figure 107.1 shows a block diagram of the I2C bus interface.

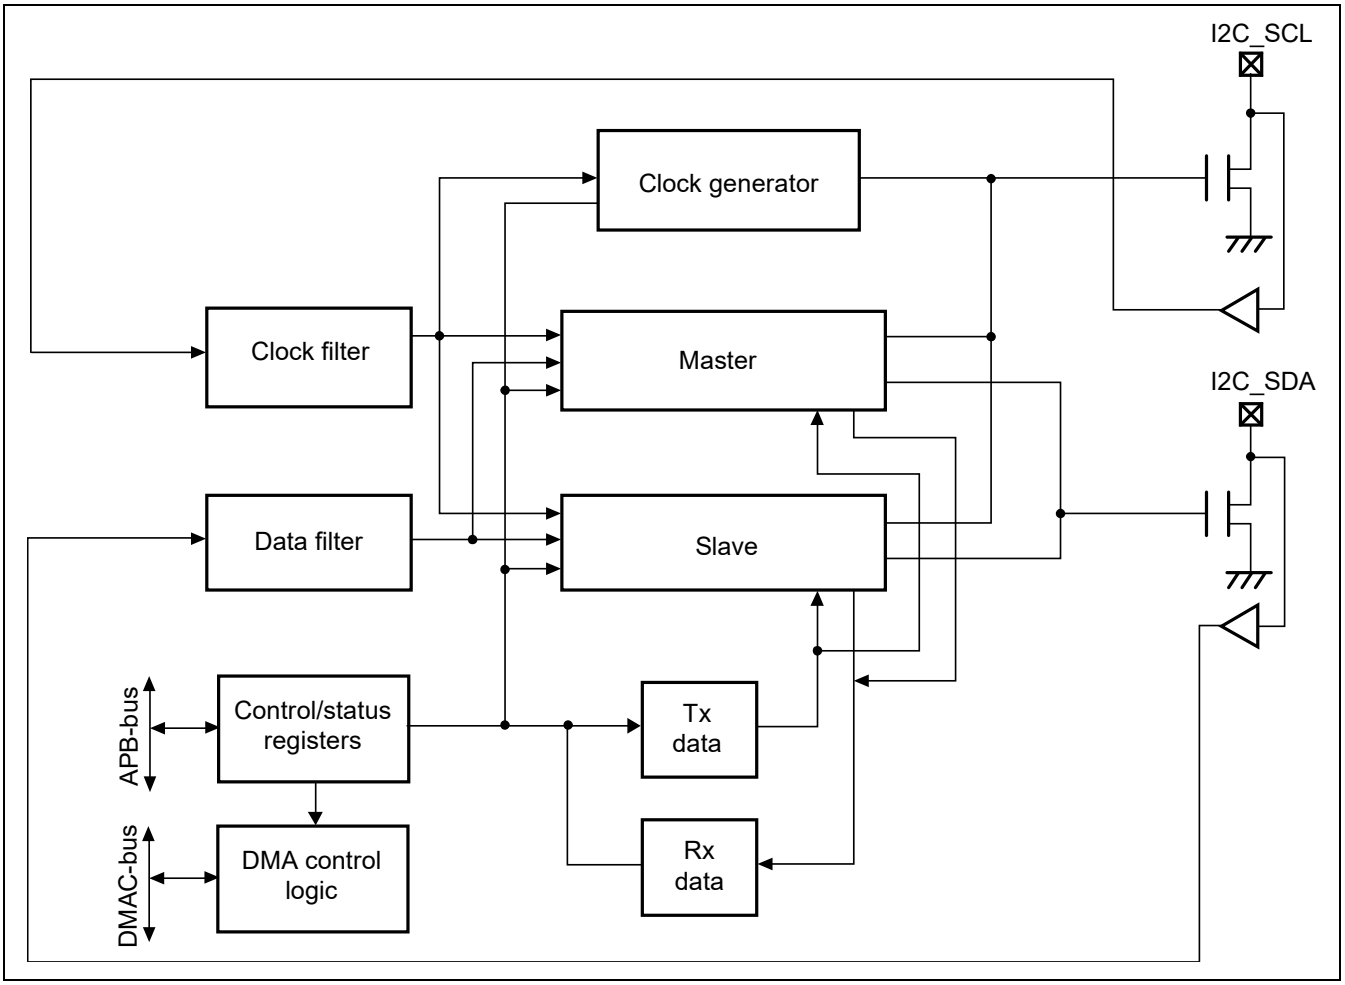

Figure 107.1 Block Diagram of I2C Bus Interface

107.1.2 External Pins

Table 107.1 lists the pins used in the I2C bus interface.

Table 107.1 I2C Bus Interface

Channel Number	Pin Name	I/O	Function	Output Buffer Type*1
0	SCL0	I/O	SCL:	OD
	SDA0		I2C serial clock input/output pin	
1	SCL1		SDA:	OD
	SDA1		I2C serial data input/output pin	
2	SCL2			OD
	SDA2			
3	SCL3			OD
	SDA3			

Note:1 Output buffer type: "OD" is open drain buffer. OD assigned channel pins are selected 1.8 V I/O or 3.3V I/O by 7.2.7 POWER Condition Control Register (POCn) register. (Not 3.3V tolerant IO cell)

The I2C buffer in this LSI is not compliant with the 5V-input. When turning off the I/O power source of this LSI, turn off the power source of the pull-up resistors connected to the I2C pins.

107.1.3 Register Configuration

(include Safety Mechanism related registers)

The base address for each channel of registers of the I2C bus interface is as follows:

- I2C0: H'E650 0000
- I2C1: H'E650 8000
- I2C2: H'E651 0000
- I2C3: H'E66D 0000

Each channel of the I2C bus interface has the registers below.

Table 107.2 Register Configuration

Register Name	Abbreviation	R/W	Offset Address from Base Address	Initial Value	Size
Slave control register	ICSCR	R/W	H'00	H'0000 0000	32
Master control register	ICMCR	R/W	H'04	H'0000 0000*3	32
Slave status register	ICSSR	R/(W)*1	H'08	H'0000 0000	32
Master status register	ICMSR	R/(W)*2	H'0C	H'0000 0000	32
Slave interrupt enable register	ICSIER	R/W	H'10	H'0000 0000	32
Master interrupt enable register	ICMIER	R/W	H'14	H'0000 0000	32
Clock control register	ICCCR	R/W	H'18	H'0000 0000	32
Slave address register	ICSAR	R/W	H'1C	H'0000 0000	32
Master address register	ICMAR	R/W	H'20	H'0000 0000	32
Receive data register	ICRXD	R	H'24	H'0000 0000	32
Transmit data register	ICTXD	W	H'24	H'0000 0000	32
Clock control register 2	ICCCR2	R/W	H'28	H'0000 0000	32
SCL mask control register	ICMPR	R/W	H'2C	H'0000 0000	32
SCL high control register	ICHPR	R/W	H'30	H'0000 0000	32
SCL low control register	ICLPR	R/W	H'34	H'0000 0000	32
DMA enable register	ICDMAER	R/W	H'3C	H'0000 0000	32
First bit setup cycle register	ICFBSCR	R/W	H'38	H'0000 0004	32

Notes: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted.
Values read from addresses other than those listed above are undefined.
Although the actual register name and its abbreviation have channel number as a suffix respectively, it is omitted in this section (the number "2" of ICCCR2 is not channel number).
Operation cannot be guaranteed if the register is not accessed as a longword (32bit)

1. Only 0 can be written to bits 4 to 0 to clear the flags.
2. Only 0 can be written to bits 6 to 0 to clear the flags.
3. Bits 30, 29, 22, 21, 14, 13, 6, and 5 are undefined.

107.2 Register Description

Registers in the I2C are allocated to and arranged in the address space of the internal bus.

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. When the bit is reserved, the write value should always be 0. Writing 1 to these bits can cause a malfunction of I2C.

—/W: Write-only. The read value is undefined.

107.2.1 Slave Control Register (ICSCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SCSS	SDBS	SIE	GCAE	FNA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7 to 5	—	All 0	R	Reserved The write value should always be 0.
4	SCSS	0	R/W	Slave Clock Stretch Select This bit is used to select the timing of Clock Stretch. 0: Clock Stretch is in front of ACK/NACK 1: Clock Stretch is next to ACK/NACK
3	SDBS	0	R/W	Slave Data Buffer Select This bit is used to select the data buffer. Select the single-buffer mode supported in this module. When this bit is set to 1, the single-buffer mode is selected. SCL will be held low from the timing when the receive data register acquires the data packet until the SDR flag is cleared. 0: Setting prohibited 1: Single-buffer mode
2	SIE	0	R/W	Slave Interface Enable This bit must be set for the slave operation. If this bit is low, the slave interface is reset.
1	GCAE	0	R/W	General Call Acknowledgement Enable When slave devices are to issue an acknowledgement in response to a general call address sent from a master, this bit must be set to 1.
0	FNA	0	R/W	Forced Non Acknowledgement In the slave receive mode, the level of this bit is sent to the transmitting device as the acknowledge signal. This bit is set to 0 during the period that the data packet is being received, and set to 1 on completion of data reception. Forced non acknowledgement is returned to the master during slave reception. When the slave has received the last byte of data in a data packet, the slave communicates with the master by sending a NACK, meaning that the acknowledgement is not driven. The master issues a stop on the bus after receiving a NACK. The setting of this bit does not affect the acknowledgement of the slave address.

107.2.2 Slave Status Register (ICSSR)

Bits 0 to 4 among the status bits in the slave status register are cleared by writing 0 to the respective status bit positions. The individual bits are held 1 until 0 is written to (other than the GCAR and STM bits).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	GCAR	STM	SSR	SDE	SDT	SDR	SAR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7	—	0	R	Reserved The write value should always be 0.
6	GCAR	0	R	General Call Address Received Indicates that the address received from the bus is a general call address (H'00). This status bit does not cause an interrupt. This bit is automatically cleared by hardware when the SIE bit (bit 2 in the slave control register) is set to 0 or when the SSR bit (bit 4 in this register) is set to 1.
5	STM	0	R	Slave Transmit Mode Indicates whether the current slave transmit mode is read or write. When this bit is set to 0, the mode is write (slave reception). When this bit is set to 1, the mode is read (slave transmission). This status bit does not cause an interrupt. This bit is automatically cleared by hardware when the SIE bit (bit 2 in the slave control register) is set to 0 or when the SSR bit (bit 4 in the slave status register) is set to 1.
4	SSR	0	R/W*	Slave Stop Received A stop condition has been output on the bus. This status bit becomes active after the rising edge of SDA during reception of a stop bit.
3	SDE	0	R/W*	Slave Data Empty Indicates that data to be transmitted has been loaded into the shift register. At the start of byte data transmission, the contents of the ICTXD register are loaded into a shift register ready for outputting data on the bus. This status bit indicates that data has been loaded and the ICTXD register is again ready for further data. This status bit becomes active on the falling edge of SCL before reception of the first data bit. - When bit SDE = 1 & bit TSDMAE = 0, the interrupt SDE is issued to CPU, so the transmit data register is to accept further data. - When bit SDE = 1 & bit TSDMAE = 1, enable DMA transfer request to DMAC. During the single-buffer mode, this bit must be reset every time new data has been written to ICTXD. If not, the slave will hold SCL low after the current data transfer has finished to stop the bus. During DMA transmit mode, the SDE bit is also set after data is loaded into the shift register. In this case, this bit is cleared by DMA logic control. This mechanism to assure the continuous data transfer without software control. For the last byte data transmitted, this bit is cleared by software.
2	SDT	0	R/W*	Slave Data Transmitted A byte of data has been transmitted to the bus. This bit becomes active after the falling edge of SCL during reception of the last data bit.
1	SDR	0	R/W*	Slave Data Received A byte of data has been received from the bus and is ready for reading from the receive data register. This bit becomes active after the falling edge of SCL during reception of the last data bit. During the single-buffer mode, this bit must be reset after data has been read from the ICRXD register. - When bit SDR = 1 & bit RSDMAE = 0, the interrupt SDR is issued to CPU, so the transmit data register is to accept further data. - When bit SDR = 1 & bit RSDMAE = 1, enable DMA transfer request to DMAC. When SDBS is set to 1, SCL will be held low from the timing when the receive data register acquires the data packet until the SDR flag is cleared. During DMA receive mode, the SDR bit is also set after data is received into RXD register. In this case, this bit is cleared by DMA logic control. This mechanism to assure the continuous data transfer without software control.

Bit	Bit Name	Initial Value	R/W	Description
0	SAR	0	R/W*	Slave Address Received Indicates that the slave has recognized its own address on the bus (defined by the contents of the slave address register). If the general call acknowledgement enable bit is enabled in the slave control register, then this status bit is also set to 1 even if the address on the bus is a general call address. In this case, the GCAR bit in this register is used to determine whether or not the address is a general call address. The STM bit indicates whether the access is read (high) or write (low). This status becomes active after the falling edge of SCL during reception of the last address bit. The slave holds the SCL signal low from the start of the ACK phase until the software resets this status bit.

Note: * This bit can be read from or written to. Writing 0 clears this bit to 0 and writing 1 is ignored.

107.2.3 Slave Interrupt Enable Register (ICSIER)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SSRE	SDEE	SDTE	SDRE	SARE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7 to 5	—	All 0	R	Reserved The write value should always be 0.
4	SSRE	0	R/W	Slave Stop Received Interrupt Enable 0: Disables the SSR interrupt. 1: Enables the SSR interrupt.
3	SDEE	0	R/W	Slave Data Empty Interrupt Enable 0: Disables the SDE interrupt. 1: Enables the SDE interrupt.
2	SDTE	0	R/W	Slave Data Transmitted Interrupt Enable 0: Disables the SDT interrupt. 1: Enables the SDT interrupt.
1	SDRE	0	R/W	Slave Data Received Interrupt Enable 0: Disables the SDR interrupt. 1: Enables the SDR interrupt.
0	SARE	0	R/W	Slave Address Received Interrupt Enable 0: Disables the SAR interrupt. 1: Enables the SAR interrupt.

107.2.4 Slave Address Register (ICSAR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SADD0_6	SADD0_5	SADD0_4	SADD0_3	SADD0_2	SADD0_1	SADD0_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7	—	0	R	Reserved The write value should always be 0.
6 to 0	SADD0_6 to SADD0_0	All 0	R/W	Slave Address This is the unique 7-bit address allocated to the slave on the I2C bus. The slave interface compares this address with the first seven bits transmitted as the slave address, at the beginning of a data packet transmission.

107.2.5 Master Control Register (ICMCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	—	—	0	0	0	0	0	0	—	—	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MDBS	FSCL	FSDA	OBPC	MIE	TSBE	FSB	ESG
Initial value:	0	—	—	0	0	0	0	0	0	—	—	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0, except bits 30, 29, 22, 21, 14, and 13 in which case, initial value is undefined.	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7	MDBS	0	R/W	Master Data Buffer Select This bit is used to select the data buffer mode. Select the single-buffer mode supported in this module. When this bit is set to 1, the single-buffer mode is selected. SCL will be held low from the timing when the receive data register acquires the data packet until the MDR flag is cleared. 0: Setting prohibited 1: Single-buffer mode
6	FSCL	—	R/W	Forced SCL This bit controls the status of the I2C_SCL pin (reading reflects the current status of the I2C_SCL pin). When the OBPC bit is set, this bit directly controls the SCL line on the bus. During a read cycle, the level on this bit (which includes the reset level) will change depending on the level on I2C_SCL since it directly reflects the level on the I2C_SCL.
5	FSDA	—	R/W	Forced SDA This bit controls the status of the I2C_SDA pin (reading reflects the busy status level on the I2C bus). When the OBPC bit is set, then this bit directly controls the SDA line on the bus. During a read cycle, the level on this bit (which includes the reset level) will show the busy status of the I2C bus (1 for busy; 0 for not busy).
4	OBPC	0	R/W	Override Bus Pin Control When this bit is set to 1, the FSDA and FSCL bits in this register control SDA and SCL directly.
3	MIE	0	R/W	Master Interface Enable When this bit is set to 1, the master interface is enabled. The master interface is disabled when this interface loses in arbitration of bus mastership even MIE bit indicates 1. If 0 is not subsequently written to the bit, the master interface is restored on detection of a STOP condition on the I2C bus. Regarding the state following a loss in arbitration of bus mastership, see the description of the MAL bit in ICMSR.
2	TSBE	0	R/W	Start Byte Transmission Enable The write value for this bit should always be 0.
1	FSB	0	R/W	Forced Stop onto the Bus When this bit is set to 1, the master transmits a STOP condition on the bus at the end of the current transfer. If ESG is also set, the master immediately transmits a START condition and begins transmitting a new data packet. If ESG is not set, the master enters the idle state.
0	ESG	0	R/W	Enable Start Generation When this bit is set to 1, the master starts transmission of a data packet. If the bus is idle when ESG is set, the master transmits a START condition on the bus and then transmits the slave address. If the master is transferring data when ESG is set, at the end of that data byte transfer, the master transmits a repeated START condition before transmitting the slave address. When transmitting a data packet, the software must reset this bit when the slave address has been transmitted, otherwise a repeated START condition is transmitted after every transmission is completed.

107.2.6 Master Status Register (ICMSR)

The status bits (bits 0 to 6) in the master status register are cleared by writing 0 to the respective status bit positions. The individual status bits are held 1 until a reset by writing 0 to the appropriate bit position.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	MNR	MAL	MST	MDE	MDT	MDR	MAT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7	—	0	R	Reserved The write value should always be 0
6	MNR	0	R/W*	Master NACK Received When this bit is set to 1, this bit indicates that the master has received a NACK response (the SDA line is high during the acknowledge cycle on the bus) to either an address or data transmission. ** To restart the address transmission from idle state on Master, this bit must be cleared.
5	MAL	0	R/W*	Master Arbitration Lost In a multi-master system, when this bit is set to 1, it indicates that the master has lost arbitration to other masters on the bus. At this point, the master interface is disabled then Master enters the idle state again.
4	MST	0	R/W*	Master Stop Transmitted When this bit is set to 1, it indicates that the master has sent a STOP condition on the bus. A STOP condition can be sent either as a result of the setting of the forced stop bit in the control register, or from a NACK being received from a slave during a slave receive data packet.
3	MDE	0	R/W*	Master Data Empty At the start of a byte data transmission, the contents of the transmit data register are loaded into a shift register ready for transmitting on the bus. This status bit becomes active: - When bit MDE = 1, MAT = 0 & bit TMDMAE = 0, the interrupt MDE is issued to CPU, so the transmit data register is to accept further data. - When bit MDE = 1, MAT = 0 & bit TMDMAE = 1, enable DMA transfer request to DMAC. During master transmission, the MDE bit is also set at the same time as the MAT bit is set after transmission of the slave address. In this case, you need to clear the MDE and MAT bits after the ICMCR's ESG bit is cleared. The clearing will restart the data transmission. During DMA transmit mode, the MDE bit is also set after data is loaded into the shift register. In this case, this bit is cleared by DMA logic control. This mechanism to assure the continuous data transfer without software control. For the last byte data transmitted, this bit cleared by software.
2	MDT	0	R/W*	Master Data Transmitted Byte data has been sent to the slave on the bus. This status bit becomes active after the falling edge of SCL during reception of the last data bit.

Bit	Bit Name	Initial Value	R/W	Description
1	MDR	0	R/W*	Master Data Received Byte data has been received from the bus and is in the receive data register. This status bit becomes active after the falling edge of SCL during reception of the last data bit. During single-buffer mode, this status bit must be reset after data has been read from the receive data register. - When bit MDR = 1, MAT = 0 & bit RMDMAE = 0, the interrupt MDR is issued to CPU, so the receive data register is to accept further data. - When bit MDR = 1, MAT = 0 & bit RMDMAE = 1, enable DMA transfer request to DMAC. When MDBS is set to 1, SCL will be held low from the timing when the receive data register acquires the data packet until the MDR flag is cleared. During master reception mode, the MDR bit is also set at the same time as the MAT bit is set after transmission of the slave address. In this case, you must clear the MDR and MAT bits after the ICMCR's ESG bit is cleared. Clearing will start the data reception. During DMA receive mode, the MDR bit is also set after data is received into RXD register. In this case, this bit is cleared by DMA logic control. This mechanism to assure the continuous data transfer without software control.
0	MAT	0	R/W*	Master Address Transmitted The master has been transmitted the slave address byte of a data packet. This bit becomes active after the falling edge of SCL during reception of the ACK bit following transmission of the address.

Note: * This bit can be read from or written to. Writing 0 clears this bit to 0 and writing 1 is ignored.

Note: ** In the case “ICMCR.ESG = 1”, STOP condition will never sent from Master I/F whenever ICMSR.MNR get asserted.

107.2.7 Master Interrupt Enable Register (ICMIER)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	MNRE	MALE	MSTE	MDEE	MDTE	MDRE	MATE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7	—	0	R	Reserved The write value should always be 0.
6	MNRE	0	R/W	Master NACK Received Interrupt Enable 0: Disables the MNR interrupt. 1: Enables the MNR interrupt.
5	MALE	0	R/W	Master Arbitration Lost Interrupt Enable 0: Disables the MAL interrupt. 1: Enables the MAL interrupt.
4	MSTE	0	R/W	Master Stop Transmitted Interrupt Enable 0: Disables the MST interrupt. 1: Enables the MST interrupt.
3	MDEE	0	R/W	Master Data Empty Interrupt Enable 0: Disables the MDE interrupt. 1: Enables the MDE interrupt.
2	MDTE	0	R/W	Master Data Transmitted Interrupt Enable 0: Disables the MDT interrupt. 1: Enables the MDT interrupt.
1	MDRE	0	R/W	Master Data Received Interrupt Enable 0: Disables the MDR interrupt. 1: Enables the MDR interrupt.
0	MATE	0	R/W	Master Address Transmitted Interrupt Enable 0: Disables the MAT interrupt. 1: Enables the MAT interrupt.

107.2.8 Master Address Register (ICMAR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SADD1_6	SADD1_5	SADD1_4	SADD1_3	SADD1_2	SADD1_1	SADD1_0	STM1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7 to 1	SADD1_6 to SADD1_0	All 0	R/W	Slave Address These bits are the address of the slave which the master communicates with.
0	STM1	0	R/W	Slave Transfer Mode This bit specifies the mode in which the slave operates. Bit STM1 sets the operating mode (transmit or receive mode) of the slave, which is an external slave device whose address matches the slave address (SADD1) sent from the master. The slave device is automatically set to transmit/receive mode by hardware on reception of the STM1 signal. When this bit is set to 1, it indicates a read operation. When this bit is cleared to 0, it indicates a write operation.

107.2.9 Clock Control Register (ICCCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SCGD						CDF		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
8 to 3	SCGD	All 0	R/W	SCL Clock Generation Divider When operation is in master mode, the SCL clock is generated from the internal clock by using SCGD as the ratio. This is also the operating clock in slave-mode operation while SCL is being held low to stop the bus after an overflow has occurred. SCGD must be specified in both master and slave modes. The formula expressing the relationship is: Equation 2: SCL rate calculation SCLfreq = I2Cck/(20 + SCGD × 8 + F[(tICF + tr + IntDelay) × I2Cck]) I2Cck: I2C internal clock frequency tICF: I2C SCL falling time (depending on external load) tr: I2C SCL rising time (depending on external load) IntDelay: LSI internal delay corresponds to output buffer type. Open drain buffer: 50 ns (typ.), 110 ns (max.) F[n]: n rounded down to an integer Suggested settings for CDF and SCGD for CPU speeds and the two I2C bus speeds are given in Table 107.3.
2 to 0	CDF	All 0	R/W	Clock Division Factor The internal clock used in most blocks in the I2C module is a divided module clock. The internal I2C clock is generated from the module clock using the CDF as the division ratio: Equation 1: I2C internal clock frequency calculation I2Cck = MOD_CLK/(1 + CDF) MOD_CLK: module clock frequency Ensure that minimum values for setup and hold times of the SDA signal relative to the SCL signal on the bus are satisfied. The clock frequency is to ensure that the glitch filtering will operate with glitches of up to 50 ns as described in the fast mode I2C specification. Note: CDF must be set so that the clock frequency (I2Cck) is lower than 20 MHz.

Table 107.3 Recommended Settings for CDF and SCGD*1 (Normal mode)

- Recommended register values for open drain buffer

	100 kHz		400 kHz	
Module Clock Frequency	**CDF(*2)**	**SCGD(*3)**	**CDF(*2)**	**SCGD(*3)**
133.33 MHz	6	21	6	3
Error		-0.80%		-0.80%

- Recommended register values for LVTTL buffer (low drive only)

	100 kHz		400 kHz	
Module Clock Frequency	**CDF(*2)**	**SCGD(*3)**	**CDF(*2)**	**SCGD(*3)**
133.33 MHz	6	21	6	3
Error		-0.28%		+1.31%

Notes: 1. These recommended values are for the SCL rate with an external load that produces tICF = 3 ns and tr = 150 ns.
Recalculate to obtain the actual values after measuring tICF and tr under actual conditions of usage.
2. Recommended value for CDF bit of ICCCR.
3. Recommended value for SCGD bit of ICCCR.

107.2.10 Receive and Transmit Data Registers (ICRXD and ICTXD)

Reading from or writing to these registers access different physical internal registers. When data is to be transmitted, the contents of the shift register are loaded via TXD. After data has been received into the shift register from the I2C bus, it is then loaded into RXD.

(1) Receive data register (ICRXD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RXD							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, bits 31 to 24, 23 to 16, and 15 to 8 reflect the values of bits 7 to 0. The write value should always be 0.
7 to 0	RXD	All 0	R	Read Receive Data Data received by master or slave.

(2) Transmit data register (ICTXD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXD							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	TXD	All 0	W	Write Transmit Data Data to be transmitted by master or slave.

107.2.11 Clock Control Register 2 (ICCCR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FMPE	—	—	—	—	CDFD	HLSE	SME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, the value in bits 7 to 0 is set to bits 31 to 24, bits 23 to 16, and bits 15 to 8. The write value should always be 0.
7	FMPE	0	R/W	FM+ Enable When this bit is set to 1, the Fast Mode+ of OD buffer is enable. 0: OD buffer is Standard / Fast mode. 1: OD buffer is Fast mode+.
6 to 3	—	All 0	R	Reserved The write value should always be 0.
2	CDFD	0	R/W	CDF Disable When this bit is set to 1, the module clock is used for internal clocks except the clock filter. For SCL rate computation, see equation 3 in Note 2. The clock filter always operates at a clock frequency divided by the CDF value.
1	HLSE	0	R/W	HIGH/LOW Separate Control Enable When this bit is set to 1, the SCGD setting is ignored and SCL is generated with the division ratio set by ICHPR during a high period and with the division ratio set by ICLPR during a low period. For SCL rate computation, see equation 3 in Note 2. The program should be prepared so that ICHPR and ICLPR should be written to before setting this bit.
0	SME	0	R/W	SCL Mask Enable When this bit is set to 1, a change of internal SCL is ignored after an SCL external input pin changes during the time equal to the number of internal clock cycles specified by ICMPR. For SCL rate computation, see equation 3 in Note 2. The program should be prepared so that ICMPR should be written to before setting this bit.

Notes: 1. The control bits should be set to "CDFD = 0, HLSE = 0, and SME = 0" or "CDFD = 1, HLSE = 1, and SME = 1". Otherwise, operation cannot be guaranteed. ICCCR2 should be written to prior to writing ICCCR.

2. Equation 3: SCL Rate Computation (CDFD = 1, HLSE = 1, and SME = 1)

Rise: SMD ≧ F[tr * MOD_CLK] + 4 * (CDF + 1)

Fall : SMD ≧ F[(IntDelay + tICF) * MOD_CLK] + 4 * (CDF + 1)

If both Rise and Fall conditions can be satisfied:

SCL freq = MOD_CLK/(8 + 2 * SMD + SCLD + SCHD)

If the Rise or Fall conditions cannot be met:

SCL freq = MOD_CLK/(8 + (F[(tr + “rise internal delay”) * MOD_CLK] + 3 * (CDF + 1)) +
(F[(IntDelay + tICF + “fall internal delay”) * MOD_CLK] + 3 * (CDF + 1)) + SCHD + SCLD)

rise/fall internal delay: Min: 0 ns Max: (CDF + 1) / MOD_CLK ns

if specified SMD size satisfies either Rise or Fall side condition, satisfied side calculation can be replaced to SMD.

For example, Rise side condition can be satisfied, (F[(tr + "rise internal delay") * MOD_CLK] + 3 * (CDF + 1)) can be replaced to SMD.

MOD_CLK: Module Clock Frequency

SMD: SCL masked period (set by the SCL mask control register)

SCLD: I2C SCL low clock period (set by the SCL HIGH control register)

SCHD: I2C SCL high clock period (set by the SCL LOW control register)

tICF: I2C SCL falling time (depending on external load)

tr: I2C SCL rising time (depending on external load)

IntDelay: LSI internal delay corresponds to output buffer type.
Open drain buffer: 50 ns (typ.), 110 ns (max.)
If ICCR2.FMPE=1: 3 ns (min.), 29 ns (typ.), 55 ns (max.).

F[n]: n rounded down to an integer

Table 107.4 shows recommended register values for two types of I2C bus speeds.

Table 107.4 Recommended Register Values when CDFD = 1, HLSE = 1, and SME = 1 (Duty variable mode)

- Recommended Register Values for open drain buffer

	100 kHz					400 kHz				
Module Clock Frequency	**CDF (*1)**	**SCGD (*2)**	**SMD (*3)**	**SCHD (*4)**	**SCLD (*5)**	**CDF (*1)**	**SCGD (*2)**	**SMD (*3)**	**SCHD (*4)**	**SCLD (*5)**
133.33 MHz	6 (*6)	0	50	607	626	6 (*6)	0	50	108	125
Error			-0.56%					-2.24%		

- Recommended Register Values for open drain buffer at Fast mode+ (When rise/fall internal delay = 0 ns (min))

	1 MHz				
Module Clock Frequency	**CDF (*1)**	**SCGD (*2)**	**SMD (*3)**	**SCHD (*4)**	**SCLD (*5)**
133.33 MHz	6 (*6)	0	21	30	43
Error			-2.67%		

Note: tICF = 20ns, tr = 35ns, and IntDelay = 110ns(open drain buffer) /55ns(ICCCR2.FMPE=1)are used to calculate Error value.

Notes:
1. Recommended value for CDF bit of ICCCR.
2. Recommended value for SCGD bit of ICCCR.
3 Recommended value for SMD bit of ICMPR.
4. Recommended value for SCHD bit of ICHPR.
5. Recommended value for SCLD bit of ICLPR.
6. In case of connecting to device, whose $t_{HD;DAT}$ is smaller than 100ns, specifying 0 as CDF is recommended.

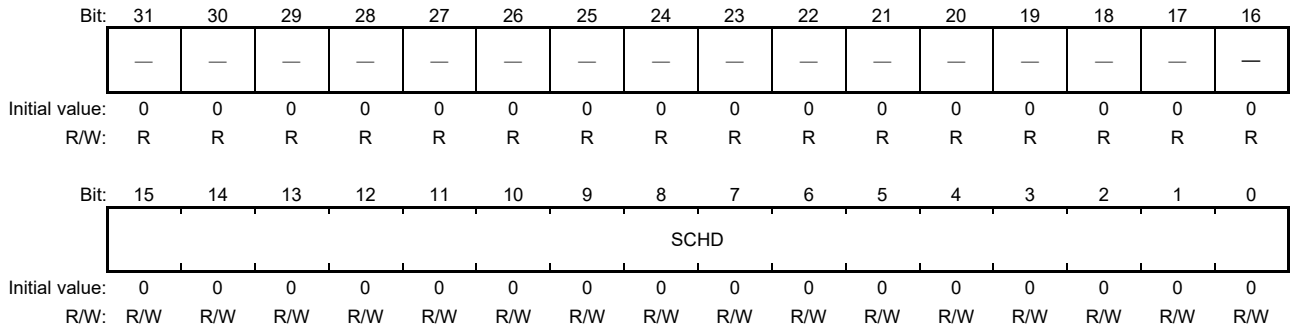
107.2.12 SCL Mask Control Register (ICMPR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SMD							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When these bits are read, the value in bits 7 to 0 is set to bits 31 to 24, bits 23 to 16, and bits 15 to 8. The write value should always be 0.
7 to 0	SMD	All 0	R/W	SCL Mask Division When SME = 1, a change of internal SCL is ignored after the external SCL changes during the time equal to the number of internal clock cycles specified by SMD. The value set in SMD should be smaller than SCHD and SCLD.

107.2.13 SCL HIGH Control Register (ICHPR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 0	SCHD	All 0	R/W	SCL HIGH Clock Division When HLSE is 1 and internal SCL is driven high, the clock generated using the SCHD internal clock division ratio is output. The period over the SCL signal is driven high can be calculated by the formula below. Period over SCL is driven high = 1/MOD_CLK × (4 + SMD + SCHD)

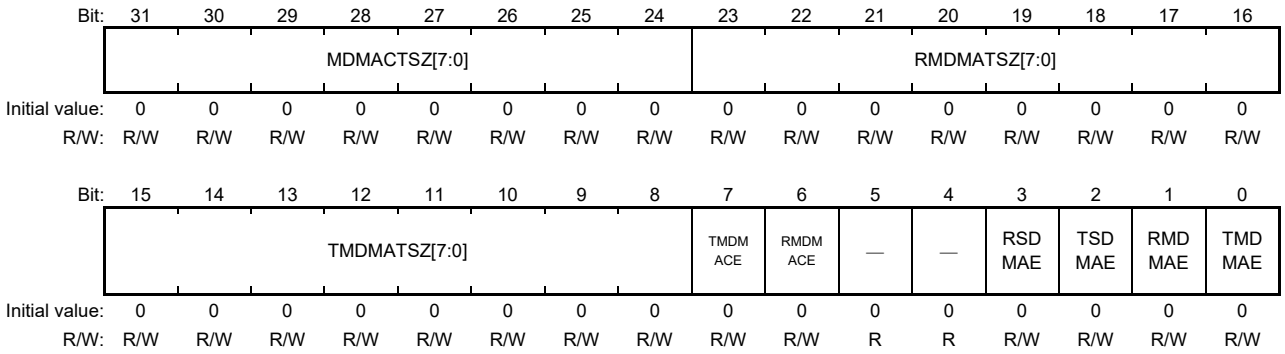
107.2.14 SCL LOW Control Register (ICLPR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCLD															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 0	SCLD	All 0	R/W	SCL LOW Clock Division When HLSE is 1 and internal SCL is driven low, the clock generated using the SCLD internal clock division ratio is output. The period over the SCL signal is driven low can be calculated by the formula below. Period over SCL is driven low = 1/MOD_CLK × (4 + SMD + SCLD)

107.2.15 DMA Enable Register (ICDMAER)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MDMACTSZ	All 0	R/W	DMA Master Continuous mode Transfer Size Specify the number of transfer counts. Transfer counts equals the number of DMAC descriptor number for this transfer. This register should be set same value of DMACHCRB.DCNT[7:0] for this DMA transfer. Minimum number is H'00. (Use 1 descriptor only) Maximum number is H'FF. (Use 256 descriptor)
23 to 16	RMDMATSZ	All 0	R/W	DMA Master Continuous Received mode 1unit Transfer Size register. Specify byte number of 1 unit transfer size. For example, Start/End bit is sent every 4byte, specify H'04. Minimum size setting is "H'01". (Transfer of 1 unit is Once) Maximum size setting is "H'00". (Transfer of 1 unit is 256 times)
15 to 8	TMDMATSZ	All 0	R/W	DMA Master Continuous Transmitted mode 1unit Transfer Size register. Specify byte number of 1 unit transfer size. For example, Start/End bit is sent every 4byte, specify H'04. Minimum size setting is "H'01". (Transfer of 1 unit is Once) Maximum size setting is "H'00". (Transfer of 1 unit is 256 times)
7	TMDMACE	0	R/W	DMA Master Continuous Transmitted Enable 0: Disables DMA Continuous Transmitted mode 1: Enables DMA Continuous Transmitted mode
6	RMDMACE	0	R/W	DMA Master Continuous Received Enable 0: Disables DMA Continuous Received mode 1: Enables DMA Continuous Received mode
5 to 4	—	All 0	R	Reserved The write value should always be 0.
3	RSDMAE	0	R/W	DMA Slave Received Enable 0: Disables DMA Slave Received Mode. 1: Enables DMA Slave Received Mode.
2	TSDMAE	0	R/W	DMA Slave Transmitted Enable 0: Disables DMA Slave Transmitted Mode. 1: Enables DMA Slave Transmitted Mode.
1	RMDMAE	0	R/W	DMA Master Received Enable 0: Disables DMA Master Received Mode. 1: Enables DMA Master Received Mode.
0	TMDMAE	0	R/W	DMA Master Transmitted Enable 0: Disables DMA Master Transmitted Mode. 1: Enables DMA Master Transmitted Mode.

107.2.16 First Bit Setup Cycle Register (ICFBSCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SRFBSC_4	SRFBSC_3	SRFBSC_2	SRFBSC_1	SRFBSC_0	—	—	—	STFBSC_4	STDBSC_3	STFBSC_2	STFBSC_1	STFBSC_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FBSC_4	FBSC_3	FBSC_2	FBSC_1	FBSC_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28 to 24	SRFBSC_4 to SRFBSC_0	All 0	R/W	Setting the delay time of the 1st data bit between SDA and SCL. This bit is available at ICSCR.SCSS = B'1 and ICSSR.STM = B'0.
23 to 21	—	All 0	R	Reserved The write value should always be 0.
20 to 16	STFBSC_4 to STFBSC_0	All 0	R/W	Setting the delay time of the 1st data bit between SDA and SCL. This bit is available at ICSCR.SCSS = B'1 and ICSSR.STM = B'1.
15 to 5	—	All 0	R	Reserved The write value should always be 0.
4 to 0	FBSC_4 to FBSC_0	B'0 0100	R/W	Setting the delay time of the 1st data bit between SDA and SCL

Note: The delay time of the 1st data bit between SDA and SCL was calculated as below Table 107.5:
Figure 107.2 shows, Timing Chart of 1st bit setup delay cycle.

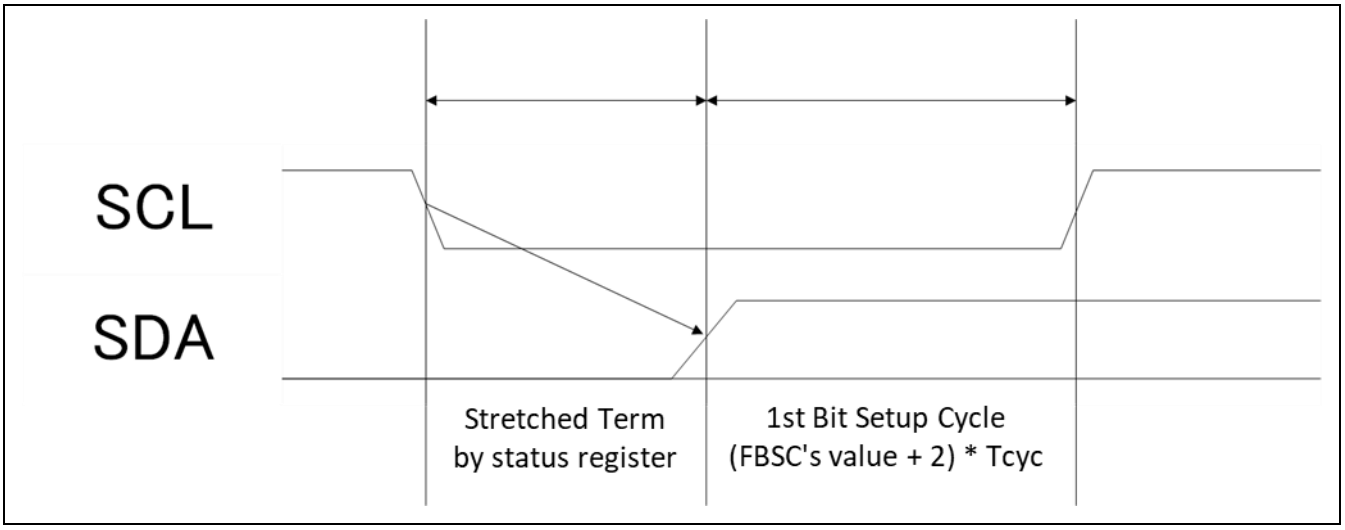


Figure 107.2 Timing Chart of 1st bit setup delay cycle

Table 107.5 First Bit Setup Cycle Value (FBSC_4to0, STFBSC_4to0, and SRFBSC_4to0)

1st Bit setup Cycle	FBSC's value	1st Bit setup Cycle	FBSC's value
02 × Tcyc	B'0 0000	18 × Tcyc	B'1 0000
03 × Tcyc	B'0 0001	19 × Tcyc	B'1 0001
04 × Tcyc	B'0 0010	20 × Tcyc	B'1 0010
05 × Tcyc	B'0 0011	21 × Tcyc	B'1 0011
06 × Tcyc	B'0 0100	22 × Tcyc	B'1 0100
07 × Tcyc	B'0 0101	23 × Tcyc	B'1 0101
08 × Tcyc	B'0 0110	24 × Tcyc	B'1 0110
09 × Tcyc	B'0 0111	25 × Tcyc	B'1 0111
10 × Tcyc	B'0 1000	26 × Tcyc	B'1 1000
11 × Tcyc	B'0 1001	27 × Tcyc	B'1 1001
12 × Tcyc	B'0 1010	28 × Tcyc	B'1 1010
13 × Tcyc	B'0 1011	29 × Tcyc	B'1 1011
14 × Tcyc	B'0 1100	30 × Tcyc	B'1 1100
15 × Tcyc	B'0 1101	31 × Tcyc	B'1 1101
16 × Tcyc	B'0 1110	32 × Tcyc	B'1 1110
17 × Tcyc	B'0 1111	33 × Tcyc	B'1 1111

Note: In Normal mode, Tcyc is period of I2Cck.
In Duty variable mode, Tcyc is period of MOD_CLK.

107.3 Operation

107.3.1 Data and Clock Filters

These blocks filter out glitches on signals coming from the I2C bus. Glitches up to one internal clock period in width are rejected (for details on the internal clock frequency, see section 107.2.9, Clock Control Register (ICCCR)). This is for the faster I2C bus rate (400 kHz) but does not violate the slower I2C bus rate specification.

These blocks also resynchronize bus signals with the internal clock.

107.3.2 Clock Generator

The clock generator has two functions. Firstly, it generates the SCL (I2C bus clock) according to commands of the master or slave interface. Secondly, it controls the internal clock rate, used by filtering blocks and the master and slave interfaces. This clock functions as a clock enable signal of the registers in these blocks.

107.3.3 Master/Slave Interfaces

These two interfaces run independently and in parallel. The master interface controls the transmission of address and data on the I2C bus. The slave interface monitors the I2C bus and takes part in transmissions if its programmed address is seen on the bus. The interfaces communicate with the control/status registers independently. There is only one interrupt line output from the I2C module. The interrupt source is either the master or the slave.

107.3.4 Software Status Interlocking

To make the software interface with the I2C module as robust and thus simple as possible, various interlocking status mechanisms have been included in the operation of the master and slave interfaces. The status bits involved are:

(1) MDR and SDR

MDR or SDR is set to 1 when data is received. Clear the status after reading the receive data register. If data is received while MDR or SDR is set, the hardware recognizes that unread data remains in the receive data register and automatically holds SCL at the low level to suspend data transmission. In this case, transmission can be resumed by clearing the status after reading the receive data.

Consequently, when receiving data continuously, be sure to clear the status bit (MDR or SDR) after reading the receive data register.

(2) MDE and SDE

If the MDE or SDE status bit is still set when data in the transmit data register is to be transmitted on the I2C bus by the slave or master, the SCL line must be held low until the MDE or SDE status bit is reset. The MDE or SDE status bit being set indicates that the data currently held in the transmit data register has already been transmitted on the I2C bus.

The software must clear this status bit when it writes to the transmit data register after transmission of the next data byte has become possible. This is not required for the first byte of data to be transmitted on the bus.

(3) MAL

When the master loses arbitration, the MAL bit (of the master status register) is set and the master interface is disabled. At this point, master mode is invalid and the I2C bus interface enters the slave mode. When master interface is restored, MAL bit must be cleared before the address re-transmission.

(4) SAR

The SAR status bit is set when the slave identifies its address on the I2C bus. At this point the slave interface forces the SCL line low until the SAR status bit is reset.

This is particularly important when a slave transmit is about to take place on the bus, and the slave will transmit the data from the transmit data register. The software responds to the SAR status by writing the required data into the transmit data register and then resetting the SAR status bit. This allows the slave interface to continue the access.

Unless the SAR bit is in use, when the slave is about to receive data, the software might still be reading out data that was loaded in previous access from the receive data register. In this case the valid data still held in the receive data register is overwritten. However, this is avoided using the SAR status bit. After the software has read data in the receive data register, reset the SAR bit (if it is set). Then overwriting the receive data register is avoided.

107.3.5 I2C Bus Data Format

Figure 107.3 shows a timing chart for the I2C bus interface. Table 107.6 describes the meaning of each symbol in Figure 107.3.

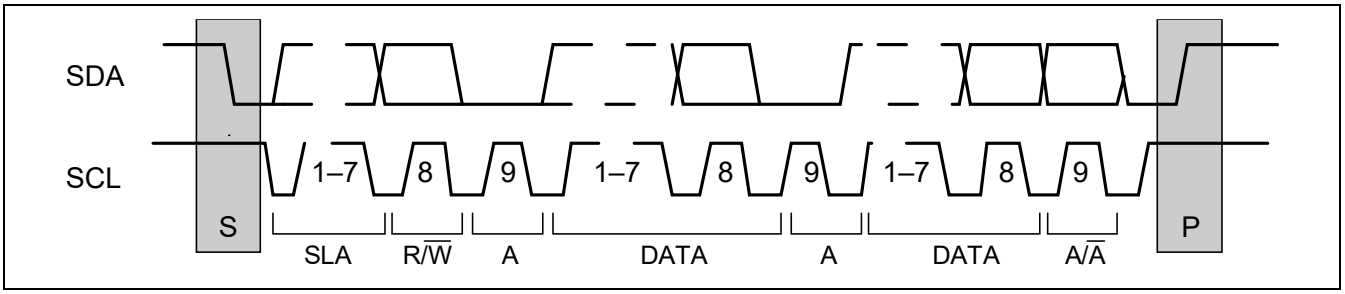

Figure 107.3 I2C Bus Timing

Table 107.6 Description on Symbols of I2C Bus Data Format

Symbol	Description
S	Indicates a start condition. A master device changes SDA from high to low while SCL is high level.
SLA	Indicates a slave address. A slave address is used when a master device selects a slave device.
R/$\overline{W}$	Indicates the direction of data transmission. If the R/$\overline{W}$ bit is 1, the data flows from the slave to the master device. If the bit is 0, the data flows from the master to the slave device.
A	Indicates data acknowledge. Data receiving device makes SDA low level (the slave device returns a data acknowledge signal in master transmission mode, and vice versa).
DATA	Indicates transmit or receive data. The data length is eight bits, which are transferred in the MSB first.
P	Indicates a stop condition. A master device changes SDA from low to high while SCL is high.

107.3.6 7-Bit Address Format

Figure 107.4 shows the format of data transfer from a master to a slave device (master data transmit format). Figure 107.5 shows the data transfer format (master data receive format) when a master device reads the second and the following byte data from a slave device.

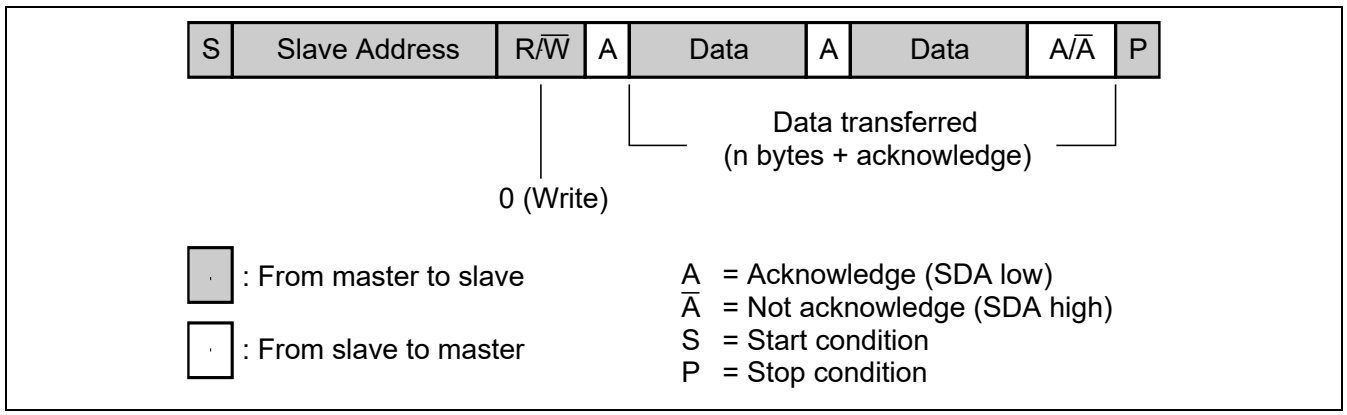

Figure 107.4 Master Data Transmit Format

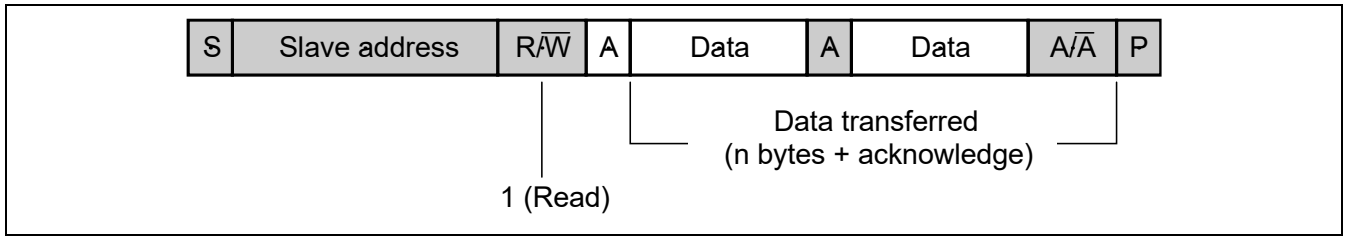

Figure 107.5 Master Data Receive Format

Figure 107.6 shows the combined format when the data transfer direction changes during one transfer. When changing the direction after the first transfer, the repeated START condition (Sr), slave address and R/ bits are transmitted. In this case, the R/ bit is set to the direction opposite to the first transfer direction. The repeated START condition is issued by the master at the end of a transmit or receive cycle if the enable start generation bit in the master control register has been set.

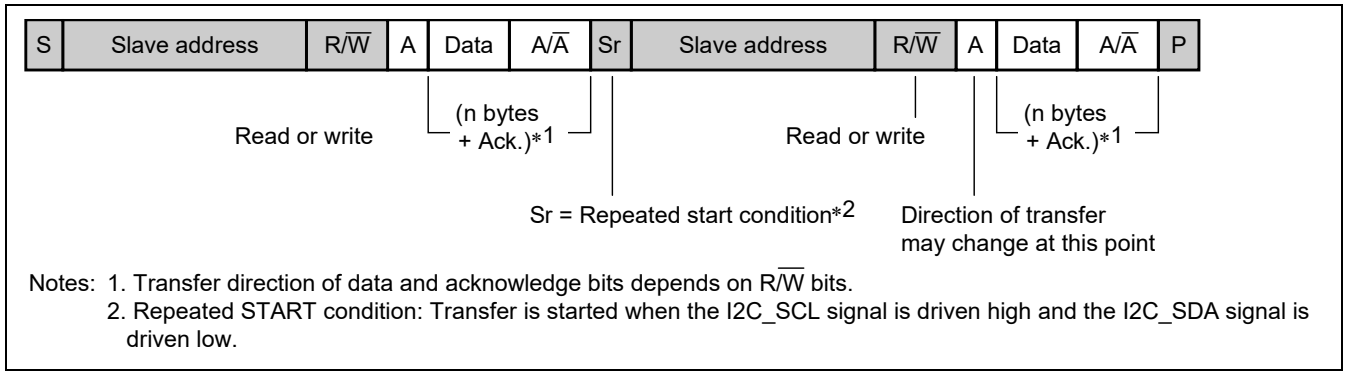

Figure 107.6 Combination Transfer Format of Master Transfer

107.3.7 10-Bit Address Format

Description is given below on the 10-bit address transfer format supported in master mode. This format has three transfer methods as the 7-bit address transfer format.

Figure 107.7 shows the data transmit format. The set value in the master address register is output in one byte following the first START condition (S). The value set in the transmit data register (TXD) is transmitted as a slave address in the second byte. Data on and after the third byte is transferred in the same way as the 7-bit address data.

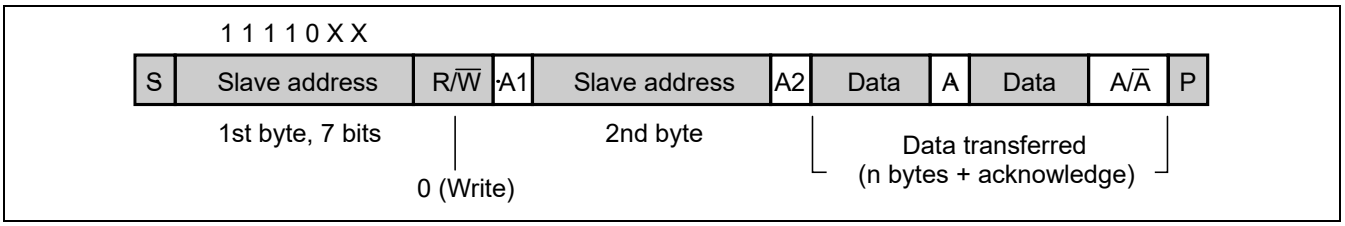

Figure 107.7 10-Bit Address Data Transmit Format

Figure 107.8 shows the data receive format. Two bytes of an address is transmitted in the same way as in the data transmit format. Then, repeated START condition (Sr) is transmitted and the value set in the address register is output. At this time, STM1 must be set to 1 (receive mode). Data is transferred in the same way as in the 7-bit address data receive format.

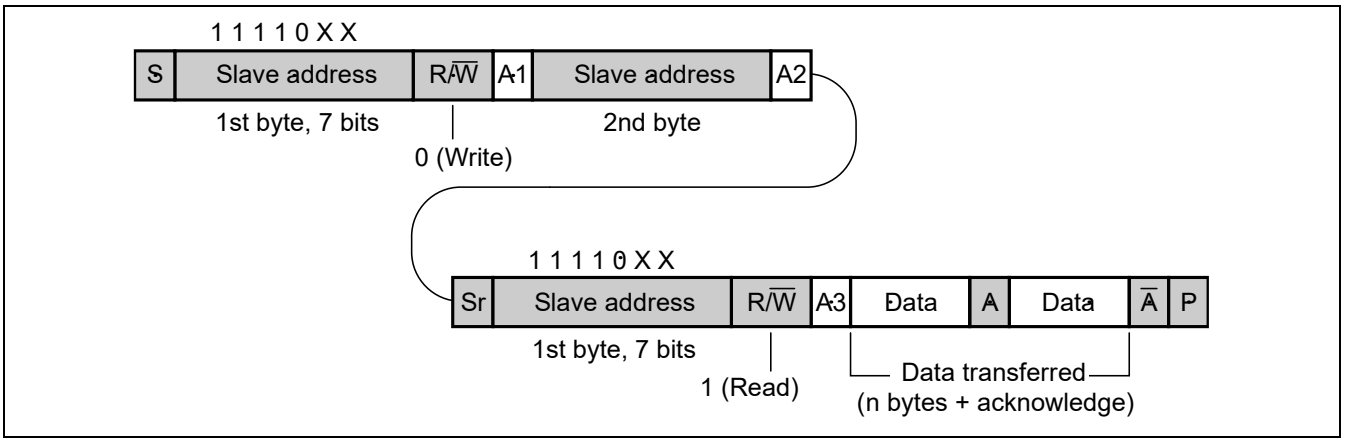

Figure 107.8 10-Bit Address Data Receive Format

Figure 107.9 shows the data transmit/receive combined format.

In the data transmit/receive combined format, data is transmitted after an address is transmitted with the first two bytes. Then, the repeated START condition (Sr) is transmitted instead of STOP condition (P). After Sr is transmitted, the procedure is the same as that in the data receive format.

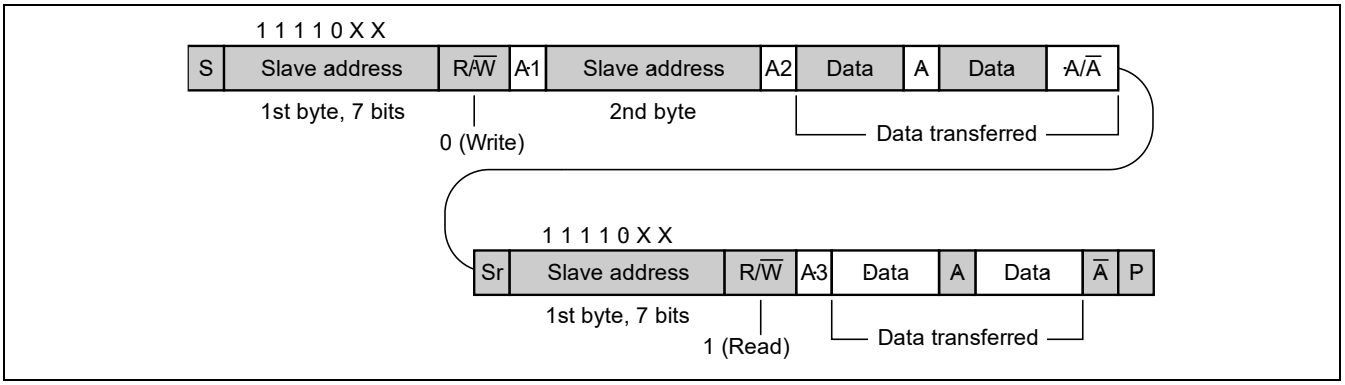

Figure 107.9 10-Bit Address Transmit/Receive Combined Format

107.3.8 Master Transmit Operation

The procedure and operations for transmission in master transmit mode are described below. Figure 107.10 shows the timing chart in master transmit mode. Setting the ICMCR.MDBS bit allows the I2C to operate in single-buffer mode.

1. Set up the initial state by setting the ICMAR, ICTXD, ICCCR, and ICMIER. Note that the setting of the clock control register must be in accord with the rate of transmission.
2. Monitor the ICMCR.FSDA. Confirm that this bit is low, meaning that other I2C devices are not using the bus. After confirmation, set the ICMCR.MIE (bit 3) and ICMCR.ESG (bit 0) bits to 1 to start master transmission.
3. After the transmit START condition, slave address, and data transfer direction bits are transmitted, an interrupt due to the ICMSR.MAT and ICMSR.MDE bits is generated at the timing of (1) in Figure 107.10. At this time, clear the ICMCR.ESG bit to 0. To suspend the data transmission, the master device will hold SCL low until the ICMSR.MDE bit is cleared.
4. Data is transmitted in units of nine bits: 8-bit data and 1-bit ACK. An interrupt of MDE (bit 3) is generated at the ninth clock before data transfer (at the timing of (2) in Figure 107.11, Figure 107.12). An interrupt of ICMSR.MDT (bit 2) is generated at the eighth clock after 1-byte data transfer (at the timing of (3) in Figure 107.11, Figure 107.12). Clear ICMSR.MDE to 0 after setting transmit data.
5. When this I2C receives NACK from the slave device, ICMSR.MNR is set to 1.
   After that, this I2C makes STOP condition and ICMSR.MST is set to 1.
6. To end of transmission, need to set ICMCR.FSB = 1.
   ICMCR.FSB must be set by MDE interruption at final byte data transmission.
   ICMSR.MST (master stop transmitted, at the timing of (4) in Figure 107.12) is checked by interruption or polling.

Signal level changes of (1) to (4) in Figure 107.10, Figure 107.11 and Figure 107.12 are generated after the falling edge of the clock.

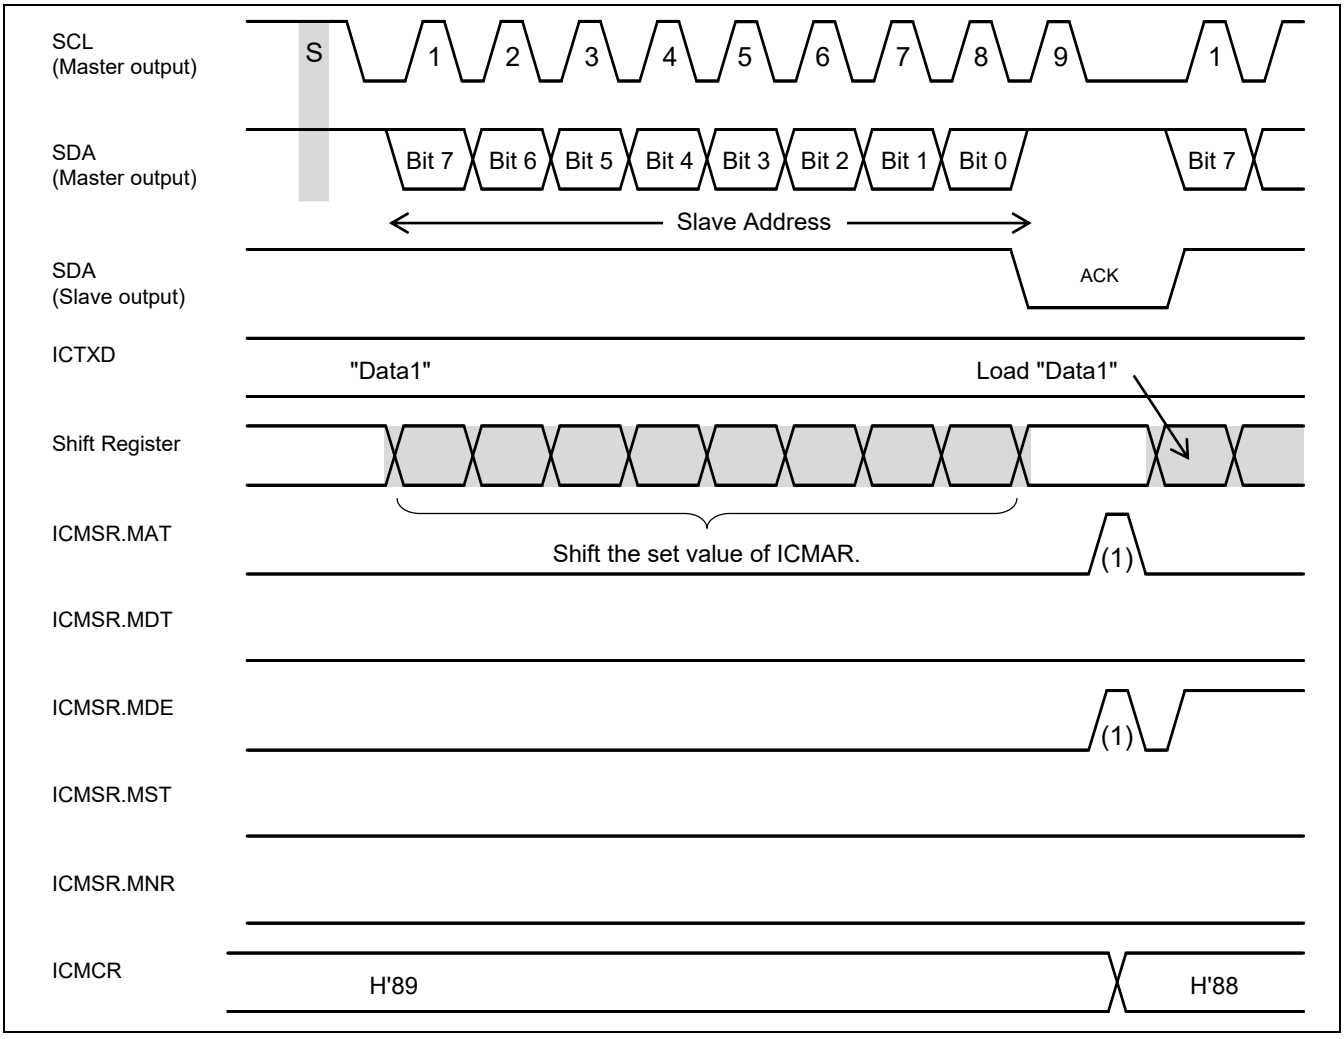

Figure 107.10 Data Transmit Mode Operation Timing

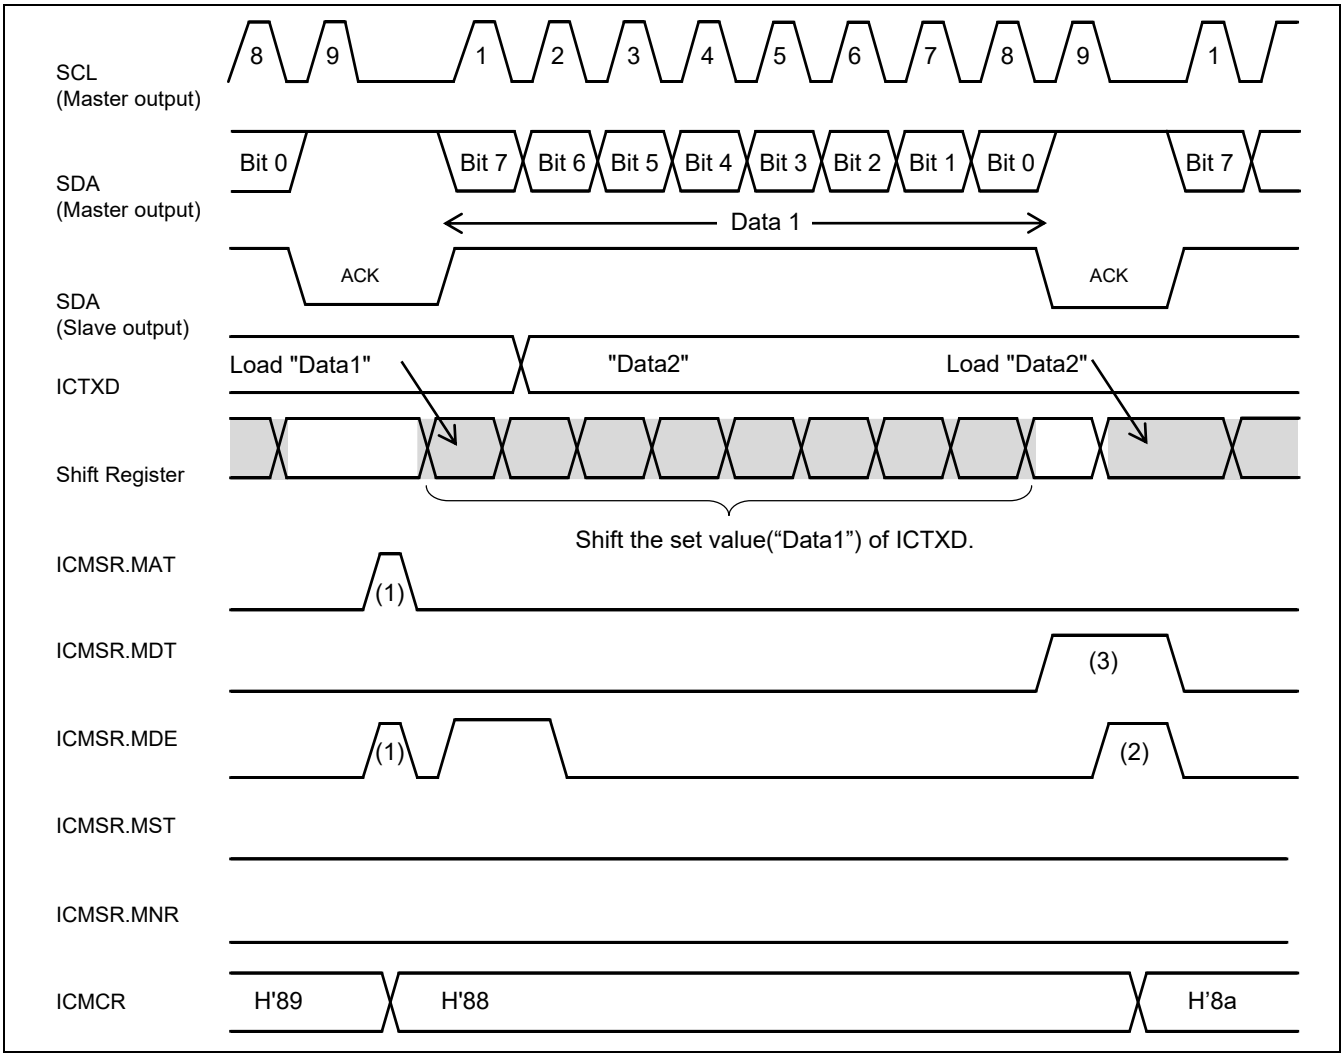

Figure 107.11 Data Transmit Mode Operation Timing

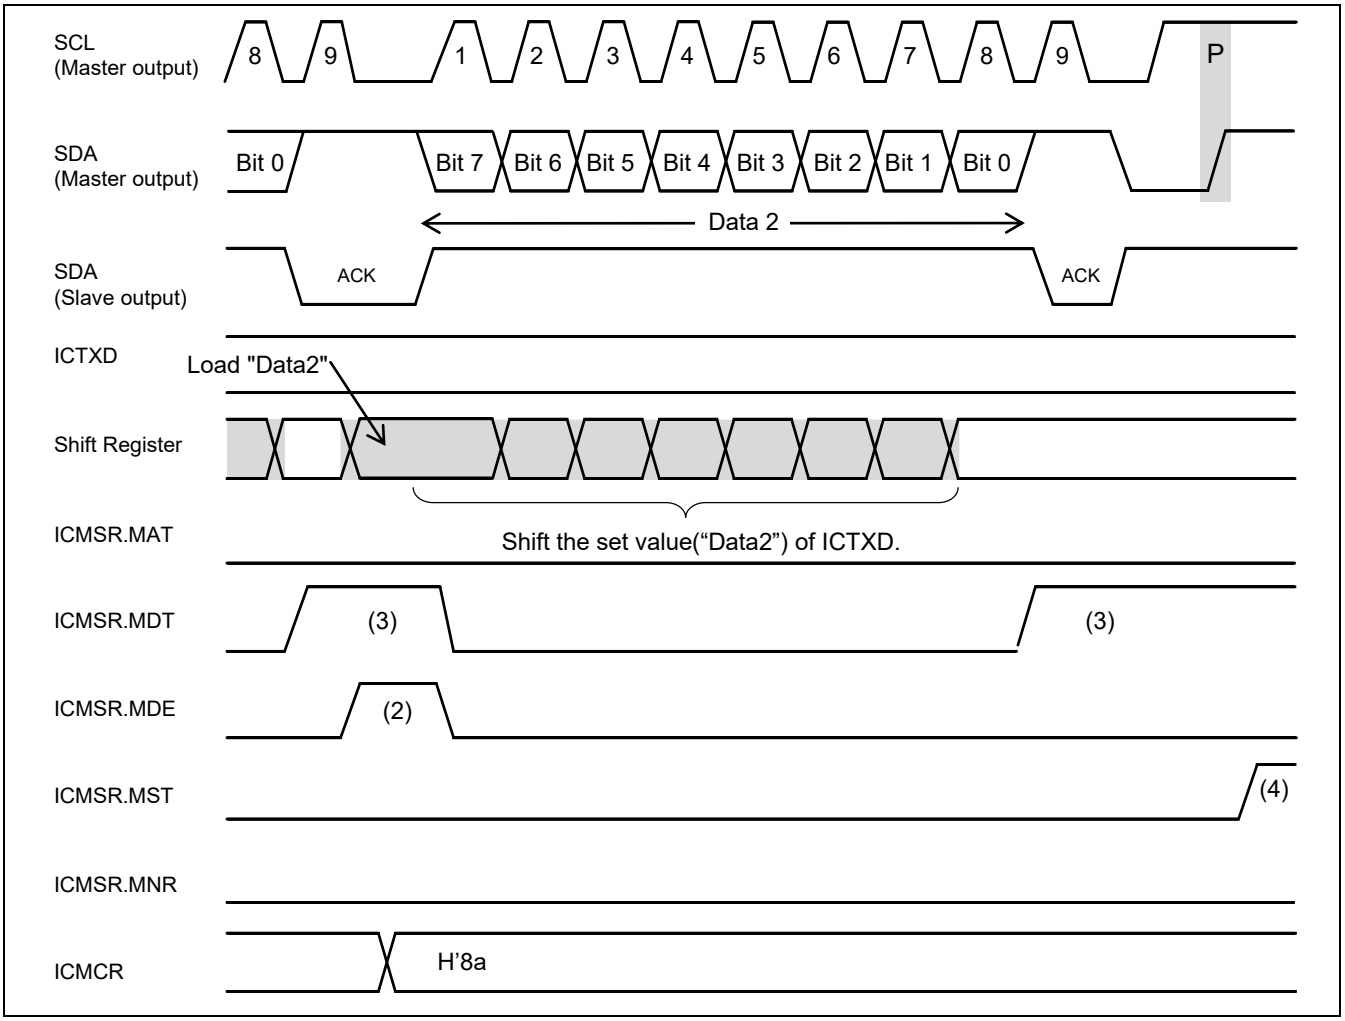

Figure 107.12 Data Transmit Mode Operation Timing

107.3.9 Master Receive Operation

The data receive procedure and operation in master receive mode are described below. Figure 107.13 shows the timing chart in master receive mode. Setting the ICMCR.MDBS bit allows the I2C to operate in single-buffer mode.

1. In master receive mode, as to transmit of a slave address and a 1-bit signal indicating the data transfer direction, operation is the same as that in master transmit mode. At this time, set the data transfer direction to 1 (reception).
2. The slave device automatically enters the data transmit mode according to the signal that indicates the data transfer direction, and transmits 1-byte data in synchronization with the SCL clock output from the master device. The master device generates an interrupt of ICMSR.MDR (bit 1) at the eighth clock (at the timing of (1) in Figure 107.13 , Figure 107.14).

   Clear the ICMSR.MDR bit after the master device reads ICRXD. If this processing is delayed, the master device extends the SCL period to suspend data transmission (at the timing of (2) in Figure 107.13 , Figure 107.14).
3. To end data transfer, set ICMCR.FSB (bit 1) of the master device and output STOP condition. In order to stop the communication after predetermined number of byte data is transferred, ICMCR.FSB bit needs to be set before the last byte data transfer is started. After confirming reception of the last byte, even when the master receiver has completed the reception transaction.

Signal level changes of (1) to (2) in Figure 107.13 and Figure 107.14 are generated after the falling edge of the clock.

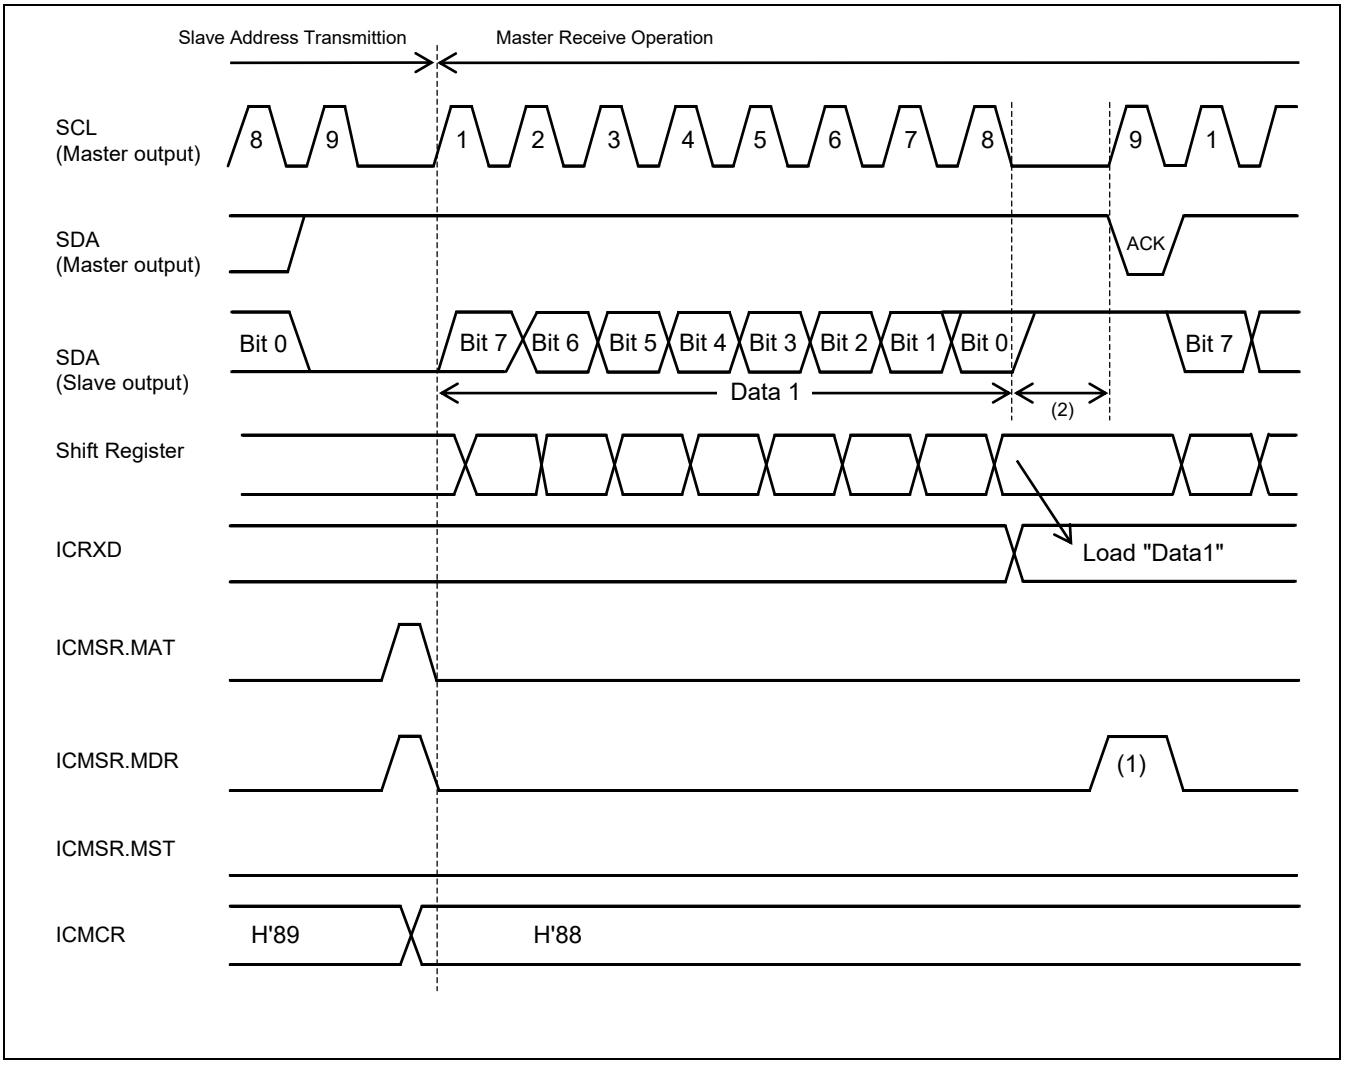

Figure 107.13 Data Receive Mode Operation Timing

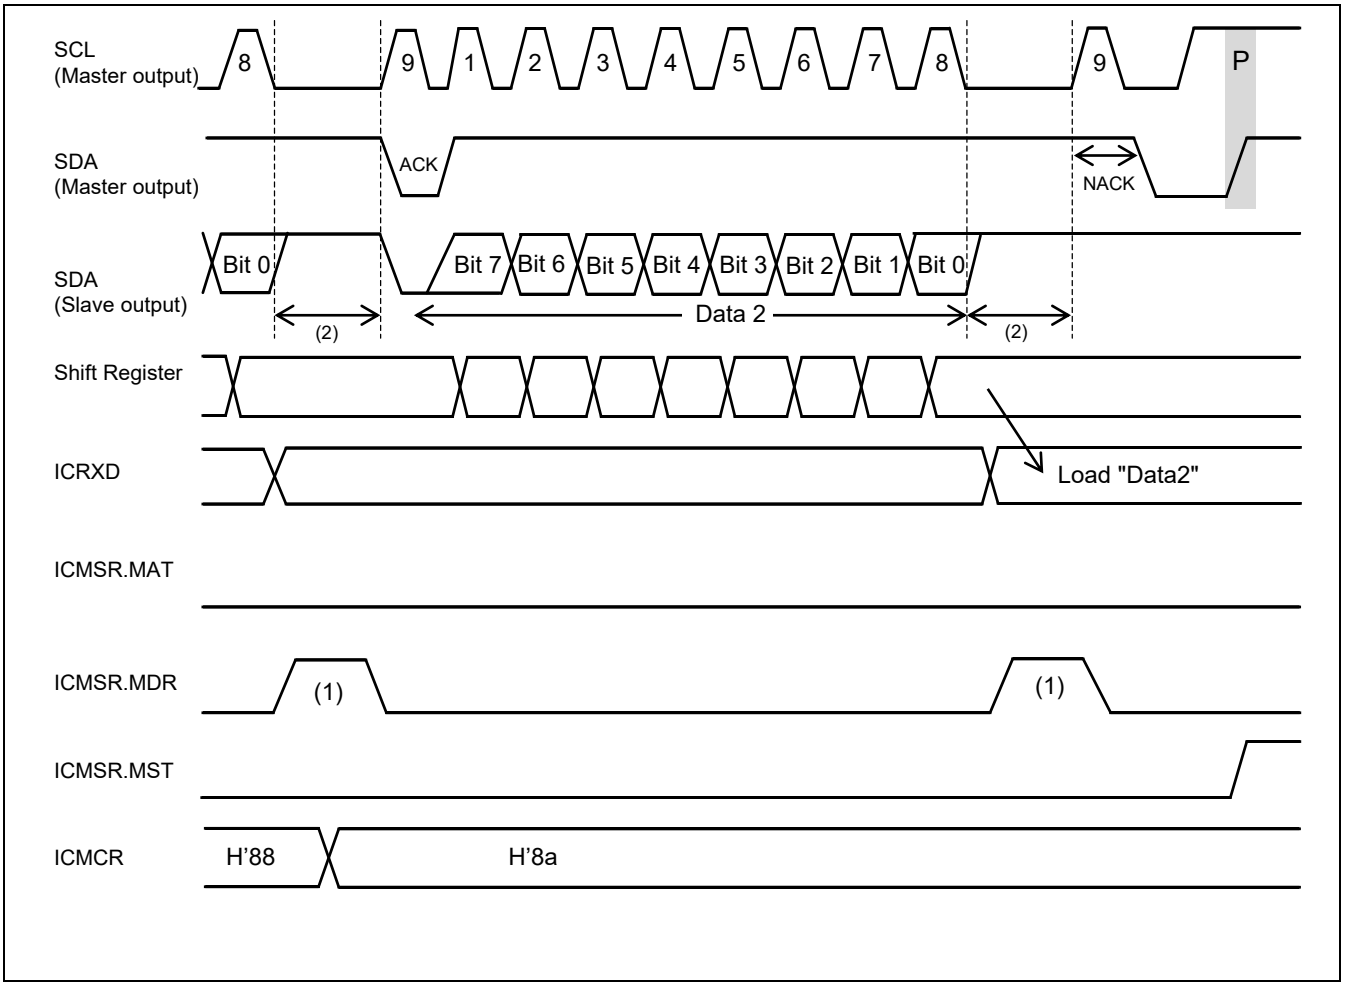

Figure 107.14 Data Receive Mode Operation Timing

107.3.10 Programming Example

107.3.10.1 Master Transmitter

In order to set up the master interface to transmit a data packet on the I2C bus, follow the procedure below (an example for I2C0):

(a) Set value for the clock control register

1. Reset I2C with SRCR and SRSTCLR.
2. Set the Clock Control register 2 (ICCCR2) = H'07 (CDFD = 1, HLSE = 1, SME = 1).
3. Set the Clock Control register (ICCCR) = H'06 (SCGD = 0, CDF = 6, I2C internal clock I2Cck: 19 MHz).
   - Setting ICCCR, ICCCR2 for using Duty ratio fixed or Duty ratio variable. The case for using Variable Duty ratio, have to setting ICCCR2 too. The case for using Fixed Duty ratio, have to setting ICCCR only.
4. Set the SCL Mask Control register (ICMPR) = H'1C (Variable Duty ratio only).
5. Set the SCL High Control register (ICHPR) = H'73 (Variable Duty ratio only).
6. Set the SCL Low Control register (ICLPR) = H'85 (Variable Duty ratio only).
7. Set the First Bit Setup Cycle register (ICFBSCR) = H'0F (1^{st} bit setup cycle = 17 × Tcyc).

(b) Set value for the master control register, first data byte, and address

1. Clear the Master Status register (ICMSR) = H'00 (all 0 clear).
2. Set the Master Interrupt Enable register (ICMIER) = H'09 (MDEE = 1, MATE = 1).
3. Set the Master Address register (ICMAR) = Slave device address + H'00 (Write mode).
4. Set the Transmit Data register (ICTXD) = 1^{st} transmission data.
5. Set the Master Control register (ICMCR) = H'89 (MDBS = 1, MIE = 1, ESG = 1).

(c) Wait for outputting address

1. Wait for master event (an interrupt of the ICMSR.MAT and ICMSR.MDE).
2. Set ICMCR to H'88 (to suspend the data transmission, the master device will hold the SCL low until the MDE bit is cleared).
   — If only one byte of data is transmitted, set the ICMCR to H'8A, meaning that the stop generation is enabled. This generates a stop on the bus as soon as one byte has been transmitted.
3. Clear the ICMSR.MAT & ICMSR.MDE bits.

(d) Monitor transmission of data

1. Wait for master event, ICMSR.MDE.
2. ICTXD = subsequent data.
3. Clear the ICMSR.MDE bit.

   Clear ICMSR.MDE after setting the last byte to be transmitted. After the last byte data is loaded into the shift register, ICMSR.MDE is generated. Before clearing ICMSR.MDE, you must set ICMSR to H'8A (set the force stop control bit).

(e) Wait for end of transmission

1. Wait for the master event, ICMSR.MST.
2. Clear the ICMSR.MST bit.

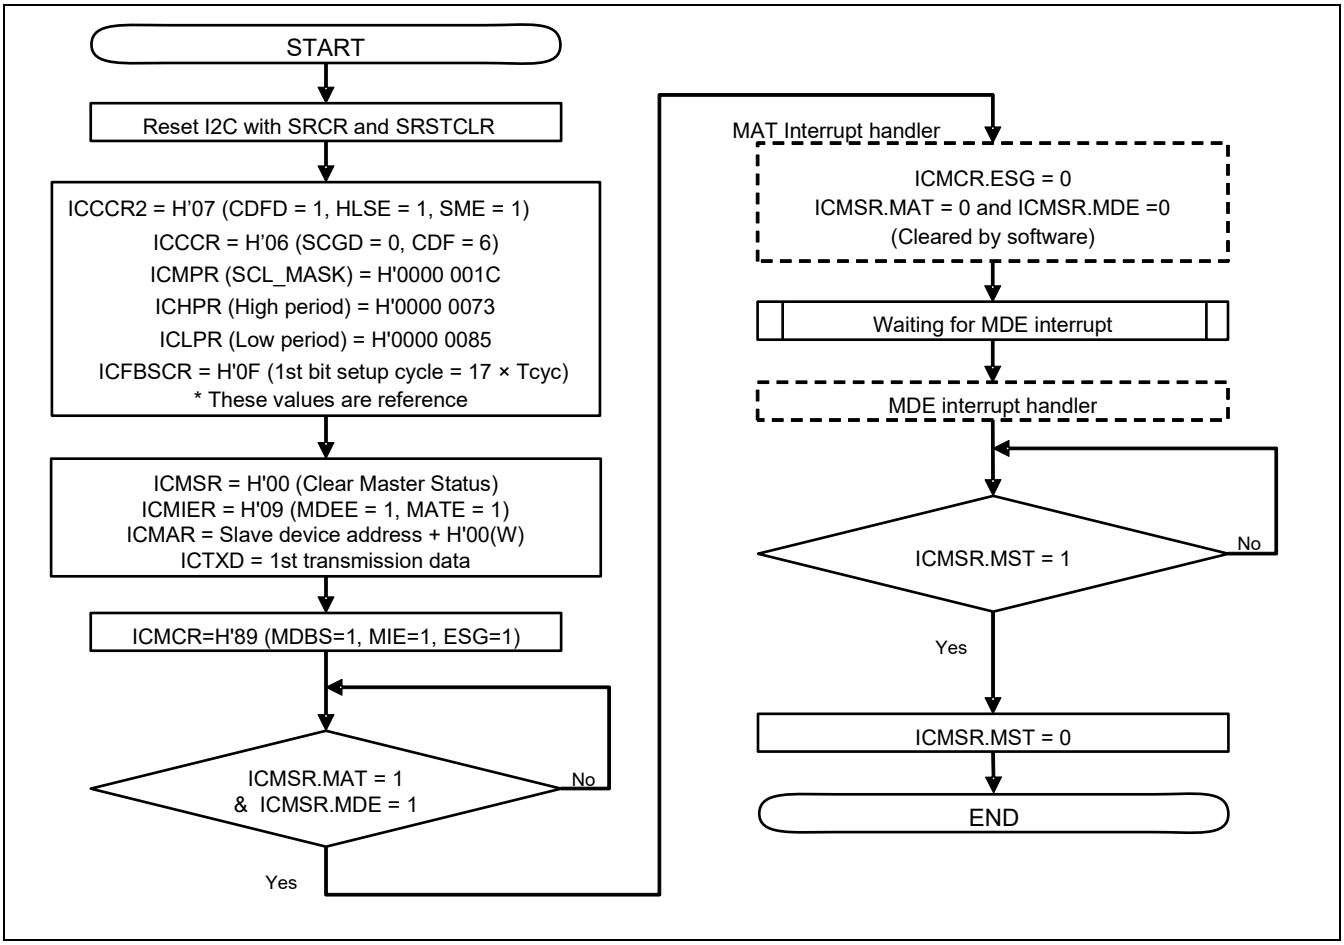

Figure 107.15 Master Transmitter Operation Setting

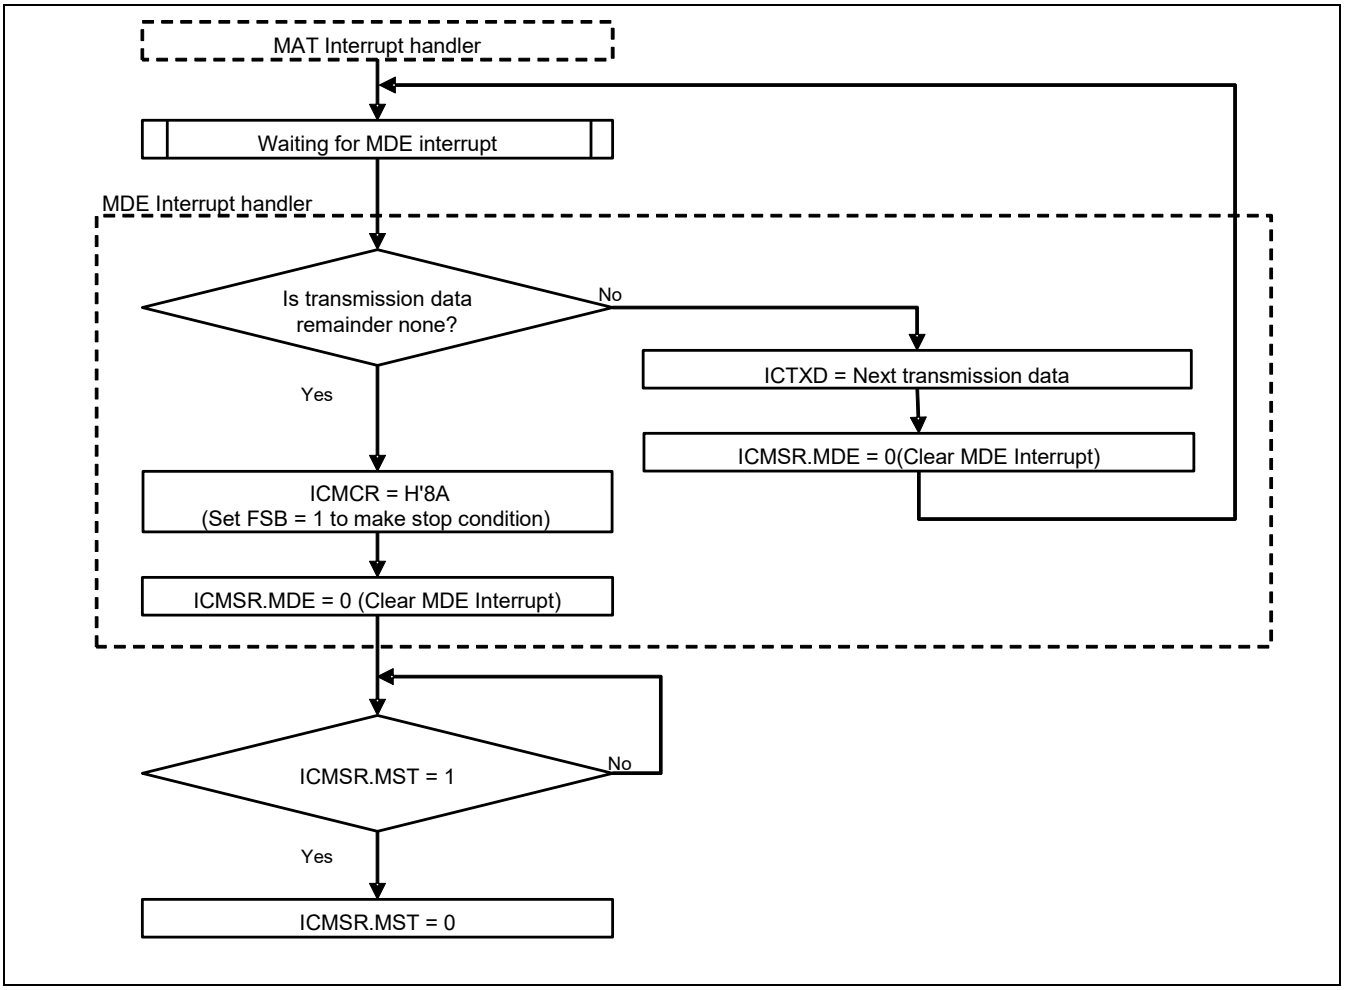

Figure 107.16 MDE Interrupt Handler for Master Transmitter Operation Setting

107.3.10.2 Master Receiver

In order to set up the master interface to receive a data packet on the I2C bus, follow the procedure below:

(a) Set value for the clock control register

The same procedure as the master transmitter is applied. See the program example for the master transmitter.

(b) Set value for the master control register and address

1. Clear the Master Status register (ICMSR) = H’00 (all 0 clear)
2. Set the Master Interrupt Enable register (ICMIER) = H’03 (MDRE = 1, MATE = 1)
3. Set the Master Address Register (ICMAR) = Slave device address + H’01 (Read mode)
4. Set the Master Control Register (ICMCR) = H'89 (MDBS = 1, MIE = 1, ESG = 1)

(c) Wait for outputting address

1. Wait for master event (an interrupt of the ICMSR.MAT and ICMSR.MDR).
2. Set the ICMCR to H'88 (to suspend the data transmission, the master device will hold the SCL low until the MDR bit is cleared).
   — If only one byte of data is transmitted, set the ICMCR to H'8A, meaning that the stop generation is enabled. This generates a stop on the bus as soon as one byte has been received.
3. Clear the ICMSR.MAT & ICMSR.MDR bits.

(d) Monitor reception of data

1. Wait for master event, ICMSR.MDR.
2. Set the ICMCR to H'8A (set the ICMCR.FSB) before the last byte data transfer is started.
3. Clear the MDR bit after reading data from the ICRXD.

(e) Wait for end of reception

1. Handle the receive interrupt (ICMSR.MDR) in the last byte: that is, read the data and clear the ICMSR.MDR.
2. Wait for master event, ICMSR.MST.
3. Clear the ICMSR.MST bit.

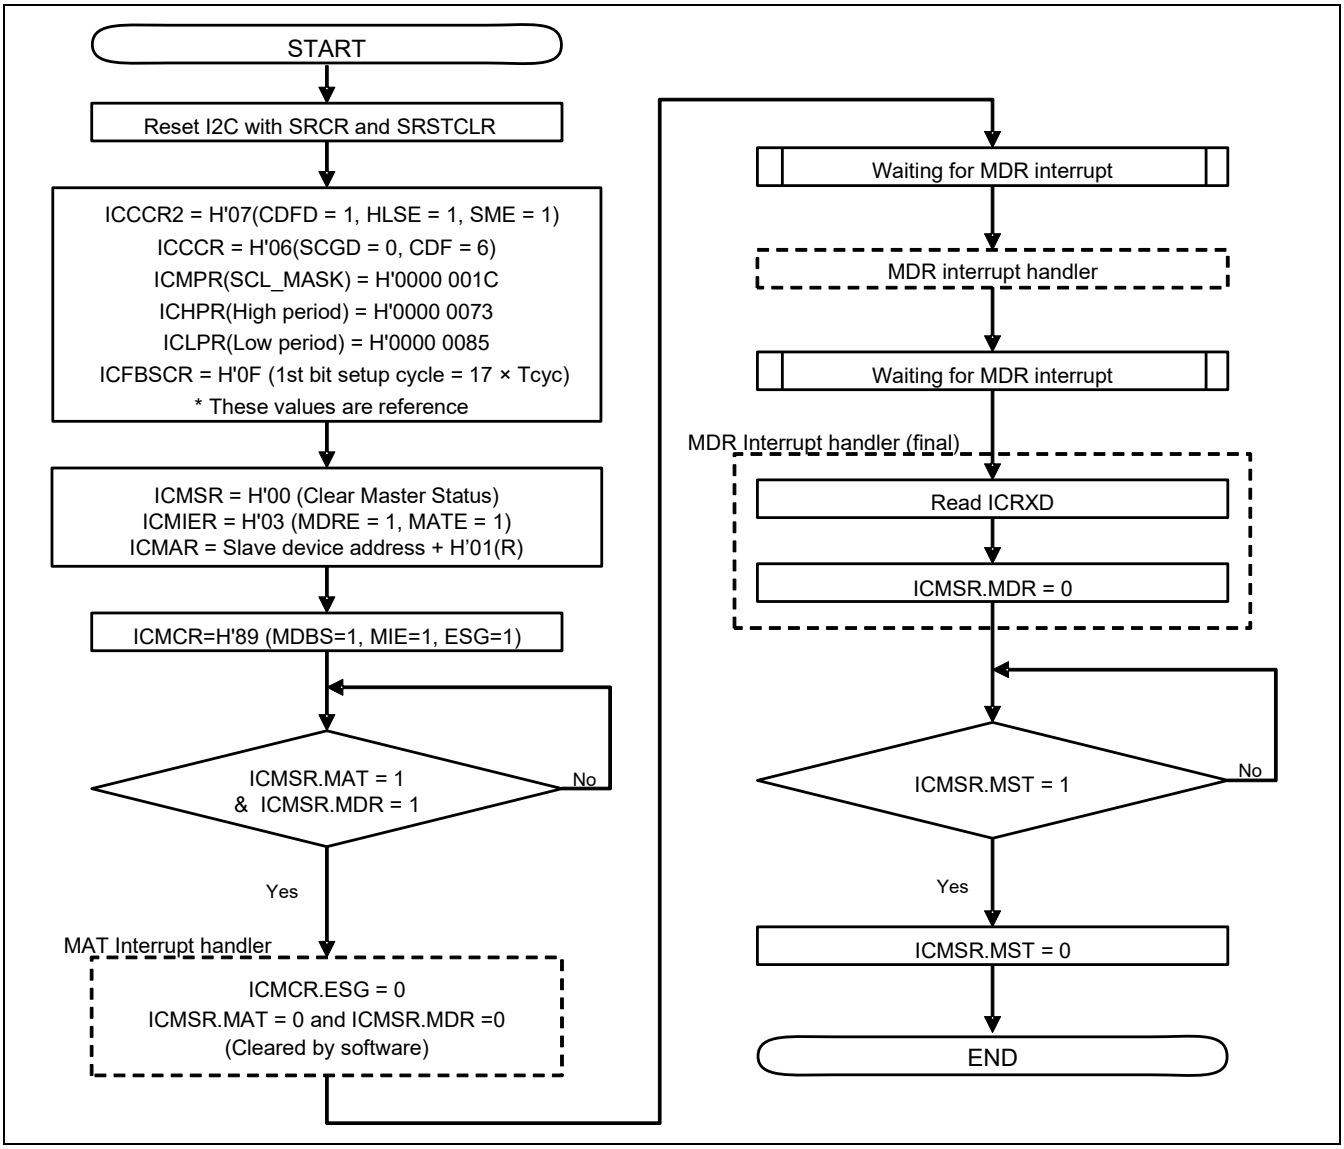

Figure 107.17 Master Receiver Operation Setting

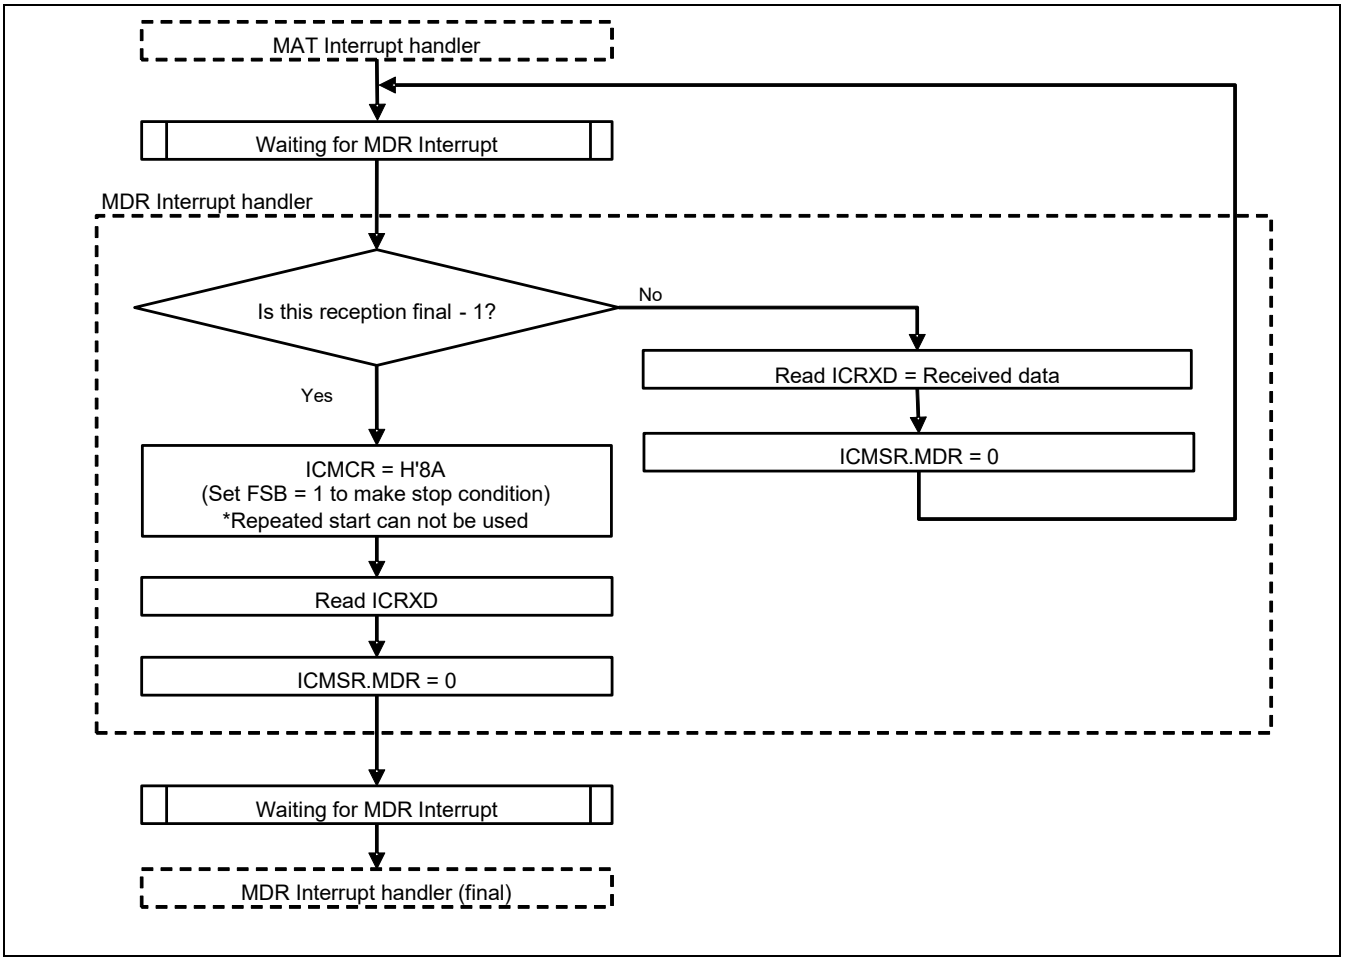

Figure 107.18 MDR Interrupt Handler for Master Receiver Operation Setting

107.3.10.3 Master Transmitter—Repeated START—Master Receiver

In order to set up the master interface to transmit a data packet on the I2C bus, issue a repeated START condition, then read byte data back from the slave, follow the procedure below:

(a) Set value for the clock control register

The same procedure as the master transmitter is applied. See the program example for the master transmitter.

(b) Set value for the master control register and address

1. Clear the Master Status register (ICMSR) = H’00 (all 0 clear).
2. Set the Master Interrupt Enable register (ICMIER) = H’0B (MDEE = 1, MDRE = 1, MATE = 1).
3. Set the Master Address register (ICMAR) = Slave device address + H’00 (Write mode).
4. Set the Transmit Data register (ICTXD) = 1st transmission data.
5. Set the Master Control register (ICMCR) = H’89 (MDBS = 1, MIE = 1, ESG = 1).

(c) Wait for outputting slave-address for master transmission

1. Wait for master event (an interrupt of the ICMSR.MAT and ICMSR.MDE bits).
2. Clear ICMCR.ESG bit..
3. Clear the ICMSR.MAT and ICMSR.MDE bits.

(d) Monitor transmission of data

1. Wait for master event (an interrupt of the ICMSR.MDE bit).
2. Set ICMAR = Slave device address + H’01 (Read mode).
3. Set ICMCR = H'89 (MDBS = 1, MIE = 1, ESG = 1).
4. Clear the ICMSR.MDE bit.

(e) Wait for outputting slave-address for master reception

1. Wait for master event (an interrupt of ICMSR.MAT and ICMSR.MDR bits).
2. Clear ICMCR.ESG bit. (To suspend stop the data transmission, the master device will hold the SCL low until the ICMSR.MDR bit is cleared.)
3. Clear the ICMSR.MAT and ICMSR.MDR bits.

(f) Monitor reception of data

1. Wait for master event (the ICMSR.MDR bit).
2. Clear the ICMSR.MDR bit after reading data from the receive data register.
3. Set ICMCR.FSB to 1 (set the force stop control bit) before the last byte data transfer is started.

(g) Wait for end of reception

1. Handle the receive interrupt (ICMSR.MDR) in the last byte: that is, read the data and clear the ICMSR.MDR.
2. Wait for master event, ICMSR.MST.
3. Clear the ICMSR.MST bit.

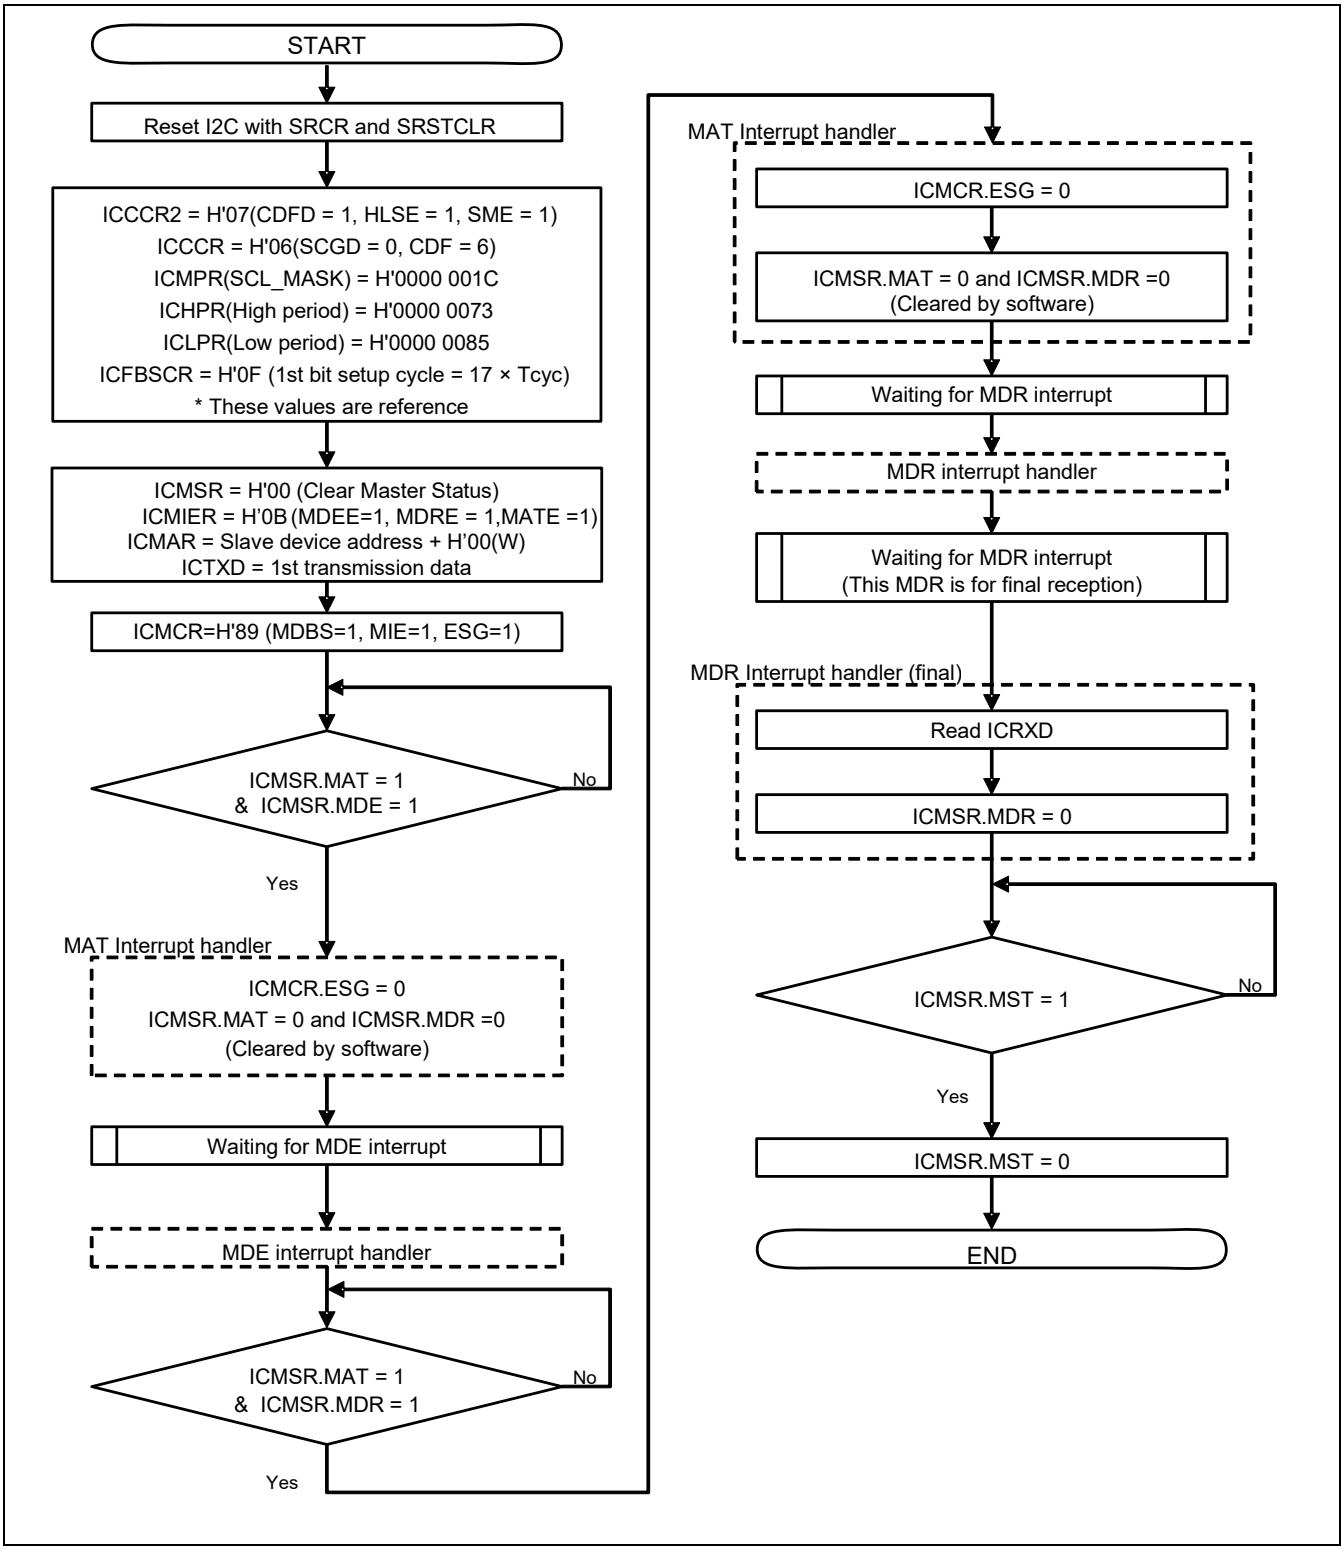

Figure 107.19 Master Transmitter – Repeated START – Receiver Operation Setting

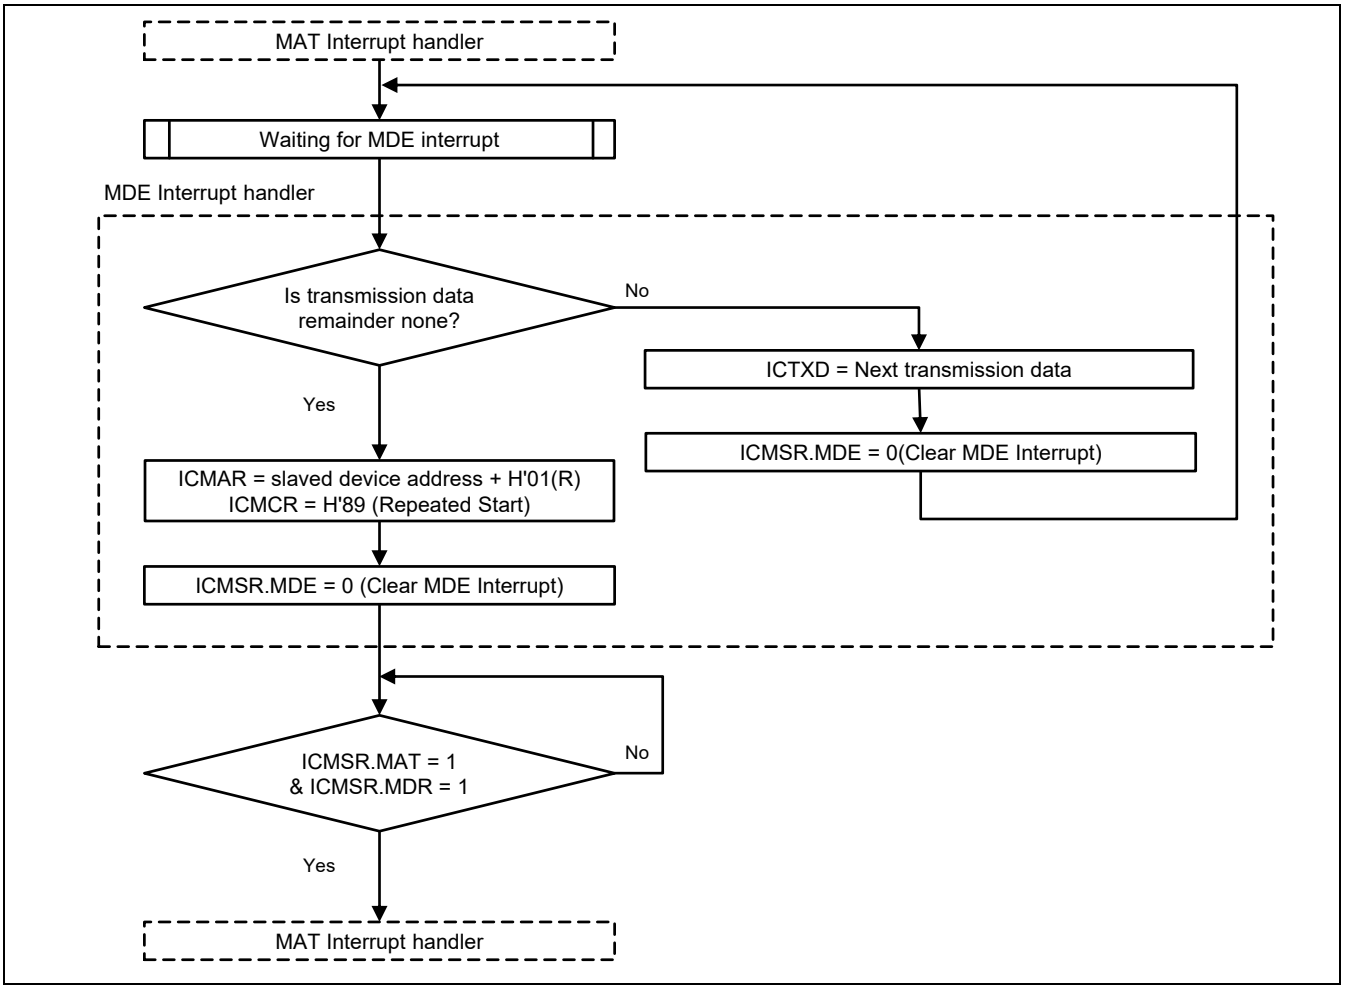

Figure 107.20 MDE Interrupt Handler for Master Transmitter – Repeated START – Receiver Operation Setting

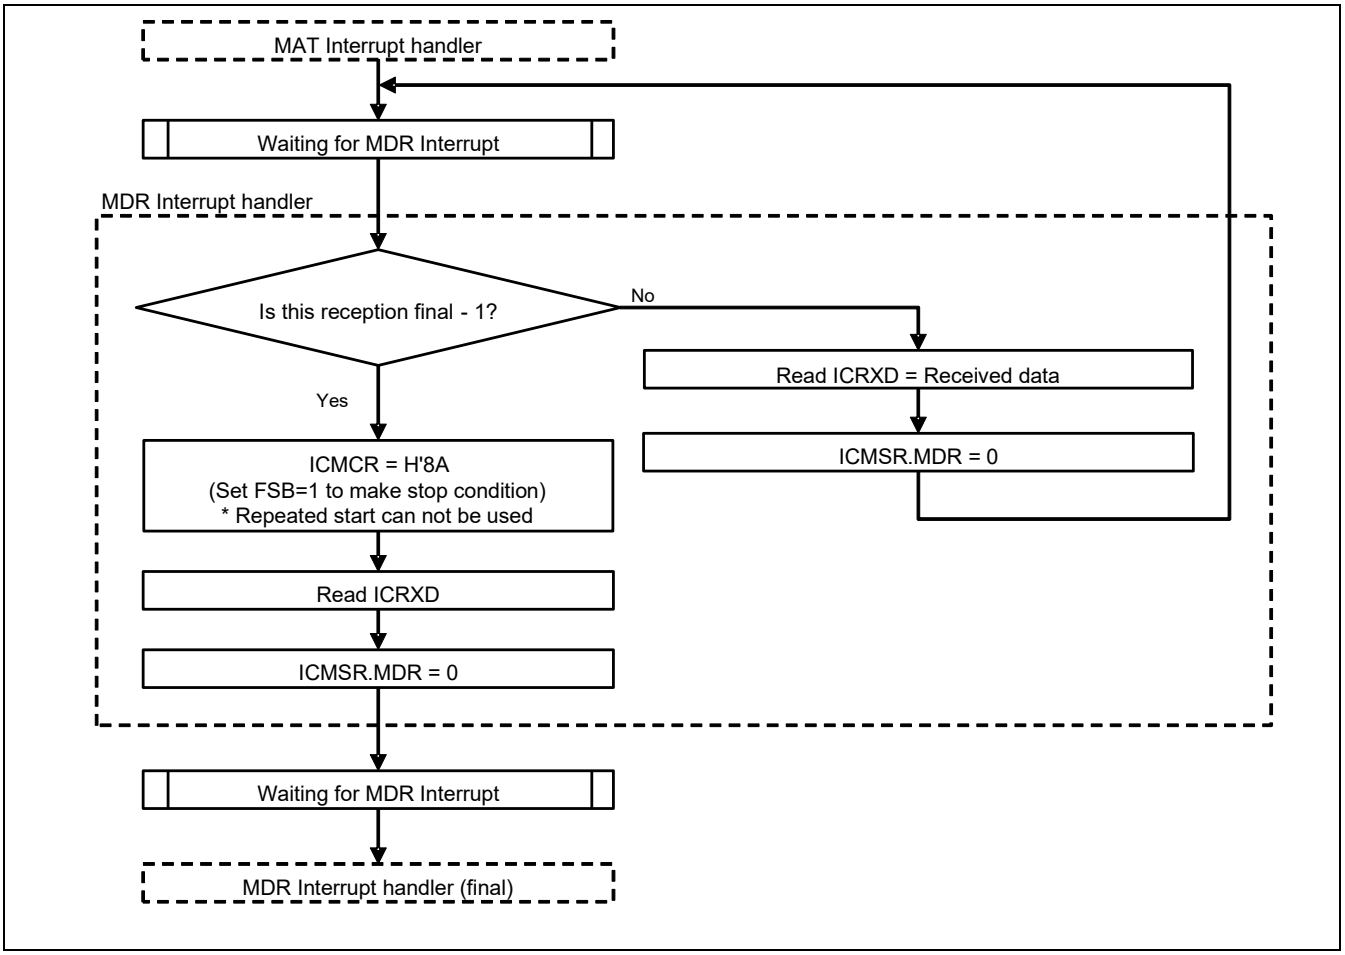

Figure 107.21 MDR Interrupt Handler for Master Transmitter – Repeated START – Receiver Operation Setting

107.3.10.4 Slave Transmitter

In order to set up the master interface to transmit a data packet on the I2C bus, follow the procedure below (an example for I2C0):

(a) Set value for the slave control register, first data byte and address

1. Reset I2C with SRCR and SRSTCLR.
2. Clear the Slave Status register (ICSSR) = H'00 (all 0 clear).
3. Set the slave Interrupt register (ICSIER) = H'09 (SDEE = 1, SARE = 1).
4. Set Slave Address register (ICSAR) = Slave device address (unique value from other slave devices).
5. Set the Transmit Data register (ICTXD) = 1st transmission data.
6. Set the Slave control register (ICSCR) = H'0E (SDBS = 1, SIE = 1, GCAE = 1).

(b) Wait for receiving address

1. Wait for slave event (an interrupt of the ICSSR.SAR).
2. Clear the ICSSR.SAR bit.

(c) Monitor transmission of data

1. Wait for master event, ICSSR.SDE.
2. ICTXD = subsequent data.
3. Clear the ICSSR.SDE bit.

   Clear ICSSR.SDE after setting the last byte to be transmitted. After the last byte data is loaded into the shift register, ICSSR.SDE is generated. So, skip writing to ICTXD at ICSSR.SDE after last byte data is loaded into the shift register.

(d) Wait for end of transmission

1. Wait for slave event, ICSSR.SSR.
2. Clear the ICSSR.SSR bit.

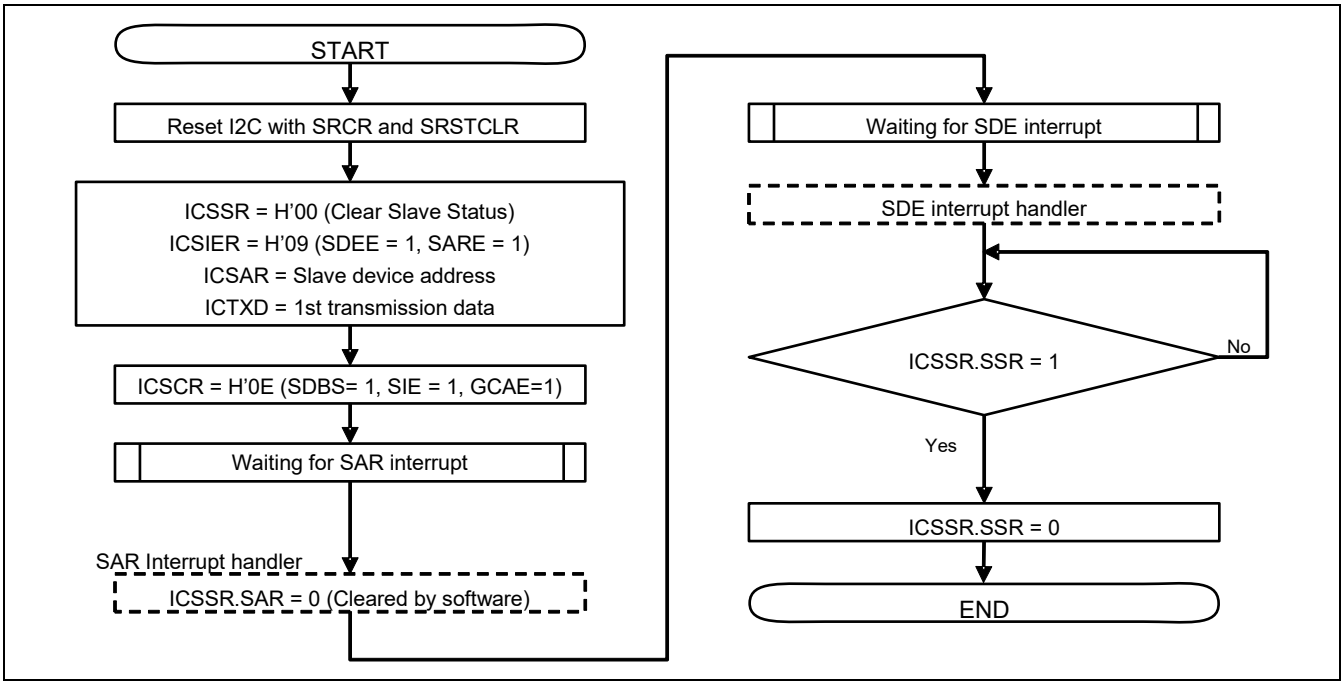

Figure 107.22 Slave Transmitter Operation Setting

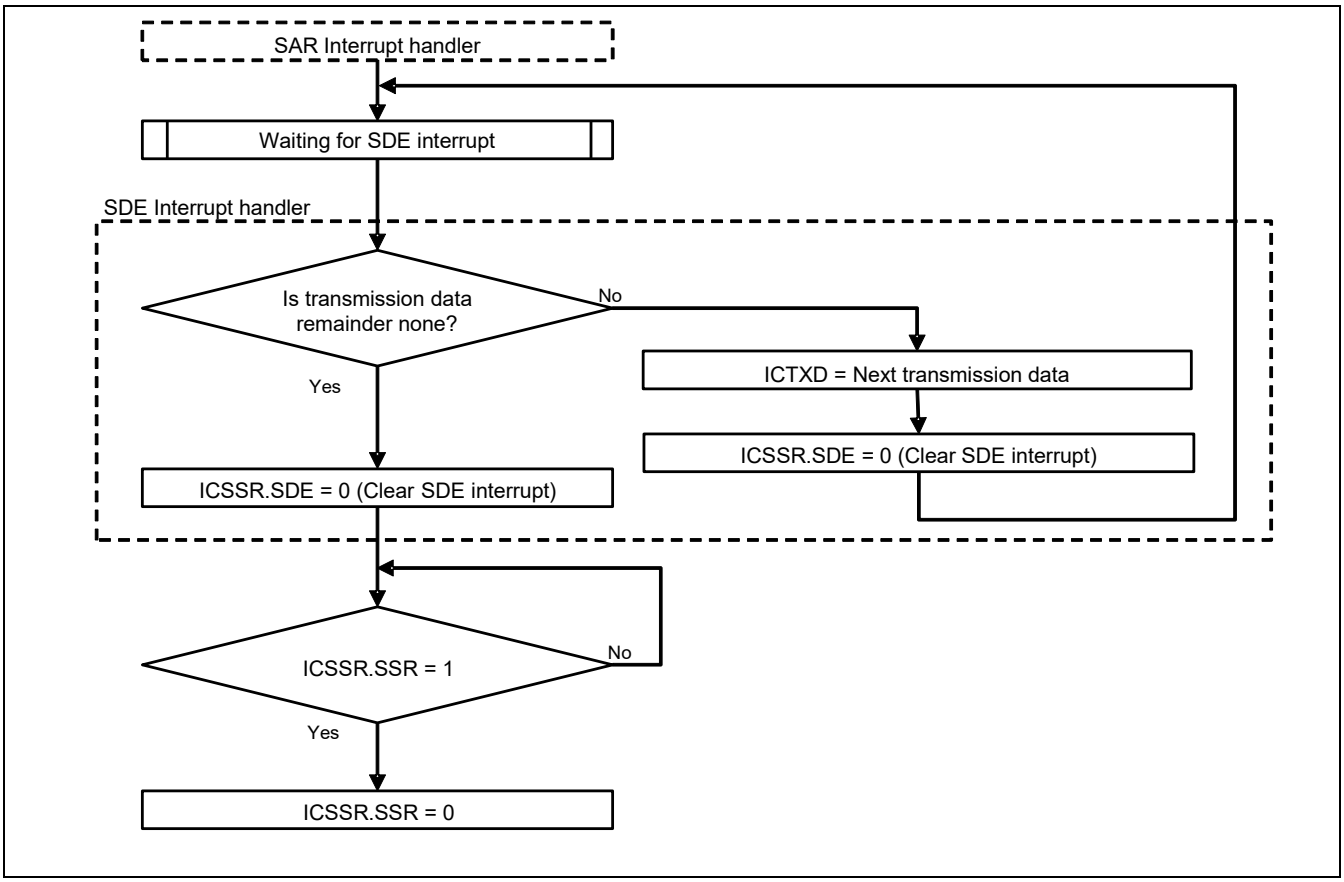

Figure 107.23 SDE Interrupt Handler for Slave transmitter Operation Setting

107.3.10.5 Slave Receiver

In order to set up the master interface to receive a data packet on the I2C bus, follow the procedure below:

(a) Set value for the master control register and address

1. Reset I2C with SRCR and SRSTCLR.
2. Clear the Slave Status register (ICSSR) = H'00 (all 0 clear).
3. Set the slave Interrupt register (ICSIER) = H'03 (SDRE = 1, SARE = 1).
4. Set Slave Address register (ICSAR) = Slave device address (unique value from other slave devices).
5. Set the Slave control register (ICSCR) = H'0E (SDBS = 1, SIE = 1, GCAE = 1).

(b) Wait for receiving address

1. Wait for slave event (an interrupt of the ICSSR.SAR).
2. Clear the ICSSR.SAR bit.

(c) Monitor reception of data

1. Wait for slave event, ICSSR.SDR bit.
2. Clear the ICSSR.SDR bit after reading data from ICRXD register.

(d) Wait for end of reception

1. Handle the ICSSR.SDR in the last byte: that is, read the data and clear the ICSSR.SDR.
2. Wait for master event, ICSSR.SSR.
3. Clear the ICSSR.SSR bit.

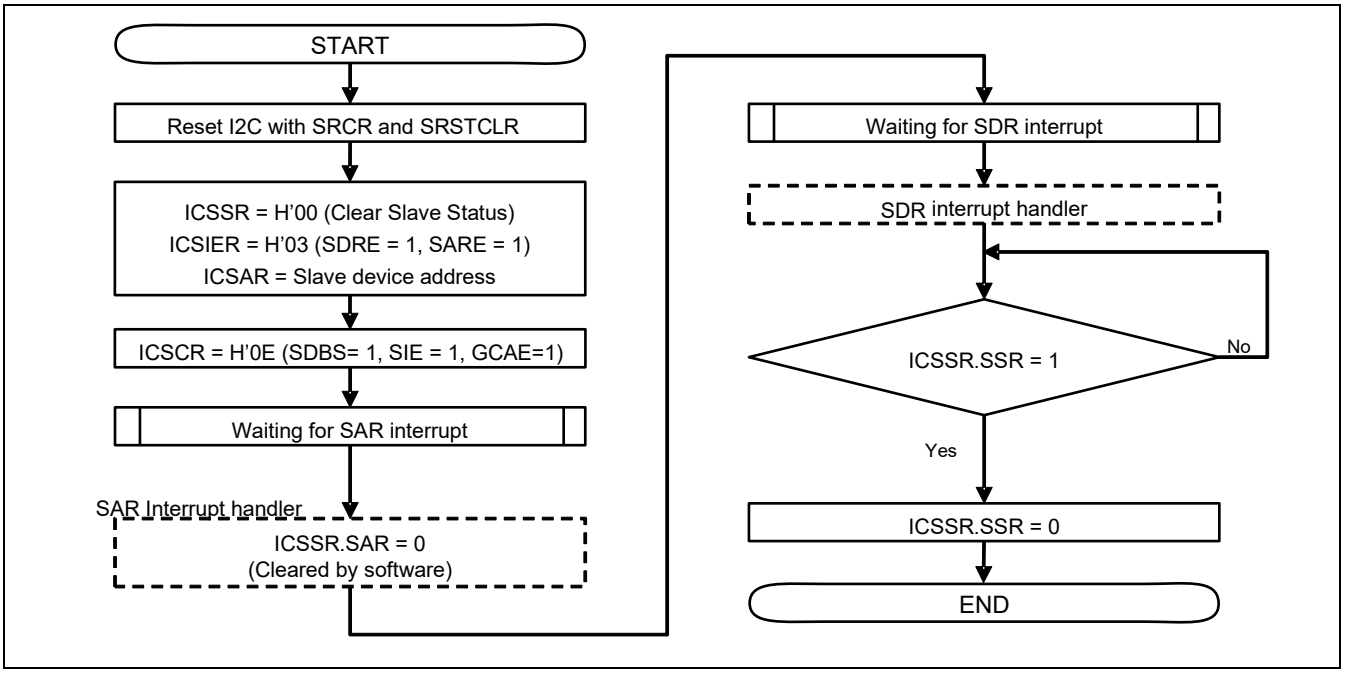

Figure 107.24 Slave Receiver Operation Setting

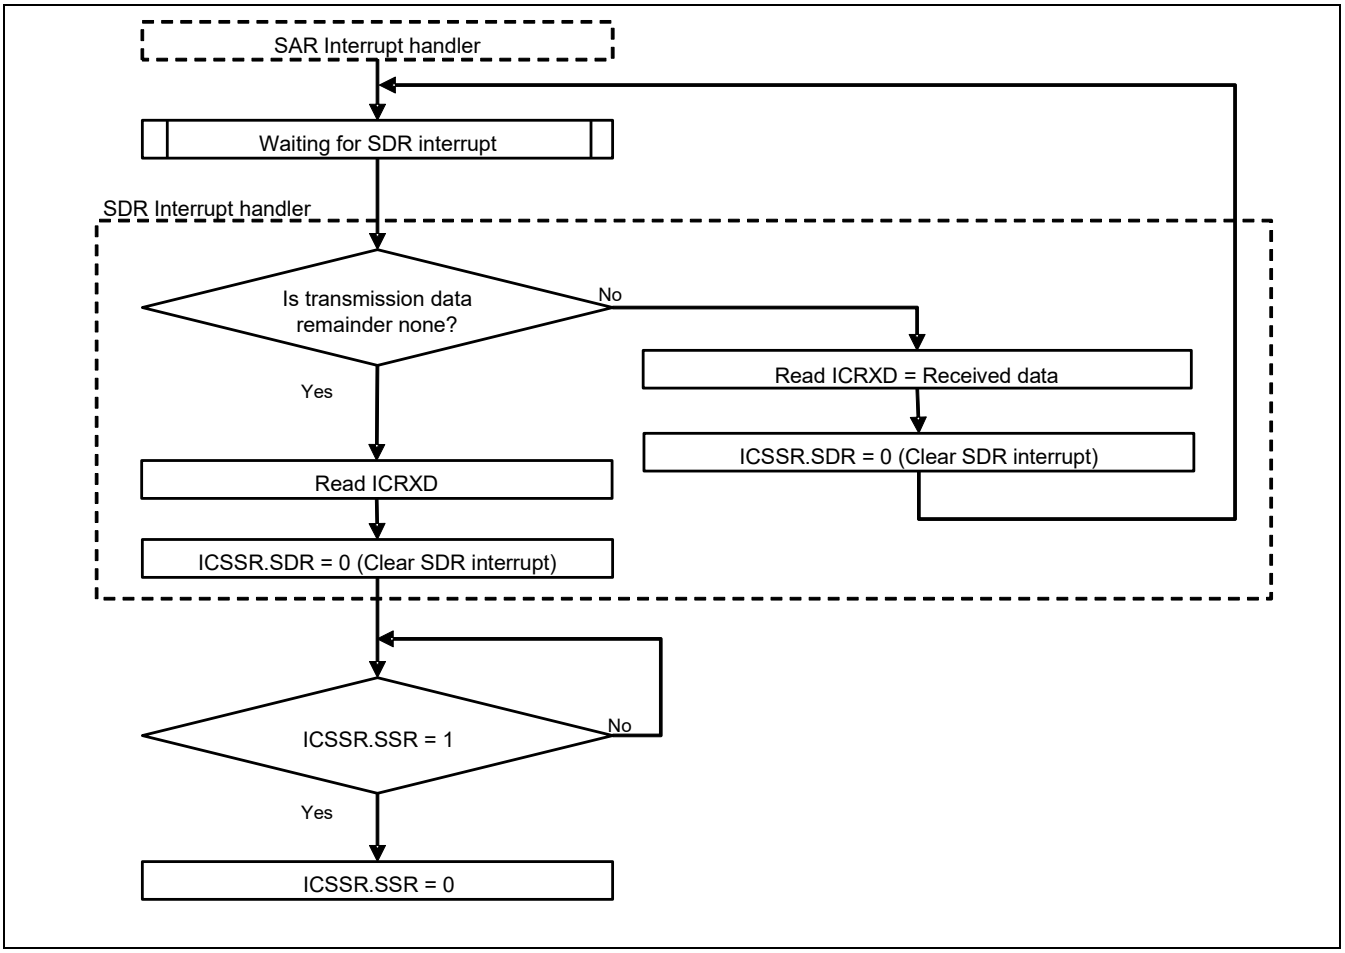

Figure 107.25 SDR Interrupt Handler for Slave Receiver Operation Setting

107.3.10.6 DMA Mode - Master Transmit Operation

The 1st byte is transferred by PIO, after that enter to DMA mode to start transfer the following bytes.

In DMA transmit mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC write data into I2C data register, and return DMARACK to I2C module. For instance, in order to transfer N0, N1, … , N10 byte. Byte N0 will be transferred by PIO, bytes N1 to N10 will be transferred by using DMAC.

The transmission procedure and operations are described as below:

(a) Set value for the clock control register

1. Reset I2C with SRCR and SRSTCLR.
2. Set the Clock Control register 2 (ICCCR2) = H'07 (CDFD = 1, HLSE = 1, SME = 1).
3. Set the Clock Control register (ICCCR) = H'06 (SCGD = 0, CDF = 6, I2C internal clock I2Cck: 19 MHz).
   — Setting ICCCR, ICCCR2 for using Duty ratio fixed or Duty ratio variable. The case for using Variable Duty ratio, have to setting ICCCR2 too. The case for using Fixed Duty ratio, have to setting ICCCR only.
4. Set the SCL Mask Control register (ICMPR) = H'1C (Variable Duty ratio only).
5. Set the SCL High Control register (ICHPR) = H'73 (Variable Duty ratio only).
6. Set the SCL Low Control register (ICLPR) = H'85 (Variable Duty ratio only).
7. Set the First Bit Setup Cycle register (ICFBSCR) = H'0F (1st bit setup cycle = 17 × Tcyc).

(b) Setting of DMAC

1. Set the number of DMA times ("Total transmit times – 1").
   - In this phase, DMACHCR.DE = 0.

(c) Set value for the master control register, first data byte, and address

1. Clear the Master Status register (ICMSR) = H'00 (all 0 clear).
2. Set the Master Interrupt Enable register (ICMIER) = H'09 (MDEE = 1, MATE = 1).
3. Set the Master Address register (ICMAR) = Slave device address + H'00 (Write mode).
4. Set the Transmit Data register (ICTXD) = 1st transmission data.
5. Set the Master Control register (ICMCR) = H'89 (MDBS = 1, MIE = 1, ESG = 1).

(d) Wait for outputting address

1. Wait for master event, ICMSR.MAT and ICMSR.MDE.
2. Set ICMCR to H'88 (to suspend the data transmission, the master device will hold the SCL low until the ICMSR.MDE bit is cleared).
   - If only one byte of data is transmitted, set the ICMCR to H'8A, meaning that the stop generation is enabled. This generates a stop on the bus as soon as one byte has been transmitted.
3. Clear the ICMSR.MAT & ICMSR.MDE bits.

(e) Enable DMA

1. Wait for master event, ICMSR.MDE.
2. Set the DMA Enable register (ICDMAER) = H'01 (TMDMAE = 1).
3. Set the DMACHCR.DE = 1 to enable DMA.

(f) DMA interrupt handler

1. Wait for DEI interrupt.
2. Set ICDMAER = H'00 (TMDMAE = 0) to disable DMA transmission.

(g) MDE interrupt handler

1. Wait for MDE interrupt.
2. Set ICMCR = H’8A (FSB = 1) to make stop condition.
3. Clear MDE interrupt (ICMSR.MDE = 0).

(h) Wait for end of transmission

1. Wait for ICMSR.MST = 1.
2. Clear ICMSR.MST = 0.

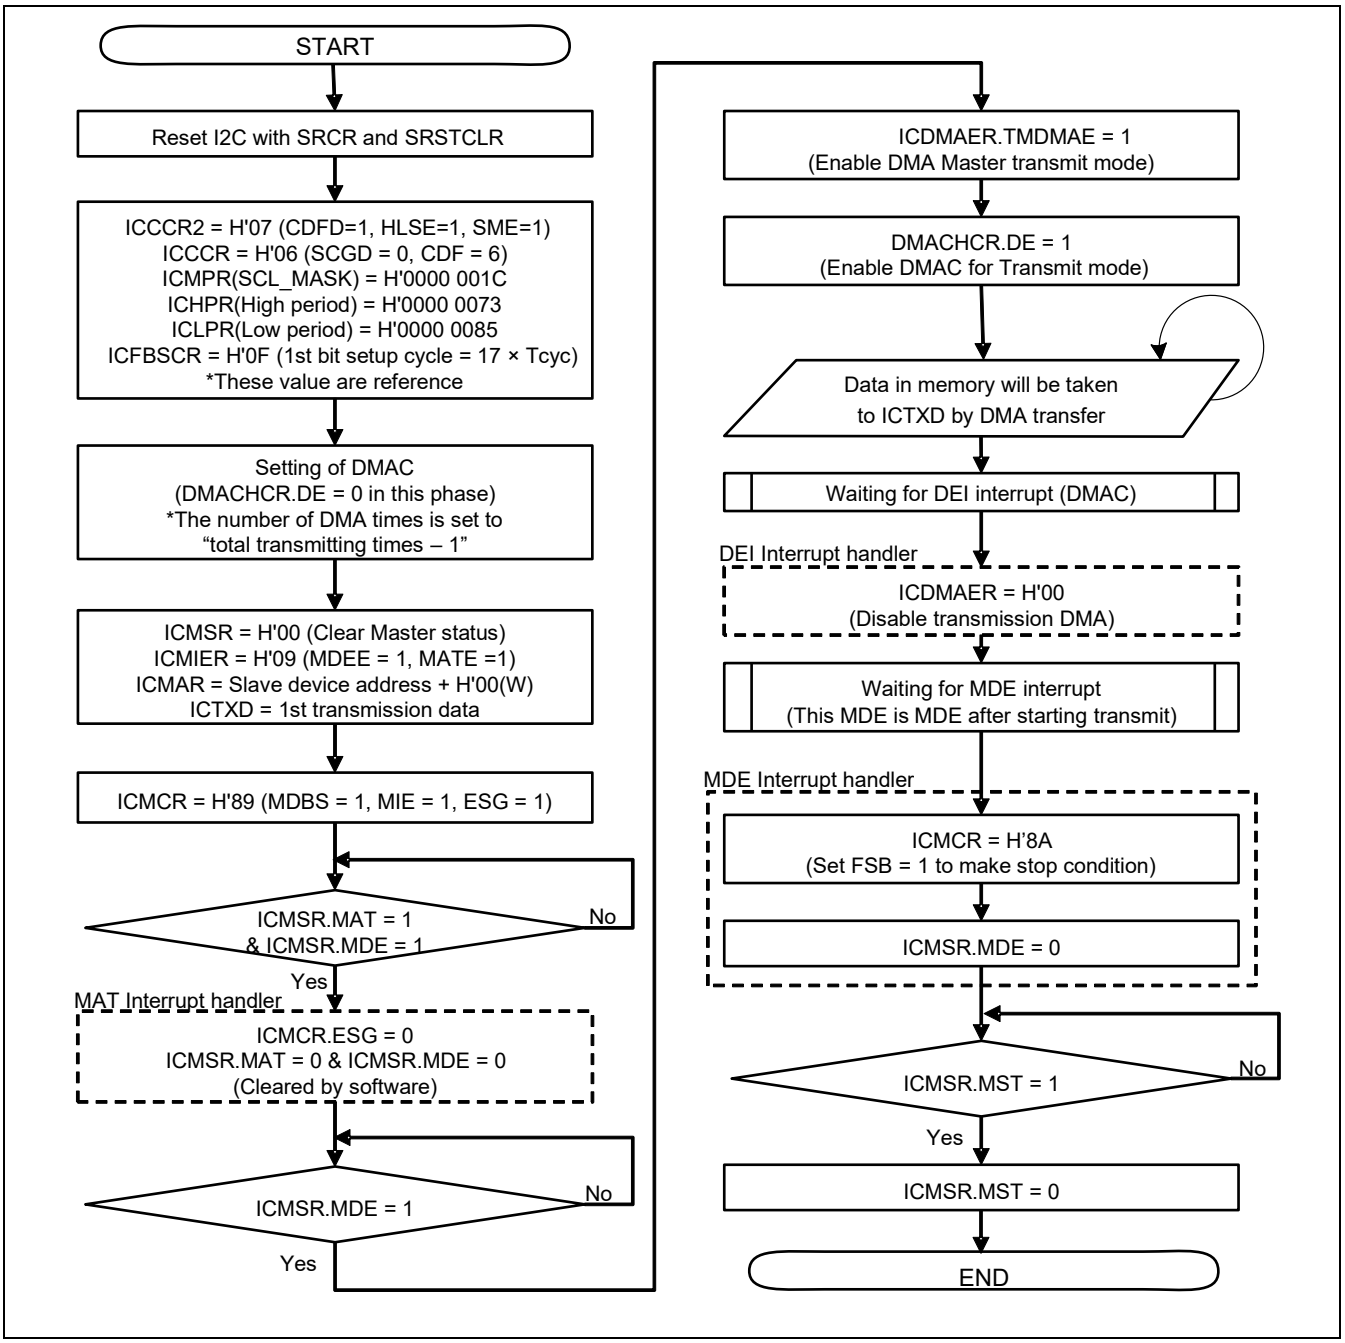

Figure 107.26 Example DMA mode – Master Transmitted Operation Setting

107.3.10.7 DMA Mode – Master Receive Operation

In DMA receive mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC reads the received data from I2C data register and returns DMARACK to I2C module. All received data bytes will be transferred by using DMAC.

The reception procedure and operations are described as below:

(a) Set value for the clock control register

The same procedure as the master transmitter is applied. See the program example for the master transmitter.

(b) Set value for the master control register, first data byte, and address

1. Clear the Master Status register (ICMSR) = H’00 (all 0 clear).
2. Set the Master Interrupt Enable register (ICMIER) = H’0B (MDEE = 1, MDRE = 1, MATE = 1).
3. Set the Master Address register (ICMAR) = Slave device address + H’00 (Write mode).
4. Set the Transmit Data register (ICTXD) = 1st transmission data.
5. Set the Master Control register (ICMCR) = H’89 (MDBS = 1, MIE = 1, ESG = 1).

(c) Wait for outputting address

1. Wait for master event (an interrupt of the ICMSR.MAT and ICMSR.MDE).
2. Set the ICMCR to H'88 (to suspend the data transmission, the master device will hold the SCL low until the MDE bit is cleared).
   — This generates a stop on the bus as soon as one byte has been transmitted.
3. Clear the ICMSR.MAT & ICMSR.MDE bits.

(d) MDE interrupt handler

1. Wait for master event, ICMSR.MDE.
2. Set the ICMAR = slave device address + H’01(Read mode).
3. Set the ICMCR = H’89 (MDBS = 1, MIE = 1, ESG = 1).
4. Clear the ICMSR.MDE = 0.

(e) Enable DMA of I2C

1. Wait for master event, ICMSR.MAT and ICMSR.MDR.
2. Clear the ICMCR.ESG = 0.
3. Set the DMA Enable register (ICDMAER) = H’02 (RMDMAE = 1).
4. Clear the ICMSR.MAT and ICMSR.MDR bits.

(f) Setting of DMAC

1. Set the number of DMA times (“Total receiving times - 2”).
   — In this phase, DMACHCR.DE = 0.

(g) Enable DMA of DMAC

1. Set the DMACHCR.DE = 1 to enable DMA.

(h) DMA interrupt handler

1. Wait for DEI interrupt.
2. Set ICDMAER = H’00 (RMDMAE = 0) to disable DMA transmission.

(i) MDR interrupt handler

1. Wait for master event, ICMSR.MDR.
2. Set the ICMCR = H'8A (MDBS = 1, MIE = 1, FSB = 1).
3. Read ICRXD.
4. Clear the ICMSR.MDR = 0.

(j) Final MDR interrupt handler

1. Wait for master event, ICMSR.MDR.
2. Read ICRXD.
3. Clear the ICMSR.MDR = 0.

(k) Wait for end of transmission

1. Wait for the master event, ICMSR.MST.
2. Clear the ICMSR.MST = 0.

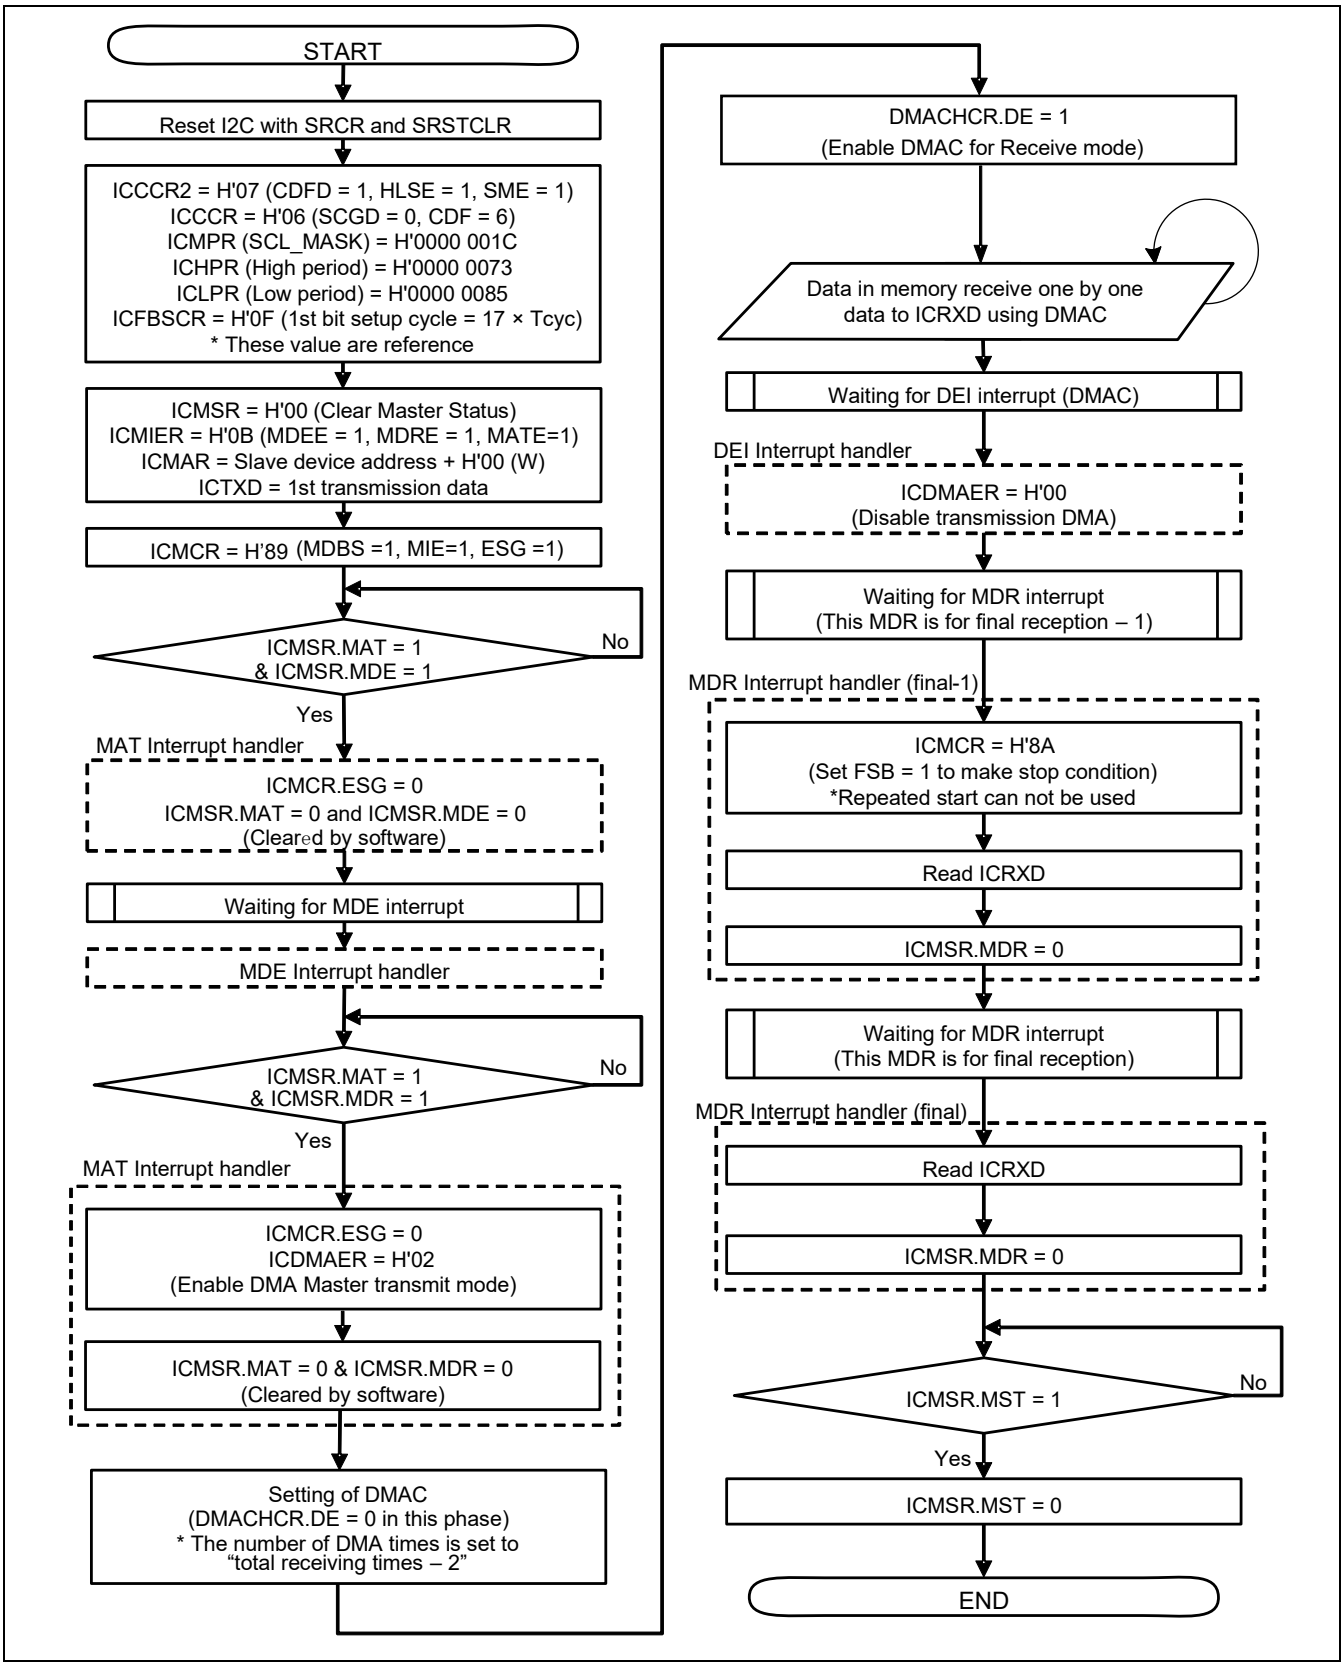

Figure 107.27 Example DMA mode – Master Received Operation Setting

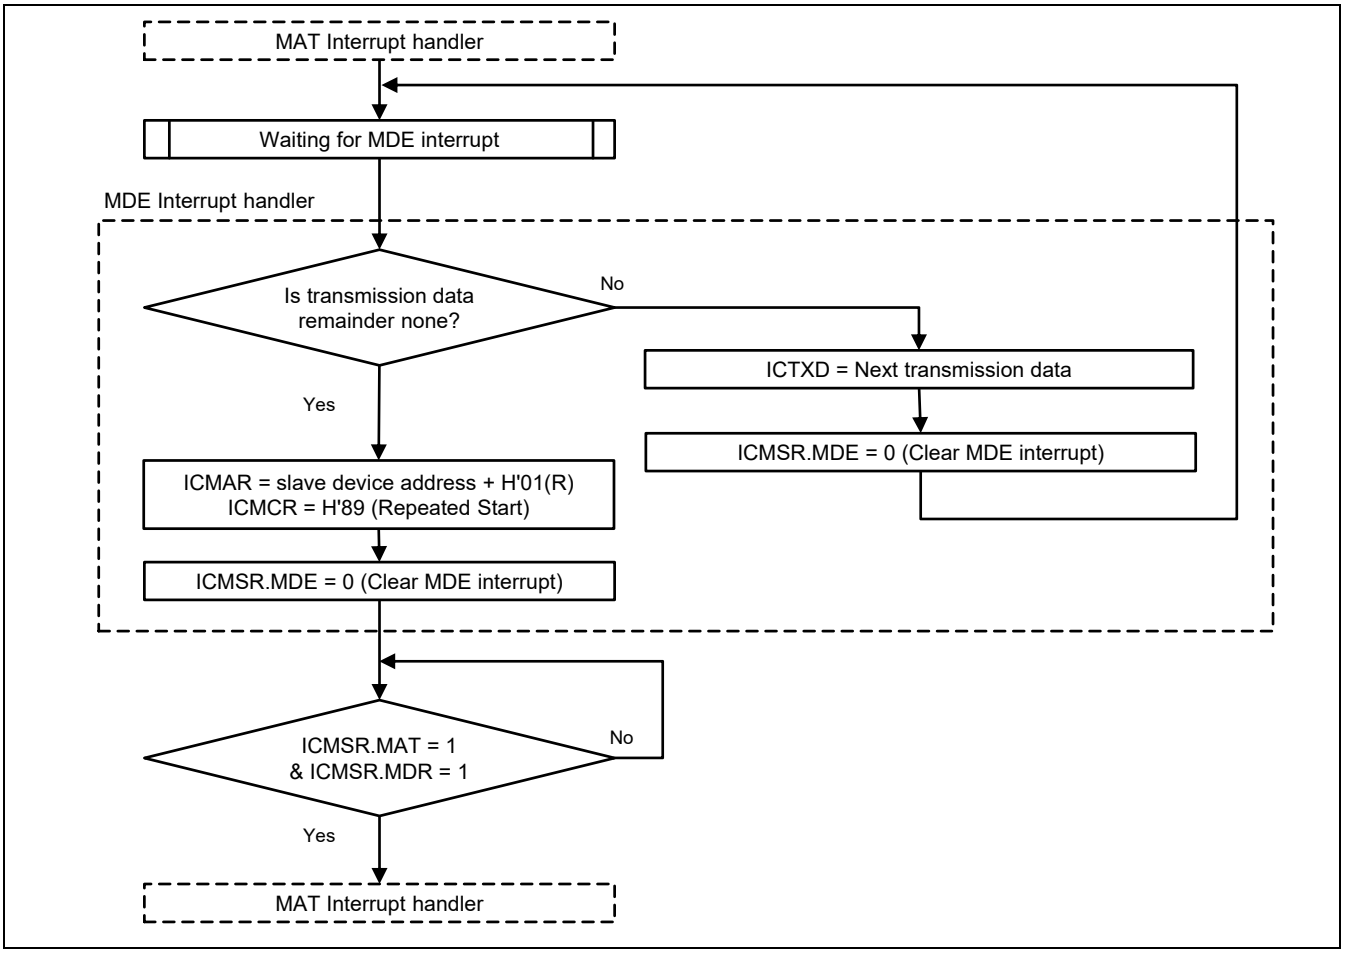

Figure 107.28 MDE Interrupt Handler for Example DMA mode – Master Received Operation Setting

107.3.10.8 DMA Mode – Slave Transmit Operation

The 1st byte is transferred by PIO, after that enter to DMA mode to start transfer the following bytes.

In DMA transmit mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC write data into I2C data register, and return DMARACK to I2C module. For instance, in order to transfer N0, N1, … , N10 byte. Byte N0 will be transferred by PIO, bytes N1 to N10 will be transferred by using DMAC.

The transmission procedure and operations are described as below:

(a) Setting of DMAC

1. Set the number of DMA times (“Total transmit times – 1”).
   — In this phase, DMACHCR.DE = 0.

(b) Set value for the slave control register, first data byte, and address

1. Reset I2C with SRCR and SRSTCLR.
2. Clear the Slave Status register (ICSSR) = H’00 (all 0 clear).
3. Set the Slave Interrupt Enable register (ICSIER) = H’09 (SDEE = 1, SARE = 1).
4. Set the Slave Address register (ICSAR) = Slave device address.
5. Set the Transmit Data register (ICTXD) = 1st transmission data.
6. Set the DMA Enable register (ICDMAER) = H’04 (TSDMAE = 1).
7. Set the Slave Control register (ICSCR) = H’0E (SDBS = 1, SIE = 1, GCAE = 1).

(c) Wait for receiving address

1. Wait for slave event, ICSSR.SAR.
2. Clear the ICSSR.SAR = 0

(d) Enable DMA

1. Wait for slave event, ICSSR.SDE.
2. Set the DMACHCR.DE = 1 to enable DMA.

(e) DMA interrupt handler

1. Wait for DEI interrupt.
2. Set ICDMAER = H’00 (TSDMAE = 0) to disable DMA transmission.

(f) SDE interrupt handler

1. Wait for slave event, ICSSR.SDE.
2. Clear SDE interrupt (ICSSR.SDE = 0).

(g) Wait for end of transmission

1. Wait for ICSSR.SSR = 1.
2. Set ICSSR.SSR = 0.

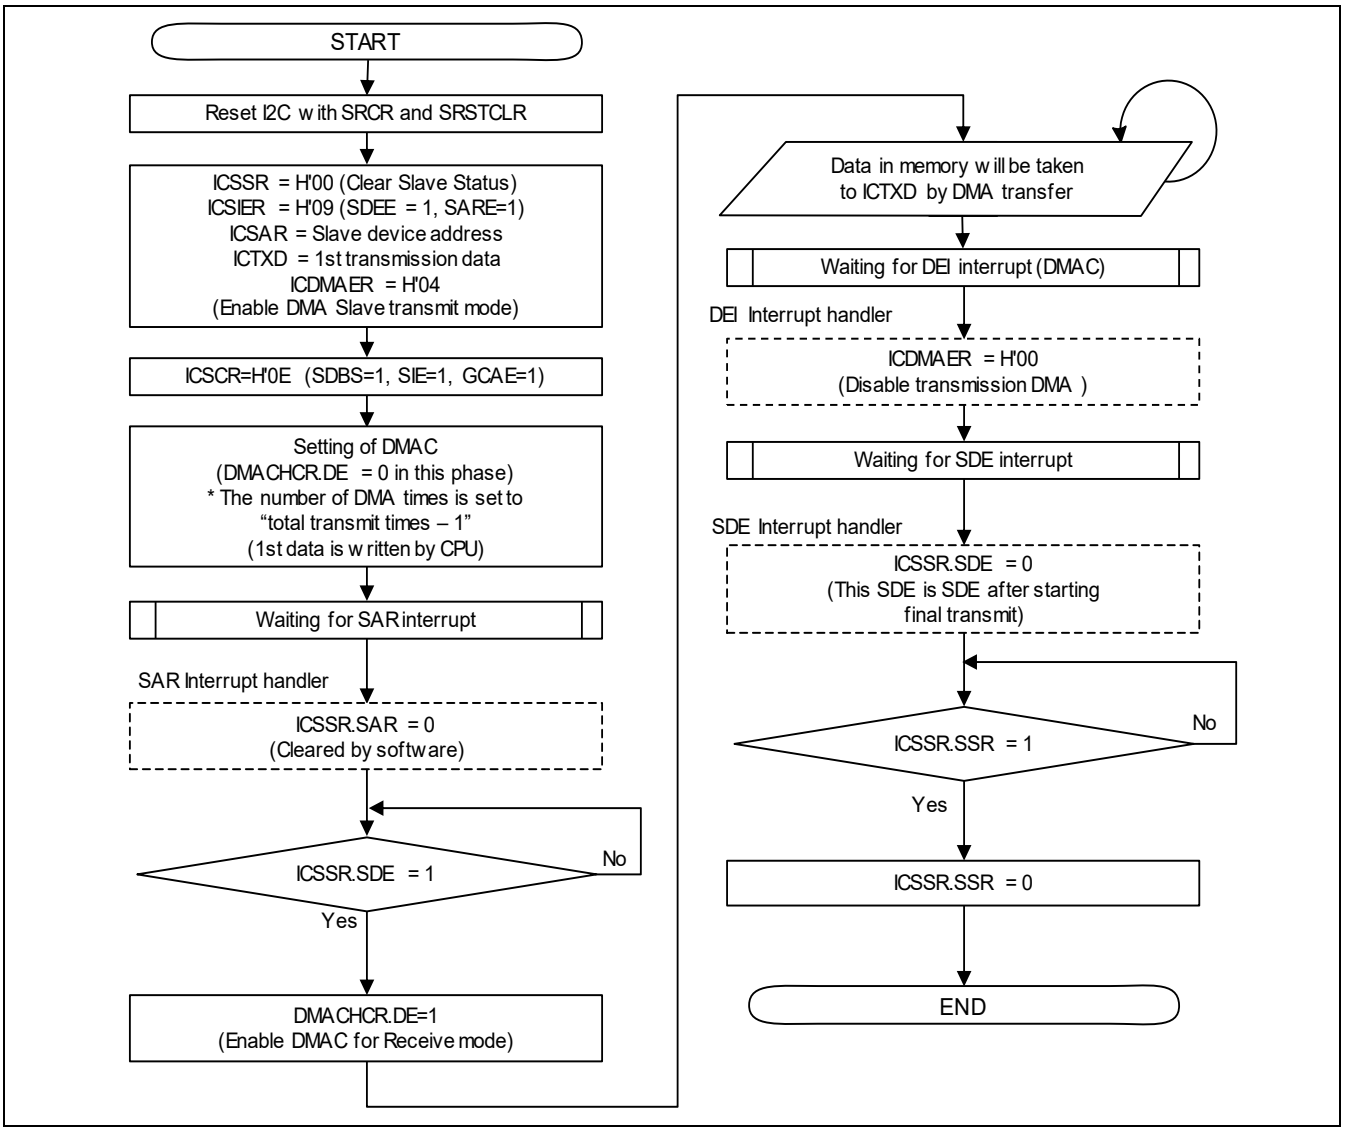

Figure 107.29 Example DMA mode – Slave Transmitted Operation Setting

107.3.10.9 DMA Mode – Slave Receive Operation

In DMA receive mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC reads the received data from I2C data register and returns DMARACK to I2C module. All received data bytes will be transferred by using DMAC.

The reception procedure and operations are described as below:

(a) Setting of DMAC

1. Set the number of DMA times (“Total receiving times”).
   — In this phase, DMACHCR.DE = 0.

(b) Set value for the slave control register, first data byte, and address

1. Reset I2C with SRCR and SRSTCLR.
2. Clear the Slave Status register (ICSSR) = H’00 (all 0 clear).
3. Set the Slave Interrupt Enable register (ICSIER) = H’03 (SDRE = 1, SARE = 1).
4. Set the Slave Address register (ICSAR) = Slave device address.
5. Set the DMA Enable register (ICDMAER) = H’08 (RSDMAE = 1).
6. Set the Slave Control register (ICSCR) = H’0E (SDBS = 1, SIE = 1, GCAE = 1).

(c) Wait for receiving address

1. Wait for slave event, ICSSR.SAR.
2. Clear the ICSSR.SAR = 0.

(d) Enable DMA

1. Wait for slave event, ICSSR.SDR.
2. Set the DMACHCR.DE = 1 to enable DMA.

(e) DMA interrupt handler

1. Wait for DEI interrupt.
2. Set ICDMAER = H’00 (RSDMAE = 0) to disable DMA transmission.

(f) Wait for end of transmission

1. Wait for ICSSR.SSR = 1.
2. Set ICSSR.SSR = 0.

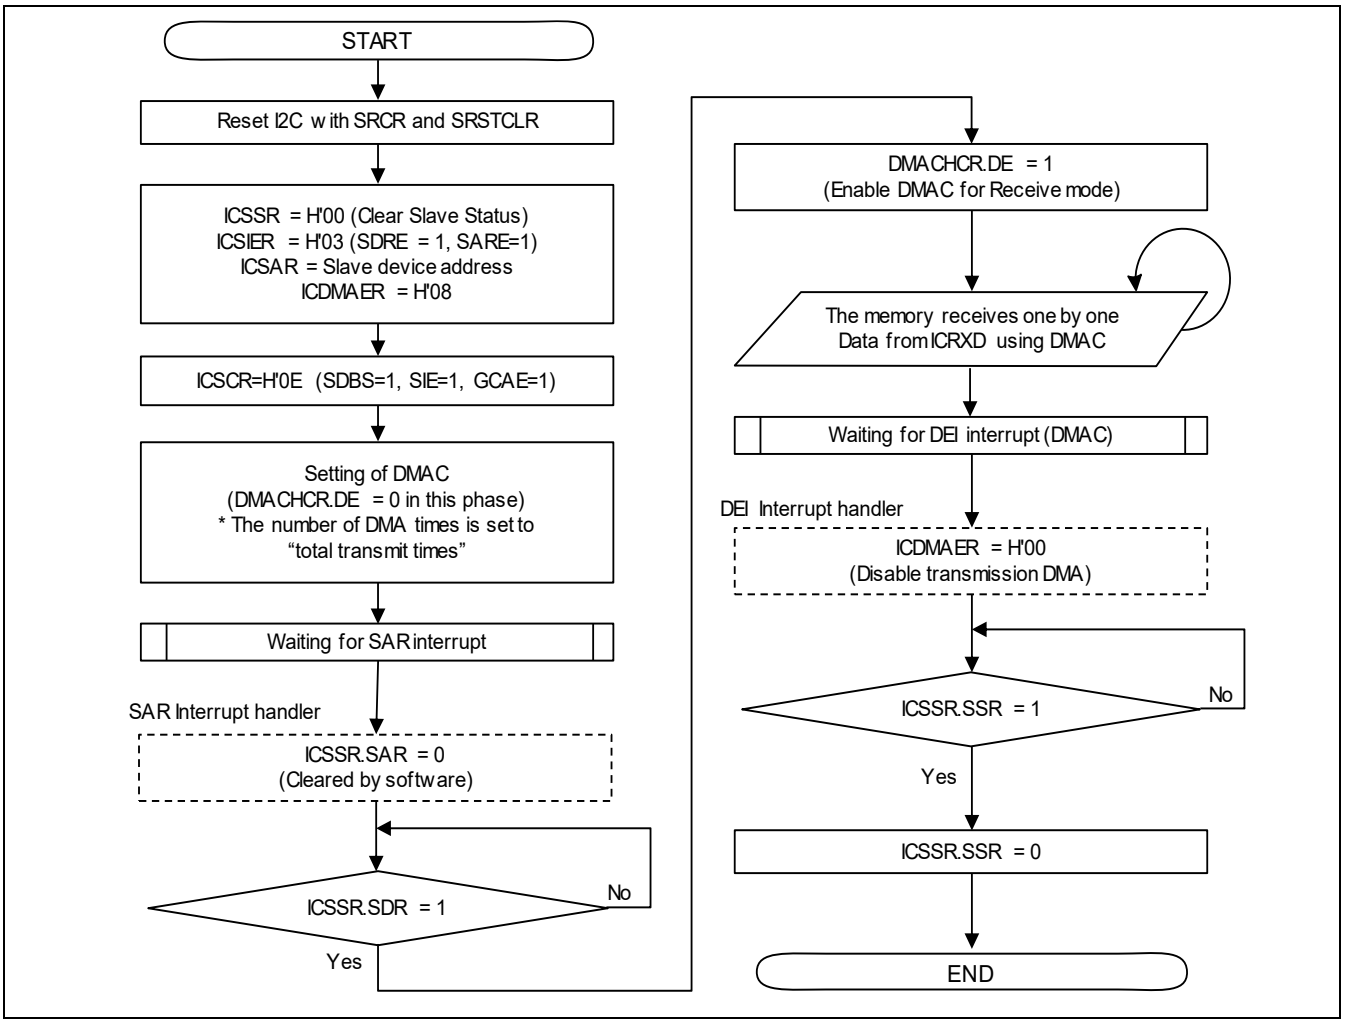

Figure 107.30 Example DMA mode – Slave Received Operation Setting

107.3.10.10 DMA Mode – Master Transmit continuous mode Operation

The Start trigger (ESG) is set by PIO, 1st Byte transmission is started and completed automatically.
After that enter to DMA mode to start transfer the following bytes.

In DMA transmit continuous mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC write data into I2C data register, and return DMARACK to I2C module.
Each Byte is written to I2C data register by the DMAC, I2C transmission is started automatically and assert DMA request to the DMAC again.
This transmission continues the number of (MDMACTSZ + 1) × TMDMATSZ. After this number of transfer, I2C stops this transmission by de-asserting TMDMACE.

The transmission procedure and operations are described as below:

1. Setting ICCCR, ICCCR2 for using Normal mode or Duty variable mode.
2. Setting for DMAC source, destination address, transfer count, data.
3. Set ICMIER = H'09 to enable MDE, MAT interrupt (condition to issue DMA request).
4. Set the 1st data byte which will be transferred by asserting ESG.
5. Set 1st bit setup delay time between SCL and SDA, default is H'04 = Tcyc × 6
6. Set ICDMAER = H'XX00YY81 to enable DMA Master Transmit mode and DMA Master Continuous Transmitted mode. (MDMACTSZ = H'XX, TMDMACSZ = H'YY. This means “XX times of YY bytes transmission”)
7. Set ICMAR.STM1 = 0 (Transmit direction); set ICMAR.SADD to select the Slave-address.
8. Monitor the FSDA bit in the master control register. Confirm that this bit is low, meaning that other I2C devices are not using the bus. After confirmation, set the MIE (bit 3), ESG (bit 0) and MDBS (bit 7) bits in the master control register ICMCR to 1 to start master transmission. This setting will transfer the 1st byte by using PIO.
9. Wait for until the bits flag MDE = 1 and MAT= 0. This means complete 1stByte transmission.
   (ESG and MAT is cleared automatically)
10. Set DMAOR = 1 to start DMA transfer. DMAC writes the transmit data into ICTXD register from memory space specified by DMAC register until transmission finishes.
11. After the number of (MDMACTSZ + 1) × TMDMATSZ transfer, I2C will stops this mode by clearing TMDMACE.
12. Wait for the clearing TMDMACE.
    Reset the MST bit after confirming MNR (master NACK received).

Figure 107.31 shows Example Flow for DMA mode – Master Continuous Transmission

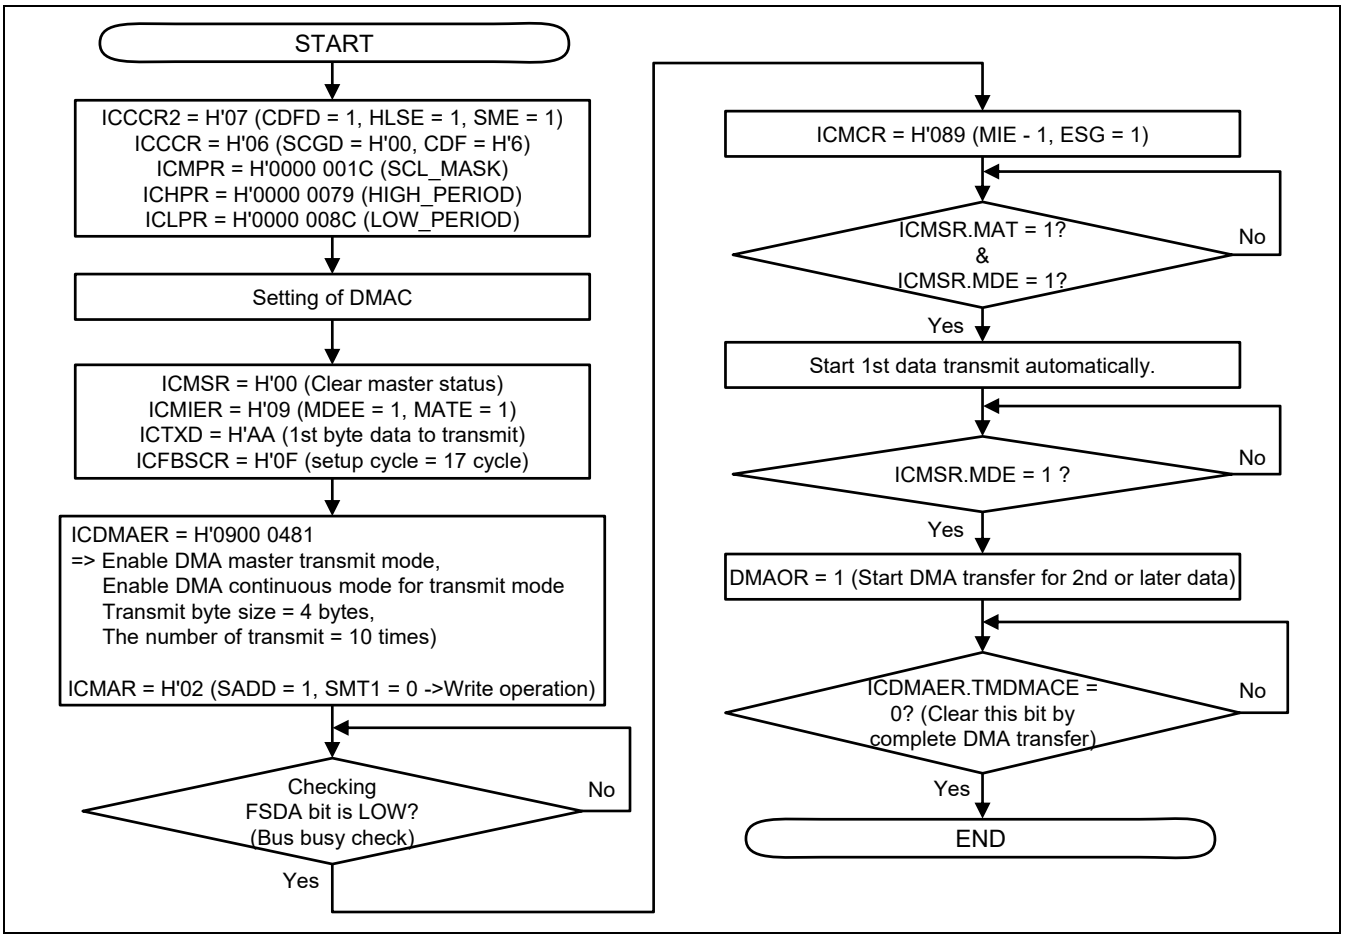

Figure 107.31 Example DMA mode – Master Transmitted Continuous Mode Operation Setting

107.3.10.11 DMA Mode – Master Receive continuous mode Operation

The Start trigger (ESG) is set by PIO, 1st Byte reception is started and completed automatically.
After that enter to DMA mode to start transfer the following bytes.

In DMA receive continuous mode, I2C module asserts a DMA request to the DMAC. After receiving the request, DMAC read data from I2C data register, and return DMARACK to I2C module.
Each Byte is read from I2C data register by the DMAC, I2C reception is started automatically and assert DMA request to the DMAC again.
This reception continues the number of (MDMACTSZ + 1) × RMDMATSZ. After this number of transfer, I2C stops this reception by de-asserting RMDMACE.

The reception procedure and operations are described as below:

1. Setting ICCCR, ICCCR2 for using Normal mode or Duty variable mode.
2. Setting for DMAC source, destination address, transfer count, data.
3. Set ICMIER = H'03 to enable MDR, MAT interrupt (condition to issue DMA request).
4. Set 1st bit setup delay time between SCL and SDA, default is H'04 = Tcyc × 6
5. Set ICDMAER = H'XXYY0042 to enable DMA Master Receive mode and DMA Master Continuous Received mode. (MDMACTSZ = H'XX, RMDMACSZ = H'YY. This means “XX times of YY bytes reception”)
6. Set ICMAR.STM1 = 1 (Received direction); set ICMAR.SADD to select the Slave-address.
7. Monitor the FSDA bit in the master control register. Confirm that this bit is low, meaning that other I2C devices are not using the bus. After confirmation, set the MIE (bit 3), ESG (bit 0) and MDBS (bit 7) bits in the master control register ICMCR to 1 to start master reception. This setting will transfer the 1st byte by using PIO.
8. Wait for until the bits flag MDR = 1 and MAT = 0. This means complete 1stByte transmission. (ESG and MAT is cleared automatically)
9. Set DMAOR = 1 to start DMA transfer. DMAC reads the received data from ICRXD register to memory space specified by DMAC register until reception finishes.
10. After the number of (MDMACTSZ + 1) × RMDMATSZ transfer, I2C will stops this mode by clearing RMDMACE.
11. Wait for the clearing RMDMACE.
    Reset the MST bit after confirming MNR (master NACK received).

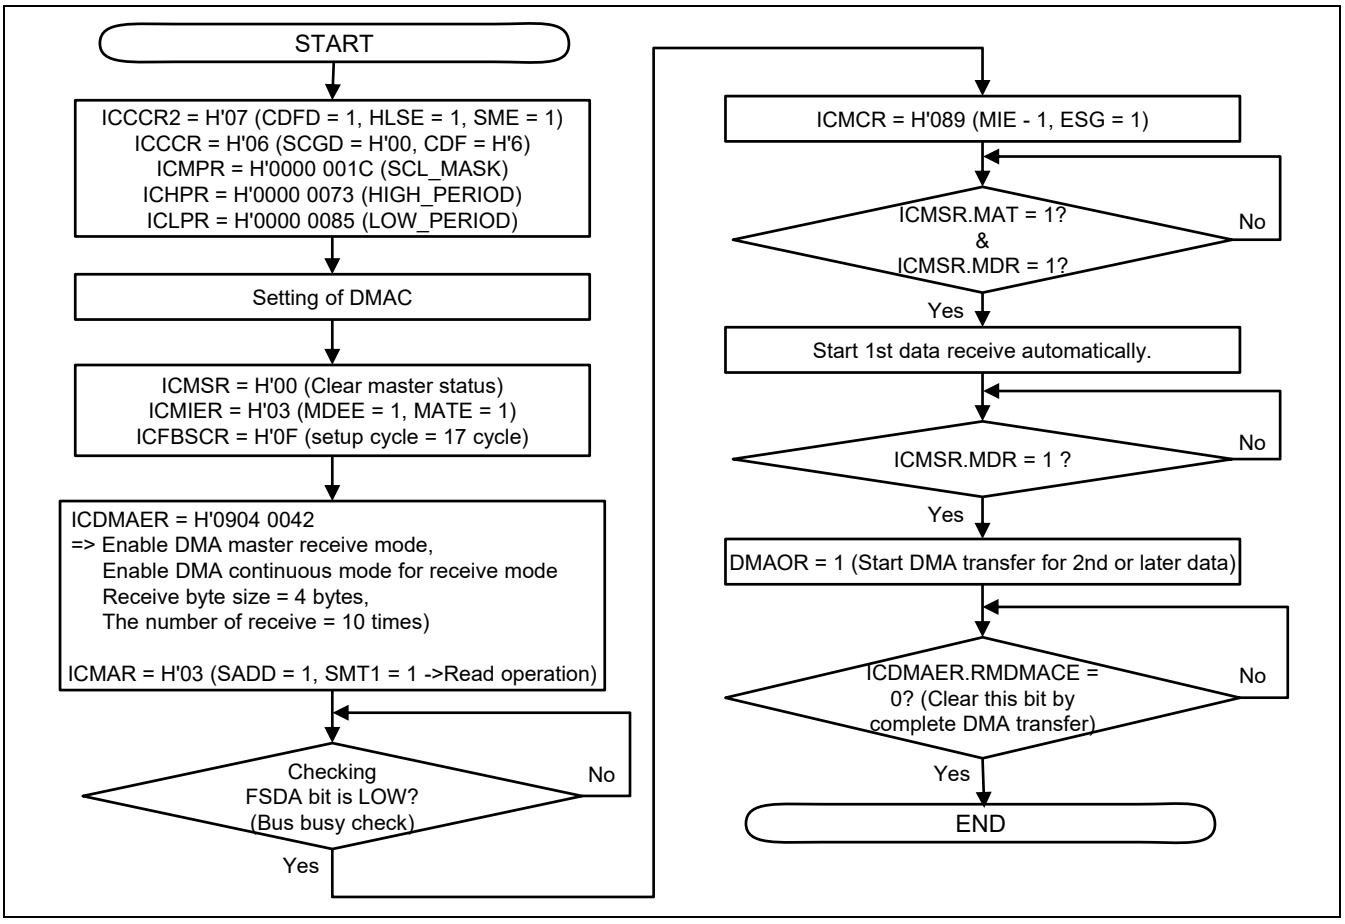

Figure 107.32 Example DMA mode – Master Received Continuous Mode Operation Setting

107.4 Usage Notes

107.4.1 Usage note for Multi-Master

Do not stop clock distribution to this module, even if this module is not directly used for data transfer, while this module is used in multi-master environment. This module is monitoring SCL and SDA bus line for detecting START and STOP condition for arbitration. If clock is stopped, arbitration problem may occur.

107.4.2 Usage note for SCL frequency calculation equation

In section 107.2.9, Clock Control Register (ICCCR), in the description of SCGD and CDF, following equation is described.

SCLfreq = I2Cck/(20 + SCGD × 8 + F[(tICF + tr + IntDelay) × I2Cck])

I2Cck: I2C internal clock frequency

tICF: I2C SCL falling time (depending on external load)

tr: I2C SCL rising time (depending on external load)

IntDelay: LSI internal delay corresponds to output buffer type.
Open drain buffer: 50 ns (typ.), 110 ns (max.)

F[n]: n rounded down to an integer

I2Cck = MOD_CLK/(1 + CDF)

MOD_CLK: module clock frequency

Based on parameter described above, this equation approximately estimates the SCL frequency, but includes some error in the resulting frequency. Before finalizing register setting to be used, measure actual SCL frequency on the board, and confirm that observed frequency satisfy the constraint. The reason why calculated result includes some error is parameters used in this equation varies depending on the characteristics of each sample. For example, tICF and tr depend on logical threshold of IO-cell, and intDelay depends on variation of fabrication process.

For adjustment of SCL frequency, modifying the setting of ICCCR [2:0]. CDF and ICCCR [8:3]. SCGD will be effective. Increasing the value of CDF or SCGD value will make SCL frequency lower. However, how they decrease SCL frequency is different. So, by increasing one register value and decreasing the other, SCL frequency can be adjusted.

107.4.3 Usage note for Pull-up resistance

Do not use internal pull up of PUEN and PUD registers in Pin Function Controller (PFC) section for I2C function. External pull up resistance on board is mandatory for SCL and SDA pins.

107.4.4 Usage note for the transmission and reception procedure

Be sure to reset I2C with Software Reset Register SRCR5 at the beginning of transmission and reception procedure.
A software reset can be set by controlling the Software Reset Register SRCR5 and Software Reset Clearing Register SRSTCLR5 of the “9. Module Standby, Software Reset”

Reset Sequence:

Set the target I2C bit of SRCRn to 1. (**) → Wait 1µsec → Set the target I2C bit of SRSTCLRn to 1. (**)
→ Wait for the target bit of SRCRn to 0. → End sequence

**: Other bit should be written 0.

107.4.5 Usage note for DMA mode of Receive Operation

If use DMA mode of Receive Operation more than once with repeated START,
issue "STOP condition" and start from beginning of transmission and reception procedure instead of repeated START.

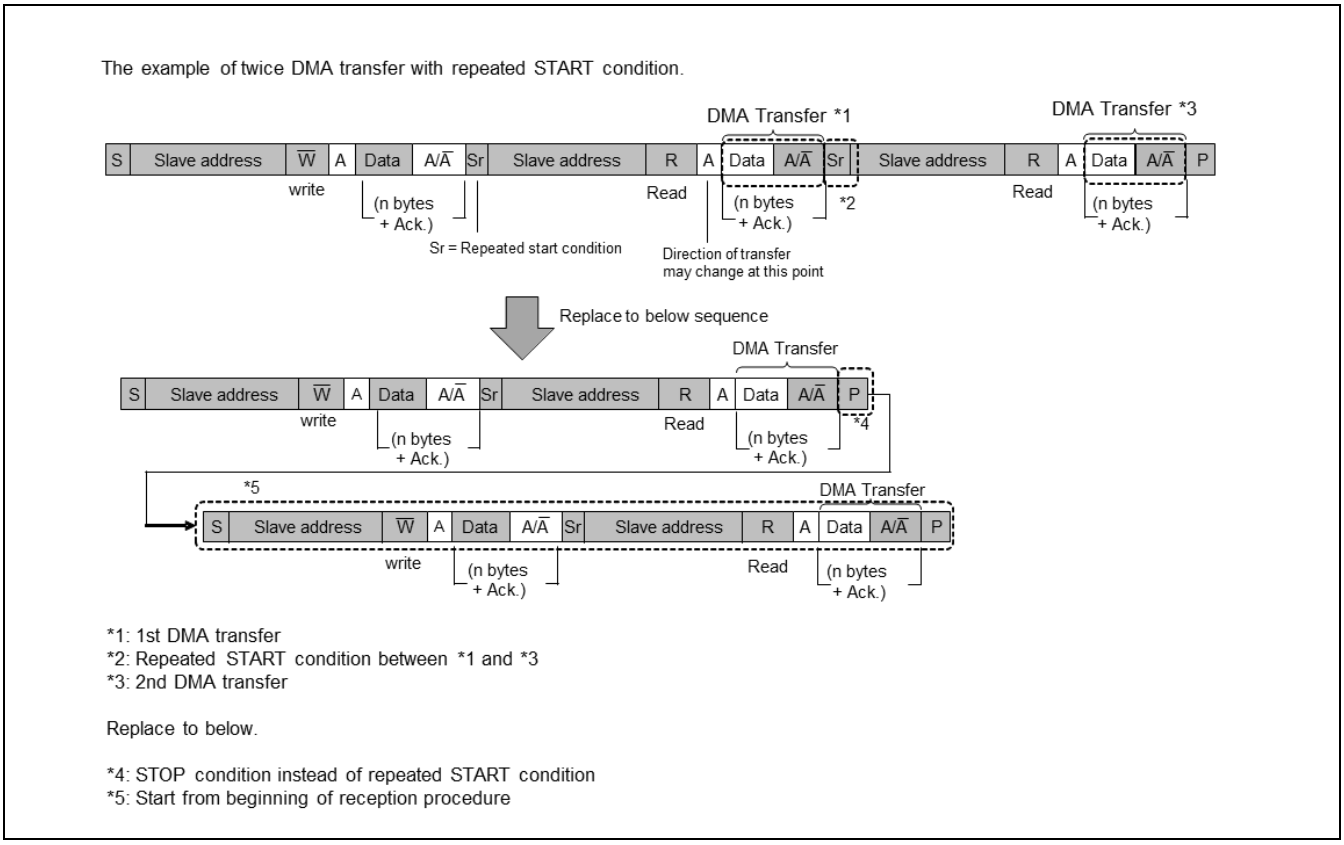

Figure 107.33 Example of Usage Note for DMA mode of Receive Operation

107.5 Safety Mechanisms

I2C module has no Mechanism of FuSa.

109. Clock-Synchronized Serial Interface with FIFO (MSIOF)

109.1 Overview

This LSI includes clock-synchronized serial I/O module with FIFO (MSIOF). In this module, MSOφ is used as a module clock.

109.1.1 Features

- Number of channels: Six channels
- FIFO capacity: 32 bits × 256 stages for transmission and 32 bits × 256 stages for reception
- MSB first or LSB first selectable for data transmission and reception
- Synchronization by frame synchronization pulse, level, or left/right channel switch
- Supports master and slave modes
- Interrupts: One interrupt line, with 12 internal factors per module.
- Serial clock
- DMA transfer
- Serial format
  Supports serial formats: IIS, SPI (master and slave modes).
- CLK/SYNC (SPI) in common transmit/receive mode

109.1.2 Block diagram

Figure 109.1 shows a block diagram of the MSIOF.

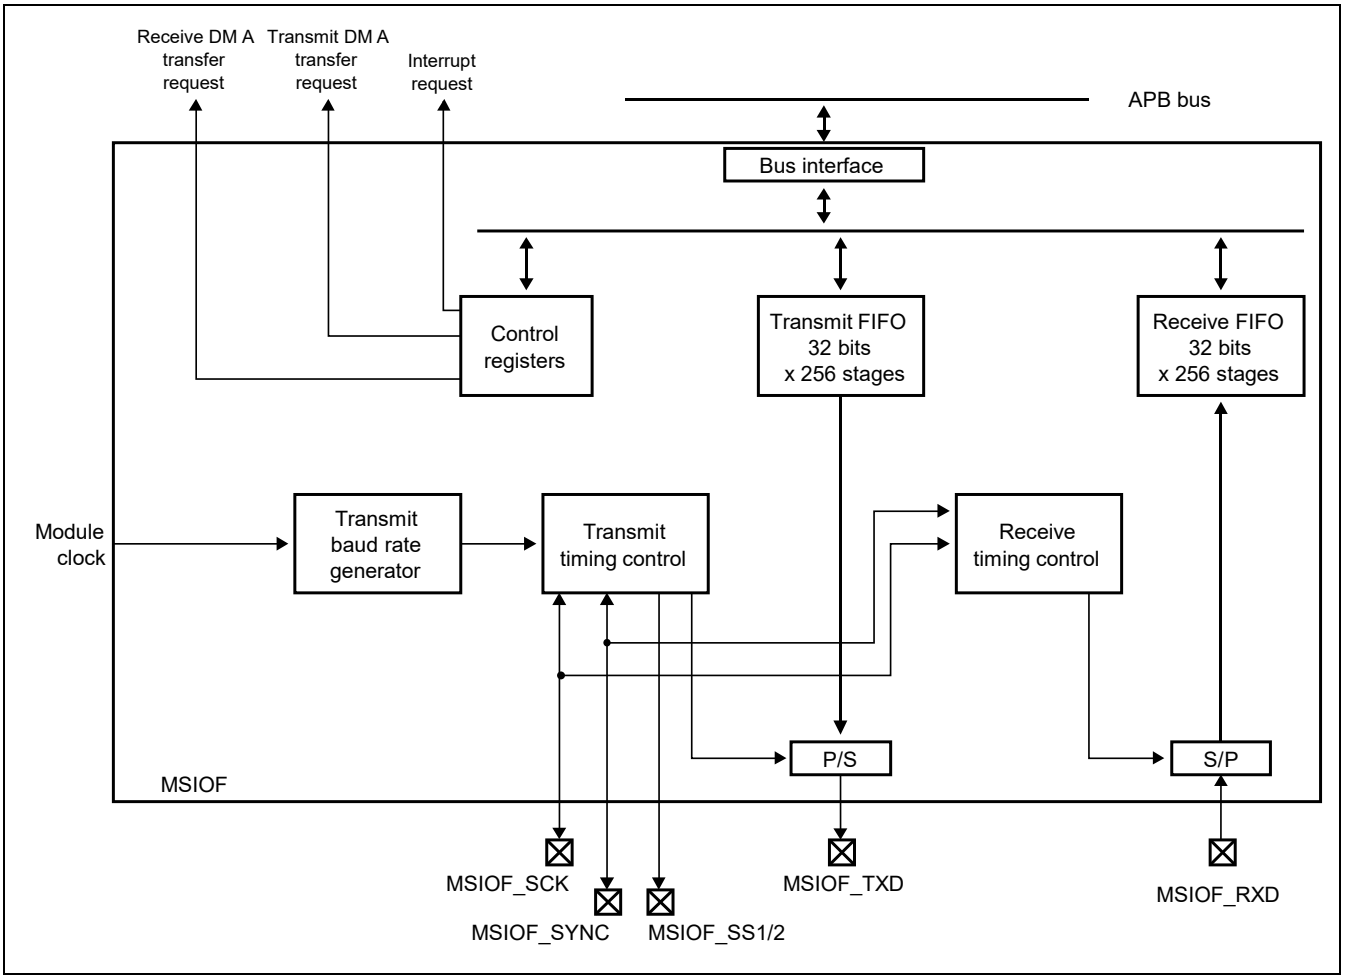

Figure 109.1 Block Diagram of MSIOF

109.1.3 External Pins

The pin configuration of this module is shown in Table 109.1 and Table 109.2.

Table 109.1 Pin Configuration

Name	Abbreviation	I/O	Function	R-Car V4M
MSIOF_SCK	SCK	I/O	MSIOF serial clock for transmission	√
MSIOF_SYNC	SYNC	I/O	MSIOF frame synchronization signal for transmission	√
MSIOF_SS1	SS1	Output	MSIOF frame synchronization signal 1 for transmission This signal can work only master mode.	√
MSIOF_SS2	SS2	Output	MSIOF frame synchronization signal 2 for transmission This signal can work only master mode.	√
MSIOF_TXD	TXD (MOSI/MISO)	Output	MSIOF transmit data	√
MSIOF_RXD	RXD (MISO/MOSI)	Input	MSIOF receive data	√

Table 109.2 Pin Group

109.2 Register Description

[Legend for Register Descriptions]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit, and writing 0 is ignored.

R: Read-only. The write value should always be initial value.

—/WB: Write-only. The read value is undefined.

109.2.1 MSIOF Transmit Mode Register 1 (SITMDR1)

SITMDR1 is a 32-bit readable/writable register that specifies the MSIOF transmit mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31	TRMD	1	R/W	Transfer Mode Selects the transfer mode. 0: Slave mode 1: Master mode
30	PCON	0	R/W	Transfer Signal Connection 0: Setting prohibited 1: MSIOF_SCK and MSIOF_SYNC are used as common signals for transmission and reception (MSIOF_SCK and MSIOF_SYNC).
29, 28	SYNCMD[1:0]	00	R/W	SYNC Mode These bits specify the mode for the MSIOF_SYNC signal. 00: Frame start synchronization pulse 01: Reserved 10: Level mode/SPI 11: L/R mode
27, 26	SYNCCH[1:0]	00	R/W	Synchronization Signal Channel Select These bits are valid only in master mode. 00: The frame synchronization signal output at MSIOF_SYNC. 01: The frame synchronization signal output at MSIOF_SS1. 10: The frame synchronization signal output at MSIOF_SS2. 11: Setting prohibited
25	SYNCAC	0	R/W	MSIOF_SYNC Polarity 0: Active-high signal in synchronization pulse or level mode, or driven high then low in L/R mode 1: Active-low signal in synchronization pulse or level mode, or driven low then high in L/R mode
24	BITLSB	0	R/W	MSB/LSB First 0: MSB first 1: LSB first
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	DTDL[2:0]	001	R/W	Data Pin Bit Delay for MSIOF_SYNC Pin The value specified with TXDIZ in SICTR is output during transmission. B'1xx is valid only in SPI mode. In SPI mode, these bits should be specified so that the sum of the delays specified through DTDL and SYNCDL becomes an integer value. 000: No bit delay 001: 1-clock-cycle delay 010: 2-clock-cycle delay 101: 0.5-clock-cycle delay 110: 1.5-clock-cycle delay Other than above: Setting prohibited
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
18 to 16	SYNCDL[2:0]	000	R/W	Frame Synchronization Signal Timing Delay These bits extend the transmit frame synchronization signal. The value specified with TXDIZ in SICTR is output during transmission. These bits are invalid when SYNCMD [1:0] = B'01. B'1xx is valid only in SPI mode. In SPI mode, these bits should be specified so that the sum of the delays specified through DTDL and SYNCDL becomes an integer value. In L/R mode, these bits should always be set to B’000. 000: No bit delay 001: 1-clock-cycle delay 010: 2-clock-cycle delay 011: 3-clock-cycle delay 101: 0.5-clock-cycle delay 110: 1.5-clock-cycle delay Other than above: Setting prohibited
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	FLD [1:0]	00	R/W	Frame Synchronization Signal Interval Specify the minimum idle time between frames in the number of serial clock cycles. This setting is valid only in master mode. In L/R mode, these bits should always be set to B’00. In SPI mode, these bits shall not be set to B’00. 00: 0-clock-cycle delay 01: 1-clock-cycle delay 10: 2-clock-cycle delay 11: 3-clock-cycle delay
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	TXSTP	1	R/W	Transmission Stop 0: Setting prohibited 1: Stop a frame from starting to transmit until either the number of FIFO stages equals the frame size or the FIFO is full and simultaneously a frame started cannot be interrupted in between.

109.2.2 MSIOF Transmit Mode Register 2 (SITMDR2)

SITMDR2 is a 32-bit readable/writable register that specifies the MSIOF transmit mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28 to 24	BITLEN1[4:0]	01111	R/W	Data Size (8 to 32 bits) The word size (bits) of Group 1 is set to the value specified in these bits + 1. Either 8, 16, 24, or 32 bits can be specified as word size.
23 to 16	WDLEN1[7:0]	H'00	R/W	Word Count (1 to 256 words) The word count of Group 1 is set to WDLEN1 + 1.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.3 MSIOF Transmit Mode Register 3 (SITMDR3)

SITMDR3 is a 32-bit readable/writable register that specifies the MSIOF transmit mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

28 to 24	BITLEN2[4:0]	01111	R/W	Word Size (8 to 32 bits) The word size (bits) of Group 2 is set to the value specified in these bits + 1. Either 8, 16, 24, or 32 bits can be specified as word size.
23 to 16	WDLEN2[7:0]	H'00	R/W	Word Count (1 to 256 words) The word count of Group 2 is set to WDLEN2 + 1.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.4 MSIOF Receive Mode Register 1 (SIRMDR1)

SIRMDR1 is a 32-bit readable/writable register that specifies the MSIOF receive mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TRMD	—	SYNCMD[1:0]		—	—	SYNCAC	BITLSB	—	DTDL[2:0]			—	SYNCDL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R/W	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31	TRMD	0	R/W	Transfer Mode Selects the transfer mode. This bit should be set to 0.
30	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
29, 28	SYNCMD [1:0]	00	R/W	SYNC Mode The mode setting in these bits should be the same as that in SITMDR1.SYNCMD. 00: Frame start synchronization pulse 01: Reserved 10: Level mode/SPI 11: L/R mode
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	SYNCAC	0	R/W	SYNC Polarity 0: Active-high signal in synchronization pulse or level mode, or driven high then low in L/R mode 1: Active-low signal in synchronization pulse or level mode, or driven low then high in L/R mode This bit must have the same setting as the SYNCAC bit of SITMDR1.
24	BITLSB	0	R/W	MSB/LSB First 0: MSB first 1: LSB first
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	DTDL[2:0]	001	R/W	Data Pin Bit Delay for MSIOF_SYNC Pin 000: No bit delay 001: 1-clock-cycle delay 010: 2-clock-cycle delay Other than above: Setting prohibited In case of SPI mode, only B’000 is allowed to set to this field.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	SYNCDL [2:0]	000	R/W	MSIOF_SYNC Timing Delay These bits should always be set to B’000.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.5 MSIOF Receive Mode Register 2 (SIRMDR2)

SIRMDR2 is a 32-bit readable/writable register that specifies the MSIOF receive mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GRP	—	BITLEN1[4:0]					WDLEN1[7:0]

Bit	Bit Name	Initial Value	R/W	Descriptions
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	GRP	0	R/W	Group Count 0: Group count 1 1: Group count 2 When using reception in master mode, set the same value as the value specified by the GRP bit in SITMDR2.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28 to 24	BITLEN1[4:0]	01111	R/W	Word Size (8 to 32 bits) The word size (bits) of Group 1 is set to the value specified in these bits + 1. Either 8, 16, 24, or 32 bits can be specified as word size. When using reception in master mode, set the same value as the value specified by the BITLEN1 bits in SITMDR2.
23 to 16	WDLEN1[7:0]	H'00	R/W	Word Count (1 to 256 words) The word count of Group 1 is set to WDLEN1 + 1. When using reception in master mode, set the same value as the value specified by the WDLEN1 bits in SITMDR2.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.6 MSIOF Receive Mode Register 3 (SIRMDR3)

SIRMDR3 is a 32-bit readable/writable register that specifies the MSIOF receive mode.
The settings of this register should be not changed when SICTR.RXE or SICTR.TXE are B'1. Otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	BITLEN2[4:0]	01111	R/W	Word Size (8 to 32 bits) The word size (bits) of Group 2 is set to the value specified in these bits + 1. Either 8, 16, 24, or 32 bits can be specified as word size. When using reception in master mode, set the same value as the value specified by the BITLEN2 bits in SITMDR3.
23 to 16	WDLEN2[7:0]	H'00	R/W	Word Count (1 to 256 words) The word count of Group 2 is set to WDLEN2 + 1. When using reception in master mode, set the same value as the value specified by the WDLEN2 bits in SITMDR3.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.7 MSIOF Control Register (SICTR)

SICTR is a 32-bit readable/writable register that specifies the MSIOF operating state.

The values written to the TXE, RXE, TFSE, RFSE, TSCKE, and RSCKE bits become valid (can be read from the bits) several cycles after writing. These bits should not be modified at the same time. Modify one bit at a time, and check that the new value can be read from the bit, and then modify another bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSCKIZ[1:0]		RSCKIZ[1:0]		TEDG	REDG	—	—	TXDIZ[1:0]		—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31, 30	TSCKIZ[1:0]	00	R/W	Transmit Clock Input/output Polarity Select in SPI Mode When Transmission is Disabled When SPI mode is not used, these bits must always be set to B'00. These bits must always be set B'10 or B'11 when SPI mode. [Master mode] 00: Outputs MSIOF_SCK when transmission is disabled. 01: Setting prohibited 10: Outputs 0. 11: Outputs 1. [Slave mode] 00: Inputs MSIOF_SCK when transmission is disabled. 01: Setting prohibited 10: Inputs 0 through MSIOF_SCK when transmission is disabled. 11: Inputs 1 through MSIOF_SCK when transmission is disabled.
29, 28	RSCKIZ[1:0]	00	R/W	Receive Clock Polarity Select in SPI Mode Set the same value as the value specified by the TSCKIZ bits. Other setting is prohibited.
27	TEDG	0	R/W	Transmit Timing 0: Outputs transmit data at the rising edge of the clock. 1: Outputs transmit data at the falling edge of the clock.
26	REDG	0	R/W	Receive Timing 0: Samples receive data at the falling edge of the clock. 1: Samples receive data at the rising edge of the clock.
25, 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	TXDIZ[1:0]	00	R/W	Pin Output When Transmission is Disabled These bits specify the MSIOF_TXD pin output state when transmission is disabled. 00: Outputs 0. 01: Outputs 1. 10: Setting prohibited 11: Setting prohibited
21 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
15	TSCKE	0	R/W	Transmit Serial Clock Output Enable This bit is valid in master mode. When this bit is set to 1, the MSIOF initializes the baud rate generator and initiates the operation. At the same time, the MSIOF outputs the clock generated by the baud rate generator to the MSIOF_SCK pin. After the clock is output, 1 can be read. When transmitting data, set this bit to 1 before setting the TFSE and TXE bits. After data transmission, clear the TFSE and TXE bits and then clear this bit to 0. [Write data] 0: Disables the MSIOF_SCK output. (Outputs the value specified with TSCKIZ.) 1: Enables the MSIOF_SCK output. [Read data] 0: Does not output MSIOF_SCK. (Outputs the value specified with TSCKIZ.) 1: Outputs MSIOF_SCK.
14	TFSE	0	R/W	Transmit Frame Synchronization Signal Output Enable This bit is valid in master mode. When this bit is set to 1, the MSIOF initializes the frame counter and initiates the operation. After the transmit frame synchronization signal is output, 1 can be read. When 0 is written to this bit, 0 is set after transmission of the frame. [Write data] 0: Disables the MSIOF_SYNC output. (Outputs the value specified with SYNCAC.) 1: Enables the MSIOF_SYNC output. [Read data] 0: Does not output MSIOF_SYNC. (Outputs the value specified with SYNCAC.) 1: Outputs MSIOF_SYNC.
13	RSCKE	0	R/W	Receive Serial Clock Output Enable The write value should always be 0.
12	RFSE	0	R/W	Receive Frame Synchronization Signal Output Enable The write value should always be 0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
9	TXE	0	R/W	Transmit Enable When this bit is set to 1, the MSIOF starts data transmission from the beginning of the next frame (at the rising edge of the frame synchronization signal). After the valid data is output, 1 can be read. When value 1 set to this bit becomes valid, the MSIOF issues a transmit data transfer request according to the setting of the TFWM bits in SIFCTR. When transmit data is stored in the transmit FIFO, transmission of data from the MSIOF_TXD pin begins. When 0 is written to this bit, 0 is set after transmission of the frame. This bit is initialized upon a transmit reset. [Write data] 0: Disables the MSIOF_TXD output. (Outputs the value specified with TXDIZ.) 1: Enables the MSIOF_TXD output. [Read data] 0: Does not output MSIOF_TXD. (Outputs the value specified with TXDIZ.) 1: Outputs MSIOF_TXD.
8	RXE	0	R/W	Receive Enable When this bit is set to 1, the MSIOF starts data reception from the beginning of the next frame (at the rising edge of the frame synchronization signal). When value 1 set to this bit becomes valid, the MSIOF starts receiving data through the MSIOF_RXD pin. When receive data is stored in the receive FIFO, the MSIOF issues a receive data transfer request according to the setting of the RFWM bits in SIFCTR. This bit is initialized upon a receive reset. [Write data] 0: Disables data reception through MSIOF_RXD. 1: Enables data reception through MSIOF_RXD. [Read data] 0: Data is not received through MSIOF_RXD. 1: Data can be received through MSIOF_RXD.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
1	TXRST	0	R/W	Transmit Reset When value 1 set to this bit becomes valid, the MSIOF immediately sets transmit data through the MSIOF_TXD pin to 0, and initializes the transmit data registers and transmit-related status. When value 1 set to this bit becomes valid when PCON = 1, the RXRST bit is also becomes valid. The following registers and bits are initialized. SITFDR (Transmit FIFO write pointer) TDREQ bit in SISTR TXE bit This bit is read as 1 until the reset operation is completed for about 20 cycles of module clock. No data should be written to SICTR or the transmit FIFO during this time period. [Write data] 0: Does not reset transmit operation. 1: Resets transmit operation. [Read data] 0: Transmit operation reset is completed. 1: Transmit operation is being reset.
0	RXRST	0	R/W	Receive Reset When value 1 set to this bit becomes valid, the MSIOF immediately disables reception through the MSIOF_RXD pin, and initializes the receive data registers and receive-related status. The following registers and bits are initialized. SIRFDR (Receive FIFO read pointer) RDREQ bit in SISTR RXE bit This bit is read as 1 until the reset operation is completed for about 20 cycles of module clock. No data should be written to SICTR or read the receive FIFO during this time period. [Write data] 0: Does not reset receive operation. 1: Resets receive operation. [Read data] 0: Receive operation reset is completed. 1: Receive operation is being reset.

109.2.8 MSIOF Transmit Clock Select Register (SITSCR)

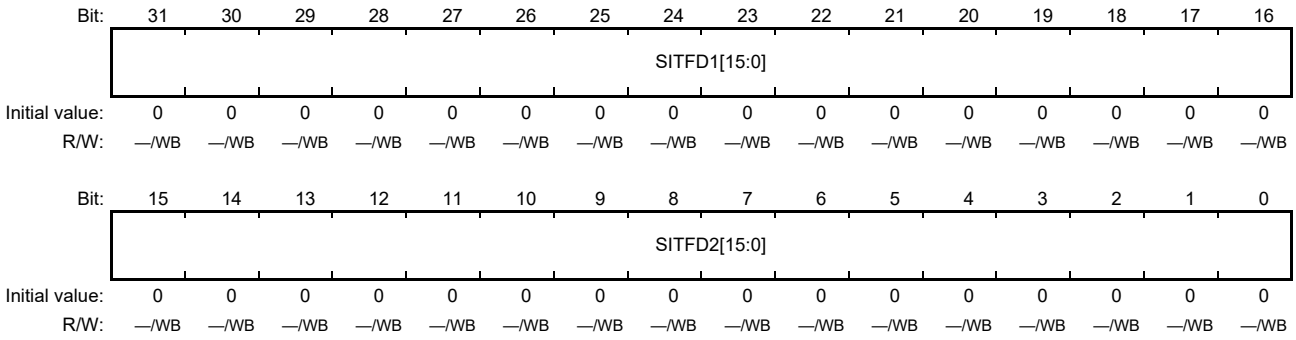
SITSCR is a 16-bit readable/writable register that specifies the conditions for generating transmit serial clock in master mode. SITSCR can be specified when the TRMD bit in SITMDR1 is set to B'1.
The settings of this register should be not changed when SICTR.TSCKE is B’1. Otherwise, the operation cannot be guaranteed.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSSEL[1:0]		MSIMM	BRPS[4:0]					—	—	—	—	—	BRDV[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15, 14	MSSEL[1:0]	00	R/W	Master Clock Source Select The master clock is the clock input to the baud rate generator. 00: Selects module clock as the source of master clock. Others: Setting prohibited
13	MSIMM	0	R/W	Master Clock Direct Select 0: Selects the clock output from the baud rate generator as the serial clock. 1: Setting prohibited
12 to 8	BRPS[4:0]	00000	R/W	Prescaler Setting These bits specify the master clock (MSOφ) division ratio in the count value of the prescaler in the baud rate generator. The specifiable value is from B’00000 (× 1/1) to B’11111 (× 1/32).
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	BRDV[2:0]	000	R/W	Baud Rate Generator's Division Ratio These bits specify the frequency division ratio for the output stage of the baud rate generator. The final frequency division ratio of the baud rate generator is determined as BRPS × BRDV (1/1024 max.). 000: Prescaler output × 1/2 001: Prescaler output × 1/4 010: Prescaler output × 1/8 011: Prescaler output × 1/16 100: Prescaler output × 1/32 101: Setting prohibited 110: Setting prohibited 111: Prescaler output × 1/1 Note: - B'111 is valid only when the BRPS [4:0] bits are set to B'00001. - BRPS × BRDV = 1/1 is invalid（BRPS × BRDV = 1/2 min).

109.2.9 MSIOF Transmit FIFO Data Register (SITFDR)

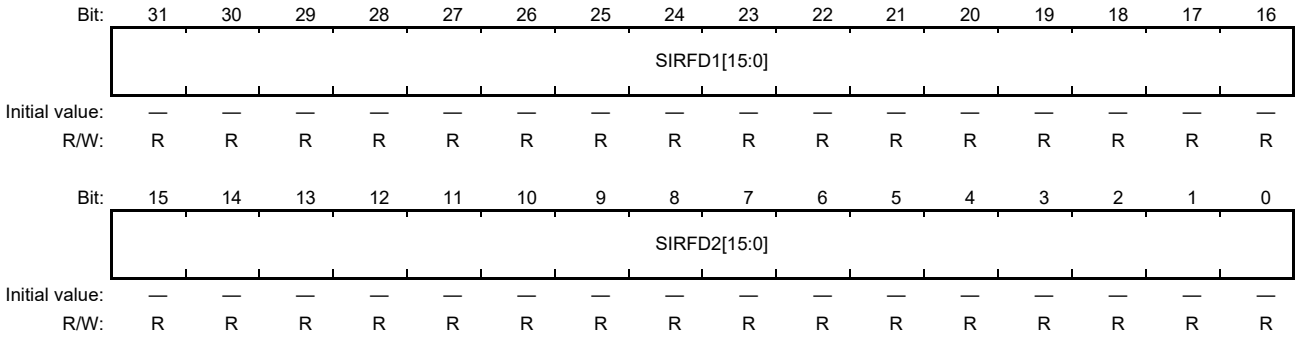
SITFDR is a 32/16/8-bit write-only register that specifies the transmit FIFO data of the MSIOF.



Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 16	SITFD1[15:0]	H'0000	—/WB	These bits specify the upper 16 bits of the FIFO data to be output through MSIOF_TXD.
15 to 0	SITFD2[15:0]	H'0000	—/WB	These bits specify the lower 16 bits of the FIFO data to be output through MSIOF_TXD.

109.2.10 MSIOF Receive FIFO Data Register (SIRFDR)

SIRFDR is a 32/16/8-bit read-only register that stores the receive FIFO data of the MSIOF.



Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 16	SIRFD1[15:0]	Undefined	R	Store the upper 16 bits of the FIFO data received through MSIOF_RXD.
15 to 0	SIRFD2[15:0]	Undefined	R	Store the lower 16 bits of the FIFO data received through MSIOF_RXD.

109.2.11 MSIOF Status Register (SISTR)

Each bit in SISTR becomes an MSIOF interrupt source when the corresponding bit in SIIER is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC	R	R	R	R	R	R/WC	R	R/WC	R/WC	R/WC	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RFFUL	RDREQ	—	—	—	—	REOF	—	RFSERR	RFUDF	RFOVF	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC	R	R	R	R	R	R/WC	R	R/WC	R/WC	R/WC	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	TFEMP	0	R/WC1	Transmit FIFO Empty This bit is set to 1, when the TXE bit in SICTR is 1, and transmit FIFO is empty. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: Transmit FIFO is not empty. 1: Transmit FIFO is empty.
28	TDREQ	0	R	Transmit Data Transfer Request This bit is set, when the empty space in the transmit FIFO exceeds the size specified by the TFWM bits in SIFCTR. When transferring transmit data through the DMAC, this bit is always cleared after one DMAC access. After DMAC access, when the conditions for setting this bit are satisfied, the MSIOF again sets this bit to 1. This bit is valid when the TXE bit in SICTR is 1. This bit indicates a state; if the size of empty space in the transmit FIFO becomes less than the size specified by the TFWM bits in SIFCTR, the MSIOF clears this bit. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. However, when the TDMAE bit is 1, only a DMAC transfer request is issued. 0: The size of empty space in the transmit FIFO has not exceeded the size specified by the TFWM bits in SIFCTR. 1: The size of empty space in the transmit FIFO has exceeded the size specified by the TFWM bits in SIFCTR.
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	TEOF	0	R/WC1	Frame Transmission End This bit is set, when one-frame data transmission is completed. This bit is valid when the TXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: One-frame transmission end is not detected. 1: One-frame transmission end is detected.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
21	TFSERR	0	R/WC1	Transmit Frame Synchronization Error This bit is set, when the next transmit frame synchronization timing arrives before the previous data transmission has been completed. If a transmit frame synchronization error occurs, the MSIOF performs transmission only for the slots that can be transferred. This bit is valid when the TXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No transmit frame synchronization error has occurred. 1: A transmit frame synchronization error has occurred.
20	TFOVF	0	R/WC1	Transmit FIFO Overflow A transmit FIFO overflow means that there has been an attempt to write to SITFDR when the transmit FIFO is full. If a transmit FIFO overflow occurs, the MSIOF ignores the write operation causing the overflow. This bit is valid when the TXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No transmit FIFO overflow has occurred. 1: A transmit FIFO overflow has occurred.
19	TFUDF	0	R/WC1	Transmit FIFO Underflow A transmit FIFO underflow means that loading for transmission has occurred when the transmit FIFO is empty. Output data is unknown when under flow is occurred. This bit is valid when the TXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No transmit FIFO underflow has occurred. 1: A transmit FIFO underflow has occurred. Note: If transmission size is more than 256-words per frame, do not use this bit. See 109.4.5 for details.
18 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RFFUL	0	R/WC1	Receive FIFO Full This bit is valid when the RXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: Receive FIFO is not full. 1: Receive FIFO is full.

Bit	Bit Name	Initial Value	R/W	Descriptions
12	RDREQ	0	R	Receive Data Transfer Request This bit is set, when the valid data space in the receive FIFO exceeds the size specified by the RFWM bits in SIFCTR. When transferring receive data through the DMAC, this bit is always cleared by one DMAC access. After DMAC access, when the conditions for setting this bit are satisfied, the MSIOF again sets this bit to 1. This bit is valid when the RXE bit in SICTR is 1. This bit indicates a state; if the size of valid data space in the receive FIFO becomes less than the size specified by the RFWM bits in SIFCTR, the MSIOF clears this bit. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. However, when the RDMAE bit is 1, only a DMAC transfer request is issued. 0: The size of valid data space in the receive FIFO has not exceeded the size specified by the RFWM bits in SIFCTR. 1: The size of valid data space in the receive FIFO has exceeded the size specified by the RFWM bits in SIFCTR.
11 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	REOF	0	R/WC1	Frame Reception End The MSIOF issues the frame reception end flag upon completion of one-frame data reception. This bit is valid when the RXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: One-frame reception end is not detected. 1: One-frame reception end is detected.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	RFSERR	0	R/WC1	Receive Frame Synchronization Error A receive frame synchronization error occurs when the next receive frame synchronization timing arrives before the previous data reception has been completed. If a receive frame synchronization error occurs, the MSIOF performs reception only for the slots that can be transferred. This bit is valid when the RXE bit in SICTR is 1. Writing 1 to this bit will clear this bit. Writing 0 to this bit will be ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No receive frame synchronization error has occurred 1: A receive frame synchronization error has occurred

Bit	Bit Name	Initial Value	R/W	Descriptions
4	RFUDF	0	R/WC1	Receive FIFO Underflow A receive FIFO underflow means that reading of SIRFDR has occurred when the receive FIFO is empty. If a receive FIFO underflow occurs, the value read from SIRFDR is not guaranteed. This bit is valid when the RXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No receive FIFO underflow has occurred. 1: A receive FIFO underflow has occurred.
3	RFOVF	0	R/WC1	Receive FIFO Overflow A receive FIFO overflow means that writing has been caused by receiving operation when the receive FIFO is full. If a receive FIFO overflow occurs, the receive data causing the overflow is lost. This bit is valid when the RXE bit in SICTR is 1. Writing 1 to this bit clears this bit. Writing 0 to this bit is ignored. If the interrupt request from this bit is enabled, an MSIOF interrupt is issued. 0: No receive FIFO overflow has occurred. 1: A receive FIFO overflow has occurred.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.12 MSIOF Interrupt Enable Register (SIIER)

SIIER is a 32-bit readable/writable register that enables the issuance of MSIOF interrupts. When each bit in this register is set to 1 and the corresponding bit in SISTR is set to 1, the MSIOF issues an interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R	R/W	R/W	R	R	R	R	R/W	R	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31	TDMAE	0	R/W	Transmit Data DMA Transfer Request Enable Specifies whether to send an interrupt as an interrupt request to the CPU or a transfer request to the DMAC. The TDREQE bit can be set as the request source. 0: Sends an interrupt request to the CPU. 1: Sends a DMA transfer request to the DMAC.
30	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
29	TFEMPE	0	R/W	Transmit FIFO Empty Enable 0: Disables interrupts due to transmit FIFO empty. 1: Enables interrupts due to transmit FIFO empty.
28	TDREQE	0	R/W	Transmit Data Transfer Request Enable 0: Disables interrupts due to transmit data transfer requests. 1: Enables interrupts due to transmit data transfer requests.
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	TEOFE	0	R/W	Frame Transmission End Enable 0: Disables a frame transmission end interrupt. 1: Enables a frame transmission end interrupt.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	TFSERRE	0	R/W	Transmit Frame Synchronization Error Enable 0: Disables interrupts due to transmit frame synchronization errors. 1: Enables interrupts due to transmit frame synchronization errors.
20	TFOVFE	0	R/W	Transmit FIFO Overflow Enable 0: Disables interrupts due to transmit FIFO overflow. 1: Enables interrupts due to transmit FIFO overflow.
19	TFUDFE	0	R/W	Transmit FIFO Underflow Enable 0: Disables interrupts due to transmit FIFO underflow. 1: Enables interrupts due to transmit FIFO underflow.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	RDMAE	0	R/W	Receive Data DMA Transfer Request Enable Specifies whether to send an interrupt as an interrupt request to the CPU or a transfer request to the DMAC. The RDREQE bit can be set as the request source. 0: Sends an interrupt request to the CPU. 1: Sends a DMA transfer request to the DMAC.
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
13	RFFULE	0	R/W	Receive FIFO Full Enable 0: Disables interrupts due to receive FIFO full. 1: Enables interrupts due to receive FIFO full.
12	RDREQE	0	R/W	Receive Data Transfer Request Enable 0: Disables interrupts due to receive data transfer requests. 1: Enables interrupts due to receive data transfer requests.
11 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	REOFE	0	R/W	Frame Reception End Enable 0: Disables a frame reception end interrupt. 1: Enables a frame reception end interrupt.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	RFSERRE	0	R/W	Receive Frame Synchronization Error Enable 0: Disables interrupts due to receive frame synchronization errors. 1: Enables interrupts due to receive frame synchronization errors.
4	RFUDFE	0	R/W	Receive FIFO Underflow Enable 0: Disables interrupts due to receive FIFO underflow. 1: Enables interrupts due to receive FIFO underflow.
3	RFOVFE	0	R/W	Receive FIFO Overflow Enable 0: Disables interrupts due to receive FIFO overflow. 1: Enables interrupts due to receive FIFO overflow.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.2.13 MSIOF FIFO Control Register (SIFCTR)

SIFCTR is a 32-bit readable/writable register that indicates the area available for the transmit/receive FIFO transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TFWM[2:0]			TFUA[8:0]									—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFWM[2:0]			RFUA[8:0]									—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 29	TFWM[2:0]	000	R/W	Transmit FIFO Watermark A transfer request of the transmit FIFO is issued by the TDREQE bit in SIIER. The transmit FIFO always operates as a 256-stage FIFO regardless of the setting of these bits. 000: Issues a transfer request when 64 stages of the transmit FIFO are empty. 001: Issues a transfer request when 32 more stages of the transmit FIFO are empty. 010: Issues a transfer request when 24 or more stages of the transmit FIFO are empty. 011: Issues a transfer request when 16 or more stages of the transmit FIFO are empty. 100: Issues a transfer request when 12 or more stages of the transmit FIFO are empty. 101: Issues a transfer request when 8 or more stages of the transmit FIFO are empty. 110: Issues a transfer request when 4 or more stages of the transmit FIFO are empty. 111: Issues a transfer request when 1 or more stages of transmit FIFO are empty.
28 to 20	TFUA[8:0]	H'100	R	Transmit FIFO Usable Area Indicate the number of words that can be transferred by the CPU or DMAC as B'0 0000 0000 (full) to B'1 0000 0000 (empty).
19 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 13	RFWM[2:0]	000	R/W	Receive FIFO Watermark A transfer request of the receive FIFO is issued by the RDREQE bit in SIIER. The receive FIFO always operates as a 256-stage FIFO regardless of the setting of these bits. 000: Issues a transfer request when 1 stage or more of the receive FIFO are valid. 001: Issues a transfer request when 4 or more stages of the receive FIFO are valid. 010: Issues a transfer request when 8 or more stages of the receive FIFO are valid. 011: Issues a transfer request when 16 or more stages of the receive FIFO are valid. 100: Issues a transfer request when 32 or more stages of the receive FIFO are valid. 101: Issues a transfer request when 64 or more stages of the receive FIFO are valid. 110: Issues a transfer request when 128 or more stages of the receive FIFO are valid. 111: Issues a transfer request when 256 stages of the receive FIFO are valid.

Bit	Bit Name	Initial Value	R/W	Descriptions
12 to 4	RFUA[8:0]	All 0	R	Receive FIFO Usable Area Indicate the number of words that can be transferred by the CPU or DMAC as B'0 0000 0000 (empty) to B'1 0000 0000 (full).
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

109.3 Operation

109.3.1 Operating Mode

(1) Common transmit/receive mode

Common clock and frame synchronization signals are used for transmission and reception.

Master mode: MSIOF_SCK and MSIOF_SYNC are output.
Slave mode: MSIOF_SCK and MSIOF_SYNC are input.

109.3.2 Serial Clocks

(1) Clock output in master mode

In master mode, the baud rate generator is used to generate the serial clock. The division ratio is from 1/2 to 1/1024.

(2) Clock input in slave mode

In slave mode, the clock input for transmission and reception is used as the serial clock.

(3) Multiple channel function

This module provides the multiple channel function as shown in Figure 109.2.

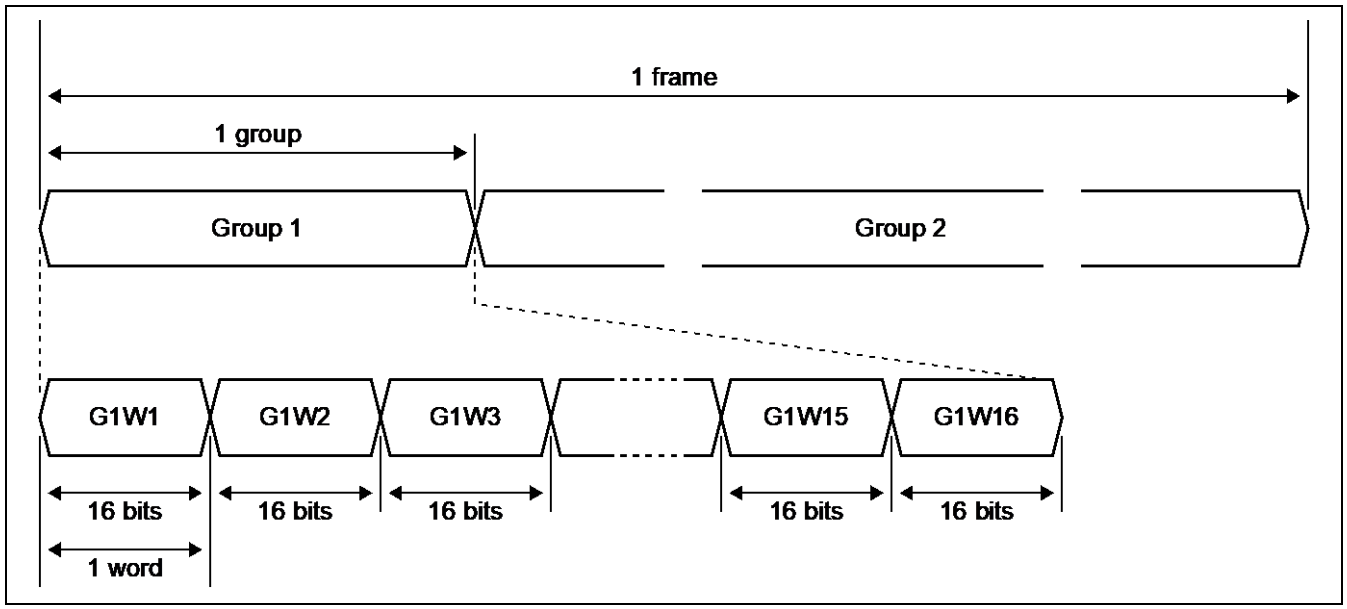

Figure 109.2 Multiple Channel Structure

The following conditions can be specified for the multiple channel function.

- Up to 2 groups in one frame
- Up to 256 words in one group
- 8, 16, 24, or 32 bits in one word

109.3.3 Serial Timing

(1) MSIOF_SYNC

The MSIOF_SYNC is a frame synchronization signal. The following three modes are available.

- Frame start synchronization pulse: 1-bit-width pulse indicating the start of a frame
- Level/SPI: Level signal asserted during frame transmission
- L/R: 1/2-frame-width pulse indicating the first-half groups in a high level and the last-half groups in a low level

Figure 109.3 to Figure 109.5 show the synchronization timing in these modes using the MSIOF_SYNC signal.

(a) Frame start synchronization pulse

The rising edge of the synchronization pulse indicates the start of a frame.

The delay between the rising edge of the synchronization signal and the start of data transmission or reception can be specified with the DTDL bits. The width of the synchronization pulse can be extended through the SYNCDL bit setting.

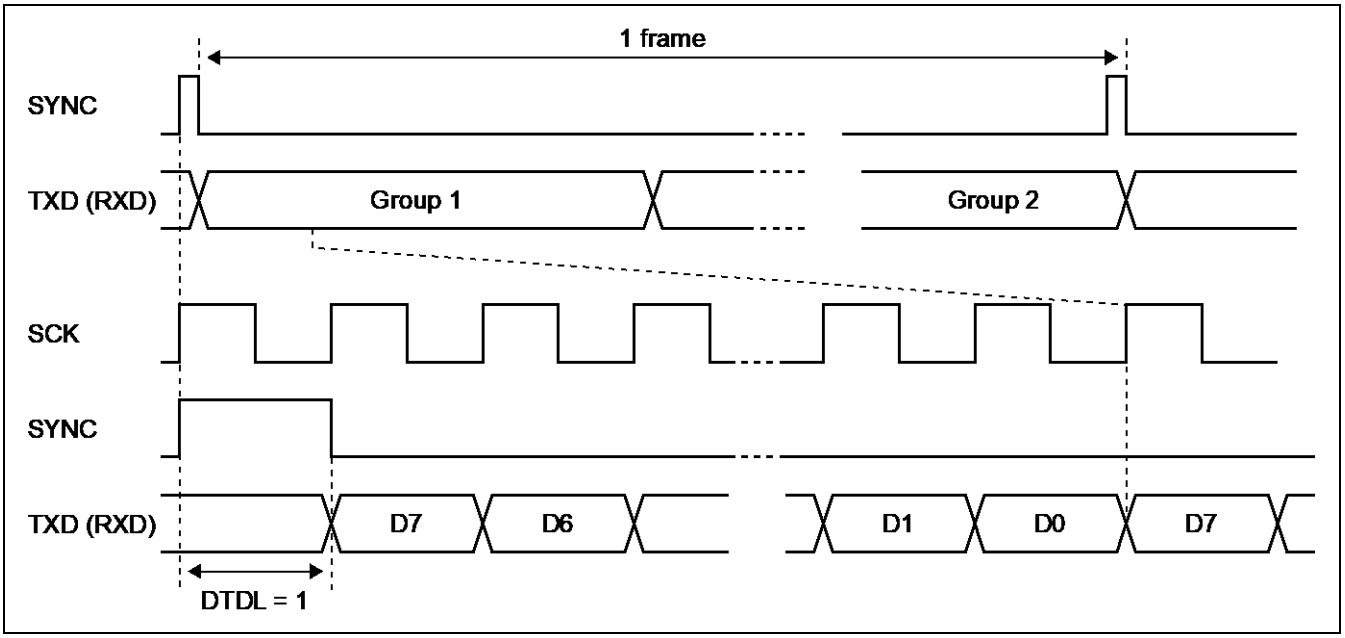

Figure 109.3 Synchronization Timing in Start Frame Synchronization Pulse Mode

(b) Level synchronization

The synchronization signal is driven high for the frame length.

The delay between the rising edge of the synchronization signal and the start of transmission or reception can be specified with the DTDL bits and the delay between the end of transmission or reception and the falling edge of the synchronization signal can be specified with the SYNCDL bits (DTDL = 0 to 2 and SYNCDL = 0 to 3). These settings are valid only in master mode. This mode is available for the SPI master or slave operation.

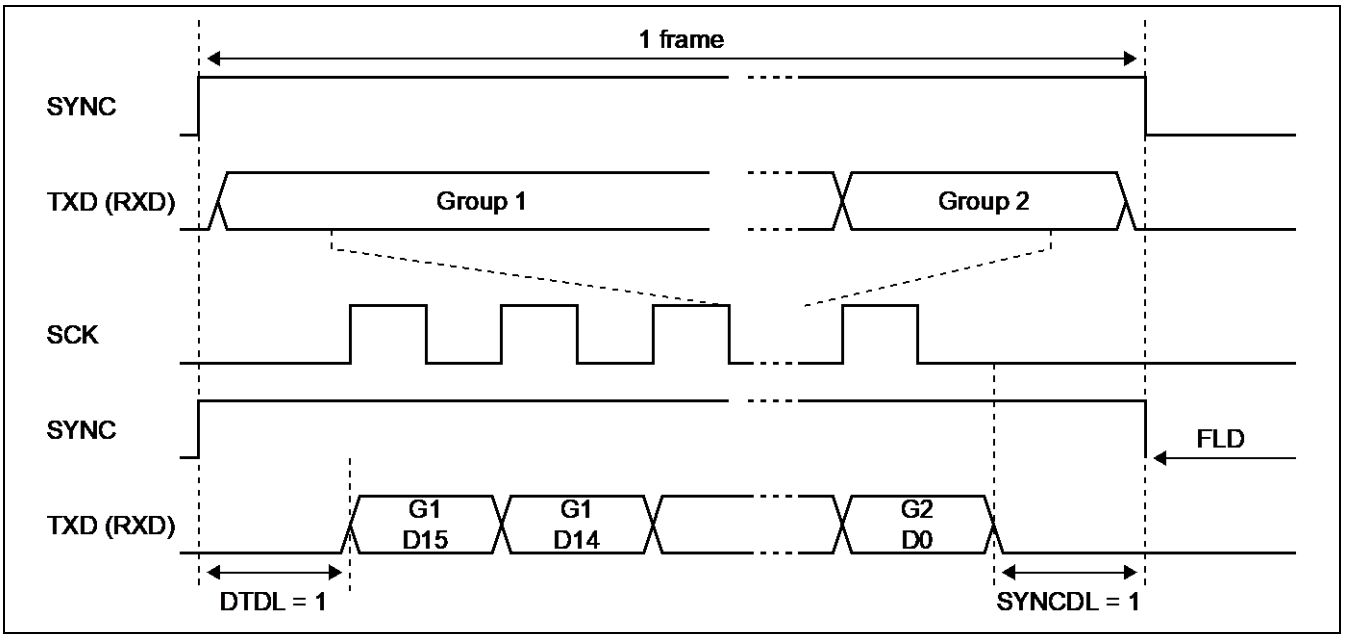

Figure 109.4 Synchronization Timing in Level Synchronization Mode

(c) L/R synchronization

A high level in the synchronization signal indicates the first-half groups and a low level indicates the last-half groups.

The delay between the rising or falling edge of the synchronization signal and the start of transmission or reception can be specified with the DTDL bits.

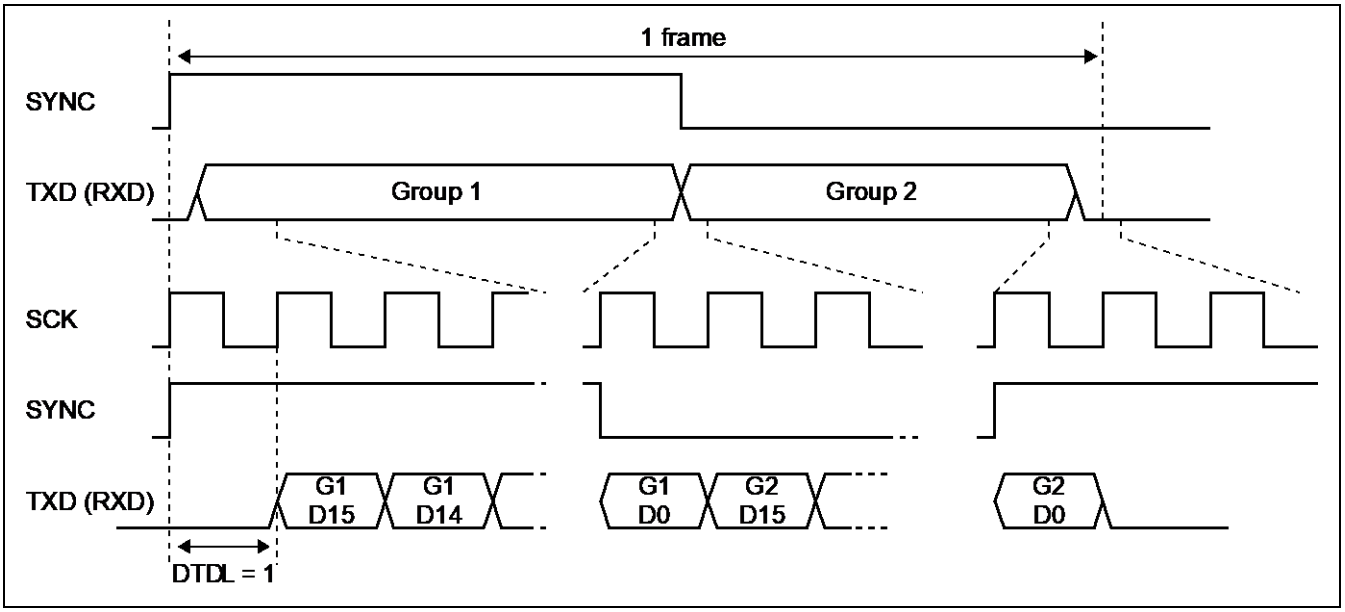

Figure 109.5 Synchronization Timing in L/R Synchronization Mode

(2) Transmit/receive timing

The timing of MSIOF_TXD transmission relative to MSIOF_SCK and of MSIOF_RXD can be specified as sampling on either edge, as listed below. The respective settings are made in TEDG and REDG bits of SICTR.

- Falling-edge sampling
- Rising-edge sampling

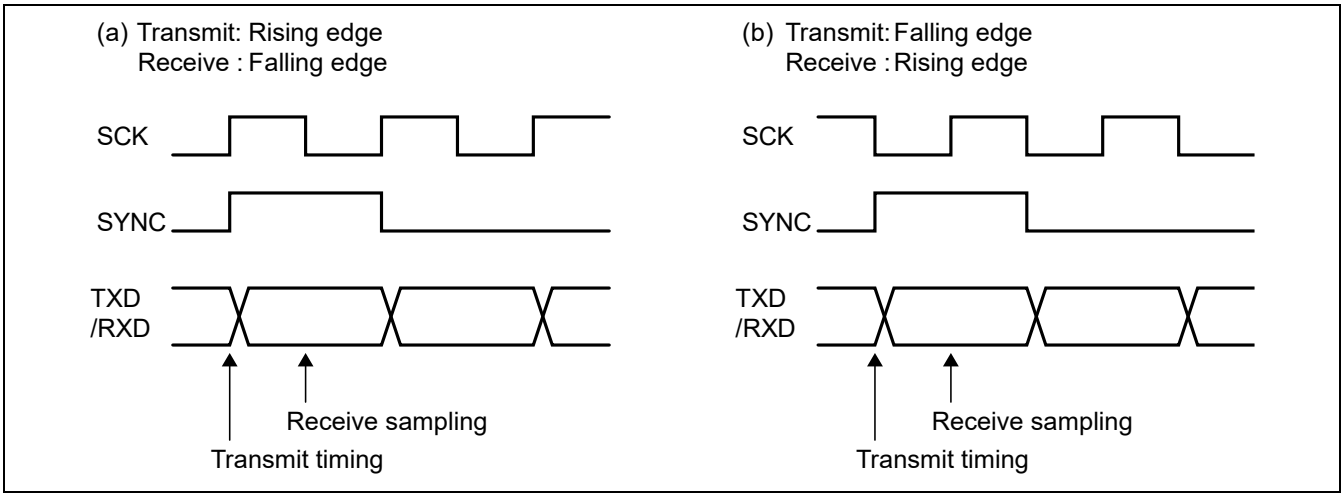

Figure 109.6 Transmit/Receive Timing.

109.3.4 Transfer Data Allocation to Registers

(1) Transmit/receive data

Transmit/receive data (FIFO data) should be written to or read from the following registers.

- Transmit FIFO data writing: SITFDR (32/16/8-bit access)
- Receive FIFO data reading: SIRFDR (32/16/8-bit access)

Figure 109.7 shows the bit alignment of these registers.

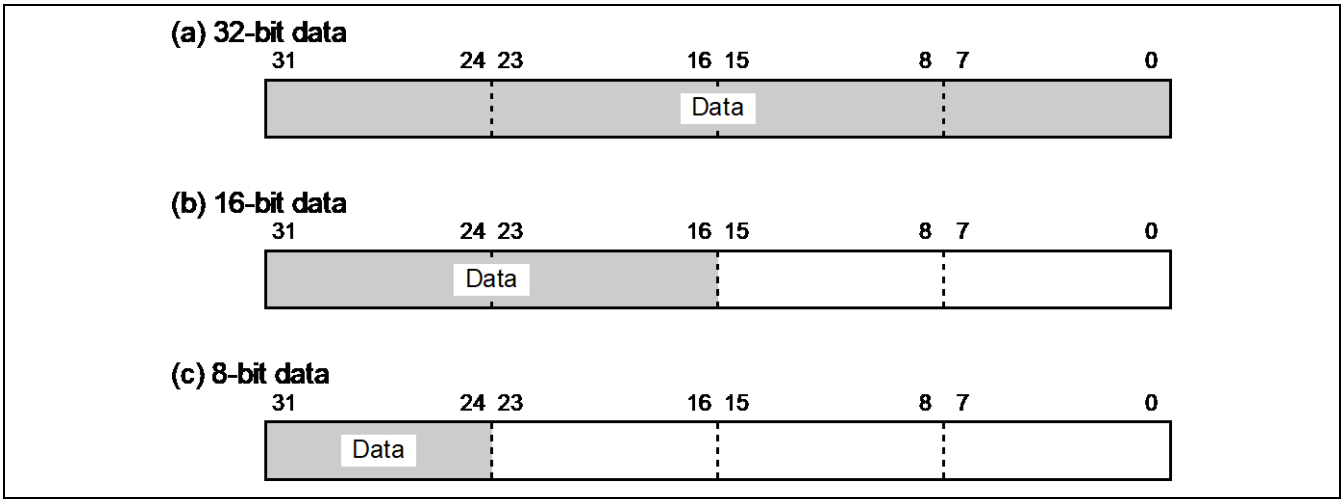

Figure 109.7 Transmit/Receive Data Bit Alignment

109.3.5 FIFO

(1) Overview

The transmission and receive FIFOs of the MSIOF have the following features.

- 32 bits × 256 stages for transmission and 32 bits × 256 stages for reception
- The FIFO pointer is updated in one read or write cycle regardless of the access size of the CPU or DMAC. (One access cannot be divided into multiple accesses.)

(2) Transfer request

A request for FIFO data transfer can be issued to the CPU or DMAC as the following interrupt sources.

- FIFO transmit request: TDREQ (interrupt source for transmission)
- FIFO receive request: RDREQ (interrupt source for reception)

The conditions for requesting FIFO data transfer can be specified separately for transmission and reception. The conditions for the transmit FIFO and receive FIFO are specified in the TFWM[2:0] bits and RFWM[2:0] bits in SIFCTR, respectively.

Table 109.7 Condition for Issuing Transmit Request

TFWM[2:0]	Number of Requested Stages	Condition for Transmit Request	Areas Used
000	192	64 stages of empty area	Smallest
001	224	32 or more stages of empty area	↑
010	232	24 or more stages of empty area	↑
011	240	16 or more stages of empty area	↑
100	244	12 or more stages of empty area	↑
101	248	8 or more stages of empty area	↑
110	252	4 or more stages of empty area	↑
111	256	1 or more stages of empty area	Largest

Table 109.8 Condition for Issuing Receive Request

RFWM[2:0]	Number of Requested Stages	Condition for Receive Request	Areas Used
000	1	1 or more stages of valid data	Smallest
001	4	4 or more stages of valid data	↑
010	8	8 or more stages of valid data	↑
011	16	16 or more stages of valid data	↑
100	32	32 or more stages of valid data	↑
101	64	64 or more stages of valid data	↑
110	128	128 or more stages of valid data	↑
111	256	256 stages of valid data	Largest

The maximum FIFO stages are always available even if the data area or empty area exceeds the size specified for the transfer condition. Accordingly, an overflow error or an underflow error occurs if the data area or empty area exceeds the maximum number of FIFO stages.

The FIFO transfer request is canceled when the specified condition is not satisfied even if the FIFO does not become empty or full.

(3) Number of FIFOs

The number of transmit and receive FIFO stages used are indicated by the following registers.

- Transmit FIFO: The number of empty FIFO stages is indicated by the TFUA [8:0] bits in SIFCTR.
- Receive FIFO: The number of valid data stages is indicated by the RFUA [8:0] bits in SIFCTR.

These registers show the number of data stages that can be transferred by the CPU. DMA transfer should be set the following setting.

SIFCTR.TFWM[2:0] = B’111
SIFCTR.RFWM[2:0] = B’000

109.3.6 Transmit and Receive Procedures

(1) Transmission in master mode

Figure 109.8 and Figure 109.9 shows an example of settings and operation for transmission in master mode.

No.	Operating flow	Description	Operation
1	SITMDR1/2/3 SITSCR SIFCTR SIIER setting	Operating mode Clock setting FIFO water mark Setting interrupt/DMA enable	
2	SICTR Set SICTR.TSCKE to 1	Transmission rate setting Baud rate generator starting	Output serial clock
3	TSCKE = 1 ? NO / YES	Read SICTR.TSCKE = 1	
4	SITFDR	Write transmission data to FIFO	
5	Set SICTR.TXE to 1	Transmission enable	
6	TXE = 1 ? NO / YES	Read SICTR.TXE = 1	
7	Set SICTR.TFSE to 1	Starting MSIOF_SYNC output	
8	TFSE = 1 ? NO / YES	Read SICTR.TFSE = 1	
9	Starting transmission		Data transmission
10	TDREQ = 1 ? NO / YES		Generating interrupt/DMA request
11	Write transmission data to FIFO		
12	Transmission end ? NO / YES		
13	Set SICTR.TFSE to 0	Frame sync disable	
14	TFSE = 0 ? NO / YES	Read SICTR.TFSE = 0	
15	Set SICTR.TXE to 0	Transmission disable	
16	TXE = 0 ? NO / YES Finish	Read SICTR.TXE = 0	

Figure 109.8 Example of Transmit Procedure in Master Mode (without DMAC)

No.	Operating flow	Description	Operation
1	• Setting interupt controller • Setting source address of DMAC channel • Setting Destination address of DMAC channel is SITFDR • Setting number of Transfer in DMAC transfer count register • Setting transfer as fixed destination address mode. • Setting Resouse Select register of DMAC channel, please refer to Chapter describe DMAC module to get the value. • DMAC start.	• DMAC setting, Refer To Chapter Describe DMAC module for More detail • Setting to interrupt controller for MSIOF interrupt event, refer to chapter describe interrupt controller for detail.	
2	SITMDR1/2/3 SITSCR SIFCTR SIIER setting	• operating mode • clock setting • fifo water mark • interrupt: Refer to Section 109.3.7 or SIIER register description (109.2.12) for MSIOF's Interrupt Factor. • dma enable (SIIER.TDMAE)	
3	SICTR Set SICTR.TSCKE to 1	Transmission rate setting Baud rate generator starting	Output serial clock
4	TSCKE = 1 ? NO / YES	Read SICTR.TSCKE = 1	
5	Set SICTR.TXE to 1	Transmission enable	
6	TXE = 1 ? NO / YES	Read SICTR.TXE = 1	
7	Set SICTR.TFSE to 1	Starting MSIOF_SYNC output	
8	TFSE = 1 ? NO / YES	Read SICTR.TFSE = 1	
9	Starting transmission		Data transmission
10	TDREQ = 1 ? NO / YES		Generating interrupt/DM A request
11	Write transmission data to FIFO		
12	Transmission end ? NO / YES	Wait bit TE in DMAC CHCR register set to 1, refer to chapter describe DMAC module for detail. Or use interrupt to avoid software polling, DMAC module support interrupt when the transfer end.	
13	Set SICTR.TFSE to 0	Frame sync disable	
14	TFSE = 0 ? NO / YES	Read SICTR.TFSE = 0	
15	Set SICTR.TXE to 0	Transmission disable	
16	TXE = 0 ? NO / YES Finish	• Read SICTR.TXE = 0 • Disable DMAC channel, refer to chapter describe DMAC module for detail	

Figure 109.9 Example of Transmit Procedure in Master Mode (with DMAC)

(2) Reception in master mode (with SITMDR1.PCON = 1)

Figure 109.10 and Figure 109.11 show an example of settings and operation for reception in master mode with SITMDR1.PCON = 1.

No.	Operating flow	Description	Operation

4		Read SICTR.RXE = 1	
5	Data reception		Receive data
6			Generating interrupt/DMA request
7	Read SIRFDR	Data read from FIFO	
8			
9	Set SICTR.RXE to 0	Reception disable	
10		Read SICTR.RXE = 0	

Figure 109.15 Example of Receive Procedure in Slave Mode

(5) Reset

After a power-on reset is applied, module stop state is canceled, or a reset signal is asserted through the TXRST or RXRST setting in SICTR, it takes about 20 cycles of module clock to complete the internal reset of the module. During a period from the beginning of reset until the TXRST or RXRST value is read as 0, do not modify the control register or access the FIFOs.

The MSIOF can reset the transmit and receive units by setting the following bits to 1.

- Transmit reset: TXRST bit in SICTR
- Receive reset: RXRST bit in SICTR

Table 109.9 Transmit and Receive Reset

Type	Objects Initialized
Transmit reset	SITFDR (Transmit FIFO write pointer) TDREQ bit in SISTR TXE bit in SICTR (When SITMDR1.PCON = 1, Receive reset is also asserted.)
Receive reset	SIRFDR (Receive FIFO read pointer) RDREQ bit in SISTR RXE bit in SICTR

(6) Initial operating mode

After a power-on reset, both transmit and receive units are initialized to master mode (0 is output through MSIOF_SCK and MSIOF_SYNC). When using slave mode, keep the connected device outputting 0 until the operating mode setting is completed.

109.3.7 Interrupts

The MSIOF has one type of interrupt.

(1) Interrupt sources

Interrupts can be generated by several sources. Each source is shown as an MSIOF status in SISTR. Table 109.10 lists the MSIOF interrupt sources.

Table 109.10 MSIOF Interrupt Sources

No.	Classification	Bit Name	Function Name	Description
1	Transmission	TDREQ	Transmit FIFO transfer request	The transmit FIFO has empty space of specified size or more.
2		TFEMP	Transmit FIFO empty	The transmit FIFO is empty.
3		TEOF	Frame transmission end	Transmission of data with a length of one frame is completed.
4	Reception	RDREQ	Receive FIFO transfer request	The receive FIFO stores data of specified size or more.
5		RFFUL	Receive FIFO full	The receive FIFO is full.
6		REOF	Frame reception end	Reception of data with a length of one frame is completed.
7	Error	TFUDF	Transmit FIFO underflow	Serial data transmit timing has arrived while the transmit FIFO is empty.
8		TFOVF	Transmit FIFO overflow	The transmit FIFO is written to while it is full.
9		RFOVF	Receive FIFO overflow	Serial data is received while the receive FIFO is full.
10		RFUDF	Receive FIFO underflow	The receive FIFO is read while the receive FIFO is empty.
11		TFSERR	Transmit FS error	A transmit frame synchronization signal is input before the specified number of bits has been reached (in slave mode).
12		RFSERR	Receive FS error	A receive frame synchronization signal is input before the specified number of bits has been reached (in slave mode).

Whether an interrupt is issued from an interrupt source is determined by the SIIER settings. If an interrupt source bit is set to 1 and the corresponding bit in SIIER is set to 1, an MSIOF interrupt is issued.

(2) TDREQ and RDREQ

The transmit FIFO transfer request (TDREQ) and receive FIFO transfer request (RDREQ) are signals indicating the state. If the state changes after TDREQ or RDREQ is set, it is automatically cleared by the MSIOF.

When the DMA transfer is used, a DMA transfer request signal is pulled low for one cycle at the end of DMA transfer.

(3) Processing when errors occur

- Transmit FIFO underflow (TFUDF)
  An undefined value is output.
- Transmit FIFO overflow (TFOVF)
  The contents of the transmit FIFO are protected, and the write operation causing the overflow is ignored.
- Receive FIFO overflow (RFOVF)
  Data causing the overflow is discarded and lost.
- Receive FIFO underflow (RFUDF)
  An undefined value is output on the bus.
- Transmit FS error (TFSERR)
  The internal counter is reset according to the synchronization signal in which an error occurs.
- Receive FS error (RFSERR)
  The internal counter is reset according to the synchronization signal in which an error occurs.

109.3.8 Transmit and Receive Timing

Examples of the MSIOF serial transmission and reception are shown in Figure 109.16 and Figure 109.17.

(1) 16-bit synchronization pulse

Synchronization pulse method, one group, one word, 16 bits in a word, no bit delay

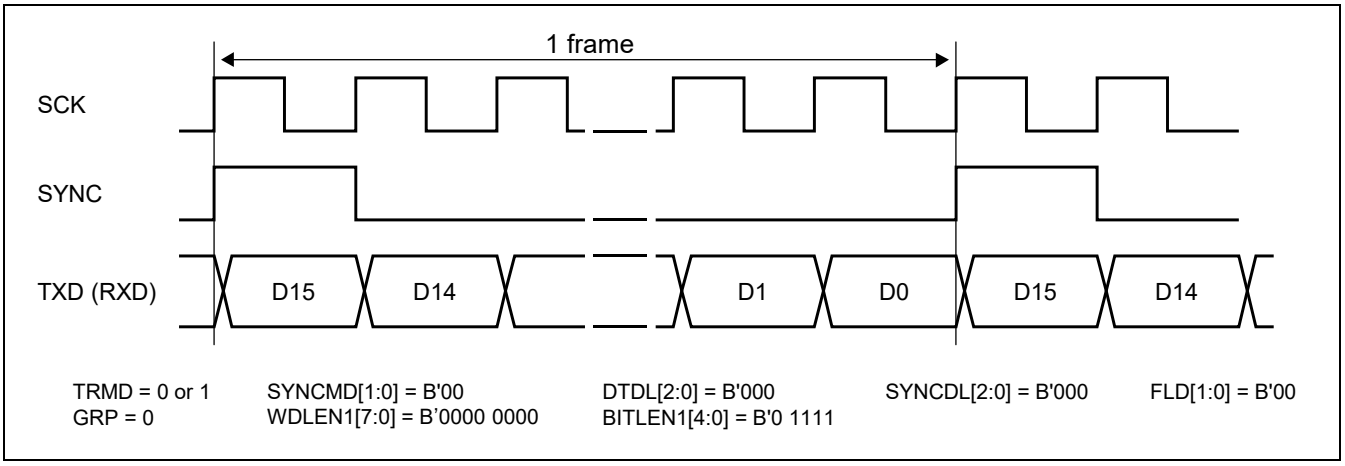

Figure 109.16 Transmit and Receive Timing (16 Bits)

(2) 32-bit synchronization pulse

Synchronization pulse method, one group, 32 words, 32 bits in a word, 1-bit delay

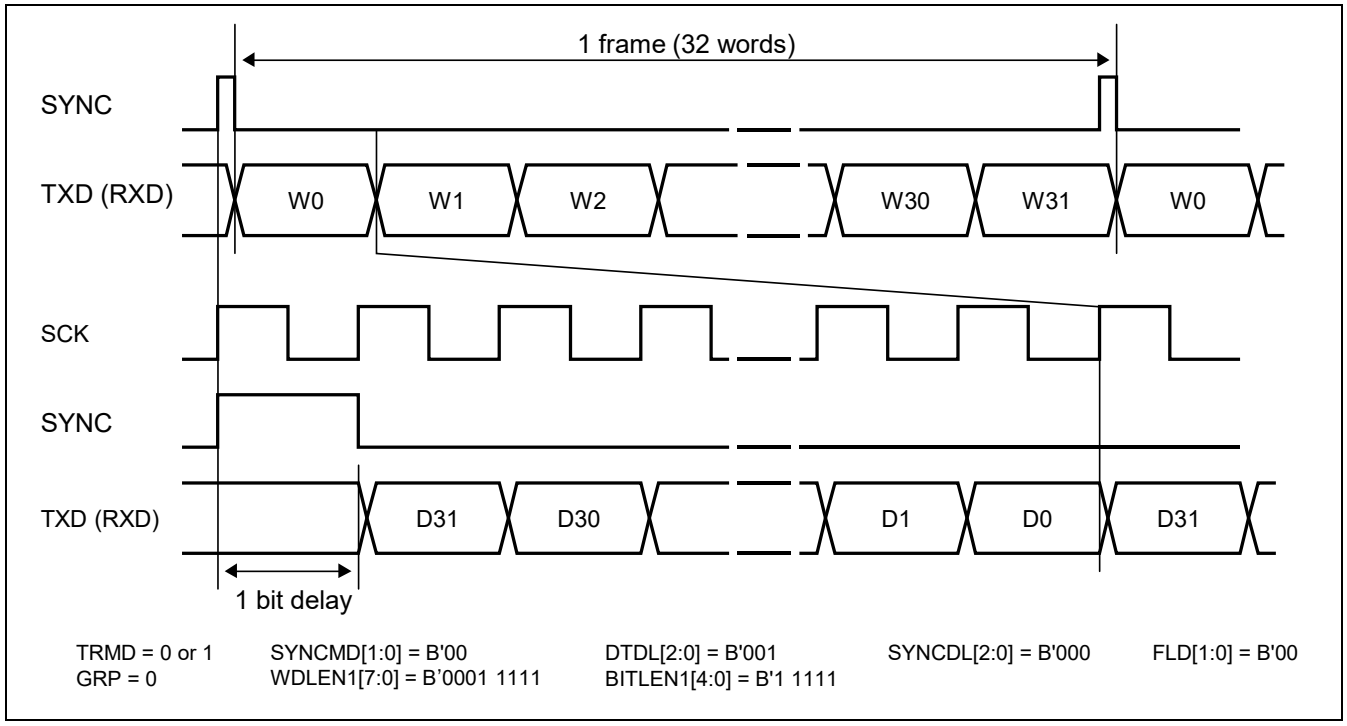

Figure 109.17 Transmit and Receive Timing (32 Bits)

(3) 32-bit IIS transmission

L/R mode, 2 groups, 1 word for each group, 32-bit word for each group, 1-bit delay

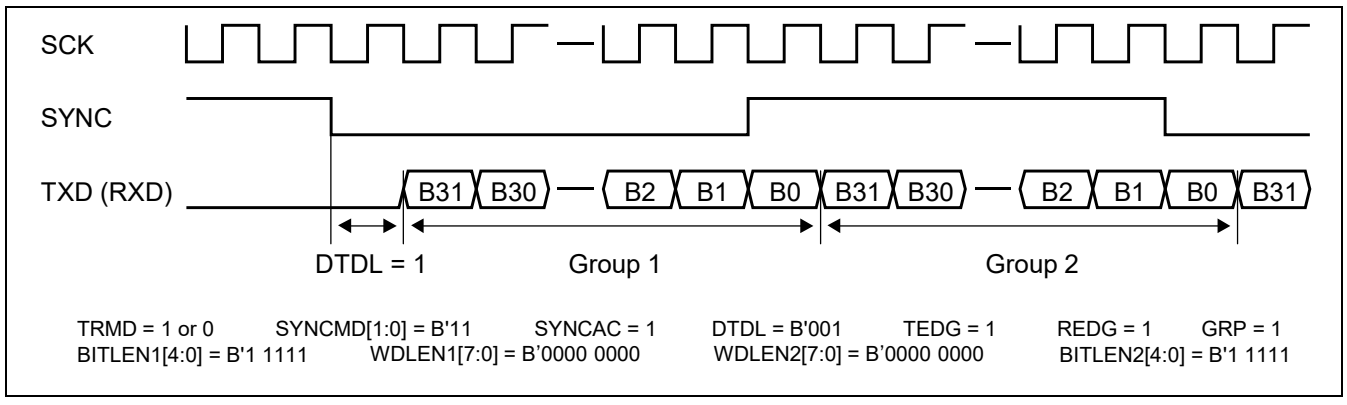

Figure 109.18 Transmit Timing (32-Bit IIS)

109.3.9 SPI

With the appropriate register settings, the MSIOF can be used as an SPI device.

(1) Example of SPI device connection

Figure 109.19 shows an example of connection with an SPI device.

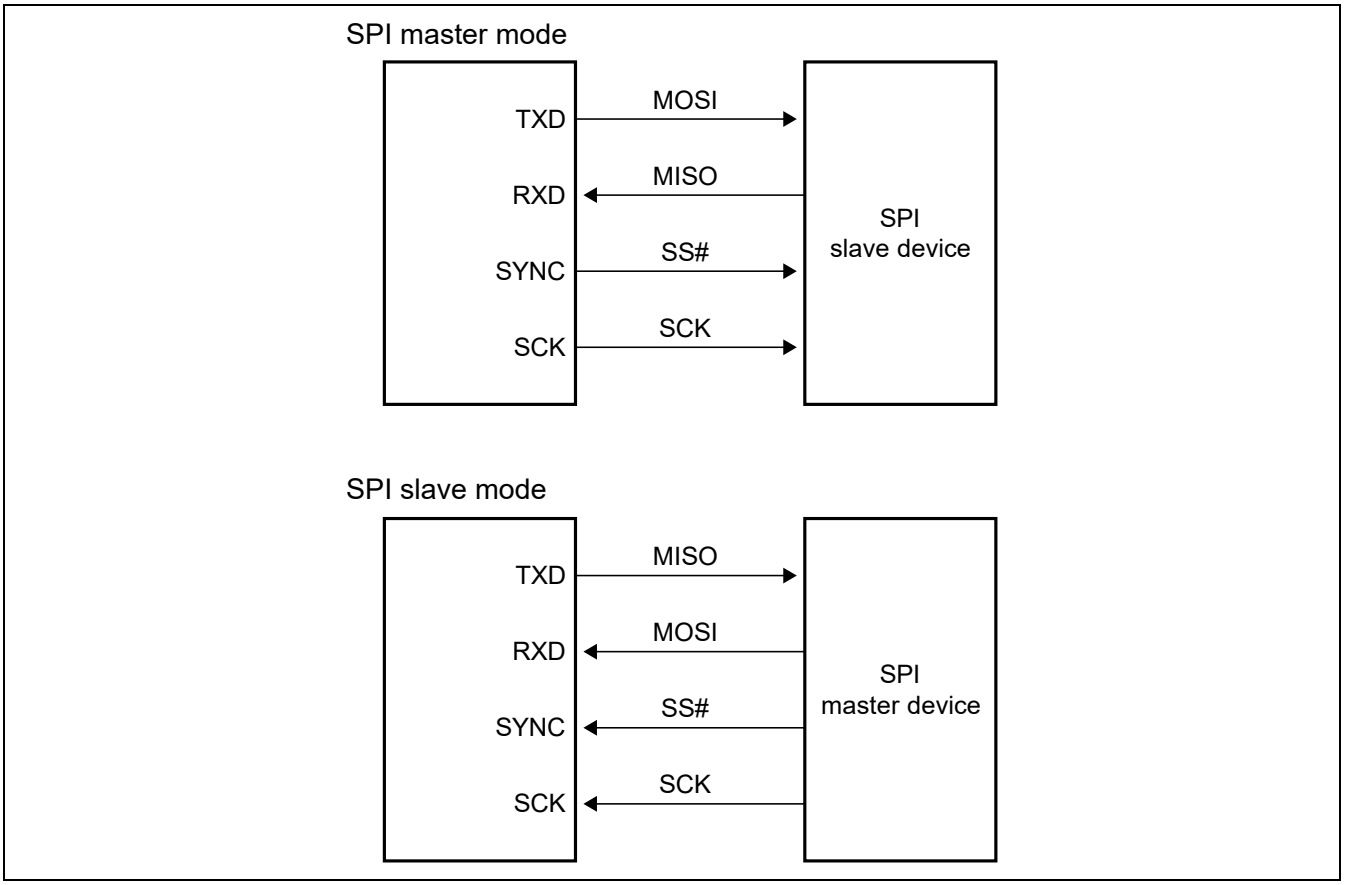

Figure 109.19 Example of SPI Device Connection

(2) SPI serial clock timing

Figure 109.20 and Figure 109.21 show the data and clock timing in SPI mode. As shown in the figures, four types of serial transfer formats can be used.

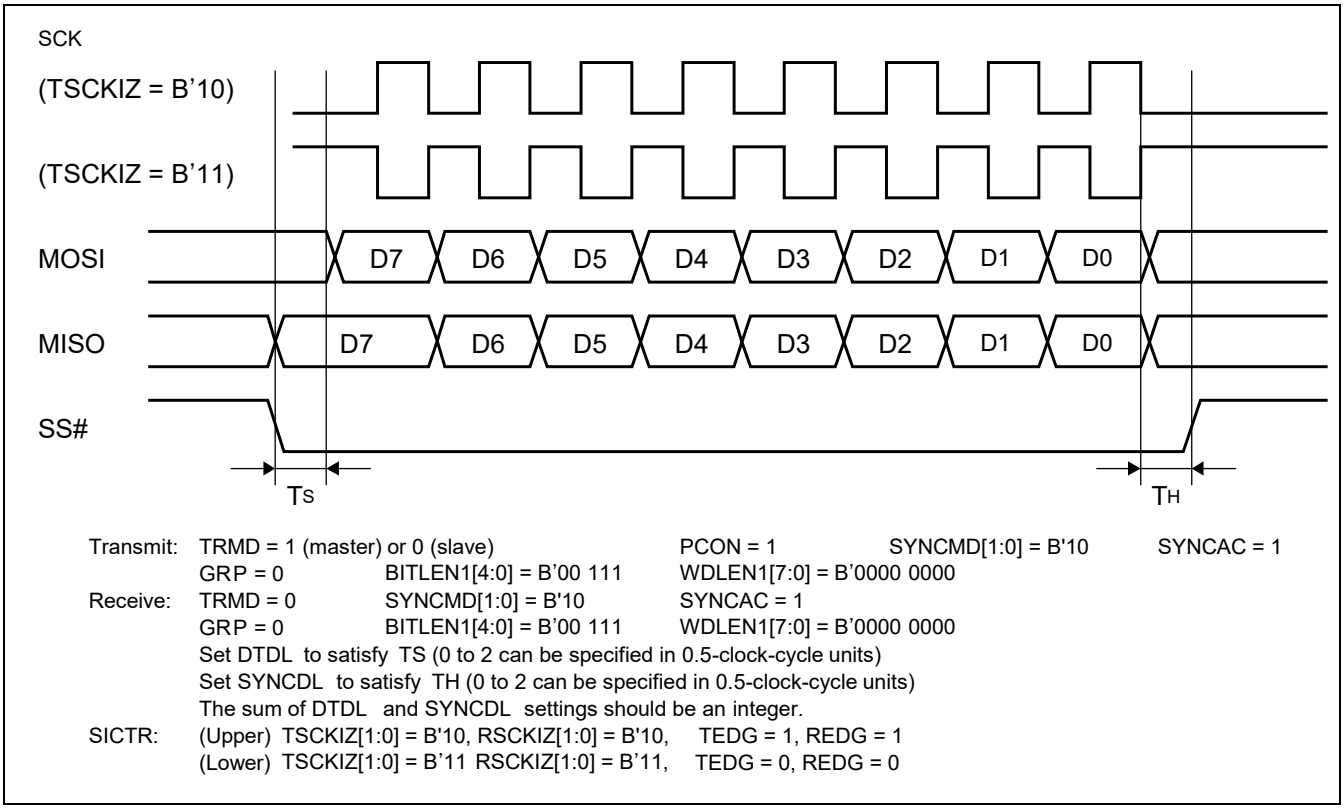

Figure 109.20 SPI Clock and Data Timing 1

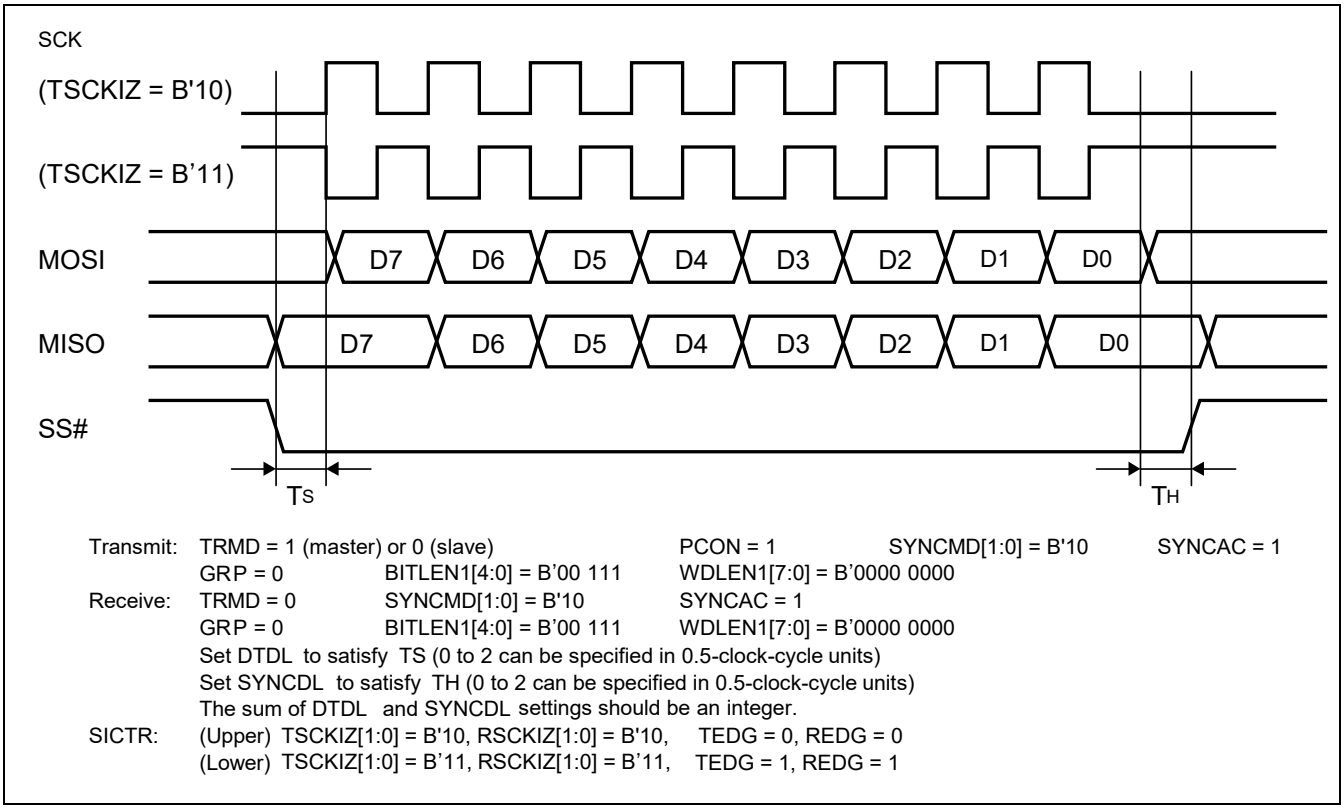

Figure 109.21 SPI Clock and Data Timing 2

109.3.10 IIS

This module can support IIS format with following setting which is shown in Figure 109.22 and Figure 109.23. BITLEN1 and BITLEN2 bits will change by usage.

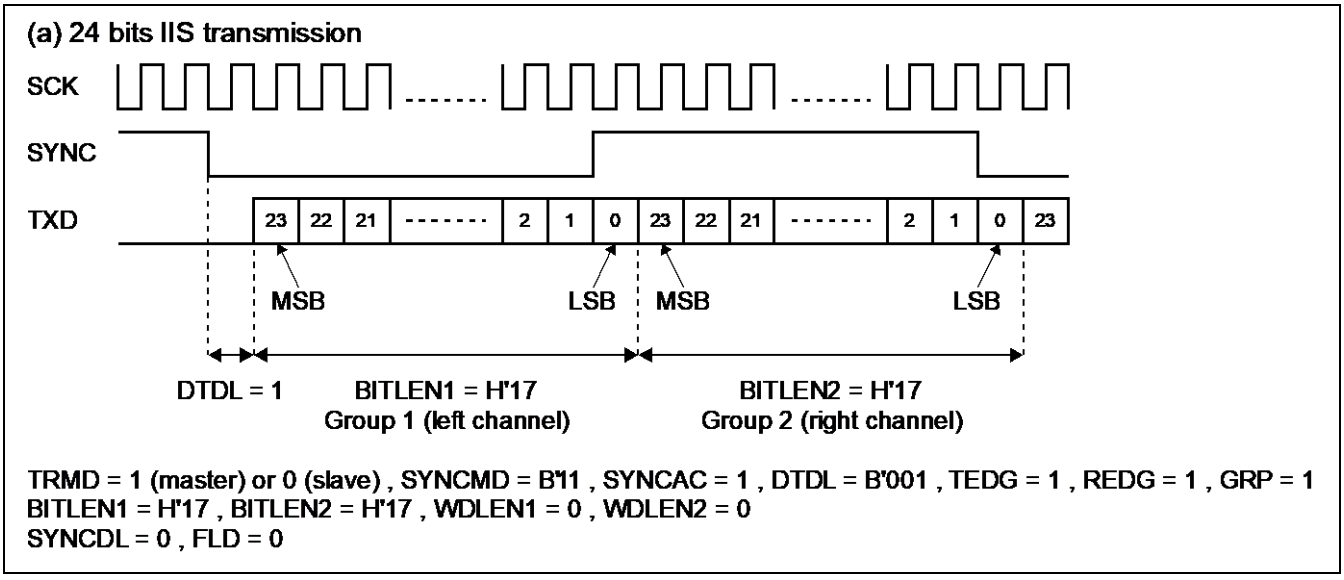

Figure 109.22 24 Bits IIS Transmission

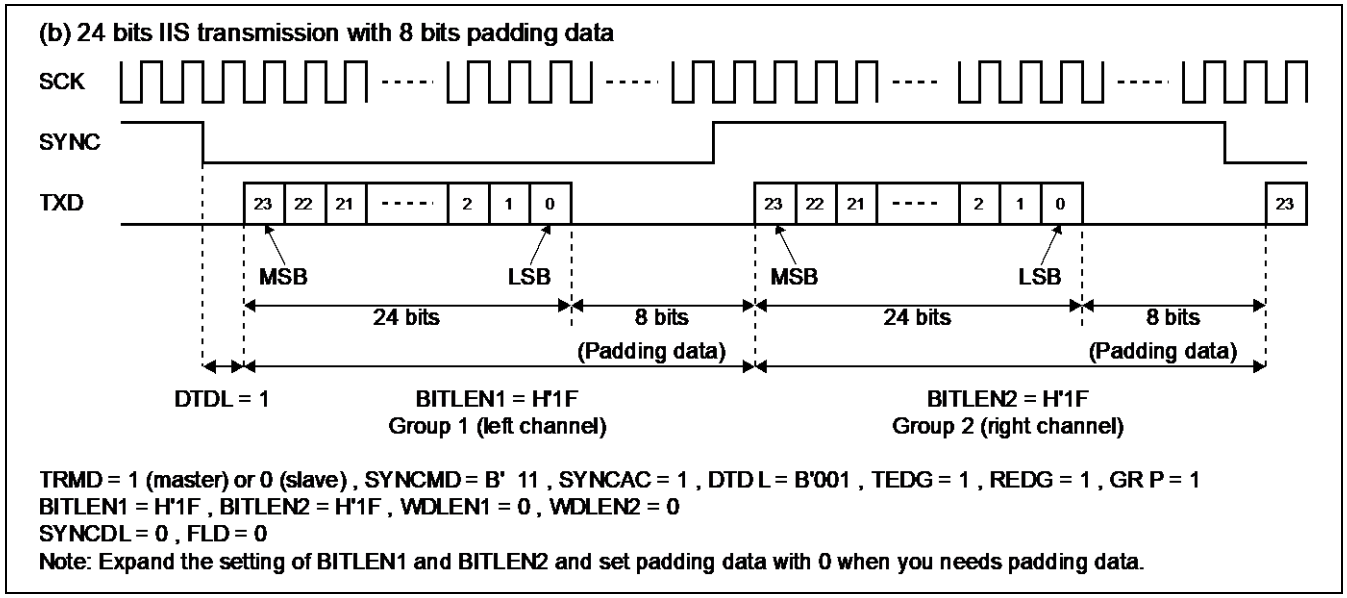

Figure 109.23 24 Bits IIS Transmission with 8 Bits Padding Data

109.4 Usage Notes

109.4.1 Notes for Using SPI Mode

- For SPI master mode operation, set the FLD bits in SITMDR1 for at least 3 cycles of module clock.
- For SPI slave mode operation, set the frame synchronization signal interval to at least 4 cycles of module clock.
- For SPI slave mode operation, the setting for data delay should be always set to 0.
- For SPI slave mode operation, TXDIZ bits work on SS signal invalid state.

109.4.2 Notes for Using SPI slave Mode

1. In case of SPI slave mode, this module can't receive any data from external device, before SICTR [8]. RXE is set to 1. Prepare scheme to guarantee data will arrive only after SICTR [8]. RXE is set to 1, by higher level arbitration.

2. In case of SPI slave mode, this module needs to receive assert of SYNC signal to start receiving data. For this purpose, SYNC signal from master device must be connected to SYNC port, even in the environment, in which only two devices (master and slave) exist. Also, SYNC signal must be asserted after SICTR [8]. RXE bit is set. SYNC signal assertion while SICTR [8]. RXE is 0, received data can't guarantee.

3. When the MSIOF operates with all the following condition 1 to 3, the MSIOF in SPI slave mode cannot start the next transmission. The MSIOF cannot support SPI mode under following condition.

- Condition

1) MSIOF is in SPI slave mode (SITMDR1.TRMD = 0, SITMDR1.SYNCMD[1:0] = 10)
2) SYNC (CS) signal is being asserted from master
3) TXE or RXE in SICTR is set to 1 during SYNC (CS) is asserted

This limitation means the MSIOF cannot respond to the SYNC (CS).
It is necessary to control the MSIOF enabling timing by the master and system.

[Workaround]
Use master mode for SPI.
If use slave mode for SPI, consider following alternative.

[Alternative]
If the master device can support handshaking, use the handshaking transmission.
For the MSIOF in SPI slave mode, use with the GPIO output for SPI handshaking; the system operation must be tested and evaluated thoroughly by user.

4. In case of SPI slave mode, this module must not set SICTR[1].TXRST or SICTR[0].RXRST during SYNC signal asserted.

109.4.3 Notes for Transmitting Audio data via MSIOF

If you want to transmit audio data via MSIOF, don't set the master clock (MSOφ) to SSCG.

109.4.4 Notes on Fixed Value related to MSIOF registers

It is necessary to change from the initial value to the specific fixed value for these bits in the MSIOF registers. Setting other value is prohibited.

Table 109.11 Fixed Value for the MSIOF Registers without any condition

Section		Bit Number	Fixed Value
109.2.1	MSIOF Transmit Mode Register 1 (SITMDR1)	30	B'1

109.4.5 Notes for Transmit FIFO Underflow (SISTR.TFUDF)

If transmission size is less than or equal to 256-words per frame, transmit FIFO Underflow (SISTR.TFUDF) needs to be ignored. If transmission size is more than 256-words per frame, use Transmit FIFO Empty (SISTR.TFEMP) instead of this bit. To skip Empty (SISTR.TFEMP) state after the transmission completion, write 1-word dummy data to the transmit FIFO and perform reset after the transferring. If the next transfer data can be prepared, it can be possible to store next data instead of dummy data. In that case, the reset process can be skipped. If Empty is detected during transfer, reset after the stop processing of each module completed, and redo initialization.

The following is an example flow when Transmit FIFO Empty (SISTR.TFEMP) error is detected.

1. SISTR.TFEMP interrupt detection
2. Clear interrupt enable of MSIOF
3. Wait for SISTR.TEOF/REOF=1 state of MSIOF
4. Stop processing of DMAC (After DMACHCR.DE=0 at DMAC, wait for DMACHCR.DE=0)
5. DMAC channel reset (DMACHCLR.CLR[m]=1 at DMAC, m=usage channel)
6. Change PFC setting(MSIOF_SCK, MSIOF_SYNC) to GPIO(In) side
7. Assert SW reset for activating MSIOF channels in use (SRCRx.MSIOF) (x= 6)
8. De-assert SW reset for using MSIOF channels in use (SRSTCLRx.MSIOF) (Regarding procedure of SW reset, please refer to the sec 9. Module Standby, Software Reset) (x=6)
9. Reconfigure MSIOF and DMAC

When using PIO access, the No4 and No5 and the reconfiguration of DMAC in No9 are unnecessary. (The reconfiguration of MSIOF in No9 is necessary.)

Note: DMAC is SYS-DMAC

109.4.6 Notes for FIFO Underflow/Overflow (SISTR.TFUDF/RFOVF)

Basically, big data size transfers (256 words or more), it recommend a BITLEN = B'1 1111(32 bit) setting. It is possible to set it in a way other than BITLEN = B'1 1111(32 bit), but since the transfer efficiency is reduced, overflow/underflow may occur. In that case, it needs to be suppressed by the system by adjusting the QoS. Refer to section 18 AXI-Bus for QoS settings.

109.5 Safety Mechanisms

This module has no Mechanism of FuSa.

110. PWM

110.1 Overview

110.1.1 Features

- PWM output cycle settable (10 bits)
- PWM output cycle settable within the range from 2 cycles to 2^24 × 1023 cycles of internal bus clock (i.e. from 30 ns to 257.5 seconds when internal bus clock = 66.66 MHz)
- High-level width of the PWM output signal settable (10 bits)
- Continuous pulse output or single pulse output selectable

110.1.2 Block Diagram

Figure 110.1 shows a block diagram of the PWM timer.

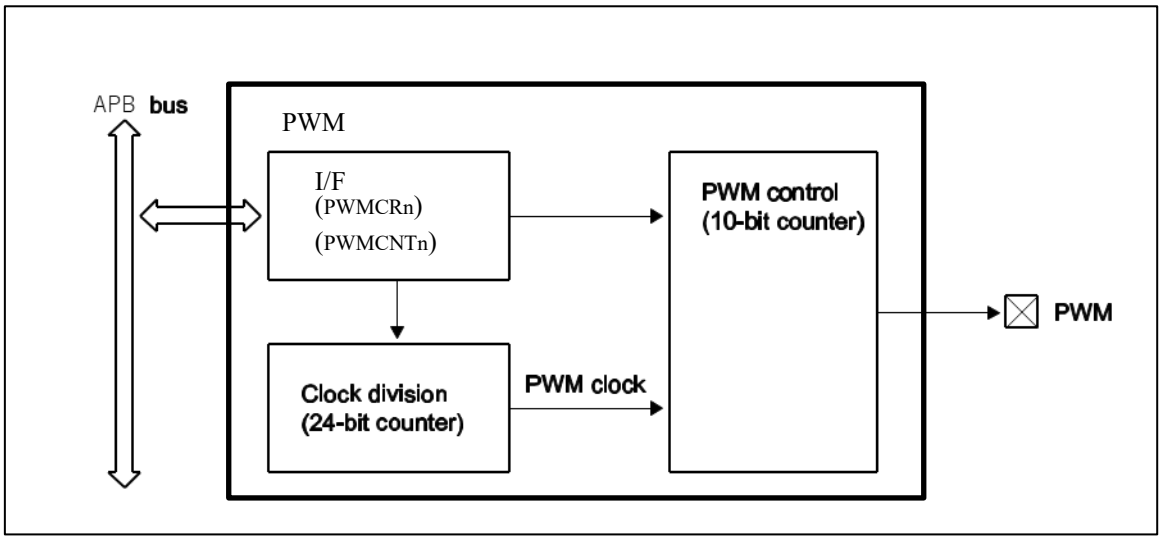

Figure 110.1 Block Diagram of PWM Timer

110.1.3 External Pins

Table 110.1 shows the pin configuration of the PWM timer.

Table 110.1 Pin Configuration

Pin Name	I/O	Function
PWM0	Output	PWM0 timer pulse output
PWM1	Output	PWM1 timer pulse output
PWM2	Output	PWM2 timer pulse output
PWM3	Output	PWM3 timer pulse output
PWM4	Output	PWM4 timer pulse output

110.1.4 Register Configuration

Table 110.2 lists the registers of the PWM timer. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

Table 110.2 List of Registers

Channel	Name	Abbreviation	R/W	Address	Access Size
0	PWM control register 0	PWMCR0	R/W	H'E6E3 0000	32
	PWM count register 0	PWMCNT0	R/W	H'E6E3 0004	32
	PWM error injection register 0	PWMEI0	R/W	H'E6E3 000C	32
1	PWM control register 1	PWMCR1	R/W	H'E6E3 1000	32
	PWM count register 1	PWMCNT1	R/W	H'E6E3 1004	32
	PWM error injection register 1	PWMEI1	R/W	H'E6E3 100C	32
2	PWM control register 2	PWMCR2	R/W	H'E6E3 2000	32
	PWM count register 2	PWMCNT2	R/W	H'E6E3 2004	32
	PWM error injection register 2	PWMEI2	R/W	H'E6E3 200C	32
3	PWM control register 3	PWMCR3	R/W	H'E6E3 3000	32
	PWM count register 3	PWMCNT3	R/W	H'E6E3 3004	32
	PWM error injection register 3	PWMEI3	R/W	H'E6E3 300C	32
4	PWM control register 4	PWMCR4	R/W	H'E6E3 4000	32
	PWM count register 4	PWMCNT4	R/W	H'E6E3 4004	32
	PWM error injection register 4	PWMEI4	R/W	H'E6E3 400C	32

Note: Do not access addresses other than those listed above. If access is attempted, a malfunction may occur.

Table 110.3 Register States in Each Operating Mode

Name	Abbreviation	Power-on Reset/Software Reset	Module Standby
PWM control register n	PWMCRn	H'0000 0000	Retained
PWM count register n	PWMCNTn	H'0000 0000	Retained
PWM error injection register n	PWMEIn	H'0000 0000	Retained

Note: n = 0~4.

The registers of the PWM timer are mapped into the internal bus address space.

110.2 Register Description

Registers in the PWM timer are allocated to and arranged in the address space of the internal bus.

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. When the bit is reserved, the write value should always be 0. Writing 1 to these bits can cause a malfunction of PWM.

—/W: Write-only. The read value is undefined.

110.2.1 PWM Control Register n (PWMCRn) (n = 0 to 4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CC0			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCMD	—	—	—	SYNC	—	—	—	—	FS		SS0	ECEN	—	—	EN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
19 to 16	CC0	0000	R/W	Clock Control The clock frequency of the PWM counter is obtained by dividing the frequency of the clock signal of internal bus clock. When the internal bus clock frequency is f MHz, the following PWM clock frequencies are obtained. 0000: f MHz 0001: f MHz/2^2 0010: f MHz/2^4 0011: f MHz/2^6 0100: f MHz/2^8 0101: f MHz/2^10 0110: f MHz/2^12 0111: f MHz/2^14 1000: f MHz/2^16 1001: f MHz/2^18 1010: f MHz/2^20 1011: f MHz/2^22 1100: f MHz/2^24 When 1101, 1110, or 1111 is set, the PWM clock frequency is f MHz/2^24.

Bit	Bit Name	Initial Value	R/W	Description
15	CCMD	0	R/W	CC0 Frequency Division Mode Changes the PWM clock frequency set by the clock control (CC0) bits. 0: The PWM clock frequency set by CC0 is used. 1: The PWM clock frequency set by CC0 is changed as follows: 1 - 0000: f MHz/2 1 - 0001: f MHz/2^3 1 - 0010: f MHz/2^5 1 - 0011: f MHz/2^7 1 - 0100: f MHz/2^9 1 - 0101: f MHz/2^11 1 - 0110: f MHz/2^13 1 - 0111: f MHz/2^15 1 - 1000: f MHz/2^17 1 - 1001: f MHz/2^19 1 - 1010: f MHz/2^21 1 - 1011: f MHz/2^23 If 1100, 1101, 1110, or 1111 is set for CC0, the PWM clock frequency is f MHz/2^24 irrespective of the CCMD value.
14 to 12	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
11	SYNC	0	R/W	Specifies whether to allow the set values in the PWM count register (PWMCNTn) to be reflected in the timer operation synchronously with setting the PWM control register (PWMCRn). 0: Allows the PWMCNTn set values to be reflected in the timer operation irrespective of PWMCRn setting. 1: Allows the PWMCNTn set values to be reflected in the timer operation synchronously with PWMCRn setting. For details, refer to section 110.3 Operation.
10 to 7	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
6 to 5	FS*1	All 0	R/W	Frequency Selection for Deglitcher function. *2 The frequency of Deglitcher function is obtained by dividing the frequency of the clock signal of internal bus clock*3. When the internal bus clock*3 frequency is f MHz, the following PWM clock frequencies are obtained. 00: f MHz/333 01: f MHz/166 10: f MHz/3330 11: f MHz/1665
4	SS0	0	R/W	Single Pulse Output 0: The timer operates in continuous pulse output mode. 1: The timer operates only for a single cycle and then stops.
3	ECEN*1	0	R/W	Error Check Enable.*2 0: Disable deglitcher function 1: Enable deglitcher function
2 to 1	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	EN0	0	R/W	Channel Enable 0: The channel is held in the idle state, and outputs a high level. 1: The channel outputs high and low levels in a predetermined cycle. This bit is automatically cleared in single pulse output mode.

Notes: *1. Functional safety use only. Keep initial value.
*2 This explanation is the explanation for PWMCRn of Channel 1.
*3: Refer to the information about internal bus clock in section 110.1.1 Features.

110.2.2 PWM Count Register n (PWMCNTn) (n = 0 to 4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CYC0									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PH0									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
25 to 16	CYC0	H'000	R/W	PWM Cycle Sets the PWM output cycle. The cycle set by these bits is the sum of the high-level and low-level periods. Setting H'000 is prohibited.
15 to 10	—	All 0	R	Reserved The read value is always 0. The write value should always be 0.
9 to 0	PH0	H'000	R/W	PWM High-Level Period Sets the period for which the PWM timer outputs a high-level signal. Setting H'000 is prohibited.

Note: For the CYC0 and PH0 bits, set the number of cycles to be counted of the PWM clock signal whose frequency has been set by the CC0 and CCMD bits in the PWM control register.

110.2.3 PWM Error Injection Register n (PWMEIn) (n = 0 to 4)

Note: *1. This explanation is for PWMEIn of Channel 1.

PWMEIn is a 32-bit readable/writable register that controls Error Injection. This error injection is used in test of connection between PWM and MFIS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMEI
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

This register is functional safety use only. Keep initial value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved The read value is always 0. The write value should always be 0.
0	PWMEI	0	R/W	PWM Error Injection 0: Normal operation 1: PWM loopback function check detection error is fixed 1.

110.3 Operation

The duty ratio of a PWM output pulse can be obtained by setting a high-level period and a cycle. The timer channel counts the PWM clock signal pulses using a 10-bit counter to generate the PWM output pulse having the specified period and cycle. When the channel function is enabled (EN0 = 1), the timer outputs a high level until the counter value reaches the value set in the PH0 bits of the PWM count register (PWMCNTn). The output goes low when the PH0 value is reached, and is held low until the counter value reaches the value set in the CYC0 bits of PWMCNTn. When the CYC0 value is reached, the output goes high and the counter is reset.

Unless the channel function is enabled, the output is held high, and the counter is held in the reset state.

Figure 110.2 shows the PWM state transition during the operation described above.

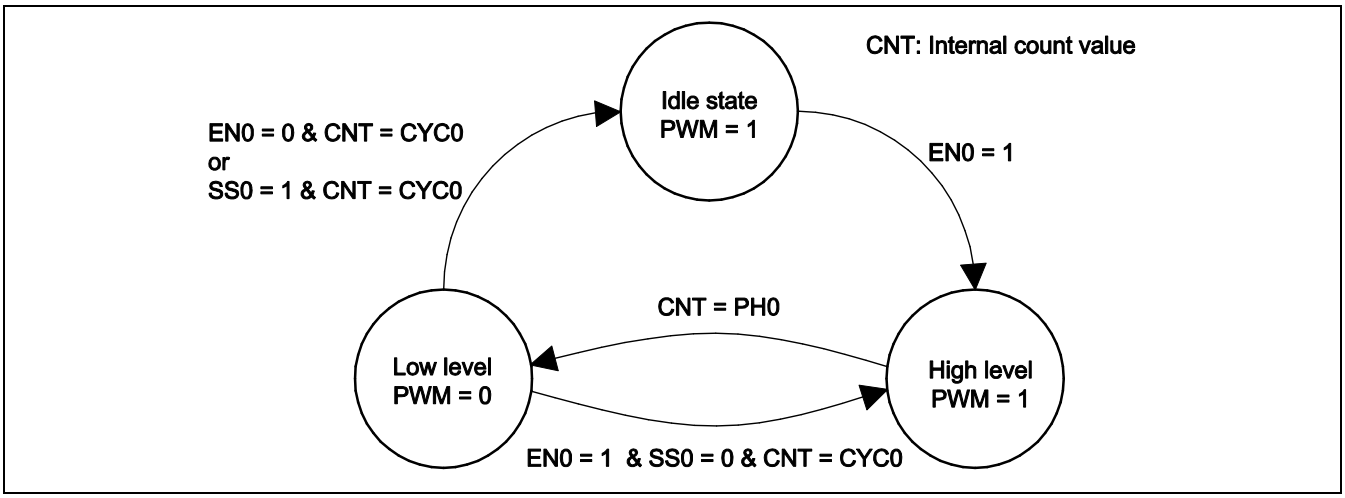

Figure 110.2 PWM Timer State Transition

Note that after a channel has been enabled by writing 1 to EN0, the number of clock pulses before output of the first falling edge from a channel is greater than the value set in the PWM control register and PWM count register by up to four cycles of the internal bus clock. After that, the PWM output rises and falls according to a set timing. Figure 110.3 schematically shows this output timing. This figure shows an internal operation.

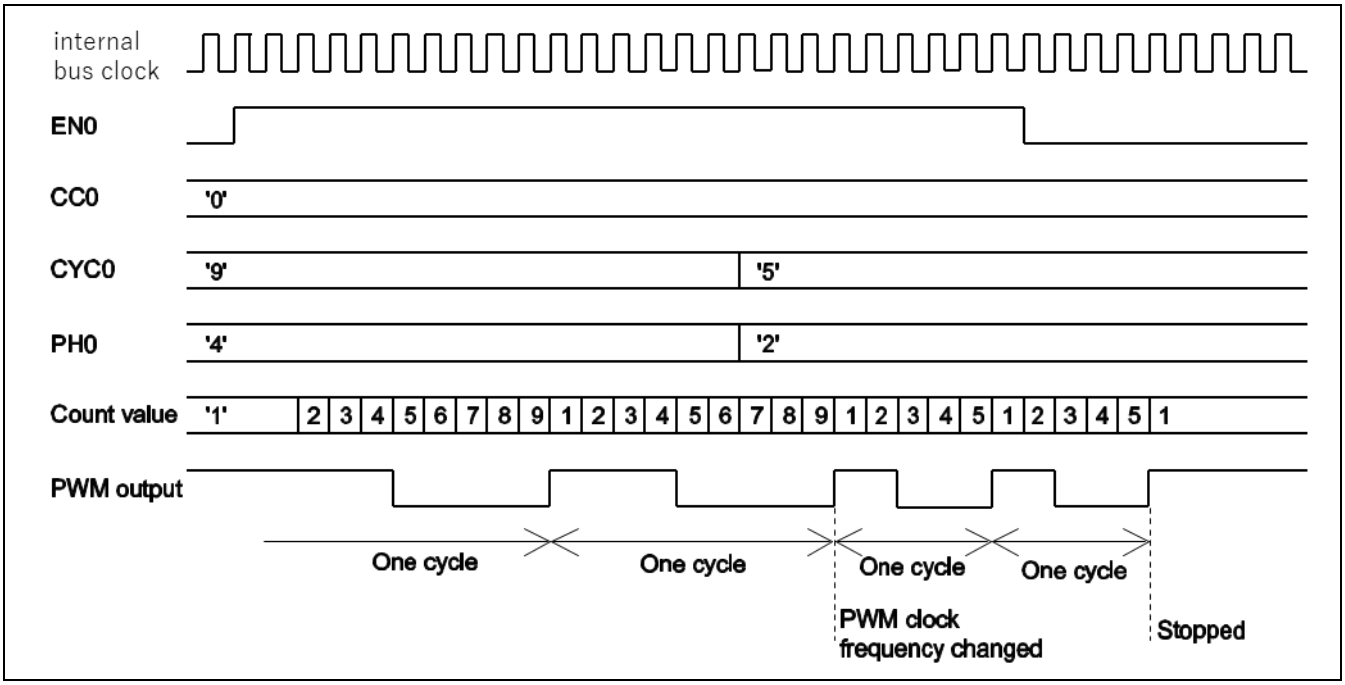

Figure 110.3 PWM Output Timing

1. The period from enabling the channel to the first falling edge output from the channel is the sum of a set value and up to four cycles of the internal bus clock.
2. After that, the PWM high and low widths are the same as the set values.
3. When the PWM count register is changed during operation (EN0 = 1), timing of the output will be in accord with the new settings after output of the current cycle has been completed.
4. When the CC0 and CCMD bit values in the PWM control register are changed during operation (EN0 = 1), timing of the output will be in accord with the new settings after output of the current cycle has been completed.
5. To stop the timer operation, write 0 to the EN0 bit. The timer stops operation after completing the output of the current cycle. Note that, however, if 1 is written to EN0 again before completing the output of the current cycle, the timer does not stop but continues to operate.
6. For the PWM timer output, continuous pulse output mode and single pulse output mode are supported. In continuous pulse output mode, the timer outputs pulses continuously while EN0 is 1. In single pulse output mode, the timer outputs a single pulse. In this mode, EN0 is automatically cleared.
7. To change the values of the clock control bits (CC0) and the CC0 frequency division mode bit (CCMD) in the PWMCRn register and of the PWM cycle bits (CYC0) and the PWM high-level period bits (PH0) in the PWMCNTn register at the same time during the PWM operation, the following procedure should be followed:
   1. Write 1 to the SYNC bit. (Write the original set values to the other bits in PWMCRn.)
   2. Change the PWMCNTn value.
   3. Change the CC0 and CCMD values in PWMCRn. (Write the original set values to the other bits in PWMCRn. The SYNC bit should be held at 1.)

   By following the above procedure, the new PWMCNTn value is reflected in the timer operation synchronously with PWMCRn setting.
   When changing only the PWMCNTn value while SYNC = 1, writing to PWMCRn is required after changing the PWMCNTn value. In this case, write the same values as the original set values to the PWMCRn bits. On the other hand, when changing only the PWMCRn value, writing to PWMCNTn is not required.
   If PWMCNTn and PWMCRn values are changed while SYNC = 0, the change to the values might not be completed within a single PWM output cycle but actually take two or more cycles. This may disturb the period or duty cycle of the PWM output.
   Note that, when the PWMCNTn value is changed while SYNC = 1, the new values are read from PWMCNTn even before PWMCRn is set.

110.4 Usage Notes

When using the PWM timer, note the following points.

When the CYC0 value is equal to or smaller than PH0 value in the PWM count register, the PWM output is held high. In this case, to start pulse output, clear EN0 to 0, set CYC0 to the value greater than the PH0 value, and then set EN0 to 1.

Note that, a maximum period equivalent to CYC0 = H'3FF at the set PWM clock frequency may be required before pulse output is started.

110.5 Safety Mechanisms

110.5.1 PWM feedback function using a deglitcher (pad check logic)

PWM module has supporting ECM connection Safety Mechanism.

This LSI chip supports a PWM loopback function to check the correctness of output values by monitoring a loopback signal from the IO cell. Detected errors are reported through the INTC or an external pin, via the MFIS module.

The PWM fault diagnosis mechanism is implemented as hardware inside the PWM module. Faults are detected inside the PWM module, and reported through the MFIS module, and then to the CPU in one of two ways, an interrupt or the signal on an external pin.

The deglitcher consists of three shift registers and an AND gate, in consideration of the delay of the loopback signal, detects errors with the signal that rejects glitches less than 3 clock cycles of timing signal (= capture_en) dividing internal bus clock by the division ratio set by PWMCR1.FS[1:0].

a) Overview

PWM feedback function is a safety mechanism for the digital I/O pins of PWM (only output pin). This safety mechanism checks whether the output of PWM is correctly transmitted to the output pin.

Channel 1 (Ch.1) is Safety-Related, and other channels are Non-Safety-Related.

b) Related Registers

Table 110.4 Related Registers

Channe	Register Name	Abbreviation
1	PWM control register 1	PWMCR1
	PWM error injection register 1	PWMEI1

c) Hardware Description

This LSI chip supports a PWM loopback function to check the correctness of output values by monitoring a loopback signal from the IO cell. Detected errors are reported through the INTC or an external pin, via the MFIS module.

The PWM fault diagnosis mechanism is implemented as hardware inside the PWM module. Faults are detected inside the PWM module, and reported through the MFIS module, and then to the CPU in one of two ways, an interrupt or the signal on an external pin.

The deglitcher consists of three shift registers and an AND gate, in consideration of the delay of the loopback signal, detects errors with the signal that rejects glitches less than 3 clock cycles of timing signal (= capture_en) dividing internal bus clock by the division ratio set by PWMCR1.FS[1:0].

Figure 110.4 shows a block diagram for the PWM functional safety mechanism.

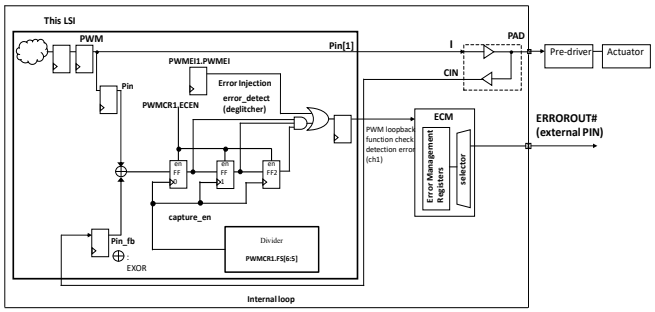

Figure 110.4 Block diagram for PWM Functional Safety Mechanism

Figure 110.5 timing chart is a timing chart for the deglitcher, an error is detected when the signal on pin [1] and the CIN signal are out of synchronization by three or more cycles of timing signal (= capture_en) dividing CLK (=internal bus clock) by the division ratio set by PWMCR1.FS[1:0] (gray-shaded portions). The signals shown in the timing chart correspond to the signals in Figure 110.4.

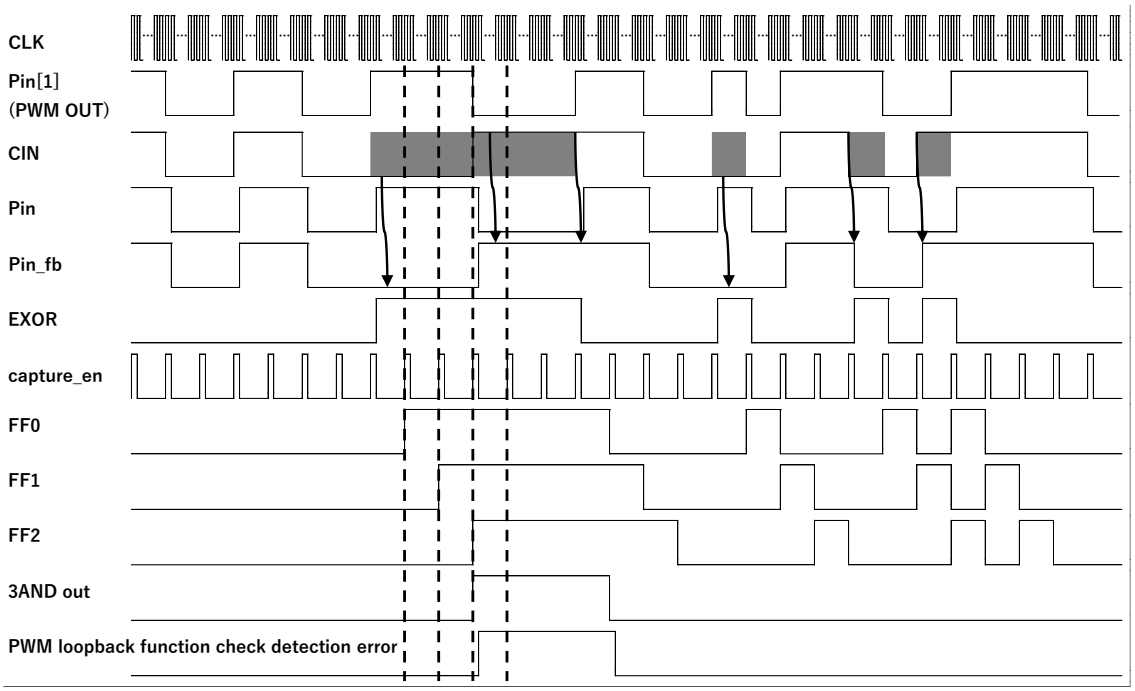

Figure 110.5 Deglitcher Timing Chart

112. SPI Multi I/O Bus Controller (RPC-IF)

112.1 Overview

The SPI multi I/O bus controller enables direct connection of the serial flash memory, HyperFlash, or Octal-SPI Flash memory to this LSI.

112.1.1 Features

This module allows the serial flash memory, HyperFlash, or Octal-SPI Flash memory connected to this LSI to be accessed by the external address space read mode or manual mode.

The external address space read mode is able to read from Flash memory only. The manual mode is able to write to and read from Flash memory.

(1) Supported memory interface

(a) Serial Flash Memory Interface

- Up to two serial flash memory devices can be connected. Note that two serial flash memory devices are operated in parallel interface and each 1xQSPI operation is not supported.
- When 1xQSPI configuration, QSPI0 pins in this LSI are connected to the serial flash memory.
- A data bus size of 1 bit or 4 bits can be selected for a serial flash memory device.
- Support single data rate (SDR) and Double data rate (DDR) transfer
- Only the master operation is supported (the slave operation is not supported).

(b) Octal-SPI flash interface

- One Octal-SPI flash can be connected.
  “Octal-SPI flash” indicates 8-bit SPI flash with one ChipSelect, one Clock source and one DataStrobe configuration.
- The data bus size is 1bit or 8bit can be selected for Octal-SPI device.
- Serial flash memory specification without “8-bit” description specifies general SPI flash interface (including SPI compatible mode) in this manual. This means when use without “8-bit” description, register settings are same as “Serial Flash Memory Interface”.

(c) HyperFlash Interface

- One HyperFlash can be connected.
- The data bus size is fixed to 8 bits.
- Wrapped Burst is not supported.

(2) Transfer Mode

(a) External Address Space Read Mode

- A read access from the bus master to the SPI multi I/O bus space is automatically converted into a read command to the device and the read data are returned to the bus master.
- Normal read and burst read operation
- Efficient data reception is possible by utilizing the on-chip read cache memory (64-bit line × 32 entries) during burst read operation.

(b) Manual Mode

- Desired command, read, and write accesses to the serial flash memory or HyperFlash memory are possible.
- Efficient data writing is possible by using write buffer.
- Not support the on-chip read cache memory during read operation.

112.1.2 Block Diagram

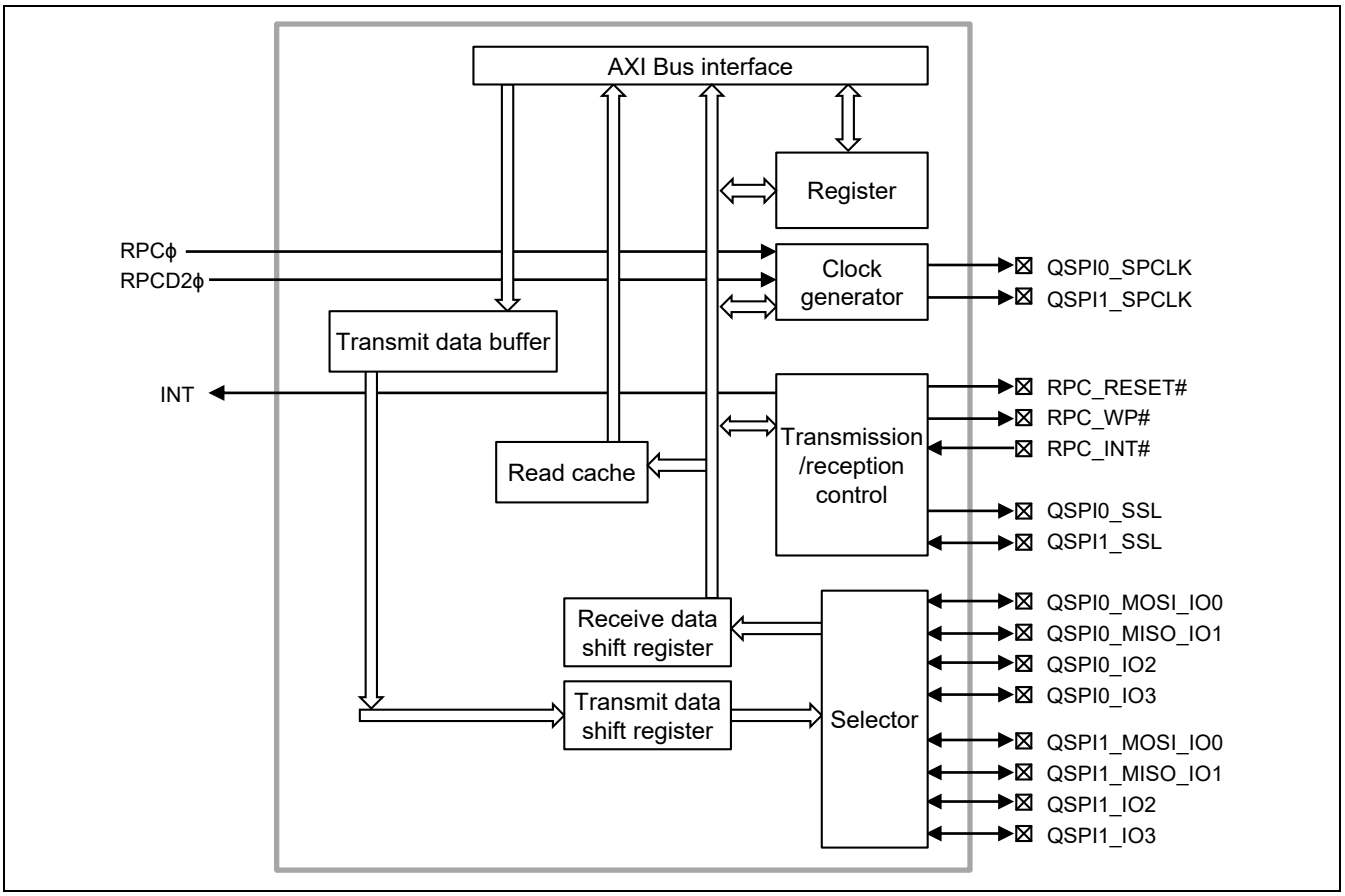

Figure 112.1 RPC-IF Block Diagram

112.1.3 External Pins

Table 112.1 shows the pin configuration of the RPC-IF.

Table 112.1 Pin Name

Pin Name	Symbol	I/O	Function			R-Car V4M
			When serial flash is selected.	When Octal-SPI flash is selected	When HyperFlash is selected.	
Channel 0 clock pin*2	QSPI0_SPCLK	Output	Clock output	Clock output	Differential clock output +	√
Channel 0 master transmit data/data 0	QSPI0_MOSI_IO0	I/O	Master transmit data/data 0	Data 0	Data 0	√
Channel 0 slave transmit data/data 1	QSPI0_MISO_IO1	I/O	Slave transmit data/data 1	Data 1	Data 1	√
Channel 0 data 2 pin	QSPI0_IO2	I/O	Data 2	Data 2	Data 2	√
Channel 0 data 3 pin	QSPI0_IO3	I/O	Data 3	Data 3	Data 3	√
Channel 0 slave select pin	QSPI0_SSL	Output	Low active Slave selection	Low active Chip selection	Low active Chip selection	√
Channel 1 clock pin*1, *2,*3	QSPI1_SPCLK	Output	Clock output	Clock output	Differential clock output -	√
Channel 1 master transmit data/data 0 pin	QSPI1_MOSI_IO0	I/O	Master transmit data/data 0	Data 4	Data 4	√
Channel 1 slave transmit data/data 1 pin	QSPI1_MISO_IO1	I/O	Slave transmit data/data 1	Data 5	Data 5	√
Channel 1 data 2 pin	QSPI1_IO2	I/O	Data 2	Data 6	Data 6	√
Channel 1 data 3 pin	QSPI1_IO3	I/O	Data 3	Data 7	Data 7	√
Channel 1 slave select pin*1*3	QSPI1_SSL	I/O	Low active Slave selection	Read data strobe (RDS)	Read data strobe (RDS)	√
Flash-RESET pin*1	RPC_RESET#	Output	Reset signal output	Reset signal output	Reset signal output	√
Write protect pin*1	RPC_WP#	Output	Write protect (WP)	Write protect (WP)	Write protect (WP)	√
INT pin*1	RPC_INT#	Input	Interrupt input	Interrupt input	Interrupt input	√

Notes: When a serial flash memory is to be connected with BSZ[1:0] being set to 00, the serial flash device should be connected to the QSPI0_* pins.

In the text, the channel number is omitted (e.g. QSPIn_SSL).

These pins are 1.8V operation only

1. These pins should be connected depending on the serial flash specification.
2. The frequency of QSPIn_SPCLK is same as RPCD2ϕ.
3. When MD[4:1]=0010/0011(dma HyperFlash), 1010/1011(xip HyperFlash),
   -During RPC_RESET# is low level, QSPI1_SPCLK is low output and QSPI1_SSL is high output.
   -During RPC_RESET# is high level, QSPI_SPCLK is high output and QSPI1_SSL is Hi-Z.

112.1.4 Register Configuration

Refer to R-CarV4M_UM_112_RPC_r1p10.xlsx

Table 112.3 shows the register initial value depending on the boot mode.

Table 112.3 Register initial value

	Initial value			
Register Name	**MD4-1 = 0100 (dma qspi single)**	**MD4-1 = 001* (dma HyperFlash)**	**MD4-1 = 101* (xip HyperFlash)**	**MD4-1 = other**

112.2 Register description

Refer to R-CarV4M_UM_112_RPC_r1p10.xlsx

112.3 Operation

112.3.1 System Configuration

With this module, one or two serial flash memory devices (data size of 1, 2, and 4 bits) or one HyperFlash (data size of 8 bits) can be connected. The connected devices can be selected using the BSZ[1:0] bits in CMNCR.

Examples of system configuration are shown in figures 112.2, 112.3, 112.4 and 112.5.

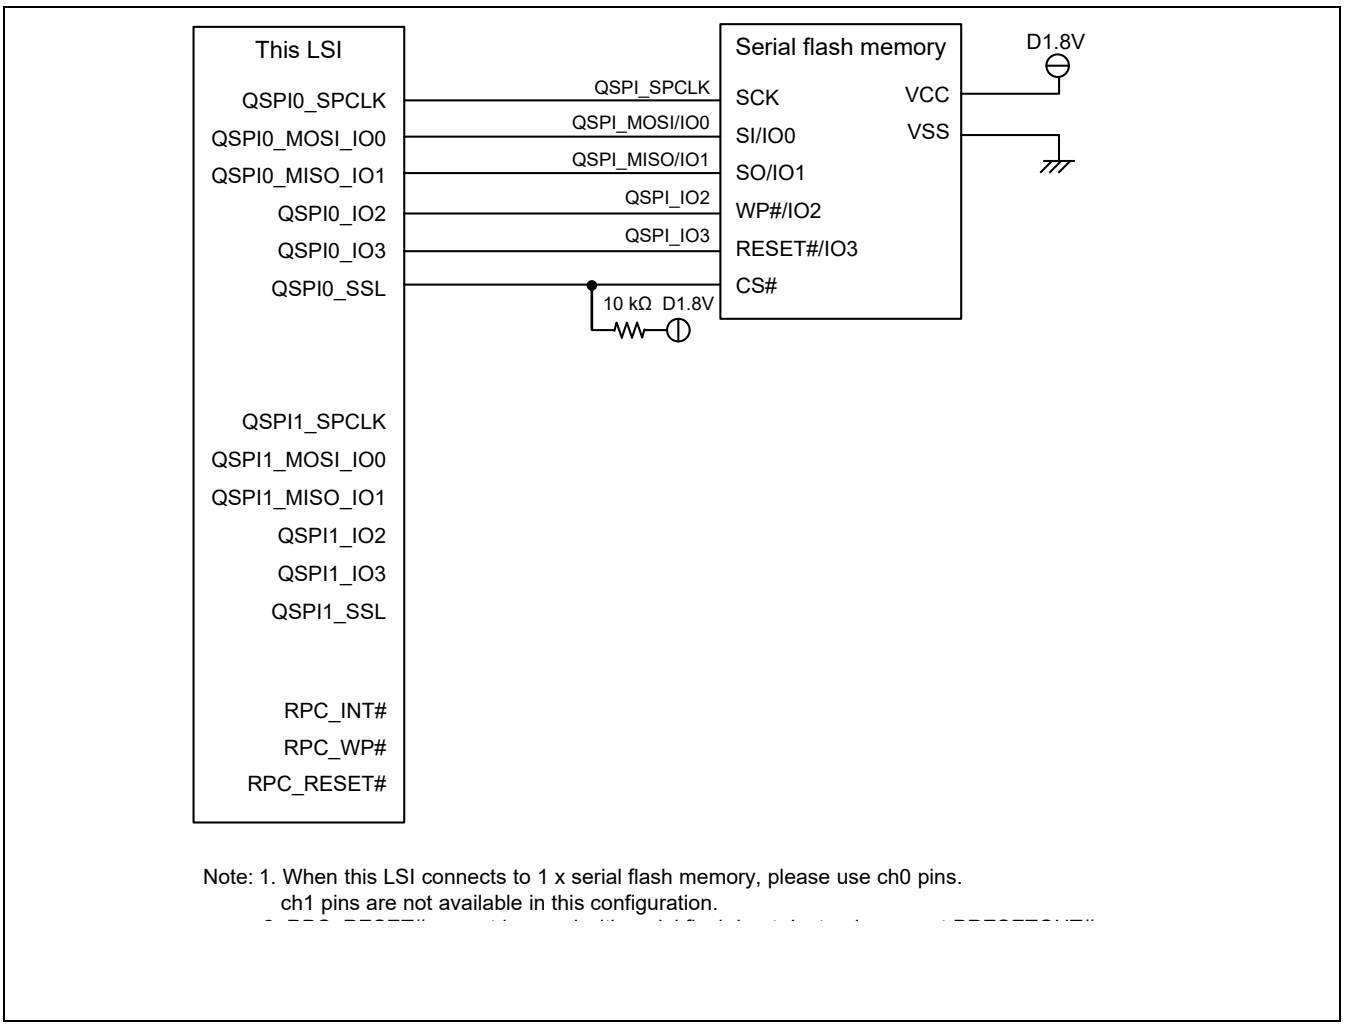

Figure 112.2 Example of System Configuration with One 4-Bit Serial Flash Memory Device Connected

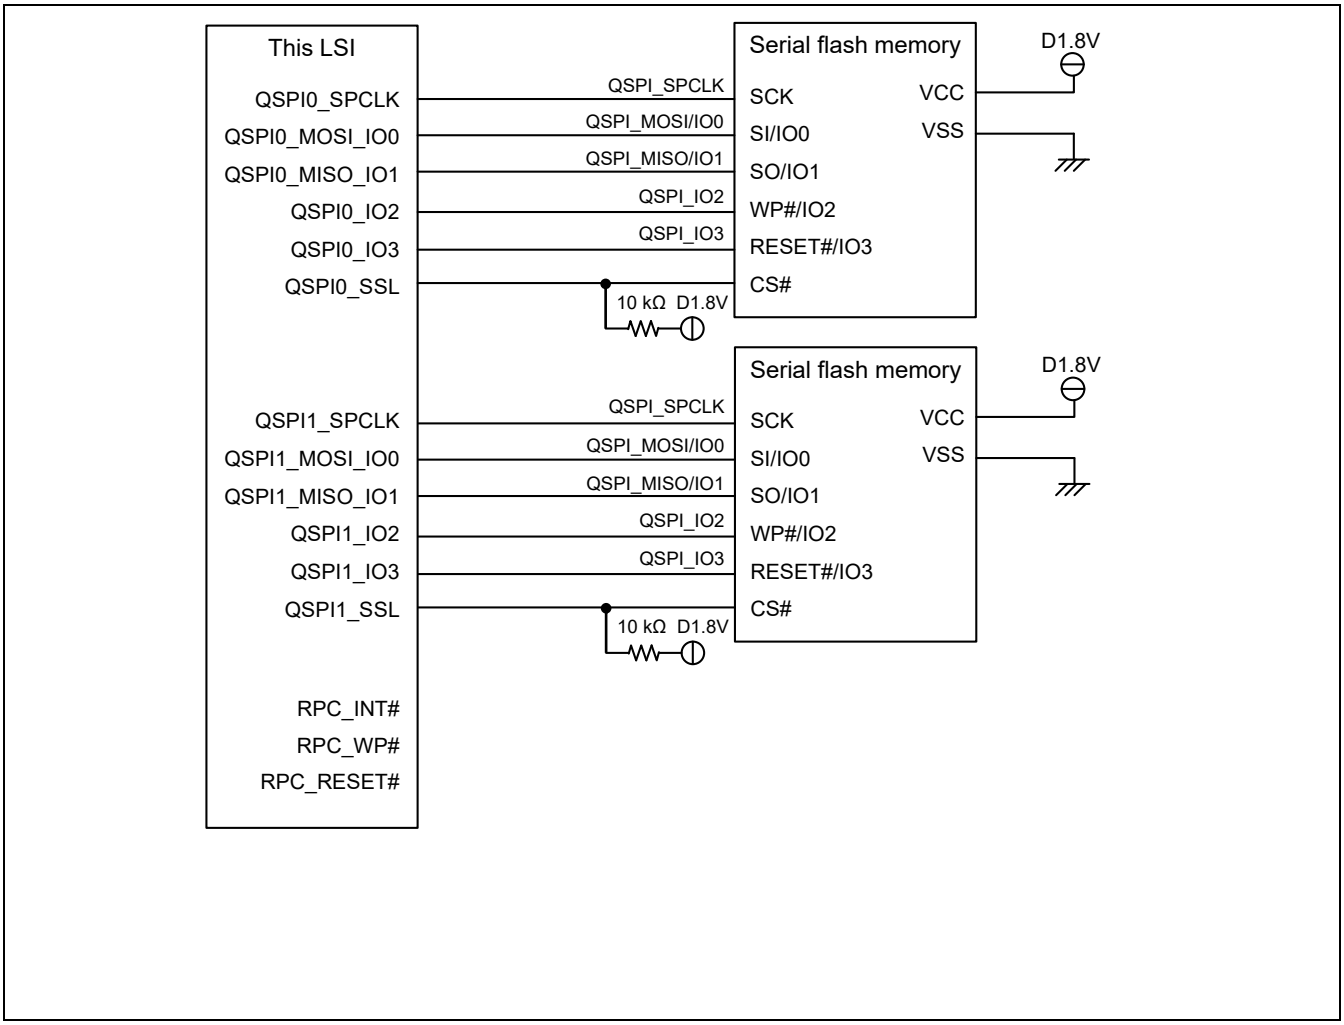

Figure 112.3 Example of System Configuration with Two 4-Bit Serial Flash Memory Devices Connected (BSZ[1:0] Bits in CMNCR = 01)

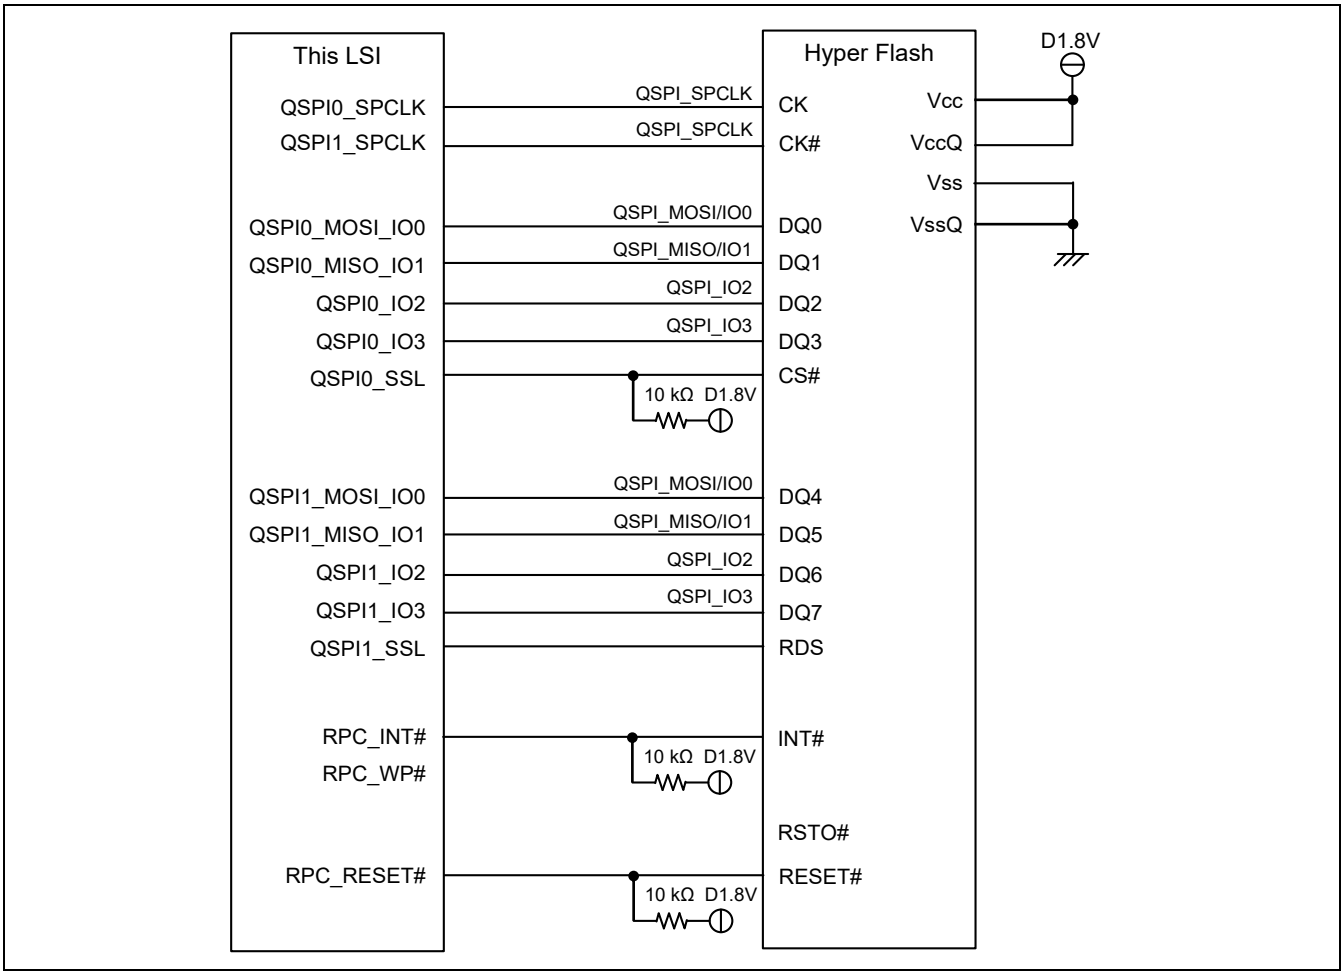

Figure 112.4 Example of System Configuration with HyperFlash Connected

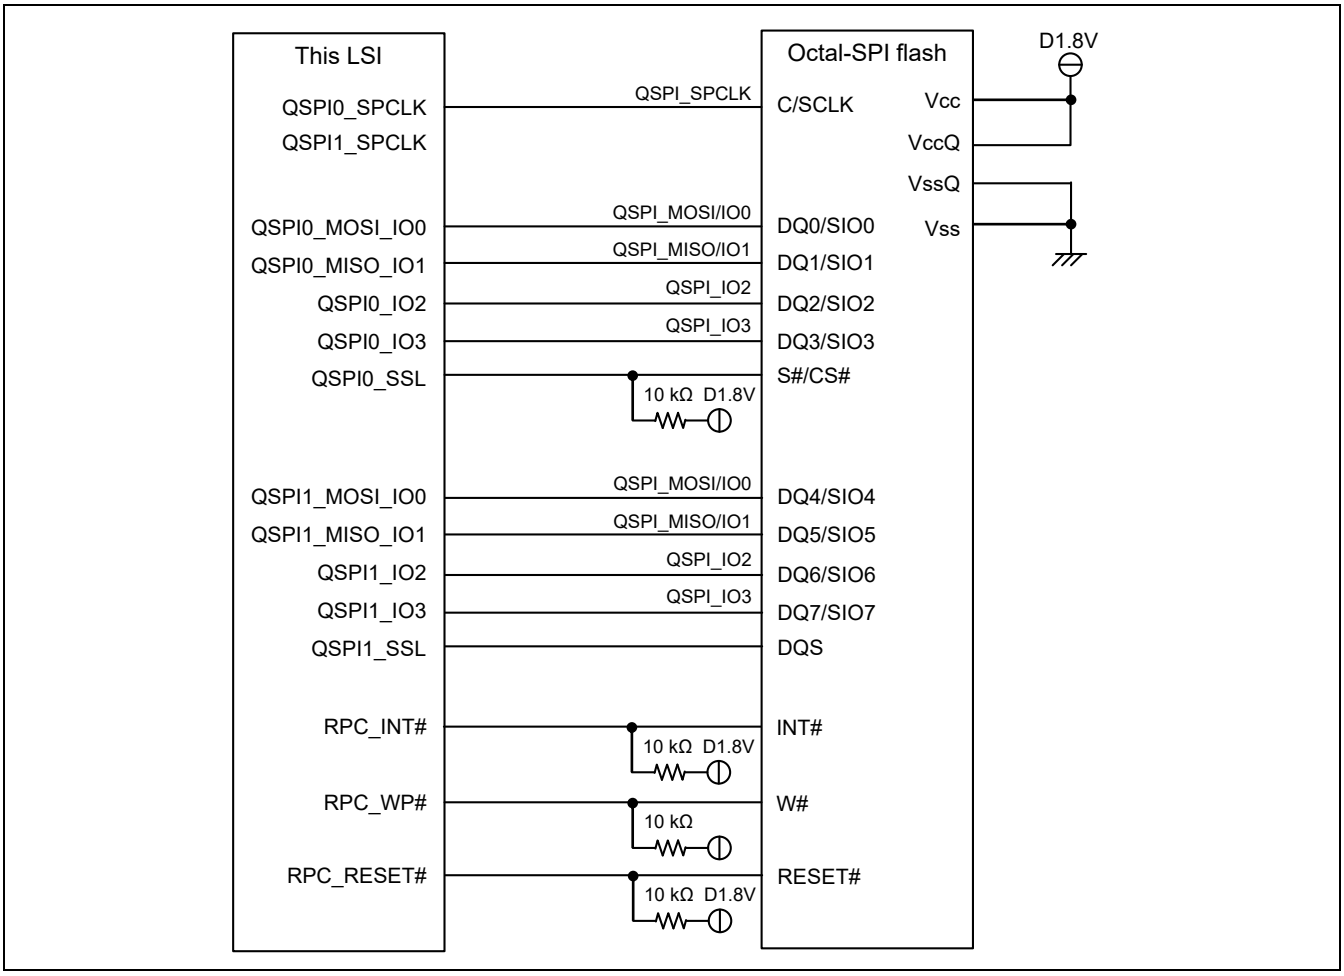

Figure 112.5 Example of System Configuration with Octal-SPI Flash Memory Device Connected

112.3.2 Address Map

In external address space read mode, the serial flash memory and HyperFlash to be connected are assigned in the SPI multi I/O bus space. The internal address space is 64MB, but with the DREAR register to specify the offset, a maximum of 4 Gbytes can be accessed when one serial flash memory is connected, and a maximum of 8 Gbytes can be accessed when two memory devices or a HyperFlash or an Octal-SPI flash memory are connected.

Table 112.4 Address Map

Internal Address	Maximum Access Area
H'0800 0000 to H'0BFF FFFF	Serial flash × 1: 4 Gbytes
	Serial flash × 2 or HyperFlash × 1 or Octal-SPI flash × 1: 8 Gbytes

Note: By setting access protection in LifeC, not only this address space but register area is also protected.

112.3.3 32-Bit Address Area in the Serial Flash Memory

Since the SPI multi I/O bus space is 64 Mbytes (with 26-bit address width), only a part of the 32-bit serial flash address area can be directly accessed. The fixed value set in the DREAR register is used as the upper-order bit value of a 32-bit address.

To output the address of the serial flash memory in 32 bits, set the ADE[3] bit in DRENR to 1, set the range of the external addresses used as the serial flash addresses to the EAC[2:0] bits in DREAR, and set the upper bit value of the 32-bit address as the fixed value to the EAV[7:0] bits in DREAR.

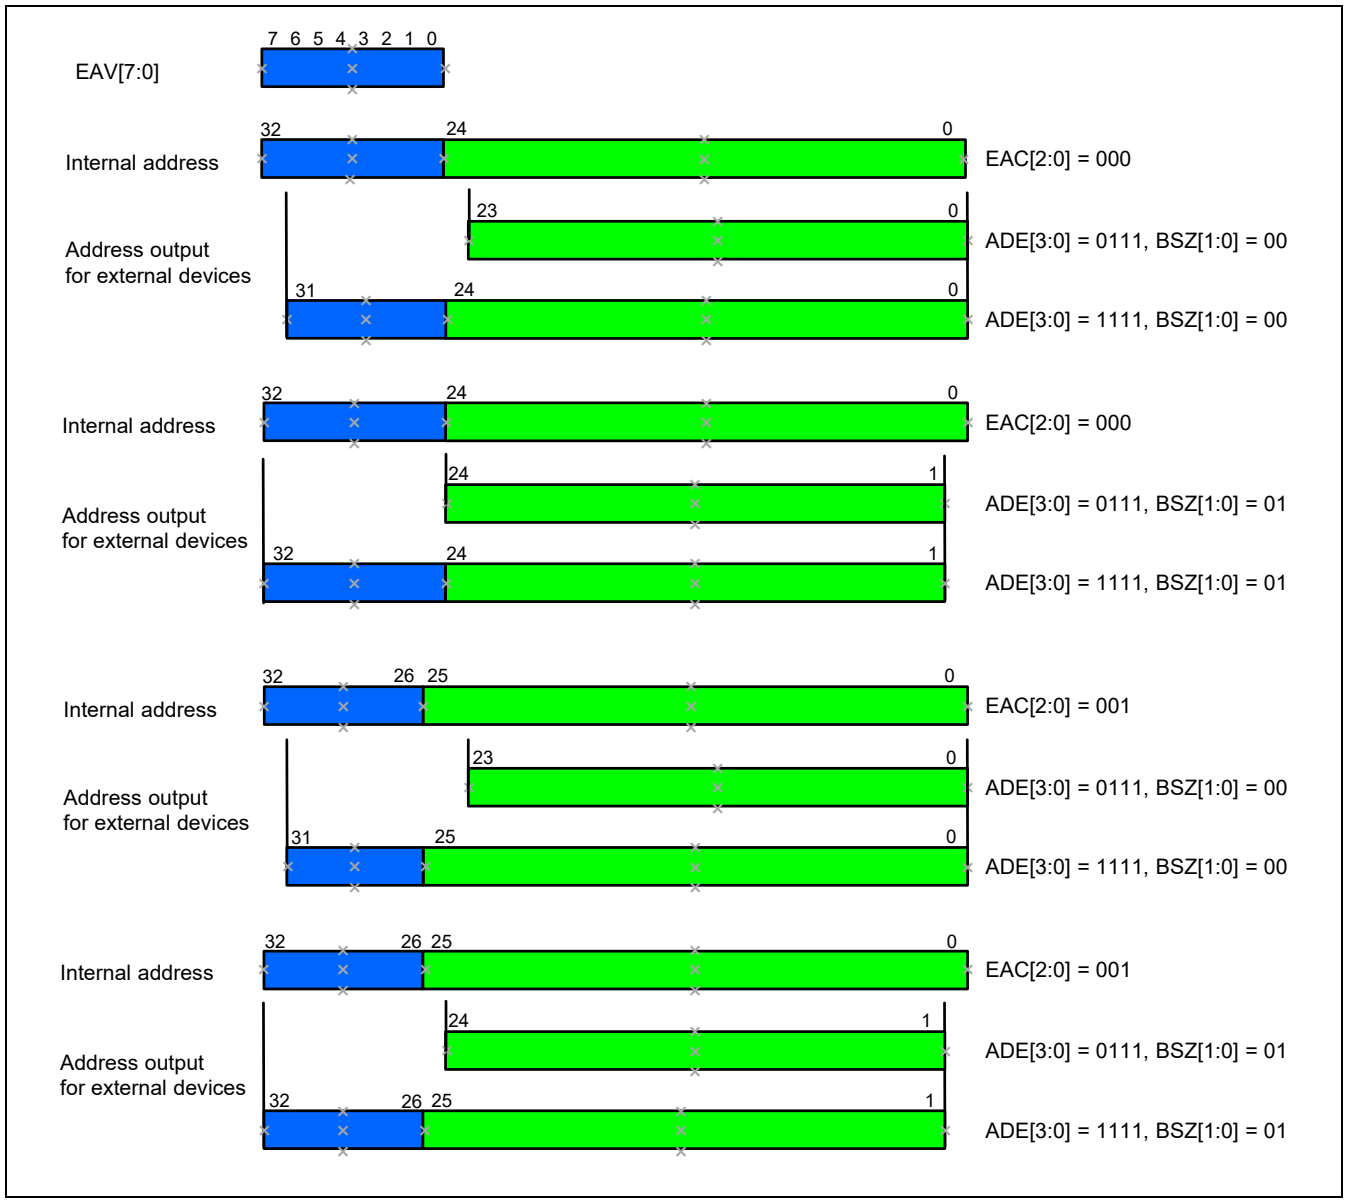

Figure 112.6 32-Bit Address Setting

Setting the ADE[3] bit in DRENR to 1 allows the serial flash address to be output using [31:0] bits. When EAC[2:0] = 000, external address bits [24:0] are valid. Set the value for [32:25] bits to EAV[7:0]. When EAC[2:0] = 001, external address bits [25:0] are valid. Set the value for [32:26] bits to EAV[7:1]. The address bits actually used for the external device are shown below.

When one serial flash memory is connected, internal address bits [31:0] are used.

When two serial flash memory devices are connected, internal address bits [32:1] are used.

When HyperFlash or an Octal SPI flash is connected, this address extension with DRENR.ADE[3] is not available, and internal address bits [25:0] (64 Mbytes area) are used. Use manual mode when access to the bigger area than 64 Mbytes area.

112.3.4 Operating Modes

This module has two operating modes: external address space read mode and manual mode.

In external address space read mode, a read access to the SPI multi I/O bus space is converted into the data read protocol and data is received from the external device. After data acquisition from the external device, data is returned to the bus master that is the issuing source of read access. For details, see section 112.3.5, External Address Space Read Mode.

The manual mode carries out an arbitrary protocol by using the register settings. For details, see section 112.3.7, Manual Mode.

112.3.5 External Address Space Read Mode

By external address space read mode, a read access to the SPI multi I/O bus space is converted into the data read protocol. Further, the commands, optional commands, option data, and dummy cycle issued for reading external device can be modified using registers.

In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), data read control register (DRCR), data read command setting register (DRCMR), data read extended address setting register (DREAR), data read option setting register (DROPR), data read enable setting register (DRENR), data read dummy cycle setting register (DRDMCR), and data read DDR enable register (DRDRENR).

(1) Normal Read Operation

When the RBE bit in DRCR is set to 0, normal read operation is performed.

In the normal read operation, the data is read from external device by reading access from bus master. After reading from external device, the QSPIn_SSL pin is negated.

The normal read operation timing with serial flash is shown in figure 112.7, Normal Read Operation Timing.

t1 is the time period from QSPIn_SSL pin assertion to QSPIn_SPCLK oscillation (clock delay), t2 is the time period from transmission of the last QSPIn_SPCLK edge of a transfer to QSPIn_SSL pin negation (QSPIn_SSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access).

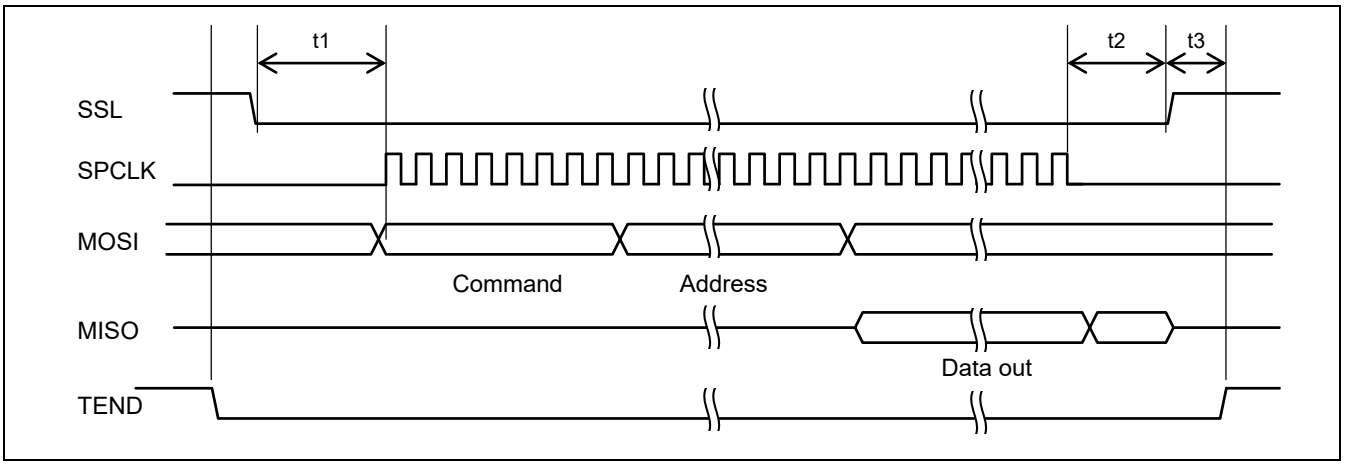

Figure 112.7 Normal Read Operation Timing

Note: t1 to t3 are specified in SSLDR.SCKDL, SSLDR.SLNDL and SSLDRSPNDL bits respectively.

(2) Burst Read Operation

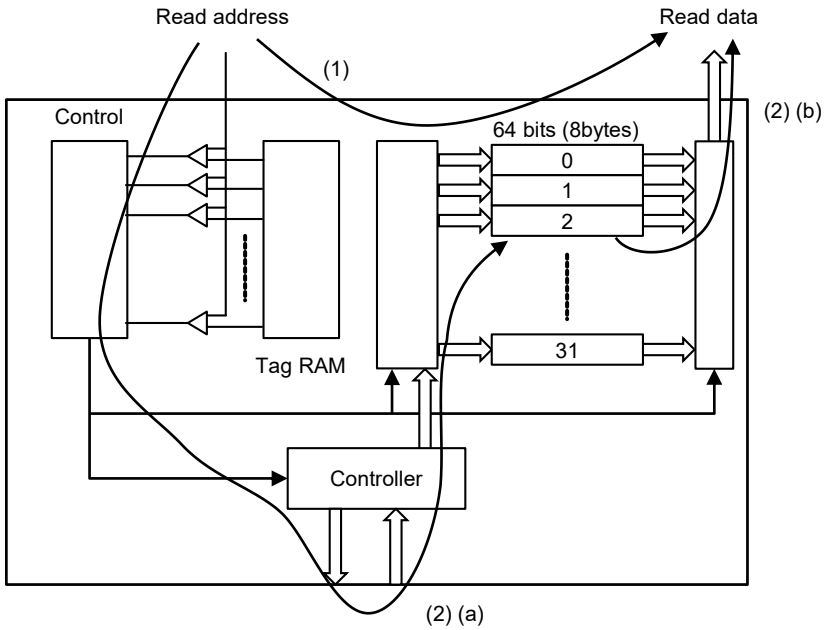
When the RBE bit in DRCR is set to 1, burst read operation is performed.

Read cache is enabled in the burst read operation. For read cache operation, see section 112.3.6, Read Cache.

For reading access from bus master, the read cache is first referred to for checking whether the data of read address of bus master is contained in the read cache memory. When the read cache memory contains the data, the data contained in the cache memory is returned to the bus master without accessing the external device. When the read cache memory does not contain the data, burst read is performed in the external device, the read data is stored in the read cache memory and the data is returned to the bus master. The data transfer length at that time is 64 bits x RBURST[4:0] bits and the data is always read from the 64-bit boundary.

The QSPIn_SSL pin status after data transfer can be selected by using the SSLE bit in DRCR. When the SSLE bit is set to 0, the QSPIn_SSL pin is always negated after data transfer. For an operation performed when the SSLE bit is set to 1, see (3) Burst Read Operation with Automatic QSPIn_SSL Negation, just below.

A pattern diagram of this operation and a burst read operation timing diagram with serial flash when SSLE bit is set to 0 are shown in figures 112.8 and 112.9.



(1) When the read cache contains data;
Data is read from the read cache, and returned to the bus master.
The external device is not accessed.
(2) When the read cache does not contain data;
(a) Data is read from the external device, and stored in the read cache.
(b) Data is read from the read cache, and returned to the bus master.

Figure 112.8 Read Operation in Burst Read Operation

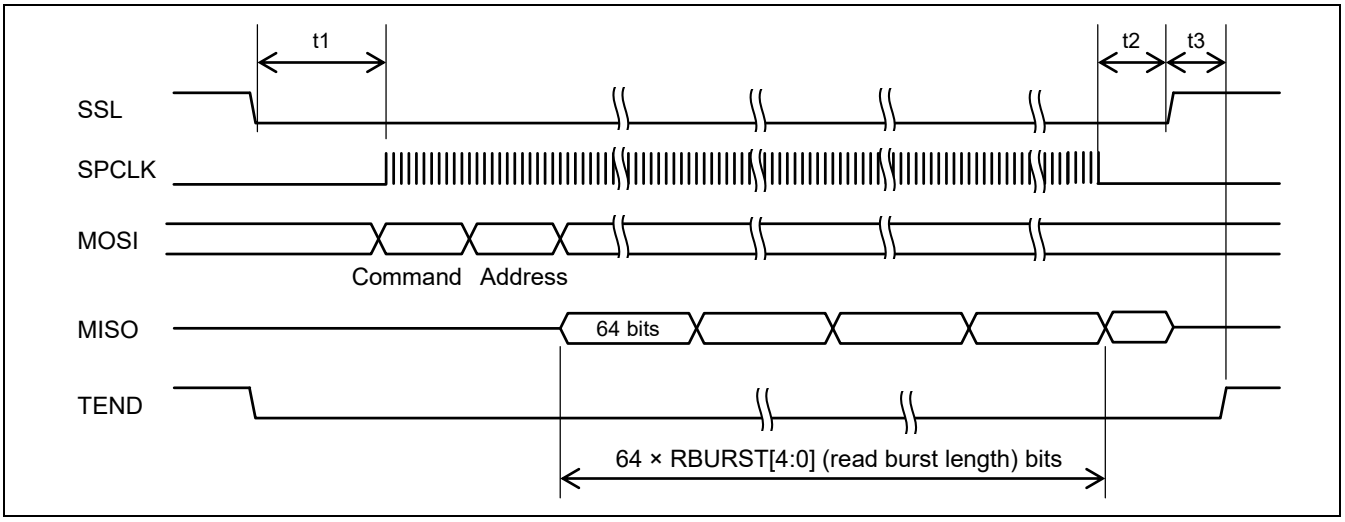


Figure 112.9 Read Timing in Burst Read Operation (SSLE Bit = 0)

Note: t1 to t3 are specified in SSLDR.SCKDL, SSLDR.SLNDL and SSLDRSPNDL bits respectively.

(3) Burst Read Operation with Automatic QSPIn_SSL Negation

When SSLE bit in DRCR is set to 1, this module does not negate the QSPIn_SSL pin after the burst read transfer on serial flash connection. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the QSPIn_SSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address with serial flash are shown in figures 112.10 and 112.11.

For the next access after negation of the QSPIn_SSL with the SSLN bit in DRCR with this operation, read SSLF = 0 in CMNSR to confirm that the QSPIn_SSL has been negated. This function is only supported to connect to serial flash memory.

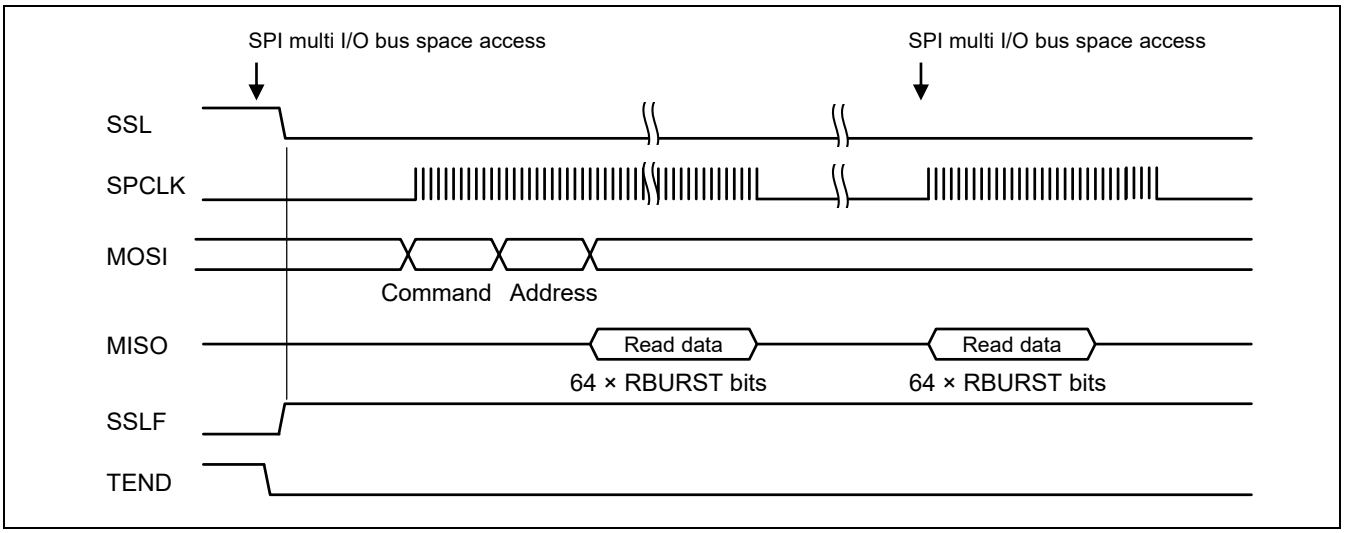

Figure 112.10 Burst Read Timing for Continuous Address (SSLE Bit = 1)

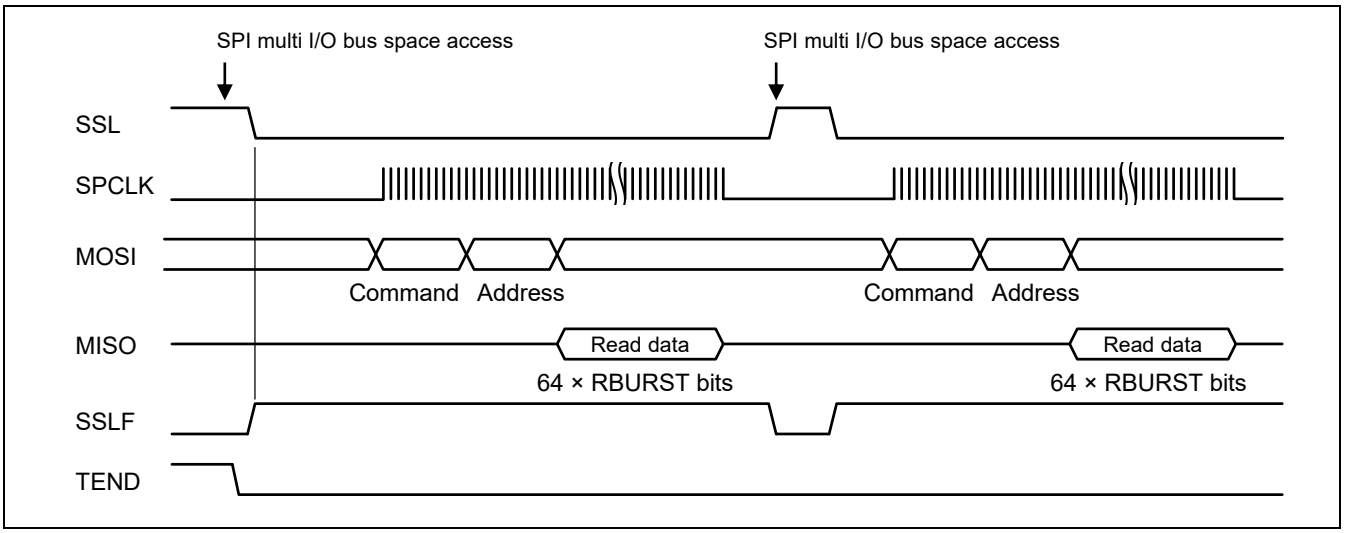

Figure 112.11 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

(4) Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in figure 112.12.

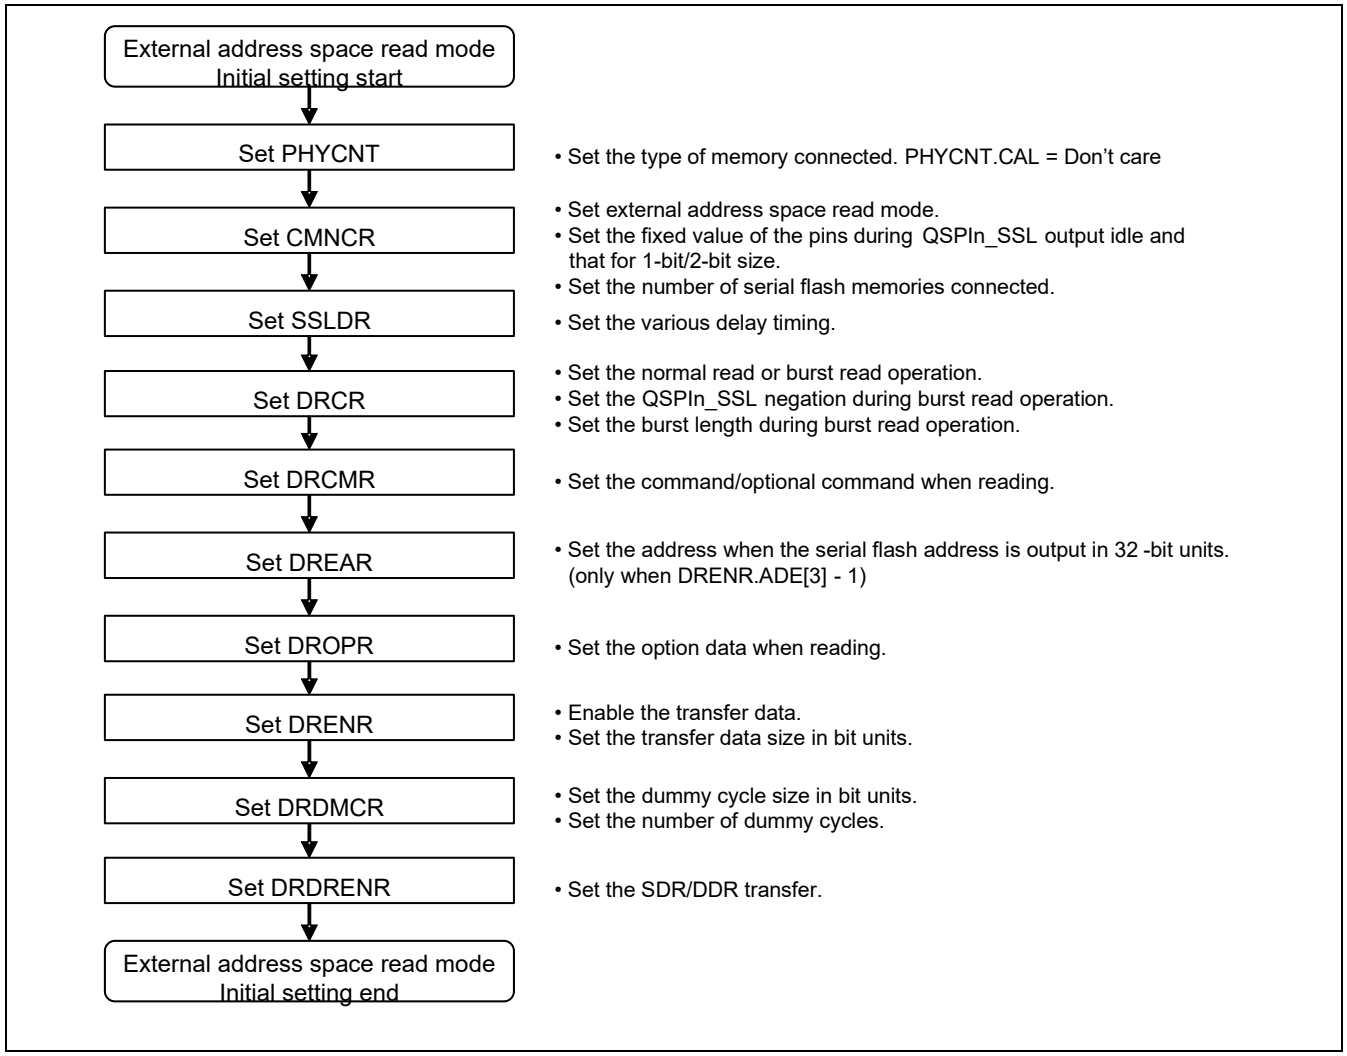

Figure 112.12 Example of Initial Setting Flow in External Address Space Read Mode

112.3.6 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 32 entries.

Read cache configuration is shown in figure 112.13.

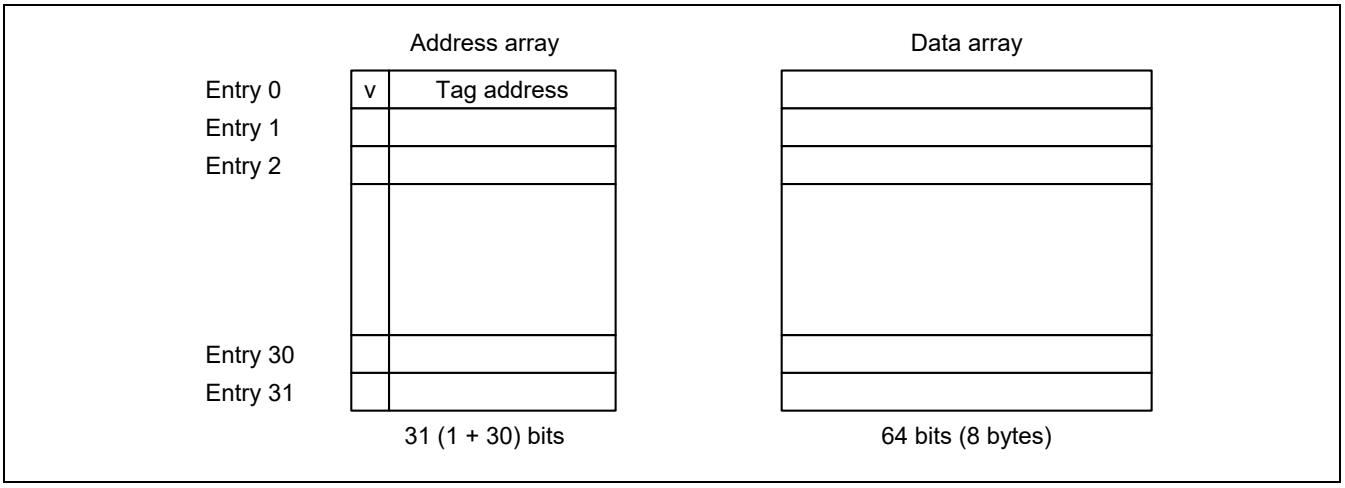

Figure 112.13 Read Cache Configuration

(1) Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the serial flash memory. Address bits 32 to 3 are used for the purpose. Address bits 23 to 3 are enabled when address output is 24 bits and one serial flash memory is connected; and address bits 24 to 3 are enabled when two serial flash memory devices are connected.

Address bits 31 to 3 are enabled when address output is 32 bits and one serial flash memory is connected; and address bits 32 to 3 are enabled when two serial flash memory devices are connected.

(2) Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

(3) Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

(4) Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

112.3.7 Manual Mode

This module can carry out an arbitrary serial transfer operation by using the register settings.

The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), manual mode control register (SMCR), manual mode command setting register (SMCMR), manual mode address setting register (SMADR), manual mode option setting register (SMOPR), and manual mode enable setting register (SMENR), manual mode read data register (SMRDR), manual mode write data register (SMWDR), manual mode dummy cycle setting register (SMDMCR), and manual mode DDR enable register (SMDRENR).

Manual mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SMCR is set to 1 to when the TEND bit is set to 1.

(1) Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SMCR to 1. When write operation is enabled, the manual mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the manual mode read data register.

The operation timing of serial transfer is shown in figure 112.14.

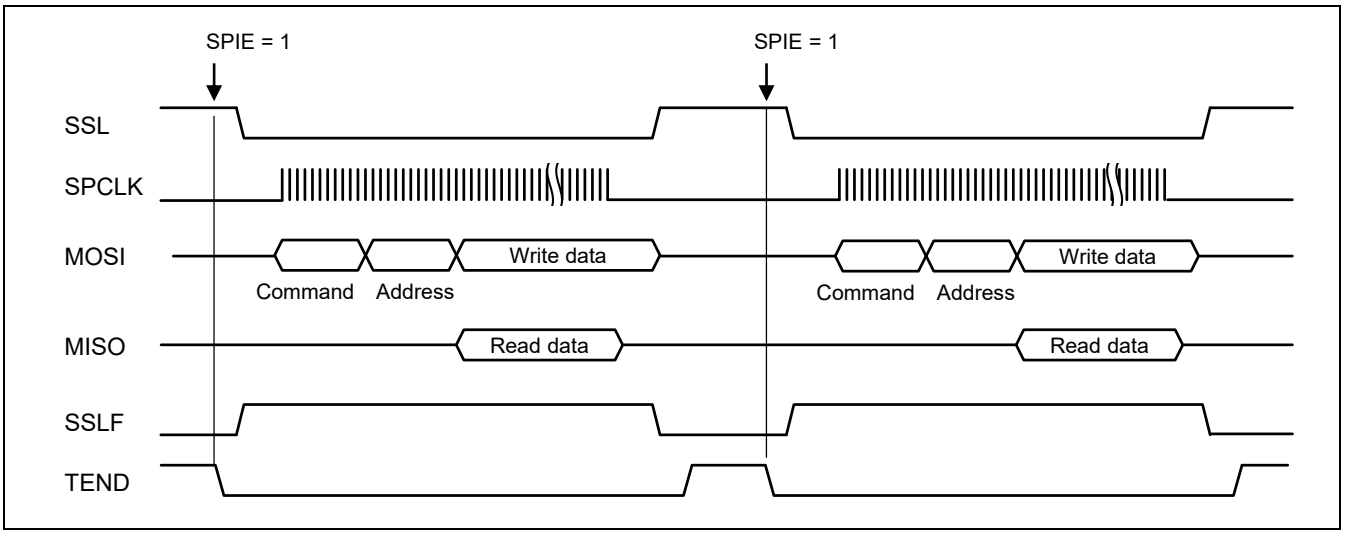

Figure 112.14 Operation Timing of Serial Transfer

(2) Read/Write Enable

Read operation: Data can be read by setting the SPIRE bit in SMCR to 1. The read data is stored into SMRDR.

Write operation: Data can be written by setting the SPIWE bit in SMCR to 1. The data stored in SMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if both the bits are enabled.

(3) Retention of QSPIn_SSL Pin Assertion

By setting the SSLKP bit in SMCR to 1, assertion of the QSPIn_SSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the QSPIn_SSL kept in the asserted state.

The data transfer timing using the SSLKP bit is shown in figure 112.15.

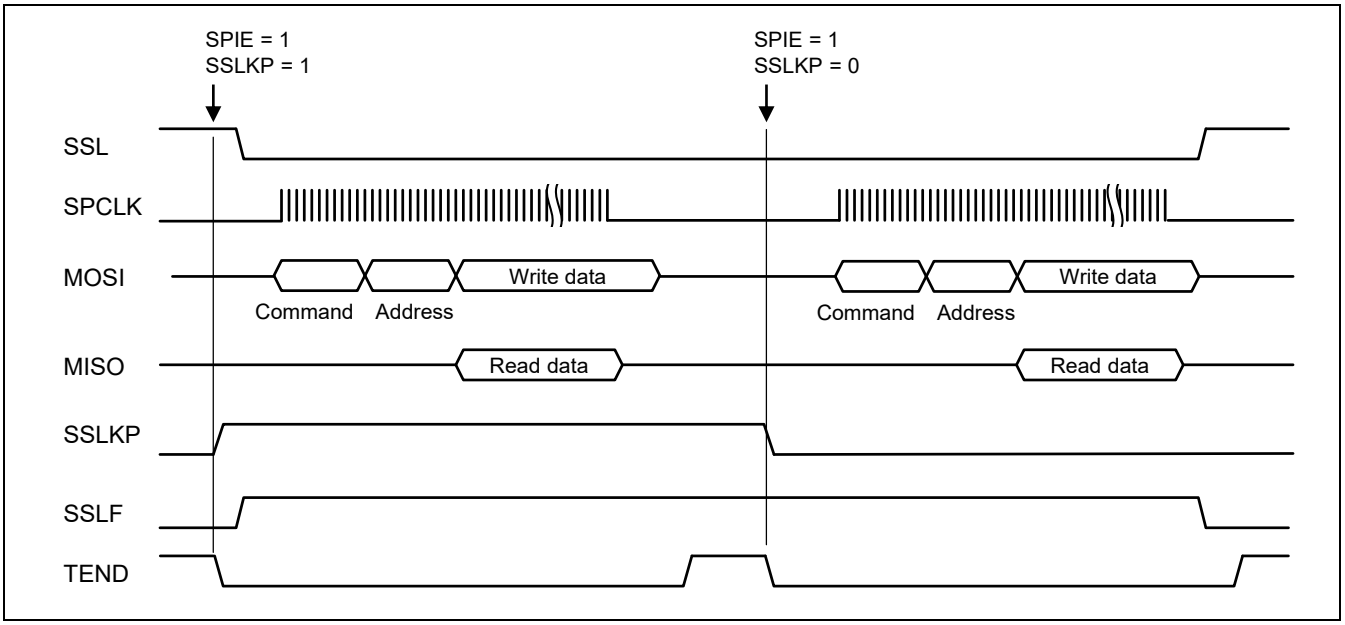

Figure 112.15 Data Transfer Timing Chart Using the SSLKP Bit

(4) Initial Setting Flow

An example of an initial setting flow in manual mode is shown in figure 112.16.

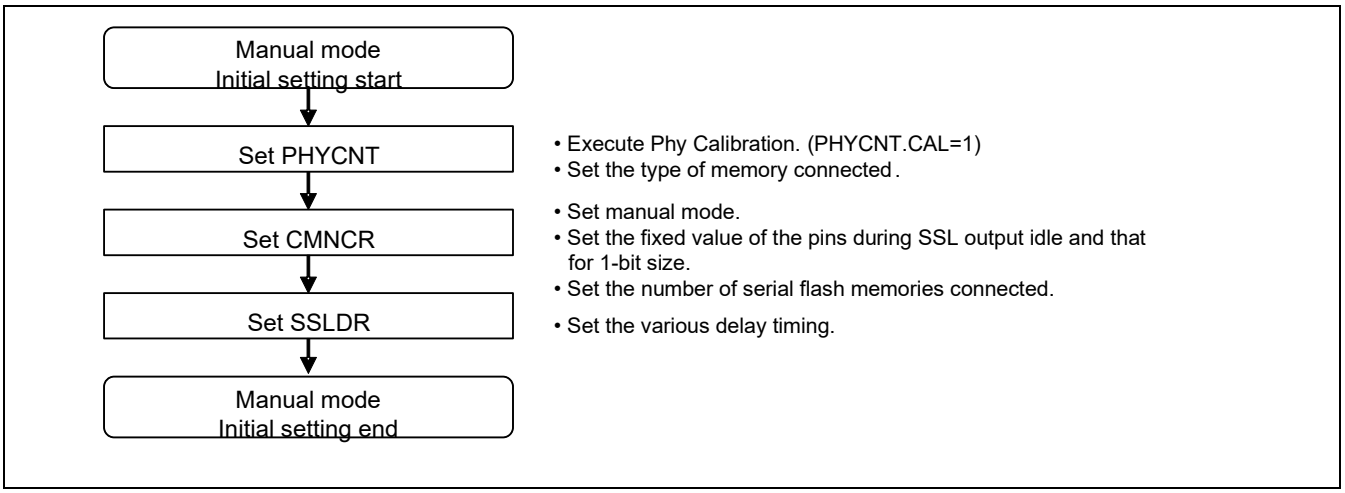

Figure 112.16 Example of Initial Setting Flow in Manual Operating Mode

(5) Data Transfer Setting Flow

An example of a data transfer setting flow in manual mode is shown in figure 112.17.

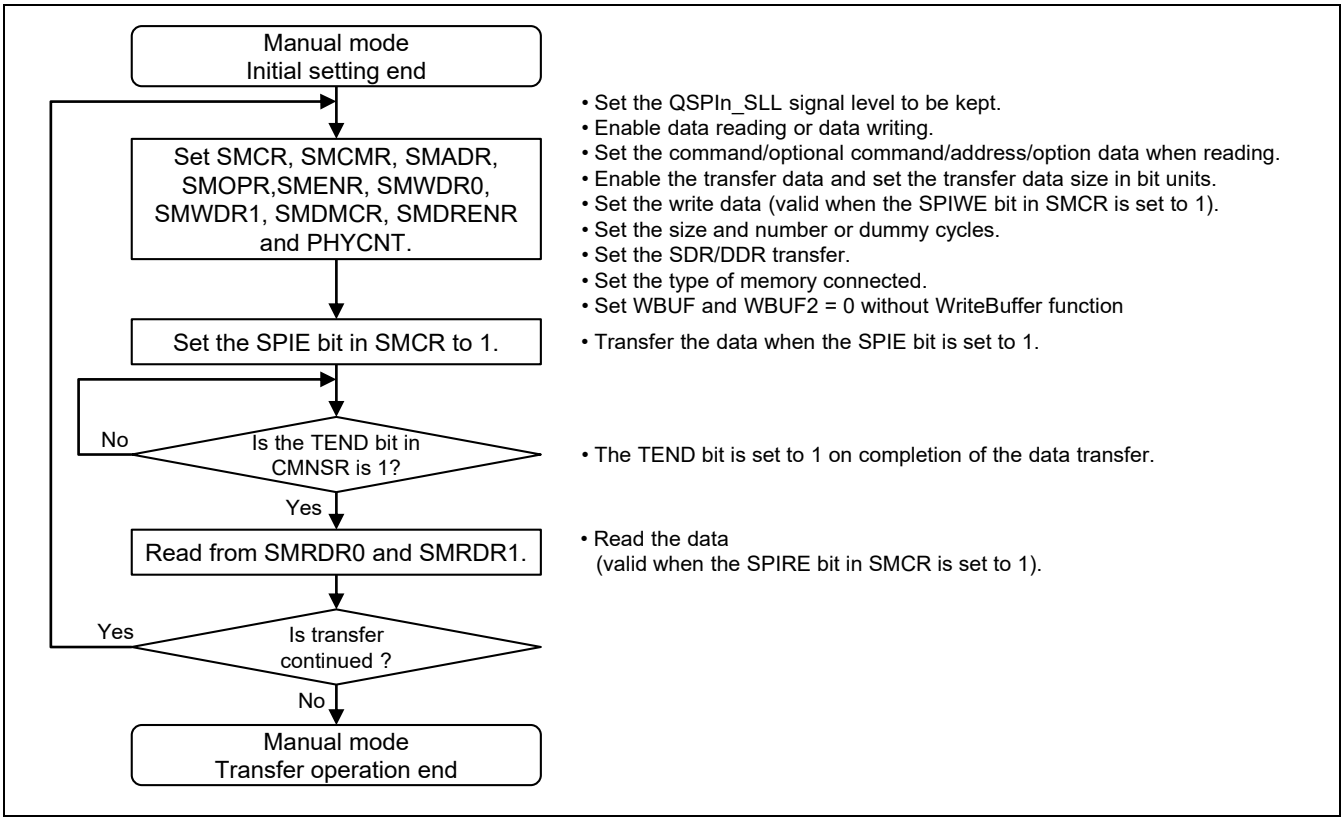

Figure 112.17 Example of Data Transfer Setting Flow in Manual Operating Mode

112.3.8 Command Sequence

This module handles input and output data in the order of command, optional command, address, option data, dummy cycle, and data.

(1) Data Registers

Table 112.5 and Table 112.6 shows the input and output data.

Table 112.5 Data Registers (serial flash)

Data		External Address Space Read Operation	Manual Operation
Command (8 bits)		CMD[7:0] bits in DRCMR	CMD[7:0] bits in SMCMR
Optional Command (8 bits)		OCMD[7:0] bits in DRCMR	OCMD[7:0] bits in SMCMR
Address (32/24 bits)	BSZ[1:0] = 00 (one serial flash memory connected)	32 bits: DREAR.EAV[7:1 to 0] bits + lower [25 to 24:0] bits of the read address. 24 bits: Lower [23:0] bits of the read address	32 bits: ADR[31:0] bits in SMADR. 24 bits: ADR[23:0] bits in SMADR
	BSZ[1:0] = 01 (two serial flash memory devices connected)	32bits: DREAR.EAV[7:1 to 0] bits + lower [25 to 24:1] bits of the read address 24bits: Lower [24:1] bits of the read address	
Option data (8 bits × 4)		DROPR	SMOPR
Dummy cycle (1 to 20 cycles)		DRDMCR	SMDMCR register (only when read)
Transfer Data		Normal read: 8, 16, and 32 bits, Burst read: 64 x RBURST bits	Read: SMRDR0 and SMRDR1 Write: SMWDR0 and SMRDR1

Table 112.6 Data Registers (HyperFlash)

Data	External Address Space Read Operation	Manual Operation
CA0 (47-40)	CMD[7:5] bits in DRCMR + [31:27] bits of the read address	CMD[7:5] bits in SMCMR + ADR[31:27] bits in SMADR
CA0 (39-32)	[26:19] bits of the read address	ADR[26:19] bits in SMADR
CA0 (31-24)	[18:11] bits of the read address	ADR[18:11] bits in SMADR
CA0 (23-16)	[10:3] bits of the read address	ADR[10:3] bits in SMADR
CA0 (15-8)	DROPR[15:8]	SMOPR[15:8]
CA0 (7-0)	DROPR[7:3] + [2:0] bits of the read address	SMOPR[7:3] + ADR[2:0] bits in SMADR
Dummy cycle (1 to 20 cycles)	DRDMCR	SMDMCR register
Transfer Data	Normal read: 8, 16, and 32 bits, Burst read: 64 x RBURST bits	Read: SMRDR0 and SMRDR1 Write: SMWDR0 and SMRDR1

Table 112.6a Data Registers (Octal-SPI flash with 8-8-8 protocol)

Data	External Address Space Read Operation	Manual Operation
Command (16 bits)	CMD[7:0] bits in DRCMR (Rise edge of command phase)	CMD[7:0] bits in SMCMR (Rise edge of command phase)
	OCMD[7:0] bits in DRCMR	OCMD[7:0] bits in SMCMR
	(Fall edge of command phase)	(Fall edge of command phase)
Address (32/24 bits)	32 bits: DREAR.EAV[7:1 to 0] bits + lower [25 to 24:0] bits of the read address.	32 bits: ADR[31:0] bits in SMADR.
	24 bits: Lower [23:0] bits of the read address	24 bits: ADR[23:0] bits in SMADR
	Note:External address mode is available at PHYCNT.OCTA=2'b10 or 11 only. (PHYCNT.OCTA=2'b01 setting is prohibited)	
Option data (8 bits × 4)	DROPR	SMOPR
Dummy cycle (1 to 20 cycles)	DRDMCR	SMDMCR register (only when read)
Transfer Data	Normal read: 8, 16, and 32 bits,	Read: SMRDR0 and SMRDR1
	Burst read: 64 x RBURST bits	Write: SMWDR0 and SMRDR1

(2) Data Enable

In external address space read mode, transfer enable or disable of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in DRENR, respectively. The size and number of dummy cycles can be controlled with the data read dummy cycle setting register (DRDMCR).

Similarly, in manual mode, enable or disable of the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SMENR, respectively. However, disabling all the above parameters is prohibited in manual mode. At least one of them except dummy cycle must be enabled. The size and number of dummy cycles can be controlled with the manual mode dummy cycle setting register (SMDMCR).

For the address and option data in external address space read mode; and the address, option data, and transfer data in manual mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent register.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in manual mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SMCR.

There are some restrictions on dummy cycle insertion. Refer to the description of the DME bits in DRENR and SMENR for details.

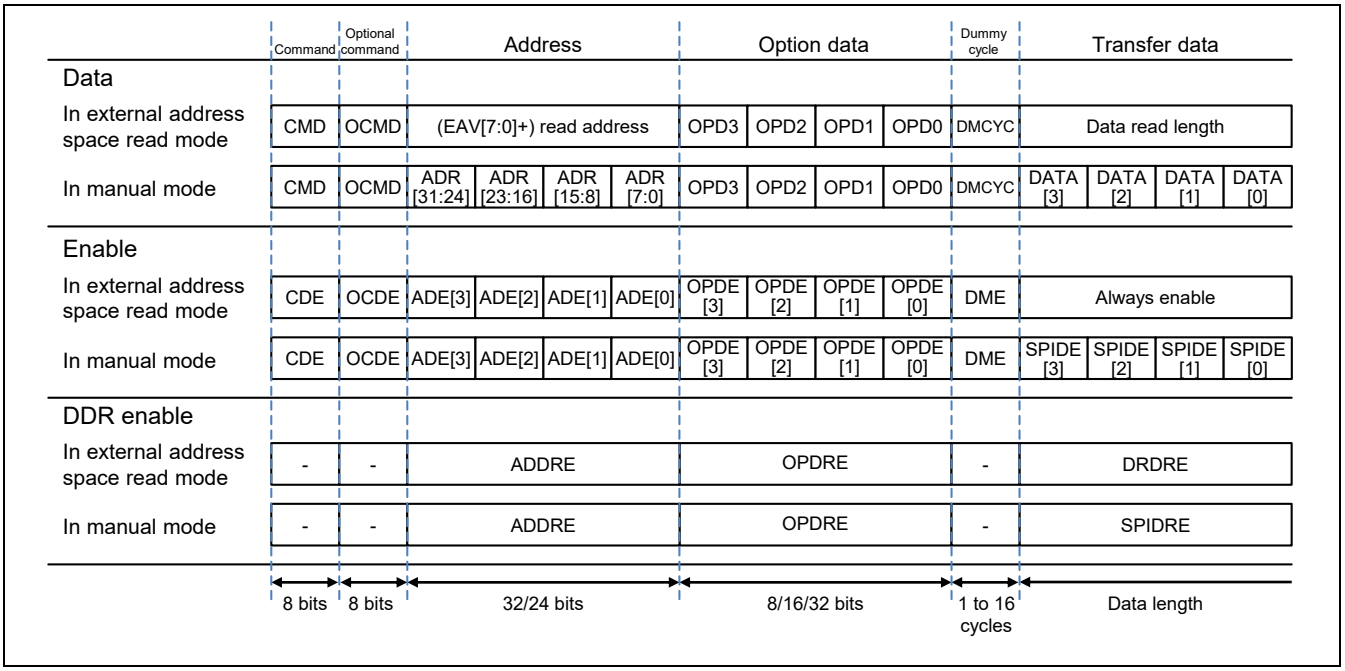

Figure 112.18 The relationship between Data and Enable

When HyperFlash is connected to this LSI, specify enable bits in CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in DRENR and HYPE[2:0], ADDRE, OPDRE and DRDRE in DRDRENR in external address space read mode, and CDE, OCDE, ADE[3:0], OPDE[3:0],DME and SPIDE[3:0] in SMENR and HYPE[2:0], ADDRE, OPDRE and SPIDRE in SMDRENR manual mode.

Table 112.7 Enable Registers (HyperFlash)

External Address Space Read Operation			Manual Operation		
Register	Bits	Setting Value	Register	Bits	Setting Value
DRENR	CDE	1	SMENR	CDE	1
	OCDE	1		OCDE	1
	ADE[3:0]	0100		ADE[3:0]	0100
	OPDE[3:0]	0000		OPDE[3:0]	0000
	DME	1		DME	Read: 1 Write: 0
DRDRENR	HYPE[2:0]	101		SPIDE[3:0]	16bit: 1000 32bit: 1100 64bit: 1111
	ADDRE	1	SMDRENR	HYPE[2:0]	101
	OPDRE	0		ADDRE	1
	DRDRE	1		OPDRE	0
				SPIDRE	1

Table 112.7a Enable Registers (Octal-SPI flash with 8-8-8 protocol)

External Address Space Read Operation			Manual Operation		
Register	Bits	Setting Value	Register	Bits	Setting Value
DRENR	CDE	1	SMENR	CDE	1
	OCDE	0		OCDE	0
	ADE[3:0]	1100		ADE[3:0]	1100
	OPDE[3:0]	0000		OPDE[3:0]	0000
	DME	1		DME	Read: 1 Write: 0
DRDRENR	HYPE[2:0]	101		SPIDE[3:0]	16bit: 1000 32bit: 1100 64bit: 1111
	ADDRE	1	SMDRENR	HYPE[2:0]	101
	OPDRE	0		ADDRE	1
	DRDRE	1		OPDRE	0
				SPIDRE	1

(3) Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in DRENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in DRDMCR.

Similarly, in manual mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SMENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SMDMCR.

(a) 1-bit Size

When the size is set to 1 bit, QSPI0_MISO_IO1 and QSPI1_MISO_IO1 pins will be the input pins and QSPI0_MOSI_IO0 and QSPI1_MOSI_IO0 pins will be the output pins. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 pins are not used.

Figures 112.19 and 112.20 show the examples of the transfer format.

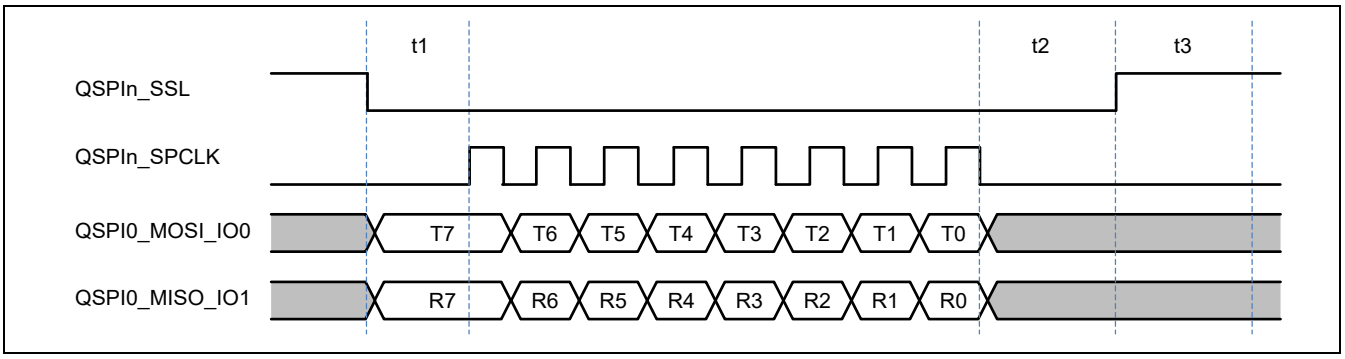

Figure 112.19 Example of Transfer Format with 1-Bit Data Size and One Serial Flash Memory Connected

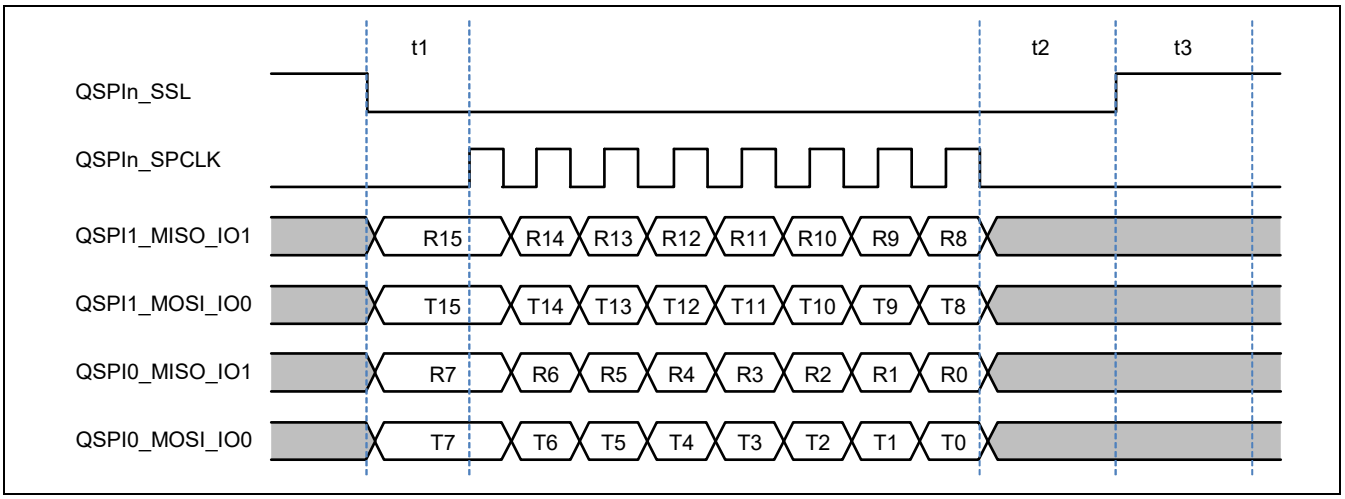

Figure 112.20 Example of Transfer Format with 1-Bit Data Size and Two Serial Flash Memory Devices Connected

(b) 4-bit Size (serial flash)

When the size is set to 4-bit, QSPI0_MOSI_IO0, QSPI1_MOSI_IO0, QSPI0_MISO_IO1, QSPI1_MISO_IO1, QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 pins will be either the input pins or the output pins. Figures 112.23 and 112.24 show the examples of the transfer format.

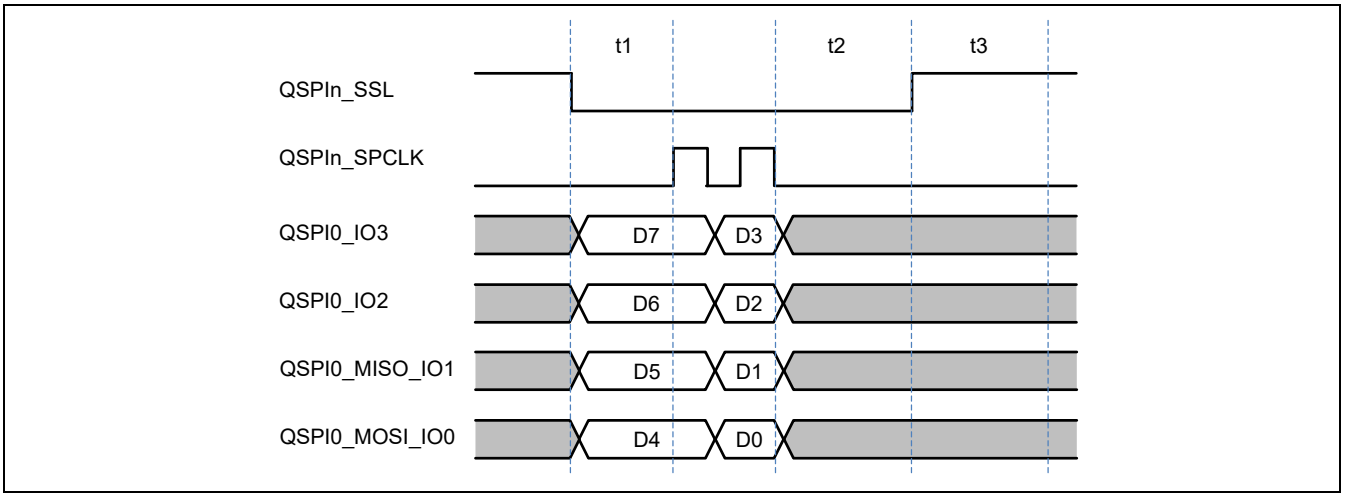

Figure 112.23 Example of Transfer Format with 4-Bit Data Size and One Serial Flash Memory Connected

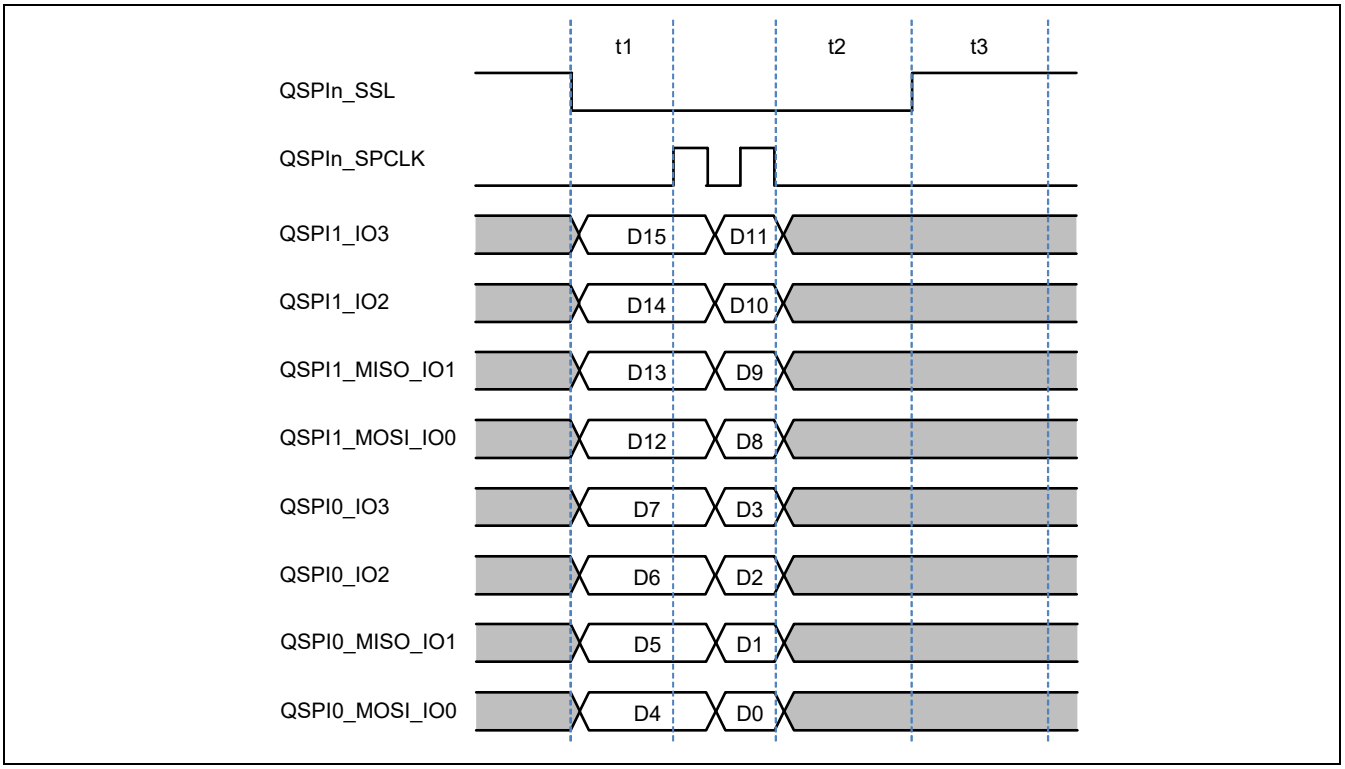

Figure 112.24 Example of Transfer Format with 4-Bit Data Size and Two Serial Flash Memory Devices Connected

(c) 4-bit Size (Hyperflash)

When HyperFlash is connected to this LSI, QSPI0_SPCLK and QSPI1_SPCLK will be differential clock, QSPI1_SSL will be input pin for RDS (Read Data Strobe) and QSPI0_MOSI_IO0, QSPI1_MOSI_IO0, QSPI0_MISO_IO1, QSPI1_MISO_IO1, QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 pins will be either the input pins or the output pins. Figure 112.25 shows the command/address sequence, and Figure 112.26 shows example of read data. In manual mode, the read data alignment is sequential, {DQ3[7:0], DQ2[7:0], DQ1[7:0], DQ0[7:0]} is stored in SMRDR1[31:0] and {DQ7[7:0], DQ6[7:0], DQ5[7:0], DQ4[7:0]} is stored in SMRDR0[31:0]. In external address space read mode, the read data is stored in little endian. For example, the 64-byte read data on RPC-IF area (0x08000000 ~ 0x0BFFFFFF) is {DQ7[31:0], DQ6[7:0], DQ5[7:0], DQ4[7:0], DQ3[7:0], DQ2[7:0], DQ1[7:0], DQ0[7:0]}.
Figure 112.27a shows example of write data(64bit). In manual mode, the write data alignment is sequential, the data in SMWDR1[7:0] is on DQ0, SMWDR1[15:8] is on DQ1, …, SMWDR0[31:24] is on DQ7. Figure 112.27b shows example of write data(16 bit). In manual mode, the write data alignment is sequential, the data in SMWDR0[23:16] is on DQ6, SMWDR0[31:24] is on DQ7. In Write Buffer mode, the write data alignment is little endian. The data stored in Write Buffer is output from H'EE20 8000 to H'EE20 80FF sequentially.

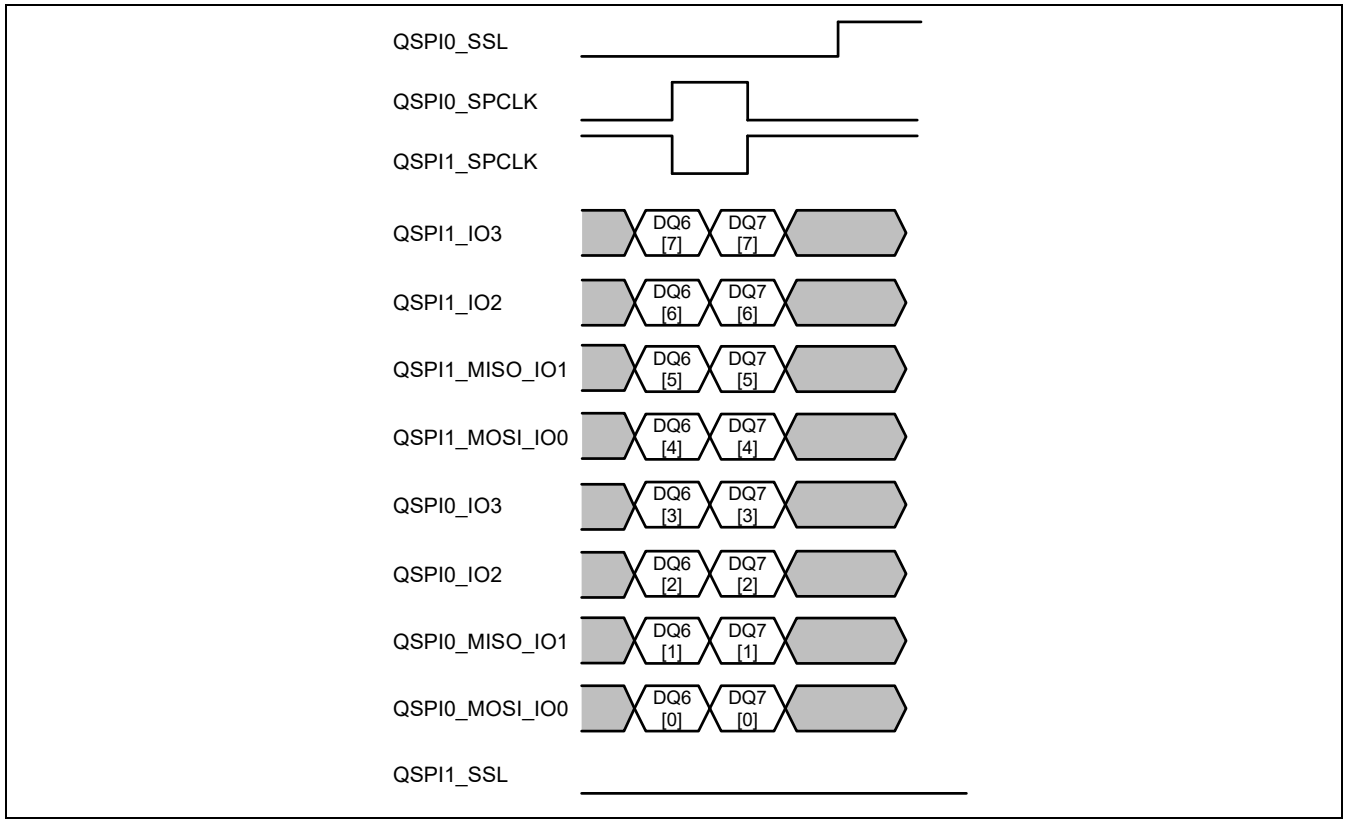

Figure 112.27b Example of Transfer Format in Write phase with HyperFlash (16 bit)

112.3.9 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the QSPIn_SSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in CMNCR.

The QSPI0_SSL and QSPIn_SPCLK pins are always output pins. The status of respective pins is specified in Table 112.8 to 112.11.

Note that connection with ch1 pins in 1 x serial flash configuration is prohibited.

Table 112.8 Pin Status (1)

		QSPIn_SSL Assertion	
		Command, Optional Command, Address, Option Data	
Pin	QSPIn_SSL Negation	1-bit Size	4-bit Size *2
QSPI0_MOSI_IO0, QSPI1_MOSI_IO0	MOIIO0 bit value	Output	Output
QSPI0_MISO_IO1, QSPI1_MISO_IO1	MOIIO1 bit value	Hi-Z	Output
QSPI0_IO2, QSPI1_IO2	MOIIO2 bit value	specified in PFC *1	Output
QSPI0_IO3, QSPI1_IO3	MOIIO3 bit value	specified in PFC *1	Output

Notes: 1. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3 and QSPI1_IO3 pin state should be controlled by PFC function. Refer to Section 7. Pin Function in User's Manual.
2. When CMNCR.BSZ[1:0]=01, Bit size becomes 8bits.

Table 112.9 Pin Status (2)

	Transfer Data			
	External Address Space Read Operation		Manual mode Operation	
			SPIRE Bit = 1, SPIWE Bit = 0	
Pin	1-bit Size	4-bit Size *2	1-bit Size	4-bit Size *2
QSPI0_MOSI_IO0, QSPI1_MOSI_IO0	IO0FV bit value	Input	IO0FV bit value	Input
QSPI0_MISO_IO1, QSPI1_MISO_IO1	Input	Input	Input	Input
QSPI0_IO2, QSPI1_IO2	specified in PFC *1	Input	specified in PFC *1	Input
QSPI0_IO3, QSPI1_IO3	specified in PFC *1	Input	specified in PFC *1	Input

Notes: 1. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3 and QSPI1_IO3 pin state should be controlled by PFC function. Refer to Section 7. Pin Function in User's Manual.
2. When CMNCR.BSZ[1:0]=01, Bit size becomes 8bits.

Table 112.10 Pin Status (3)

	Transfer Data			
	Manual mode Operation			
	SPIRE Bit = 0, SPIWE Bit = 1		SPIRE Bit = 1, SPIWE Bit = 1	
Pin	1-bit Size	4-bit Size *2	1-bit Size	4-bit Size *2
QSPI0_MOSI_IO0, QSPI1_MOSI_IO0	Output	Output	Output	Setting prohibited
QSPI0_MISO_IO1, QSPI1_MISO_IO1	Hi-Z	Output	Input	Setting prohibited
QSPI0_IO2, QSPI1_IO2	specified in PFC *1	Output	specified in PFC *1	Setting prohibited
QSPI0_IO3, QSPI1_IO3	specified in PFC *1	Output	specified in PFC *1	Setting prohibited

Notes: 1. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3 and QSPI1_IO3 pin state should be controlled by PFC function. Refer to "7. Pin Function"
2. When CMNCR.BSZ[1:0]=01, Bit size becomes 8bits.

Table 112.11 Pin Status (4)

	Dummy Cycle	
Pin	1-bit Size	4-bit Size *2
QSPI0_MOSI_IO0, QSPI1_MOSI_IO0	IO0FV bit value	Hi-Z
QSPI0_MISO_IO1, QSPI1_MISO_IO1	Hi-Z	Hi-Z
QSPI0_IO2, QSPI1_IO2	specified in PFC *1	Hi-Z
QSPI0_IO3, QSPI1_IO3	specified in PFC *1	Hi-Z

Notes: 1. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3 and QSPI1_IO3 pin state should be controlled by PFC function. Refer to "7. Pin Function"
2. When CMNCR.BSZ[1:0]=01, Bit size becomes 8bits.

112.3.10 QSPIn_SSL Pin Control

Negation conditions of the QSPIn_SSL pin are as follows.

(1) External Address Space Read Operation

(a) Normal read operation (RBE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

(b) Burst read operation without automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

(c) Burst read operation with automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 1)

- QSPIn_SSL negated after t2 cycle when the read address is not continuous with the previously read address
- QSPIn_SSL negated after the SSLN bit in DRCR is set to 1.

Note: This function is available when connecting to serial flash.

(2) Manual Mode

(a) QSPIn_SSL pin assertion not retained (SSLKP bit in SMCR = 0)

QSPIn_SSL negated after completing the data transfer.

(b) QSPIn_SSL pin assertion retained (SSLKP bit in SMCR = 1)

QSPIn_SSL not negated.

When to be negated, data should be transferred after setting the SSLKP bit to 0.

Note: QSPI1_SSL is used as input pin for data strobe when connecting to HyperFlash or Octal-SPI flash.

112.3.11 QSPIn_SPCLK Pin Control

QSPI0_SPCLK and QSPI1_SPCLK are output depending on the following setting

Table 112.12 QSPIn_SPCLK output

Pin	HyperFlash (CMNCR.BSZ = 01 PHYCNT.PHYMEM = 11)	Serial flash x 1ch (CMNCR.BSZ = 00 PHYCNT.PHYMEM = 00 or 01)	Serial flash x 2ch or Octal-SPI Flash with 8-8-8 protocol (CMNCR.BSZ = 01 PHYCNT.PHYMEM = 00 or 01)
QSPI0_SPCLK	Output	Output	Output
QSPI1_SPCLK	Output in differential relation with QSPI0_SPCLK	Hi-Z	Output

112.3.12 Flags

This module has two flag bits SSLF and TEND in CMNSR. These bits are read-only bits.

(1) SSLF Bit

This bit indicates the QSPIn_SSL pin status. The status is 1 when the QSPIn_SSL is asserted, and the status is 0 when the QSPIn_SSL is negated.

(2) TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and QSPIn_SSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

(3) Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in DRCR, should be modified when TEND = 1.

The data should be read when the TEND flag in SMRDR0 or SMRDR1 is 1;

CMNSR can always be read.

112.3.13 Write Buffer Operation

This module uses read cache as write buffer in write operation. This write buffer improve the performance.

Table 112.13 Write Buffer Area

Address	Access Size
H'EE20 8000 to H'EE20 80FF	4, 8, 16, 32, 64 Byte

Note: This area should be accessed sequentially from the start address and transfer size to the device is 256-byte unit.
All Write Buffer area should be filled with transfer data in every transfer.
When accessing non-sequentially or at random, the operation is not guaranteed.
After Write Buffer Operation, this cache area must be cleared by DRCR.RCF bit.
Write Buffer operation supports 24bit or 32bit address only. SMENR.ADE should be specified 0111 (ADR[23:0]) or 1111 (ADR[31:0]).

Figure 112.28 shows the sequence to use write buffer. About the initial setting of Manual mode, refer to Figure 112.16.

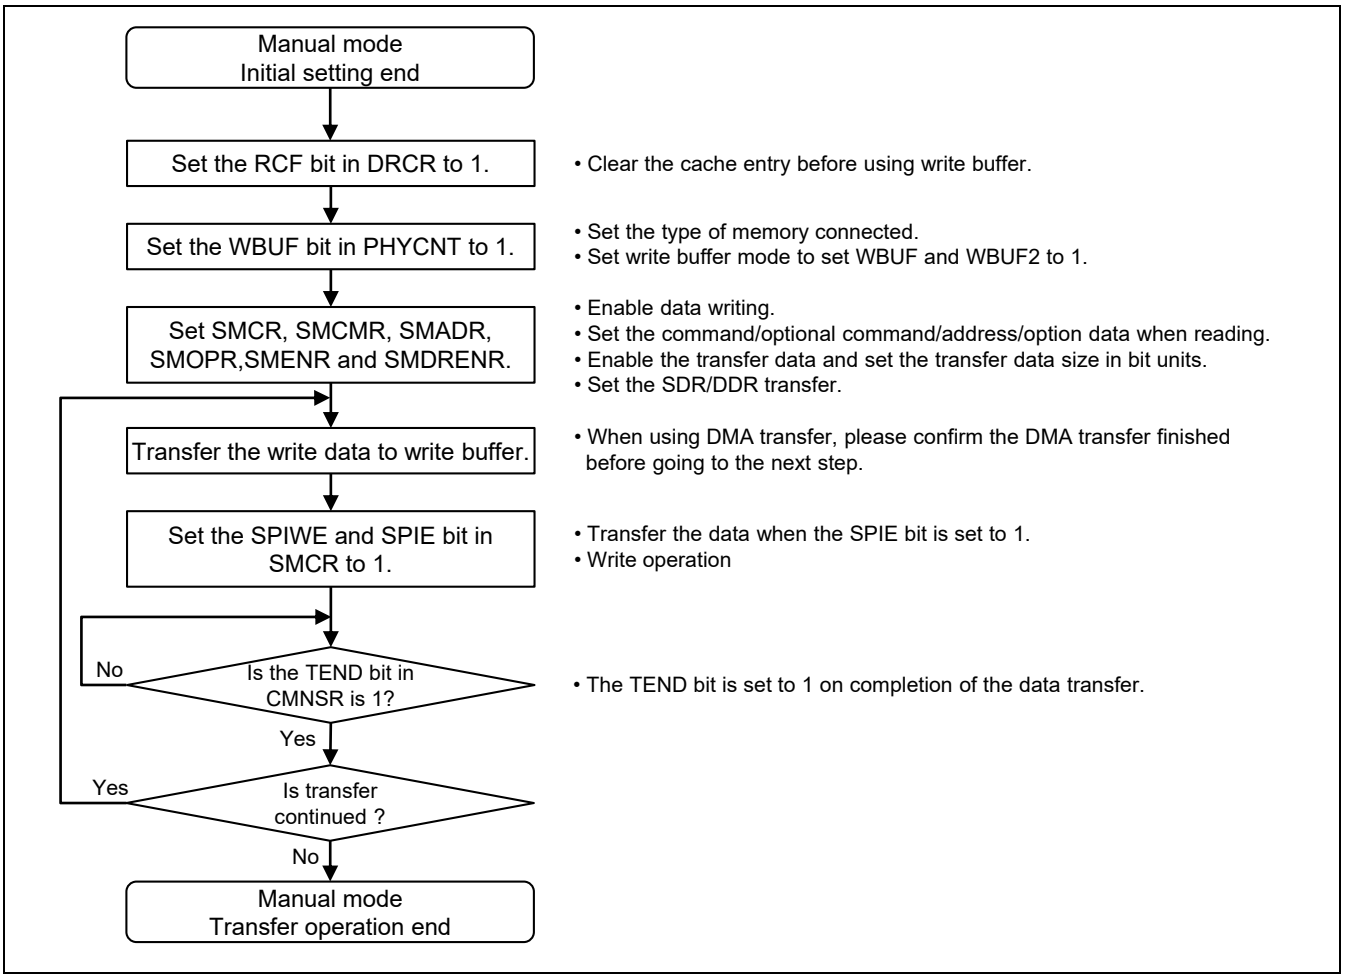

Figure 112.28 Write Buffer Usage Sequence

112.3.14 Data Alignment with Octal-SPI flash memory

When this LSI connects to Octal-SPI flash memory, this controller support two types of data alignment. Figure 112.29 and Figure 112.30 show sequential and alternate alignment respectively. Write data alignment in Write Buffer operation is same.

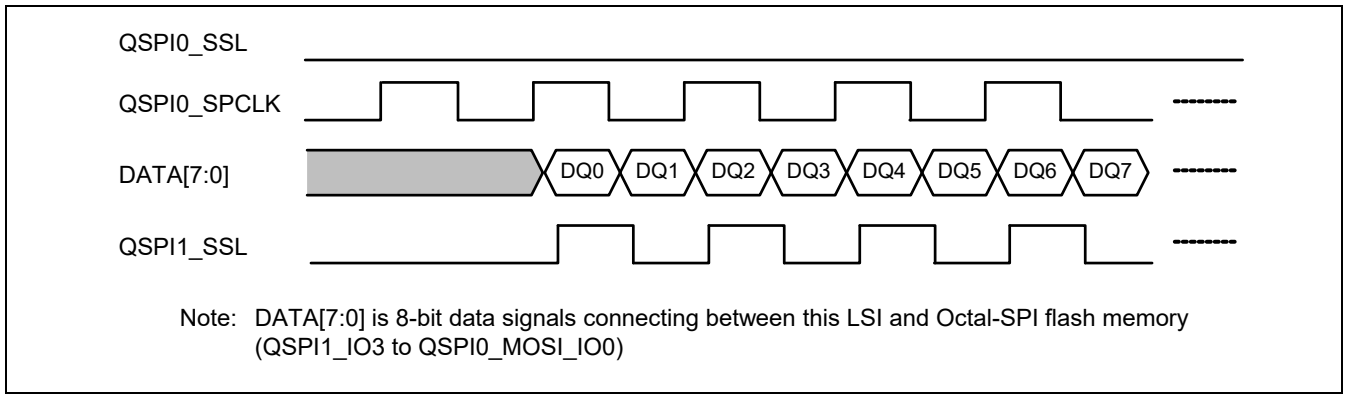

Figure 112.29 Sequential Data Alignment with Octal-SPI flash (PHYCNT.OCTA = 10)

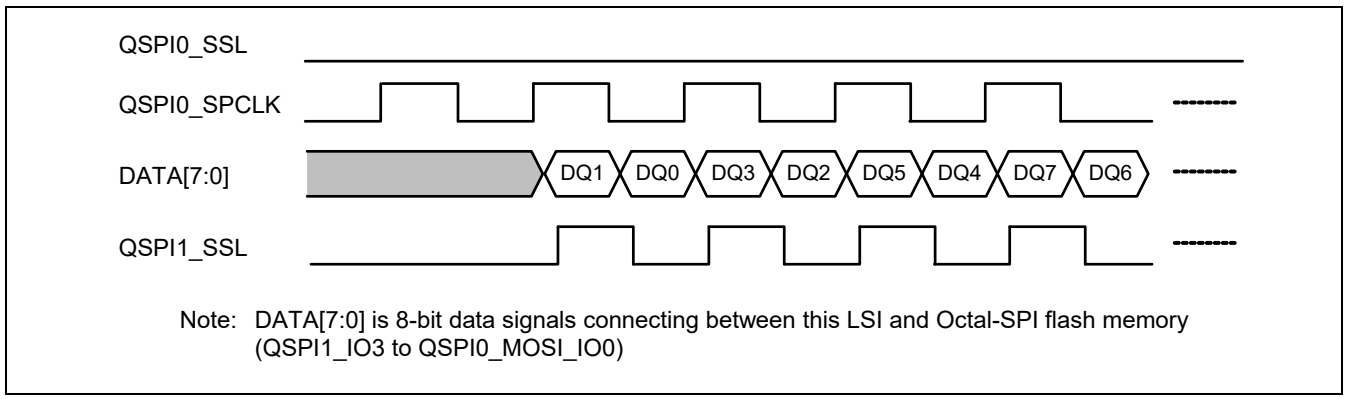

Figure 112.30 Alternate Data Alignment with Octal-SPI flash (PHYCNT.OCTA = 01, 11)

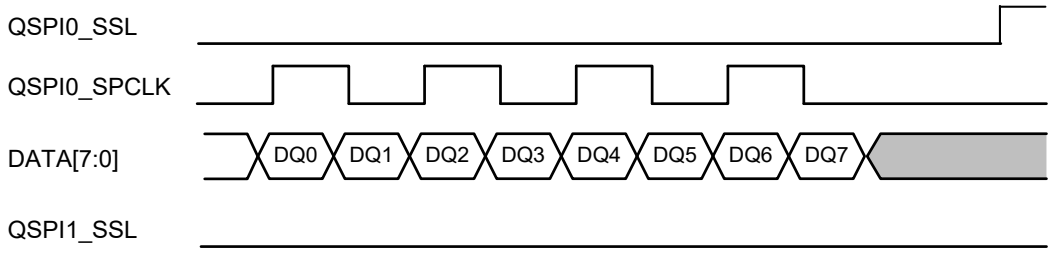
Figure 112.31 shows the write data alignment in 8-8-8 protocol in manual mode operation.



DQ0[7:0]	SMWDR1[15:12], SMWDR1[7:4]	DQ4[7:0]	SMWDR0[15:12], SMWDR0[7:4]
DQ1[7:0]	SMWDR1[11:8], SMWDR1[3:0]	DQ5[7:0]	SMWDR0[11:8], SMWDR0[3:0]
DQ2[7:0]	SMWDR1[31:28], SMWDR1[23:20]	DQ6[7:0]	SMWDR0[31:28], SMWDR0[23:20]
DQ3[7:0]	SMWDR1[27:24], SMWDR1[19:16]	DQ7[7:0]	SMWDR0[27:24], SMWDR0[19:16]

Figure 112.31 Write Data Alignment with Octal-SPI flash in manual mode

112.3.15 Supported Serial Flash Protocol

Table 112.14 shows the protocols of serial flash memory which are supported in this LSI.

Table 112.14 Supported protocols of serial flash memory

Bit width (Command-Address-Data)	Command	Address	Data
1-0-0	SDR	NA	NA
1-0-1	SDR	NA	SDR
1-1-1	SDR	SDR	SDR
	SDR	DDR	DDR
1-1-4	SDR	SDR	SDR
1-4-4	SDR	SDR	SDR
	SDR	DDR	DDR

112.3.16 Supported Octal-SPI Flash Protocol

Table 112.15 shows the protocols of Octal-SPI flash memory which are supported in this LSI.

Table 112.15 Supported protocols of Octal-SPI flash memory

Bit width (Command-Address-Data)	Command	Address	Data
1-0-0	SDR	NA	NA
1-0-1	SDR	NA	SDR
1-1-1	SDR	SDR	SDR
8-0-0	SDR	NA	NA
	DDR	NA	NA
8-0-8	DDR	NA	DDR
8-8-8	DDR	DDR	DDR

112.3.17 DDR operation

This controller supports hardware calibration to adjust the timing of data strobe to support DDR protocol. When this LSI connects to the device with data strobe like HyperFlash or Octal SPI flash, this controller adjusts the strobe point automatically. When this LSI connects to the device without data strobe like serial flash memory in DDR mode, more adjustment is necessary to support DDR operation.

To adjust the timing of DDR operation without data strobe flash device, dummy read operation is necessary by software to change the delay of the internal strobe. PHYCNT.STRTIM bits change the delay. The delay depends on the specified value, 0000(biggest) > 0001 > … > 1110 > 1111 (smallest), of PHYCNT.STRTIM bits. The maximum value of tVSD in Table 200.65 can be achieved among these setting values, so software can find the appropriate timing for changing these values one by one. Figure 112.32 shows the flow of this timing adjustment.

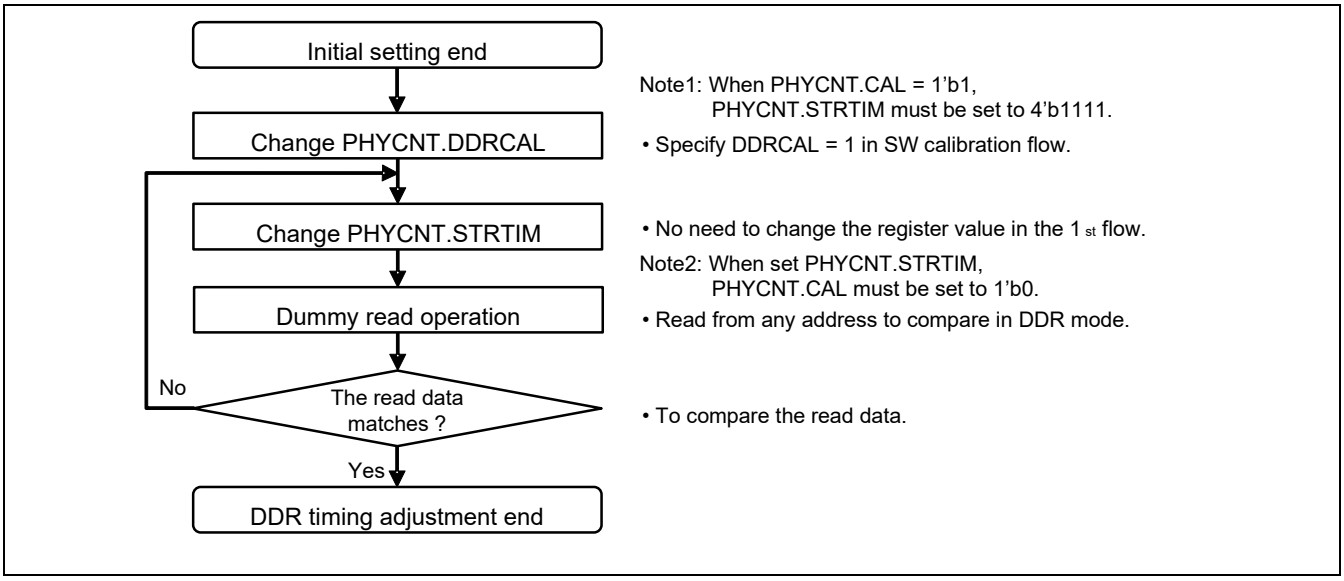


Figure 112.32 DDR timing adjustment to connect to the device without data strobe

This timing adjustment should be done in periodically because the timing changes with PVT condition in both this LSI and the connected device.

112.3.18 Security function

This controller supports security function to protect the data on the Flash device.

(1) SPI multi I/O bus space division

ADD_DIVn.ADD_DIVn (n = 1, 2, 3) bit specifies the address space division to separate the area into four. And SEC_CONF.AREAn (n = 0, 1, 2, 3) specifies the attribution of each area. The address specified ADD_DIVn.ADD_DIVn[19:0] bit are shifted and evaluate the bus address with 4K granularity. For example, when ADD_DIV1.ADD_DIV1[19:0] is specified to 20'h09FFF and SEC_CONF.AREA0 is specified to 2'b01 (non-secure) setting, Area0 becomes H'0800_0000 – H'09FF_FFFF and Non-Secure attribution, and Area1 starts from H'0A00_0000.

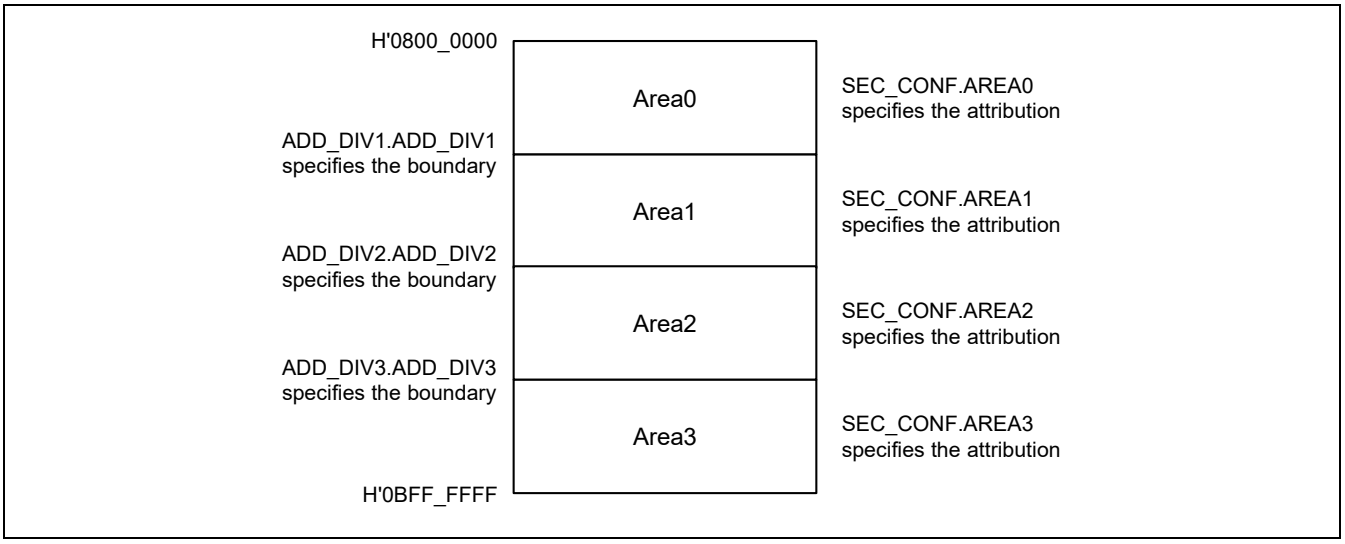

Figure 112.33 Area protection to divide the address space

Note that ADD_DIVn (n = 1 to 3) should be specified to keep the order of 0x0800_0000 < ADD_DIV1.ADD_DIV1 < ADD_DIV2.ADD_DIV2 < ADD_DIV3.ADD_DIV3 < H'0BFF_FFFF. If this order is not kept, the operation of this module is not guaranteed. Specifying ADD_DIV1.ADD_DIV1 = 20h'08000 to make H'0800_0000 ~ H'0800_0FFF in Area0 is not available.

(2) Command restriction for serial flash

This controller can limit the command to issue to the connected serial flash. SEC_CMDn (n = 0 to 15) and NON_SEC_CMDn (n = 0 to 15) specify the limited command. For example, when H'FF is specified in SEC_CMD0.LIMCMD[7:0] bit and H'FF command is specified in SMCMR.CMD bit, the operation by Secure CPU is not issued. LIMEN bit in each register enables this function.

(3) Write/Erase protect function for serial flash

This controller can protect the mistaken overwrite or erase on the other attribution to limit the Write/Erase command to the specific area on serial flash. ERASELISTn (n = 1, 2) and WRITELISTn (n = 1, 2) specify the prohibited command. When the target address belongs to secure attribution area specified in ADD_DIVn and SEC_CONF registers, the operation by non-secure attribution is not issued.

(4) Access Right

This controller has access right function for the register setting. There are two attribution, Secure and Non-Secure same as area protection. The master which specifies ARIGHT.RIGHT_EN bit has the right to access. The access right is reflected in each bit 3 to 1 according to the attribution of each master. To cancel the access right, the same attribution master should access to this register with RIGHT_EN = 0. The access is ignored when the attribution of access is different.
When the access is ignored, write result is not reflected to register in this function, then read result is all 0.

112.3.19 Hardware calibration

RPC has the hardware calibration function to adjust data receiving timing.
This function adjusts the delay of DelayLine circuit in following figure 112.34.
Target delay of this adjustment is 1/4 transfer period (If transfer period is 12.5ns at 80MHz, 3.25ns is target) and hardware calibration selects nearest delay tap from 32taps of DelayLine.

Trigger of hatdware calibration is following 2 cases.

1. Set PHYCNT.CAL=1
2. Before starting read action with external address space read mode(CMNCR.MD=0) and PHYCNT.DDRCAL=0.

This calibration result can be confirmed with register RDLMON and FDLMON of 112.3.20 PHY register interface

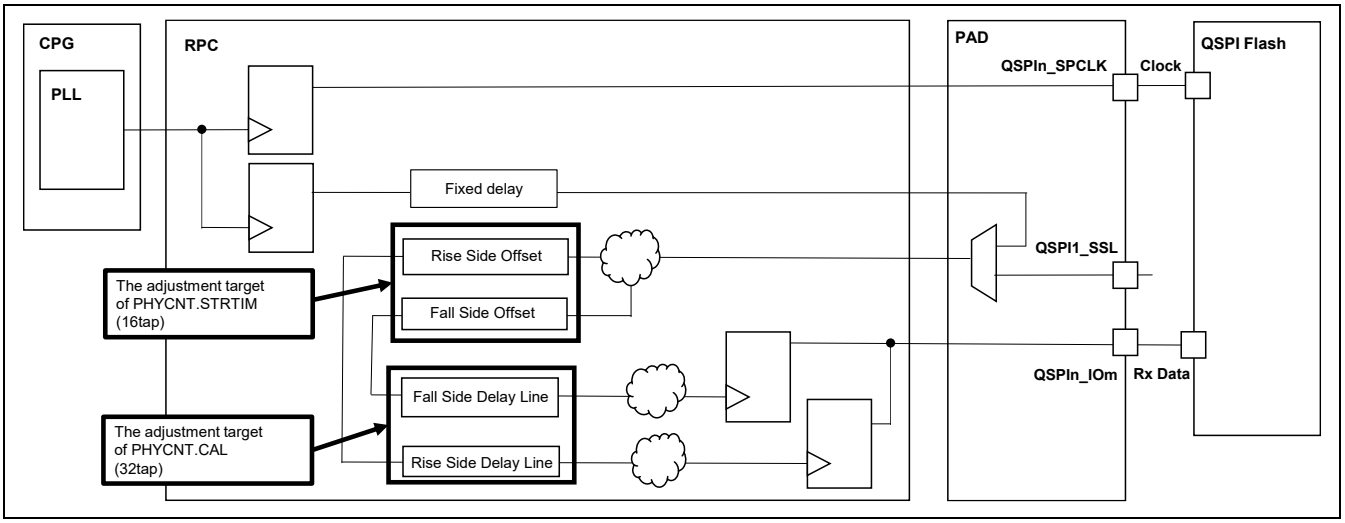

Figure 112.34 The circuit of data receiving

112.3.20 PHY register interface

This register interface is for check the result of hardware calibration.

(1) Register Configuration

Table 112.16 shows a list of the PHY register interface. For the details of PHY interface registers, refer to Section 112.1.4 and Section 112.2.

Table 112.16 List of PHY register interface

Register Name	Abbreviation	R/W
PHY Address Register	PHYADD	R/W
PHY Write Data Register	PHYWR	R/W
PHY Read Data Register	PHYRD	R/W

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

Table 112.17 shows the register configuration of PHY. The registers in Table 112.17 can be accessed only by register in Table 112.16.

Table 112.17 Register Configuration of PHY

Register Name	Abbreviation	R/W	Address of PHYADD.ADD	Initial value	Access Size	R-Car Series Products: R-Car V4M
Mode register	MD	R/W	H'00	H'0000 0000	32	√
Rise edge Delay line tap monitor	RDLMON	R	H'26	undefined	32	√
Fall edge Delay line tap monitor	FDLMON	R	H'28	undefined	32	√

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

(2) Register Description

The registers of the RPC-PHY are assigned to and located in the address space of the internal bus.

[Legend for Register Descriptions]

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be initial value.

W: Write-only.

(a) Mode register (MD)

MD is a 32bit register that specifies the mode of registers in PHY.

This register is used to enable to access other registers in Table 112.17 .

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 0	-	All 0	R	Reserved. The write value should always be set to initial value.

(b) Rise edge Delay line tap monitor (RDLMON)

RDLMON is a 32bit register to monitor rise edge delay line tap.

This register is used to check hardware calibration result of DelayLine.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(c) Fall edge Delay line tap monitor (FDLMON)

FDLMON is a 32bit register to monitor fall edge delay line tap .

This register is used to check hardware calibration result of DelayLine.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(3) The way of access to PHY internal register

For both of write and read sequence, it is mandatory to set MD.PHYREGEN register to H'A539

(a) Write sequence

Execute write sequence according to the following procedure

1. Specify write data in PHYWR
2. Specify the PHY register address in PHYADD.ADD, PHYADD.RW=0 (write) and PHYADD.ACCEN=1 to start write sequence.

(b) Read sequence

Execute read sequence according to the following procedure

1. Specify the PHY register address in PHYADD.ADD, PHYADD.RW=1 (read) and PHYADD.ACCEN=1 to start read sequence.
2. Dummy Read to PHYRD to make time to finish reading from PHY internal register.
3. Read PHYRD register to get the read value

112.4 Usage Notes

112.4.1 Transfer to Read Data while the Signal on the QSPIn_SSL Pin is Negated

Set the SMENR.SPIDE[3:0] bits to B'1100 or B'1111 when transfer only for reading data is to proceed.

Transfer will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is B'1000.

112.4.2 Transfer to Read Data while the Signal on the QSPIn_SSL Pin is Asserted

When transfer only for reading data is to proceed, set the SMENR.SPIDE[3:0] bits to B'1100 or B'1111, or end the immediately preceding transfer with reading data.

When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is B'1000.

112.4.3 Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode

Be sure to set the SPIWE bit in the SMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the QSPIn_SSL pin is being asserted in manual mode.

112.4.4 RPC_RESET# operation

There are two ways to operate RPC_RESET# pins.

1. Use PHYINT.RSTEN, PHYINT.RSTVAL to operate.
   The RPC_RESET# state depends on PHYINT.RSTVAL value.
2. Activate reset to this module
   During reset period by Power-on-reset or Software Reset, RPC_RESET# pin state is L. After reset is deactivated, RPC_RESET# pin state is H.

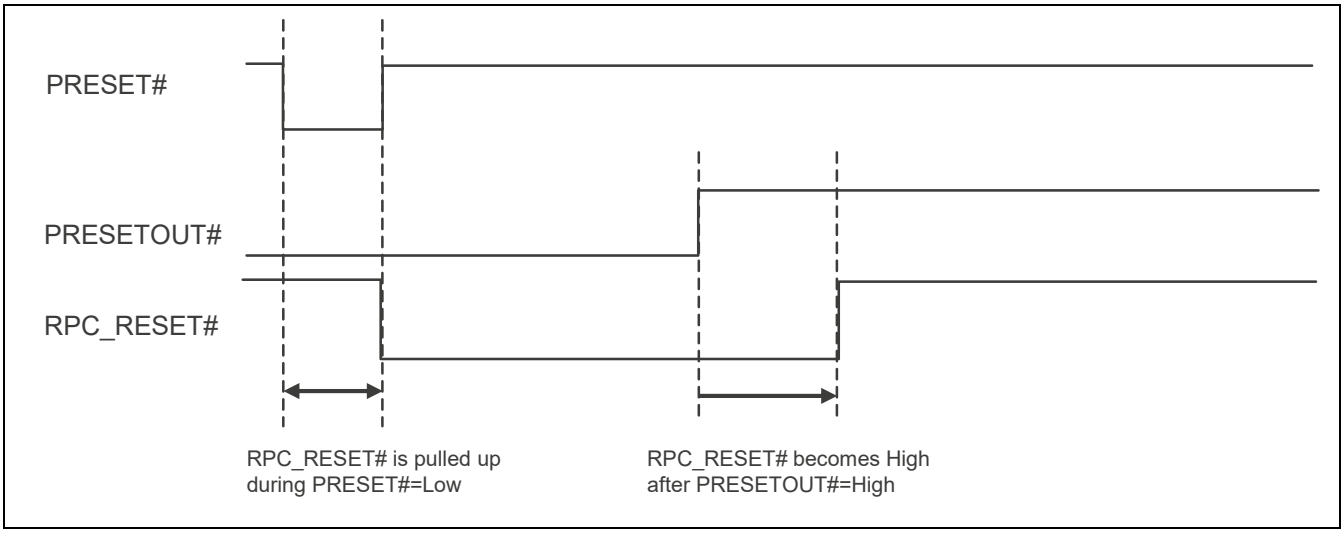

Figure 112.35 Relationship of RPC_RESET# and PRESET# timing

112.4.5 Software Reset after Module Stop operation

Be sure to supply software reset to this module after module stop is deactivated. Note that RPC_RESET# pin state is L while software reset is activated. Guarantee the reset period and accessible period after reset which are required in the connected devices.

112.4.6 DMA transfer

In read operation by DMA transfer, external address space read mode is available. The read address (source address in DMAC) is the memory area (H'08000000 – H'0BFFFFFF) by Auto-Request mode. In High Speed response mode (PHYCNT.HS = 1), the transfer size should be same as the cache size which is specified in DRCR.RBURST. Accessing to register area during DMA transfer is prohibited during High Speed response mode.
In write operation, refer to 112.3.13.

112.4.7 Frequency change

When the operation frequency changes by setting RPCCKCR in CPG, read after write operation on this register is necessary to guarantee the setting to be applied.
And before changing RPCCKCR setting, set CMNCR.MOIIOx(x=0,1,2,3) register to B'11 (Hi-Z).

112.4.8 Notes on RPC register area reading after read transfer with PHYCNT.HS=1 and read cache

When PHYCNT.HS=1, even if read access to RPC register area, read cache side address is also checked cache hit or not. And if Read cache is hit by this read access to RPC register area, read result becomes logical OR of register area data and read cache data. So, read data may be broken in this case.

For example, in the case of DRCR.EAV[7:0]=H'00, read cache treats register area address with PHYCNT.HS=1 as (2) and (3) in following Table 112.18.
And, when use PHYCNT.HS=1 setting, DMAC is used for read access to Memory area address. So, if last 256Byte address of DMAC transfer does not match with (4) and (5) in following Table 112.18, it is not applicable for this issue. Because, if that address is not matched, other address is stored in read cache after DMAC transfer.

In the case of last 256Byte address of DMAC transfer is matched, this issue can be avoided by PHYCNT.HS=0 or DRCR.RCF=1 before reading RPC register area.

Table 112.18 Example of Address relationship with DRCR.EAV[7:0]=H'00

No.	Explanation of related address	Address
(1)	Register Area address	0xEE20_0XXX
(2)	Read cache address with DRCR.EAC=B'000 at Register Area address	0x0020_0XXX
(3)	Read cache address with DRCR.EAC=B'001 at Register Area address	0x0220_0XXX
(4)	Memory area address to store 0x0020_0XXX address in Read cache	0x0820_0XXX
(5)	Memory area address to store 0x0220_0XXX address in Read cache	0x0A20_0XXX

112.5 Safety Mechanisms

This module has no Mechanism of FuSa.

132. AES Accelerator (AES-ACC)

132.1 Overview

This module is to accelerate AES operation.

- AES Accelerator (AES-ACC) consists of access management unit, crypto engines, and seed generators. AES-ACC supports functions for confidentiality, integrity, and authentication. AES-ACC working with dedicated software provided by Renesas.
- This module is controlled by WCRC module, accessible both Cortex-R52 and Cortex-A76.
  The reference of WCRC is chapter 135 CRC.

132.1.1 Features

- 8 modules working independently.
- 2 modules of AES-ACC are connected to 1 WCRC, and they can operate independently at the same time.
- AES-ACC is connected to RT-DMAC through WCRC module, not directly.
- Operating clock is S0D2_RTφ.
- AES length 128 and 256 bits are supported.
- The supported chaining mode for AES are ECB, CBC, CTR, XTS, CMAC, GMAC, CCM and GCM.
- The hash engine supports GHASH.
- Key management function protects encryption keys from being exposed on memory or falsified by other functions.
- Self-test function.

132.1.2 Address Region of Each Channel

Table 132.1 Address region of each channel

Domain name	Address region
CH0	H'E780 0000 – H'E780 0FFF
CH1	H'E780 1000 – H'E780 1FFF
CH2	H'E780 2000 – H'E780 2FFF
CH3	H'E780 3000 – H'E780 3FFF
CH4	H'E780 4000 – H'E780 4FFF
CH5	H'E780 5000 – H'E780 5FFF
CH6	H'E780 6000 – H'E780 6FFF
CH7	H'E780 7000 – H'E780 7FFF

132.2 Register Description

No description on this section.

132.3 Operation

No description on this section.

132.4 Usage Notes

To use AES-ACC function, Module Stop for both AES-ACC Wrapper and each AES-ACC Channel shall be cleared.

Refer to chapter "9. Module Standby, Software Reset" for this setting.

132.5 Safety Mechanisms

No description on this section.

133. Life Cycle

133.1 Overview

Life Cycle (LifeC) has setting registers for data scramble/de-scramble at DBSC5. Host CPU can access to these registers via APB I/F.

133.1.1 Features

The data scramble/de-scramble setting register value are directly provided to DBSC5.

133.1.2 Register Configuration

Table 133-1 shows the LifeC register configurations. Accessing to the address not defined below is prohibited.

Table 133-1 Register Configurations

Name	Abbreviation	R/W	Address	Size
SDRAM write/read data scramble/de-scramble function control	DBSCRM	R/W	H'E611 0238	32

133.2 Register Description

All registers are 32bit and access size are 32-bit.

Explanation of abbreviation of register

Initial value: Value of the register after power-on reset

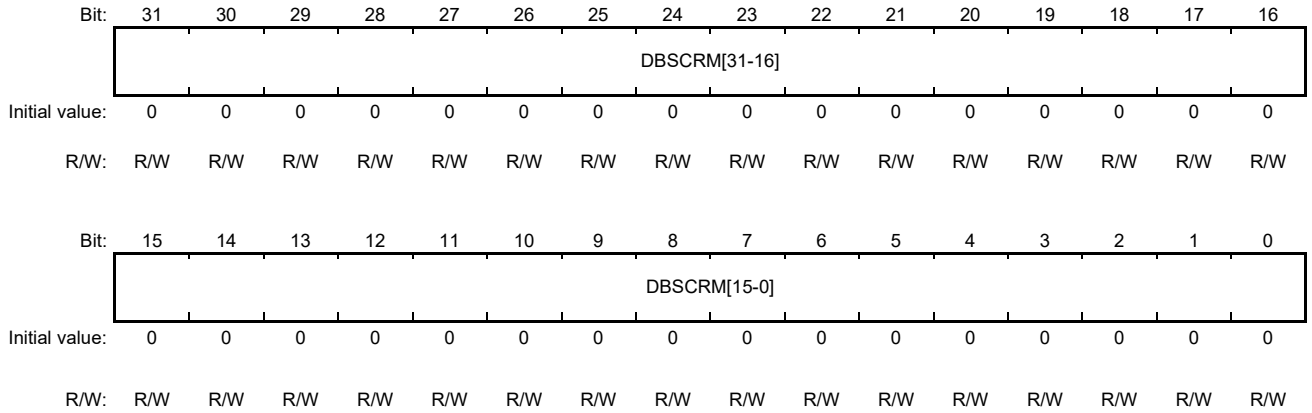
- : Undefined value

R/W : The bit or field is readable and writable.

R : The bit or field is readable only. When writing to the register, write 0 to it.

133.2.1 DBSCRM

DBSCRM controls SDRAM write/read data scramble/de-scramble function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DBSCRM[31-0]	0	R/W	All 0: Disable scramble/descramble function. Other: Use DBSCRM value as scramble/descramble seed.

133.3 Operation

No description on this section.

133.4 Usage Notes

133.4.1 DBSCRM Setting

Setting to DBSCRM should be performed before DRAM access.

Dummy read to DBSCRM are necessary for wait time.

Resetting DBSCRM after DRAM access is prohibited because the data value written before resetting cannot be read correctly.

133.5 Safety Mechanisms

No description on this section.

134. ICUMX

134.1 Overview

The Intelligent Cryptographic Unit/Master Extension (ICUMX) is a hardware security module (HSM).

The features of the ICUMX are described below.

134.1.1 Features

- The ICUMX integrates an Intelligent Cryptographic Unit Processor (ICUP) that controls the ICUMX sub-system and runs the user-defined security services.
- The ICUMX includes an accelerator that supports a block cipher algorithm based on the AES (Advanced Encryption Standard, FIPS PUB 197). ICUMX supports DMA transfer for AES block data.
- The ICUMX integrates several public key cryptographic algorithms like RSA, ECC.
- The ICUMX integrates an accelerator that supports HASH function based on SHA-1, SHA-224, and SHA-256(Secure Hash Algorithm, FIPS-PUB 180) and SHA-3 (Secure Hash Algorithm, FIPS PUB 202).
- The ICUMX integrates a true random number generator.
- The ICUMX can be used as a slave peripheral to run security services upon request. The ICUMX handles processing of other user-defined security services (for example, checking contents of memory for completeness and integrity) and operates as a master handling procedures to strengthen measures for security.
- The ICUMX has exclusive read access and programming access to a specific area of memory which holds confidential data (keys and certificates) and highly confidential code for operating security services.
- The ICUMX zeroizes key materials in FA mode.

134.2 Register Description

No description on this section.

134.3 Operation

No description on this section.

134.4 Usage Notes

No description on this section.

134.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

134.5.1 ECC for ICUMXB

134.5.1.1 Overview

ECC protection is applied to dedicated SRAM in ICUMX core (ICUMXB). Local RAM, Instruction cache TAG RAM, Instruction cache DATA RAM, PKCC RAM and SDMAC DATA RAM are protected by ECC.

134.5.1.2 Related Registers

For details, refer to section 14, ECC Error Detection and Correction of AXI and AXIAB, in ICUMXB User's Manual: Hardware.

134.5.1.3 Hardware Description

Each RAM in ICUMXB is protected by SEC-DED error correction code (ECC) checking. When an error is detected, an interrupt is issued to ICUMX_INTC1 and an error notification is issued to error status register of ICUMXB. For details, refer to section 14, ECC Error Detection and Correction of AXI and AXIAB, in ICUMXB User's Manual: Hardware.

134.5.2 Hardware Redundancy for ICUMX

134.5.2.1 Overview

The dual core lock step (DCLS) architecture is applied to ICUMX_AESD0 and ICUMX_DMACA0.

134.5.2.2 Related Registers

Table 134.1 shows related registers for DCLS.

Table 134.1 Related Registers for DCLS

Register Name	Abbreviation	R-Car V4M
Error injection lock control register	ICUMX_ERRLOCKCTL	√
Clock monitor and DCLSERRCTL authority control setting register	ICUMX_CKMDCLSECA	√
ICUMX_FUSA Error Status Register	ICUMX_FUSAERRST	√
ICUMX_FUSA Error Status Clear Register	ICUMX_FUSAERRSC	√

For details, refer to section 11, ICUMXB Command Register (ICUMX_CMDREG), in ICUMXB User's Manual: Hardware.

134.5.2.3 Hardware Description

When the DCLS error is detected, ICUMX_AESD0 or ICUMX_DMACA0 issues an error notification and an interrupt. An error notification is issued to ECM and an interrupt is issued to ICUMX_INTC1.

135. CRC

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents. However, this module can be also treated as non-safety-related function.

135.1 CRC_Wrapper (WCRC)

135.1.1 Overview

This module supports the transfer of large capacity data at high speed.

(1) Features

This module has an AXI slave interface. (128bit data bus 400MHz clock(S0D2_RTφ))
This module has 2 sets of interfaces for transferring to AES-ACC module.
This module contains one CRC and one KCRC module. (400MHz clock(S0D2_RTφ), Processing performance: 4 bytes / cycle)
Store the data captured from the AXI bus in FIFO, deliver it to CRC, KCRC or AES-ACC module and operate on each module.
The operated data is stored in FIFO and read via the AXI bus.
This module supports function of comparing generated CRC data with expected data that is written in FIFO.
This module supports function of read back (Data through mode) that can read the data captured into FIFO via AXI bus.

Number of Units and Channels

Number of Units	4
Name	WCRCm (m = 0 to 3)

Connection between WCRC channels and AES-ACC channels

WCRC channel	Connected AES-ACC channel
WCRC0	AES-ACC_0 AES-ACC_1
WCRC1	AES-ACC_2 AES-ACC_3
WCRC2	AES-ACC_4 AES-ACC_5
WCRC3	AES-ACC_6 AES-ACC_7

(2) Block Diagram

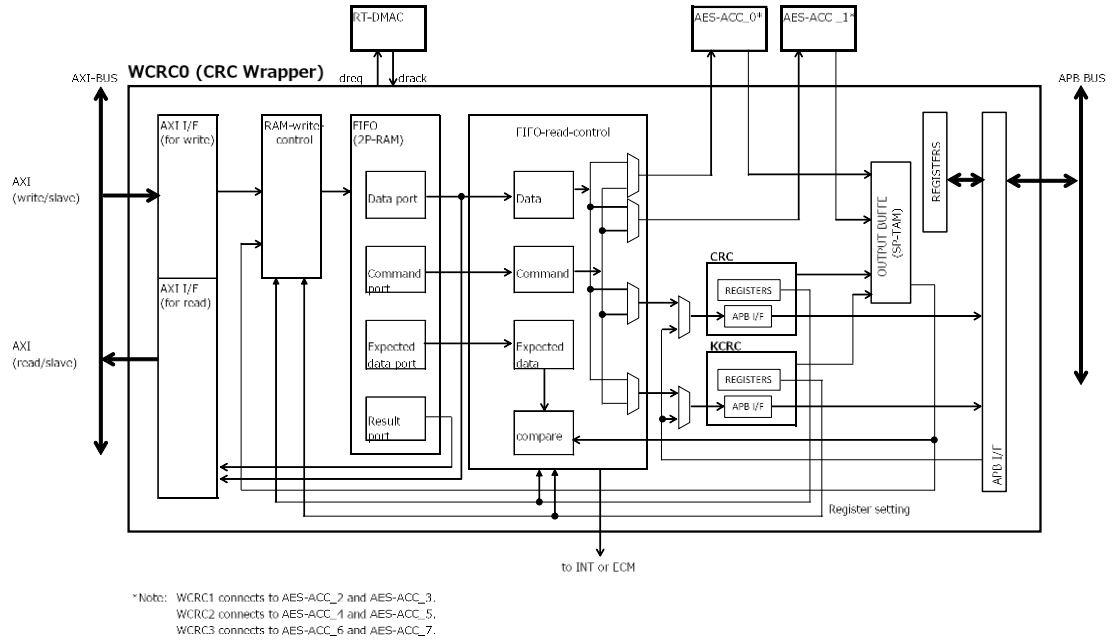


Figure 135.1 CRC Wrapper Block Diagram

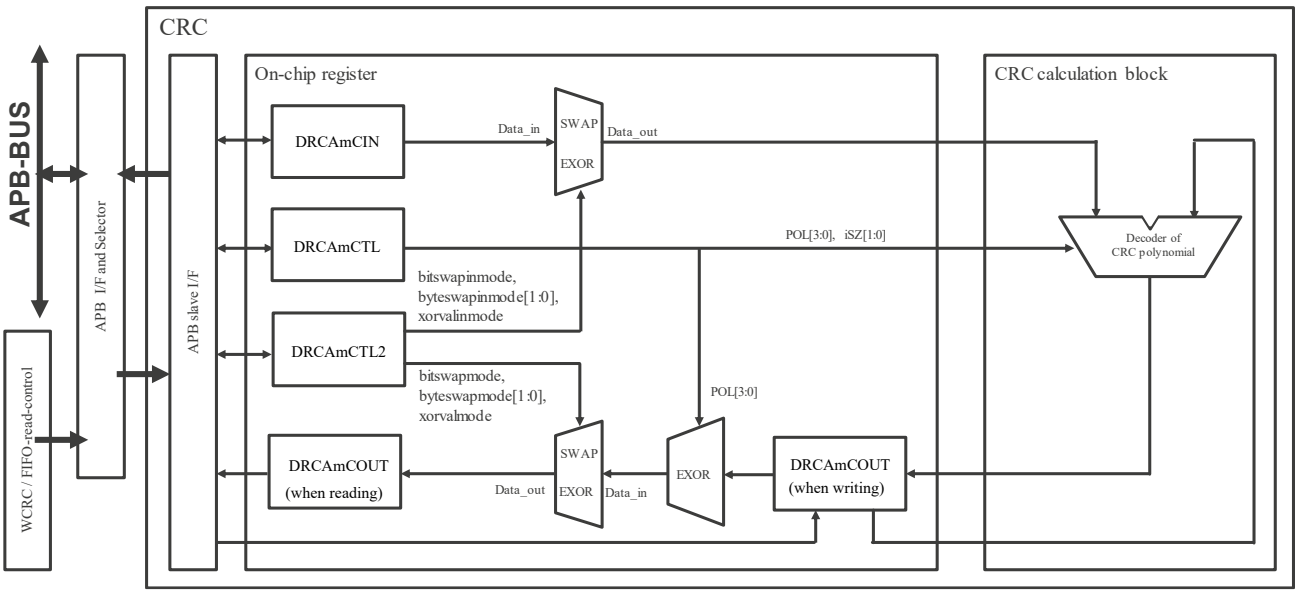

Figure 135.2 CRC Wrapper Block Diagram (CRC module part)

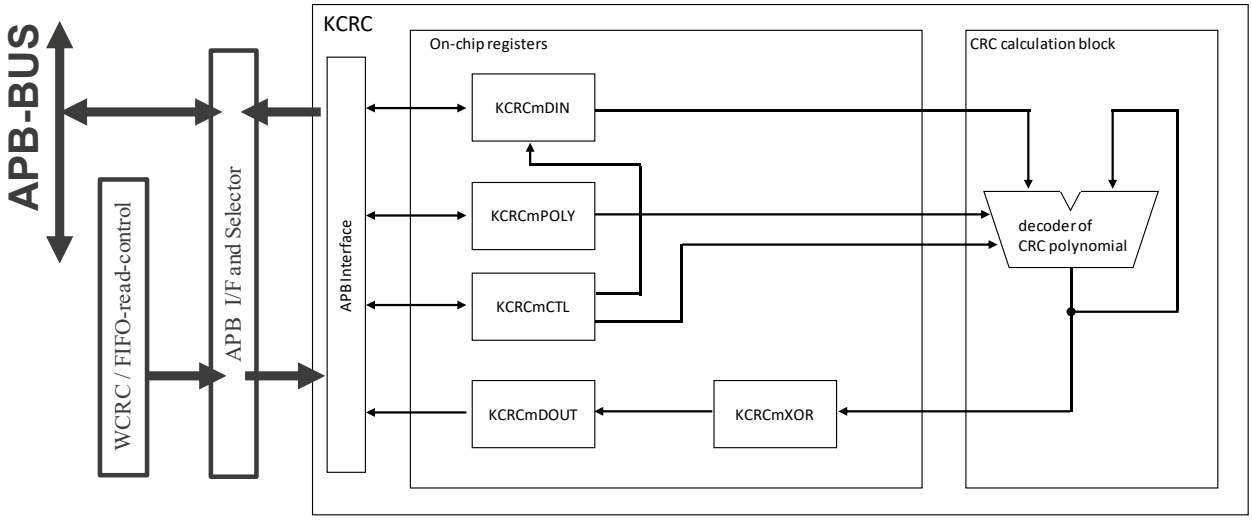

Figure 135.3 CRC Wrapper Block Diagram (KCRC module part)

(3) Register Configurations

The base address for each channel of registers of the CRC Wrapper is as follows:

Table 135.1 offset address Configurations

Module Name	Offset Base Address
WCRC0	H'E708 0000
WCRC1	H'E709 0000
WCRC2	H'E70A 0000
WCRC3	H'E70B 0000

Each channel of the CRC Wrapper has the registers below.

Table 135.2 shows the CRC Wrapper register configurations and register value in each state.

Table 135.2 Register Configurations

Register Name	Abbreviation	R/W	Offset from Base Address	Initial Value (Power On Reset by PRESET# Pin)	Initial Value (Software Reset)	Access Size
WCRCm CAIPn transfer enable register	WCRCm_CAIPn_EN	R/W	H'0000	H'0000 0000	H'0000 0000	32

Note: Access to the addresses other than those listed above is prohibited. Otherwise, operation cannot be guaranteed. If read, an undefined value is read.

135.1.2 Register Descriptions

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

(1) WCRCm CAIPn transfer enable register (WCRCm_CAIPn_EN)

WCRCm_CAIPn_EN is a register that sets enable the data transfer to/from each port for AES-ACC_n interface in FIFO.
Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	out_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	res_en	—	—	—	—	—	—	trans_en	in_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	out_en	0	R/W	Output data from Data port in FIFO enable 0: Disable output from Data port 1: Enable output from Data port
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	res_en	0	R/W	Output result data from Result port in FIFO enable 0: Disable output from Result port 1: Enable output from Result port
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	trans_en	0	R/W	Transferring data from Data port in FIFO to AES-ACC_n enable 0: Disable transferring data to AES-ACC_n 1: Enable transferring data to AES-ACC_n When transfer to AES-ACC_n isn't performed, this bit should be 0.
0	in_en	0	R/W	Input data to Data/Command port in FIFO enable 0: Disable input to Data/Command port 1: Enable input to Data/Command port

(2) WCRCm CAIPn transfer stop register (WCRCm_CAIPn_STOP)

WCRCm_CAIPn_STOP is a register that stop transfer to AES-ACC_n interface.

Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	stop
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	stop	0	—/W	1: Stop data transfer. Writing 0 to this bit is ignored.

(3) WCRCm CAIPn transfer command enable register (WCRCm_CAIPn_CMDEN)

WCRCm_CAIPn_CMDEN is a register that sets enable command function for AES-ACC_n module.
For detail of command function, please refer section 135.1.3(6).
Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmd_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	cmd_en	0	R/W	Command function enable 0: Disable command function 1: Enable command function

(4) WCRCm CAIPn wait register (WCRCm_CAIPn_WAIT)

WCRCm_CAIPn_WAIT is a register that wait subsequent command for AES-ACC_n interface.

Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	wait
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	wait	0	—/W	1: Wait subsequent command for 128 cycles @ S0D2_RTφ. This bit should be accessed by command function via command port for AES-ACC_n in FIFO. Otherwise, operation cannot be guaranteed. Writing 0 to this bit is ignored.

(5) WCRCm CAIPn status register (WCRCm_CAIPn_STS)

WCRCm_CAIPn_STS is a register that indicates the state of operation related to AES-ACC_n module.
Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done	—	—	—	—	—	—	cmd_done	—	—	—	res_done	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/WC1	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	trans_done
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done	0	R/WC1	Indicates the state of stop operation by WCRCm_CAIPn_STOP register. 0: Stop operation in progress or not done. 1: Stop operation is done
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
24	cmd_done	0	R/WC1	Indicates the state of command function. 0: Accessing to register by command in progress or not accessing 1: Accessing to register by command is done
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
20	res_done	0	R/WC1	Indicates the state of result data transfer. 0: Transfer in progress or not transferring 1: Transfer is done
19 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
0	trans_done	0	R/WC1	Indicates the state of input data transfer. 0: Transfer in progress or not transferring 1: Transfer is done

(6) WCRCm CAIPn interrupt enable register (WCRCm_CAIPn_INTEN)

WCRCm_CAIPn_INTEN is a register that sets enable for the interrupt of operation related to AES-ACC_n module.
Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done_ie	—	—	—	—	—	—	cmd_done_ie	—	—	—	res_done_ie	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R

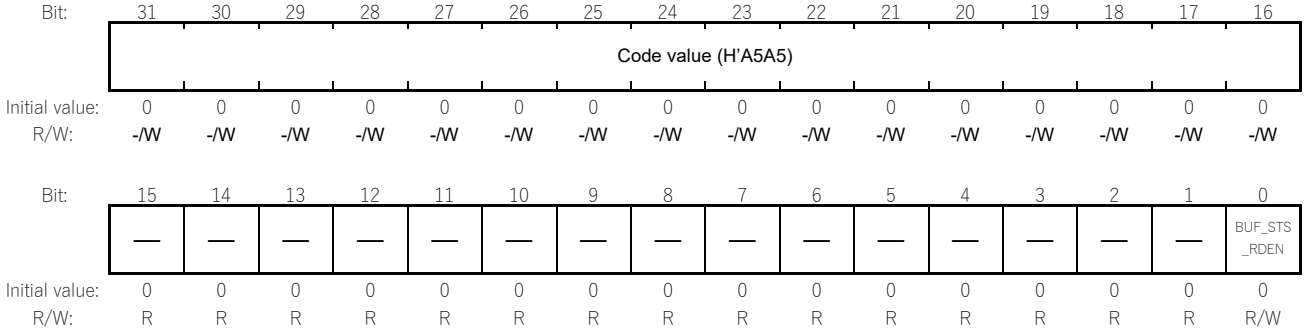
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	trans_done_ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done_ie	0	R/W	Interrupt for the complete of stop operation by WCRCm_CAIPn_STOP register. 0: Disable interrupt 1: Enable interrupt
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	cmd_done_ie	0	R/W	Interrupt for the complete of command function enable. 0: Disable interrupt 1: Enable interrupt
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
20	res_done_ie	0	R/W	Interrupt for the complete of result data transfer enable. 0: Disable interrupt 1: Enable interrupt
19 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	trans_done_ie	0	R/W	Interrupt for the complete of input data transfer enable. 0: Disable interrupt 1: Enable interrupt

(7) WCRCm CAIPn Buffer state read enable register (WCRCm_CAIPn_BUF_STS_RDEN)

WCRCm_CAIPn_BUF_STS_RDEN is a register that sets enable for the interrupt of operation related to AES-ACC_n module.

Note: (m,n) = (0,0), (1,2), (2,4), (3,6)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	All 0	-/W	Code value (H'A5A5) Set "Code value" to these bits when writing to this register to enable writing to this register. When read, return 0.
15 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	BUF_STS_RDEN	0	R/W	WCRCm_CAIPn_BUF_STS enable. 0: Disable WCRCm_CAIPn_BUF_STS 1: Enable WCRCm_CAIPn_BUF_STS

(8) WCRCm CAIPn Buffer state read register (WCRCm_CAIPn_BUF_STS)

WCRCm_CAIPn_BUF_STS is a register that sets enable for the interrupt of operation related to AES-ACC_n module.
Note: (m,n) = (0,0), (1,2), (2,4), (3,6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	buf_empty	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
17	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
16	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
15 to 13	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
11 to 10	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
8	buf_empty	0	R	Buffer empty flag. 0: Buffer is not empty 1: Buffer is empty
7 to 6	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(9) WCRCm CAIPp transfer enable register (WCRCm_CAIPp_EN)

WCRCm_CAIPp_EN is a register that sets enable the data transfer to/from each ports for AES-ACC_p interface in FIFO.

Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	out_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	res_en	—	—	—	—	—	—	trans_en	in_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	out_en	0	R/W	Output data from Data port in FIFO enable 0: Disable output from Data port 1: Enable output from Data port
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	res_en	0	R/W	Output result data from Result port in FIFO enable 0: Disable output from Result port 1: Enable output from Result port
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	trans_en	0	R/W	Transferring data from Data port in FIFO to AES-ACC_p enable 0: Disable transferring data to AES-ACC_p 1: Enable transferring data to AES-ACC_p When transfer to AES-ACC_p isn't performed, this bit should be 0.
0	in_en	0	R/W	Input data to Data/Command port in FIFO enable 0: Disable input to Data/Command port 1: Enable input to Data/Command port

(10) WCRCm CAIPp transfer stop register (WCRCm_CAIPp_STOP)

WCRCm_CAIPp_STOP is a register that stop transfer to AES-ACC_p interface.

Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	stop
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	stop	0	—/W	1: Stop data transfer. Writing 0 to this bit is ignored.

(11) WCRCm CAIPp transfer command enable register (WCRCm_CAIPp_CMDEN)

WCRCm_CAIPp_CMDEN is a register that sets enable command function for AES-ACC_p module.
For detail of command function, please refer section 135.1.3(6).
Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmd_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	cmd_en	0	R/W	Command function enable 0: Disable command function 1: Enable command function

(12) WCRCm CAIPp wait register (WCRCm_CAIPp_WAIT)

WCRCm_CAIPp_WAIT is a register that wait subsequent command for AES-ACC_p interface.

Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	wait
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	wait	0	—/W	1: Wait subsequent command for 128 cycles @ S0D2_RTφ. This bit should be accessed by command function via command port for AES-ACC_p in FIFO. Otherwise, operation cannot be guaranteed. Writing 0 to this bit is ignored.

(13) WCRCm CAIPp status register (WCRCm_CAIPp_STS)

WCRCm_CAIPp_STS is a register that indicates the state of operation related to AES-ACC_p module.
Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done	—	—	—	—	—	—	cmd_done	—	—	—	res_done	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/WC1	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	trans_done
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done	0	R/WC1	Indicates the state of stop operation by WCRCm_CAIPp_STOP register. 0: Stop operation in progress or not done. 1: Stop operation is done
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
24	cmd_done	0	R/WC1	Indicates the state of command function. 0: Accessing to register by command in progress or not accessing 1: Accessing to register by command is done
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
20	res_done	0	R/WC1	Indicates the state of result data transfer. 0: Transfer in progress or not transferring 1: Transfer is done
19 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
0	trans_done	0	R/WC1	Indicates the state of input data transfer. 0: Transfer in progress or not transferring 1: Transfer is done

(14) WCRCm CAIPp interrupt enable register (WCRCm_CAIPp_INTEN)

WCRCm_CAIPp_INTEN is a register that sets enable for the interrupt of operation related to AES-ACC_p module.
Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done_ie	—	—	—	—	—	—	cmd_done_ie	—	—	—	res_done_ie	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R

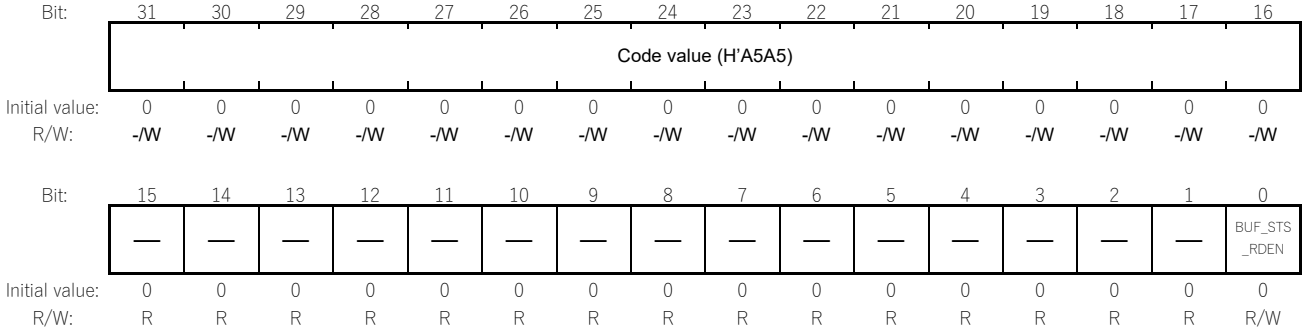
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	trans_done_ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done_ie	0	R/W	Interrupt for the complete of stop operation by WCRCm_CAIPp_STOP register. 0: Disable interrupt 1: Enable interrupt
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	cmd_done_ie	0	R/W	Interrupt for the complete of command function enable. 0: Disable interrupt 1: Enable interrupt
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
20	res_done_ie	0	R/W	Interrupt for the complete of result data transfer enable. 0: Disable interrupt 1: Enable interrupt
19 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	trans_done_ie	0	R/W	Interrupt for the complete of input data transfer enable. 0: Disable interrupt 1: Enable interrupt

(15) WCRCm CAIPp Buffer state read enable register (WCRCm_CAIPp_BUF_STS_RDEN)

WCRCm_CAIPp_BUF_STS_RDEN is a register that sets enable for the interrupt of operation related to AES-ACC_p module.

Note: (m,p) = (0,1), (1,3), (2,5), (3,7)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	All 0	-/W	Code value (H'A5A5) Set "Code value" to these bits when writing to this register to enable writing to this register. When read, return 0.
15 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	BUF_STS_RDEN	0	R/W	WCRCm_CAIPp_BUF_STS enable. 0: Disable WCRCm_CAIPp_BUF_STS 1: Enable WCRCm_CAIPp_BUF_STS

(16) WCRCm CAIPp Buffer state read register (WCRCm_CAIPp_BUF_STS)

WCRCm_CAIPp_BUF_STS is a register that sets enable for the interrupt of operation related to AES-ACC_p module.
Note: (m,p) = (0,1), (1,3), (2,5), (3,7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	buf_empty	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
17	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
16	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
15 to 13	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
11 to 10	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
8	buf_empty	0	R	Buffer empty flag. 0: Buffer is not empty 1: Buffer is empty
7 to 6	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(17) WCRCm CRCm transfer enable register (WCRCm_CRCm_EN)

WCRCm_CRCm_EN is a register that sets enable the data transfer to/from each port for CRCm module in FIFO.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	out_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	res_en	—	—	—	—	—	—	trans_en	in_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	out_en	0	R/W	Output data from Data port in FIFO enable 0: Disable output from Data port 1: Enable output from Data port
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	res_en	0	R/W	Output result data from Result port in FIFO enable 0: Disable output from Result port 1: Enable output from Result port
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	trans_en	0	R/W	Transferring data from Data port in FIFO to CRCm enable 0: Disable transferring data to CRCm 1: Enable transferring data to CRCm When transfer to CRCm isn't performed, this bit should be 0.
0	in_en	0	R/W	Input data to Data/Command/Expected data port in FIFO enable 0: Disable input to Data/Command/Expected data port 1: Enable input to Data/Command/Expected data port

(18) WCRCm CRCm transfer stop register (WCRCm_CRCm_STOP)

WCRCm_CRCm_STOP is a register that stop transfer to CRCm module.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	stop
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	stop	0	—/W	1: Stop data transfer. Writing 0 to this bit is ignored.

(19) WCRCm CRCm transfer command enable register (WCRCm_CRCm_CMDEN)

WCRCm_CRCm_CMDEN is a register that sets enable command function for CRCm module.
For detail of command function, please refer section 135.1.3(6).
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmd_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	cmd_en	0	R/W	Command function enable 0: Disable command function 1: Enable command function

(20) WCRCm CRCm compare setting register (WCRCm_CRCm_COMP)

WCRCm_CRCm_COMP is a register that sets enable comparing CRC result from CRCm module with expected data in FIFO.
For detail of comparing CRC result function, please refer section 135.1.3(7).
Note: m = 0, 1, 2, 3

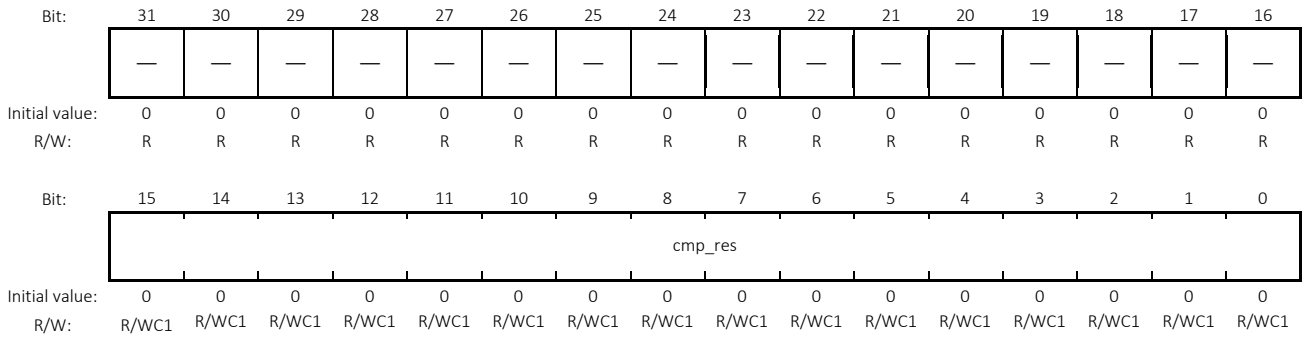
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmp_freq [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	exp_reqsel	cmp_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
17 to 16	cmp_freq	00	R/W	Set the frequency of comparing. 00：Compare every 16Byte CRC generated 01：Compare every 32Byte CRC generated 10：Setting prohibited 11：Compare every 64Byte CRC generated
15 to 2	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
1	exp_reqsel	0	R/W	Select DMA Transfer request source for transferring expected data. 0: dmareq_wcrc***m***_crc***m***_in 1: dmareq_wcrc***m***_crc***m***_res ***m***: 0 to 3
0	cmp_en	0	R/W	Comparing CRC result with expected data enable 0: Disable comparing function 1: Enable comparing function

(21) WCRCm CRCm compare result register (WCRCm_CRCm_COMP_RES)

WCRCm_CRCm_COMP_RES is a register that indicates the result of comparing CRC for CRCm module.
Note: m = 0, 1, 2, 3

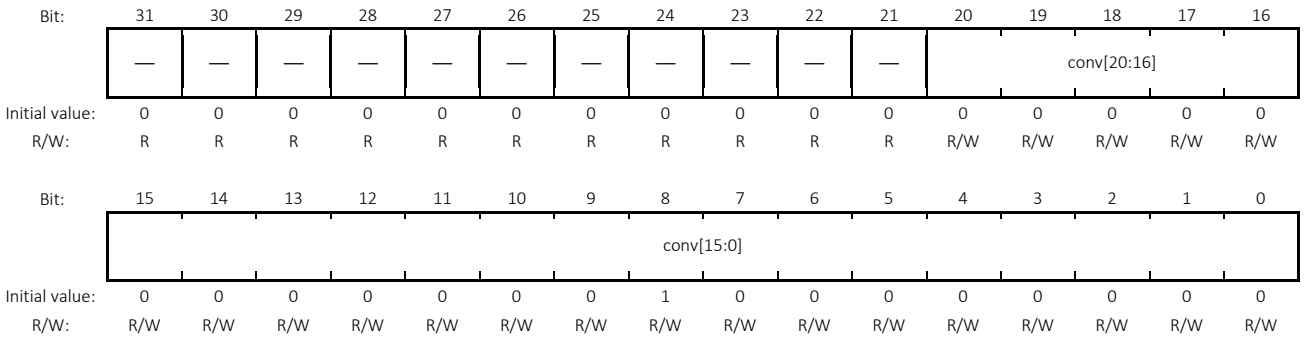


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15 to 0	cmp_res	H'0000	R/WC1	The result of comparing CRC These bits indicate mismatched point of comparing data in 4-byte units. 0: No error 1: Mismatch Figure 135.4 shows correspondence between comparing data and these bits.

(22) WCRCm CRCm conversion setting register (WCRCm_CRCm_CONV)

WCRCm_CRCm_CONV is a register that sets CRC conversion size to once for CRCm module.

Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 0	conv	H'00 0100	R/W	CRC conversion size specification Specifies the CRC conversion size in 1-byte units. Max:H'10 0000

(23) WCRCm CRCm wait register (WCRCm_CRCm_WAIT)

WCRCm_CRCm_WAIT is a register that wait subsequent command for CRCm module.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

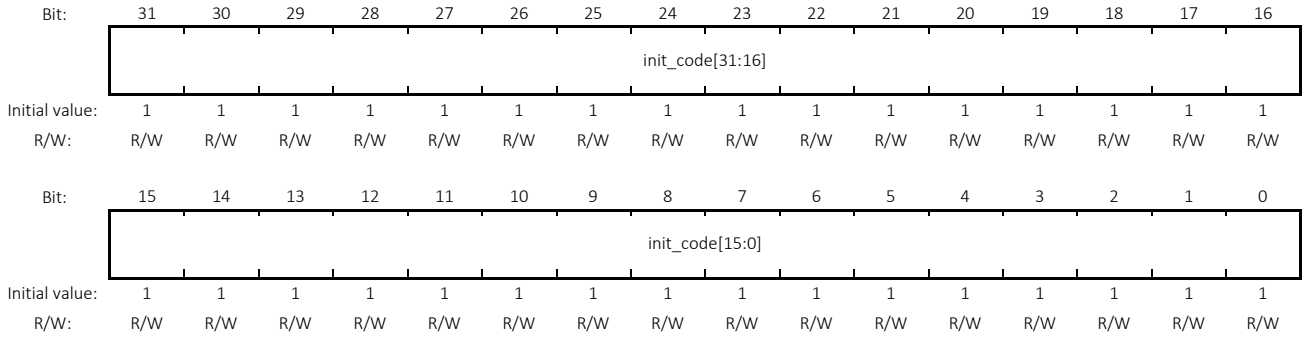
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	wait
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	wait	0	—/W	1: Wait subsequent command for 128 cycles @ S0D2_RTφ. This bit should be accessed by command function via command port for CRCm in FIFO. Otherwise, operation cannot be guaranteed. Writing 0 to this bit is ignored.

(24) WCRCm CRCm initial CRC code register (WCRCm_CRCm_INIT_CRC)

WCRCm_CRCm_INIT_CRC is a register that sets CRC code value to DCRAmCOUT register at auto clear.

Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	init_code	H'FFFF FFFF	R/W	CRC code value to DCRAmCOUT register at auto clear.

(25) WCRCm CRCm status register (WCRCm_CRCm_STS)

WCRCm_CRCm_STS is a register that indicates the state of operation related to CRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done	—	—	—	—	—	—	cmd_done	—	—	—	res_done	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/WC1	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_err	comp_done	—	—	—	—	—	—	—	—	—	—	—	trans_done
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done	0	R/WC1	Indicates the state of stop operation by WCRCm_CRCm_STOP register. 0: Stop operation in progress or not done. 1: Stop operation is done
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
24	cmd_done	0	R/WC1	Indicates the state of command function. 0: Accessing to register by command in progress or not accessing 1: Accessing to register by command is done
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
20	res_done	0	R/WC1	Indicates the state of result data transfer. 0: Transfer in progress or not transferring 1: Transfer is done
19 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
13	comp_err	0	R/WC1	Indicates the error of comparing CRC. 0: No comparing error or not comparing 1: Mismatch has occurred
12	comp_done	0	R/WC1	Indicates the state of comparing CRC. 0: Comparison in progress or not comparing 1: Comparing is done
11 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
0	trans_done	0	R/WC1	Indicates the state of input data transfer. 0: Transfer in progress or not transferring 1: Transfer is done

(26) WCRCm CRCm interrupt enable register (WCRCm_CRCm_INTEN)

WCRCm_CRCm_INTEN is a register that sets enable for the interrupt of operation related to CRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done_ie	—	—	—	—	—	—	cmd_done_ie	—	—	—	res_done_ie	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_err_ie	comp_done_ie	—	—	—	—	—	—	—	—	—	—	—	trans_done_ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done_ie	0	R/W	Interrupt for the complete of stop operation by WCRCm_CRCm_STOP register. 0: Disable interrupt 1: Enable interrupt
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	cmd_done_ie	0	R/W	Interrupt for the complete of command function enable. 0: Disable interrupt 1: Enable interrupt
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
20	res_done_ie	0	R/W	Interrupt for the complete of result data transfer enable. 0: Disable interrupt 1: Enable interrupt
19 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
13	comp_err_ie	0	R/W	Interrupt for the error of comparing CRC enable 0: Disable interrupt 1: Enable interrupt
12	comp_done_ie	0	R/W	Interrupt for the complete of comparing CRC enable. 0: Disable interrupt 1: Enable interrupt
11 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	trans_done_ie	0	R/W	Interrupt for the complete of input data transfer enable. 0: Disable interrupt 1: Enable interrupt

(27) WCRCm CRCm ECM output enable register (WCRCm_CRCm_ECMEN)

WCRCm_CRCm_ECMEN is a register that sets enable for error notification to ECM module on operation related to CRCm module.
Note: m = 0, 1, 2, 3

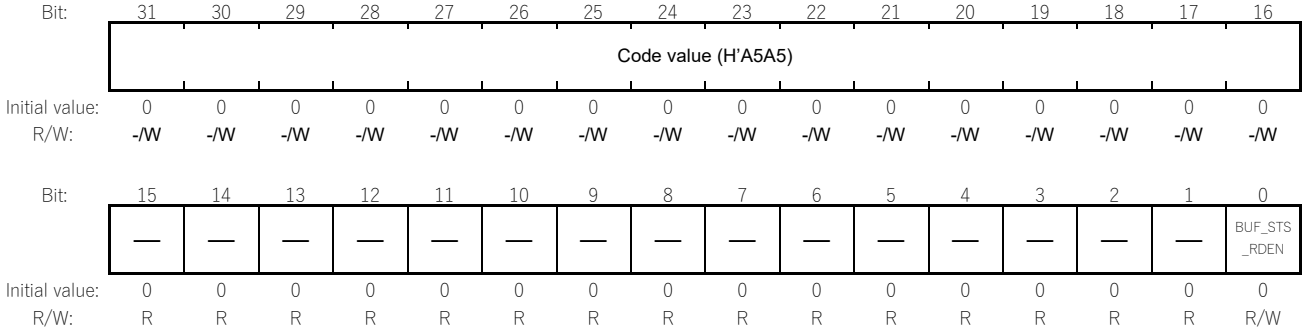
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_ err_oe	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
13	comp_err_oe	0	R/W	Error notification for the error of comparing CRC enable 0: Disable notification 1: Enable notification
12 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(28) WCRCm CRCm Buffer state read enable register (WCRCm_CRCm_BUF_STS_RDEN)

WCRCm_CRCm_BUF_STS_RDEN is a register that sets enable for the interrupt of operation related to CRCm module.
Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	All 0	-/W	Code value (H'A5A5) Set "Code value" to these bits when writing to this register to enable writing to this register. When read, return 0.
15 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	BUF_STS_RDEN	0	R/W	WCRCm_CRCm_BUF_STS enable. 0: Disable WCRCm_CRCm_BUF_STS 1: Enable WCRCm_CRCm_BUF_STS

(29) WCRCm CRCm Buffer state read register (WCRCm_CRCm_BUF_STS)

WCRCm_CRCm_BUF_STS is a register that sets enable for the interrupt of operation related to CRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	res_comp_endflag	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	buf_empty	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
18	res_comp_endflag	0	R	Comparing CRC result end flag. 0: Comparing CRC result is not end 1: Comparing CRC result is end
17	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
16	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
15 to 13	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
11 to 10	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
8	buf_empty	0	R	Buffer empty flag. 0: Buffer is not empty 1: Buffer is empty
7 to 6	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(30) WCRCm KCRCm transfer enable register (WCRCm_KCRCm_EN)

WCRCm_KCRCm_EN is a register that sets enable the data transfer to/from each port for KCRCm module in FIFO.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	out_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	res_en	—	—	—	—	—	—	trans_en	in_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	out_en	0	R/W	Output data from Data port in FIFO enable 0: Disable output from Data port 1: Enable output from Data port
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	res_en	0	R/W	Output result data from Result port in FIFO enable 0: Disable output from Result port 1: Enable output from Result port
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	trans_en	0	R/W	Transferring data from Data port in FIFO to KCRCm enable 0: Disable transferring data to KCRCm 1: Enable transferring data to KCRCm When transfer to KCRCm isn't performed, this bit should be 0.
0	in_en	0	R/W	Input data to Data/Command/Expected data port in FIFO enable 0: Disable input to Data/Command/Expected data port 1: Enable input to Data/Command/Expected data port

(31) WCRCm KCRCm transfer stop register (WCRCm_KCRCm_STOP)

WCRCm_KCRCm_STOP is a register that stop transfer to KCRCm module.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	stop
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	stop	0	—/W	1: Stop data transfer. Writing 0 to this bit is ignored.

(32) WCRCm KCRCm transfer command enable register (WCRCm_KCRCm_CMDEN)

WCRCm_KCRCm_CMDEN is a register that sets enable command function for KCRCm module.
For detail of command function, please refer section 135.1.3(6).
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmd_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	cmd_en	0	R/W	Command function enable 0: Disable command function 1: Enable command function

(33) WCRCm KCRCm compare setting register (WCRCm_KCRCm_COMP)

WCRCm_KCRCm_COMP is a register that sets enable comparing CRC result from KCRCm module with expected data in FIFO.
For detail of comparing CRC result function, please refer section 135.1.3(7).
Note: m = 0, 1, 2, 3

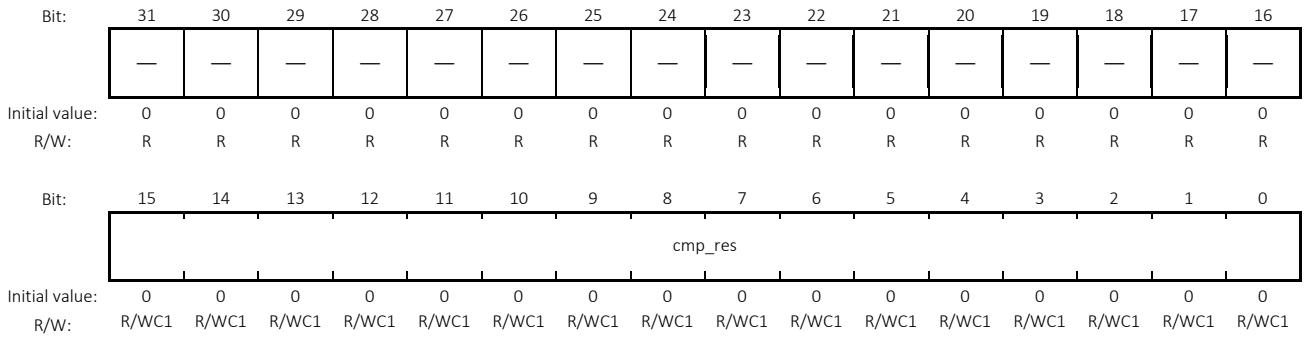
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	cmp_freq [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	exp_reqsel	cmp_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
17 to 16	cmp_freq	00	R/W	Set the frequency of comparing. 00：Compare every 16Byte CRC generated 01：Compare every 32Byte CRC generated 10：Setting prohibited 11：Compare every 64Byte CRC generated
15 to 2	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
1	exp_reqsel	0	R/W	Select DMA Transfer request source for transferring expected data. 0: dmareq_wcrc***m***_kcrc***n***_in 1: dmareq_wcrc***m***_kcrc***n***_res ***m***: 0 to 3, ***n***: 4 to 7
0	cmp_en	0	R/W	Comparing CRC result with expected data enable 0: Disable comparing function 1: Enable comparing function

(34) WCRCm KCRCm compare result register (WCRCm_KCRCm_COMP_RES)

WCRCm_KCRCm_COMP_RES is a register that indicates the result of comparing CRC for KCRCm module.
Note: m = 0, 1, 2, 3

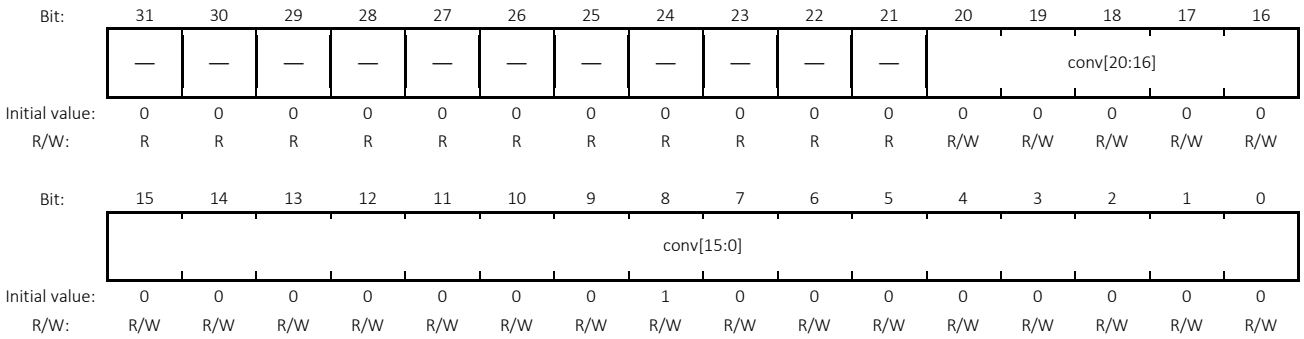


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15 to 0	cmp_res	H'0000	R/WC1	The result of comparing CRC These bits indicate mismatched point of comparing data in 4-byte units. 0: No error 1: Mismatch Figure 135.4 shows correspondence between comparing data and these bits.

(35) WCRCm KCRCm conversion setting register (WCRCm_KCRCm_CONV)

WCRCm_KCRCm_CONV is a register that sets CRC conversion size to once for KCRCm module.

Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 0	conv	H'00 0100	R/W	CRC conversion size specification Specifies the CRC conversion size in 1-byte units. Max:H'10 0000

(36) WCRCm KCRCm wait register (WCRCm_KCRCm_WAIT)

WCRCm_KCRCm_WAIT is a register that wait subsequent command for KCRCm module.

Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

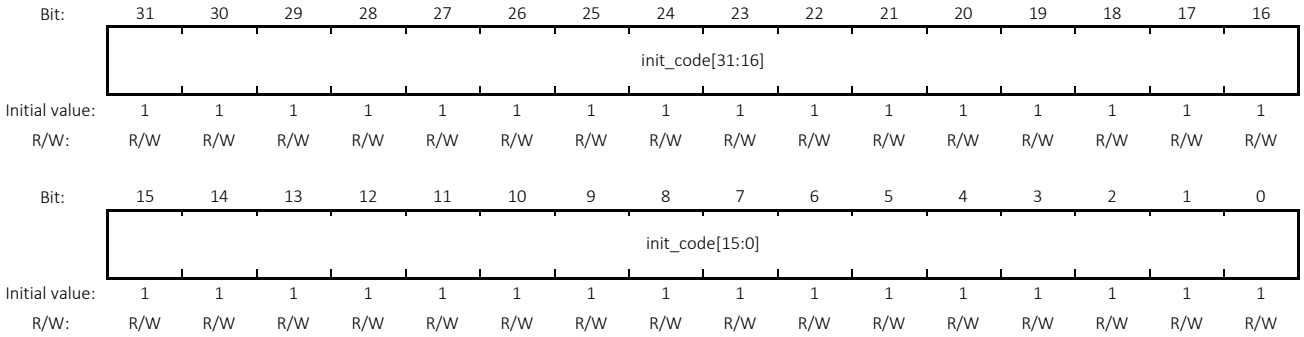
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	wait
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	wait	0	—/W	1: Wait subsequent command for 128 cycles @ S0D2_RTφ. This bit should be accessed by command function via command port for KCRCm in FIFO. Otherwise, operation cannot be guaranteed. Writing 0 to this bit is ignored.

(37) WCRCm KCRCm initial CRC code register (WCRCm_KCRCm_INIT_CRC)

WCRCm_KCRCm_INIT_CRC is a register that sets CRC code value to KCRCmDOUT register at auto clear.

Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	init_code	H'FFFF FFFF	R/W	CRC code value to KCRCmDOUT register at auto clear.

(38) WCRCm KCRCm status register (WCRCm_KCRCm_STS)

WCRCm_KCRCm_STS is a register that indicates the state of operation related to KCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done	—	—	—	—	—	—	cmd_done	—	—	—	res_done	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/WC1	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_err	comp_done	—	—	—	—	—	—	—	—	—	—	—	trans_done
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done	0	R/WC1	Indicates the state of stop operation by WCRCm_KCRCm_STOP register. 0: Stop operation in progress or not done. 1: Stop operation is done
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
24	cmd_done	0	R/WC1	Indicates the state of command function. 0: Accessing to register by command in progress or not accessing 1: Accessing to register by command is done
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
20	res_done	0	R/WC1	Indicates the state of result data transfer. 0: Transfer in progress or not transferring 1: Transfer is done
19 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
13	comp_err	0	R/WC1	Indicates the error of comparing CRC. 0: No comparing error or not comparing 1: Mismatch has occurred
12	comp_done	0	R/WC1	Indicates the state of comparing CRC. 0: Comparison in progress or not comparing 1: Comparing is done
11 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
0	trans_done	0	R/WC1	Indicates the state of input data transfer. 0: Transfer in progress or not transferring 1: Transfer is done

(39) WCRCm KCRCm interrupt enable register (WCRCm_KCRCm_INTEN)

WCRCm_KCRCm_INTEN is a register that sets enable for the interrupt of operation related to KCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	stop_done_ie	—	—	—	—	—	—	cmd_done_ie	—	—	—	res_done_ie	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_err_ie	comp_done_ie	—	—	—	—	—	—	—	—	—	—	—	trans_done_ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	stop_done_ie	0	R/W	Interrupt for the complete of stop operation by WCRCm_KCRCm_STOP register. 0: Disable interrupt 1: Enable interrupt
30 to 25	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	cmd_done_ie	0	R/W	Interrupt for the complete of command function enable. 0: Disable interrupt 1: Enable interrupt
23 to 21	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
20	res_done_ie	0	R/W	Interrupt for the complete of result data transfer enable. 0: Disable interrupt 1: Enable interrupt
19 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
13	comp_err_ie	0	R/W	Interrupt for the error of comparing CRC enable 0: Disable interrupt 1: Enable interrupt
12	comp_done_ie	0	R/W	Interrupt for the complete of comparing CRC enable. 0: Disable interrupt 1: Enable interrupt
11 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	trans_done_ie	0	R/W	Interrupt for the complete of input data transfer enable. 0: Disable interrupt 1: Enable interrupt

(40) WCRCm KCRCm ECM output enable register (WCRCm_KCRCm_ECMEN)

WCRCm_KCRCm_ECMEN is a register that sets enable for error notification to ECM module on operation related to KCRCm module.
Note: m = 0, 1, 2, 3

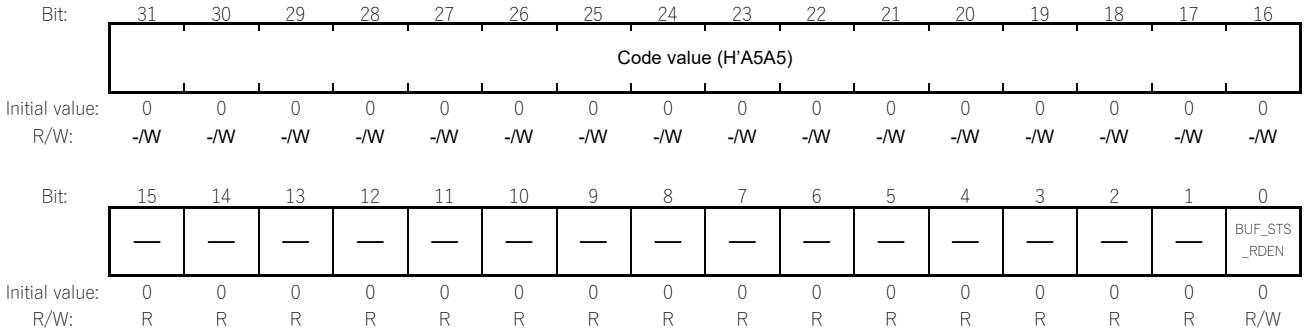
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	comp_ err_oe	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
13	comp_err_oe	0	R/W	Error notification for the error of comparing CRC enable 0: Disable notification 1: Enable notification
12 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(41) WCRCm KCRCm Buffer state read enable register (WCRCm_KCRCm_BUF_STS_RDEN)

WCRCm_KCRCm_BUF_STS_RDEN is a register that sets enable for the interrupt of operation related to KCRCm module.
Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	All 0	-/W	Code value (H'A5A5) Set "Code value" to these bits when writing to this register to enable writing to this register. When read, return 0.
15 to 1	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	BUF_STS_RDEN	0	R/W	WCRCm_KCRCm_BUF_STS enable. 0: Disable WCRCm_KCRCm_BUF_STS 1: Enable WCRCm_KCRCm_BUF_STS

(42) WCRCm KCRCm Buffer state read register (WCRCm_KCRCm_BUF_STS)

WCRCm_KCRCm_BUF_STS is a register that sets enable for the interrupt of operation related to KCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	res_comp_endflag	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	buf_empty	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
18	res_comp_endflag	0	R	Comparing CRC result end flag. 0: Comparing CRC result is not end 1: Comparing CRC result is end
17	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
16	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
15 to 13	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
11 to 10	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
8	buf_empty	0	R	Buffer empty flag. 0: Buffer is not empty 1: Buffer is empty
7 to 6	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(43) WCRCm common status register (WCRCm_COMMON_STS)

WCRCm_COMMON_STS is a register that indicates the state of operation related to WCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	edc_err
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.
16	edc_err	0	R/WC1	Indicates the error of EDC. 0: No EDC error 1: EDC error has occurred
15 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value can be either 0 or 1.

(44) WCRCm common interrupt enable register (WCRCm_COMMON_INTEN)

WCRCm_COMMON_INTEN is a register that sets enable for the interrupt of operation related to WCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	edc_err_ie
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
16	edc_err_ie	0	R/W	Interrupt for the error of EDC enable 0: Disable interrupt 1: Enable interrupt
15 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(45) WCRCm common ECM output enable register (WCRCm_COMMON _ECMEN)

WCRCm_COMMON_ECMEN is a register that sets enable for error notification to ECM module on operation related to WCRCm module.
Note: m = 0, 1, 2, 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	edc_err_oe
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

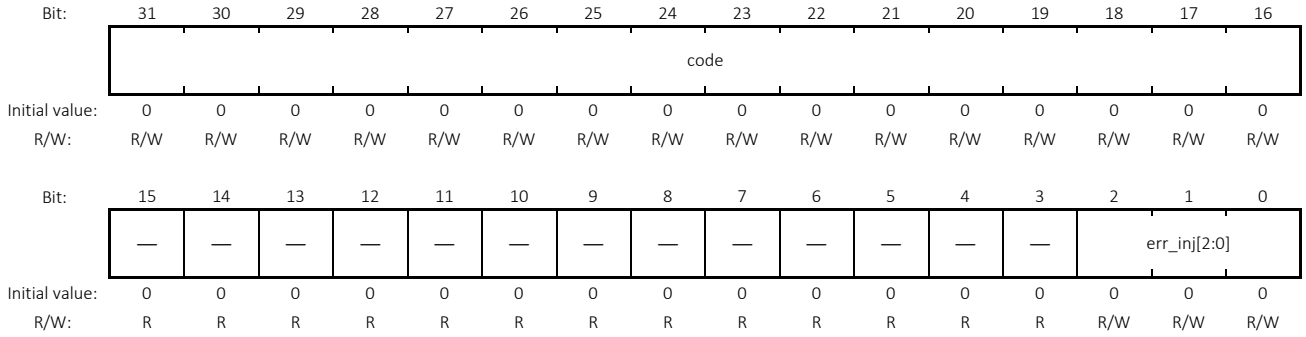
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
16	edc_err_oe	0	R/W	Error notification for EDC error enable 0: Disable notification 1: Enable notification
15 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

(46) WCRCm error injection register (WCRCm_ERRINJ)

WCRCm_ERRINJ is a register that sets enable error injection for bus data signal or EDC code signal.

Note: m = 0, 1, 2, 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	code	H'0000	R/W	Code value Set H'A5A5 due to enable error injection.
15 to 3	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
2 to 0	err_inj[2:0]	0	R/W	Error injection enable Bit[0]: 0: Disables single bit error for bus data signal 1: Enables single bit error for bus data signal Bit[1]: 0: Disables double bit error for bus data signal 1: Enables double bit error for bus data signal Bit[2]: 0: Disables error for EDC code signal 1: Enables error for EDC code signal

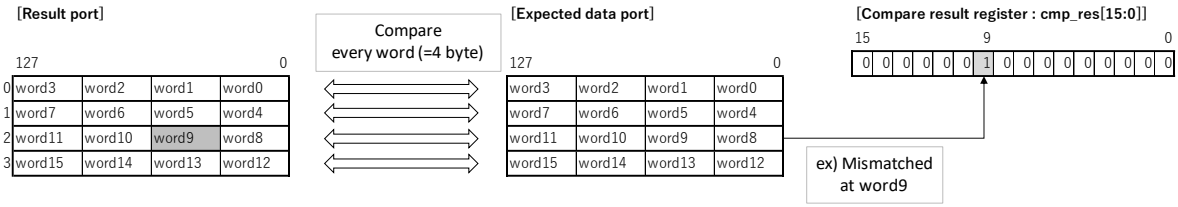


Figure 135.4 Correspondence between comparing data and cmp_res

135.1.3 Operation

(1) Independent CRC mode

The input data via the APB bus is directly transferred to CRCm or KCRCm module and operated on each module.
The operated data can be read via the APB bus.
For detail, refer to the chapter 135.2 CRC and 135.3 KCRC.

The procedure of this mode is as follows.

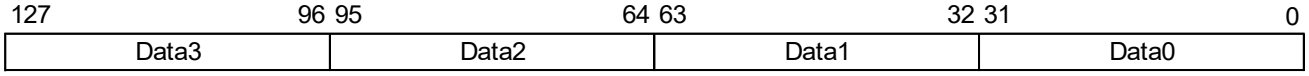
<For CRC module>
1. Set DCRAmCTL, DCRAmCTL2 registers.
2. Set initial value to DCRAmCOUT register.
3. Set input value to DCRAmCIN register.
4. Read out the operated data from DCRAmCOUT register.

<For KCRC module>
1. Set KCRCmCTL, KCRCmPOLY, KCRCmXOR registers.
2. Set initial value to KCRCmDOUT register.
3. Set input value to KCRCmDIN register.
4. Read out the operated data from KCRCmDOUT register.

(2) E2E CRC mode

The 1 packet data is written to the data port in FIFO via the AXI bus, it is transferred to CRCm or KCRCm module according to their data size. And the operated data on each module can be read via the AXI bus.

(Data alignment on AXI Bus)



(Routing of data)

1. AXI (Write) -> FIFO (Data port) -> CRCm -> OUTPUT BUFFER -> FIFO (Result port) -> AXI (Read)
2. AXI (Write) -> FIFO (Data port) -> KCRCm -> OUTPUT BUFFER-> FIFO (Result port) -> AXI (Read)

The procedure of this mode is as follows.

1. Set CRC conversion size to once in WCRCm_XXXX_CONV register.
2. Set initial CRC code value in WCRCm_XXXX_INIT_CRC register.
3. (For CRC) Set DCRAmCTL, DCRAmCTL2, DCRAmCOUT registers.
   (For KCRC) Set KCRCmCTL, KCRCmPOLY, KCRCmXOR, KCRCmDOUT registers.
4. Set in_en=1, trans_en=1, res_en=1 in WCRCm_XXXX_EN register.
5. Set cmd_en=1 in WCRCm_XXXX_CMDEN register
6. Transfer input data to data port of FIFO by DMAC.
7. Read out result data from result port of FIFO by DMAC.
8. Set stop=1 in WCRCm_XXXX_STOP by command function.
9. Clear stop_done in WCRCm_XXXX_STS.

Note:If the data transfer must be stopped during the DMAC transfer, stop the data transfer by setting stop=1 in WCRCm_XXXX_STOP by CPU

(3) AES-ACC mode

The 1 block data is written to the data port in FIFO via the AXI bus, it is transferred to AES-ACC module according to their data size. And the operated data on each module can be read via the AXI bus. The data alignment on AXI bus is same as E2E CRC mode.

(Routing of data)

1. AXI (Write) -> FIFO (Data port) -> (Local connect) -> AES-ACC_n (n=0,2,4,6) -> (Local connect) -> OUTPUT BUFFER -> FIFO(Result port) -> AXI (Read)

2. AXI (Write) -> FIFO (Data port) -> (Local connect) -> AES-ACC_p (p=1,3,5,7) -> (Local connect) -> OUTPUT BUFFER -> FIFO (Result port) -> AXI (Read)

The procedure of this mode is as follows.

1. Set in_en=1, trans_en=1, res_en=1 in WCRCm_XXXX_EN register.
2. Set cmd_en=1 in WCRCm_XXXX_CMDEN register
3. Transfer input data to data port of FIFO by DMAC.
4. Read out result data from result port of FIFO by DMAC.
5. Set stop=1 in WCRCm_XXXX_STOP by command function.
6. Clear stop_done in WCRCm_XXXX_STS.

Note:If the data transfer must be stopped during the DMAC transfer, stop the data transfer by setting stop=1 in WCRCm_XXXX_STOP by CPU

(4) Data through mode

The written data to the data port in FIFO can be read directly via the AXI bus.
The data alignment on AXI bus is same as E2E CRC mode.

(Routing of data)

AXI (Write) -> FIFO (Data port) -> AXI (Read)

The procedure of this mode is as follows.

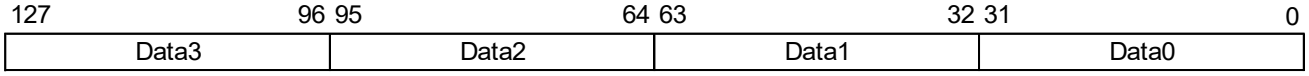
1. Set in_en=1, out_en=1 in WCRCm_XXXX_EN register.
2. Write input data to data port of FIFO by DMAC.
3. Read out input data from data port of FIFO by DMAC.
4. Set stop=1 in WCRCm_XXXX_STOP by CPU.
5. Clear stop_done in WCRCm_XXXX_STS.

Note: 1. In this mode, to set trans_en=1 in WCRCm_XXXX_EN register and use command function are prohibited.
2. The DMA transfer size (TS[3:0]) of read should be same as one of write.

(5) E2E and data through mode

It is possible to read both the data written to the data port in FIFO and the operated data in CRCm/KCRCm/AES-ACC for that data simultaneously.

(Data alignment on AXI Bus)



(Routing of data)

1. AXI (Write) -> FIFO (Data port)
   -> CRCm -> OUTPUT BUFFER -> FIFO (Result port) -> AXI (Read)
   -> AXI (Read)

2. AXI (Write) -> FIFO (Data port)
   -> KCRCm -> OUTPUT BUFFER-> FIFO (Result port) -> AXI (Read)
   -> AXI (Read)

3. AXI (Write) -> FIFO (Data port)
   -> (Local connect)-> AES-ACC_n (n=0,2,4,6)-> (Local connect) ->Output buffer ->FIFO(Result port) ->AXI (Read)
   -> AXI (Read)

4. AXI (Write) -> FIFO (Data port)
   -> (Local connect) -> AES-ACC_p (p=1,3,5,7) -> (Local connect) ->Output buffer ->FIFO(Result port) ->AXI (Read)
   -> AXI (Read)

The procedure of this mode is as follows.

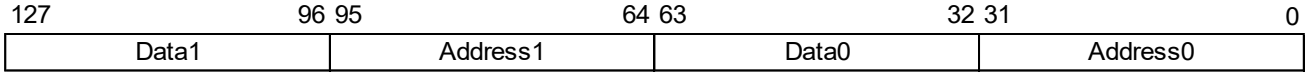
1. (For AES-ACC) Set registers in AES-ACC module.
2. (For CRC/KCRC) Set CRC conversion size to once in WCRCm_XXXX_CONV register.
3. (For CRC/KCRC) Set initial CRC code value in WCRCm_XXXX_INIT_CRC register.
4. (For CRC) Set DCRAmCTL, DCRAmCTL2, DCRAmCOUT registers.
   (For KCRC) Set KCRCmCTL, KCRCmPOLY, KCRCmXOR, KCRCmDOUT registers.
5. Set in_en=1, trans_en=1, res_en=1, out_en=1 in WCRCm_XXXX_EN register.
6. Set cmd_en=1 in WCRCm_XXXX_CMDEN register
7. Transfer input data to data port of FIFO by DMAC.
8. Read out input data from data port of FIFO by DMAC.
9. Read out result data from result port of FIFO by DMAC.
10. Set stop=1 in WCRCm_XXXX_STOP by command function.
11. Clear stop_done in WCRCm_XXXX_STS.

Note:If the data transfer must be stopped during the DMAC transfer, stop the data transfer by setting stop=1 in WCRCm_XXXX_STOP by CPU

(6) Register access by command function

When 32bit address and 32bit data are written to the command port in FIFO via the AXI bus, the write register access is performed to the specified address for WCRC, CRC, KCRC or AES-ACC module. This function makes possible to set register with descriptor control from DMAC.

(Data alignment on AXI Bus)



(Routing of data)

1. AXI (Write) -> FIFO(Command port) -> CRCm
2. AXI (Write) -> FIFO(Command port) -> KCRCm
3. AXI (Write) -> FIFO(Command port) -> (Local connect) -> AES-ACC_n (n=0,2,4,6)
4. AXI (Write) -> FIFO(Command port) -> (Local connect) -> AES-ACC_p (p=1,3,5,7)

The procedure of this mode is as follows.

1. Set in_en=1, trans_en=1 in WCRCm_XXXX_EN register.
2. Set cmd_en=1 in WCRCm_XXXX_CMDEN register
3. Transfer command data to command port of FIFO by DMAC.

Note:If the data transfer must be stopped during the DMAC transfer, stop the data transfer by setting stop=1 in WCRCm_XXXX_STOP by CPU

(7) Comparing CRC result

When the expected data of CRC calculation is written to the expected data port in FIFO via the AXI bus, this function compares the expected data with the CRC calculation result that was made in CRCm or KCRCm module until that time.
If they are corresponding, the both of expected data and calculated data are discarded.
And if they are difference, the interrupt occurs due to inform this mismatch.
To compare correctly, it is necessary to write the expected data after completing CRC calculation.
The data alignment on AXI bus is same as E2E CRC mode.

The procedure of this mode is as follows.

1. Write 0xa5a50001 to WCRCm_XXXX_BUF_STS_RDEN register.
2. Set CRC conversion size to once in WCRCm_XXXX_CONV register.
3. Set initial CRC code value in WCRCm_XXXX_INIT_CRC register.
4. Set cmp_en=1, exp_reqsel=1 in WCRCm_XXXX_COMP register.
5. Set cmd_done_ie in WCRCm_XXXX_INTEN register.
6. (For CRC) Set DCRAmCTL, DCRAmCTL2, DCRAmCOUT registers.
   (For KCRC) Set KCRCmCTL, KCRCmPOLY, KCRCmXOR, KCRCmDOUT registers.
7. Set in_en=1, trans_en=1, res_en=1 in WCRCm_XXXX_EN register.
8. Set cmd_en=1 in WCRCm_XXXX_CMDEN register
9. Transfer input data to data port of FIFO by DMAC.
10. Transfer expected data to expected data port of FIFO by DMAC.
11. Set stop=1 in WCRCm_XXXX_STOP by command function.
12. Wait Interrupt. After detecting Interrupt, verifying WCRCm_XXXX_STS register.
    If stop_done is set, goto No.14.
    If stop_done is not set, read WCRCm_XXXX_BUF_STS register and wait until both BIT8 and BIT18 become “1”.
13. After both BIT8 and BIT18 become “1”, set stop=1 in WCRCm_XXXX_STOP by CPU.
14. Clear stop_done in WCRCm_XXXX_STS.
15. Read comp_err in WCRCm_XXXX_STS register.
16. If comp_err = 1, read WCRCm_XXXX_COMP_RES register.

Note:If the data transfer must be stopped during the DMAC transfer, stop the data transfer by setting stop=1 in WCRCm_XXXX_STOP by CPU

(8) FIFO

FIFO in this module is composed of 64bytes * 4 planes * 4 areas. Each area corresponds to AES-ACC_n (n=0,2,4,6), AES-ACC_p (p=1,3,5,7), CRCm, and KCRCm. And each plane corresponds to the port of data, command, expected data and result. Table 135.3 shows the base address of FIFO for each channel. And Table 135.4 shows the address assignment of each port in FIFO. Those are fixed address.

Table 135.3 Base address of FIFO

Module Name	Base Address
WCRC0	H'FFFF 0000
WCRC1	H'FFFF 4000
WCRC2	H'FFFF 8000
WCRC3	H'FFFF C000

Table 135.4 Address assignment of FIFO

Communicate to	Port	Address (+Base Address)
AES-ACC_n (n=0,2,4,6)	Data	H'000
	Command	H'100
	(Reserved)	H'200
	Result	H'300
AES-ACC_p (p=1,3,5,7)	Data	H'400
	Command	H'500
	(Reserved)	H'600
	Result	H'700
CRCm (m=0,1,2,3)	Data	H'800
	Command	H'900
	Expected data	H'A00
	Result	H'B00
KCRCm (m=0,1,2,3)	Data	H'C00
	Command	H'D00
	Expected data	H'E00
	Result	H'F00

(9) Configuration of Descriptor Memory

The DMA transfer for each area of FIFO by using descriptor of RT-DMAC module is possible. In that case, it is necessary to write 16 Byte DMA setting to descriptor memory in RT-DMAC every step. Table 135.5 shows the correspondence of the address of descriptor memory to DMA setting.

Refer to section 30. RT-DMAC for the detail of control procedure for descriptor in RT-DMAC module.

The descriptor operates in the order descripted, so the out of order don't occur.

Table 135.5 Correspondence of the address of descriptor memory to DMA setting

Offset Address	Bit	Content
H'0	31 to 0	DMA Source Address
H'4	31 to 0	DMA Destination Address
H'8	23 to 0	DMA Transfer Count The number of times of DMA transfer H'0000 0001 : 1 time H'00FF FFFF : 16,777,215 times (max)
H'C	23 to 16	DMARS[7:0] For detail assignment, refer to section 30.
	11, 10	Destination address mode (DM[1:0]) Specify whether the DMA destination address is incremented or fixed, and the amount of increment. 00: Fixed destination address 01: Destination address is incremented + 4 in longword units transfer + 8 in 8-byte units transfer + 16 in 16-byte units transfer + 32 in 32-byte units transfer + 64 in 64-byte units transfer 10: Destination address is decremented – 4 in longword units transfer Setting prohibited in 8-/16-/32-/64-byte units transfer 11: Setting Prohibited

Offset Address	Bit	Content
	9, 8	Source Address Mode (SM[1:0]) Specify whether the DMA source address is incremented or fixed, and the amount of increment. 00: Fixed source address 01: Source address is incremented + 4 in longword units transfer + 8 in 8-byte units transfer + 16 in 16-byte units transfer + 32 in 32-byte units transfer + 64 in 64-byte units transfer 10: Source address is decremented – 4 in longword units transfer Setting prohibited in 8-/16-/32-/64-byte units transfer 11: Setting Prohibited
	7, 6	Resource selection (RS[3:2]) Specify which transfer requests will be sent to the RT-DMAC. 00: Setting prohibited 10: Selected by DMA extended resource selector Other than above: Setting prohibited
	4	Descriptor step end interrupt enable（DSIE) Specifies whether an interrupt request is generated to CPU at the time of termination of one step of Descriptor. When DSIE is set to 1, if DSE is set to 1, interruption (DEI) will be generated to CPU. 0: Interrupt request is disabled 1: Interrupt request is enabled
	3 to 0	DMA transfer size (TS[3:0]) (Data write to FIFO (Data port)/Data read from FIFO (Data port)/Data write to FIFO(Command port)) 0010: Longword (4-byte) units transfer 0011: 16-byte units transfer 0100: 32-byte units transfer 0101: 64-byte units transfer 0111: 8-byte units transfer Other than above: Setting prohibited (Data read from FIFO (Result port)) 0011: 16-byte units transfer Other than above: Setting prohibited

Figure 135.5 and Figure 135.6 shows the examples for operation with descriptor.

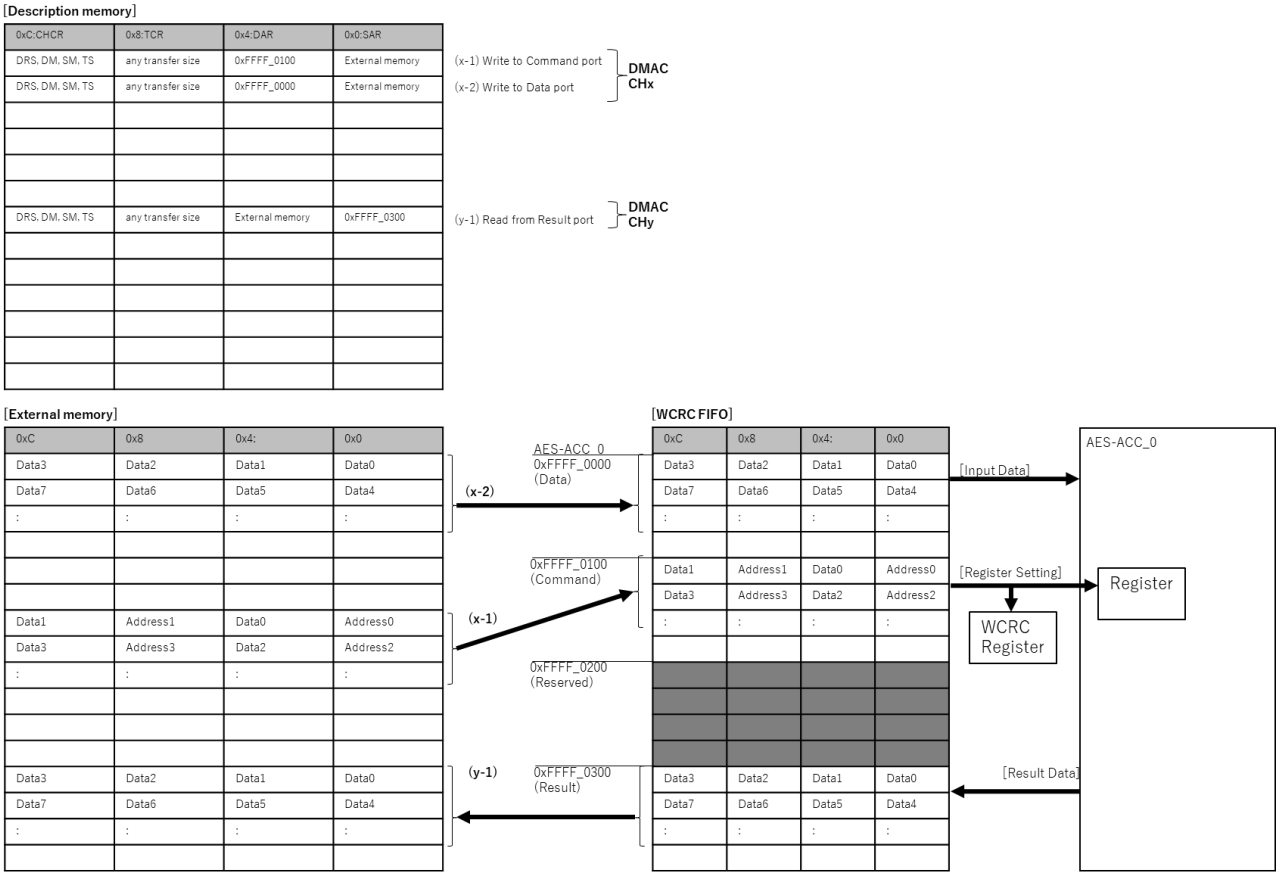


Figure 135.5 Example of AES-ACC_0 operation with descriptor.

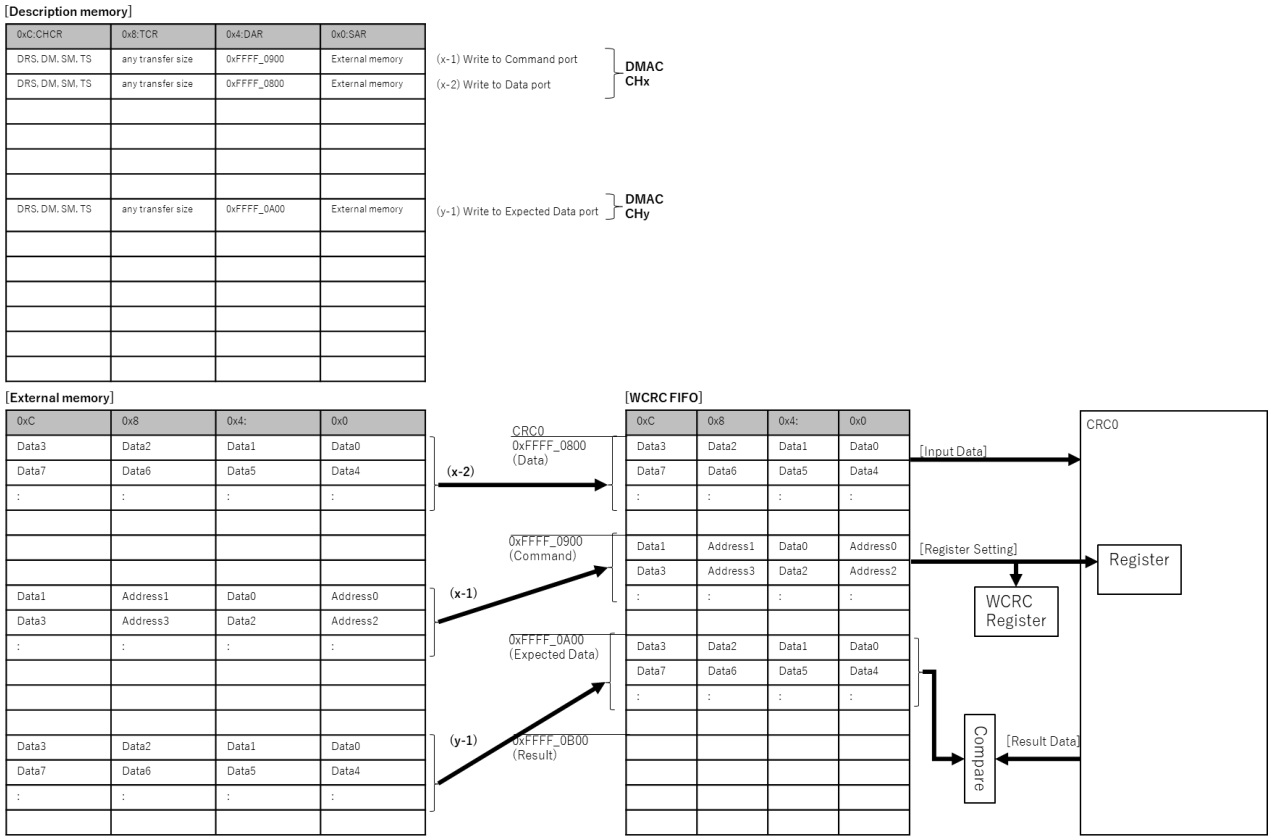

Figure 135.6 Example of CRC comparing function with descriptor.

135.1.4 Usage Notes

(1) Note on start address for data

Start address on memory where data is stored must be a 4-byte boundary.

(2) Prohibition of simultaneous operation of Data through mode and Comparing CRC result

There is no function of simultaneous operation of Data through mode (135.1.3.4) and Comparing CRC result (135.1.3.7). If you use simultaneous operation of Data through mode and Comparing CRC result, operation cannot be guaranteed.

(3) Prohibition of simultaneous operation of Data through mode and Register access by command function

There is no function of simultaneous operation of Data through mode (135.1.3.4) and Register access by command function (135.1.3.6). If you use simultaneous operation of Data through mode and Register access by command function, operation cannot be guaranteed.

135.1.5 Safety Mechanisms

WCRC is used only as module for Mechanism of FuSa.

135.2 CRC

135.2.1 Overview

The cyclic redundancy check block is a function block to generate and check CRC of input data via the APB bus.
The CRC based on this generator polynomial are stored in the register.
This module supports CRC calculation of Specification of CRC Routines of AUTOSAR Release 4.2.2.

(1) Features

This module supports the following 9 polynomials of below.

(1) 32-bit Ethernet polynomial (CRC-32-IEEE 802.3) (Specification of CRC Routines AUTOSAR Release 4.2.2)
$(X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X^1 + 1)$
The hamming distance of the code generated by this polynomial is 4 for 4KByte data.

(2) 16-bit CCITT -FALSE CRC16 (Specification of CRC Routines AUTOSAR Release 4.2.2)
$(X^{16} + X^{12} + X^5 + 1)$

(3) 8-bit SAE J1850 (8bit CRC code) (Specification of CRC Routines AUTOSAR Release 4.2.2)
$(X^8 + X^4 + X^3 + X^2 + 1)$

(4) 8-bit 0x2F polynomial (Specification of CRC Routines AUTOSAR Release 4.2.2)
$(X^8 + X^5 + X^3 + X^2 + X + 1)$

(5) 32-bit 0xF4ACFB13 polynomial (Specification of CRC Routines AUTOSAR Release 4.2.2)
$(X^{32} + X^{31} + X^{30} + X^{29} + X^{28} + X^{26} + X^{23} + X^{21} + X^{19} + X^{18} + X^{15} + X^{14} + X^{13} + X^{12} + X^{11} + X^9 + X^8 + X^4 + X^1 + 1)$
It has an advantage with respect to the Ethernet CRC - it has a Hamming Distance of 6 up to 4kB

(6) 32-bit 0x1EDC6F41 polynomial (CRC-32C) (Castagnoli)
$(X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1)$

(7) 21-bit 0x102899 polynomial (CRC-21)
$(X^{21} + X^{20} + X^{13} + X^{11} + X^7 + X^4 + X^3 + 1)$

(8) 17-bit 0x1685B polynomial (CRC-17)
$(X^{17} + X^{16} + X^{14} + X^{13} + X^{11} + X^6 + X^4 + X^3 + X^1 + 1)$

(9) 15-bit 0x4599 polynomial (CRC-15)
$(X^{15} + X^{14} + X^{10} + X^8 + X^7 + X^4 + X^3 + 1)$

The CRC is a module for calculating the CRC code of the input data. The CPU or DMAC writes input data to the DCRAmCIN register. The CRC code is calculated for each data write cycle. By reading the DCRAmCOUT register value after all input data has been written to the DCRAmCIN register, CRC code value can be obtained.
Note: m = 0 to 3

(1) Configuration of 32-bit Ethernet polynomial (CRC-32-IEEE 802.3) CRC calculation

Figure 135.7 shows the CRC calculation generator polynomial of the 32-bit Ethernet polynomial.
The source is AUTOSAR_SWS_CRCLibrary of AUTOSAR Release 4.2.2.

CRC result width	32 bits	
Polynomial	04C1 1DB7h	
Initial value	FFFF FFFFh	
Input data reflected	Yes	
Result data reflected	Yes	
XOR value	FFFF FFFFh	

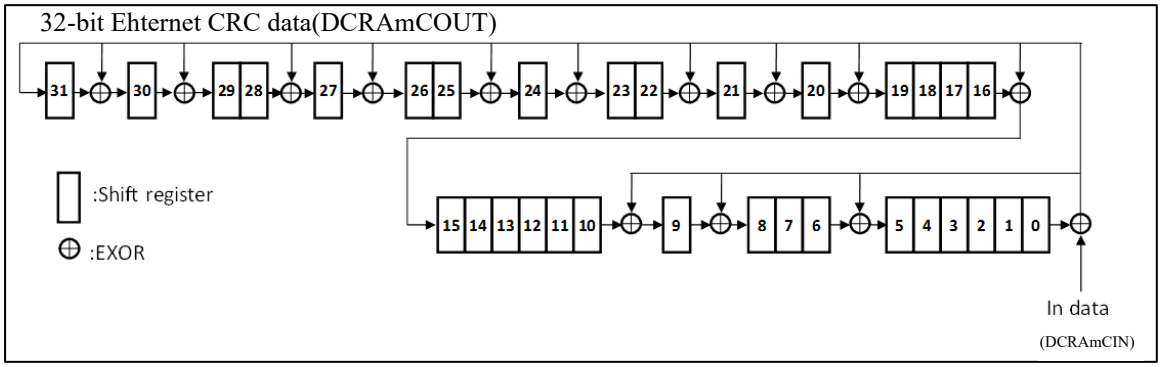

Figure 135.7 32-Bit Ethernet

(2) Configuration of 16-bit CCITT-FALSE CRC16 CRC calculation

Figure 135.8 shows the CRC calculation generator polynomial of 16-bit CCITT-FALSE CRC16
The source is AUTOSAR_SWS_CRCLibrary of AUTOSAR Release 4.2.2.

CRC result width	16 bits
Polynomial	1021h
Initial value	FFFFh
Input data reflected	No
Result data reflected	No
XOR value	0000h

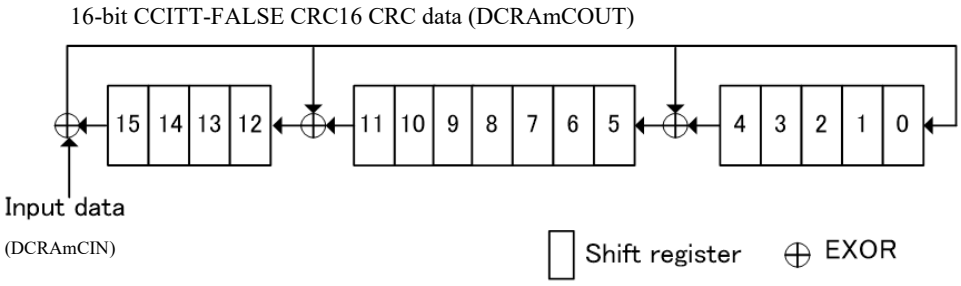

Figure 135.8 16-bit CCITT-FALSE CRC16

(3) Configuration of 8-bit SAE J1850 CRCcalculation

Figure 135.9 shows the CRC calculation generator polynomial of 8-bit SAE J1850 (8bit CRC code)
The source is AUTOSAR_SWS_CRCLibrary of AUTOSAR Release 4.2.2.

CRC result width	8 bits
Polynomial	1Dh
Initial value	FFh
Input data reflected	No
Result data reflected	No
XOR value	FFh

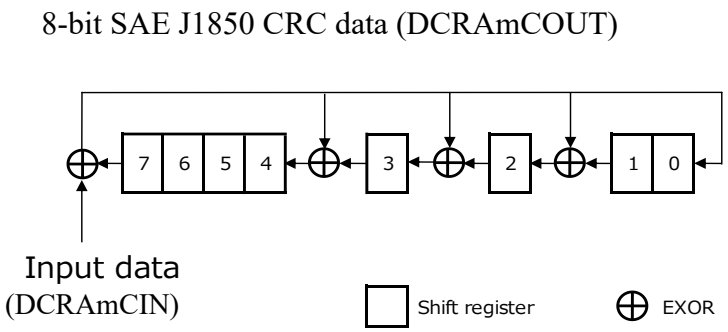

Figure 135.9 8-bit SAE J1850 Polynomial

(4) Configuration of 8-bit 0x2F polynomial CRC calculation

Figure 135.10 shows the 8bit 0x2F CRC calculation generator polynomial of the 8-bit 0x2F polynomial.
The source is AUTOSAR_SWS_CRCLibrary of AUTOSAR Release 4.2.2.

CRC result width	8 bits
Polynomial	2Fh
Initial value	FFh
Input data reflected	No
Result data reflected	No
XOR value	FFh

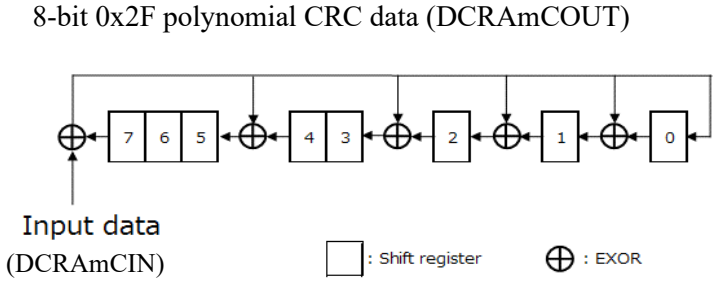

Figure 135.10 8-bit 0x2F polynomial

(5) Configuration of 32-bit 0xF4ACFB13 polynomial CRC calculation

Figure 135.11 shows the CRC calculation generator polynomial of the 32-bit 0xF4ACFB13 polynomial. The source is AUTOSAR_SWS_CRCLibrary of AUTOSAR Release 4.2.2.
It has an advantage with respect to the Ethernet CRC - it has a Hamming Distance of 6 up to 4kB.

CRC result width	32 bits
Polynomial	F4AC FB13h
Initial value	FFFF FFFFh
Input data reflected	Yes
Result data reflected	Yes
XOR value	FFFF FFFFh

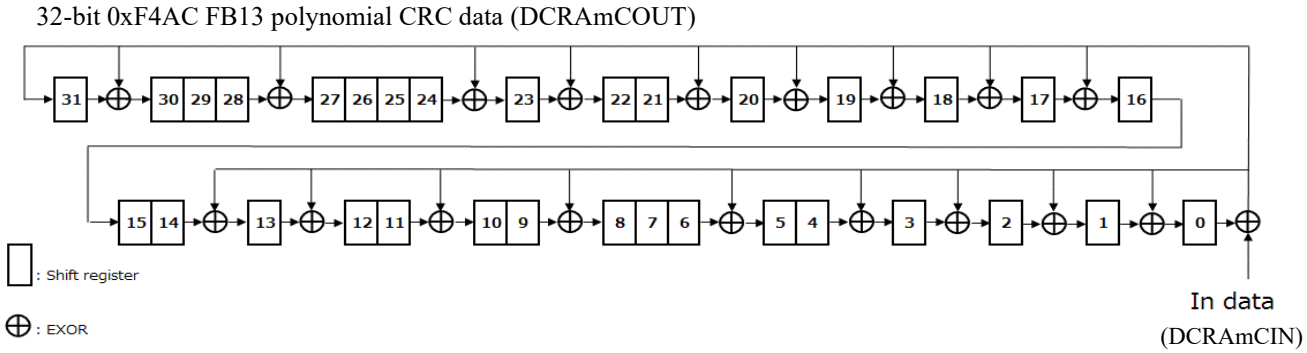

Figure 135.11 32-bit 0xF4AC FB13 polynomial

(6) Configuration of 32-bit 0x1EDC6F41 polynomial (CRC-32C) (Castagnoli) CRC calculation

Figure 135.12 shows the CRC calculation generator polynomial of the 32-bit 0x1EDC6F41 polynomial.

CRC result width	32 bits
Polynomial	1EDC 6F41h
Initial value	FFFF FFFFh
Input data reflected	Yes
Result data reflected	Yes
XOR value	FFFF FFFFh

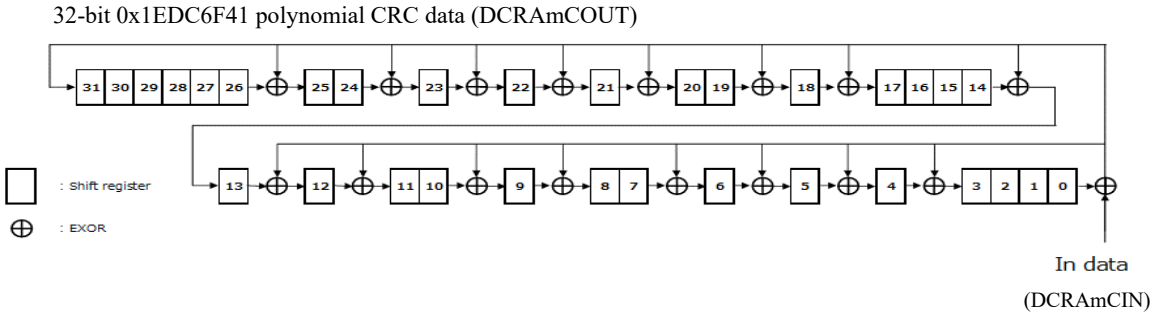

Figure 135.12 32-bit 0x1EDC6F41 polynomial

(7) Configuration of 21-bit 0x102899 polynomial CRC-21 CRC calculation

Figure 135.13 shows the CRC calculation generator polynomial of the 21-bit 0x102899 polynomial.

CRC result width	21 bits
Polynomial	10 2899h
Initial value	1F FFFFh
Input data reflected	Yes
Result data reflected	Yes
XOR value	1F FFFFh

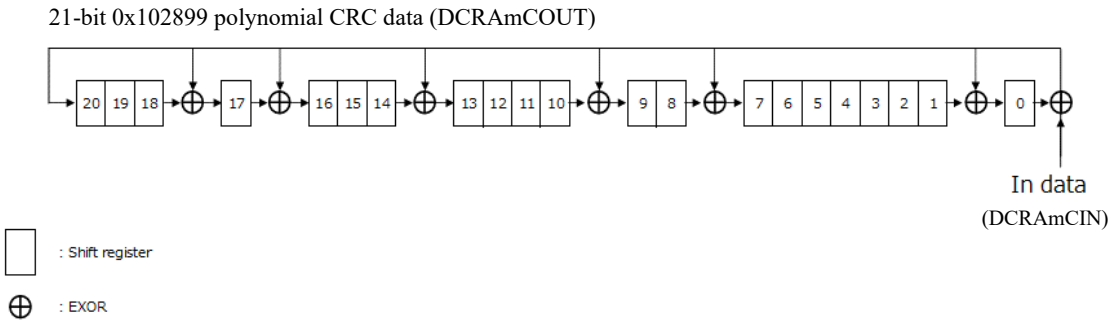

Figure 135.13 21-bit 0x102899 polynomial

(8) Configuration of 17-bit 0x1685B polynomial (CRC-17) calculation

Figure 135.14 shows the CRC calculation generator polynomial of the 17-bit 0x1685B polynomial.

CRC result width	17 bits
Polynomial	1 685Bh
Initial value	1 FFFFh
Input data reflected	Yes
Result data reflected	Yes
XOR value	1 FFFFh

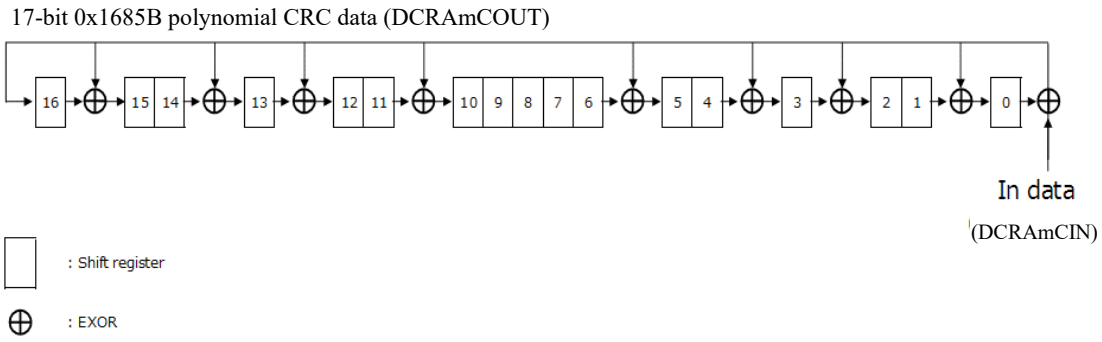

Figure 135.14 17-bit 0x1685B polynomial

(9) Configuration of 15-bit 0x4599 polynomial (CRC-15) calculation

Figure 135.15 shows the CRC calculation generator polynomial of the 15-bit 0x4599 polynomial.

CRC result width	15bits
Polynomial	4599h
Initial value	7FFFh
Input data reflected	Yes
Result data reflected	Yes
XOR value	7FFFh

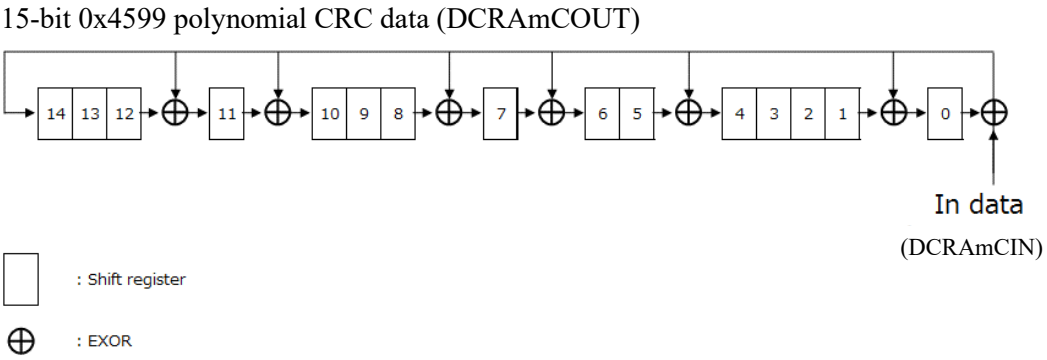

Figure 135.15 15-bit 0x4599 polynomial

(2) Block Diagram

The CRC includes the internal registers and the CRC calculation block. Figure 135.16 shows the block diagram of the CRC.

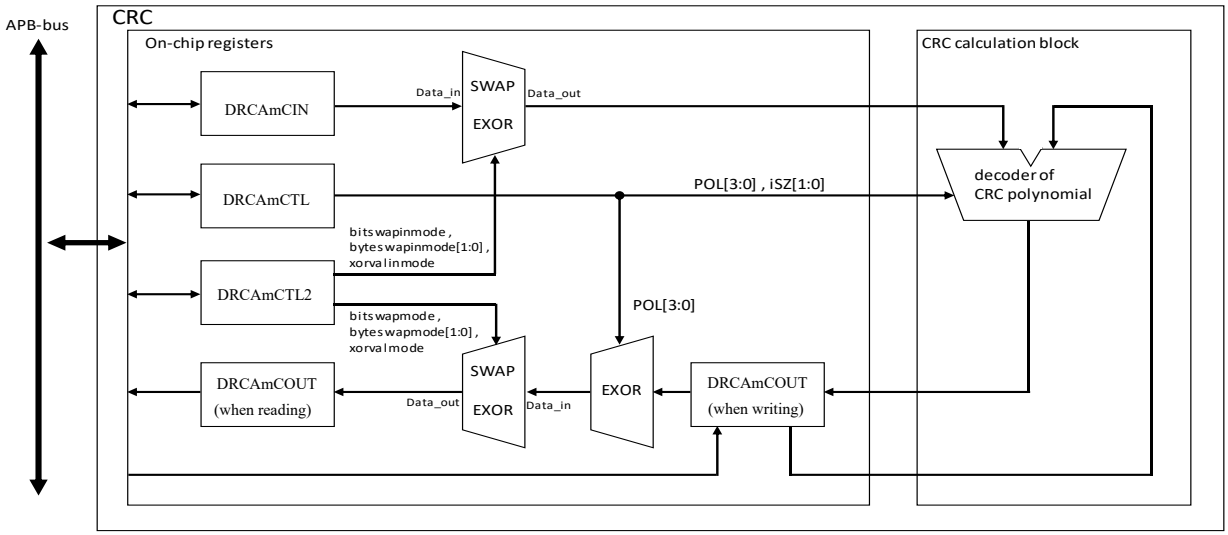

Figure 135.16 CRC Block Diagram

(3) Register Configurations

The base address for each channel of registers of the CRC is as follows:

Table 135.6 offset address Configurations

Module Name	Offset Base Address
CRC 0	H'E6F0 0000
CRC 1	H'E6F1 0000
CRC 2	H'E700 0000
CRC 3	H'E701 0000

Each channel of the CRC has the registers below.

Table 135.7 shows the CRC register configurations and register value in each state.

Table 135.7 Register Configurations

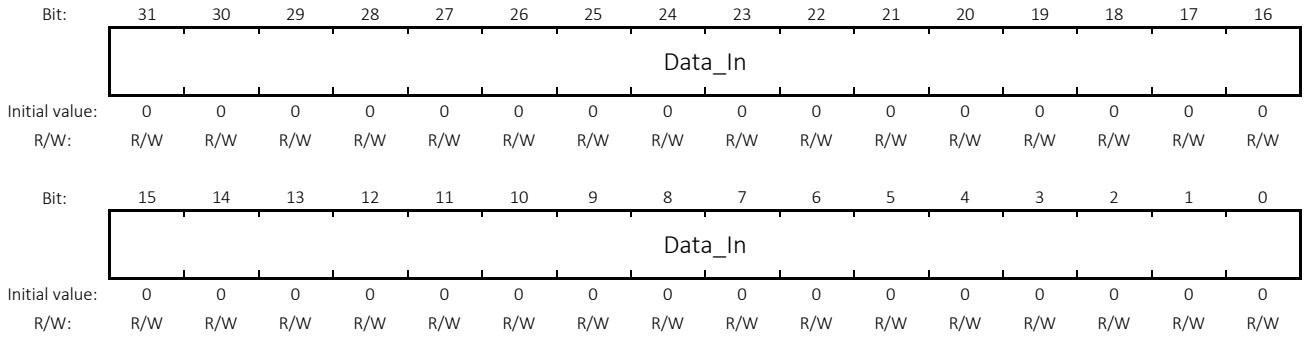
Register Name	Abbreviation	R/W	Offset from Base Address	Initial Value (Power On Reset by PRESET# Pin)	Initial Value (Software Reset)	Access Size
CRCm Input Register	DCRAmCIN	R/W	H'0000	H'0000 0000	H'0000 0000	32
CRCm Data Register	DCRAmCOUT	R/W	H'0004	H'0000 0000	H'0000 0000	32
CRCm Control Register	DCRAmCTL	R/W	H'0020	H'0000 0000	H'0000 0000	32
CRCm Control Register2	DCRAmCTL2	R/W	H'0040	H'0000 0000	H'0000 0000	32

Note: m = 0 to 3
Note: Access to the addresses other than those listed above is prohibited. Otherwise, operation cannot be guaranteed. If read, an undefined value is read.

135.2.2 Register Descriptions

(1) CRCm Input Register (DCRAmCIN)

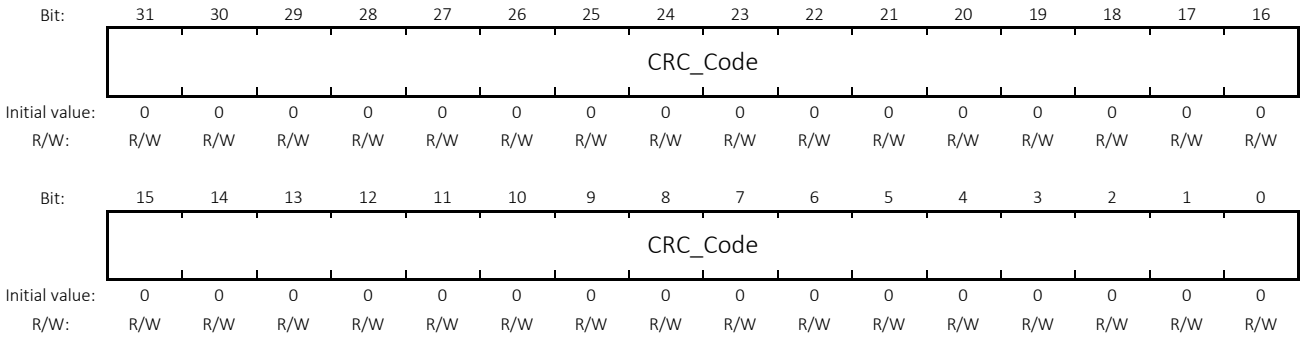
DCRAmCIN is a register that sets input data.
Note: m = 0 to 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Data_In	H'0000 0000	R/W	Set input data The valid bit position depends on the ISZ bit setting. Bit 31 to 0: When 32-bit data width is enabled (ISZ[1:0] in DCRAmCTL = B'00).

(2) CRCm Data Register (DCRAmCOUT)

DCRAmCOUT is a register that obtains the CRC codes.
Note: m = 0 to 3



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRC_Code	H'0000 0000	R/W	CRC code The valid bit width depends on the DCRAmCTL.POL bit setting. When the 16-bit CCITT-FALSE CRC16 or 15bit 0x4599 polynomial (CRC-15) is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. When 8-bit SAE J1850 or 8-bit 0x2F polynomial is enabled, bits 7 to 0 show the CRC result. The bits 31 to 8 are undefined. On reading these bits, the value read out is the XOR of each polynomial "XOR value" and the DCRAmCOUT.CRC_Code bits (This does not affect the DCRAmCOUT.CRC_Code bits).

Note: Although the hardware initial value of the CRC data register is H'FFFF FFFF, the read value is H'0000 0000. This is because the hardware value is exclusively ORed with H'FFFF FFFF before being read. Therefore, for CRC calculation, be sure to write H'FFFF FFFF to this register as default.
Note: This register must be initialized with the initial value corresponded by each polynomial before the first data of the data block is written to DCRAmCIN register.

(3) CRCm Control Register (DCRAmCTL)

DCRAmCTL is a register that determines the valid bit width of the input data and generator polynomial for the CRC codes.

Note: m = 0 to 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	ISZ[1:0]		POL[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	ISZ[1:0]	00	R/W	The value written to this field determines the valid bit width of input data. 2'b00: 32bit(DCRAmCIN31-0) 2'b01: 16bit(DCRAmCIN15-0) 2'b10: 8bit(DCRAmCIN7-0) 2'b11: Setting prohibited
3 to 0	POL[3:0]	0000	R/W	The value written to this field determines the generator polynomial for the CRC codes. 4'b0000: 32 bit Ethernet (CRC-32-IEEE 802.3) 4'b0001: 16-bit CCITT-FALSE CRC16 4'b0010: 8 bit SAE J1850 4'b0011: 8 bit 0x2F polynomial 4'b0100: 32 bit 0xF4ACFB13 polynomial 4'b0101: 32 bit 0x1EDC6F41 polynomial (CRC-32C) (Castagnoli) 4'b0110: 21 bit 0x102899 polynomial (CRC-21) 4'b0111: 17 bit 0x1685B polynomial (CRC-17) 4'b1000: 15 bit 0x4599 polynomial (CRC-15) 4'b1001: Reserved 4'b101x: Reserved 4'b11xx: Reserved

Note: The value of this register should not be changed during data write to DCRAmCIN (prior to CRC code value calculation). If the value of this register is changed during data write, the generated CRC code value (DCRAmCOUT) is not guaranteed.

(4) CRCm Control Register2 (DCRAmCTL2)

DCRAmCTL2 is a register that determines the swap, exor of input data and output data.
Note: m = 0 to 3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

135.2.5 Safety Mechanisms

CRC is used only as module for Mechanism of FuSa

135.3 KCRC

135.3.1 Overview

The cyclic redundancy check block is a function block to generate and check CRC of input data via the APB bus.
CRC based on this generator polynomial are stored in the register.

(1) Features

Number of Units and Channels

Number of Units	4
Name	KCRCm (m = 0 to 3)

Function

The KCRC can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- Supported CRC polynomials

(1) 32-bit Ethernet CRC
$04C11DB7_h$: $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X^1+1$

(2) 16-bit CCITT CRC
1021_h : $X^{16}+X^{12}+X^5+1$

(3) 8-bit SAE J1850 CRC
$1D_h$: $X^8+X^4+X^3+X^2+1$

(4) 8-bit 0x2F CRC
$2F_h$: $X^8+X^5+X^3+X^2+X+1$

(5) 32-bit CRC32C (Castagnoli)
$1EDC6F41_h$: $X^{32}+X^{28}+X^{27}+X^{26}+X^{25}+X^{23}+X^{22}+X^{20}+X^{19}+X^{18}+X^{14}+X^{13}+X^{11}+X^{10}+X^9+X^8+X^6+X+1$

- CRC generation to an arbitrary data block length
- After initialization of the KCRC data register, every write access to the KCRC input register generates a new CRC according to the chosen polynomial and the result is stored in the KCRC data register.

(2) Block Diagram

The KCRC includes the internal registers and the CRC calculation block. Figure 135.18 shows the block diagram of the KCRC.

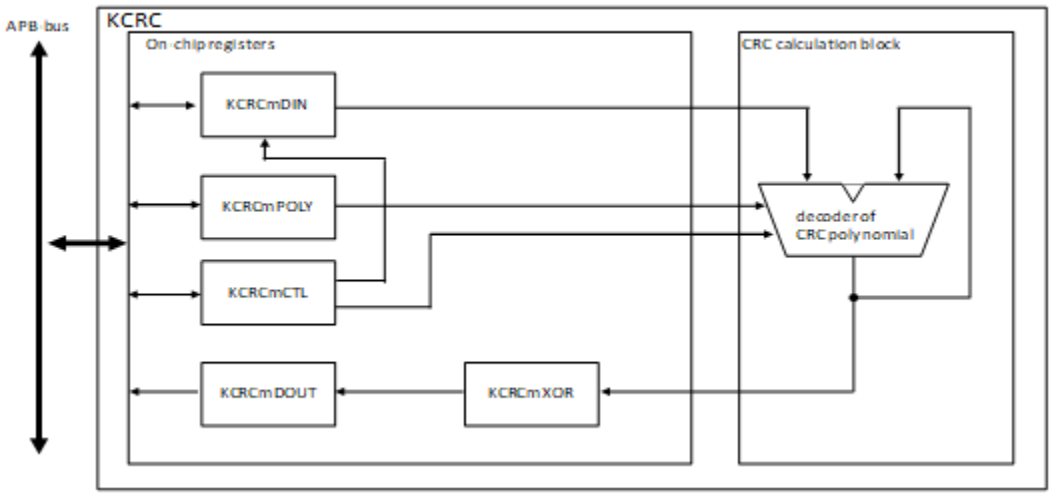

Figure 135.18 KCRC Block Diagram

(3) Register Configurations

The base address for each channel of registers of the KCRC is as follows:

Table 135.8 offset address Configurations

Module Name	Offset Base Address
KCRC 0	H'E702 0000
KCRC 1	H'E703 0000
KCRC 2	H'E704 0000
KCRC 3	H'E705 0000

Each channel of the KCRC has the registers below.

Table 135.9 shows the KCRC register configurations and register value in each state.

Table 135.9 Register Configurations

Register Name	Abbreviation	R/W	Offset from Base Address	Initial Value (Power On Reset by PRESET# Pin)	Initial Value (Software Reset)	Access Size
KCRCm Data Input Register	KCRCmDIN	R/W	H'00	H'0000 0000	H'0000 0000	32
KCRCm Data Output Register	KCRCmDOUT	R/W	H'80	H'0000 0000	H'0000 0000	32
KCRCm Control Register	KCRCmCTL	R/W	H'90	H'001F 0000	H'001F 0000	32
KCRCm Polynomial Register	KCRCmPOLY	R/W	H'A0	H'04C1 1DB7	H'04C1 1DB7	32
KCRCm XOR Mask Register	KCRCmXOR	R/W	H'B0	H'FFFF FFFF	H'FFFF FFFF	32

Note: Access to the addresses other than those listed above is prohibited. Otherwise, operation cannot be guaranteed. If read, an undefined value is read.

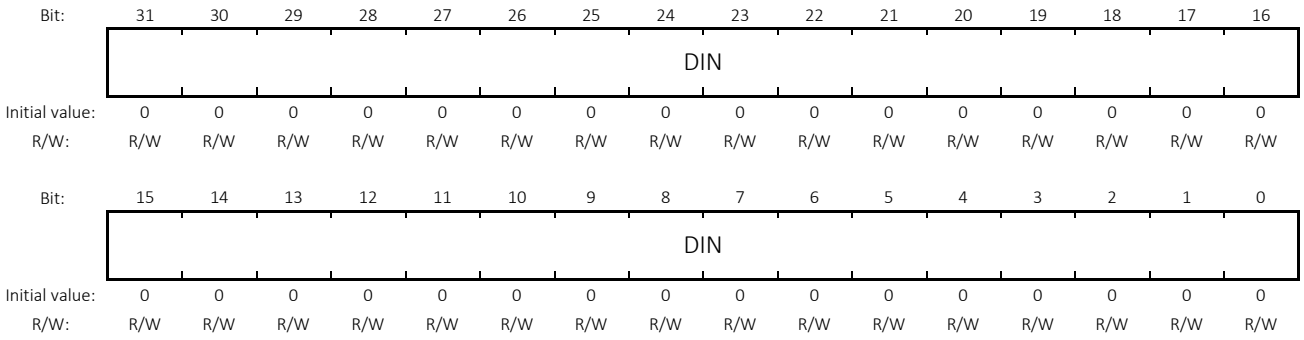
(4) Connected Module

Table 135.10 Connected Modules

Module Name	Connected Module Name	Connected Module Function
KCRC	APMU	Access the Register
	CPG	Output Clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	RT-DMAC	Control Direct Memory Access

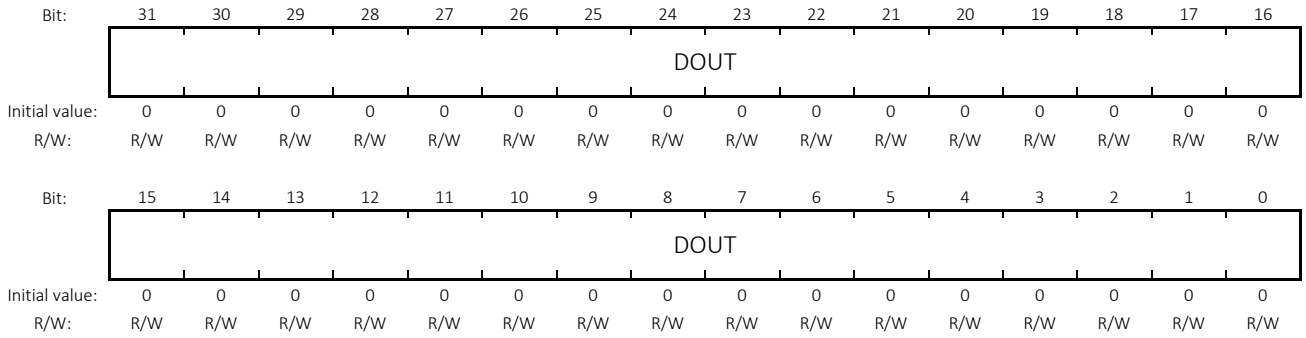
135.3.2 Register Descriptions

(1) KCRCm Data Input Register (KCRCmDIN)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DIN	H'0000 0000	R/W	Input Data for CRC calculation. The valid bits are controlled by KCRCmCTL.DW: For 32 bit effective bit width: DIN[31:0] For 16 bit effective bit width: DIN[15:0] For 8 bit effective bit width: DIN[7:0]

(2) KCRCm Data Output Register (KCRCmDOUT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DOUT	H'0000 0000	R/W	Output Data for CRC calculation. The valid bits are controlled by KCRCmCTL.DW: For 32 bit effective bit width: DOUT[31:0] For 16 bit effective bit width: DOUT[15:0] For 8 bit effective bit width: DOUT[7:0] Setting this register to initialize value.

(3) KCRCm Control Register (KCRCmCTL)

This register provided CRC calculate setting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	PSIZE				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CMD0	—	—	CMD1	CMD2	—	DW		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	PSIZE	H'1F	R/W	Polynomial size 0x7: 8 bit 0xF: 16 bit 0x1F: 32bit Other: setting prohibit
15 to 9	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CMD0	0	R/W	Calculate Mode 0 0: Mode N (normal) 1: Mode R (output reflect)
7 to 6	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	CMD1	0	R/W	Calculate Mode 1 0: Mode N (normal) 1: Mode R (input reflect)
4	CMD2	0	R/W	Calculate Mode 2 0: Mode M (MSB shift) 1: Mode L (LSB shift)
3	-	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DW	000	R/W	Input Data size select These bits define valid data width of Data input. 000: 32 bit fix mode 001: 16 bit fix mode 011: 8 bit fix mode Other: Setting prohibit

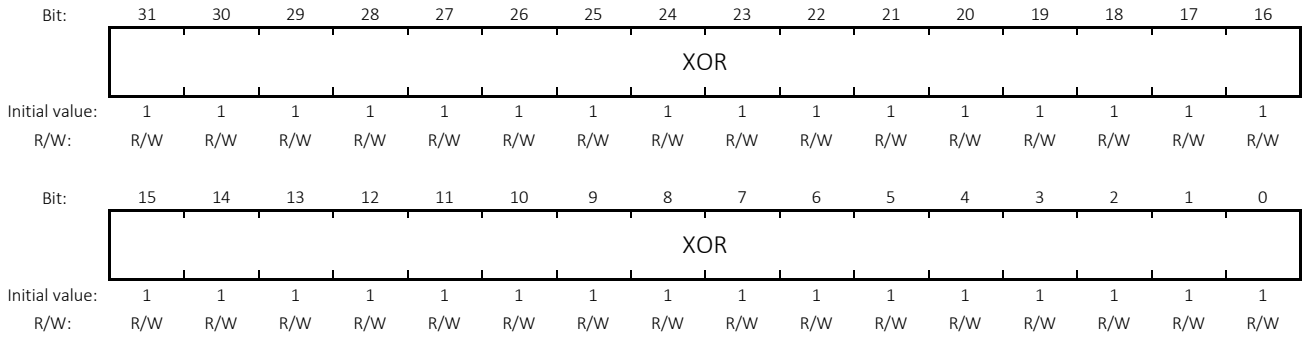
(4) KCRCm Polynomial Register (KCRCmPOLY)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POLY															
Initial value:	0	0	0	0	0	1	0	0	1	1	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POLY															
Initial value:	0	0	0	1	1	1	0	1	1	0	1	1	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	POLY	H’04C1 1DB7	R/W	Polynomial for CRC calculation.

(5) KCRCm XOR Mask Register (KCRCmXOR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XOR	H'FFFF FFFF	R/W	XOR mask for Data output.

135.3.3 Operation

Please refer to 135.1.1.3-Operation.

135.3.4 Usage Notes

No description on this section

135.3.5 Safety Mechanisms

KCRC is used only as module for Mechanism of FuSa

136. Failure Self-Detection Output(RFSO)

136.1 Overview

RFSO is a module which consists interval and time-out timers. This module can be used as a trigger and time-out detection for Runtime Test, trigger for Periodical Checks, internal watchdog timer, and for fault notification to ECM.

Internal clock: S0D6_PERφ

T_{bus} (Period of S0D6_PERφ) = 7.50 ns
f_{bus} (Frequency of S0D6_PERφ) = 133.33MHz

136.1.1 Features

136.1.1.1 Error detection

(1) Output an interrupt request every specified time to initiate the routine that checks whether the target module has any failure. The interrupt request is called “Interval Timer Interrupt” that abbreviated “ITI”.

(2) Determine a failure in two steps either as a transient fault or a permanent fault due to a circuit failure or some other causes.

(3) Output a time-out interrupt (TOI) if no ITI is accepted, ITI is not completed or ITI is completed too early during the specified time window.

136.1.1.2 Timers

(1) Interval timer for Runtime Test (Free run timer)

(2) Can be used to initiate the operation routine that checks whether the LSI chip has any failure at the specified time periodically.

(3) Time-out detection timer which detects either time-out error of Runtime Test or FTTI violation.

(4) Detects a time-out error when the time-out detection timer has not been stopped within the specified maximum value by Time-out detection timer time-out cycle register (CNT1_CYCm).

(5) Detects early timer stop when the time-out detection timer has been stopped earlier than the specified minimum value by Time-out detection timer stop minimum cycle register (CNT1_UNSm).

(6) Detects time-out error when time-out detection timer has not been stopped exceeding specified FTTI.

136.1.2 Block Diagram

This module includes the register interface and pin controller. Figure 136.1 show the block diagram of this module.

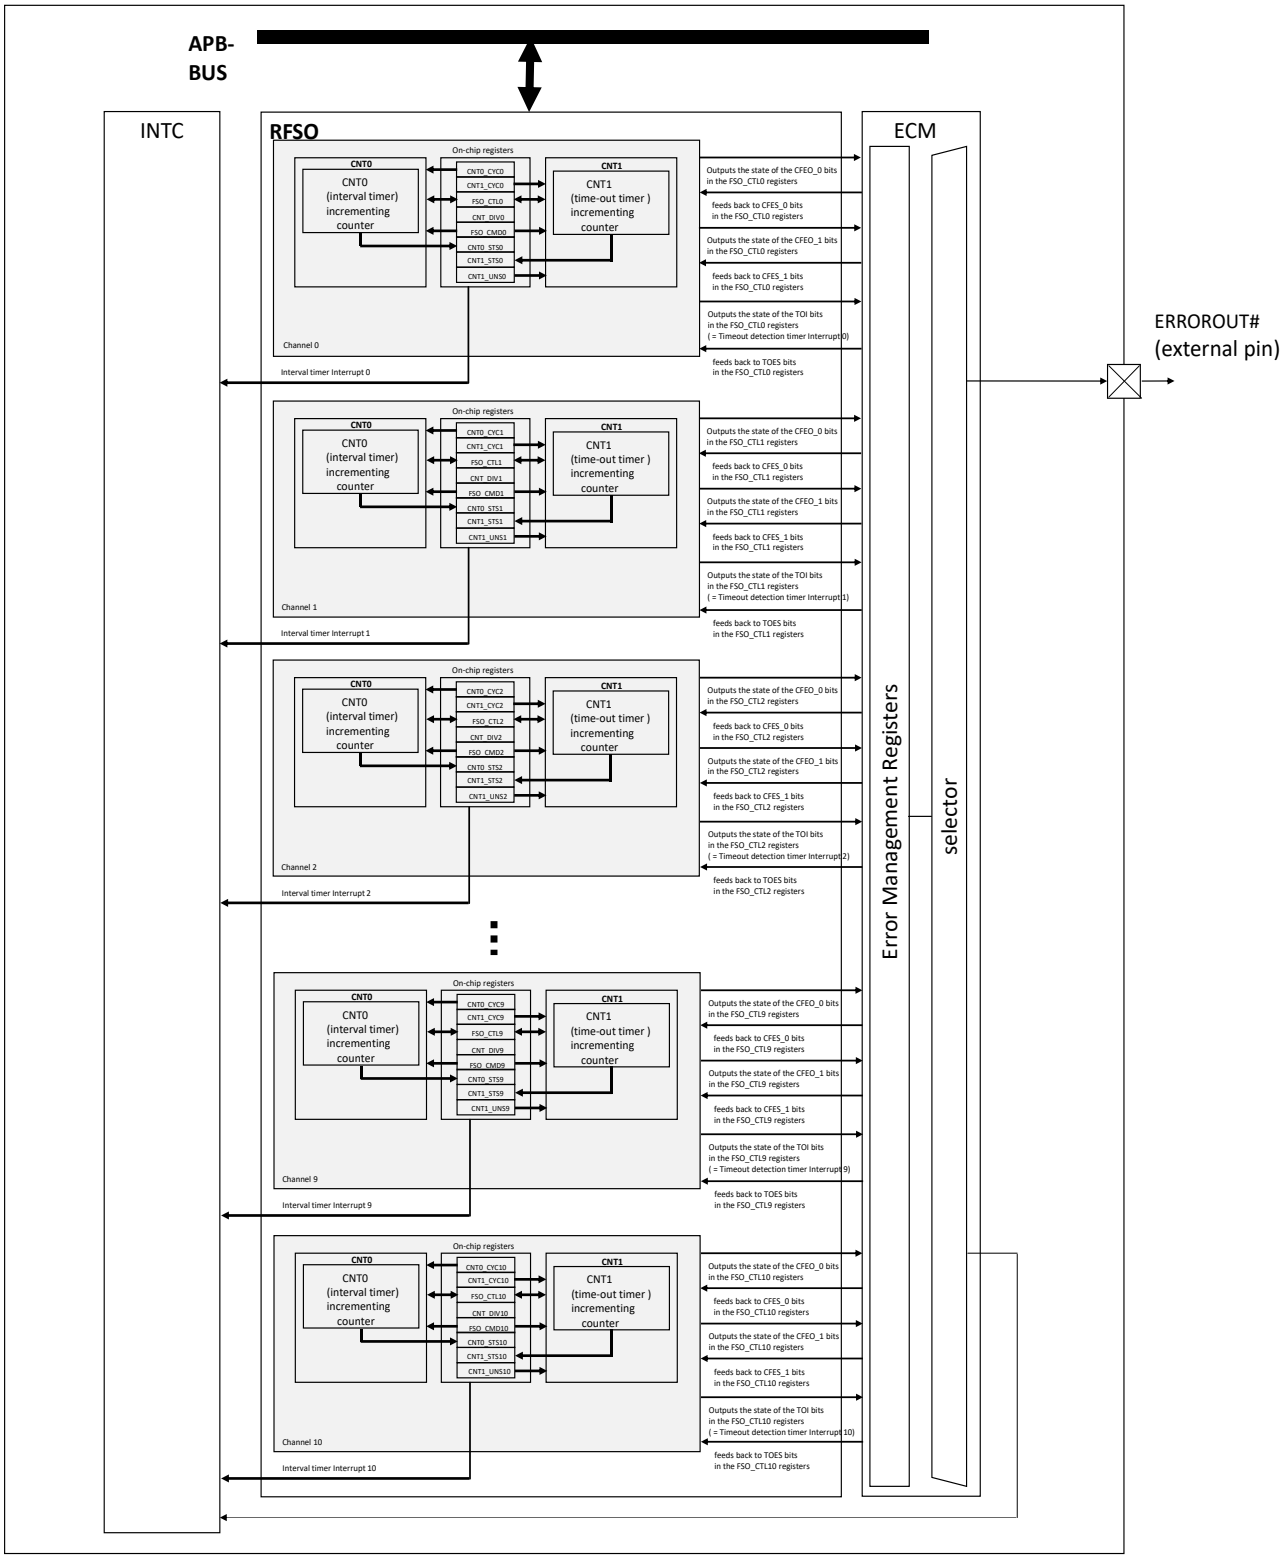


Figure 136.1 Block Diagram

136.1.3 Register Configurations

The base address for each channel of registers of the RFSO is as follows:

Table 136.1 Base Address Configurations

Module Name	Base Address
RFSO 0	H'FFE8 0000
RFSO 1	H'FFE8 1000
RFSO 2	H'FFE8 2000
RFSO 3	H'FFE8 3000
RFSO 4	H'FFE8 4000
RFSO 5	H'FFE8 5000
RFSO 6	H'FFE8 6000
RFSO 7	H'FFE8 7000
RFSO 8	H'FFE8 8000
RFSO 9	H'FFE8 9000
RFSO 10	H'FFE8 A000

Each channel of the RFSO has the registers below.
Table 136.2 shows the register configurations of this module.
Table 136.3 shows the register states in each operating mode.

Table 136.2 Register Configurations

Register Name	Abbreviation	R/W	Offset from Base Address	Access Size
Interval timer cycle register m	CNT0_CYCm	R/W	H' 000	32
Time-out detection timer time-out cycle register m	CNT1_CYCm	R/W	H' 004	32
Control register m	FSO_CTLm	R/W	H' 008	32
Timer counter clock frequency division register m	CNT_DIVm	R/W	H' 00C	32
Command register m	FSO_CMDm	-/WB	H' 010	32
Interval timer status register m	CNT0_STSm	R	H' 014	32
Time-out detection timer status register m	CNT1_STSm	R	H' 018	32
Time-out detection timer operation minimum cycle register m	CNT1_UNSm	R/W	H' 01C	32

Notes: 1. Access to the addresses other than those listed above is prohibited. Otherwise, operation cannot be guaranteed. If read, an undefined value is read.
2. m=0~10

Table 136.3 Register status in each operating mode

Register Name	Abbreviation	Power On Reset by RESET# Pin
Interval timer cycle register m	CNT0_CYCm	H'0000 0000
Time-out detection timer time-out cycle register m	CNT1_CYCm	H'0000 0000
Control register m	FSO_CTLm	H'0000 0000
Timer counter clock frequency division register m	CNT_DIVm	H'0000 0001
Command register m	FSO_CMDm	H'0000 0000
Interval timer status register m	CNT0_STSm	H'0000 0000
Time-out detection timer status register m	CNT1_STSm	H'0000 0000
Time-out detection timer operation minimum cycle register m	CNT1_UNSm	H'0000 0000

Notes: 1. To avoid wrong reset assertion, this module is designed so that reset signals are not asserted by a manual reset or module reset.
2. m=0~10

136.1.4 Connected Module

The base address for each channel of registers of the RFSO is as follows:
Table 136.4 shows the Connected Modules of this module.

Table 136.4 Connected Modules

Module Name	Connected Module Name	Connected Module Function
RFSO	CPG	Provide clock to the RFSO modules (Internal clock 133.33 MHz)
	RESET	Apply a reset to the RFSO target modules
	INTC	Provide interval timer interrupt to INTC
	ECM	Provide time-out detection timer interrupt to ECM

136.2 Register Description

136.2.1 Interval Timer Cycle Register m (CNT0_CYCm) (m = 0 to 10)

CNT0_CYCm sets the periodical cycle value to the interval timer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT0_CYC															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

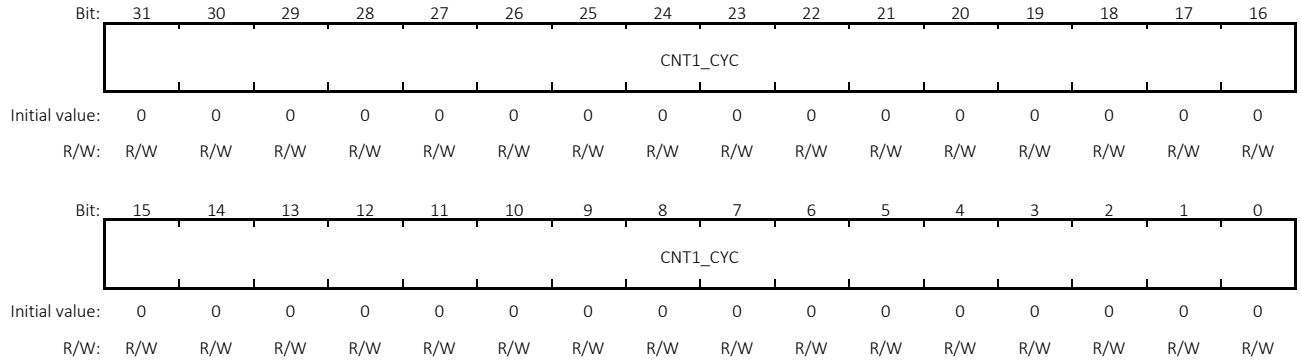
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT0_CYC															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT0_CYC	H'0000 0000	R/W	Specify the periodical cycle value to the interval timer. A Cycle is Timer counter clock interval. H'FFFF FFFF is the Maximum cycle (4294967295=2^32-1). The real time of the period interrupt as follows. Timer counter clock interval × CNT0_CYC = T_{bus} × (CNT_DIV set value) × CNT0_CYC. After this module is started, CNT0 starts incrementing the counter value.

Note: Change of the value of CNT0_CYCm is inhibited during timers are in operation.
Note: Value H'0000 0000 is prohibited

136.2.2 Time-out Detection Timer Time-out Cycle Register m (CNT1_CYCm) (m = 0 to 10)

CNT1_CYCm sets the periodical cycle value to the time-out detection timer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT1_CYC	H'0000 0000	R/W	Specify the periodical cycle value to the time-out detection timer. A Cycle is Timer counter clock interval. The initial value (H'0000 0000) is the Maximum cycle (4294967296=2^32). The real time of the period interrupt as follows. (When CNT1_CYC ≠ H'00000000) Timer counter clock interval × CNT1_CYC = T_{bus} × (CNT_DIV set value) × CNT1_CYC. (When CNT1_CYC = H'00000000) Timer counter clock interval × H'100000000 = T_{bus} × (CNT_DIV set value) × H'100000000. After this module is started, CNT1 starts incrementing the counter value. Note) CNT1_CYC should be set smaller than CNT0_CYC value.

Note: Change of the value of CNT1_CYCm is inhibited during timers are in operation.

136.2.3 Control Register m (FSO_CTLm) (m = 0 to 10)

FSO_CTLm is a control register of this module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KEYCODE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB	-/WB

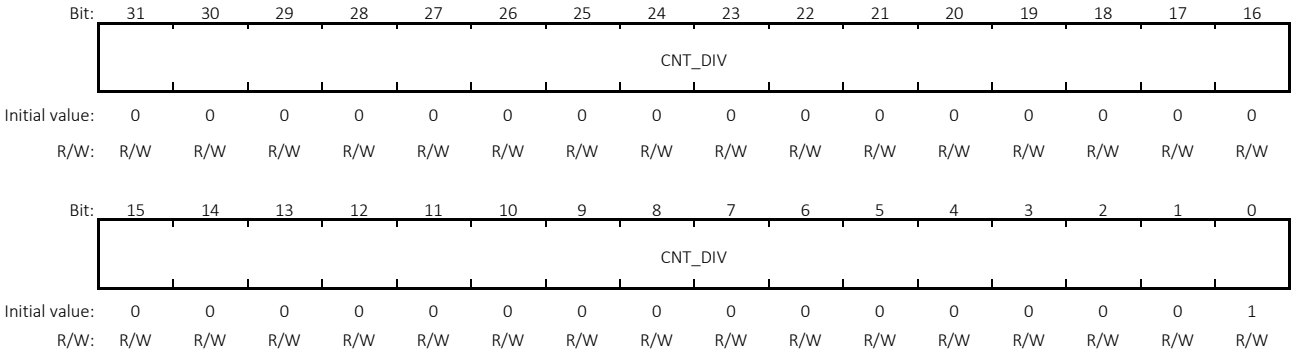
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ITE	TOCUNF	TOI	ITI	TOES	CFES_1	CFEO_1	CFEO_0	CFES_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	KEYCODE	All 0	-/WB	Register write enable code. Set “KEYCODE” to these bits when writing to this register to enable writing to this register. KEYCODE =H’779A.
15 to 10	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	ITE	0	R/W	Enables or disables an interval timer (CNT0) interrupt request. 0: Disables the interrupt. 1: Enables the interrupt.
7	TOCUNF	0	R	Indicates whether a time-out detection timer (CNT1) has stopped when the value of a time-out detection timer (CNT1) is below the lower limit (CNT1_UNSm) 0: A time-out detection timer (CNT1) has stopped when the value of a time-out detection timer (CNT1) is greater than or equal to the lower limit (CNT1_UNSm) 1: A time-out detection timer (CNT1) has stopped when the value of a time-out detection timer (CNT1) is below the lower limit (CNT1_UNSm) Note: When 1 is written in TOC bit of the FSO_CMDm register, this bit is cleared.

Bit	Bit Name	Initial Value	R/W	Description
6	TOI	0	R	Indicates whether a time-out detection timer (CNT1) has stopped under the condition that the value of a time-out detection timer (CNT1) is equal to the upper limit (CNT1_CYCm) or whether a time-out detection timer (CNT1) has stopped under the condition that the value of a time-out detection timer (CNT1) is blew the lower limit (CNT1_UNSm) 0: There is no interrupt. 1: There is an interrupt. (This bit is set when a time-out detection timer (CNT1) has stopped under the condition that the value of a time-out detection timer (CNT1) is blew the lower limit (CNT1_UNSm) or when a time-out detection timer (CNT1) has stopped under the condition that the value of a time-out detection timer (CNT1) is equal to the upper limit (CNT1_CYCm)) Note: When 1 is written in TOC bit of the FSO_CMDm register, this bit is cleared.
5	ITI	0	R	Indicates whether there is an interval timer (CNT0) interrupt request. 0: There is no interrupt. 1: There is an interrupt. (This bit is set when an interval timer (CNT0) has stopped under the condition that the value of an interval timer (CNT0) is equal to the upper limit (CNT0_CYCm)) Note: When 1 is written in ITC bit of the FSO_CMDm register, this bit is cleared. Clear function is independent from the value of ITE.
4	TOES	0	R	Indicates that time-out error status is appropriately output to the ECM module. This bit is cleared when a reset is applied or 1 is written to the TOC bit in the FSO_CMDm register thus clearing the time-out interrupt (TOI). TOES bit is the feed back value from ECM module for TOI bit status of each channels. This function is implemented in consideration of internal disconnection.
3	CFES_1	0	R	Indicates that the CFEO_1 bit status is appropriately output to the ECM module. CFES_1 bit is the feed back value from ECM module for CFEO_1 bit status of each channels. This function is implemented in consideration of internal disconnection.
2	CFEO_1	0	R/W	Sets the expected value verification result during test routine when the CFEO_0 bit is 1. 1 write: When result is different from the expectant value. 0 write: When result agrees with the expectant value.
1	CFEO_0	0	R/W	Sets the expected value verification result during test routine. 1 write: When result is different from the expectant value. 0 write: When result agrees with the expectant value.
0	CFES_0	0	R	Indicates that the CFEO_0 bit status is appropriately output to the ECM module. CFES_0 bit is the feed back value from ECM module for CFEO_0 bit status of each channels. This function is implemented in consideration of internal disconnection.

136.2.4 Timer Counter Clock Frequency Division Register m (CNT_DIVm) (m = 0 to 10)

CNT_DIVm sets the interval timer/time-out detection timer counter clock frequency divisor.

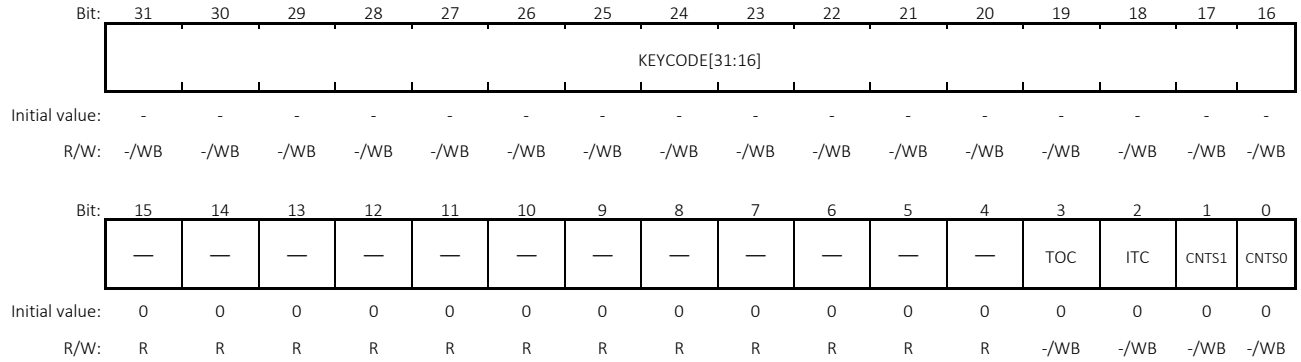


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT_DIV	H'0000 0001	R/W	Set the timer counter clock frequency divisor. Timer counter clock interval = operating clock of module T_{bus} * (CNT_DIV set value). CNT_DIV is not set to H'00000000

Note: Change of the value of CNT_DIVm is inhibited during timers are in operation.

136.2.5 Command Register m (FSO_CMDm) (m = 0 to 10)

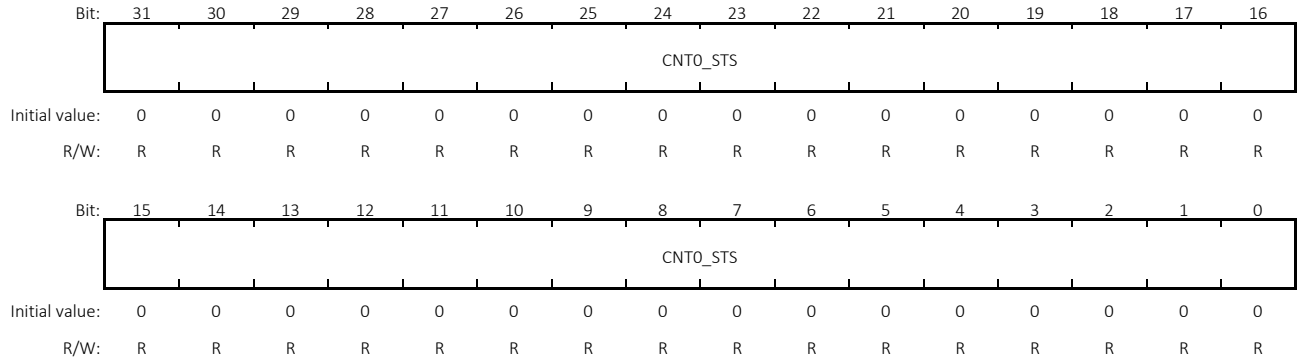
FSO_CMDm activates this module and clears the interrupts.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	KEYCODE	-	-/WB	Register write enable code. Set “KEYCODE” to these bits when writing to this register to enable writing to this register. KEYCODE =H’779A.
15 to 4	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
3	TOC	0	-/WB	Clears a time-out detection timer (CNT1) interrupt. 1 write: Clears the interrupt. 0 write: Invalid. Writing 1 to this bit clears the TOI bit in the FSO_CTLm register to 0. This bit is always read as 0, not an undefined value.
2	ITC	0	-/WB	Clears an interval timer (CNT0) interrupt. 1 write: Clears the interrupt. 0 write: Invalid. Writing 1 to this bit clears the ITI bit in the FSO_CTLm register to 0. This bit is always read as 0, not an undefined value.
1	CNTS1	0	-/WB	Activates or stops the time-out detection timer (CNT1). 1 write: Activates the overrun error timer. 0 write: Stops the overrun error timer. This bit is always read as 0, not an undefined value. Note: When the timer is in operation, current operation is canceled and restarted loading initial value from CNT1_CYCm register by writing 1. When the timer is stopped, nothing occurs by writing 0.
0	CNTS0	0	-/WB	Activates or stops the interval timer (CNT0). 1 write: Activates the interval timer. 0 write: Stops the interval timer. This bit is always read as 0, not an undefined value. Note: When the timer is in operation, current operation is continued even though writing 1. When the timer is stopped, nothing occurs by writing 0.

136.2.6 Interval Timer Status Register m (CNT0_STSm) (m = 0 to 10)

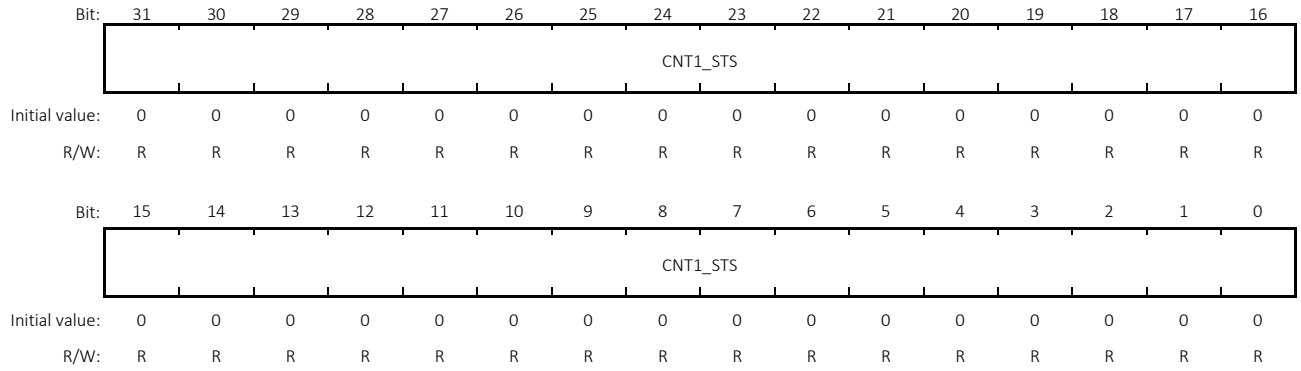
CNT0_STSm indicates the interval timer value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT0_STS	H'0000 0000	R	Indicates the interval timer value.

136.2.7 Time-out Detection Timer Status Register m (CNT1_STSm) (m = 0 to 10)

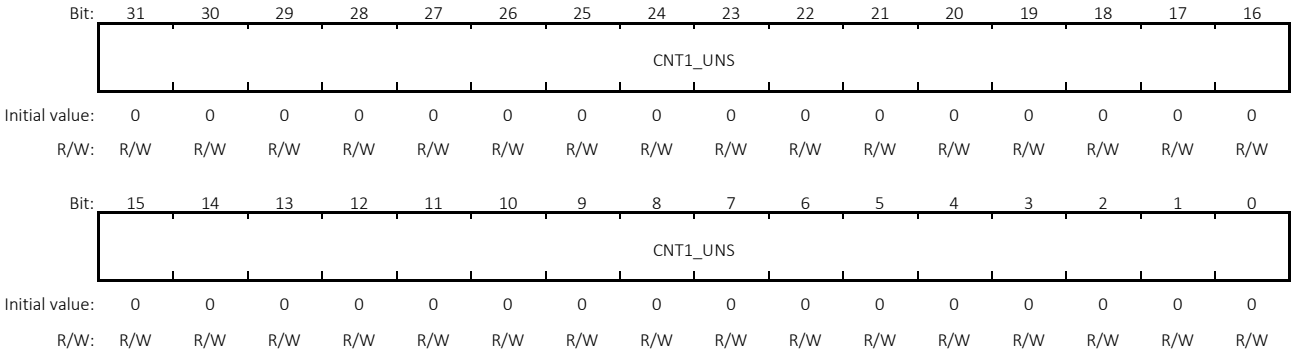
CNT1_STSm indicates the time-out detection timer value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT1_STS	H'0000 0000	R	Indicates the time-out detection timer value.

136.2.8 Time-out detection timer operation minimum cycle register m (CNT1_UNSm) (m = 0 to 10)

Set time-out detection timer operation minimum cycle register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CNT1_UNS	H'0000 0000	R/W	Set minimum cycle value to stop Time-out detection timer. The initial value is 0 cycle. CNT1_UNS is not set to 1.

Note: Change of the value of CNT1_UNSm is inhibited during timers are in operation.

136.5.1 Failure Self-DetectionOutoutput(RFSO)

a) Overview

Please refer to 136.1 Overview.

b) Related Registers

Please refer to 136.1.3 Register Configurations and 136.2 Register Description.

c) Hardware Description

Please refer to 136.3 Operation.

150. SD Card/MMC Interface

150.1 Overview

The SD Card/MMC Interface enables direct connection of SDHI or MMC to this LSI.

150.1.1.1 Features

This LSI has 1 channel SD Card/MMC Interface.
The select setting of SDHI and MMC is unnecessary.

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, and SDR104 transfer modes supported
- SD clock (SDCLK) frequency = internal SD0ϕ frequency/2^n (n = 0 to 9)
  SDCLK = 200 MHz (SDR104)
  SDCLK = 100 MHz (SDR50)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 1
- Card detect function
- Write protect support
- MMC interface (1-bit/4-bit/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS200, and HS400 transfer modes supported
  SDCLK = 200MHz (HS200, HS400)
- High-priority interrupt (HPI) supported
- Alternative Boot operation supported
- Sequencer function (SEQ)
  The SEQ can issue maximum 8 commands sequentially.

Development of the SD-related products needs the conclusion of the following agreement.

SD Host/Ancillary Product License Agreement (SD HALA)

150.1.1.2 Block Diagram

Figure 150.1 shows a block diagram of the SD host interface.

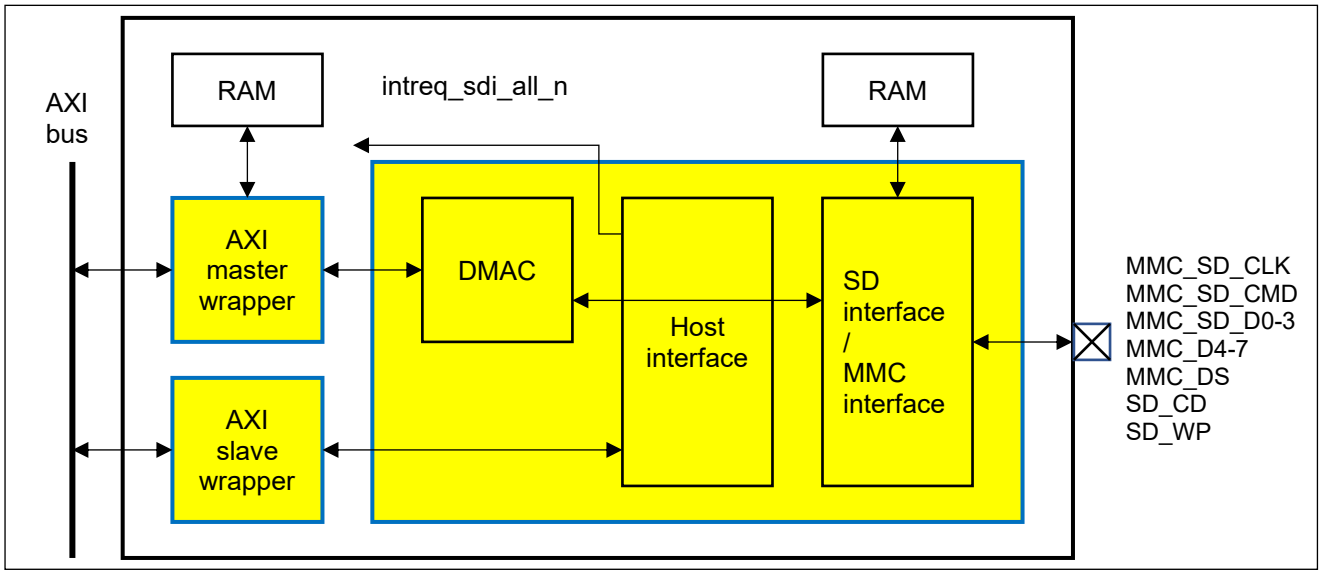

Figure 150.1 Block Diagram of SD Host Interface

150.1.1.3 External Pins

Table 150.1 lists the input and output pins used by the interface. The voltage of the SDHI terminal is variable.
Therefore a power network is separate. When choosing the function of PIO and the other ones, be careful.

Table 150.1 Pin Configuration

Name	Abbreviation	I/O	Function	R-Car V4H **R-Car V4M**
MMC_SD_CLK	–	O	MMC clock	√*2
MMC_SD_CMD	–	I/O	Command/response	√*2
MMC_SD_D0	–	I/O	Data [bit 0]	√*2
MMC_SD_D1	–	I/O	Data [bit 1]	√*2
MMC_SD_D2	–	I/O	Data [bit 2]	√*2
MMC_SD_D3	–	I/O	Data [bit 3]	√*2
MMC_D4	–	I/O	Data [bit 4]	√*3
MMC_D5	–	I/O	Data [bit 5]	√*3
MMC_D6	–	I/O	Data [bit 6]	√*3
MMC_D7	–	I/O	Data [bit 7]	√*3
MMC_DS	–	I	Data Strobe	√*3
SD_CD	–	I	Card detect *1	√
SD_WP	–	I	Write protect *1	√

*1 When a pin is not in use, fix the corresponding signal to High.
*2 This is used by both of SDHI and MMC.
*3 This is used only MMC.

150.1.1.4 Register Configuration

The base address for each interface are as follows. The select setting of SDHI and MMC is unnecessary.
The difference between SDHI and MMC is only the command type by Command type register (SD_CMD).

- SDHI: H'00 EE14 0000
- MMC: H'00 EE14 0000

Note: The pairs of interfaces (SDHI and MMC) can only be used for either the SDHI or MMC interface.

Table 150.2 summaries the registers of the interface.

Table 150.2 Register Configurations

Name	Abbreviation	Address	Access Width	Mirror
Command type register	SD_CMD	H'0000	16/32/64	
Port select register	SD_PORTSEL	H'0008	16/32/64

Name	Abbreviation	Address ([9:0])	Access Size
Hardware adjustment register 7	SCC_TMPPORT7	H'070	32

150.2 Register Description

150.2.1.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to section 150.3.6.15, Example of SD_CMD and MMC_CMD Register Setting.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MD7	0	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer)
14	MD6	0	R/W	00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD host interface -> SD card) 1: Read (SD host interface <- SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	0	R/W	Mode/Response Type
9	MD1	0	R/W	000: Normal mode
8	MD0	0	R/W	The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see section 150.3.6.15, Example of SD_CMD Register Setting to select mode/response type.

Bit	Bit Name	Initial Value	R/W	Description
7	C1	0	R/W	00: CMD
6	C0	0	R/W	01: ACMD
				10: Setting prohibited
				11: Setting prohibited
5	CF45	0	R/W	Command Index
4	CF44	0	R/W	These bits specify Command Format[45:40] (command index).
3	CF43	0	R/W	[Examples]
2	CF42	0	R/W	CMD6: SD_CMD[7:0] = B'0000 0110
1	CF41	0	R/W	CMD18: SD_CMD[7:0] = B'0001 0010
0	CF40	0	R/W	ACMD13: SD_CMD[7:0] = B'0100 1101

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

150.2.1.2 Port Select Register (SD_PORTSEL)

The port select register (SD_PORTSEL) selects the ports for SD cards.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved bits
				These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 10	—	All 0	R	Reserved bits
				These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	NP1	0	R	Number of ports supported for SD cards
8	NP0	1	R	[NP1,NP0] = 01: One port
7 to 4	—	All 0	R	Reserved bits
				These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
3 to 0	—	All 0	R/W	Reserved
				The write value should always be 0.

150.2.1.3 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

- Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.
- SD_ARG

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CF39 to CF8	All 0	R/W	Set command format[39:8] (argument).

- SD_ARG1 (Mirror of SD_ARG[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Fixed 0
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument).

150.2.1.4 Data Stop Register（SD_STOP）

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
18	—	0*1	R/W	Reserved The write value should always be 0.
17	HPIMODE	0*1	R/W	HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode.
16	HPICMD	0*1	R/W*3	HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. • After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. • After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0.
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. • 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) • 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	STP	0*1	R/W	Stop • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. • Set STP to 1 after the response end flag has been set. • Set STP to 0 after the response end flag has been set.

Notes: 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.
3. It is effective only if 1 is written.

150.2.1.5 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT31 to CNT0	All 0	R/W	Number of Transfer Blocks* When H'0000 0001 is set, the number of transfer blocks is 1. : When H'0000 FFFF is set, the number of transfer blocks is 65535. : When H'FFFF FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H'0000 0000 if multiple blocks are to be transferred.

Note: * Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

150.2.1.6 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

- SD_RSP10

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8	All 0	R	Hold the response from the SD card

- SD_RSP1 (Mirror of SD_RSP10[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R39 to R24	All 0	R	Hold the response from the SD card

- SD_RSP32 (Mirror of SD_RSP10[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	R71 to R40	All 0	R	Hold the response from the SD card

- SD_RSP3 (Mirror of SD_RSP32[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R71 to R56	All 0	R	Hold the response from the SD card

- SD_RSP54

Bit	Bit Name	Initial Value	R/W	Description
63 to 56	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
55 to 0	R127 to R72	All 0	R	Hold the response from the SD card

- SD_RSP5 (Mirror of SD_RSP54[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R103 to R88	All 0	R	Hold the response from the SD card

- SD_RSP76 (Mirror of SD_RSP54[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	R127 to R104	All 0	R	Hold the response from the SD card

- SD_RSP7 (Mirror of SD_RSP76[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	R127 to R120	All 0	R	Hold the response from the SD card

Table 150.4 lists the response types and corresponding SD_RSP registers.

Table 150.4 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*
R2[127:8]	SD_RSP54 and SD_RSP10

Response Types	SD_RSP Registers
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note: * The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

150.2.1.7 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	HPIRES	0*2	R/W*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES
15 to 11	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
10	INFO10	Unknown	R	Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1.
9	INFO9	0	R/W*1	SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of SD0φ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of SD0φ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0.
6	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
5	INFO5	Unknown	R	Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0	R/W*1	ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
2	INFO2	0*2	R/W*1	Access End [Setting conditions] • 1. When read access to the buffer is completed in the case of transfer for single block read • 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read • 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 • 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write • 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write • 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 • 7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read • 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write • 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read • 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0[*2]	R/W[*1]	Response End [Setting conditions] • 1. When reception of the response is completed • 2. When transmission of a command without response is completed • 3. When reception of the busy state after R1b response is completed • 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read • 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When a command without data is issued, the command sequence is terminated when the response end bit is set to 1.

Notes: 1. It is effective only if 0 is written.
2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

150.2.1.8 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] • 1. Writing of data to SD_CMD within a command sequence (CBSY=1) • 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0]= B'0000 1100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1*2	R	0: The SD bus (CMD, DAT) is busy. Writing to the SCLKEN and DIV bits in SD_CLK_CTRL is not possible. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
11	—	0	R/W	Reserved The write value should always be 1. There is no problem even if 0 is written.
10	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
9	BWE	0*2	R/W*1	SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] • 1. When SD_BUF is empty at single block transfer • 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] • 1. When 0 is written to BWE • 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3.

Bit	Bit Name	Initial Value	R/W	Description
8	BRE	0*2	R/W*1	SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] • 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer • 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] • 1. When 0 is written to BRE • 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	Unknown	R	SDDAT0 Indicates the SDDAT0 state. 0: SDDAT0 is set to 0. 1: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received though a longer time than 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0 is written to ERR6 The command sequence is halted by the response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] • 1. When SD_BUF is empty while SD_BUF0 is read • 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5

Bit	Bit Name	Initial Value	R/W	Description
4	ERR4	0[*2]	R/W[*1]	SD_BUF Illegal Write Access [Setting conditions] • 1. When data is written to SD_BUF0 while it is not in the data read/write command state • 2. When data is written to SD_BUF0 while SD_BUF is full • 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length • 4. When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.
3	ERR3	0[*2]	R/W[*1]	Data Timeout (except response timeout) [Setting conditions] • 1. After R1b response, the busy state (SDDAT0 = 0) continues for longer than Ncycle. • 2. After CRC status, the busy state (SDDAT0 = 0) continues for longer than Ncycle. • 3. After write data, the CRC status is not received though Ncycle has elapsed. • 4. After read command, read data is not received though a longer time than Ncycle has elapsed. • 5. After CMD12 has been issued within a command sequence, the busy state (SDDAT0 = 0) for longer than Ncycle continues. • 6. After the reception of read data, read data for the next block are not received though a longer time than Ncycle has elapsed. • 7. After release of the read wait state, read data for the next block are not received though a longer time than Ncycle has elapsed. [Clearing condition] When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0[*2]	R/W[*1]	END Error [Setting conditions] • 1. When an error occurs in the response length (and the end bit has not been detected) • 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) • 3. When an error occurs in the CRC status length (and the end bit has not been detected) • 4. An error in the length of a response to a command issued within a command sequence*[5] (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.[*4]

Bit	Bit Name	Initial Value	R/W	Description
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] • 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') • 2. When a CRC error occurs in the read data • 3. When a CRC error occurs in the response • 4. A CRC error in the response to a command issued within a command sequence *5 [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting conditions] • 1. The command index of the transmitted command differing from the command index of the received response • 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Notes: 1. It is effective only if 0 is written.
2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.
4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing.
5. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

150.2.1.9 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	IMASK16	1	R/W	HPIRES interrupt masked
15 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
0	IMASK0	1	R/W	INFO0 interrupt masked

150.2.1.10 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
11	—	1	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. There is no problem even if 1 is written.
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

150.2.1.11 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	—	0	R/W	Reserved The write value should always be 0.
15 to 11	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	—	0*1	R/W	Reserved The write value should always be 0.
9	SDCLK OFFEN	0	R/W	SD Clock (SD_CLK) Output Automatic Control Enable 0: Automatic control for SD clock (SD_CLK) output is disabled. 1: Automatic control for SD clock (SD_CLK) output is enabled. This function of automatic control for SD clock (SD_CLK) output causes SD_CLK output only within a command sequence. The timing with which SD_CLK output starts and stops is as follows. SD_CLK output starts after writing to SD_CMD. SD_CLK output stops when 8 cycles of SD_CLK have elapsed after the end of the command sequence. In addition, SD_CLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0*1	R/W*2	SD Clock (SD_CLK) Output Control Enable 0: SD clock (SD_CLK) output is disabled. The SD_CLK signal is fixed 0. 1: SD clock (SD_CLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SD_CLK)
6	DIV6	0	R/W*2	B'1000 0000: SDϕ/512
5	DIV5	1	R/W*2	B'0100 0000: SDϕ/256
4	DIV4	0	R/W*2	B'0010 0000: SDϕ/128
3	DIV3	0	R/W*2	B'0001 0000: SDϕ/64
2	DIV2	0	R/W*2	B'0000 1000: SDϕ/32
1	DIV1	0	R/W*2	B'0000 0100: SDϕ/16
0	DIV0	0	R/W*2	B'0000 0010: SDϕ/8 B'0000 0001: SDϕ/4 B'0000 0000: SDϕ/2 B'1111 1111: SDϕ Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[7:0] to B'1111 1111.

Notes: 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Notes on when setting the SD clock (SDCLK) to SDϕ (DIV[7:0] = B'1111 1111)

When changing the setting of bits DIV[7:0] to B'1111 1111, or from B'1111 1111 to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)
(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)
(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to B'1111 1111 after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

150.2.1.12 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note: * Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

150.2.1.13 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	WIDTH	0*1	R/W	Bus width*2 {WIDTH,WIDTH8} = 01: 8-bit width {WIDTH,WIDTH8} = 00: 4-bit width {WIDTH,WIDTH8} = 10,11: 1-bit width In the case of data transfer in HS400 mode (HS400 bit in SDIF_MODE = 1), do not set this bit to 1. In the case of writing of one-byte block, 8-bit width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	—	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13	WIDTH8	0*1	R/W	Bus width*2 See the description of the WIDTH bit.
12 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
9	EXTOP	0*1	R/W	Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{13} to SDCLK*2^{27}. 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{14} to SDCLK*2^{28}.
8	TOUTMASK	0*1	R/W	Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.
7	TOP27	1*1	R/W	Timeout Counter*2
6	TOP26	1*1	R/W	0000: SDCLK*2^{13}
5	TOP25	1*1	R/W	0001: SDCLK*2^{14}
4	TOP24	0*1	R/W	: :
				1101: SDCLK*2^{26}
				1110: SDCLK*2^{27}
				1111: Setting prohibited
3	CTOP24	1*1	R/W	Card Detect Time Counter
2	CTOP23	1*1	R/W	0000: SDϕ 2^{10}
1	CTOP22	1*1	R/W	0001: SDϕ *2^{11}
0	CTOP21	0*1	R/W	: :
				1101: SDϕ *2^{23}
				1110: SDϕ *2^{24}
				1111: Setting prohibited

Notes: 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

150.2.1.14 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
63 to 15	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
14	E14	0*1	R	These bits hold the CRC status. (normal: 010)
13	E13	1*1		
12	E12	0*1		
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

Notes: 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

150.2.1.15 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
63 to 7	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	E6	0*1	R	Set to 1 when the busy state continues for longer than Ncycle after the CRC status
5	E5	0*1	R	Set to 1 when the CRC status is not received though a longer time than Ncycle has elapsed after data writing
4	E4	0*1	R	Set to 1 when read data is not received though a longer time than Ncycle has elapsed after read command. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after R1b response.
1	E1	0*1	R	Set to 1 when the response to a command issued within a command sequence*2 is not received though a longer time than 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received though a longer time than 640 cycles of SDCLK have elapsed.

Notes: 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

150.2.1.16 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF31 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

Note: When using the DMAC, the bus width should be fixed at 64 bits.

150.2.1.17 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	C52PUB	0	R/W	SDIO None Abort • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1. • Set C52PUB to 1 after the response end flag has been set.

Bit	Bit Name	Initial Value	R/W	Description
8	IOABT	0	R/W	SDIO Abort • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. • Set IOABT to 1 after the response end flag has been set. • Set IOABT to 0 after the access end flag has been set.
7 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	IOMOD	0	R/W	SDIO Mode * 0: Disables the SD host interface to receive SDIO interrupt from the SDIO card 1: Enables the SD host interface to receive SDIO interrupt from the SDIO card

Note: * Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

150.2.1.18 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] • 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. • 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	All 0*2	R/W	Reserved The write value should always be 1. The value may change during operation.
0	IOIRQ	0*2	R/W*1	[Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3

Notes: 1. It is effective only if 0 is written.
2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

150.2.1.19 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R/W	Reserved The write value should always be 1.
1	—	1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

150.2.1.20 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 13	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
12	—	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. There is no problem even if 0 is written.
11, 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	—	All 0	R/W	Reserved The write value should always be 0.
7, 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	—	0	R/W	Reserved The write value should always be 0.
4	—	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. There is no problem even if 0 is written.
3, 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer * 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled. At the SD_BUF read/write DMA transfer, set DMASDRW to 1 before setting SD_CMD.
0	—	0	R/W	Reserved The write value should always be 0.

Note: * Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

150.2.1.21 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD host interface and before attempting access to the other registers.

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. There is no problem even if 0 is written.
1	—	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. There is no problem even if 0 is written.
0	SDRST	1	R/W	Software Reset of SD Interface Unit 0: Reset 1: Reset released

150.2.1.22 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	UR7	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
14	UR6	1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5 to UR4	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0	H'D	R	Version of Renesas' IP
7 to 0	IP7 to IP0	H'10	R	Version of introductory IP

150.2.1.23 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	BUSWIDTH	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1.
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	ENDIAN	0	R/W	SD_BUF0 data swap
0	WMODE	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access

Notes: 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.
2. When using the DMAC, the bus width should be fixed at 64 bits.

150.2.1.24 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register (SDIF_MODE) specifies HS400 mode.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	—	0*1	R/W	Reserved The write value should always be 0.
8	NOCHKCR	0*1	R/W	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	HS400	0*1	R/W	HS400 Mode Select*2 0: Normal mode (default, high speed, or SDR) 1: HS400 mode (DDR mode) Set this bit to 0 when the SD clock division ratio is specified as 1:1 (bits DIV[7:0] in SD_CLK_CTRL are set to 11111111).

Notes: 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

150.2.1.25 DMAC Interrupt Flag Register 1 (DM_CM_INFO1)

The DMAC interrupt flag register 1 (DM_CM_INFO1) indicates the status of DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
20	DTRANEND1	0*1	R/W	DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1
19, 18	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17	—	0*1	R/W	Reserved The write value should always be 0.
16	DTRANEND0	0*2	R/W	DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEQSUSPEND	0	R/W	Interrupt of command sequencer process suspend This bit is asserted, when SDIP goes to suspend mode by DM_CM_CTRL.SEQ_SUSPEND at DM_CM_SEQ_CTRL.SEQ_TYPE = 01.
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQEND	0*3	R/W	Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND

Notes: 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.
2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.
3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

150.2.1.26 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 21	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
20	DTRANEND1_MASK	1	R/W	DTRANEND1 interrupt masked
19, 18	—	All 1	R/W	Reserved The write value should always be 1.
17	—	0	R/W	Reserved The write value should always be 1.
16	DTRANEND0_MASK	1	R/W	DTRANEND0 interrupt masked
15 to 9	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
8	SEQSUSPEND_MASK	0	R/W	Interrupt mask for DM_CM_INFO1.SEQSUSPEND
7 to 1	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQEND_MASK	1	R/W	SEQEND interrupt masked

150.2.1.27 DMAC Interrupt Flag Register 2 (DM_CM_INFO2)

The DMAC interrupt flag register 2 (DM_CM_INFO2) indicates the status of DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
19, 18	—	All 0	R	Reserved The write value should always be 0.
17	DTRANERR1	0*1	R/W	DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1
16	DTRANERR0	0*2	R/W	DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0
15 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQERR	0*3	R/W	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR

Notes: 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.
2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.
3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

150.2.1.28 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 20	—	All 1	R	Reserved bits These bits are always read as 1 The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
19, 18	—	All 1	R	Reserved The write value should always be 1.
17	DTRANERR1_MASK	1	R/W	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1	R/W	DTRANERR0 interrupt masked
15 to 1	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQERR_MASK	1	R/W	SEQERR interrupt masked

150.2.1.29 DMAC Sequencer Set Register (DM_CM_SEQ_REGSET)

This register indicates a DMAC(SEQ) context, table setting register.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	TABLE_NUM	All 0	R/W	Sequencer Table number 0 : sequencer table 0 1 : sequencer table 1 Software sets the number of sequencer table storing the value of DM_SEQ_***.
7 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1 to 0	CTXT_NUM	All 0	R/W	Context number (0~3) Software sets the number of context storing the value of DM_SEQ_***.

150.2.1.30 DMAC Sequencer Control Register (DM_CM_SEQ_CTRL)

This register indicates a DMAC(SEQ) control register.

Bit	Bit Name	Initial Value	R/W	Description
63 to 29	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
28	SEQ_TABLE	0	R/W	This bit indicates sequencer table number for queuing command.
27 to 25	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24	T_NUM	All 0	R/W	Maximum Table number for SDmultiple command stack This bit indicates the maximum number of sequencer table (SEQ_TYPE=01).
23 to 18	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17 to 16	SEQ_TYPE	All 0	R/W	Sequencer mode selector 00: Not use Sequencer 01: SD multiple command stack 10: - (Setting prohibit) 11: - (Setting prohibit)
15 to 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13 to 12	START_NUM	All 0	R/W	These bits indicate start number of context for queuing command (0-3). Set START_NUM is less than or equal to END_NUM. SDIP stores START_NUM to the table indicated by SEQ_TABLE, when software sets these bits. SDIP outputs START_NUM of the table indicated by SEQ_TABLE, when software reads these bits.
11 to 10	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9 to 8	END_NUM	All 0	R/W	These bits indicate end number of context for queuing command (0-3). Set END_NUM is greater than or equal to START_NUM. SDIP stores END_NUM to the table indicated by SEQ_TABLE, when software sets these bits. SDIP outputs END_NUM of the table indicated by SEQ_TABLE, when software reads these bits.
7	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	PRIORITY_MODE	0	R/W	Priority control mode selector for SD multiple command stack *1 0: SDIP executes in order, from table0 to table1 (table 0 -> table 1). 1: SDIP executes in order of priority (table1 is higher priority than table0). Don't switch this mode during sequencer process.
5 to 4	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
3	SEQ_SUSPEND	0	R/W	This bit triggers to suspend sequencer process SDIP clears this bit automatically, when SDIP goes to suspend mode or DM_CM_INFO1.SEQEND interrupt is occurred.
2	SEQ_RESUME	0	R/W	This bit triggers to resume sequencer process SDIP clears this bit automatically, when SDIP recovers from suspend mode. Don't set this bit to 1 when SDIP is not in suspend mode.

Bit	Bit Name	Initial Value	R/W	Description
1	—	0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQ_START	0	R/W	This bit triggers to queuing command. SDIP clears this bit automatically, when SDIP queues command. SDIP queues command to the table whose number is set by SEQ_TABLE at SEQ_TYPE=01. Start number and end number of context for queuing command are set by START_NUM and END_NUM.

150.2.1.31 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

This register indicates a DMAC(DTRAN) mode select register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17 to 16	CH_NUM	All 0	R/W	DMAC channel selector 00 : SD down stream 01 : SD up stream 10, 11: - (Setting prohibit)
15 to 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 4	BUS_WIDTH	All 0	R/W	Bus width selector 00: - (Setting prohibit) 01: - (Setting prohibit) 10: - (Setting prohibit) 11: 64-bit [default] These bits are common set for all channels.
3 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	ADDR_MODE	0	R/W	System address mode selector 0: fixed address 1: address increment These bits are common for all channels.

150.2.1.32 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

This register indicates a DMAC(DTRAN) control register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	—	0	R/W	Reserved The write value should always be 0.
7 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	DM_START	0	R/W	DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

150.2.1.33 DMAC Reset Register (DM_CM_RST)

The Initial value should be written on each bit not in use now for the future extended specification.
High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
9 to 8	DTRANRST	All 0	R/W	When software sets this bit to 0, SDIP executes soft reset to control FF of each channel. When software sets this bit to 1, SDIP releases soft reset. DTRANRST[0]: control FF of channel 0, 1 Set this bit to 0 for Error recovery (for DM_CM_INFO2.DTRANERR). Set this bit to 0 only for the purpose mentioned above, otherwise the SDIP will not accurately operate.
7 to 1	—	All 1	R	Reserved bits These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQRST	0	R/W	When software sets this bit to 0, SDIP executes soft reset to control FF of sequencer. When software sets this bit to 1, SDIP releases soft reset. Set this bit to 0 for Error recovery (for DM_CM_INFO2.SEQERR). Set this bit to 0 only for the purpose mentioned above, otherwise the SDIP will not accurately operate.

150.2.1.34 DMAC Status Register (DM_CM_SEQ_STAT)

This register outputs the status register of sequencer process. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1 to 0	SEQTBSTS	All 0	R/W	busy flag of sequencer process These bits indicate that sequencer process is busy or not for each table (SEQTBSTS[1 :0]={table1, table0}). These bits are asserted from software sets DM_CM_SEQ_CTRL.SEQ_START=1 to command sequencer process completion. 0: not busy 1: busy

150.2.1.35 DMAC Transfer Address Register (DM_DTRAN_ADDR)

This register indicates system memory address(forwarding/source). This register is indirect register. SDIP stores in context indicated by DM_CM_DTRAN_MODE.CH_NUM, when software sets this register. SDIP outputs the value of context indicated by DM_CM_DTRAN_MODE.CH_NUM, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 7	DADDR	All 0	R/W	destination address / source address (128 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length (more detail, refer to chapter 5) is less than or equal to 2^32.
6 to 0	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

150.2.1.36 DMAC Sequencer Command Register (DM_SEQ_CMD)

This register indicates a command controller register for sequencer in DM_CM_SEQ_CTRL.SEQ_TYEP=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	PRIORITY_MASK	0	R/W	Priority Mask for SD multiple command stack When software sets this bit to 1, SDIP goes to high priority sequencer table after current context is completed.
15 to 14	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
13	MULTI	0	R/W	Selects Single or Multiple block transfer 0: single block transfer (byte mode) 1: multiple block transfer (block mode)
12	DIO	0	R/W	Selects Write or Read transfer 0: write transfer 1: read transfer
11	CMDTYP	0	R/W	Selects the command with data or without data. 0: without data 1: with data
10 to 8	RESTYP	All 0	R/W	Response Type These bits select Response type as shown below. 000 : Not Specified 011 : No Response 100 : R1, R5, R6, R7 101 : R1b, R5b 110 : R2 111 : R3, R4 Others : Reserved(Setting prohibit)
7	NONAUTOSTP	0	R/W	UHS-I only 0: issue Auto CMD12 1: not issue Auto CMD12
6	APP	0	R/W	indicator for application command 0: regular command 1: application command
5 to 0	INDEX	All 0	R/W	Command Index

150.2.1.37 DMAC Sequencer Argument Register (DM_SEQ_ARG)

This register indicates a command argument register for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	ARG	All 0	R/W	command argument

150.2.1.38 DMAC Sequencer Size Set Register (DM_SEQ_SIZE)

This register indicates the number of bytes per sector register for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	SIZE	All 0	R/W	Number of bytes per sector (byte unit) Set the value which is equal to or more than 8 and a power-of-two to this register at DM_SEQ_CMD.MULTI=1. Note that DM_SEQ_SIZE * DM_SEQ_SECCNT is less than 2^32.

150.2.1.39 DMAC Sequencer Count Set register (DM_SEQ_SECCNT)

This register indicates the number of sector counts register for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT	All 0	R/W	The number of sector counts This register is invalid at DM_SEQ_CMD.MULTI=0. Note that DM_SEQ_SIZE * DM_SEQ_SECCNT is less than 2^32.

150.2.1.40 DMAC Sequencer Response Register (DM_SEQ_RSP)

This register indicates the expected value of argument of command response for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by

DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	RSP	All 0	R/W	The expected value for the argument of response. When DM_SEQ_CMD.{MULTI,CMDTYP,NONAUTOSTP}=110, SDIP uses the value of this register to the expected value for the argument of response both of data transfer command and Auto CMD12.

This register is not supported to R2 type response.

150.2.1.41 DMAC Sequencer Response Check register (DM_SEQ_RSP_CHK)

This register indicates the bit of comparing expected value of argument of command response for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	RSP_CHK	All 0	R/W	This register indicates the bit which performs comparison with expected value for the argument of response. 0: SDIP does not compare. [default] 1: SDIP compares DM_SEQ_RSP and actual read data. When DM_SEQ_CMD.{MULTI,CMDTYP,NONAUTOSTP}=110, SDIP uses the value of this register to the expected value for the argument of response both of data transfer command and Auto CMD12.

150.2.1.42 DMAC Sequencer Address Register (DM_SEQ_ADDR)

This register indicates system memory address (forwarding/source) for sequencer in DM_CM_SEQ_CTRL.SEQ_TYPE=01. This register is indirect register. SDIP stores in context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software sets this register. SDIP outputs the value of context indicated by DM_CM_SEQ_REGSET.{TABLE_NUM, CTXT_NUM}, when software reads this register. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 7	SADDR	All 0	R/W	destination address / source address (128 byte unit) Note that the value of DM_SEQ_ADDR + transfer data length (more detail, refer to chapter 5) is less than 2^32.
6 to 0	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

150.2.1.43 Initial Setting Register (SCC_DTCNTL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	TAPNUM7 to TAPNUM0	H'0A	R/W	SCC Sampling Clock Selection Width When the SD clock frequency obtained by setting DIV7 to DIV0 in the SD_CLK_CTRL register to 0xFF (1:1 mode) is 200 MHz, set these bits to H'08.
15 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	TAPEN	0	R/W	SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled.

150.2.1.44 Sampling Clock Position Setting Register (SCC_TAPSET)

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	TAPSET7 to TAPSET0	H'00	R/W	SCC Sampling Clock Position ▪ Set the tuning result in the range from 0 to TAPNUM-1.

150.2.1.45 Sampling Clock Selection Register (SCC_CKSEL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DTSEL	0	R/W	Sampling Clock Selection 0: An SCC sampling clock is not used (other than SDR104, HS200, HS400). 1: An SCC sampling clock is used (SDR104, HS200, HS400). • For SDR104, HS200 and HS400, set DTSEL to 1. • For SDR104 and HS200, set DIV7 to DIV0 in the SD_CLK_CTRL register to H'FF (1:1 mode). • For HS400, set DIV7 to DIV0 in the SD_CLK_CTRL register to H'00 (SDϕ/2 mode). • When this bit is switched, stop the SD clock output from the SD host interface (set SCLKEN in SD_CLK_CTRL to 0).

150.2.1.46 Sampling Clock Position Correction Register (SCC_RVSCNTL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	TAPSEL7 to TAPSEL0	H'00	R	SCC Sampling Clock Position Display • Displays the SCC sampling clock position selected by hardware. • After RVSEN has been set to 1, the value may differ from that of TAPSET.
7 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	RVSW	0	R/W	This bit is read as 0. The write value should be 0.
0	RVSEN	0	R/W	SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. • When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD host interface. • However, when RVSERR is 1, this module does not correct the SCC sampling clock position. • While tuning is being performed, set RVSEN to 0.

150.2.1.47 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RVSERR	0	R/W	SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. • If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. • Ignore this bit while tuning is being performed. • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
1	REQTAPUP	0	R/W	SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	REQTAPDWN	0	R/W	SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

150.2.1.48 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that data pins, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	DT2NESET7 to DT2NESET0	H'04	R/W	Hardware Adjustment 1 The following is the recommended setting value for each SD_CLK frequency. This bit must be changed from its initial value. SDR104 mode ： H'03 HS200 mode ： H'03 HS400 mode ： H’03
7 to 0	DT2NSSET7 to DT2NSSET0	H'01	R/W	Hardware Adjustment 2 The following is the recommended setting value for each SD_CLK frequency. This bit must be changed from its initial value. SDR104 mode ：H'00 HS200 mode ： H'00 HS400 mode ： H'00

150.2.1.49 Hardware Adjustment Register 2 (SCC_TMPPORT2)

Bit	Bit Name	Initial Value	R/W	Description
31	HS400EN	0	R/W	Set this bit to 1 to select operation of this module in HS400 mode. 0: Disables HS400 mode. 1: Enables HS400 mode.
30 to 5	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
4	HS400OSEL	0	R/W	Set this bit to 1 to select operation of this module in HS400 mode. 0: Disables HS400 data output timing. 1: Enables HS400 data output timing.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

150.2.1.50 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24 to 16	CMPNGU	All 0	R/W	Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register
15 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8 to 0	CMPNGD	All 0	R/W	Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register

150.2.1.51 Hardware Adjustment Register 3 (SCC_TMPPORT3)

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1 to 0	ofsel[1-0]	10	R/W	Select offset value of 90 degree phase shifter for HS400: 00 : max (offset=3) 11 : min (offset=0)

150.2.1.52 Hardware Adjustment Register 4 (SCC_TMPPORT4)

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	dll_acc_start	All 0	R/W	DLL(90 degree phase shifter) register Access Start 0 : register access stop 1 : register access start

150.2.1.53 Hardware Adjustment Register 5 (SCC_TMPPORT5)

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	dll_rw_sel	All 0	R/W	DLL(90 degree phase shifter) register read/write select 0 : Write 1 : Read
7 to 6	—	All 0	R	Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5 to 0	dll_addr[5-0]	All 0	R/W	DLL(90 degree phase shifter) register address

150.2.1.54 Hardware Adjustment Register 6 (SCC_TMPPORT6)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	dll_wdata[31-0]	All 0	R/W	DLL(90 degree phase shifter) register write data

150.2.1.55 Hardware Adjustment Register 7 (SCC_TMPPORT7)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	dll_rdata[31-0]	All 0	R/W	DLL(90 degree phase shifter) register read data

150.3 Operation

150.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1) The SD host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see figures 150.2, 150.3 and 150.4.)
2) The receive data is stored in SD_BUF of the SD host interface. (SD_BUF store data: see Figure 150.5)
3) The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see Figure 150.6)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the HOST_MODE. (See Table 150.5)

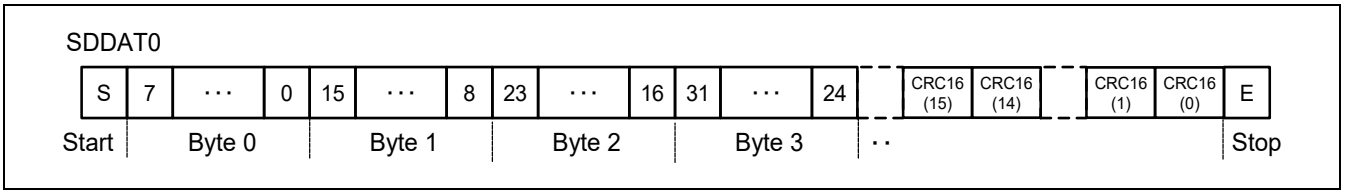

Figure 150.2 SDDAT in 1-Bit Width Mode

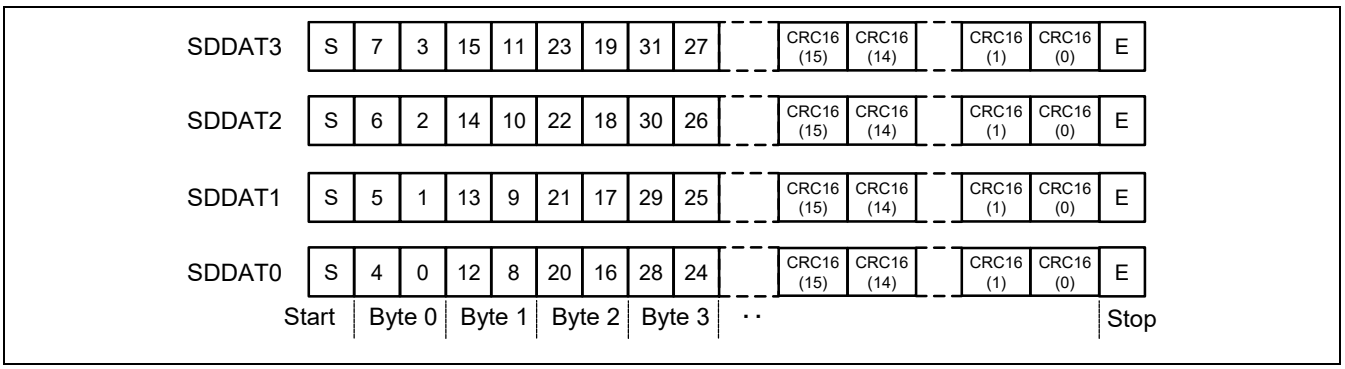

Figure 150.3 SDDAT in 4-Bit Width Mode

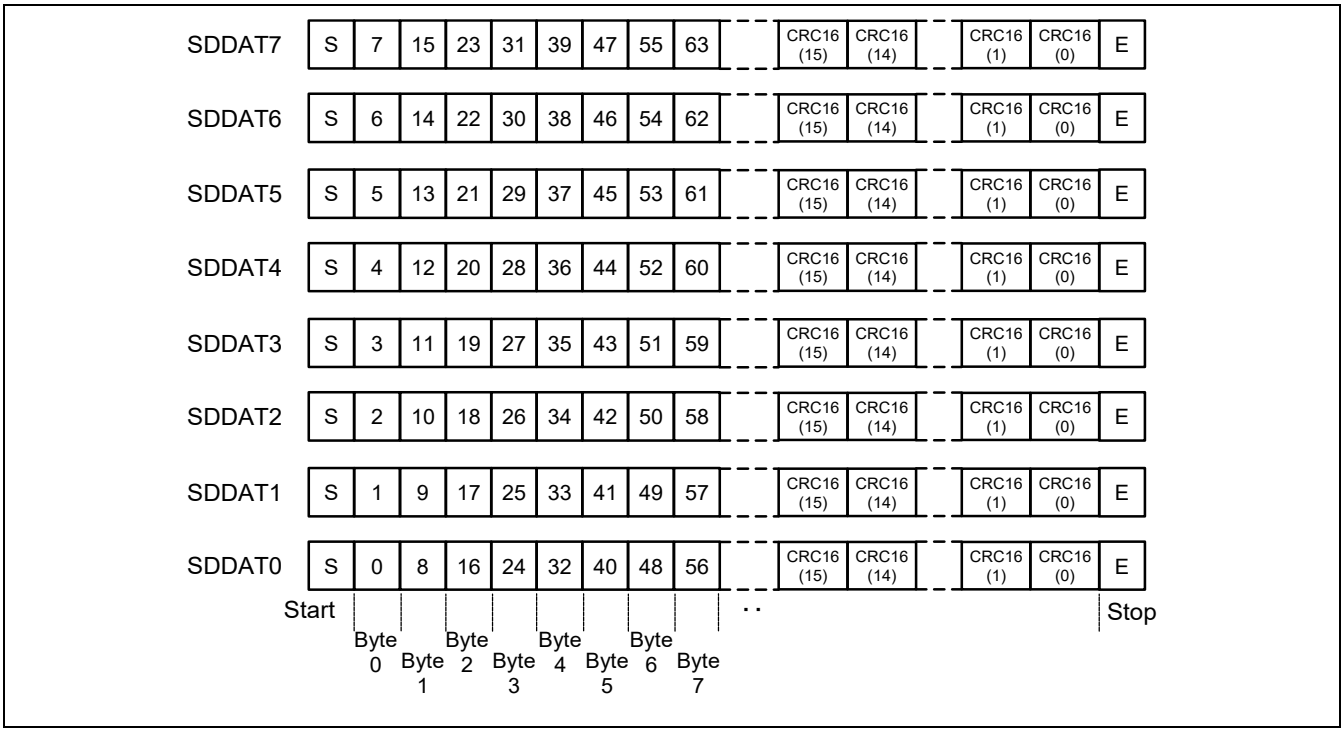

Figure 150.4 SDDAT in 8-Bit Width Mode

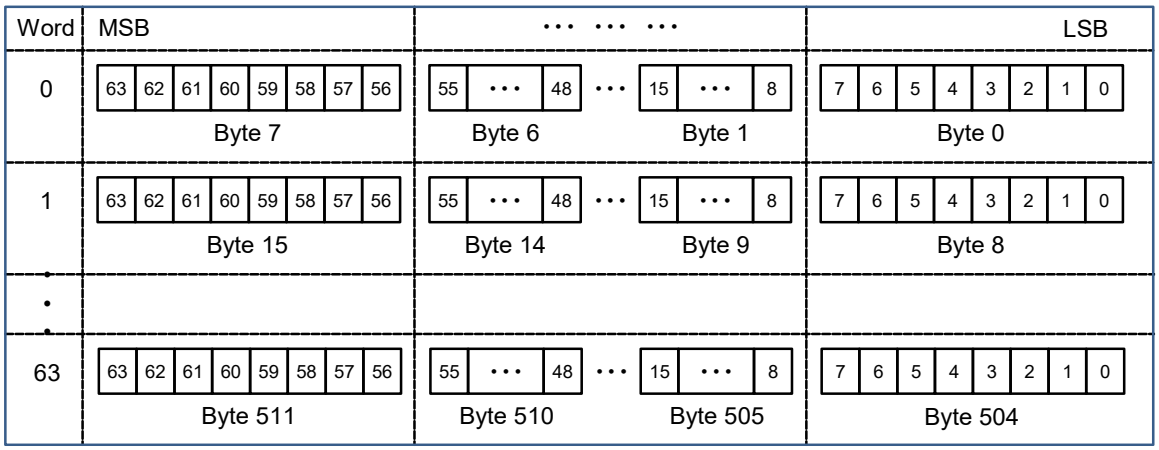

Figure 150.5 SD_BUF Store Data

Table 150.5 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	H'0123456789ABCDEF
0	0	1	H'EFCDAB8967452301
1	1	0	H'89ABCDEF (1st) H'01234567 (2nd)
1	1	1	H'EFCDAB89 (1st) H'67452301 (2nd)
1	0	0	H'CDEF (1st) H'89AB (2nd) H'4567 (3rd) H'0123 (4th)
1	0	1	H'EFCD (1st) H'AB89 (2nd) H'6745 (3rd) H'2301 (4th)

Notes: 1. The name of a bit in HOST_MODE.
2. When the data stored in SD_BUF is H'0123456789ABCDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(i) Issuing CMD11

Perform command sequence processing of CMD11.

(ii) Stopping the SD clock (a)

Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop* the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

Note: When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(iii) Checking the value of SDDAT

Check that the DAT0 bit in the SD_INFO2 register is 0.

(iv) Changing the electric potential of the host device

Change the electric potential of the LSI, which is supplied to the VDDQVA_SD pin, from 3.3 V to 1.8 V.

(v) Starting supply of the SD clock (b)

After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(vi) Checking the value of SDDAT

After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

150.3.2 Card Detect/Write Protect

(1) Card Detect

The SD host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

  Figure 150.6 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

  [Card insertion]

  ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

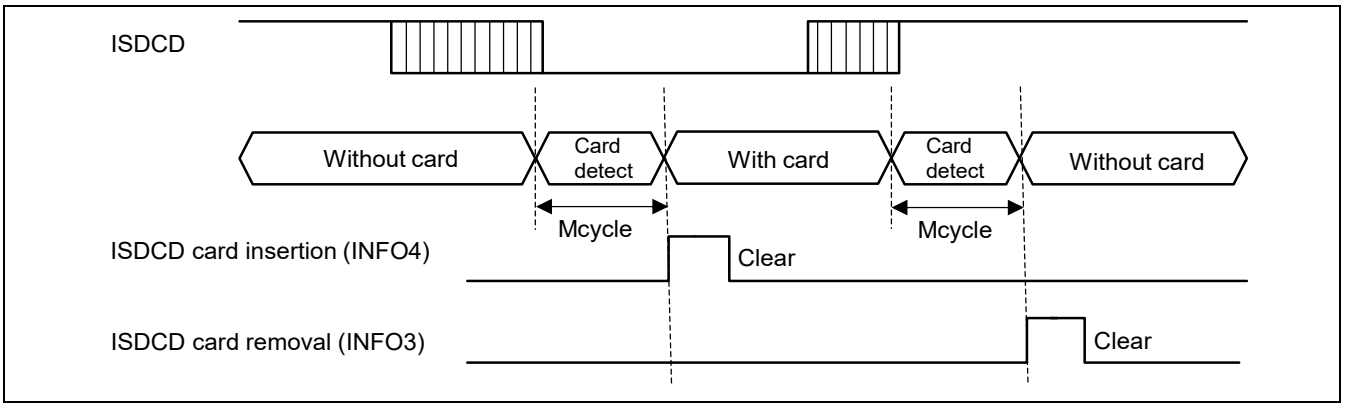

Figure 150.6 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

  Figure 150.7 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

  [Card insertion]

  When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

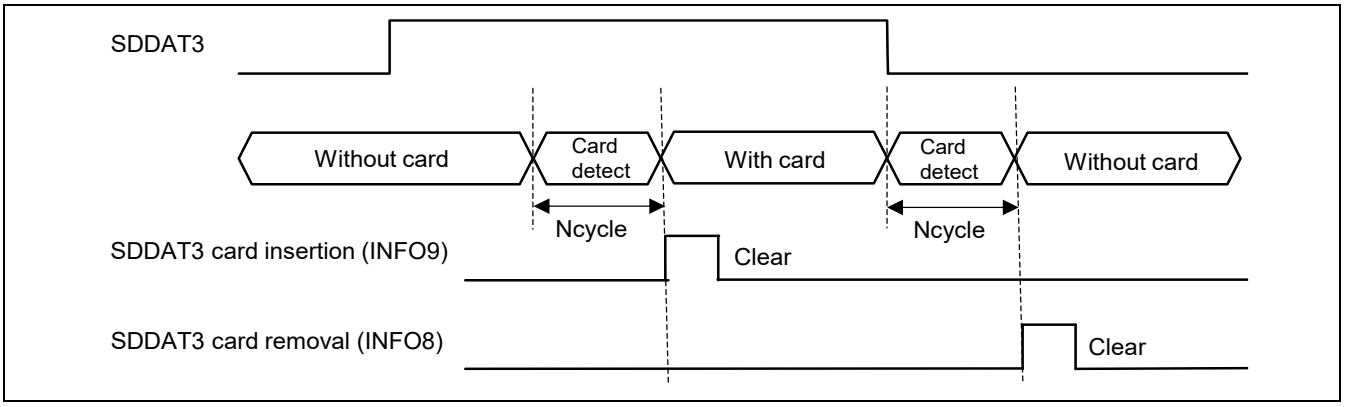

Figure 150.7 SD Card Detect with SDDAT3

(2) Write Protest

The SD host interface has two types of write protect functions.

- Write protect with ISDWP

  ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.
- Write protect with command

  The card's internal write protection and the card lock/unlock operation are realized by the command.

150.3.3 Interrupt Request

(1) Interrupt Request

The SD host interface has the interrupt requests shown in Table 150.6. Table 150.6 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 150.6 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	**Register Name**	**Bit Name**	**Register Name**	**Bit Name**
Card access interrupt	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

150.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Tables 150.7 and 150.8 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

When an error or timeout occurs during boot mode, the DTRAN1ERR or SEQERR bit in DM_CM_INFO2 is set to 1. Confirm the source of error or timeout by reading SD_INFO2, SD_ERR_STS1, and SD_ERR_STS2.

Table 150.7 Communications Errors

Communication Error	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 150.8 Timeouts

Timeout	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received though a longer time than 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received though a longer time than 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the busy state (SDDAT0 = 0) continues for longer than Ncycle* after the CRC status
				E5	When the CRC status is not received though a longer time than Ncycle* has elapsed after data writing
				E4	When read data is not received though a longer time than Ncycle* has elapsed after read command
					When read data for the next block are not received though a longer time than Ncycle* has elapsed after the reception of read data
					When read data for the next block are not received though a longer time than Ncycle* has elapsed after release of the read wait state
				E3	When the busy state (SDDAT0 = 0) for longer than Ncycle* continues after CMD12 has been issued within a command sequence.
				E2	When the busy state (SDDAT0 = 0) for longer than Ncycle* continues after R1b response

Note: * Ncycle is set by bit 7 to bit 4 in SD_OPTION.

150.3.5 Multiple commands serial issue

The SEQ stacks multiple commands by the sequencer table.

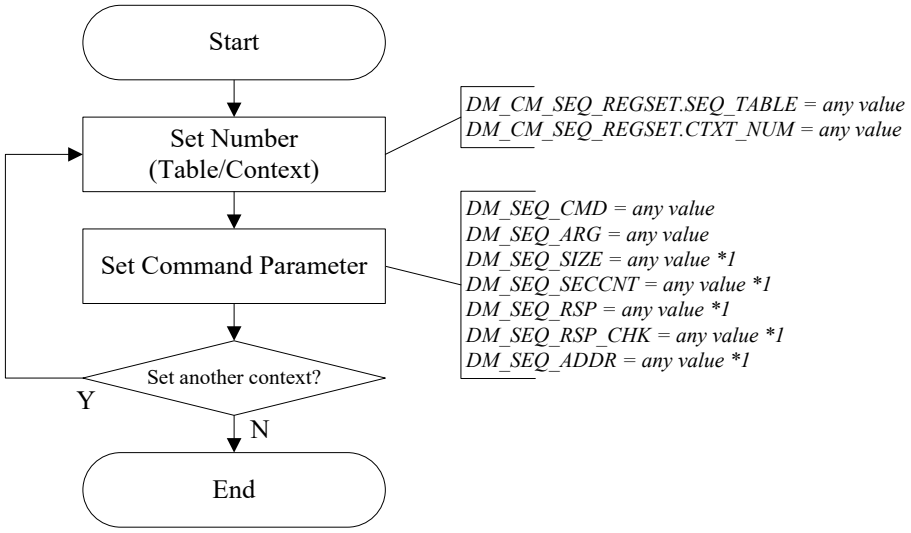
And the SEQ issues (SDMEM, SDIO) command sequentially and checks the response (including clear of response interrupt). The SEQ has command stack by the sequencer table and the priority control of command issuing. The SEQ has 2 sequencer tables and each sequencer table has 4 contexts. The SEQ can issue maximum 8 commands sequentially.

(1) Context setting

The following flowchart indicates context setting procedure.

1) Software sets DM_CM_SEQ_REGSET to the number of sequencer table (TABLE_NUM) and the number of context (CTXT_NUM).

2) Software sets command parameters (DM_SEQ_***) for context of step 1.



*1 Set parameters as needed.

(2) SEQ startup / suspend / resume

The SEQ starts up sequencer for the table indicated by DM_CM_SEQ_CTRL.SEQ_TABLE when software sets DM_CM_SEQ_CTRL.SEQ_START to 1.

Software can not access registers except for DM_*** during sequencer process. If software accesses registers except for DM_*** during sequencer process, suspend it using suspend/resume function. Don't overwrite context during sequencer process (from software sets DM_CM_SEQ_CTRL.SEQ_START=1 to SDIP asserts DM_CM_INFO1.SEQEND).

When software sets DM_CM_SEQ_CTRL.SEQ_SUSPEND=1 during sequencer process, SDIP suspends it by the command (context).

When software sets DM_CM_SEQ_CTRL.SEQ_RESUME=1, SDIP continues sequencer process.

(3) Interrupt during sequencer process

Interrupts from OXMNIRQ occurred during sequencer process are as follows.

output interrupts	DM_CM_INFO1.<each factor>, DM_CM_INFO2.<each factor>
masked interrupts	SD_INFO1.<each factor>, SD_INFO2.<each factor>, SDIO_INFO.<each factor>,

Interrupts from OXASIOIRQ are independent from sequencer process.

(4) Priority control

SDIP has 2 priority control modes (fix mode, interrupt mode).

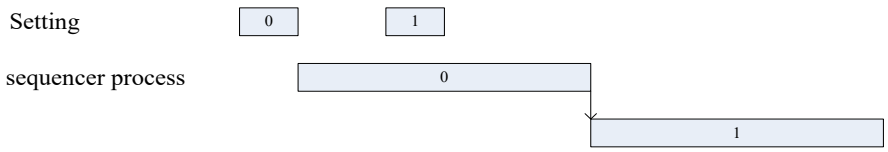
In fix mode (DM_CM_SEQ_CTRL.PRIORITY_MODE=0), SDIP executes in order, from table0 to table1.

Software can set context for table1 during sequencer process for table0. Below is example flow of sequencer process in fix mode.

"setting" indicates process from context setting to DM_CM_SEQ_CTRL.SEQ_START=1.

"sequencer process" indicates during execution of command (context) process.

DM_CM_SEQ_CTRL.PRIORITY_MODE=0

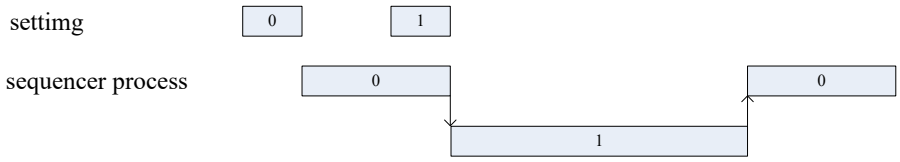


In interrupt mode (DM_CM_SEQ_CTRL.PRIORITY_MODE=1), SDIP executes in order of priority (table1 is higher priority than table0). SDIP switches table by the command (context). In the case that one process consists of some commands, SDIP can switch table by that process unit(Set DM_SEQ_CMD.PRIORITY_MASK at context setting). Below is example flow of sequencer process in interrupt mode.

"setting" indicates process from context setting to DM_CM_SEQ_CTRL.SEQ_START=1.

"sequencer process" indicates during execution of command (context) process.

DM_CM_SEQ_CTRL.PRIORITY_MODE=1



150.3.6 Usage Example

150.3.6.1 Command without Data Transfer

(1) Flowchart

Figures 150.8 and 150.9 show flowchart examples.

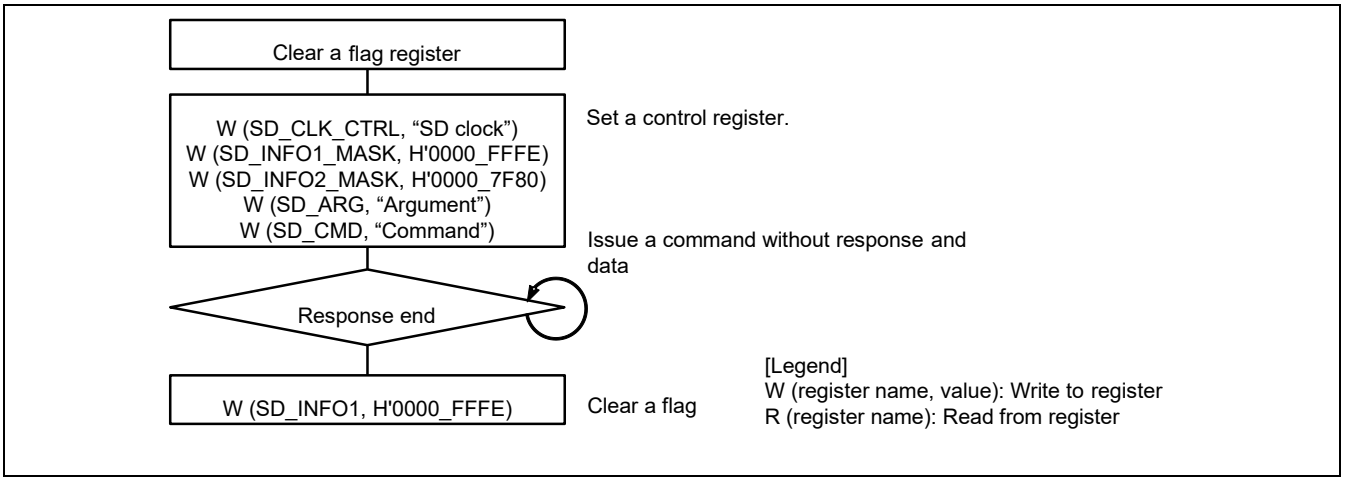


Figure 150.8 Flow Example of Command without Response and Data

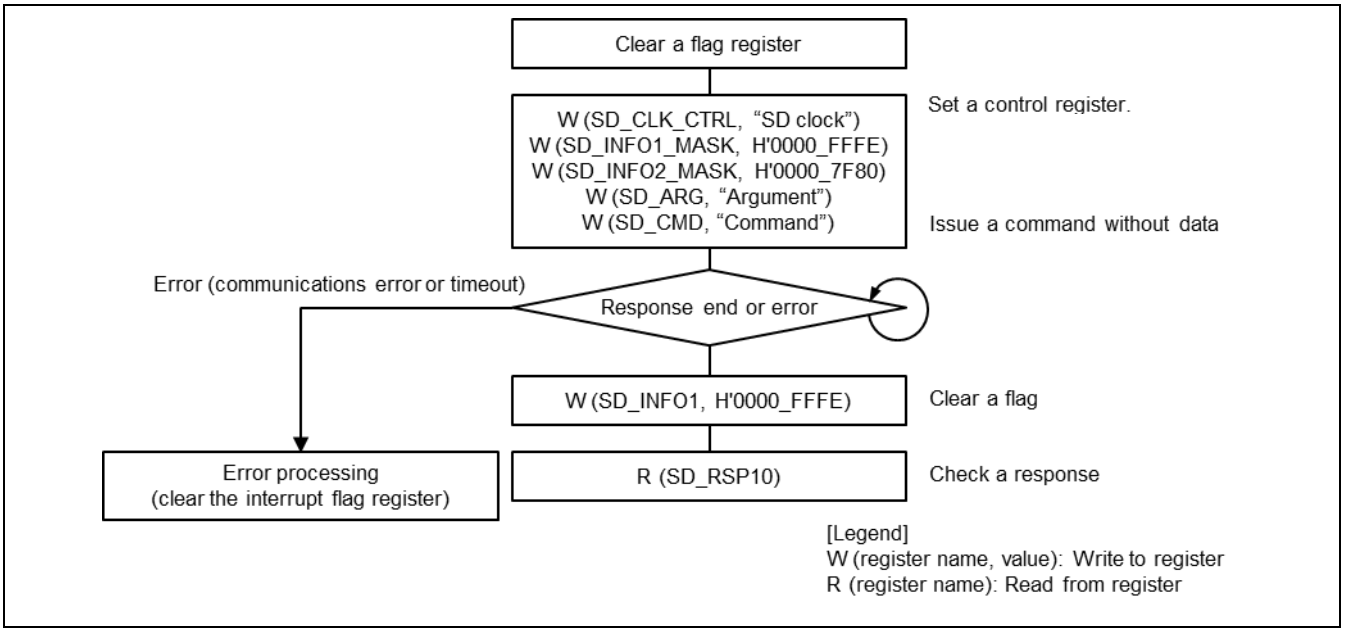

Figure 150.9 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value): Write to register
R (register name): Read from register

The operation is described as below.

(a) Command without response and data

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4) Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4) Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5) Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.2 Single Block Read

(1) Flowchart

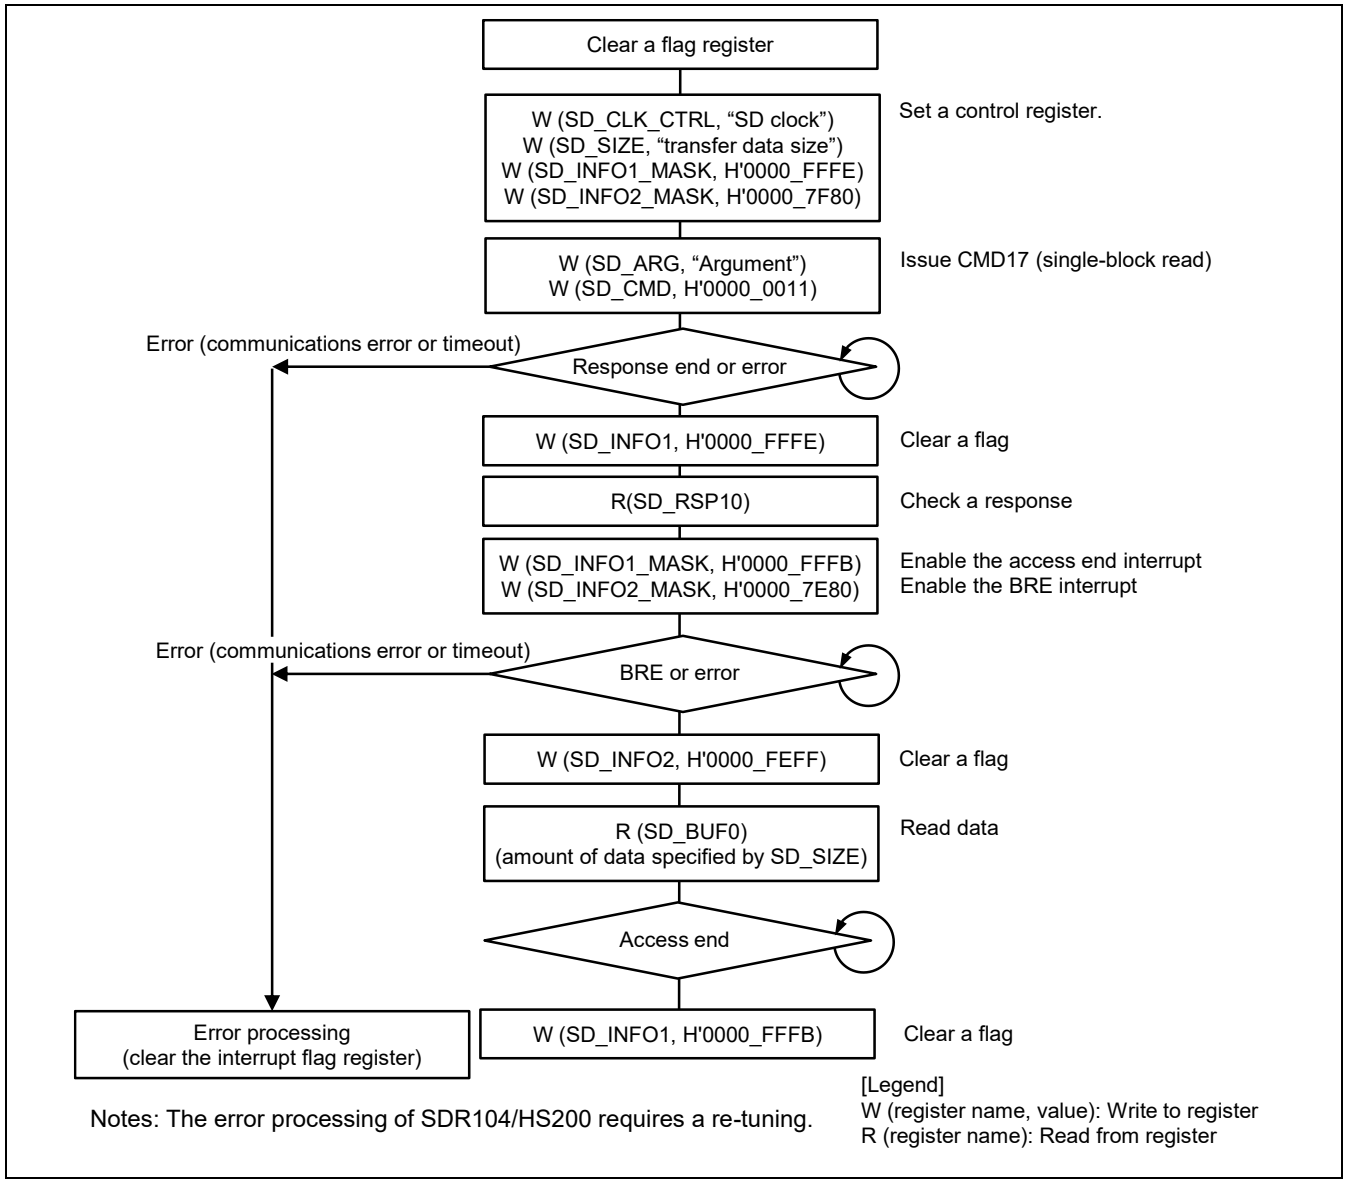

Figure 150.10 Single Block Read Flowchart Example

(2) Operation for Single Block Read

The operation of the single block read is described below.

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H'0000 0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4) Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5) Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6) Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.3 Single Block Write

(1) Flowchart

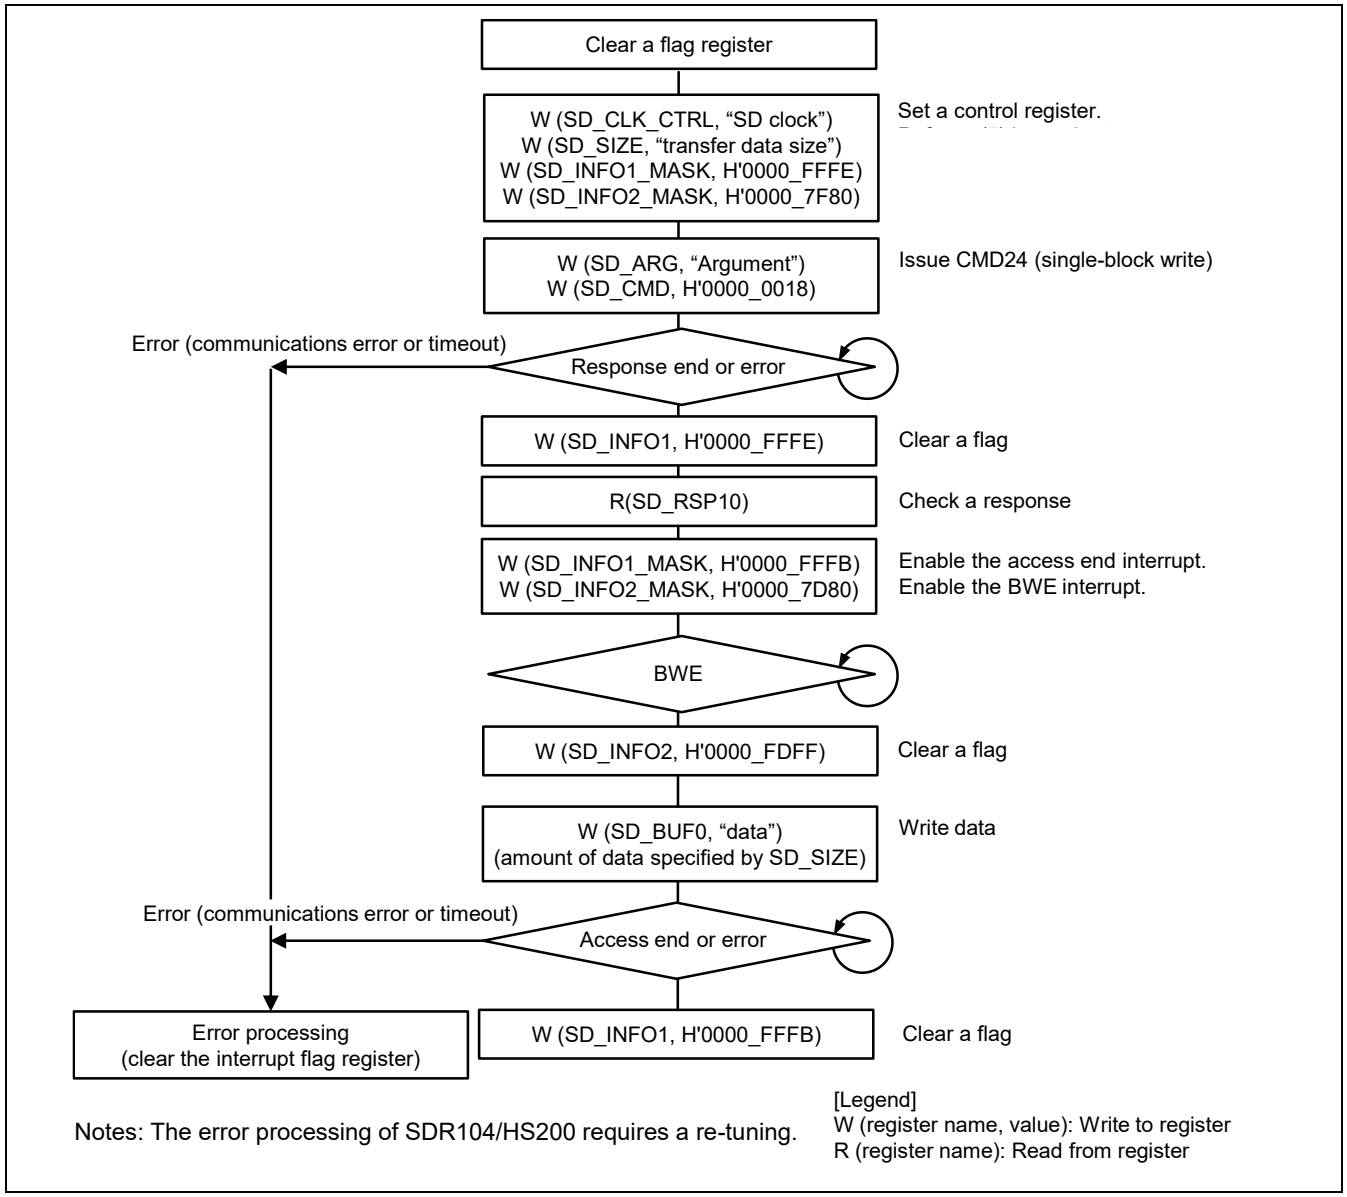

Figure 150.11 Single Block Write Flowchart Example

(2) Operation for Single Block Write

The operation of the single block write is described below.

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4) Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5) Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6) Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.4 Multiple Block Read

(1) Flowchart

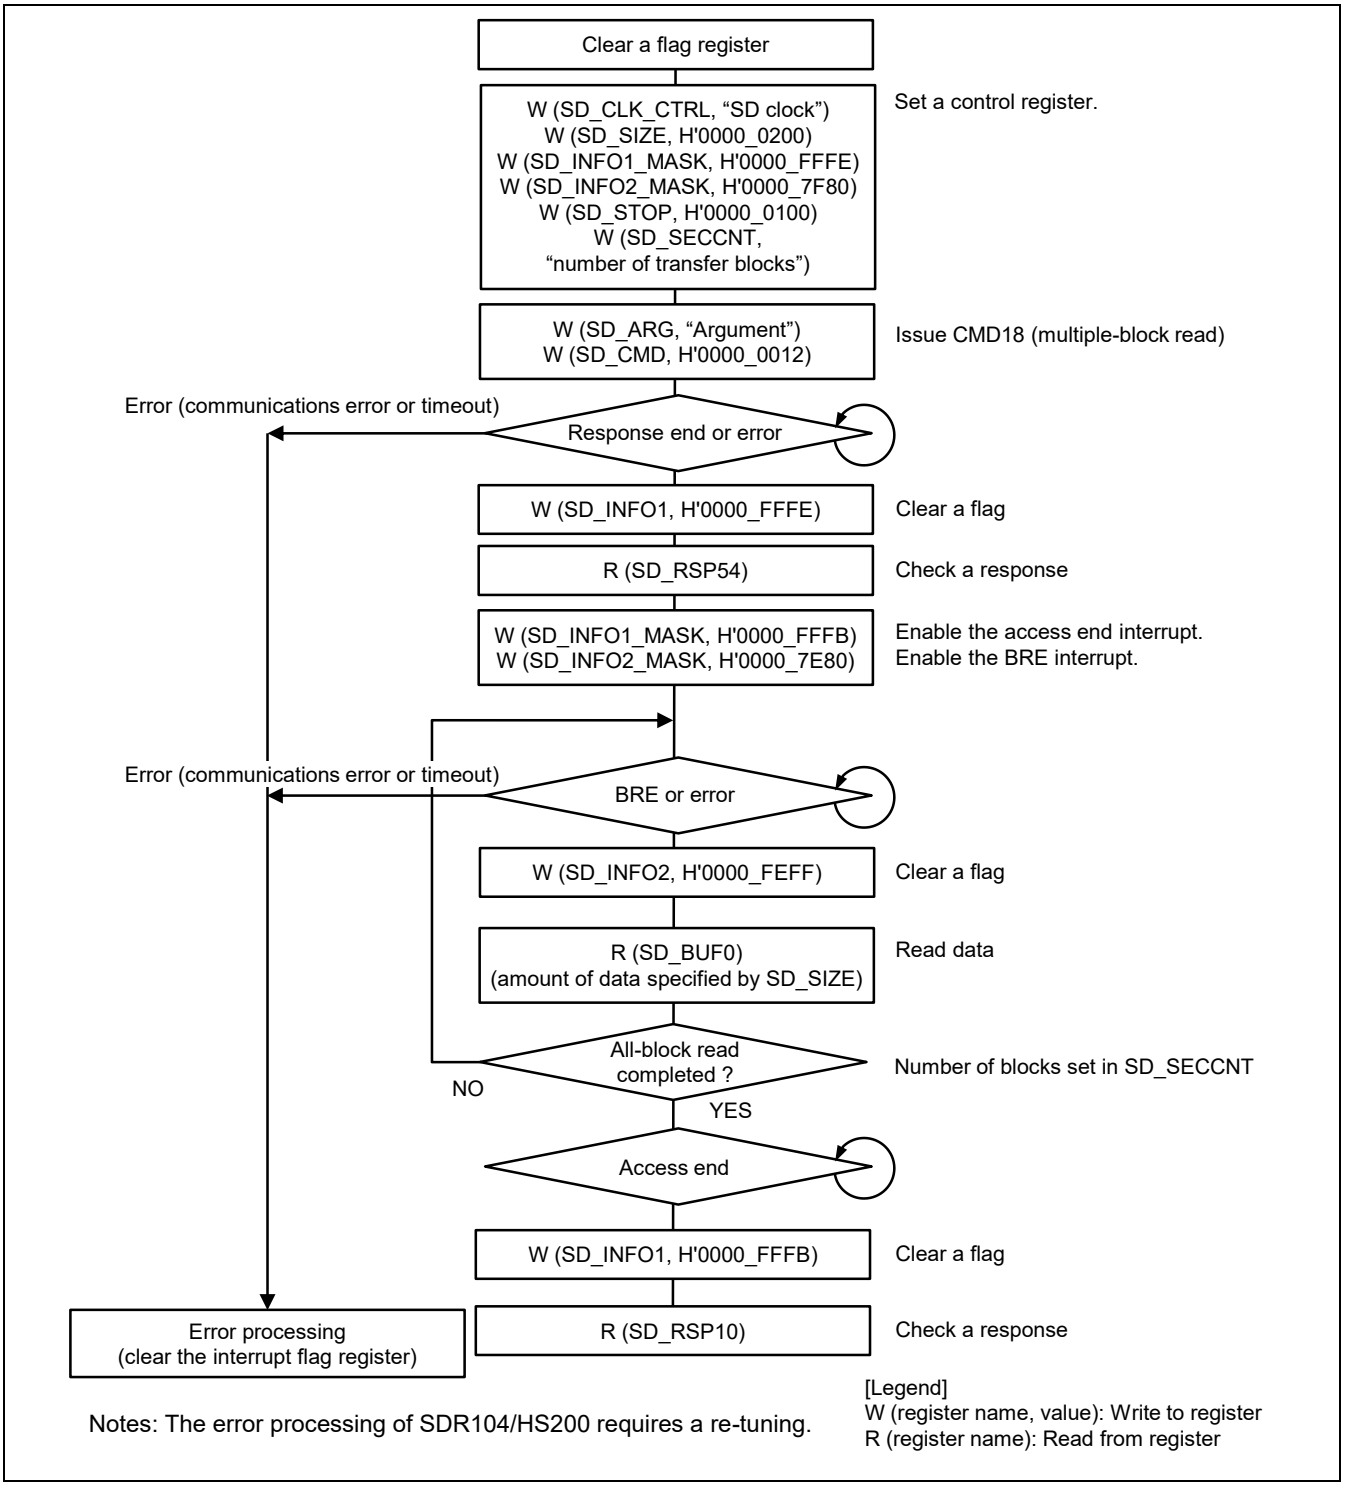

Figure 150.12 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

1) Flag register clear

First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

2) Control register set

Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

3) Command issue (CMD18)

Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.

Accordingly, CMD18 is issued, and the multiple block read operation is started.

4) Response check

On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.

If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.

5) Data receive from SD card and data read

Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.

6) Operation complete

When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 150.13 shows the flowchart when using an internal timer.

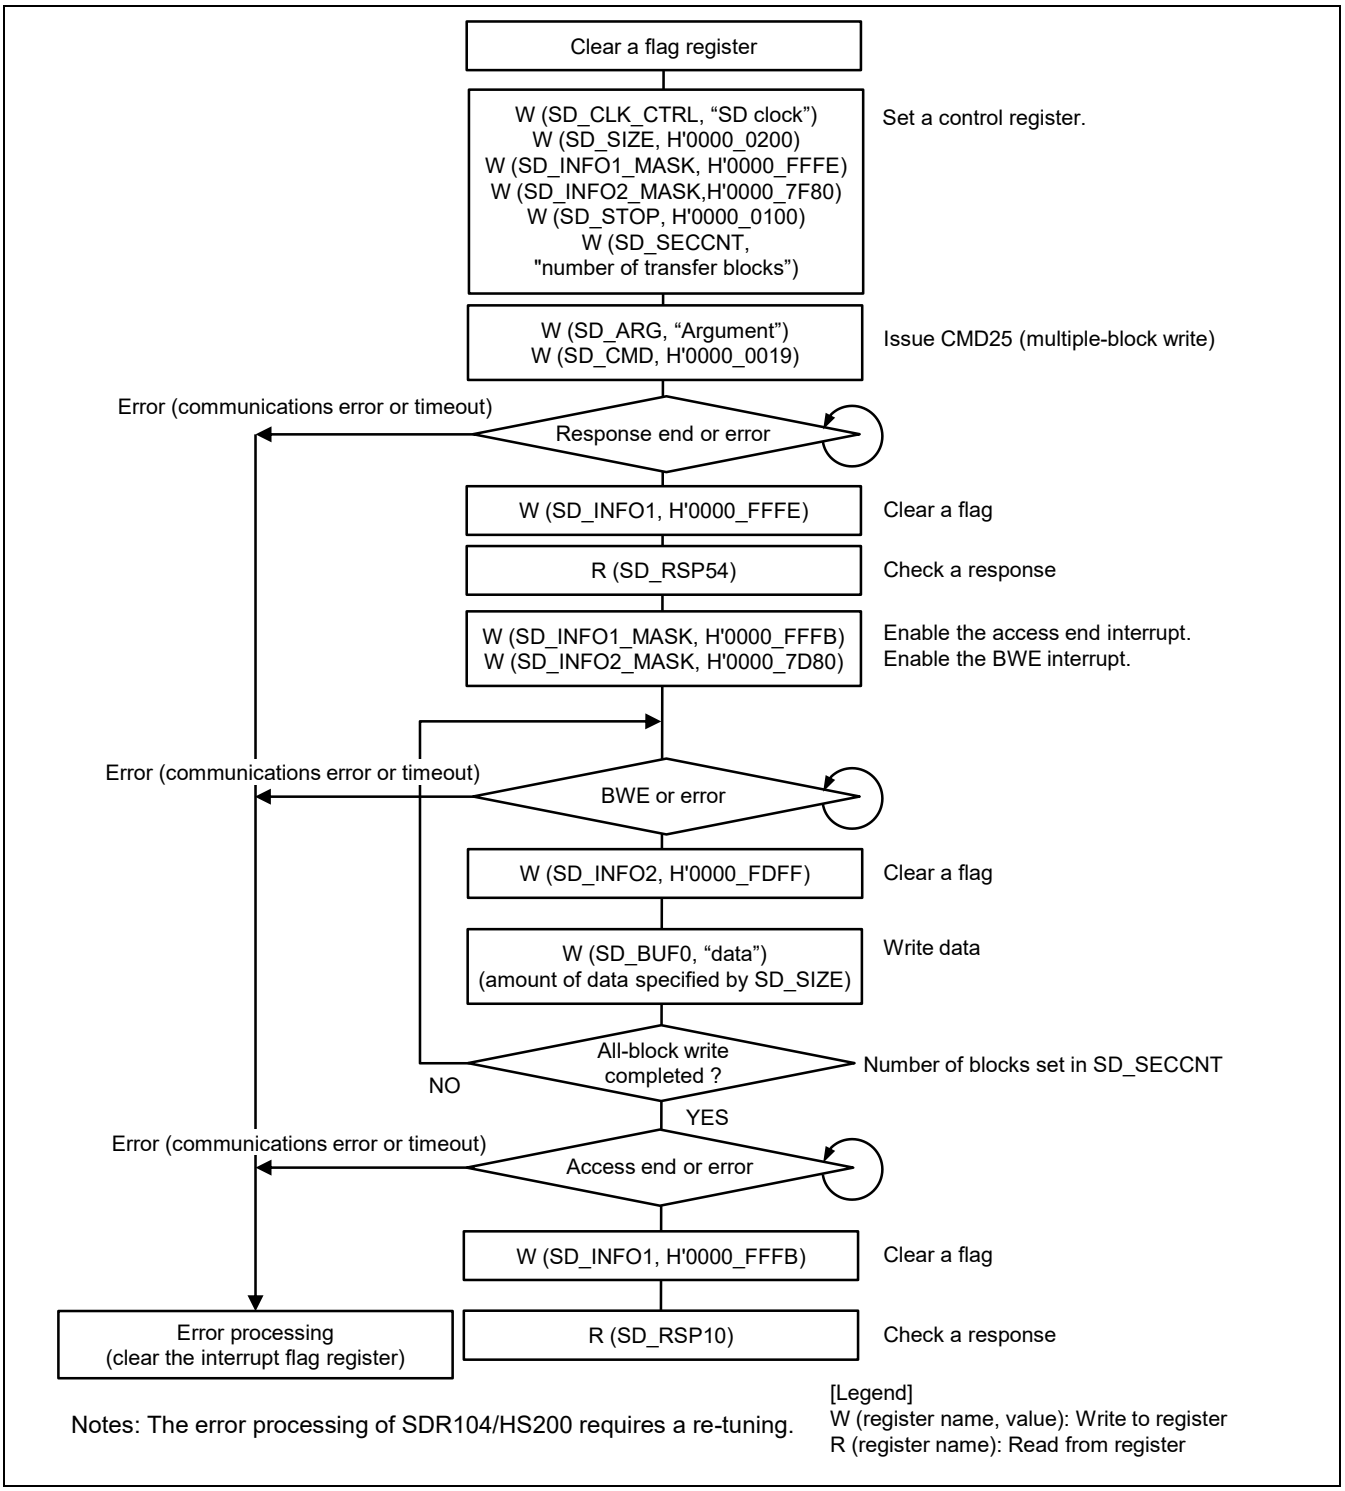

Figure 150.13 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3) Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4) Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5) Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.

However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 0000.

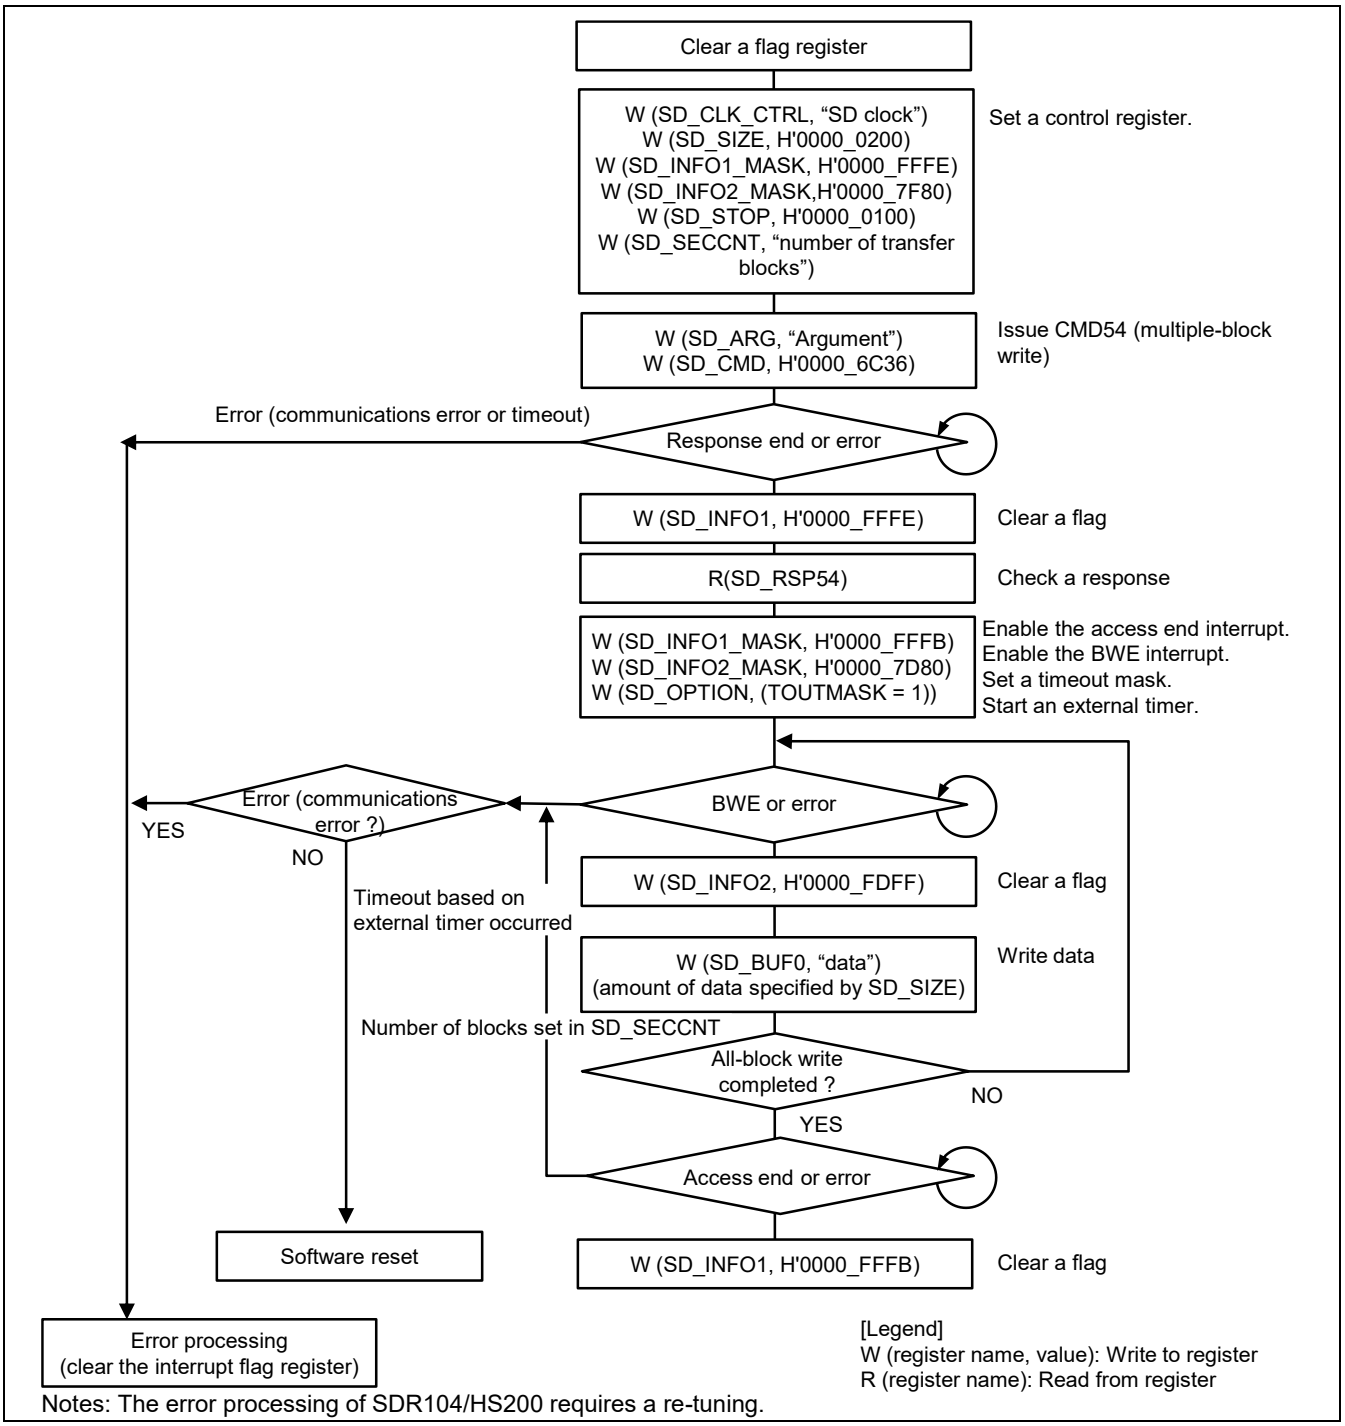
6) Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of IP is shown below.



Notes: The error processing of SDR104/HS200 requires a re-tuning.

Figure 150.14 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1) Flag register clear

   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

2) Control register set

   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

3) Command issue (CMD54)

   Set CMD54 Argument in SD_ARG and write H'0000 6C36 to SD_CMD.

   Accordingly, CMD54 is issued, and the multiple block write operation is started.

4) Response check

   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.

   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.

5) Data write and data transmit to SD card

   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.

   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.

6) Operation complete

   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

150.3.6.12 High-Priority Interrupt (without Data Transfer)

(1) Flowchart

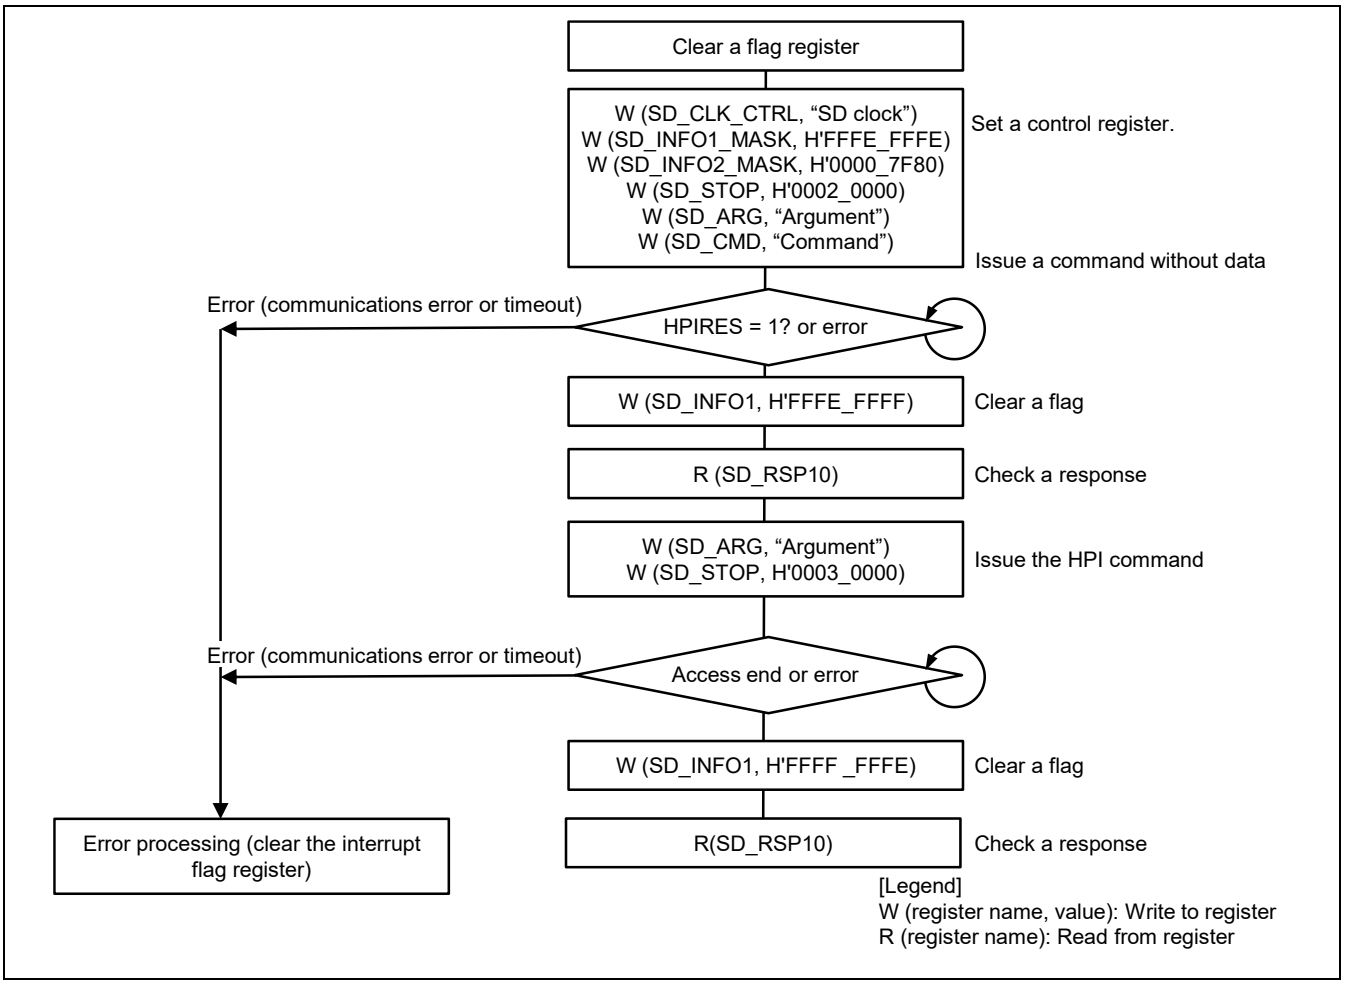

Figure 150.25 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

The operation of the high-priority interrupt (HPI) without data transfer is described below.

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4) Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5) Read the response from SD_RSP10.
6) HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7) Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.13 High-Priority Interrupt (at Single Block Write)

(1) Flowchart

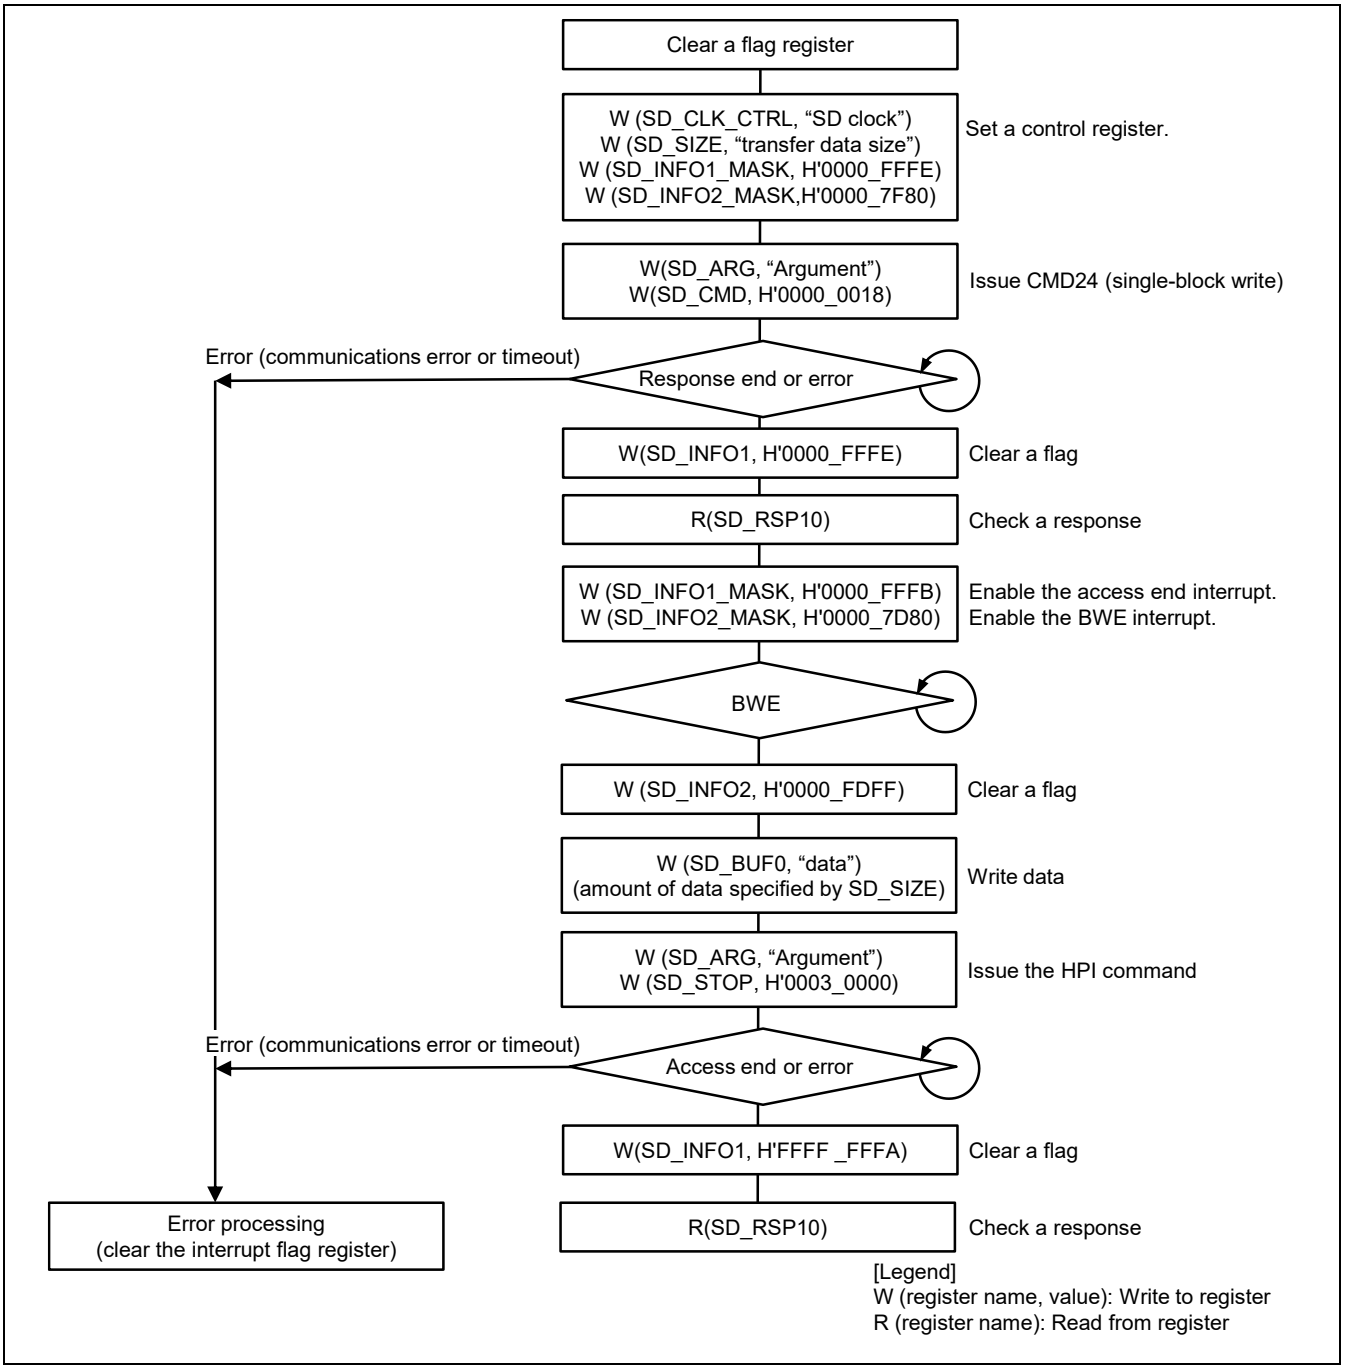

Figure 150.26 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

The operation of HPI at single block write is described below.

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3) Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4) Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5) Data write and data transmit to SD card

Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.

6) HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7) Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.14 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart

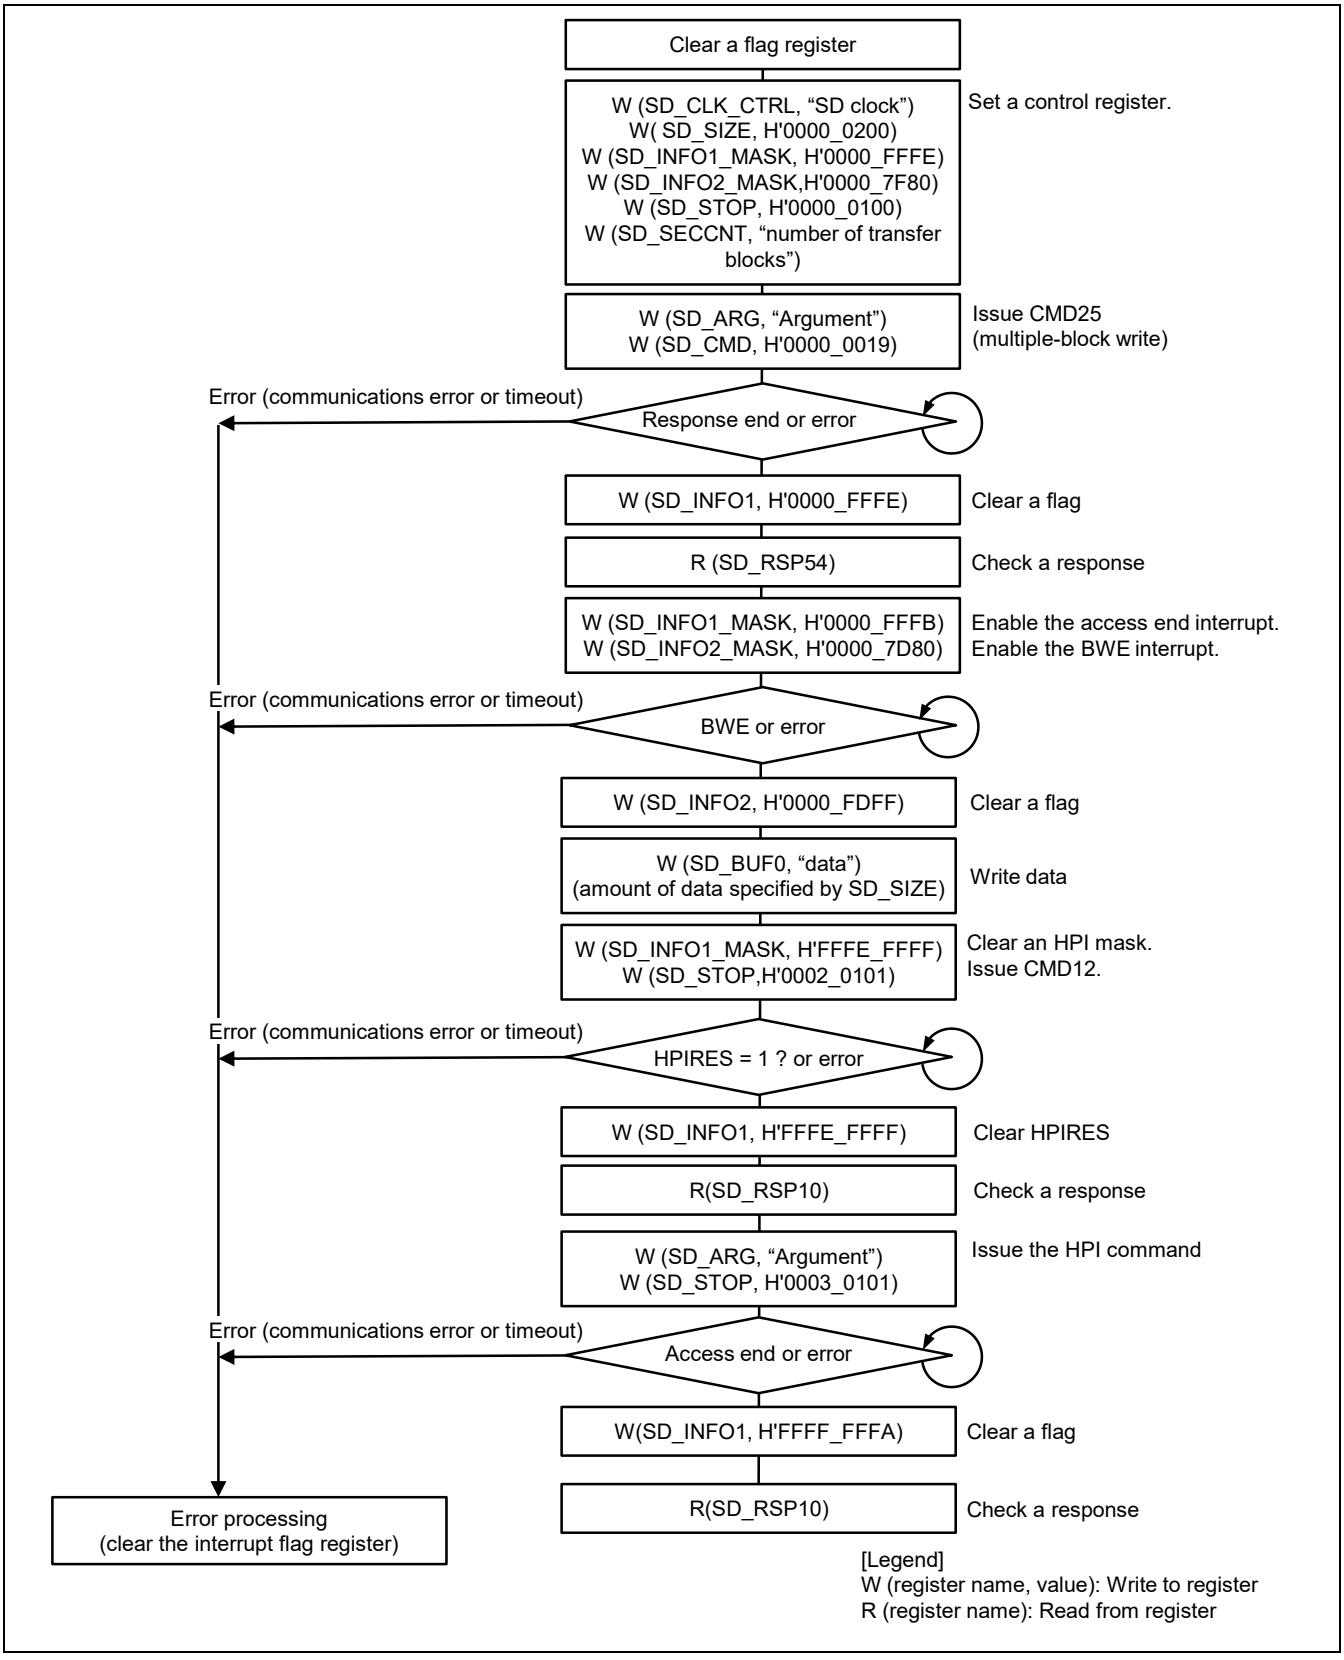

Figure 150.27 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)

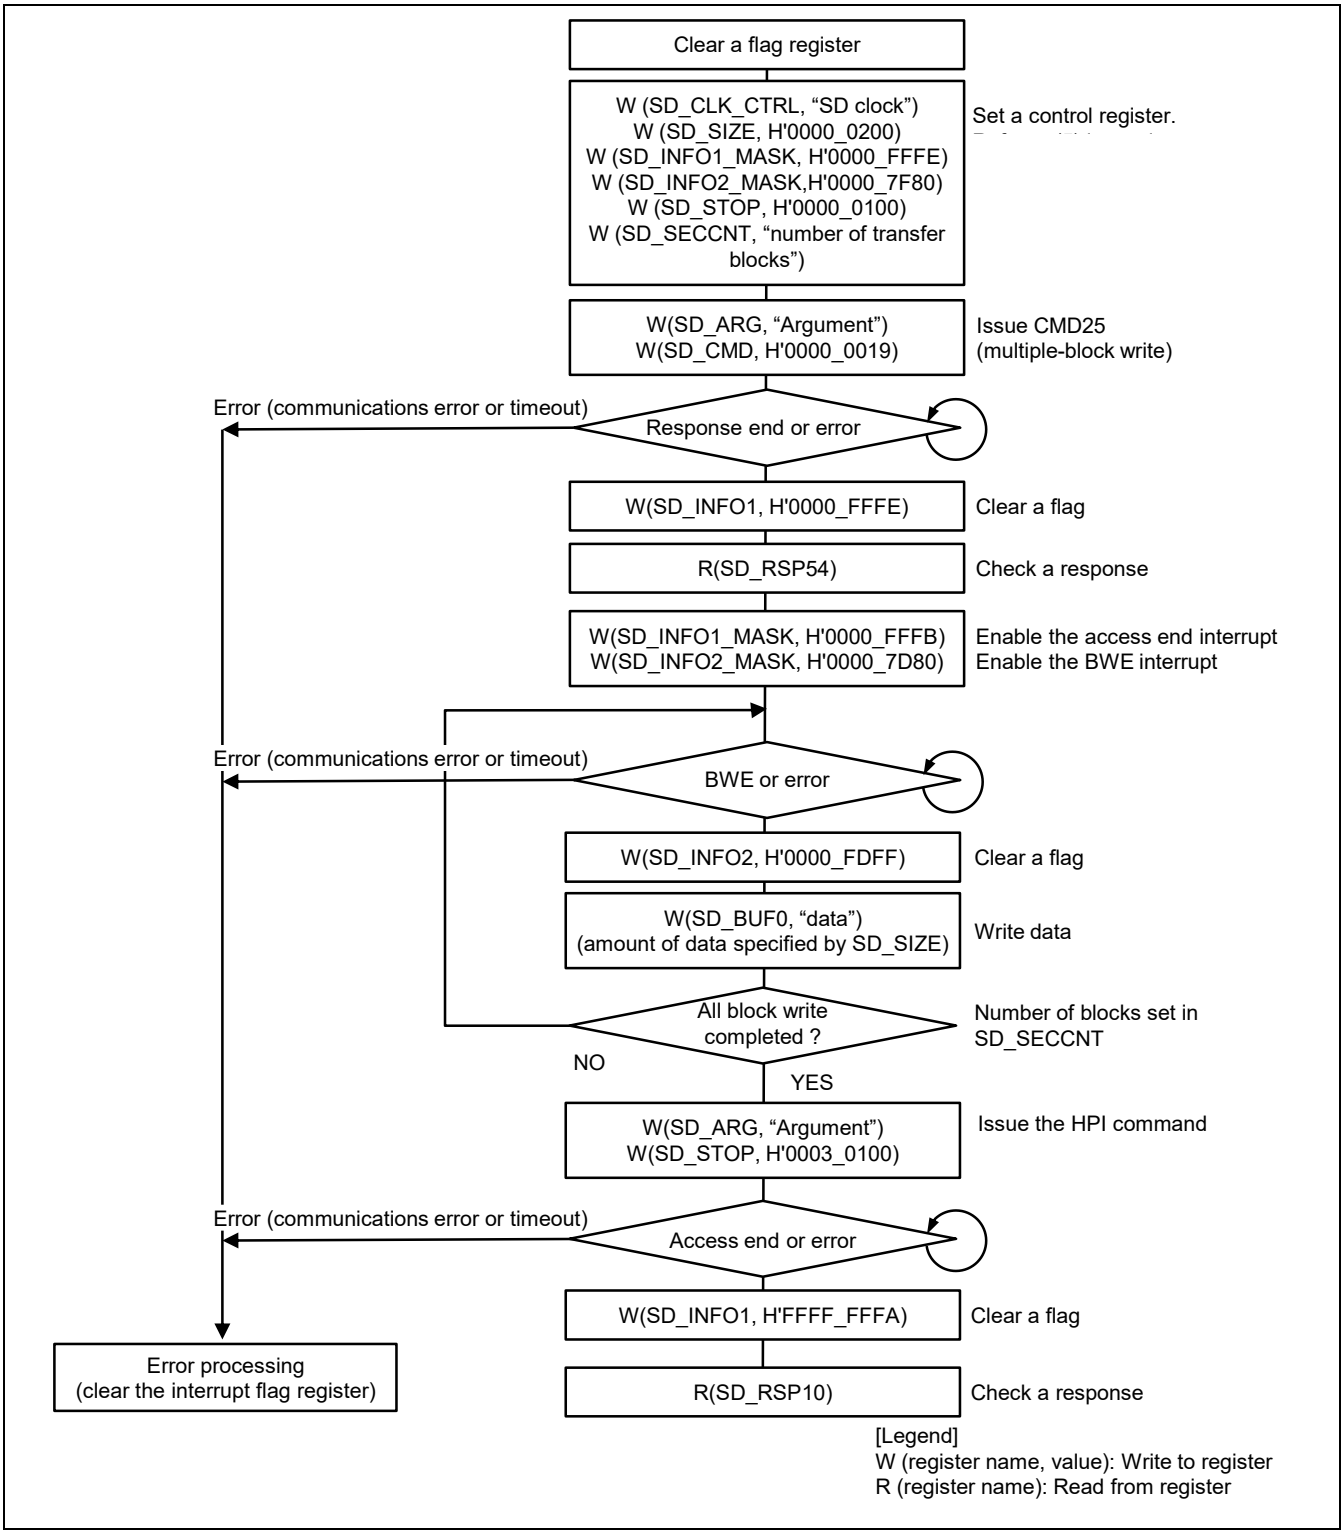

Figure 150.28 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2) Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3) Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4) Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5) Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6) Command issue (CMD12)
   Write H'FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt.

Write H'0002 0101 to SD_STOP, which causes CMD12 to be issued.

7) Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8) HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9) Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1) Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

2) Control register set

   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

3) Command issue (CMD25)

   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.

   Accordingly, CMD25 is issued, and the multiple block write operation is started.

4) Response check

   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.

   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.

5) Data write and data transmit to SD card

   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.

   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.

   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.

6) HPI command issue

   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.

7) Operation complete

   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

150.3.6.15 Example of SD_CMD Register Setting

Table 150.9 and Table 150.10 list the example of SD_CMD and MMC_CMD register setting.

Table 150.9 Example of SD_CMD Register Setting (SD)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	H'0000 0000	
	CMD2	H'0000 0002	
	CMD3	H'0000 0003

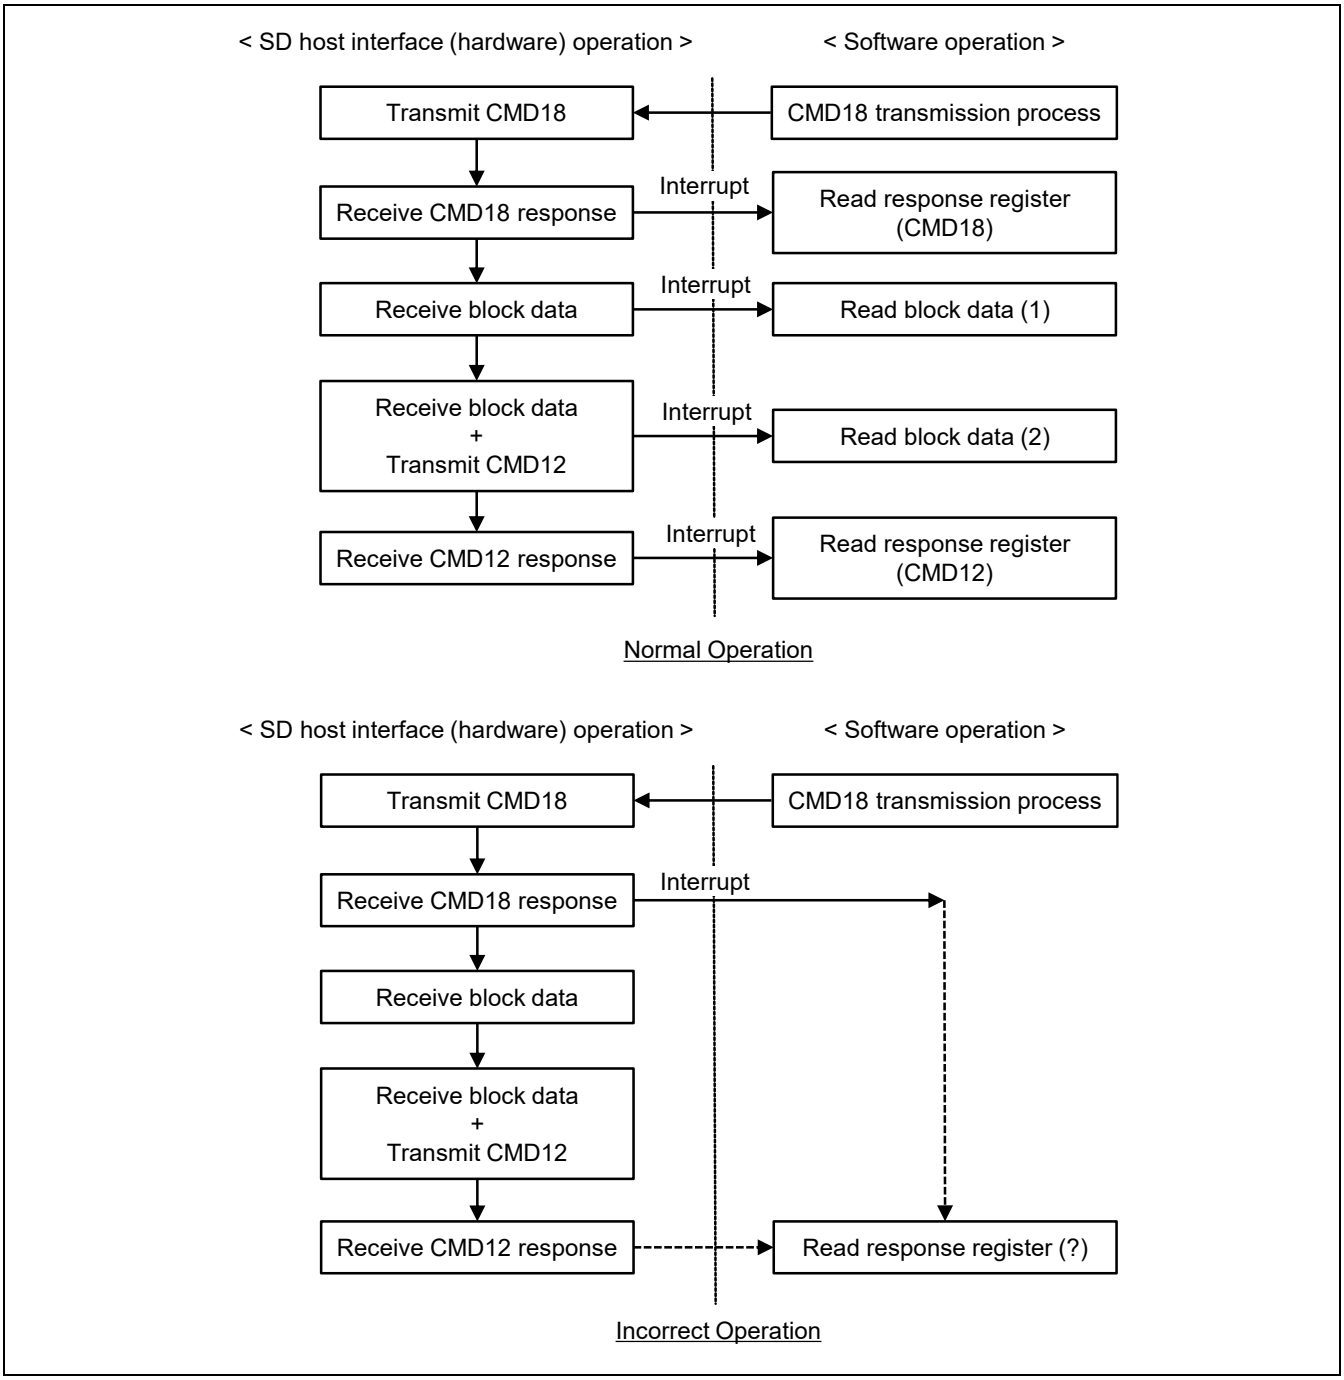

Figure 150.29 Flowcharts for Multiple Block Read Operation (Two Blocks)

(1) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(2) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(3) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(4) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.
5. The open-ended multiple-block transfer for MMC cards is not supported.

(5) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

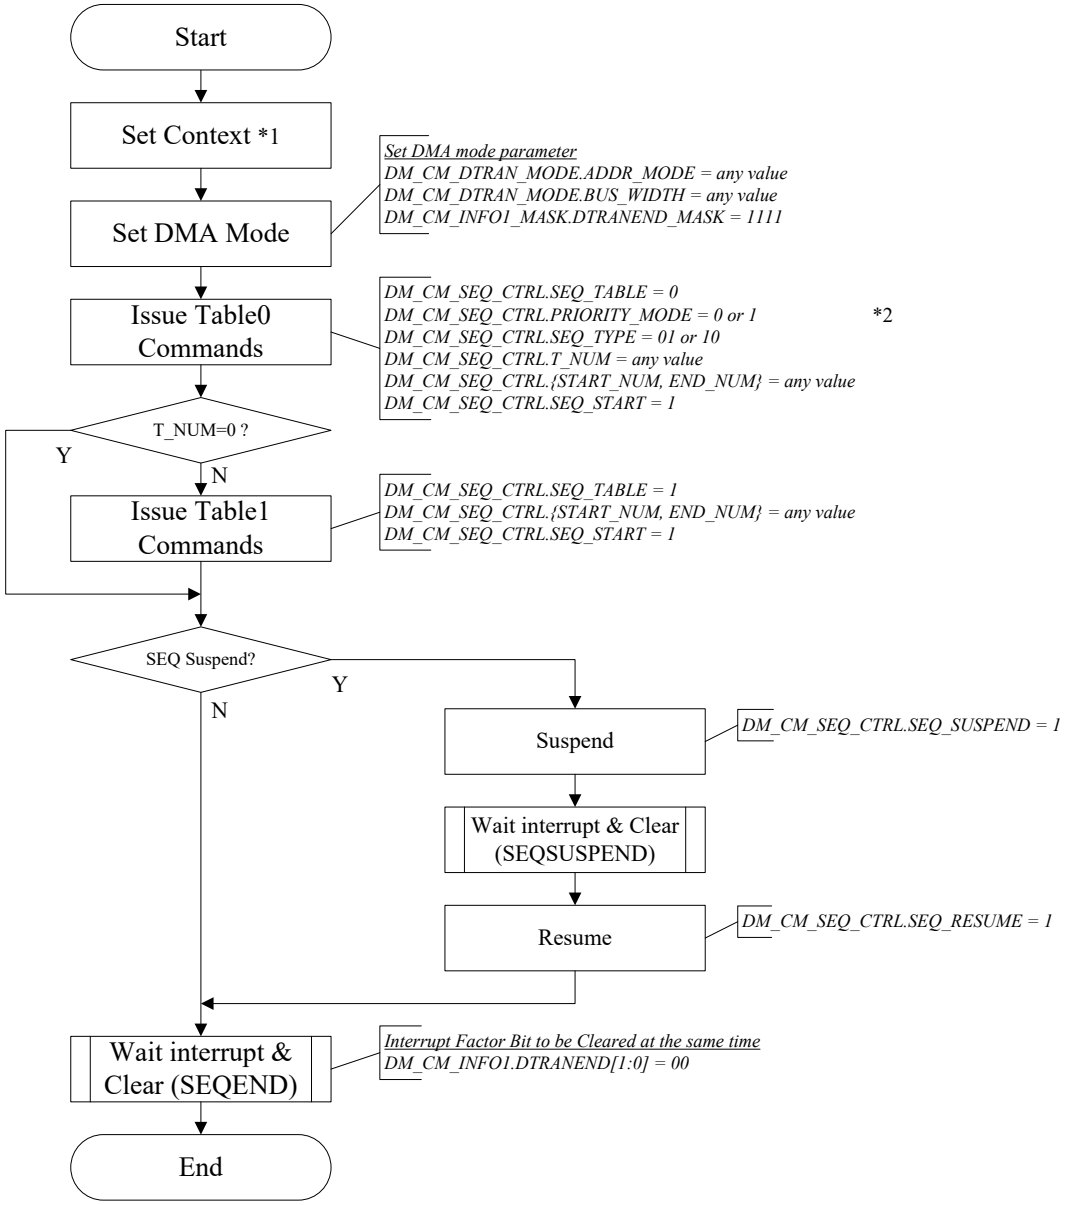
To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

150.3.6.16 Multiple Commands issuing with SEQ

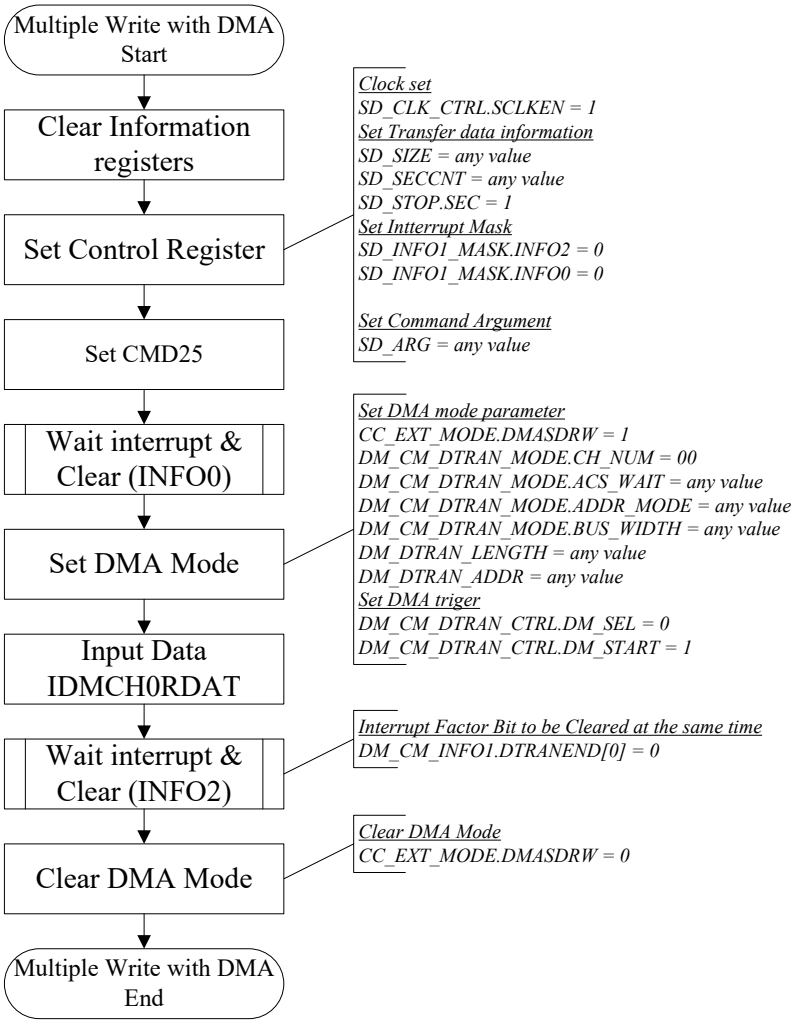
The following sequence can be executed after Card detection and Card initialization.



*1 SDIP keeps the value of context (DM_SEQ_***) after the completion of sequencer process.
Software can skip "set context" in the case of repetitive same sequencer process.
*2 Software must execute sequencer table in order of table number (table0 -> table1)

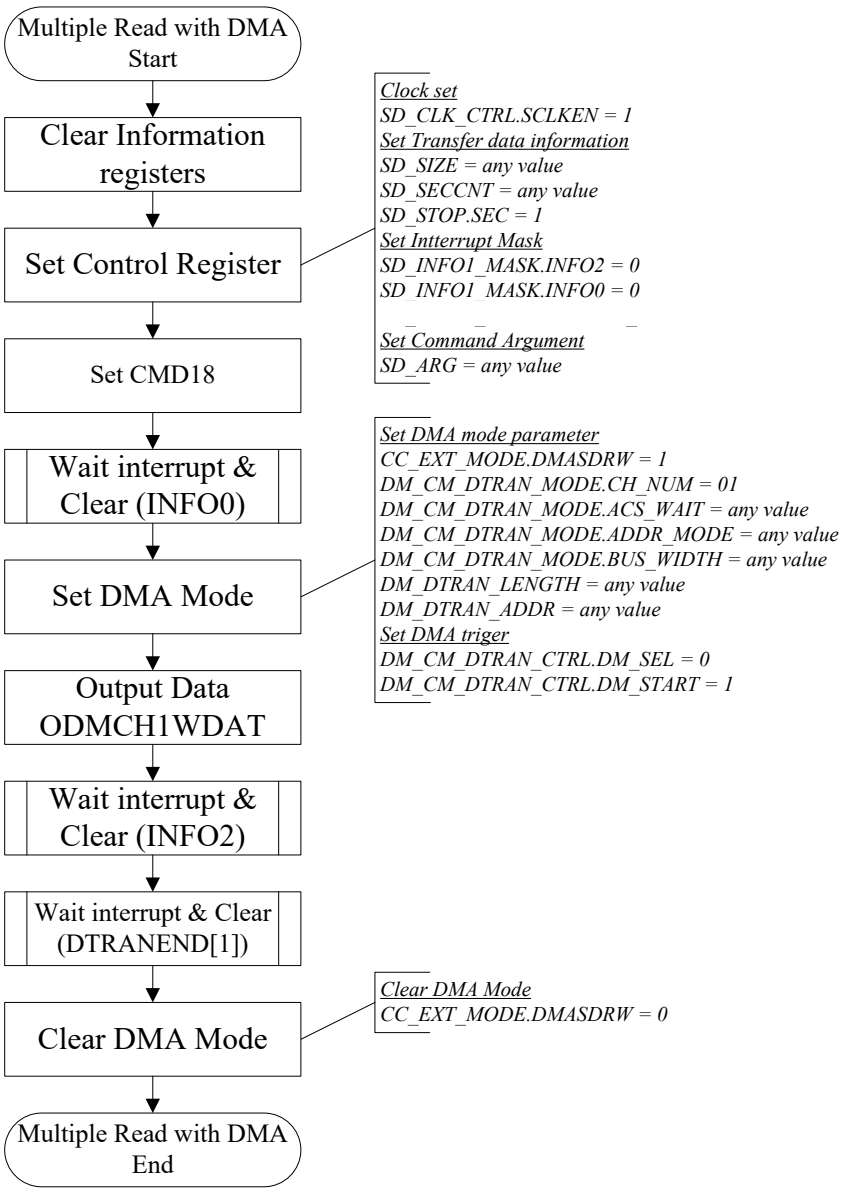
150.3.6.17 SD buffer DMA Write without SEQ

The following sequence can be executed after Card detection and Card initialization.



150.3.6.18 SD buffer DMA Read without SEQ

The following sequence can be executed after Card detection and Card initialization.



150.3.7 Sampling Clock Controller (SCC)

150.3.7.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/SDR104, MMC HS200 and MMC HS400. When this module is used with the LSI, SD UHS-I/SDR104, MMC HS200 and MMC HS400 can be supported.

The total number of TAPs in HS400 mode for each product is 8.

150.3.7.2 SCC Block Diagram

Figure 150.30 and 150.30B shows a block diagram of the sampling clock controller.

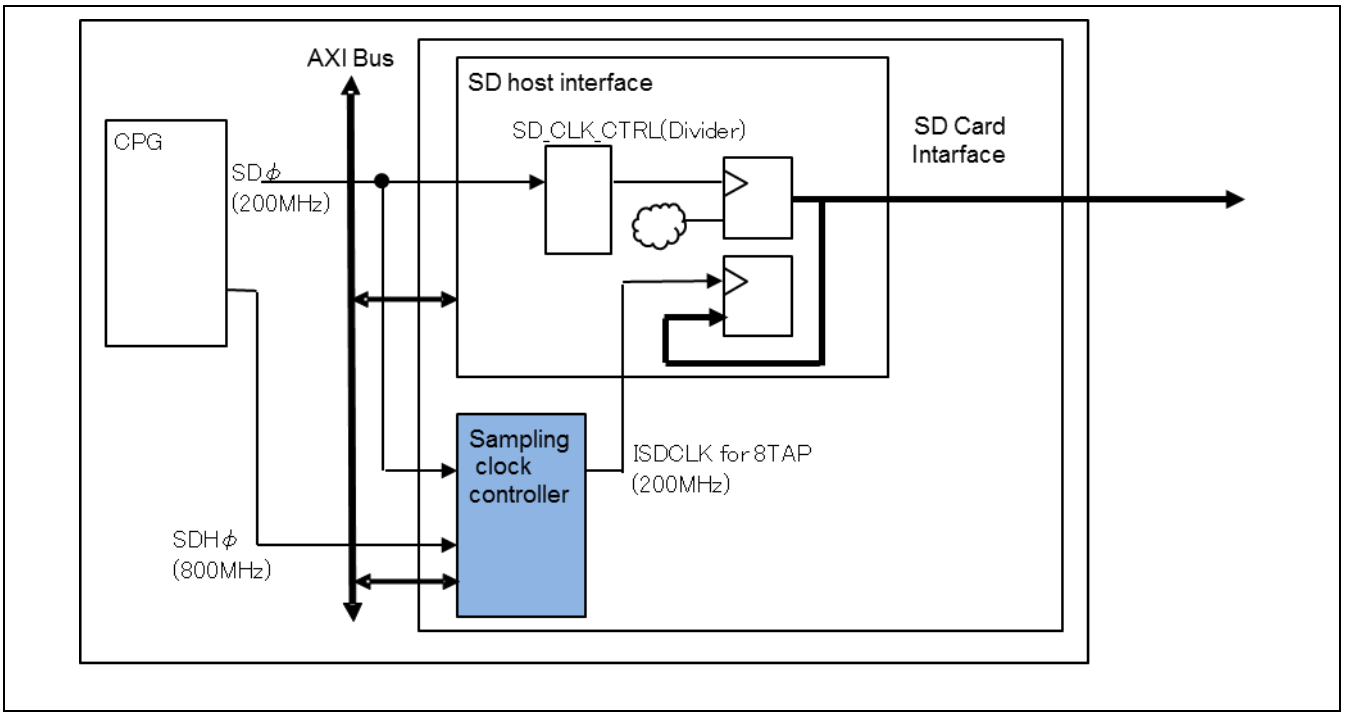


Figure 150.30 Block Diagram of the Sampling Clock Controller

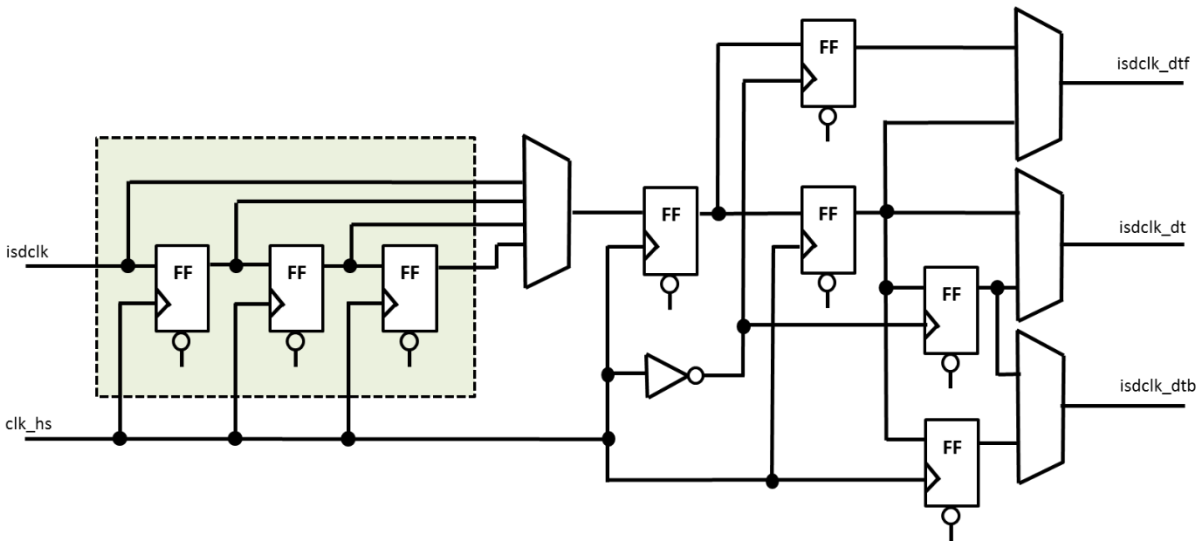

Figure 150.31 Detail of Sampling clock controller

The Delay Tap generates a plurality of clocks for sampling the input data (CMD / DAT) for each different phase (TAP position), and controls the phase (TAP position) of the sampling clock. Figure 150.31 shows a schematic diagram of delay Tap. This circuit shifts the edge of OSDCLK at both edges of the high-speed clock (clk_hs), and generates a sampling clock (isdclk_dt) having a plurality of phases and a correction clock (isdclk_dtf, isdclk_dtb).

The procedure for adjusting the appropriate TAP position is as follows.

(1) A sampling clock and a correction clock having a plurality of phases are generated at both edges of the high-speed clock.

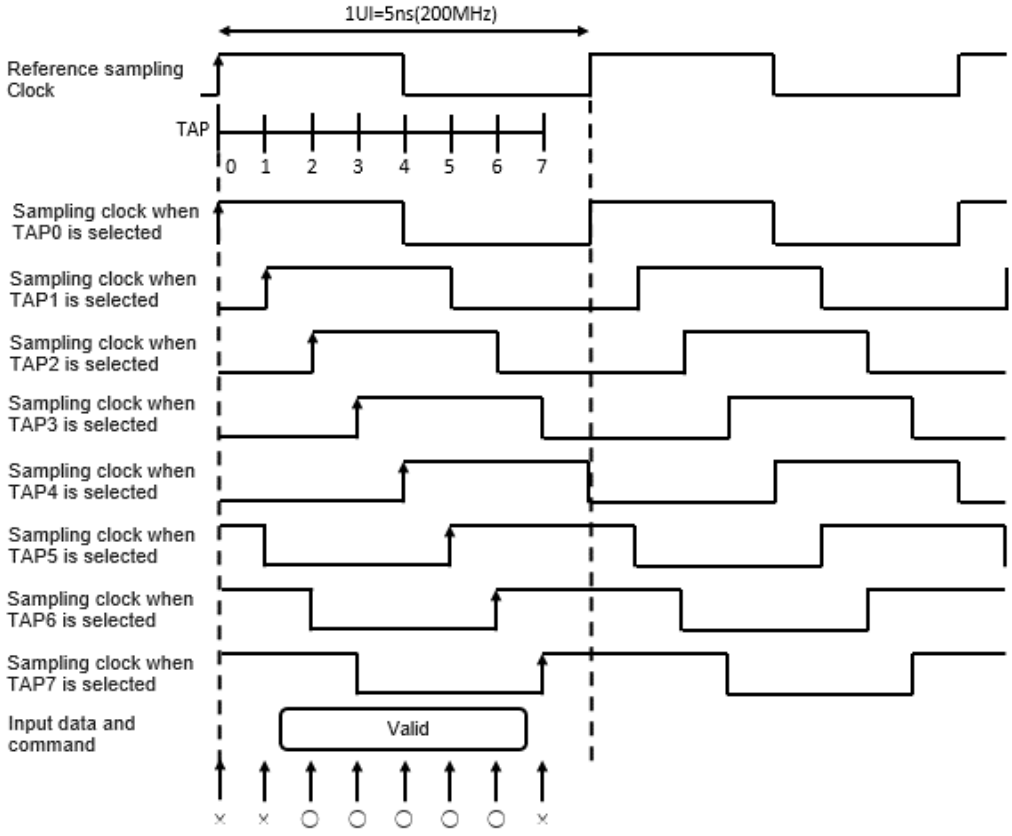
(2) Capture data with sampling clock and preceding and succeeding correction clocks.

(3) Compare the three values.

(4) When a mismatch occurs in the above comparison result, adjust the position by shifting the position of the sampling clock.

150.3.7.3 Sampling clock selection (TAP position selection) function

Delay Tap divides the "sampling clock cycle" by the number of TAPs and generates sampling clocks having different phases at each divided timing. Since this transfer mode samples input data (CMD / DAT) at an appropriate timing, it is necessary to select an appropriate TAP position. Figure 150.32 shows an example of the clock generated by Delay Tap when the sampling clock is 200 MHz and the TAP number is 8 and the sampling timing adjustment method at the time of host interface initialization.



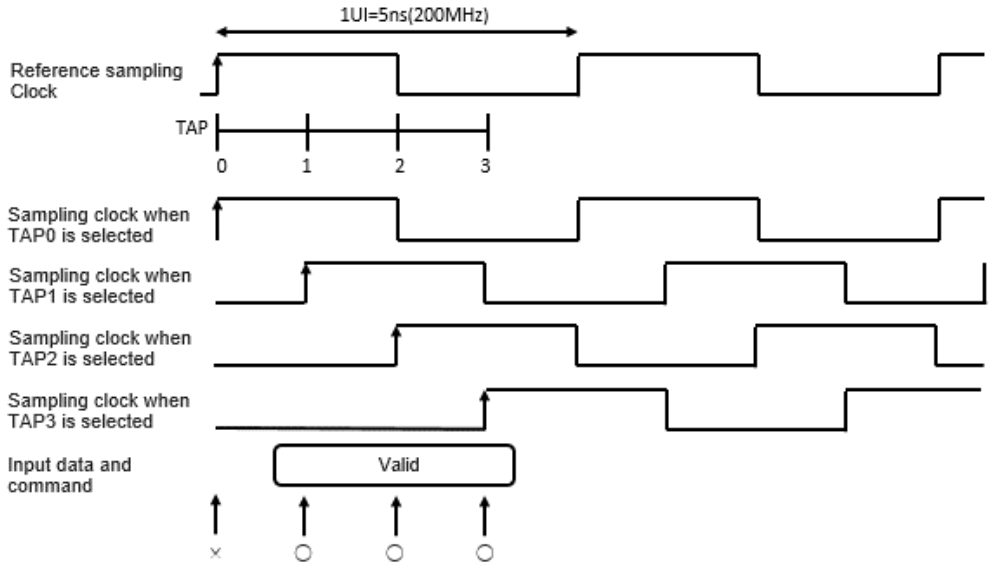


Figure 150.32 Clock Generated by Delay Tap

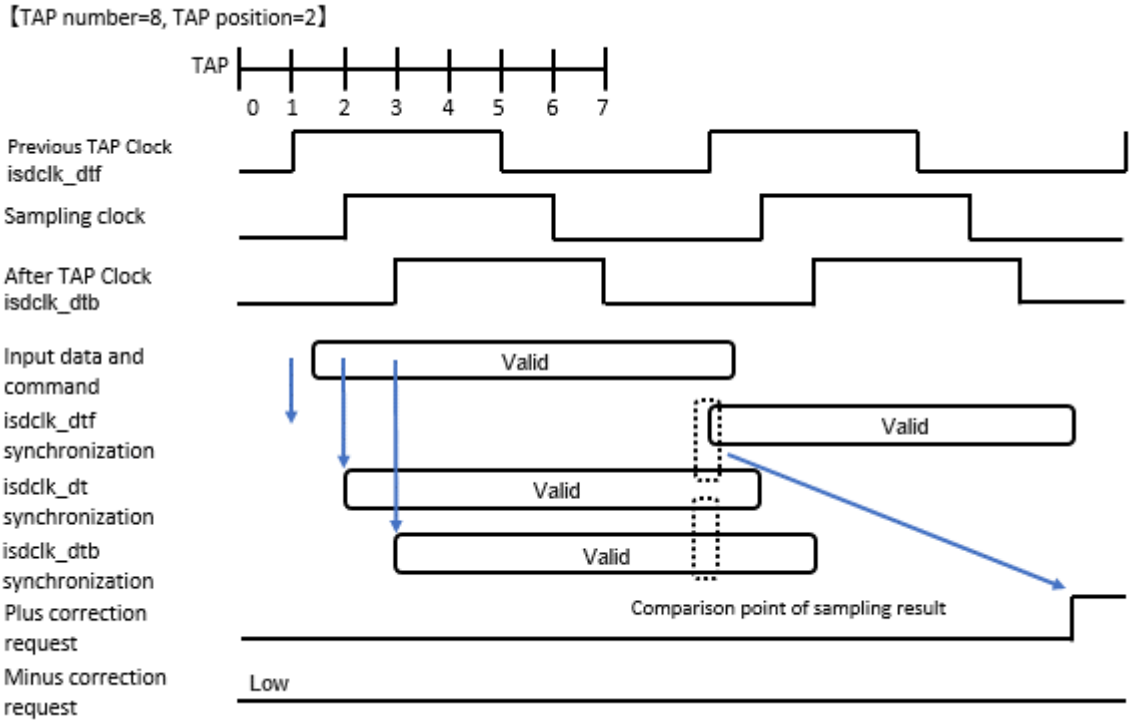
150.3.7.4 TAP position correction request

Figure 150.33 shows the waveform when plus correction request is generated. Figure 150.34 shows the waveform when minus correction request is generated. The value sampled by the selected TAP is compared with the value sampled by the selected preceding and succeeding TAP to judge the correction of the TAP position. When correction is requested, the TAP position is changed in accordance with the correction direction.



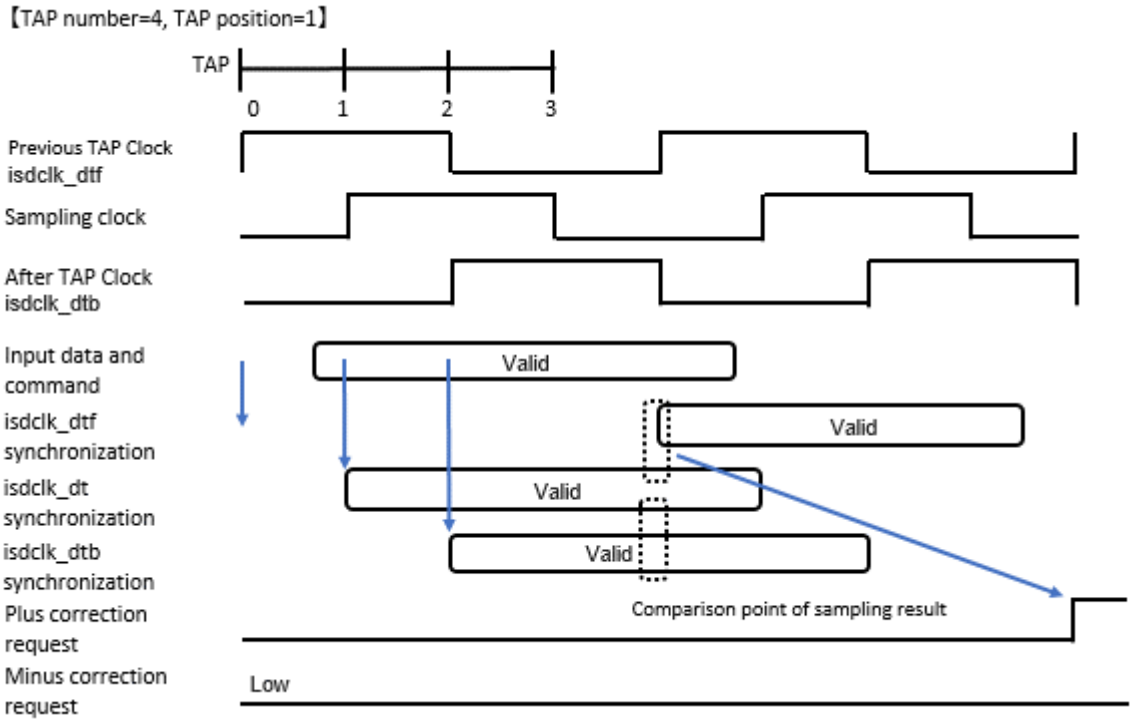


Figure 150.33 Plus correction request generation

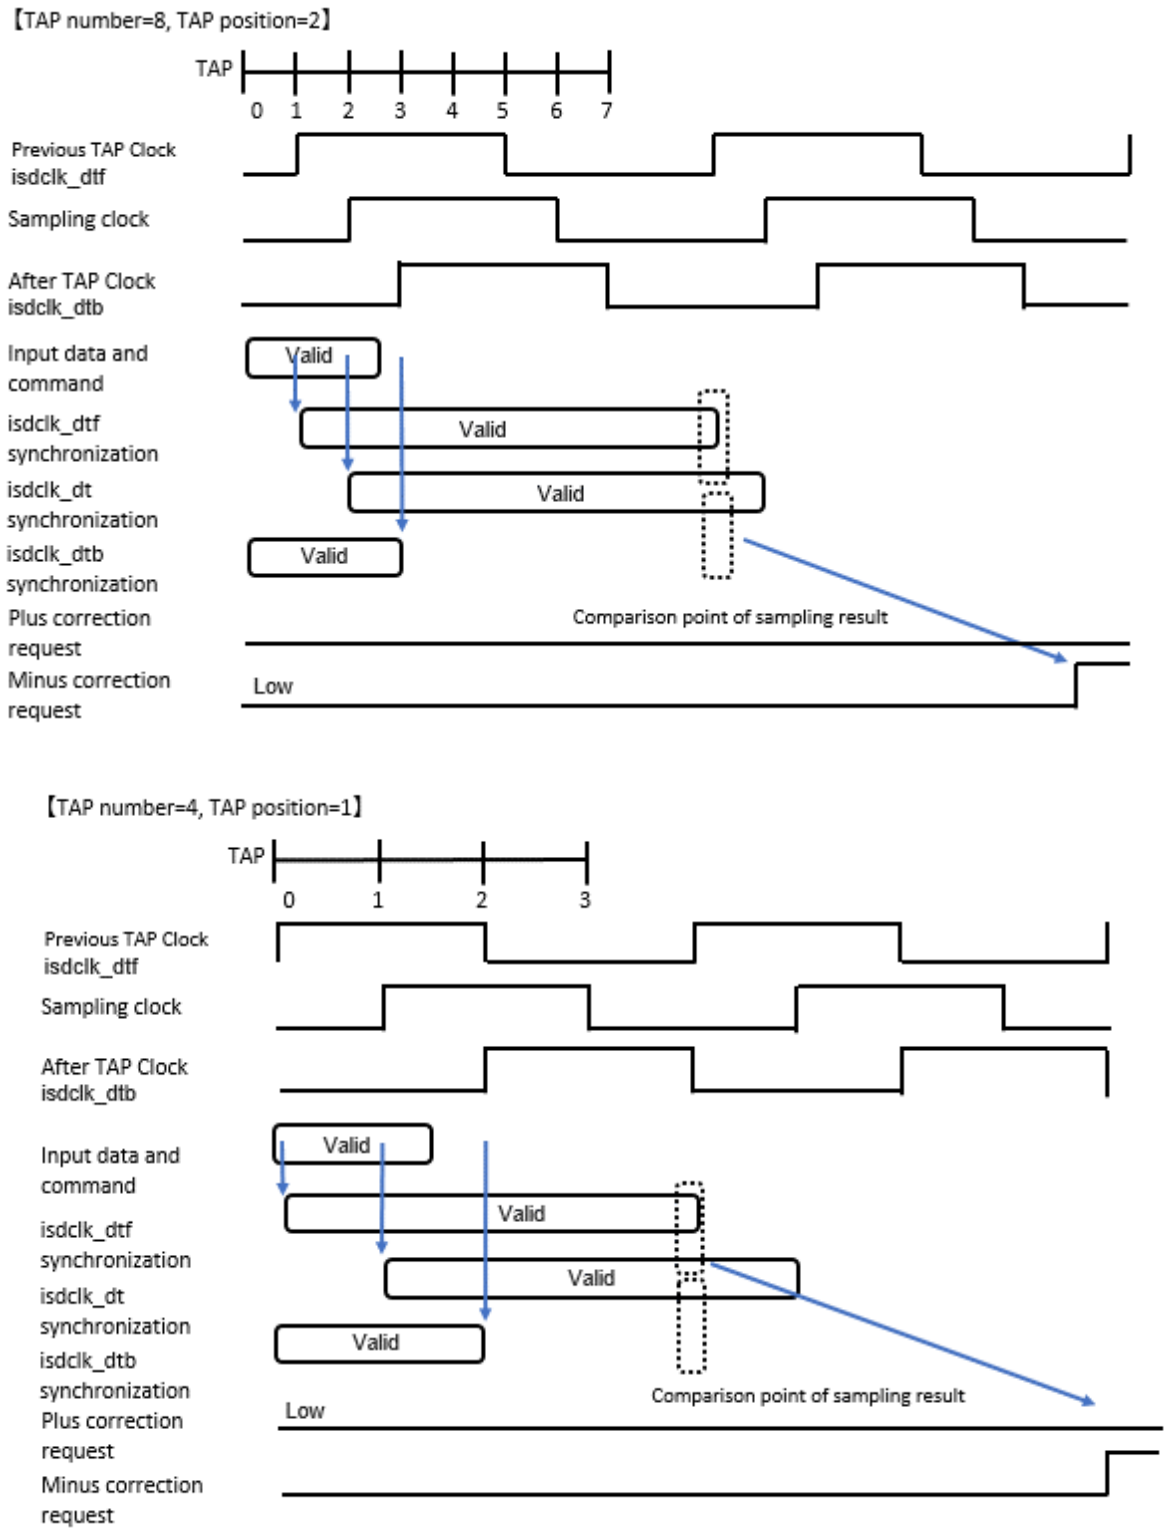

Figure 150.34 Minus correction request generation

150.3.7.5 TAP position automatic correction

When TAP position automatic correction is enabled (the RVSEN bit of the SCC_RVSCNTL register is 1), the TAP position correction request is not set and the TAP position is automatically changed each time the command sequence is started. The TAP position after automatic correction is not reflected in the TAPSET of the SCC_TAPSET register but reflected in the TAPSEL of the SCC_RVSCNTL register. When automatic correction is performed, when the TAP position is corrected to the plus side with the maximum value, it returns to the minimum value, and when the TAP position is corrected to the minus side with the minimum value, it becomes the maximum value.

150.3.7.6 TAP position correction error

When the TAP position automatic correction is invalid (the RVSEN bit of the SCC_RVSCNTL register is 0), both the plus correction request of the TAP position (the REQTAPUP bit of the SCC_RVSREQ register) and the minus correction request (the REQTAPDWN bit of the SCC_RVSREQ register) within the same command sequence When it is set, Delay Tap correction request error occurs (1 set in RVSERR of SCC_RVSREQ register).
When the TAP position automatic correction is enabled (the RVSEN bit of the SCC_RVSCNTL register is 1), the plus correction request (the REQTAPUP bit of the SCC_RVSREQ register) and the minus correction request (the REQTAPDWN bit of the SCC_RVSREQ register) of the TAP position are not set, If one condition is satisfied for both the plus correction request and the minus correction request of the TAP position in the TAP position, a Delay Tap correction request error occurs (one set in the RVSERR of the SCC_RVSREQ register). If there is a Delay Tap correction request error, it is necessary to perform tuning again.

150.3.7.7 SCC Register Configuration

Following DLL Register Configuration table is the SCC registers that can access by SCC_TMPPORT4/5/6/7.

DLL Register Configuration

Name	Abbreviation	dll_addr[5-0]*	Access Size
Mode register	MD	H'00	32
Shifter code setting register	DQSRSETH0	H'22	32
Shifter code monitor register	DQSRMONH0	H'26	32

Note: (*) Refer to 150.2.53 Hardware Adjustment Register 5 (SCC_TMPPORT5).

150.3.8 Usage Example of SCC

150.3.8.1 Overview

Below is an overview of SCC settings.

Figure 150.35 shows the example of setting flow when using SCC.

When using SCC, it is necessary to perform tuning to determine the tap position of the received clock. Tuning is performed on the HS200 even when operating on the HS400. When tuning is completed, set the clock and mode to HS400 when operating with HS400.

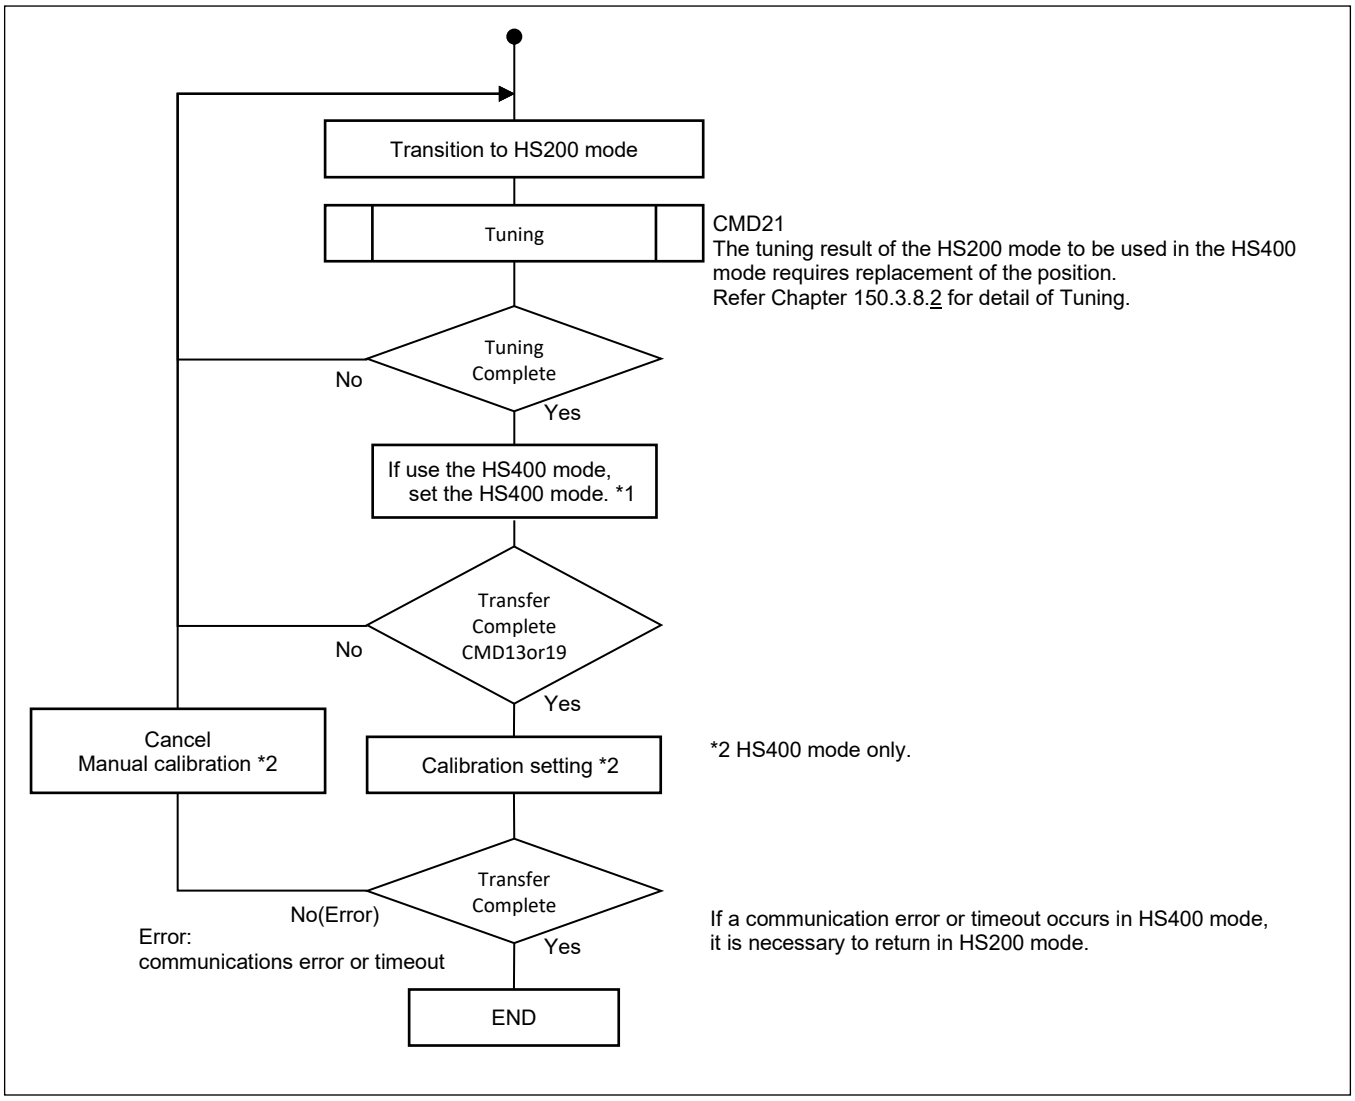

Figure 150.35 Example of setting flow when using SCC.

*1 Automatic Correction is a function to adjust the TAP position automatically. When operating with HS400, set Calibration.

150.3.8.2 Tuning

SCC is tuned by using operation of single-block reading.

Tuning is performed on the HS200 even when operating on the HS400.

As shown in Figure 150.36, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 150.37 and Table 150.11 show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).

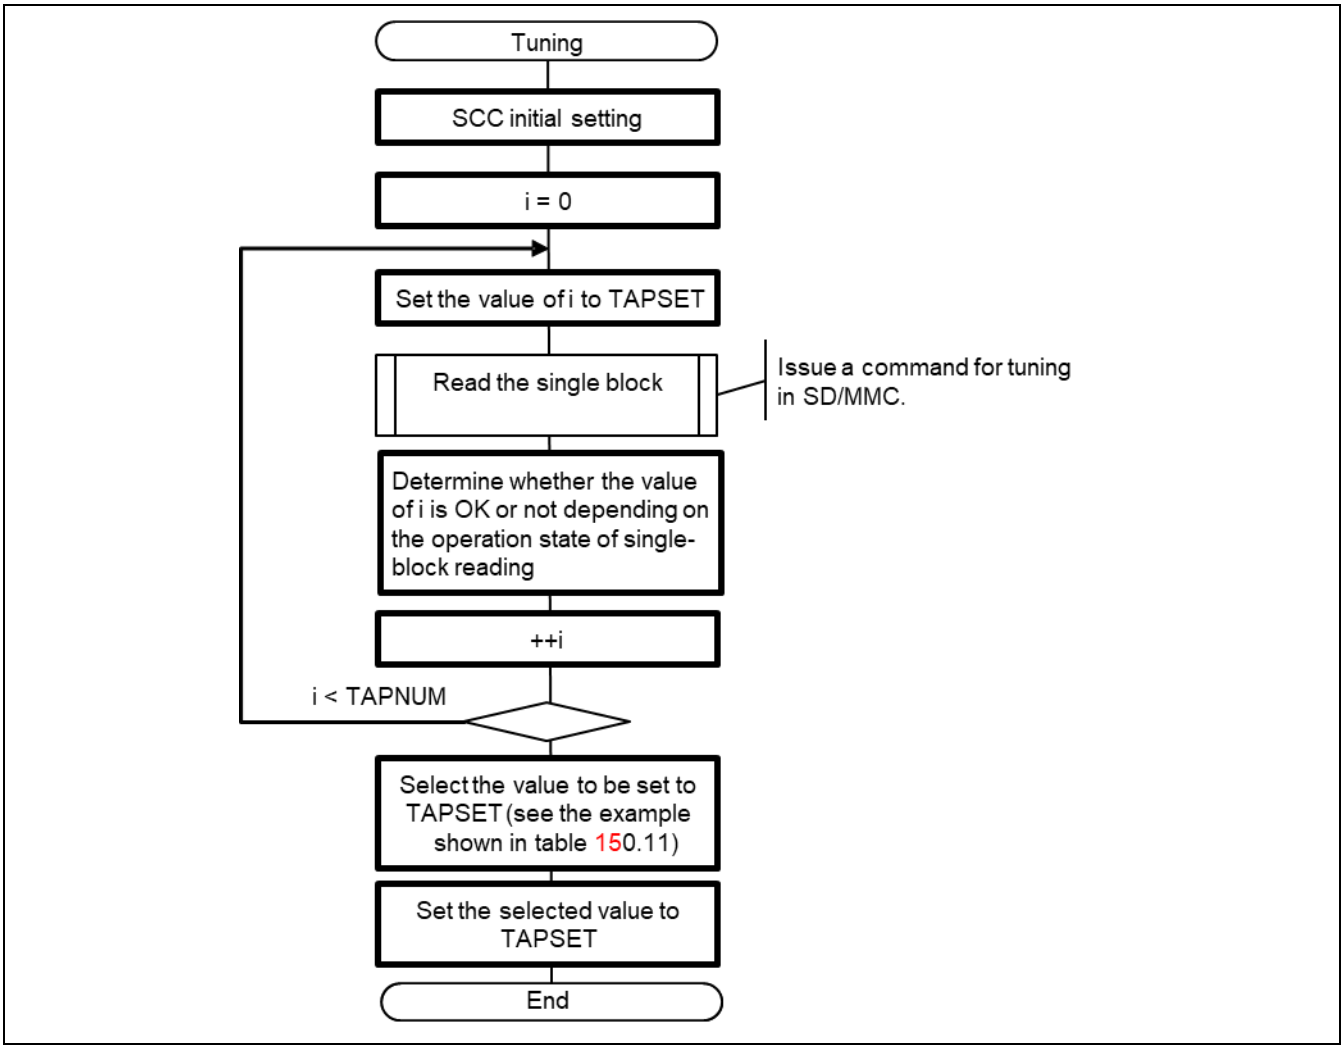

Figure 150.36 Example of Tuning Flow (Outline)

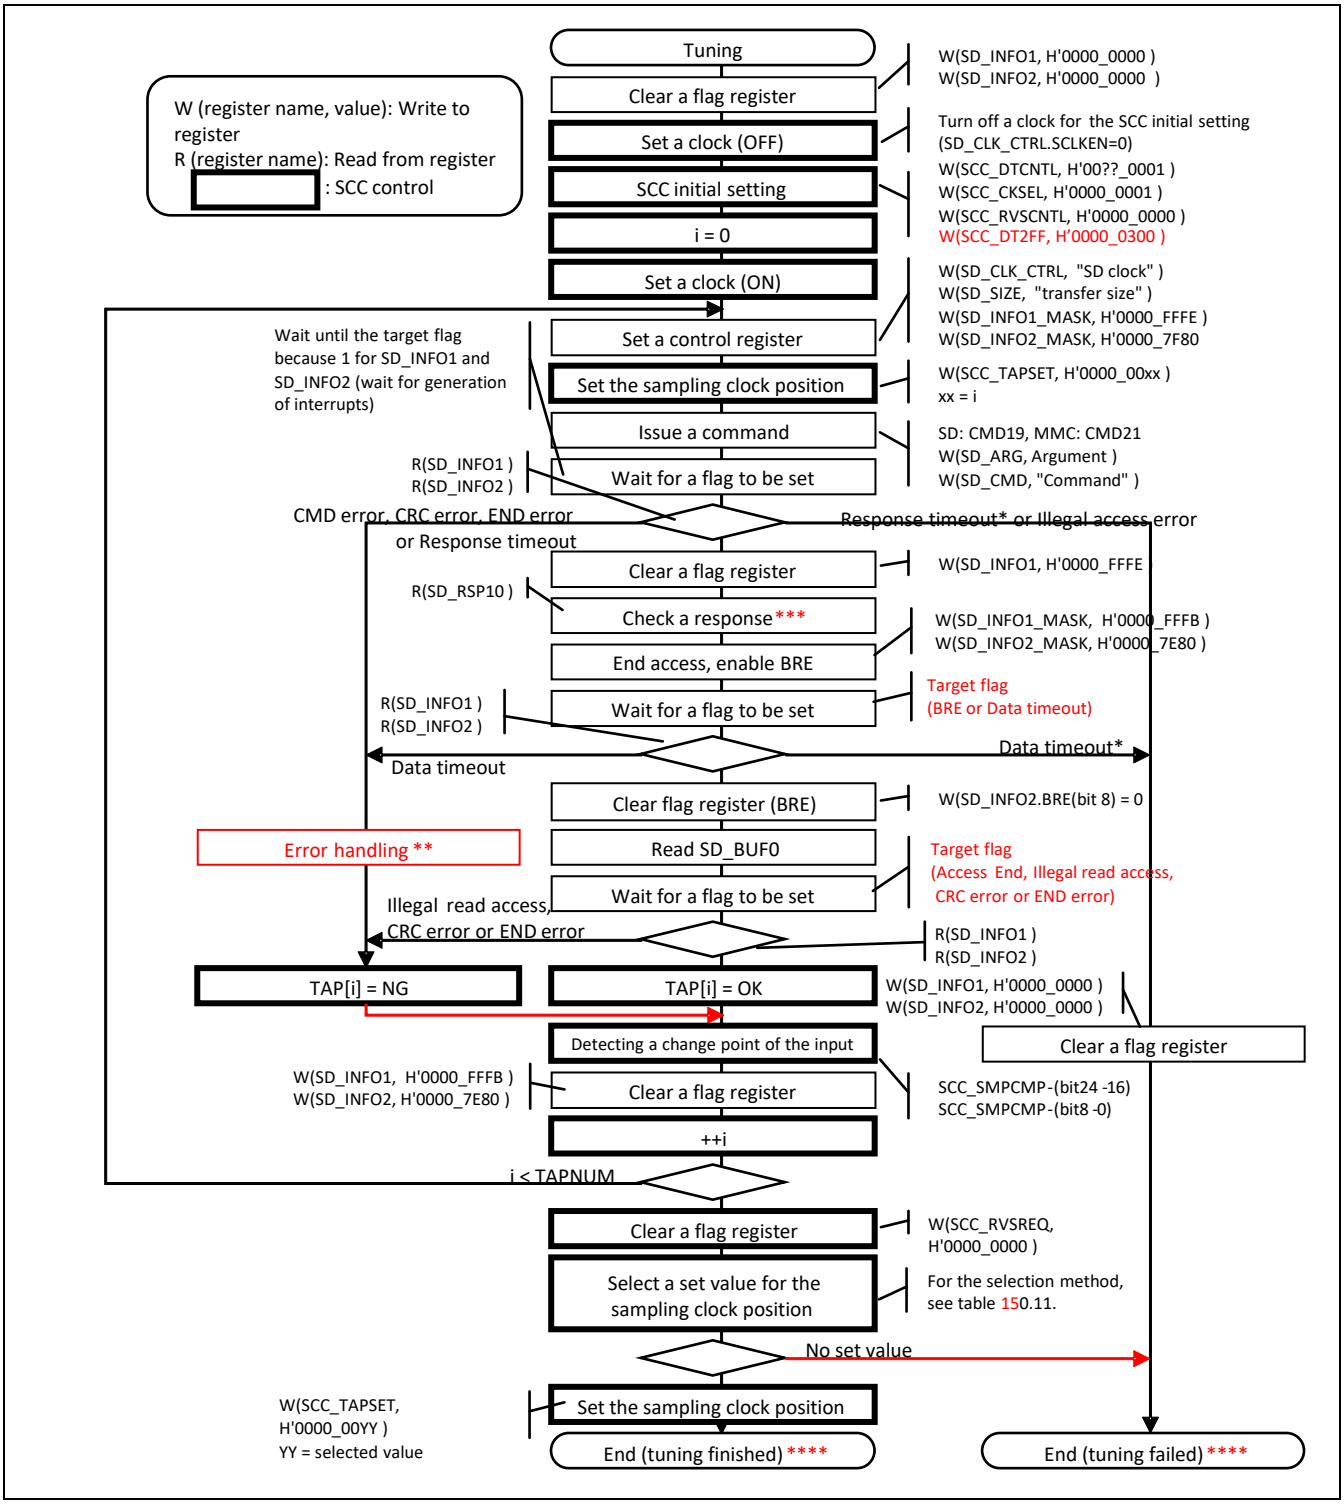

Figure 150.37 Example of Tuning Flow (Detailed)

*: If all of the TAP[i] has become "NG".
**: Perform one of the following for error handling.
- Issue STOP command(CMD12). (CMD error, CRC error, END error and Response timeout can be ignored.)
- Wait for a device to be ready. (Please decide waiting time by checking datasheet of memory device, and please set maximum delay value of data for tuning command as waiting time.)

***: Illegal command shall be ignored.
****: Clean-up is expected by issuing CMD13 and discard the response.

Table 150.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5 *1
TAP[i]	0	NG	OK	NG	OK	OK
	1	OK	OK	NG	NG	OK
Max. value →	2	OK	NG	OK	NG	OK
	3	OK(←)	NG	OK	NG	OK
	4	OK	NG	NG	NG	OK
	5	OK	OK	NG	OK	OK
	6	NG	OK	NG	OK(←)	OK
	7	NG	OK(←)	NG	OK	OK
	(0)	NG	OK	NG	OK	OK
	(1)	OK	OK	NG	NG	OK
	(2)	OK	NG	OK	NG	OK
	(3)	OK	NG	OK	NG	OK
	(4)	OK	NG	NG	NG	OK
	(5)	OK	OK	NG	OK	OK
	(6)	NG	OK	NG	OK	OK
	(7)	NG	OK	NG	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Symbols: (←): Example of selection, (x): repeated display of index x of TAP[x]

*1 If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register.

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAP number-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

150.3.8.3 Sampling Clock Position Correction after Tuning (Excluding HS400 mode)

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 150.38 shows the flow of manual correction of the sampling clock position. If manual correction is out and a communication failure occurs, require performed re-tuning.

Table 150.12 shows set values determined when correction is required.

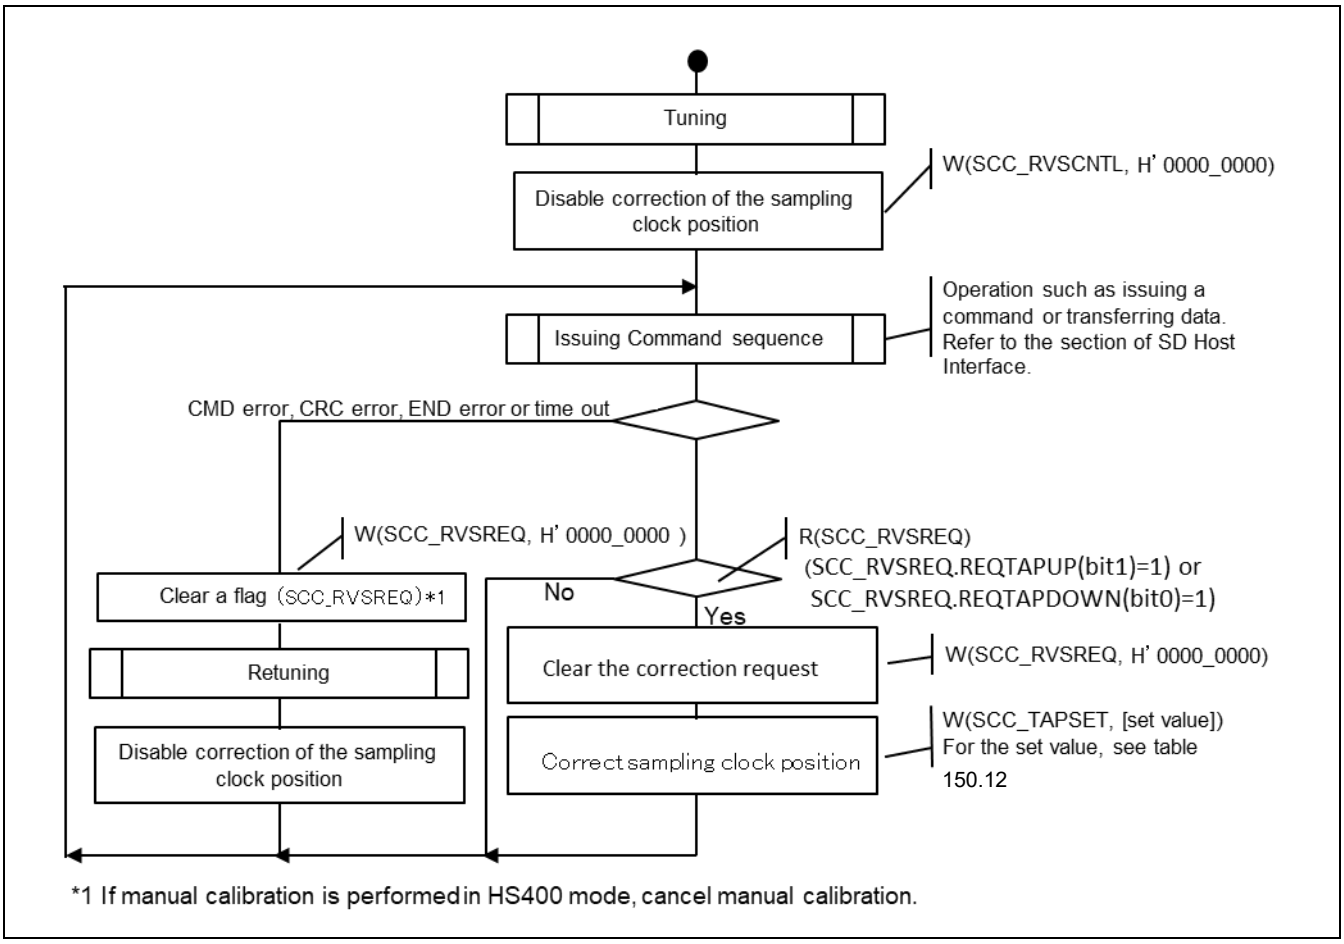

Figure 150.38 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 150.12 Set Values for TAPSET when Correction is Required

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 150.39 shows the flow of automatic correction of the sampling clock position. If automatic correction is out and a communication failure occurs, require performed re-tuning.

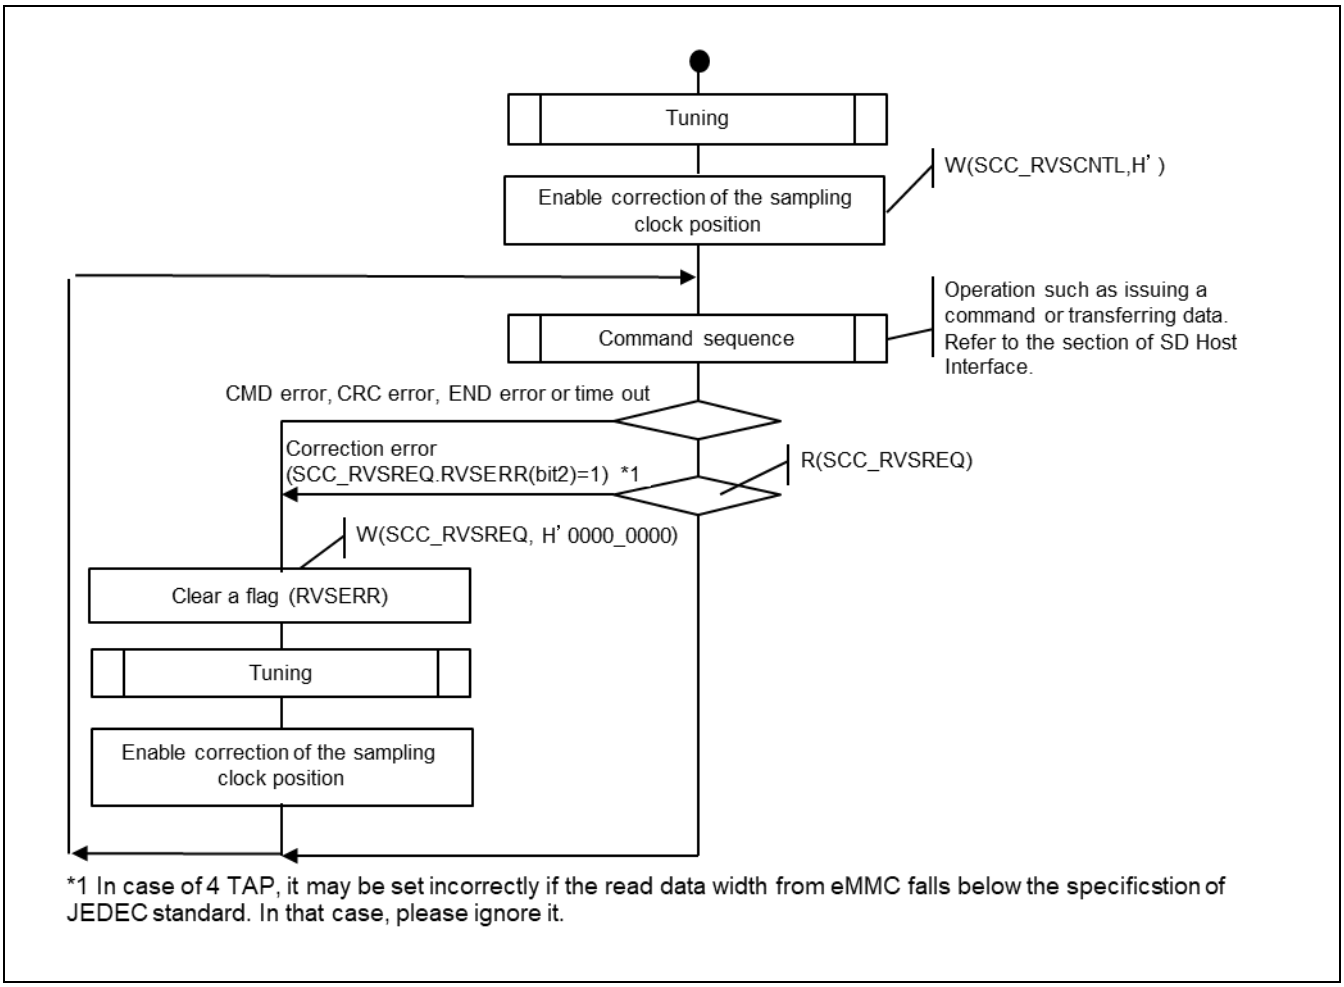

Figure 150.39 Flow of Automatic Correction of the Sampling Clock Position (Example)

150.3.8.4 Sampling Clock Position Correction after Tuning (HS400 mode)

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

When operating in HS400 mode, there are TAPs whose settings are prohibited. It is necessary to keep the result of tuning in order to determine whether the operable TAP has changed since tuning. The prohibited TAPs for each product are as follows.

(1) Manual correction of the sampling clock position

Figure 150.38 shows the flow of manual correction of the sampling clock position. If manual correction is out and a communication failure occurs, require performed re-tuning.

Table 150.12 shows set values determined when correction is required.

a. Setting procedure

1. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following is an example of how to correct for HS400.

2. Is it a true Correction request? If the value read from SCC_RVSREQ is not 'H0000_0000, check the detailed information. Only the command signal status of bit24 and bit8 of SCC_SMPCMP is referenced. If these 2 bits are 00, there is no command signal error and the transfer continues. If it is not 00, move to Correction.

3. Correction:

When above 2bit is 11, it will be retuning as a correction error.

If not, determine the destination TAP according to the value of 2 bits above.

In the case of 01, since it is a Down request, the destination TAP is set to TAP [i-1].

In the case of 10, since it is an Up request, the destination TAP is set to TAP [i + 1].

If the destination TAP is not a prohibited TAP, move the TAP. If the destination TAP is a prohibited TAP, check if the TAP that caused the correction request was passing during tuning.

If it originally failed, the status does not change and the transfer continues. If it was passed at the time of tuning, the condition deteriorated and retuning is performed. If any bit of SCC_RVSREQ is set after issuing the command, read SCC_SMPCMP to get detailed information. The read value determines whether to retune, move the TAP position, or continue at the same TAP position.

Figure 150.40 shows the flow of manual correction of the sampling clock position. (TAP number = 8)

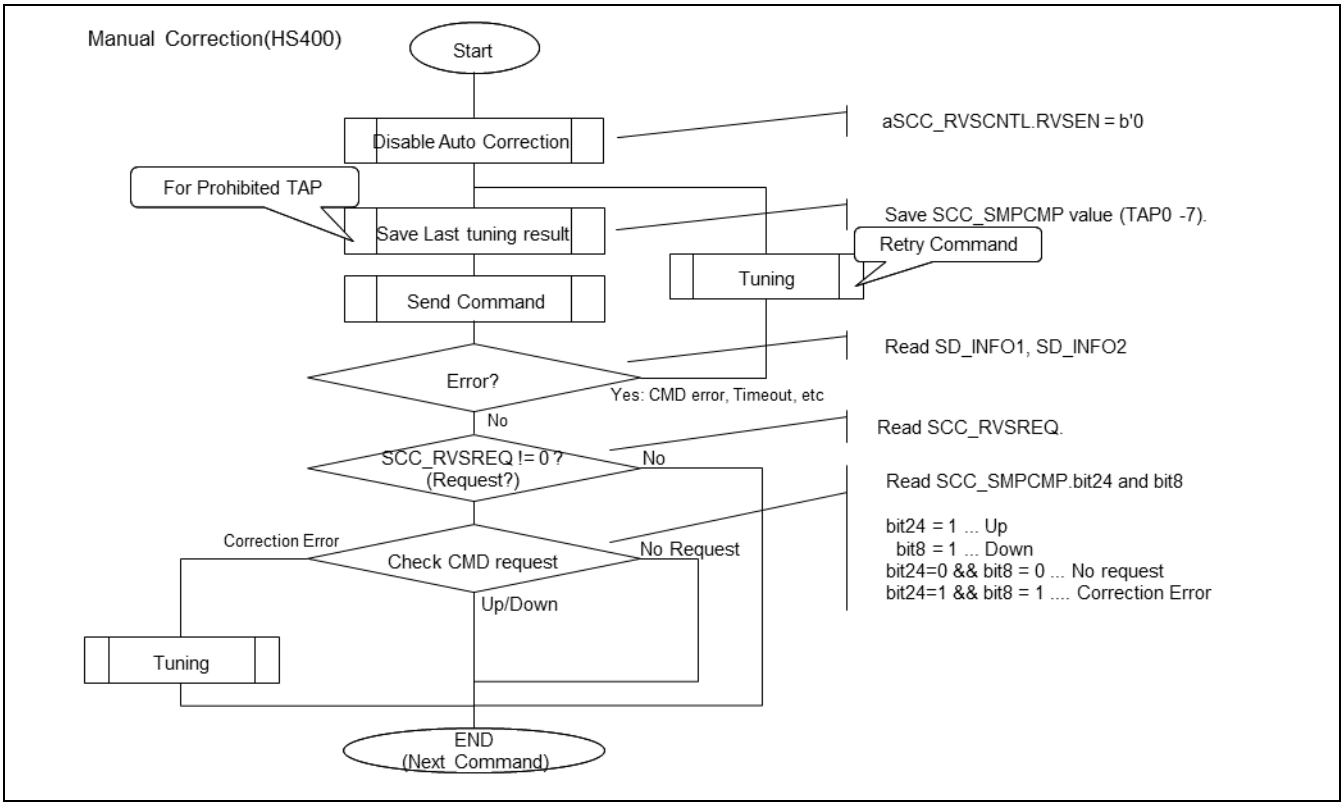

Figure 150.40 Flow Example of Sampling clock position correction(TAP number=8)

(2) Automatic correction of the sampling clock position

Figure 150.41 shows the flow of automatic correction of the sampling clock position. If automatic correction is out and a communication failure occurs, require performed re-tuning.

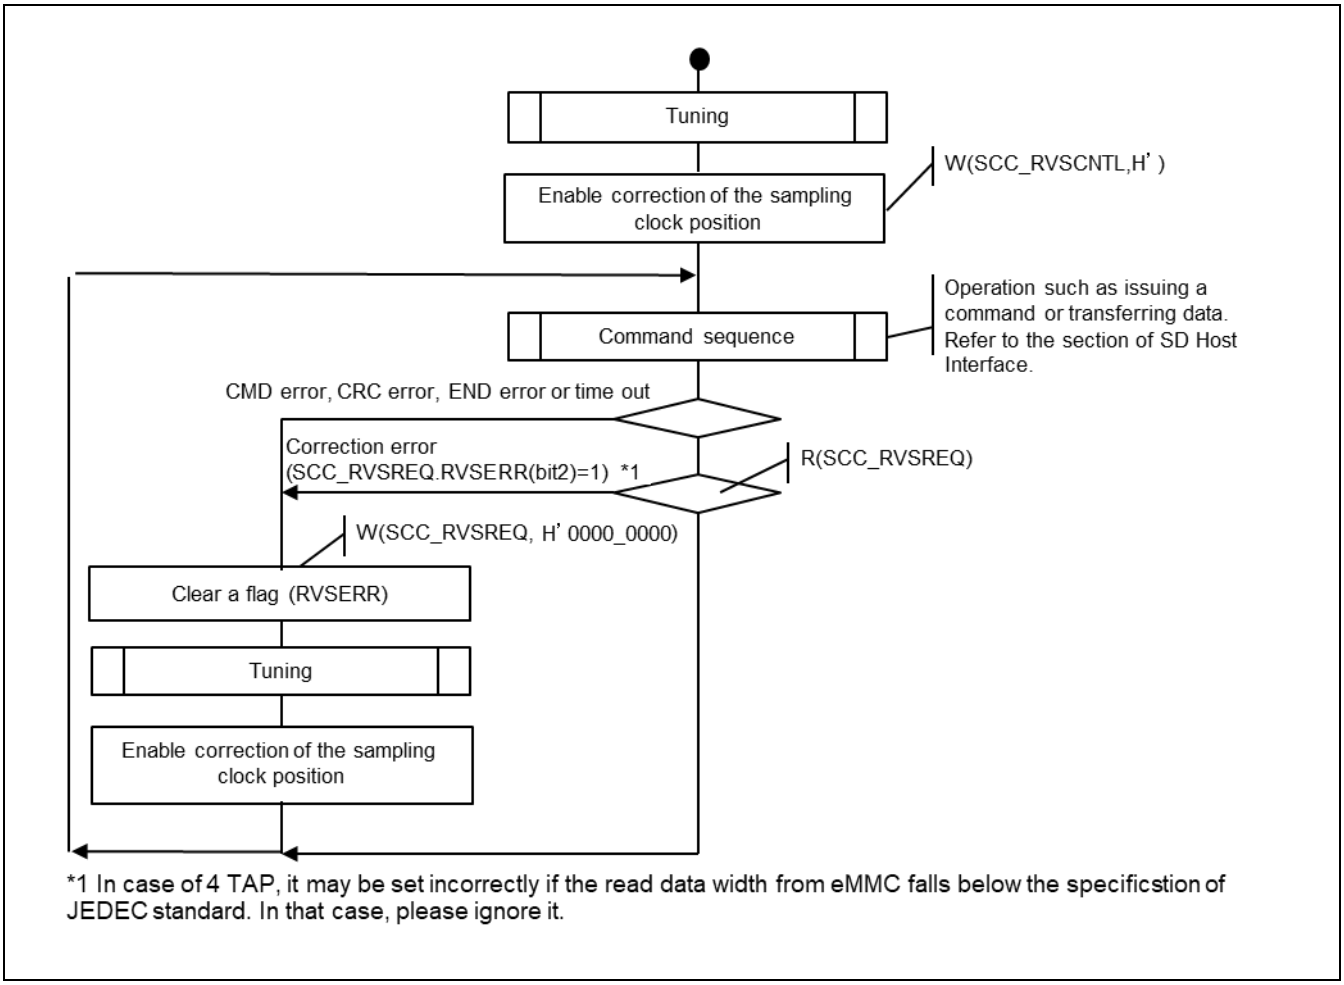

Figure 150.41 Flow of Automatic Correction of the Sampling Clock Position (Example)

150.3.8.5 Calibration (Only HS400 mode)

With the HS400, data is captured by the clock generated by shifting the phase of the DS signal.
Adjust the delay value for the DS signal to capture data.
There are two ways to determine the delay value.

(1) Auto calibration
Auto calibration is set by default.

(2) Manual calibration
The manual calibration procedure is shown below.

a. Manual calibration setting
1. Transition to HS400 mode(HS400EN=1)
Issue of CMD13(SEND_STATUS)

2. Write Protect release of DLL register
W(SCC_TMPPORT5, H'0000_0000) Write instruction
W(SCC_TMPPORT6, H'A500_0000) Write Protect release

W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End

3. Reading the calibration code value
W(SCC_TMPPORT5, H'0000_0126) Read instruction
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End
R(SCC_TMPPORT7) Read the calibration code value

4. Manual calibration of internal DS signal
W(SCC_TMPPORT5, H'0000_0022) Write instruction
W(SCC_TMPPORT6, H'0000_00m) Set the DQSRSETH0.Set_enable bit and "calibration code value"
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End
W(SCC_TMPPORT3, H'0000_000n) Delay Line Offset value change (n=3)

i: read calibration code
m: calibration code
n: offset value

b. Cancel manual calibration
If retuning is required due to communication error, cancel manual calibration.
Please note that the calibration value is not cleared by software reset (SOFT_RST) because the register that sets the calibration value is a local register in the DLL.

1. DLL built-in register Write Protect release
W(SCC_TMPPORT5, H'0000_0000) Write instruction
W(SCC_TMPPORT6, H'A500_0000) Write Protect release
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End

2. Cancel manual correction of internal DS signal
W(SCC_TMPPORT5, H'0000_0022) Write instruction
W(SCC_TMPPORT6, H'0000_0000) Cancel manual correction
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End
W(SCC_TMPPORT3, H'0000_0000) Offset value Initial state set

150.3.8.6 Setting Example (HS400 mode)

(HS400 mode setting)
The HS400 mode setting using the SCC sampling clock are shown below.

(1)SDSRCφ is 800 a (MHz).
Register is SDHI of CPG Clock Frequency Control Register (SD0CKCR).
SDSRCFC[2:0]：3'b000
SD0FC[1:0]：2'b01

(2)The output clock 1: 1 mode.
Register is SD Clock Register (SD_CLK_CTRL).
DIV[7:0]：8'b1111 1111

(3)Setting of SCC_DT2FF for HS200
Register is Hardware Adjustment Register 1(SCC_DT2FF)
DT2NESET7 to DT2NESET0: 8'H03
DT2NSSET7 to DT2NSSET0: 8'H00

(4)Enable the SCC sampling clock.
Register is the sampling clock select register (SCC_CKSEL).

DTSEL：1’b1

(5)It will conduct the 8TAP tuning of CMD terminal and data terminal in the HS200 mode.

(6)SDSRCφ = 800 a (MHz).
Register is SDHI of CPG Clock Frequency Control Register (SD0CKCR).

SDSRCFC[2:0]：3’b000(SD0H = 800MHz)

SD0FC[1:0]：2’b01(SD0 = 200MHz)

(7)The output clock is the 1/2 frequency mode.
Register is SD Clock Register (SD_CLK_CTRL).
DIV[7:0]：8’b0000 0000

(8)Setting of SCC_DT2FF for HS400
Register is Hardware Adjustment Register 1(SCC_DT2FF)

DT2NESET7 to DT2NESET0: 8’H03
DT2NSSET7 to DT2NSSET0: 8’H00

(9)Enable the HS400 mode.
Register is Interface Mode Setting Register. (SDIF_MODE)
HS400 : 1’b1
Register is a hardware adjustment register 2. (SCC_TMPPORT2)
HS400EN：1’b1

HS400OSEL：1’b1

(10)Manual calibration
The manual calibration procedure is shown below.

① Transition to HS400 mode(HS400EN=1)
Issue of CMD13(SEND_STATUS)

② Write Protect release of DLL register
W(SCC_TMPPORT5, H’0000_0000) Write instruction
W(SCC_TMPPORT6, H’A500_0000) Write Protect release
W(SCC_TMPPORT4, H’0000_0001) Register access start
W(SCC_TMPPORT4, H’0000_0000) Register Access End

③ Reading the calibration code value
W(SCC_TMPPORT5, H’0000_0126) Read instruction
W(SCC_TMPPORT4, H’0000_0001) Register access start
W(SCC_TMPPORT4, H’0000_0000) Register Access End
R(SCC_TMPPORT7) Read the calibration code value

④ Manual correction of internal DS signal
W(SCC_TMPPORT5, H’0000_0022) Write instruction
W(SCC_TMPPORT6, H’0000_00m) Set the DQSRSETH0.Set_enable bit and write the calibration code value
W(SCC_TMPPORT4, H’0000_0001) Register access start
W(SCC_TMPPORT4, H’0000_0000) Register Access End
W(SCC_TMPPORT3, H’0000_000n) Delay Line Offset value change(n=3)

i: read calibration code

m: calibration code
n: offset value

(11) Cancel manual calibration
If retuning is required due to communication error, cancel manual calibration.

① DLL built-in register Write Protect release
W(SCC_TMPPORT5, H'0000_0000) Write instruction
W(SCC_TMPPORT6, H'A500_0000) Write Protect release
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End

② Cancel manual correction of internal DS signal
W(SCC_TMPPORT5, H'0000_0022) Write instruction
W(SCC_TMPPORT6, H'0000_0000) Cancel manual correction
W(SCC_TMPPORT4, H'0000_0001) Register access start
W(SCC_TMPPORT4, H'0000_0000) Register Access End
W(SCC_TMPPORT3, H'0000_0000) Offset value Initial state set

150.3.9 Change clock source from PLL5 to PLL4 for HS400/HS200 transfer clock

R-Car V4M can select PLL4 as source clock of this module to enable fine-grained frequency change.

Note that on using PLL4 for source clock, there are following restrictions.
- Clock frequency for 3D Graphics Engine also changes via PLL setting for this module
- Cannot use SSCG and Fractional multiplication (PLL4CR0.SSMODE[2:0] shall be B'000 only in this use)

Figure 150.42 shows how to change clock source from PLL5 to PLL4 and change divider ratio of PLL4.
Table 150.13 shows an example of PLL4CR0.NI [7:0] setting to make clock frequency as SD0Hφ/SD0φ = around 760/190MHz ~ 772/193MHz, respectively.

This flow changes registers SD0CKCR, PLL4CR0, CKSRCSELCR, PLLECR, MSTPCR0, and MSTPCR7 described in 8. Clock Pulse Generator (CPG) and 9. Module Standby, Software Reset section.
To write these registers, writing inverted value to CPGWPR is required before writing target value.
This flowchart omits this CPGWPR write step.

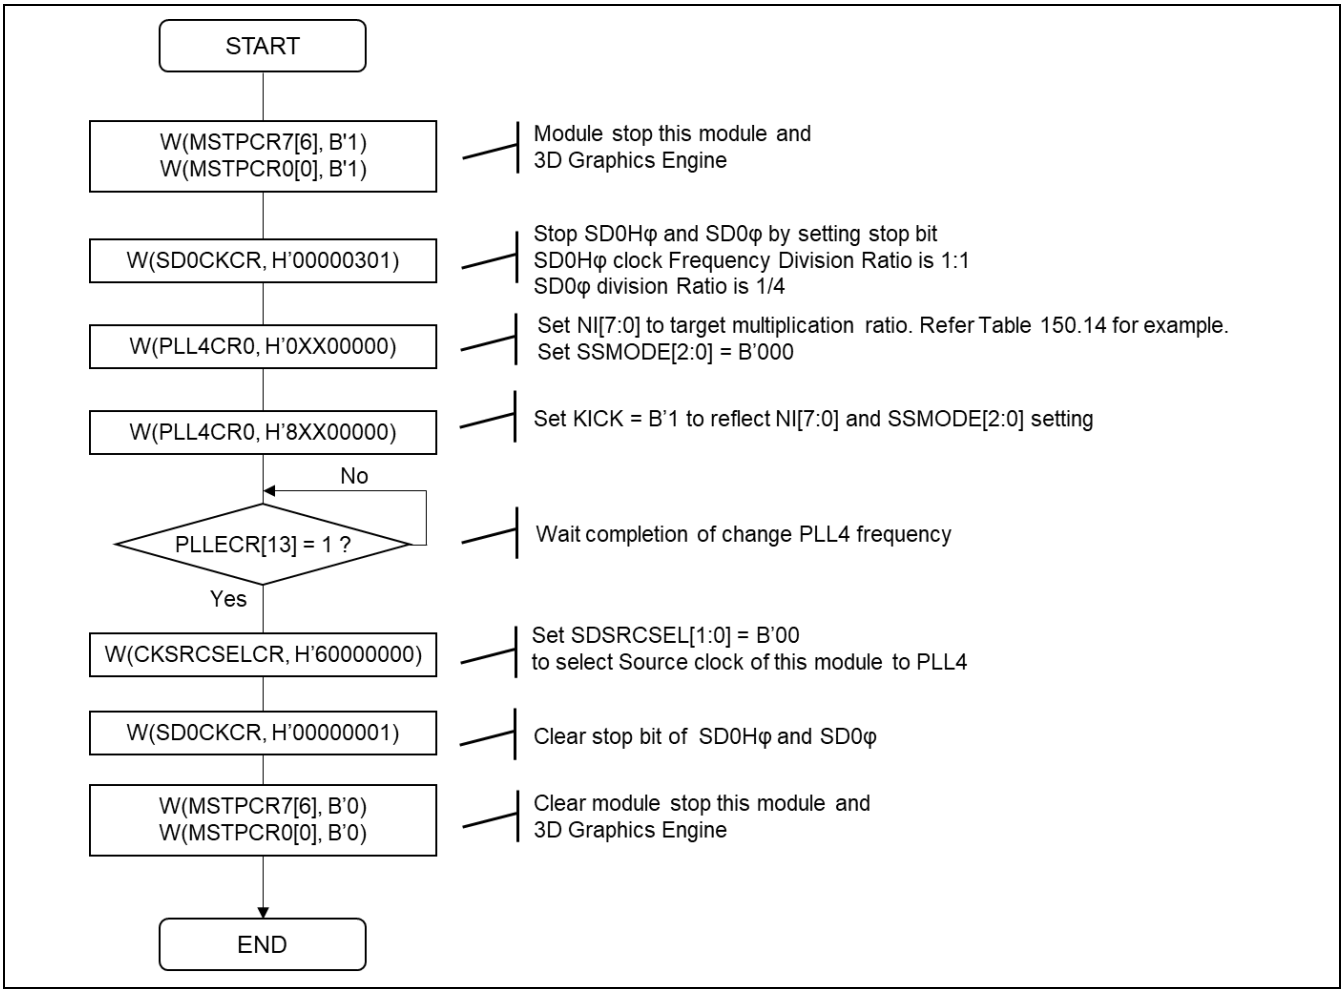

Figure 150.42 Flow to change clock source from PLL5 to PLL4

Table 150.13 Example of PLL4CR0.NI [7:0] to select around SD0Hφ/SD0φ=760/190MHz ~ 772/193MHz

PLL4 reference clock [MHz] *1	PLL4CR0.NI [7:0]	SD0Hφ [MHz] *2	SD0φ [MHz] *2
16.66	H'71	760	190
	H'72	766.66	191.66
	H'73	773.33	193.33
20.00	H'60	776	194
	H'5F	768	192
	H'5E	760	190

Note.1: Please refer Table 8.1.5.4 PLL4 initial Parameter Setting for "PLL4 reference clock" information
Note.2: SD0Hφ/SD0φ value is the case of SD0CKCR.SDSRCFC[2:0] = B'000 and SD0CKCR.SD0FC[1:0] = B'01

150.4 Usage Notes

150.4.1 Designing the board

SDHI and MMC interface transfer performance has been improved. When designing the board, run the SI simulation using the IBIS model.

150.4.2 SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

150.4.3 Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 150.29 shows the processing flows of SD host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 150.29, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

150.4.4 Clock register setting of the HS400 mode

When HS400 mode is used, setting of clock control register is bellow.

1) SD-IFn Clock Frequency Control Register(SD0CKCR)

SDSRCFC[2:0] = B’000(SD0H = 800MHz) , SD0FC[1:0] = B’01(SD0 = 200MHz)

2) SD Clock Control Register(SD_CLK_CTRL)

DIV[7:0] = B’0000 0000

150.4.5 Stop and restart during data communication

If stopping and restarting IP during data communication, data is not guaranteed.

150.5 Safety Mechanisms

This module is treated as non-safety-related function in case of the products supporting functional safety.

154. Watchdog Timer (RCLKWDT, WindowWDT, SystemWDT, ...)

Timer Unit module is a module composed of RWDT, WWDT, and SWDT.

Refer to following section for the detailed function.

- RWDT:154.1 RCLK Watchdog Timer (RWDT)
- WWDT:154.2 Window Watchdog Timer (WWDT)
- SWDT:154.3 System Watchdog Timer (SWDT)

154.1 RCLK Watchdog Timer (RWDT)

154.1.1 Overview

This LSI includes the RCLK watchdog timer (RWDT).

This LSI can be reset by the overflow of the counter when the value of the counter has not been updated because of a system runaway.

The RWDT is a single-channel timer that uses the RCLK as an input and can be used as a watchdog timer. RCLK is a clock, which is generated by the clock pulse generator (CPG).

Frequency of RCLK: 32.8 kHz.

154.1.1.1 Features

- One channel is provided.
- Can be used as a watchdog timer. Reset is generated when the counter overflows.
- A counter input clock can be chosen from:
  Clocks (RCLK/1 to RCLK/ (128 × 60 × 30)) that are obtained by dividing the RCLK.

154.1.1.2 Block Diagram

Figure 154.1.1.1 shows block diagrams of the RWDT.

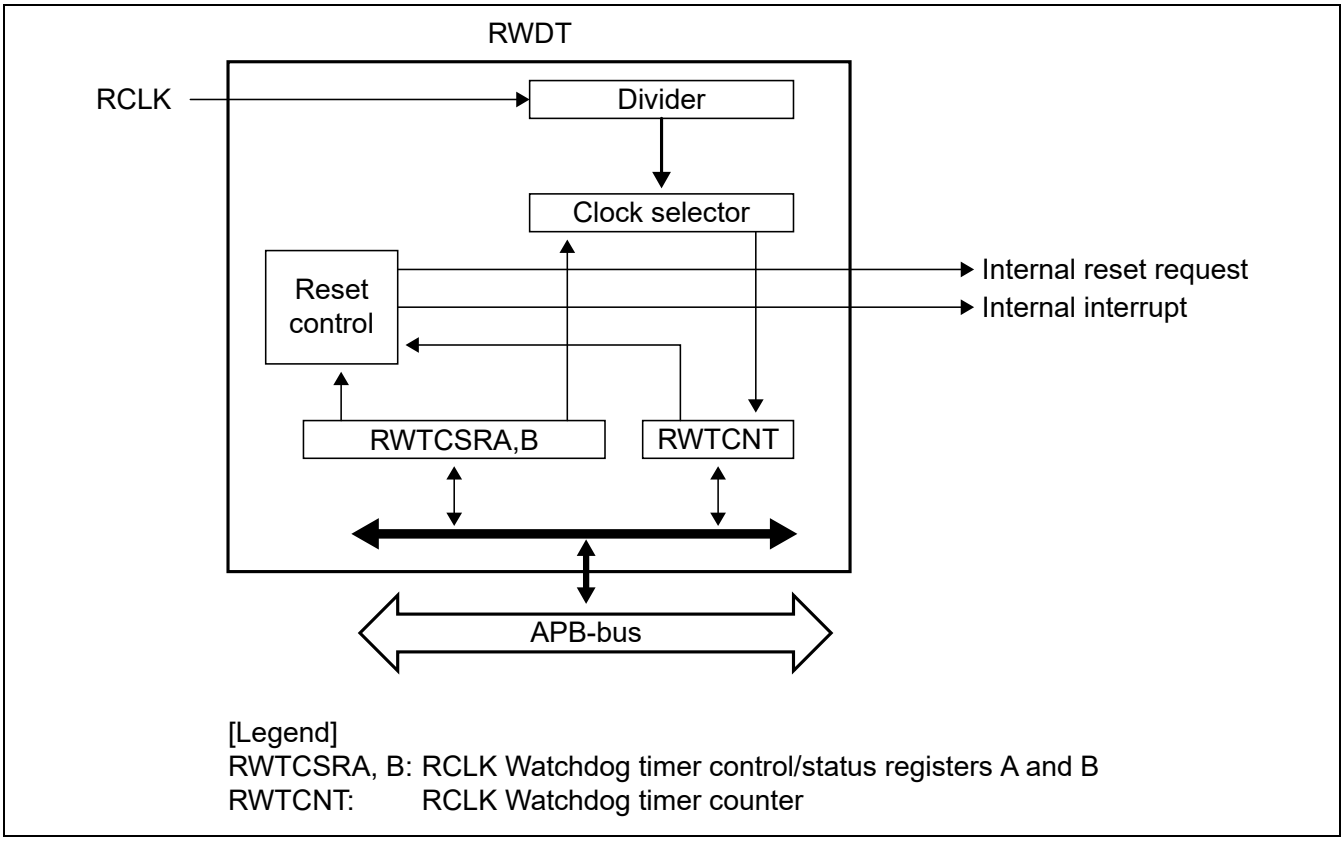

Figure 154.1.1.1 Block Diagram of RWDT

154.1.1.3 Register Configuration

Table 154.1.1.1 shows the RWDT register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.
Table 154.1.1.2 shows the register state in each processing mode.

Table 154.1.1.1 Register Configuration of RWDT

Name	Abbreviation	R/W	Address	Access Size
RCLK watchdog timer counter	RWTCNT	R/W	H'E602 0000	16/32*1
RCLK watchdog timer control/status register A	RWTCSRA	R/W*3	H'E602 0004	8/32*2
RCLK watchdog timer control/status register B	RWTCSRB	R/W	H'E602 0008	8/32*2

Notes: 1. Write is performed in 32 bits and read in 16 bits. Operation cannot be guaranteed if the register is not written as a longword (32bits) and not read as a word (16bits).
2. Write is performed in 32 bits and read in 8 bits. Operation cannot be guaranteed if the register is not written as a longword (32bits) and not read as a byte (8bits).
3. Except for bit [4] that is R/WC0 register.

Table 154.1.1.2 Register State of RWDT in Each Processing Mode

Register Abbreviation		Reset Caused by Other than Overflow	Reset Caused by Overflow*
Register	Bit		
RWTCNT	All	Initialized	Initialized
RWTCSRA	WOVF	Initialized	Retained
	Other than WOVF	Initialized	Initialized
RWTCSRB	All	Initialized	Initialized

Note: * Section 154.3. System Watchdog Timer (SWDT) and RWDT overflow reset.

154.1.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

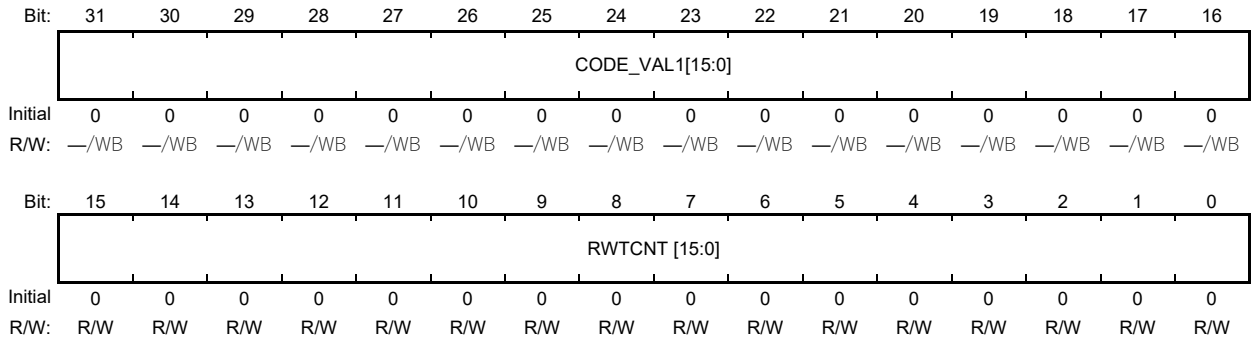
R: Read-only. The write value should always be initial value.

—/WB: Write-only. The read value is undefined.

154.1.2.1 RCLK Watchdog Timer Counter (RWTCNT)

RWTCNT is a 16-bit readable/writable register that increments on the selected clock. When an overflow occurs, it generates a Reset. The RWTCNT counter is initialized to H'0000 by a power-on reset and RWDT software reset.

Use a long word access to write to the RWTCNT counter, with H'5A5A in the upper byte. Use a word access to read RWTCNT.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CODE_VAL1 [15:0]	H’0000	—/WB	Code value 1 When writing this register, write H’5A5A to this bit field. When reading, these bits are always read as same as RWTCNT [15:0].
15 to 0	RWTCNT [15:0]	H’0000	R/W	Timer Counter Bits

154.1.2.2 RCLK Watchdog Timer Control/Status Register A (RWTCSRA)

RWTCSRA is an 8-bit readable/writable register composed of bits to select the clock used for the count, overflow flag, and enable bit.

Use a long word access to write to RWTCSRA, with H'A5 A5A5 in the upper byte. Use a byte access to read RWTCSRA.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE_VAL2[23:8]															
Initial	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CODE_VAL2[7:0]								TME	—	WRFLG	WOVF	WOVFE	CKS0[2:0]		
Initial	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	R/W	R	R	R/WC0	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	CODE_VAL2 [23:0]	H'0F 0F0F	—/WB	Code value 2 When writing this register, write H'A5 A5A5 to this bit field. When reading, these bits are always read as {RWTCSRA [7:0], RWTCSRA [7:0], RWTCSRA [7:0]}.
7	TME	0	R/W	Starts and stops timer operation. 0: Timer disabled: Count-up stops and RWTCNT value is retained 1: Timer enabled
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	WRFLG	0	R	Write Status Flag When this bit is 1, write access to RWTCNT is prohibited. If it isn't maintained, operation isn't secured. This bit indicates the period that the writing to RWTCNT is masked for synchronization after the writing to RWTCNT Confirm that this flag is 0 when RWTCNT is written to continuously.
4	WOVF	0	R/WC0	Indicates that the RWTCNT has overflowed. This bit isn't initialized by a generated reset by an overflow of RWDT and section 154.3. System Watchdog Timer (SWDT). Write 0 to this bit before using the RWDT. 0: No overflow 1: RWTCNT has overflowed Note: Only 0 can be written to clear the flag. Writing 1 to this bit is ignored.
3	WOVFE	1	R/W	Overflow Interrupt Disable/Enable 0: Disables interrupts due to overflow 1: Enables interrupts due to overflow

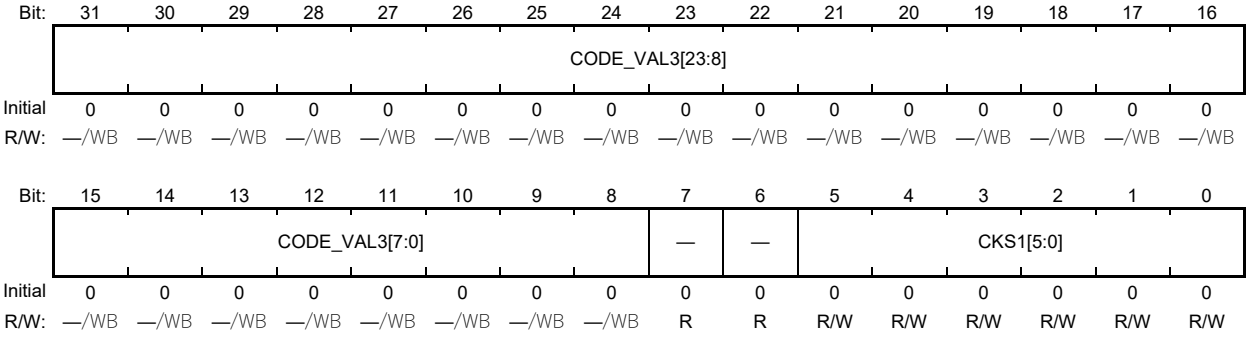
Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CKS0[2:0]	111	R/W	RTC Clock Select These bits select the clock to be used for the RWTCNT count from the eight types obtainable by dividing the RCLK. The overflow period that is shown inside the parenthesis in the table is the approximate value when the RCLK is 32.8 kHz. 000: RCLK (RWTCNT: H'0000 = 1.9 s (RWTCNT: H'FF00 = 7.7 ms)) 001: RCLK/4 (RWTCNT: H'0000 = 7.9 s (RWTCNT: H'FF00 = 31.1 ms)) 010: RCLK/16 (RWTCNT: H'0000 = 31.9 s (RWTCNT: H'FF00 = 124.5 ms)) 011: RCLK/32 (RWTCNT: H'0000 = 63.9 s (RWTCNT: H'FF00 = 249.0 ms)) 100: RCLK/64 (RWTCNT: H'0000 = 127.8 s (RWTCNT: H'FF00 = 498.0 ms)) 101: RCLK/128 (RWTCNT: H'0000 = 255.7 s (RWTCNT: H'FF00 = 0.9 s)) 110: RCLK/1024 (RWTCNT: H'0000 = 2046.0 s (RWTCNT: H'FF00 = 7.9 s)) 111: RCLK select expanded mode The clock cycle varies depending on the CKS1 bit in RWTCSRB. If RWTCSRB.CKS1[3:0] is H'0, division ratio is RCLK/4096 and values of overflow time is RWTCNT: H'0000 = 8192.0 s (RWTCNT: H'FF00 = 32.0 s). If RWTCSRB.CKS1[3:0] is other than H'0, values of overflow time is calculated with formula in chapter 154.1.3.3. Note. These overflow periods are calculated from the rounded value of RCLK = 32.8 kHz as example.

Note: If bits CKS0 [2:0] are modified when the RWDT is operating, the up-count may not be performed correctly. Ensure that the bits CKS0 [2:0] are modified only when the RWDT is not operating.

154.1.2.3 RCLK Watchdog Timer Control/Status Register B (RWTCSRB)

RWTCSRB is an 8-bit readable/writable register composed of bits to select the clock used for the count.

Use a word access to write to RWTCSRB, with H'A5 A5A5 in the upper byte. Use a byte access to read RWTCSRB.



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	CODE_ VAL3[23:0]	H’00 0000	— /WB	Code value 3 When writing this register, write H’A5 A5A5 to this bit field. When reading, these bits are always read as {RWTCSRB [7:0], RWTCSRB [7:0], RWTCSRB [7:0]}.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CKS1[5:0]	All 0	R/W	RCLK Select for RCLK Select Expanded Mode Selects the clock used for the RWTCNT count when the CKS0 bit in RWTCSRA is B'111. Table 154.1.2.1 shows the time values (approximate value) used to cause an overflow from the counter H'0000(Overflow time from counter H'FF00). Assuming the overflow cycle in the table is calculated for the case when the RCLK is 32.8 kHz. For more values of overflow time, refer chapter 154.1.3.3.

Note: If the CKS1 [5] to CKS1 [0] bits are modified when the RWDT is running, the up-count may not be performed correctly. Ensure that these bits are modified only when the RWDT is not running.

Table 154.1.2.1 Example of Overflow time

CKS1[5:4] / CKS1[3:0]	B'00	B'01	B'10	B'11
H'0	8184.0s (31.8 s)			
H'1	255.7 s (0.9 s)	1278.7 s (4.9 s)	255.7 min (0.9 min)	1278.7 min (4.9 min)
H'2	511.5 s (1.9 s)	2557.5 s (9.9 s)	511.5 min (1.9 min)	2557.5 min (9.9 min)
H'3	767.2 s (2.9 s)	3836.2 s (14.9 s)	767.2 min (2.9 min)	3836.2 min (14.9 min)
H'4	1023.0 s (3.9 s)	5115.0 s (19.9 s)	1023.0 min (3.9 min)	5115.0 min (19.9 min)
H'5	1278.7 s (4.9 s)	6393.7 s (24.8 s)	1278.7 min (4.9 min)	6393.7 min (24.8 min)
H'6	1534.5 s (5.9 s)	7672.5 s (29.8 s)	1534.5 min (5.9 min)	7672.5 min (29.8 min)
H'7	1790.2 s (6.9 s)	8951.2 s (34.8 s)	1790.2 min (6.9 min)	Prohibited (Prohibited)
H'8	2046.0 s (7.9 s)	10230.0 s (39.8 s)	2046.0 min (7.9 min)	Prohibited (Prohibited)
H'9	2301.7 s (8.9 s)	11508.8 s (44.7 s)	2301.7 min (8.9 min)	Prohibited (Prohibited)
H'A	2557.5 s (9.9 s)	12787.5 s (49.7 s)	2557.5 min (9.9 min)	Prohibited (Prohibited)
H'B	Prohibited (Prohibited)	14066.3 s (54.7 s)	Prohibited (Prohibited)	Prohibited (Prohibited)
H'C	Prohibited (Prohibited)	15345.0 s (59.7 s)	Prohibited (Prohibited)	Prohibited (Prohibited)
from H'D	Prohibited (Prohibited)	Prohibited (Prohibited)	Prohibited (Prohibited)	Prohibited (Prohibited)

Note. These overflow periods are calculated from the rounded value of RCLK = 32.8 kHz as example.

154.1.3 Operation

154.1.3.1 Control of System Runaway

After a reset, RWDT is disabled. When the counter overflow occurs after the counter starts, an internal reset is again generated. By this function, a reset can be automatically generated even when this LSI has caused a system runaway. While this LSI is operating correctly, write H'0000 (or the set value) to RWTCNT periodically so that RWTCNT does not overflow.

Take the following steps to use the RWDT.

1. Clear the TME bit in RWTCSRA to 0 to temporarily stop counting.
   (Confirm that RCLK was input more than 2 cycles in case RWTCNT is not initialized)
2. Write H'0000 or the set value in RWTCNT
3. Clear the WOVF bit in RWTCSRA to 0.
4. Set the kind of count clock to the CKS0 [2:0] bits in RWTCSRA, and CKS1 [5:0] bits in RWTCSRB.
5. Confirm that RWTCSRA.WRFLG becomes 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the TME bit in RWTCSRA to 1.
   (TME and CKS0 can't be set at the same time. When setting that at the same time, behavior isn't guaranteed.)
7. While this LSI is operating correctly, write H'0000 (or the set value) to RWTCNT periodically so that RWTCNT does not overflow.
8. When RWTCNT overflows, Reset is generated because the RWDT sets the WOVF flag in RWTCSRA to 1. At this time, RWTCNT, RWTCSRA (excluding the WOVF bit), and RWTCSRB are initialized.

Execute a power-on reset or a software reset at that time and initialize RWDT.

When not initializing and using RWDT, behavior isn't guaranteed.

154.1.3.2 Module Stop

A setup of a stop of the Clock by a Module Stop signal is possible when RWDT is an idle state. The Idle state of RWDT is when the condition of following all was satisfied.

- When RWTCSRA.TME bit is 0
- When RWTCSRA.WRFLG is 0
- When 3 or more cycles have passed in RCLK since the last Register access

154.1.3.3 Formula to calculate overflow time

This is the formula to calculate the overflow time for RWDT when choosing Expanded Mode.

Overflow time = 128 × T_RCLK × opset_val × (65536 – RWTCNT)

T_RCLK: is the period of RCLK clock.

RWTCNT: is value of RWTCNT in decade.

opset_val: refer to Table 154.1.3.1.

Table 154.1.3.1 Value of opset_val

CKS1[5:0]	opset_val	CKS1[5:0]	opset_val	CKS1[5:0]	opset_val	CKS1[5:0]	opset_val
H'00	32	H'10	32	H'20	32	H'30	32
H'01	1	H'11	5	H'21	60	H'31	300
H'02	2	H'12	10	H'22	120	H'32	600
H'03	3	H'13	15	H'23	180	H'33	900
H'04	4	H'14	20	H'24	240	H'34	1200

Other case	1	H'1B	55	Other case	1		
		H'1C	60				
		Other case	1				

154.1.3.4 Notes on Register Access

RWTCSRA: Bits TME, CKS0

RWTCSRB: Bits CKS1

After writing a value in this register, it is possible to read that value 2 cycles in counter input clock (RCLK) after writing has finished. And 2 cycles of RCLK need to be inputted until the set-up value is reflected.

RWTCNT: Bits 15 to 0

After writing a value in this register, it is possible to read that value 2 cycles in counter input clock (RCLK) after writing has finished. And 2 cycles of RCLK need to be inputted until the set-up value is reflected. Writing to this register, once started, is protected from further write operations until the writing operation has been completed. Read RWTCSRA. If WRFLG is 0, the next value can be written in RWTCNT.

The writing procedure to RWTCNT, RWTCSRA, and RWTCSRB differs from that of other registers with the purpose of preventing an unintended write. The procedure for writing to these registers is given below.

Writing to RWTCNT, RWTCSRA, and RWTCSRB:

- These registers must be written by a long word transfer instruction. They cannot be written by a byte or word transfer instruction.
- When writing to RWTCNT, set the upper byte to H'5A5A and transfer the lower byte as the write data. When writing to RWTCSRA and RWTCSRB, set the upper byte to H'A5A5A5 and transfer the lower byte as the write data.

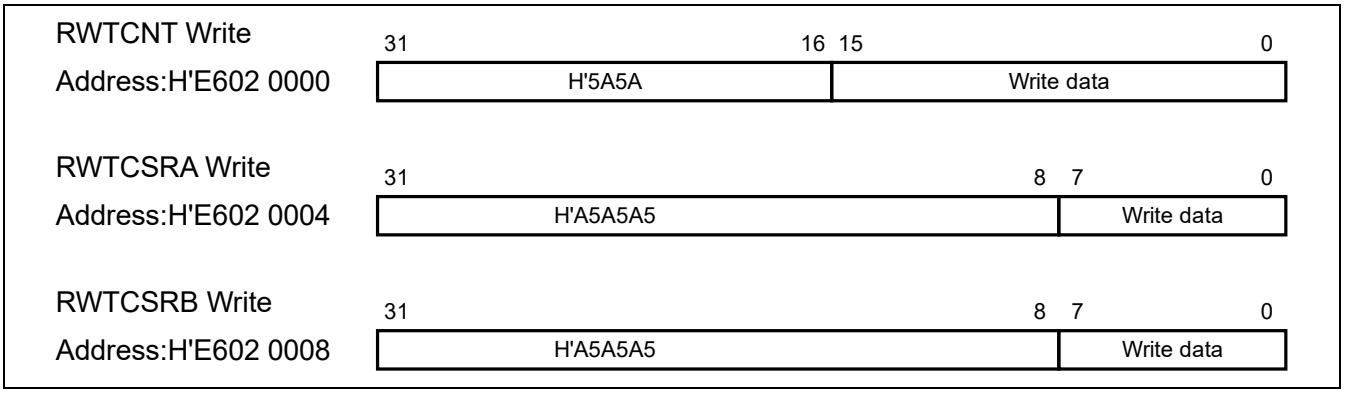

Figure 154.1.3.1 Writing to RWTCNT, RWTCSRA, and RWTCSRB

154.1.4 Usage Notes

No description on this section.

154.1.5 Safety Mechanisms

154.1.5.1 Power-On test

This module is protected by Power-On test.

154.2 Window Watchdog Timer (WWDT)

154.2.1 Overview

The Window Watchdog Timer (hereinafter referred to as the "WWDT") is a module of Watchdog timer with window that makes monitoring-period by CPU varying.

154.2.1.1 Features

The WWDT has the following features.

- Window watchdog function;
  - — When counter reach overflow value then module will detect error.
  - — When the start trigger register is written during the window is close then module will detect error.
  - — When counter reach 75% value of overflow value then module will create 75% interrupt.
- Generates Reset or NMI on error detection.
- Support Software trigger mode.
- 7 channels.

154.2.1.2 Block Diagram

Figure 154.2.1.1 is a block diagram of the WWDT.

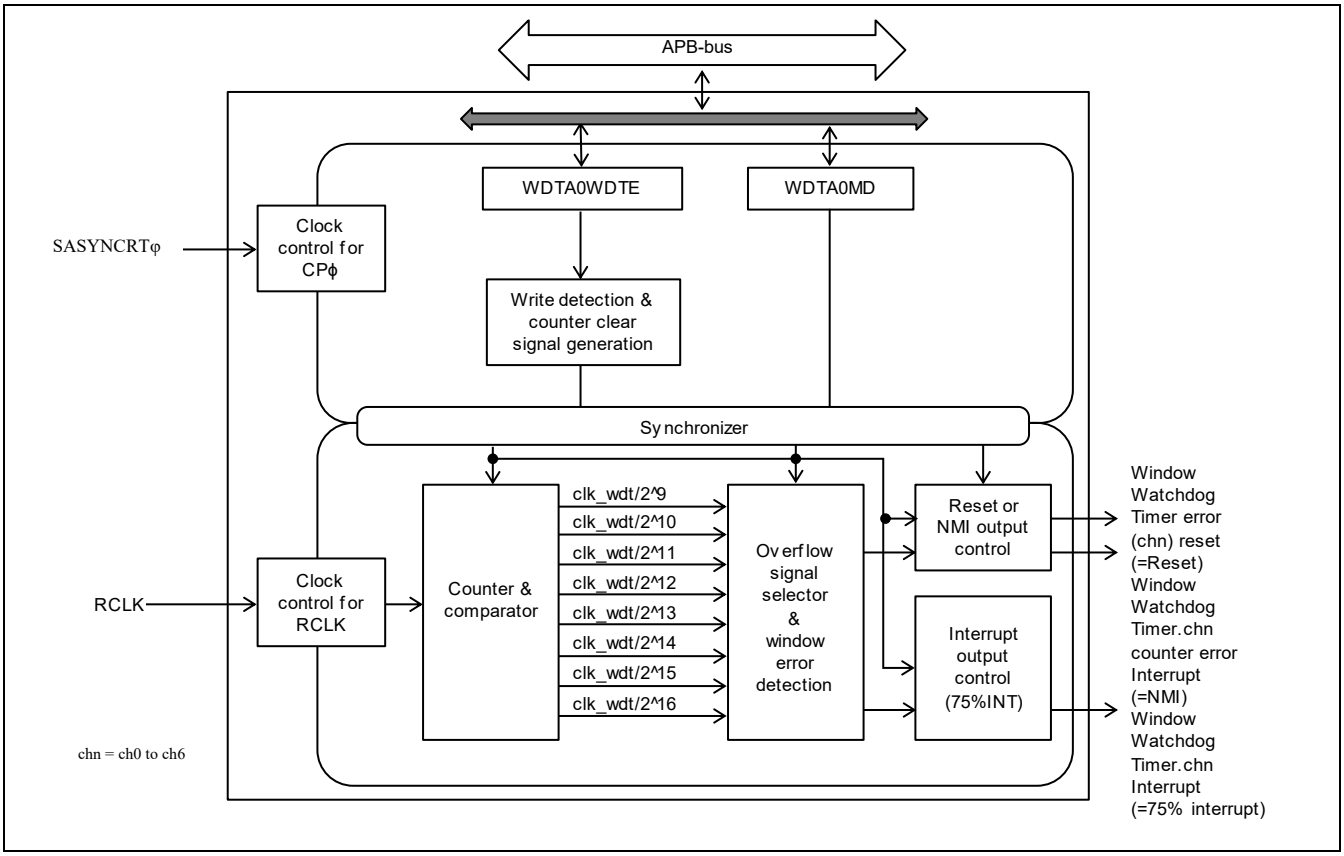

Figure 154.2.1.1 Block Diagram of the WWDT

154.2.1.3 Register Configuration

Table 154.2.1.1 shows the WWDT register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a byte (8 bits). Operation cannot be guaranteed if the register is not accessed as a byte.

Table 154.2.1.1 Register Configuration

Channel n n = 0 to 6	Name	Abbreviation	R/W	Address	Size	Reset
0	Watchdog Timer Enable register 0	WDTA0WDTE0	R/W	H'FFC9 0000	8	H'2C
	Watchdog Timer Mode register 0	WDTA0MD0	R/W	H'FFC9 000C	8	H'04
1	Watchdog Timer Enable register 1	WDTA0WDTE1	R/W	H'FFCA 0000	8	H'2C
	Watchdog Timer Mode register 1	WDTA0MD1	R/W	H'FFCA 000C	8	H'04
2	Watchdog Timer Enable register 2	WDTA0WDTE2	R/W	H'FFCB 0000	8	H'2C
	Watchdog Timer Mode register 2	WDTA0MD2	R/W	H'FFCB 000C	8	H'04
3	Watchdog Timer Enable register 3	WDTA0WDTE3	R/W	H'FFCC 0000	8	H'2C
	Watchdog Timer Mode register 3	WDTA0MD3	R/W	H'FFCC 000C	8	H'04
4	Watchdog Timer Enable register 4	WDTA0WDTE4	R/W	H'FFCF 0000	8	H'2C
	Watchdog Timer Mode register 4	WDTA0MD4	R/W	H'FFCF 000C	8	H'04
5	Watchdog Timer Enable register 5	WDTA0WDTE5	R/W	H'FFEF 0000	8	H'2C
	Watchdog Timer Mode register 5	WDTA0MD5	R/W	H'FFEF 000C	8	H'04
6	Watchdog Timer Enable register 6	WDTA0WDTE6	R/W	H'FFF1 0000	8	H'2C
	Watchdog Timer Mode register 6	WDTA0MD6	R/W	H'FFF1 000C	8	H'04

154.2.1.4 Connected Module

Table 154.2.1.2 Connected modules

Module name	Connected module name	Function of connected module
WWDT	CPG	Supply clock and reset
	INTC-SYS, INTC-RT	Control to interrupt
	MFIS	Control error happen

154.2.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R: Read-only. The write value should always be initial value.

All registers are accessed in byte units.

154.2.2.1 Watchdog Timer Enable Register (WDTA0WDTEn)

The register is a trigger register.

To clear (= trigger) the counter, 0xAC must be written on this register. Writing wrong value or writing while window is window closed leads to error detection.

Bit:	7	6	5	4	3	2	1	0
	WDTA0RUN	—	—	—	—	—	—	—
Initial value:	0	0	1	0	1	1	0	0
R/W:	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	WDTA0RUN	0	R/W	Watchdog timer count start or stop. WDTA0RUN bit is the set only register and it can only be cleared by PRESETZ. When "1" is written on WDTA0RUN, the watchdog timer starts counting.
6 to 0	—	H'2C	R	Reserved

154.2.2.2 Watchdog Timer Mode register (WDTA0MDn)

This register is timer mode register.

This register can be updated only once after any resets and before first write to trigger register.

The updated new value will be effective from next period (= when the counter value becomes H'0000).

Updating this register after the first writing of trigger leads to error detection.

Updating this register more than once leads to error detection.

The new or initial value of WDTA0MD applies after the first trigger.

Bit:	7	6	5	4	3	2	1	0
	—	WDTA0OVF2	WDTA0OVF1	WDTA0OVF0	WDTA0WIE	WDTA0ERM	WDTA0WS1	WDTA0WS0
Initial value:	0	0	0	0	0	1	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved
6	WDTA0OVF2	0	R/W	Interval time mode Please refer to Table 154.2.2.2 for details.
5	WDTA0OVF1	0	R/W	Interval time mode Please refer to Table 154.2.2.2 for details.
4	WDTA0OVF0	0	R/W	Interval time mode Please refer to Table 154.2.2.2 for details.
3	WDTA0WIE	0	R/W	75% interrupt enable 0: 75% interrupt is disabled 1: 75% interrupt is enabled
2	WDTA0ERM	1	R/W	Error mode 0: NMI mode 1: Reset mode (Default)
1	WDTA0WS1	0	R/W	Window Size selection Please refer to Figure 154.2.2.1 and Table 154.2.2.1 for details.
0	WDTA0WS0	0	R/W	Window Size selection Please refer to Figure 154.2.2.1 and Table 154.2.2.1 for details.

Note: 3 cycles are necessary with SASYNCRTφ before initial value is reflected on each bit after reset release. It must be designed in a way the register update timing and timer counter clear timing, which is the timing the register value is loaded, will not occur at the same time to avoid inconsistency.

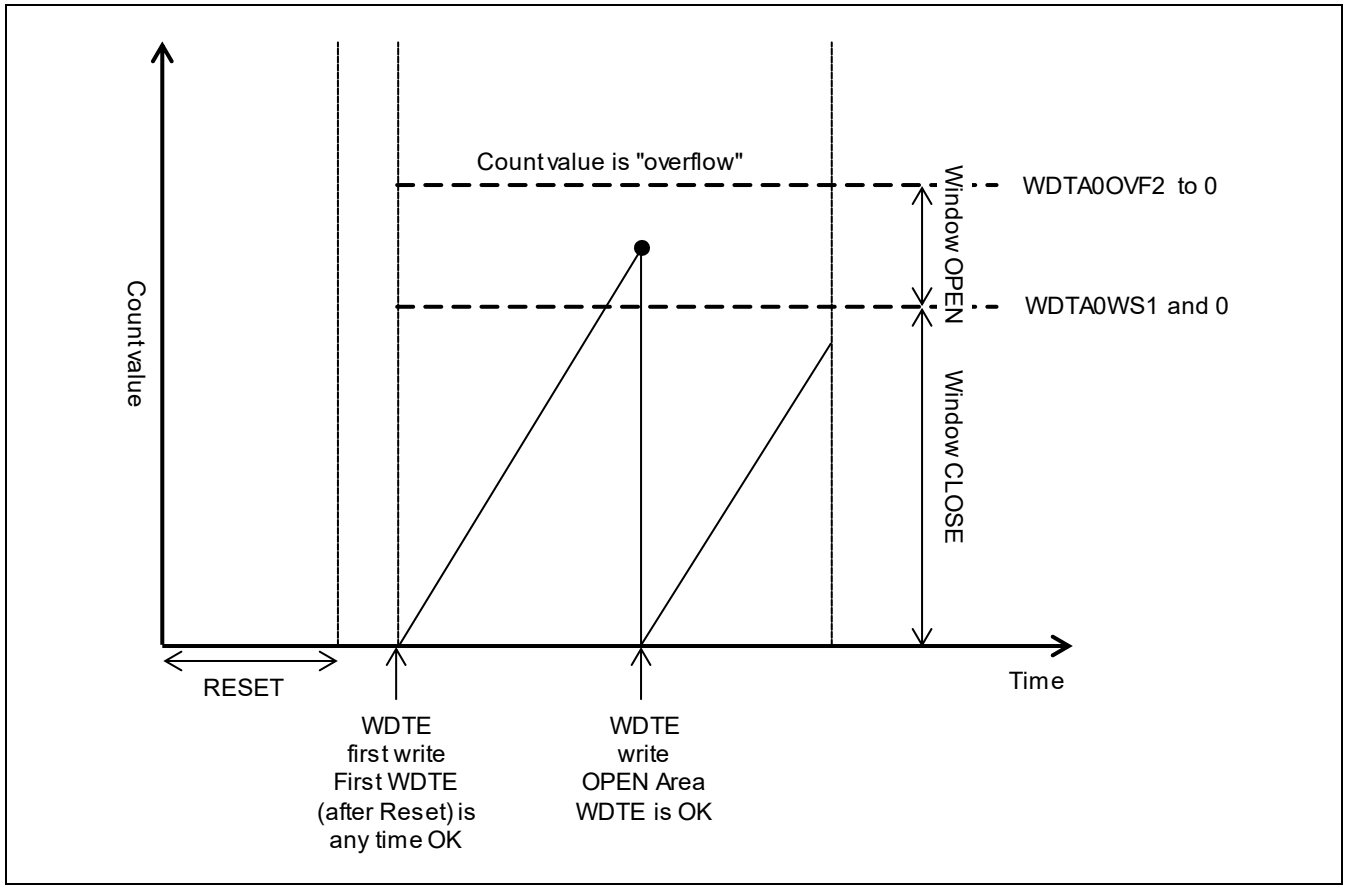

Figure 154.2.2.1 Window Size Selection

Table 154.2.2.1 **Window Size selection**

WDTA0WS1	WDTA0WS0	Window Size selection
0	0	25%
0	1	50%
1	0	75%
1	1	100%

Window Size selection is ration Window OPEN/ (Window OPEN + Window CLOSE).

Table 154.2.2.2 Interval Time Mode

WDTA0OVF2	WDTA0OVF1	WDTA0OVF0	Interval time
0	0	0	2^9/clk_wdt
0	0	1	2^{10}/clk_wdt
0	1	0	2^{11}/clk_wdt
0	1	1	2^{12}/clk_wdt
1	0	0	2^{13}/clk_wdt
1	0	1	2^{14}/clk_wdt
1	1	0	2^{15}/clk_wdt
1	1	1	2^{16}/clk_wdt

Note: “clk_wdt” is watchdog timer operation clock which is input from RCLK. In case that input clock frequency is 32.8kHz and if the setting of overflow is set to clk_wdt/2^9, the overflow time is
32.8kHz / 2^9 ➔ about 64.0Hz ➔ about 15.6msec

154.2.3 Operation

154.2.3.1 Operation After Reset Timing

(1) Software Trigger Start mode

WWDT is reset by Power-On Reset For Software Trigger Start mode, WWDT is stopped with reset conditions after reset release.

(2) Operation parameter after reset release

After reset release, the operation parameter becomes the following set regardless of software trigger start mode.

- Overflow interval time: clk_wdt / 2^9
- Window period size: 100%
- 75% Interruption disabled
- Software trigger mode

154.2.3.2 Window watchdog function

Window open size is defined by WDTA0MD.WDTA0WS1-0, and writing the start trigger register outside the period results in error detection.

However, the window open size is 100% right after the reset release to enable software to make initial trigger without waiting the window to open.

Window at software trigger start mode

- Initial trigger of the counter can be done anytime.
- The triggering afterwards must be done during the window is open.

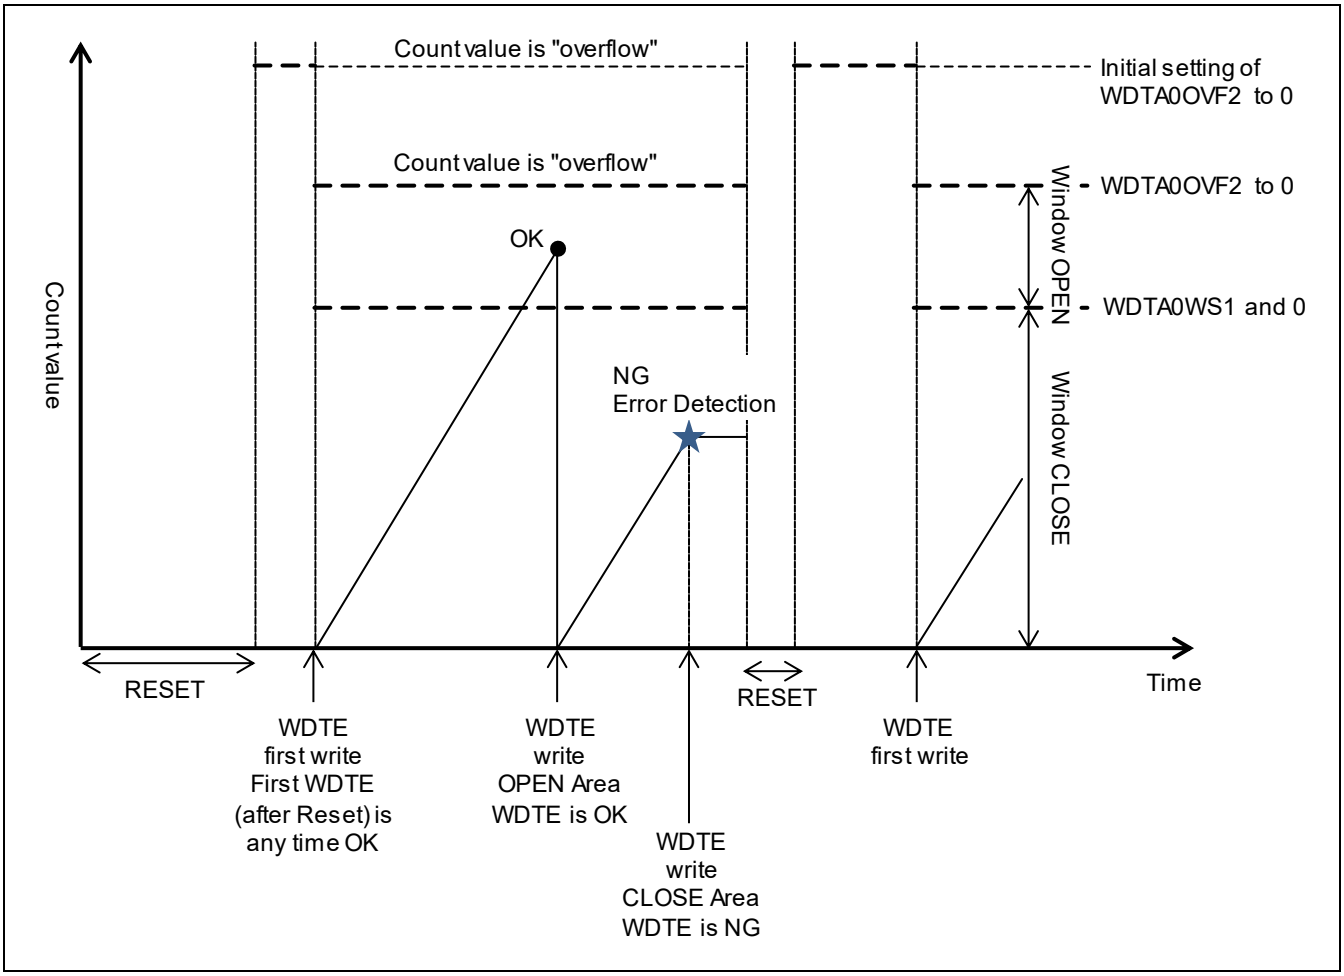

Figure 154.2.3.1 Window watchdog function

154.2.3.3 75% interrupt output

When the counter reaches 75% of the overflow setting defined by WDTA0MD.WDT0OVF2-0, 75% interrupt is generated with the pulse width of 1CLK of RCLK. This function is effective if WDTA0WIE bit is 1.

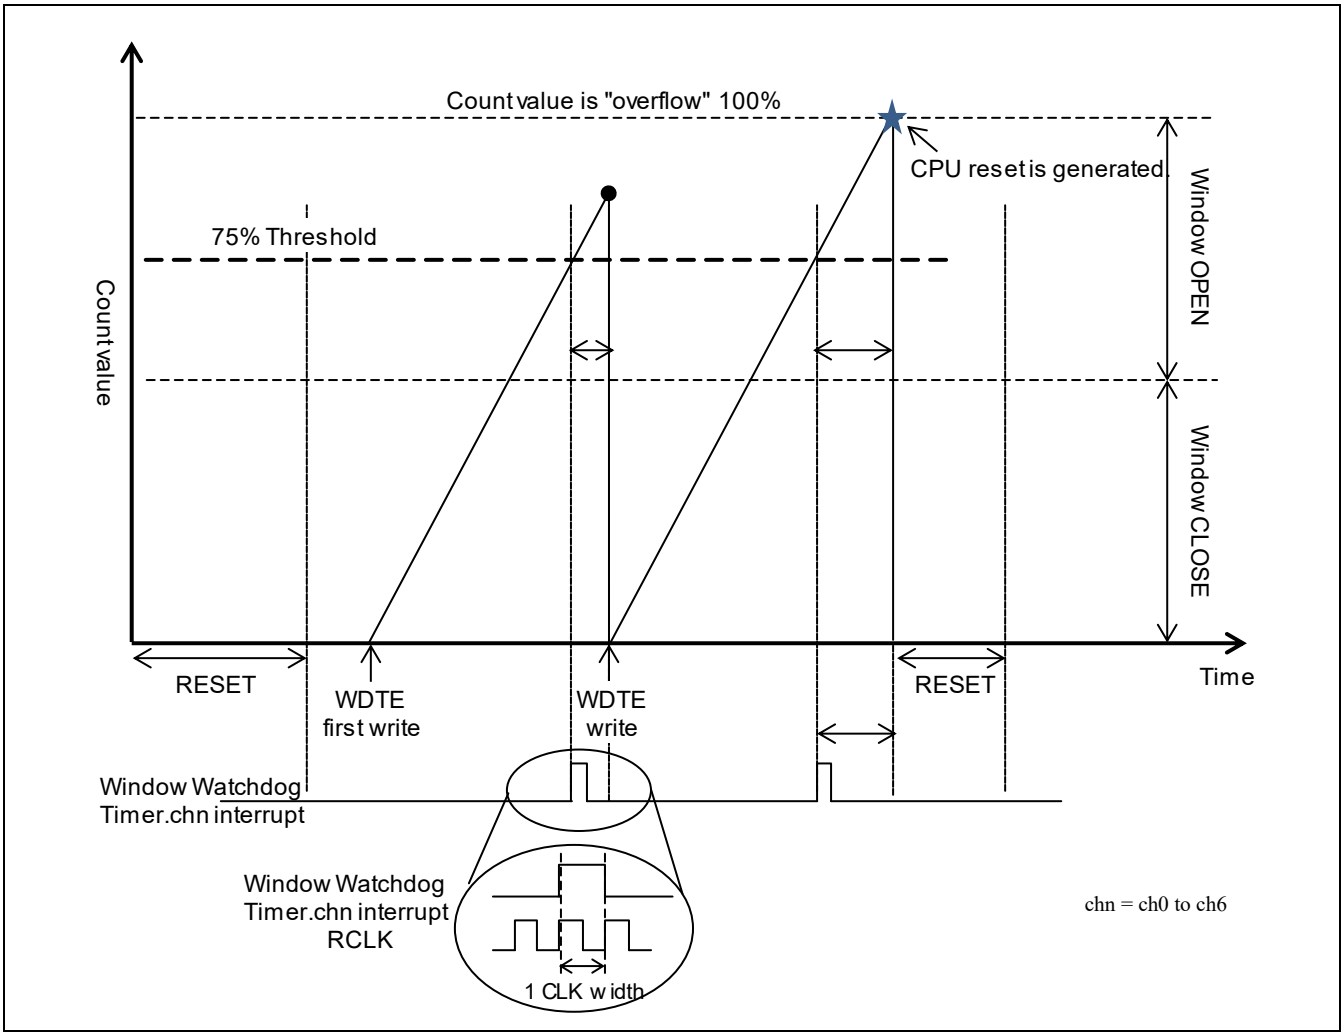

Figure 154.2.3.2 75% interrupt

154.2.3.4 NMI or Reset interrupt output

When this module detects error, either NMI or Reset is output with the pulse width of 1 RCLK. The selection of NMI or Reset is done by WDTA0MD.WDTA0ERM.

The counter stops upon error detection and can be restarted only by reset (Power-On Reset).

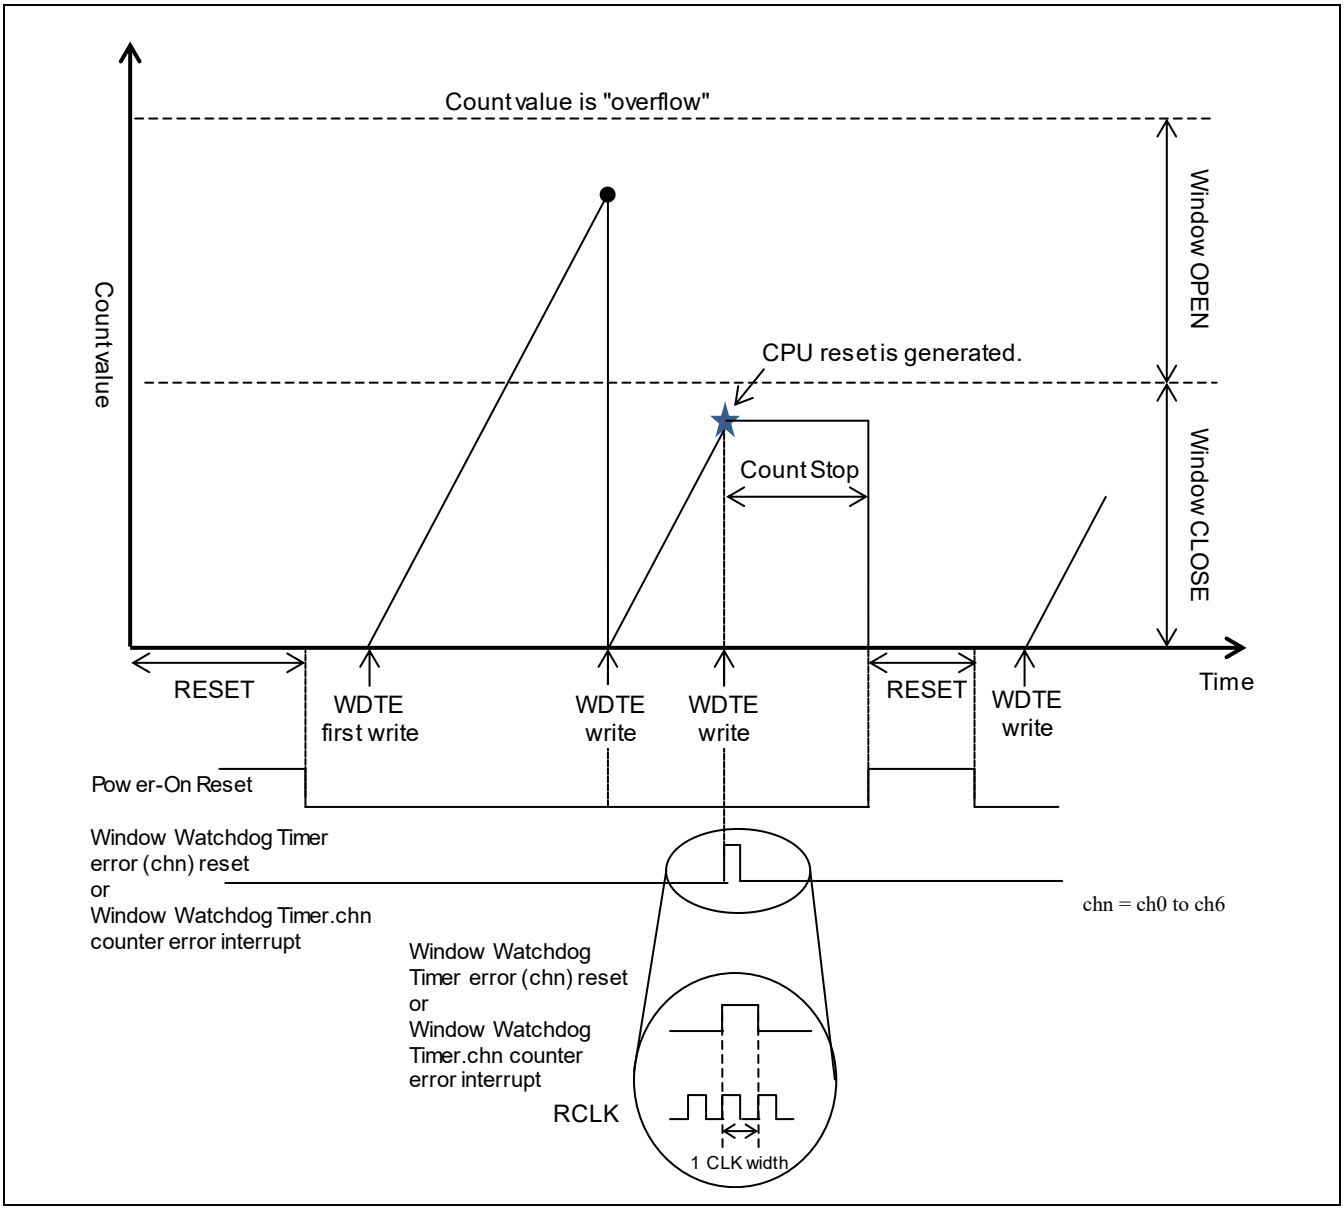

Figure 154.2.3.3 Detect error by NMI and Reset interrupt

154.2.3.5 Error Detection Condition

The conditions that this module regards as errors are described below.

(1) Timer counter overflow

An error is detected if timer counter reaches the overflow value defined by WDTA0MD.WDTA0OVF2-0.

(2) Writing wrong trigger code on trigger register

An error is detected if value other than H'AC is written on WDTA0WDTE register.

(3) Writing trigger register when window is closed

An error is detected if triggering is done while the window is closed.

Note: window size right after reset release is 100%.

(4) Irregular update of WDTA0MD register

This register must be updated only with the following conditions. An error is detected if violated.

— Updating before the first triggering is required.

— Updating more than once is only arrowed if the written value is same as the old value.

Following Table 154.2.3.1 describes irregular update of WDTA0MD.

Table 154.2.3.1 Irregular update of WDTA0MD register

Condition			Error detection
Update #	**Write Before/After initial triggering**	**Write value**	
Initial update	Before	Same	—
		New	—
	After	Same	—
		New	Detect
Second and afterwards	Before	Same	—
		New	Detect
	After	Same	—
		New	Detect

154.2.3.6 Setting Flow

H'AC must always be written as a trigger code on WDTA0WDTE.

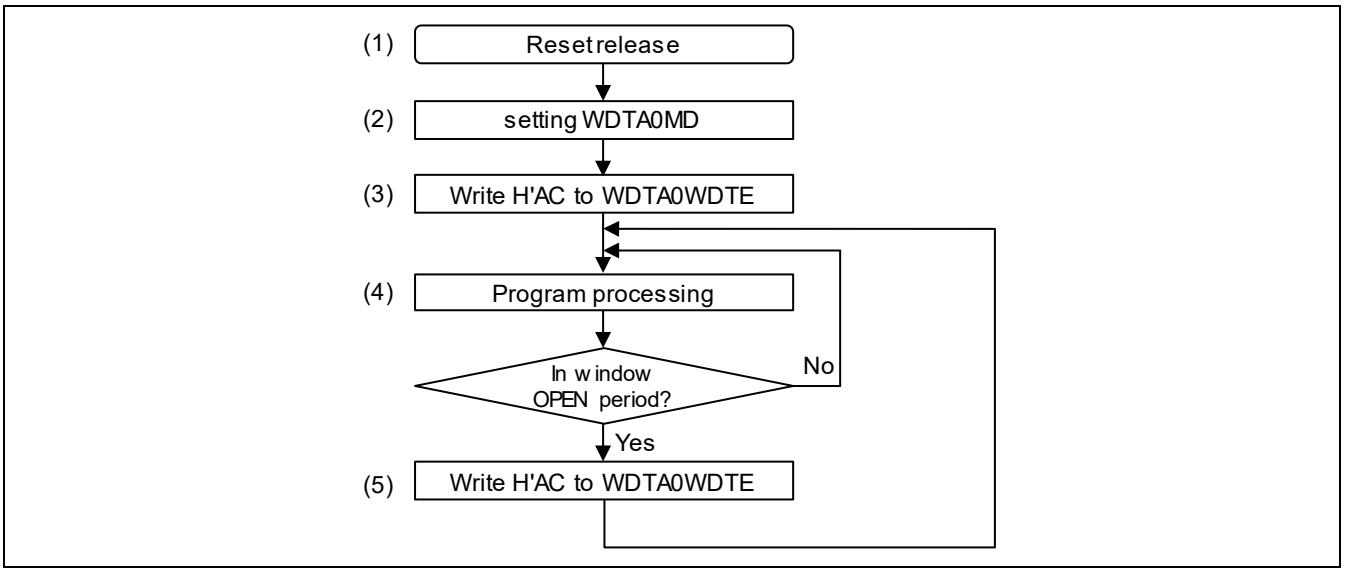

Figure 154.2.3.4 Setting flow WWDT module

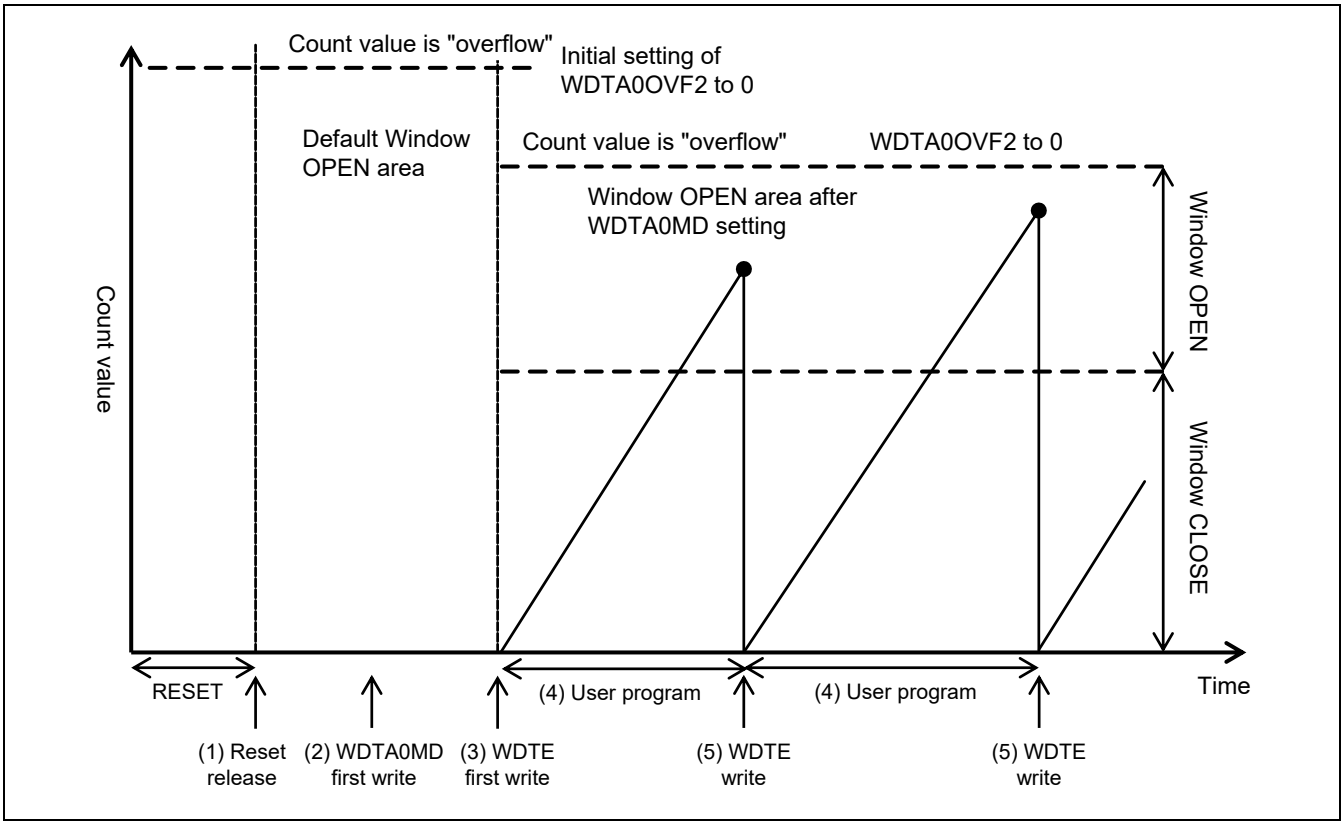

Figure 154.2.3.5 Steps setting flow

154.2.4 Usages Notes

154.2.4.1 Timer counter start timing

The gap is caused from the completion of writing in the start trigger register to beginning the movement of the timer counter to operate with clock (RCLK) of the asynchronous system in the timer counter of this module.

The maximum of this gap is 3 RCLK cycle.

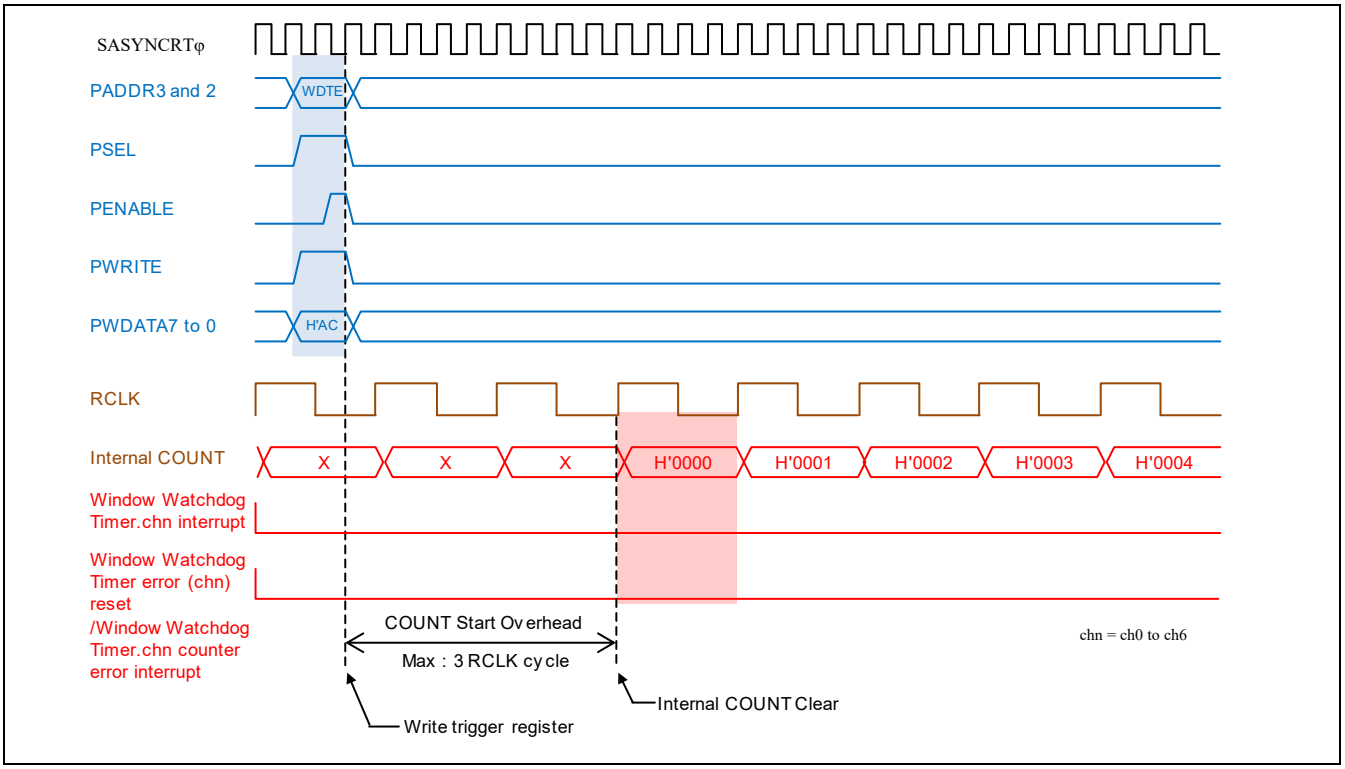

Figure 154.2.4.1 Timer counter start timing

154.2.4.2 75% interrupt output timing

In this module, after the period 75% of overflow setting value (WDTA0OVF), 75% interrupt output is output from the writing completion of the start trigger register.

But one RCLK cycle is necessary for output 75% interrupt after a timer counter reached 75%. Moreover, the gap is caused in the output timing of 75% interrupt for the gap of the timer counter by the asynchronous system.

Therefore, even when the window size is set to 75% (WDTA0WS = 10), the period when writing in the start trigger register is permitted is generated.

It is 3 RCLK cycle before the 75% interrupt start at the maximum for this period.

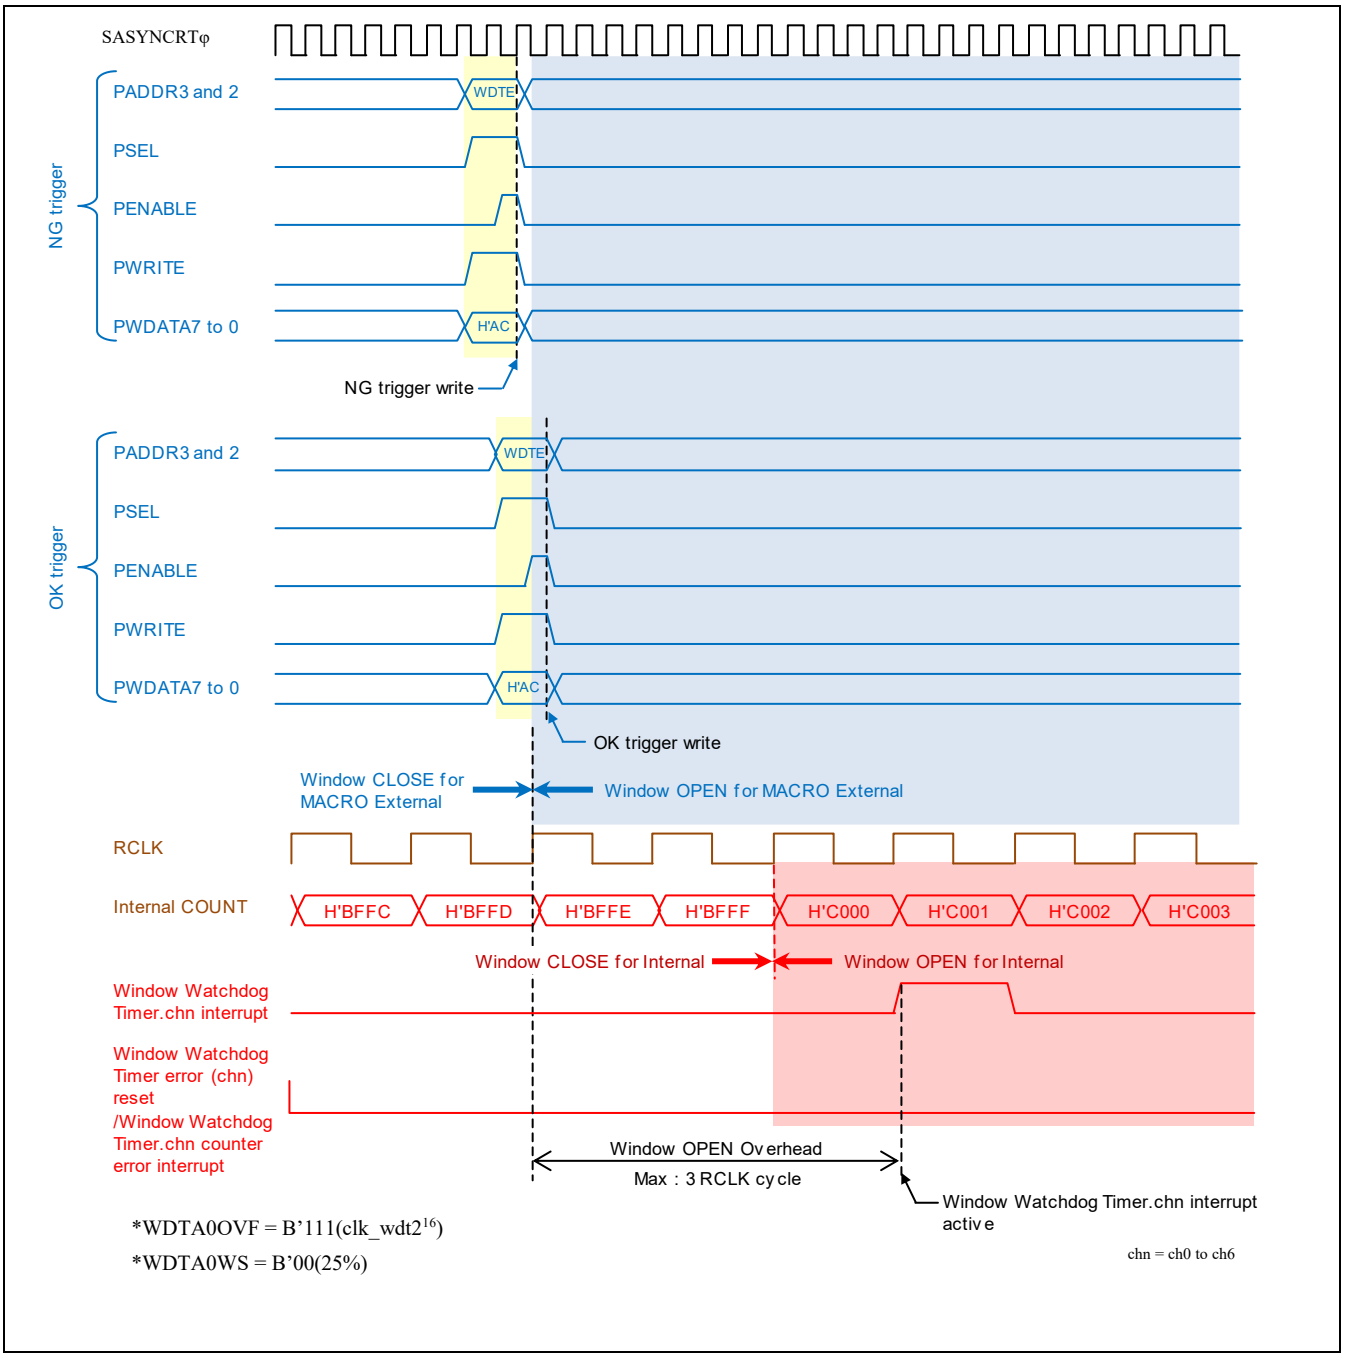

Figure 154.2.4.2 75% interrupt output timing

154.2.4.3 Reset / NMI output timing for Overflow

In this module, Reset/NMI output is output from the writing completion of the start trigger register after the period 100% of overflow setting value (WDTA0OVF), and the operation of this module stops.

But one RCLK cycle is necessary for output Reset / NSI after a timer counter reached the overflow. Moreover, the gap is caused in the output timing of Reset / NSI for the gap of the timer counter by the asynchronous system.

Therefore, writing in the start trigger register is disregarded because the overflow has been error detected internally before Reset / NMI is generated, and the period when Reset / NSI is output is generated.

It is 3 RCLK cycle before the Reset / NSI start at the maximum for this period.

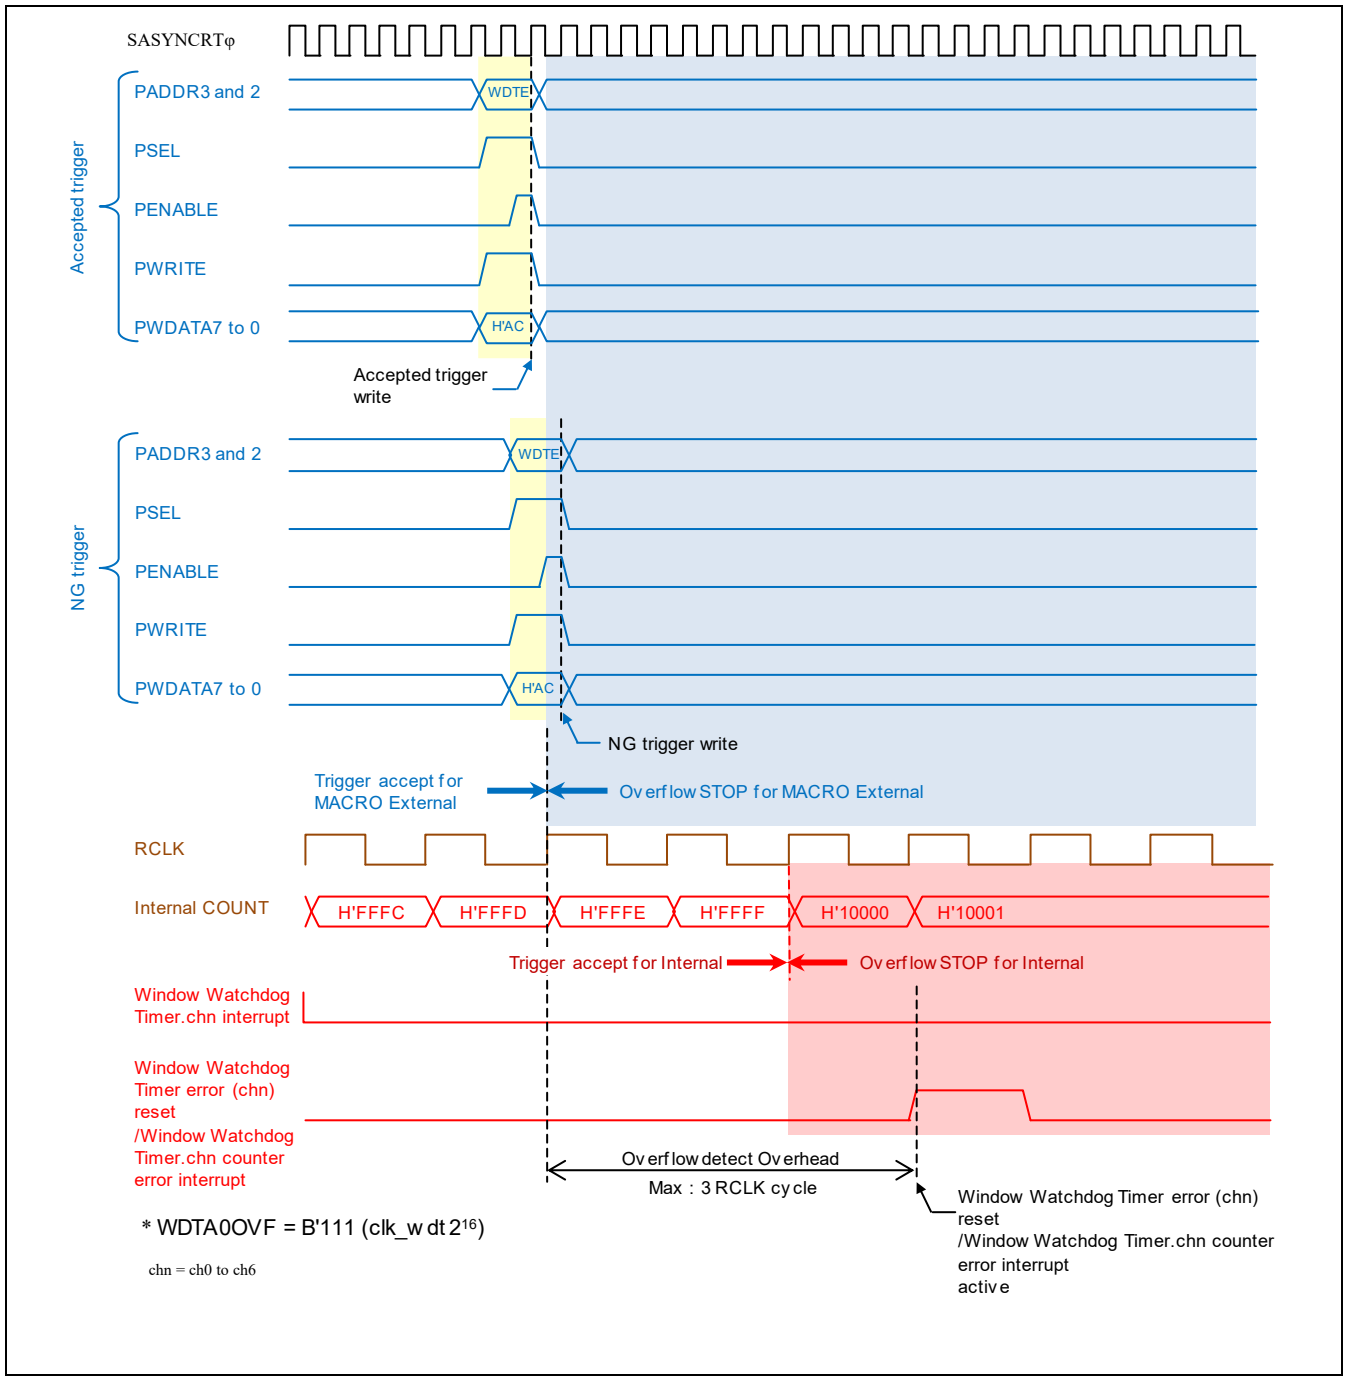

Figure 154.2.4.3 Reset / NMI output timing for Overflow

154.2.4.4 Reset / NMI output timing for error detection

In this module, Reset/NMI output is output after it error detects it of writing etc. of a wrong start trigger, and the operation of this module stops.

However, the register access, the timer counter operation, and the Reset / NMI output are late and the output timing of Reset / NMI is delayed because of the asynchronous system.

3 RCLK cycle at the maximum delays for register access to become the error detection after Reset / NMI are output.

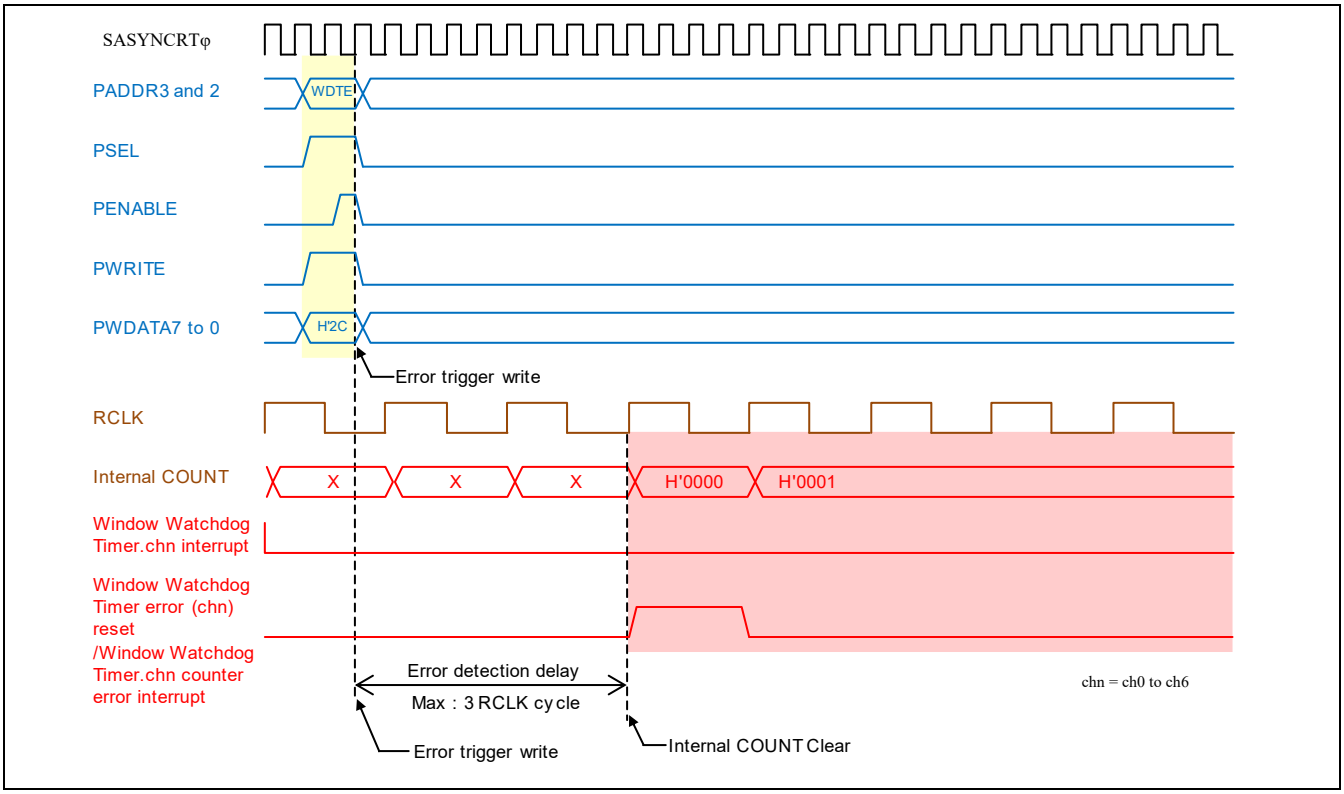

Figure 154.2.4.4 Reset / NMI output timing for error detection

154.2.4.5 Notes on using emulator

When a break is issued to Cortex-A76 / Cortex-R52 when using the emulator, WWDT stop unlike R-Car Gen3.

154.2.5 Safety Mechanisms

154.2.5.1 Power-On test

This module is protected by Power-On test.

154.3 System Watchdog Timer (SWDT)

154.3.1 Overview

This LSI includes the System Watchdog Timer (SWDT).
This LSI can be reset by the overflow of the counter when the value of the counter has not been updated because of a system runaway.
The System Watchdog timer is a single-channel timer that uses the OSCCLK as an input clock and can be used as a watchdog timer. OSCCLK is a clock which is generated by CPG.

154.3.1.1 Features

- One channel is provided.
- Can be used as a watchdog timer. A reset is generated when the counter overflows.

154.3.1.2 Block Diagram

Figure 154.3.1.1 shows a block diagram of the System Watchdog Timer.

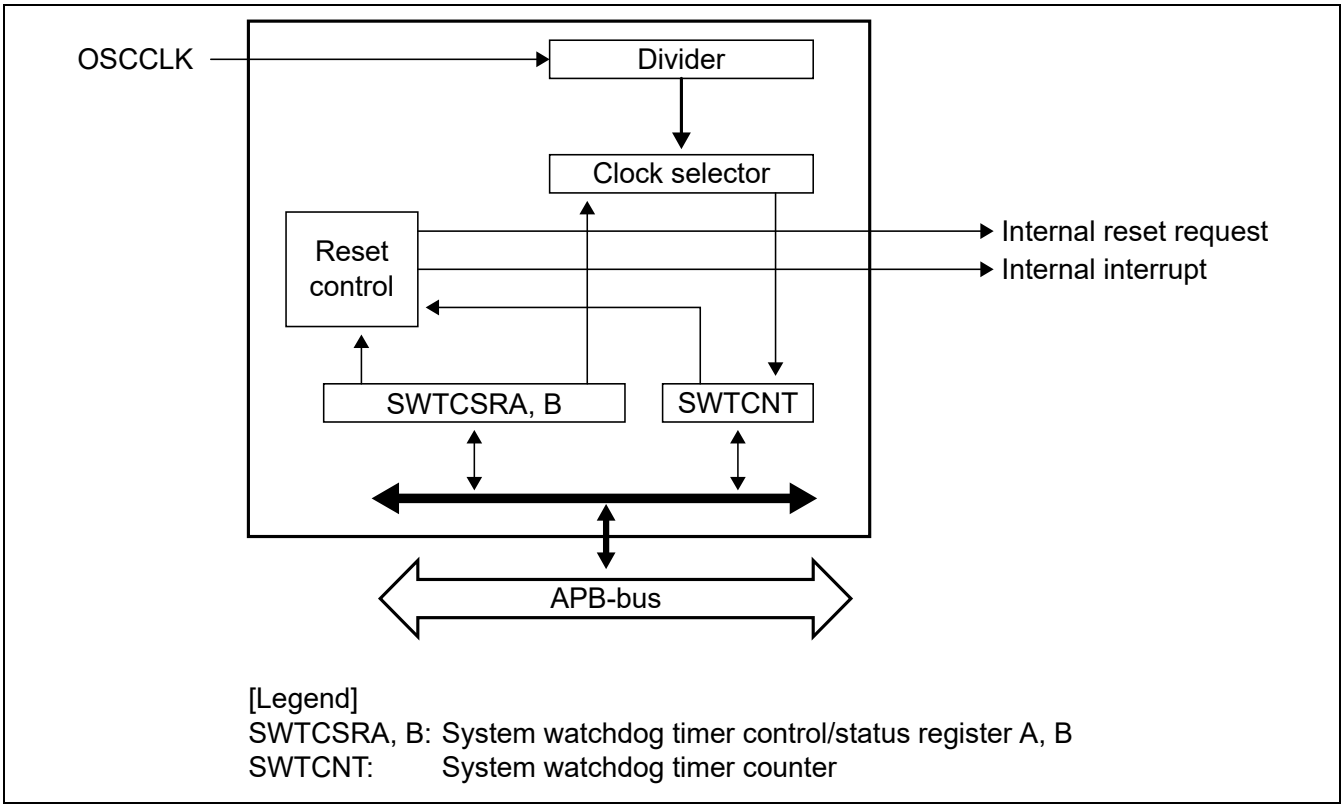

Figure 154.3.1.1 Block Diagram of System Watchdog Timer

154.3.1.3 Register Configuration

Table 154.3.1.1 shows the System Watchdog Timer register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

Table 154.3.1.2 shows the register state in each processing mode.

Table 154.3.1.1 Register Configuration of System Watchdog Timer

Name	Abbreviation	R/W	Address	Access Size
System watchdog timer counter	SWTCNT	R/W	H'E603 0000	16/32*1
System watchdog timer control/status register A	SWTCSRA	R/W*3	H'E603 0004	8/32*2
System watchdog timer control/status register B	SWTCSRB	R/W	H'E603 0008	8/32*2

Notes: 1. Write is performed in 32 bits and read in 16 bits. Operation cannot be guaranteed if the register is not written as a longword (32bits) and not read as a word (16bits).
2. Write is performed in 32 bits and read in 8 bits. Operation cannot be guaranteed if the register is not written as a longword (32bits) and not read as a byte (8bits).
3. Except for bit [4] that is R/WC0 register.

Table 154.3.1.2 Register State of System Watchdog Timer in Each Processing Mode

Register Abbreviation		Reset Caused by Other than Overflow	Reset Caused by Overflow*
Register	Bit		
SWTCNT	All	Initialized	Initialized
SWTCSRA	WOVF	Initialized	Retained
	Other than WOVF	Initialized	Initialized
SWTCSRB	All	Initialized	Initialized

Note: * System Watchdog Timer (SWDT) and Section 154.1. RCLK Watchdog Timer (RWDT) overflow reset.

154.3.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be initial value.

—/WB: Write-only. The read value is undefined.

154.3.2.1 System Watchdog Timer Counter (SWTCNT)

SWTCNT is a 16-bit readable/writable register that increments on the selected clock. When an overflow occurs, it generates a reset. The SWTCNT counter is initialized to H'F488 by a power-on reset.

Use a long word access to write to the SWTCNT counter, with H'5A5A in the upper byte. Use a word access to read SWTCNT.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE_VAL1[15:0]															
Initial	1	1	1	1	0	1	0	0	1	0	0	0	1	0	0	0
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CODE_VAL1 [15:0]	H’ F488	—/WB	Code value 1 When writing this register, write H’5A5A to this bit field. When reading, these bits are always read as same as SWTCNT [15:0].
15 to 0	SWTCNT	H’F488	R/W	Timer Counter Bits

154.3.2.2 System Watchdog Timer Control/Status Register A (SWTCSRA)

SWTCSRA is an 8-bit readable/writable register composed of bits to select the clock used for the count, overflow flag, and enable bit.

Use a long word access to write to SWTCSRA, with H'A5 A5A5 in the upper byte. Use a byte access to read SWTCSRA.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE_VAL2[23:8]															
Initial	**0**	**0**	**0**	**0**	**1**	**1**	**1**	**1**	**0**	**0**	**0**	**0**	**1**	**1**	**1**	**1**
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CODE_VAL2[7:0]								TME	—	WRFLG	WOVF	WOVFE	CKS0[2:0]		
Initial	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
R/W:	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	—/WB	R/W	R	R	R/WC0	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	CODE_VAL2 [23:0]	H'0F 0F0F	—/WB	Code value 2 When writing this register, write H'A5 A5A5 to this bit field. When reading, these bits are always read as {SWTCSRA [7:0], SWTCSRA [7:0], SWTCSRA [7:0]}.
7	TME	0	R/W	Starts and stops timer operation. 0: Timer disabled: Count-up stops and SWTCNT value is retained 1: Timer enabled
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	WRFLG	0	R	Write Status Flag When this bit is 1, write access to SWTCNT is prohibited. If it isn't maintained, operation isn't secured. This bit indicates the period that the writing to SWTCNT is masked for synchronization after the writing to SWTCNT Confirm that this flag is 0 when SWTCNT is written to continuously.
4	WOVF	0	R/WC0	Indicates that the SWTCNT has overflowed. This bit isn't initialized by a generated reset by an overflow of section 154.1. RCLK Watchdog Timer (RWDT) and System Watchdog Timer. Write 0 to this bit before using the System Watchdog Timer. 0: No overflow 1: SWTCNT has overflowed Note: Only 0 can be written to clear the flag.
3	WOVFE	1	R/W	Overflow Interrupt Disable/Enable 0: Disables interrupts due to overflow 1: Enables interrupts due to overflow

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CKS0[2:0]	111	R/W	RTC Clock Select These bits select the clock to be used for the SWTCNT count from the eight types obtainable by dividing the OSCCLK. The overflow period that is shown inside the parenthesis in the table is the approximate value when the OSCCLK is 131.57 kHz. 000: OSCCLK (SWTCNT: H'0000 = 498 ms (SWTCNT: H'FBFC = 7.8 ms)) 001: OSCCLK /4 (SWTCNT: H'0000 = 1.9 s (SWTCNT: H'FBFC = 31.2 ms)) 010: OSCCLK /16 (SWTCNT: H'0000 = 7.9 s (SWTCNT: H'FBFC = 125.0 ms)) 011: OSCCLK /32 (SWTCNT: H'0000 = 15.9 s (SWTCNT: H'FBFC = 250.0 ms)) 100: OSCCLK /64 (SWTCNT: H'0000 = 31.8 s (SWTCNT: H'FBFC = 500.0 ms)) 101: OSCCLK /128 (SWTCNT: H'0000 = 63.7 s (SWTCNT: H'FBFC = 1.0 s)) 110: OSCCLK /1024 (SWTCNT: H'0000 = 510.0 s (SWTCNT: H'FBFC = 8.0 s)) 111: OSCCLK select expanded mode The clock cycle varies depending on the CKS1 bit in SWTCSRB. If SWTCSRB.CKS1[3:0] is H'0, division ratio is OSCCLK/4096 and values of overflow time is SWTCNT: H'0000 = 2040.2 s (SWTCNT: H'FBFC = 32.0 s). If SWTCSRB.CKS1[3:0] is other than H'0, values of overflow time is calculated with formula in chapter 154.3.3.2. Note: These overflow periods are calculated from the rounded value of OSCCLK = 131.57 kHz.

Note: If bits CKS0 [2:0] are modified when the System Watchdog Timer is operating, the up-count may not be performed correctly. Ensure that the bits CKS0 [2:0] are modified only when the System Watchdog Timer is not operating.

154.3.2.3 System Watchdog Timer Control/Status Register B (SWTCSRB)

SWTCSRB is an 8-bit readable/writable register composed of bits to select the clock used for the count.

Use a word access to write to SWTCSRB, with H'A5 A5A5 in the upper byte. Use a byte access to read SWTCSRB.

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	CODE_ VAL3[23:0]	H'21 2121	—/WB	Code value 3 When writing this register, write H'A5 A5A5 to this bit field. When reading, these bits are always read as {SWTCSRB [7:0], SWTCSRB [7:0], SWTCSRB [7:0]}.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CKS1[5:0]	100001	R/W	OSCCLK Select for OSCCLK Select Expanded Mode Selects the clock used for the SWTCNT count when the CKS0 bit in SWTCSRA is B'111. Table 154.3.2.1 shows the time values (approximate value) used to cause an overflow from the counter H'0F13 (Overflow from counter H'FBFC). Assuming the overflow cycle in the table is calculated for the case when the OSCCLK is 131.57 kHz. For more values of overflow time, refer to chapter 154.3.3.2

Note: If the CKS1 [5] to CKS1 [0] bits are modified when the System Watchdog Timer is running, the up-count may not be performed correctly. Ensure that these bits are modified only when the System Watchdog Timer is not running.

Table 154.3.2.1 Example of Overflow time

CKS1[5:4] / CKS1[3:0]	B'00	B'01	B'10	B'11
H'0	1920.1 s (32.0 s)			
H'1	60.0 s (1.0 s)	5.0 min (5.0 s)	60.0 min (1.0 min)	300.0 min (5.0 min)
H'2	120.0 s (2.0 s)	10.0 min (10.0 s)	120.0 min (2.0 min)	600.0 min (10.0 min)
H'3	180.0 s (3.0 s)	15.0 min (15.0 s)	180.0 min (3.0 min)	900.0 min (15.0 min)
H'4	240.0 s (4.0 s)	20.0 min (20.0 s)	240.0 min (4.0 min)	1200.0 min (20.0 min)
H'5	5.0 min (5.0 s)	25.0 min (25.0 s)	300.0 min (5.0 min)	1500.0 min (25.0 min)
H'6	6.0 min (6.0 s)	30.0 min (30.0 s)	360.0 min (6.0 min)	1800.1 min (30.0 min)
H'7	7.0 min (7.0 s)	35.0 min (35.0 s)	420.0 min (7.0 min)	Prohibited (Prohibited)
H'8	8.0 min (8.0 s)	40.0 min (40.0 s)	480.0 min (8.0 min)	Prohibited (Prohibited)

H'C	Prohibited (Prohibited)	60.0 min (60.0 s)	Prohibited (Prohibited)	Prohibited (Prohibited)
from H'D	Prohibited (Prohibited)	Prohibited (Prohibited)	Prohibited (Prohibited)	Prohibited (Prohibited)

154.3.3 Operation

154.3.3.1 Control of System Runaway

After a reset, System Watchdog Timer is disabled. When the counter overflow occurs after the counter starts, an internal reset is again generated. By this function, a reset can be automatically generated even when this LSI has caused a system runaway. While this LSI is operating correctly, write H'0000 (or the set value) to SWTCNT periodically so that SWTCNT does not overflow.

Take the following steps to use the System Watchdog Timer.

1. Clear the TME bit in SWTCSRA to 0 to temporarily stop counting.
   (Confirm that OSCCLK was input more than 2 cycles in case SWTCNT is not initialized)
2. Write H'0000 or the set value in SWTCNT
3. Clear the WOVF bit in SWTCSRA to 0.
4. Set the kind of count clock to the CKS0 [2:0] bits in SWTCSRA, and CKS1 [5:0] bits in SWTCSRB.
5. Confirm that SWTCSRA.WRFLG becomes 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the TME bit in SWTCSRA to 1.
   (TME and CKS0 can't be set at the same time. When setting that at the same time, behavior isn't guaranteed.)
7. While this LSI is operating correctly, write H'0000 (or the set value) to SWTCNT periodically so that SWTCNT does not overflow.
8. When SWTCNT overflows, Reset is generated because the System Watchdog Timer sets the WOVF flag in SWTCSRA to 1. At this time, SWTCNT, SWTCSRA (excluding the WOVF bit), and SWTCSRB are initialized.

Execute a power-on reset or a software reset at that time and initialize System Watchdog Timer.

When not initializing and using System Watchdog Timer, behavior isn't guaranteed.

154.3.3.2 Formula to calculate overflow time

This is the formula to calculate the overflow time for SWDT when choosing Expanded Mode.

Overflow time = 128 × T_OSCCLK × opset_val × (65536 – SWTCNT)

T_OSCCLK: is the period of OSCCLK clock.

SWTCNT: is value of SWTCNT in decade.

opset_val: refer to Table 154.3.3.1.

Table 154.3.3.1 Value of opset_val

CKS1[5:0]	opset_val	CKS1[5:0]	opset_val	CKS1[5:0]	opset_val	CKS1[5:0]	opset_val
H'00	32	H'10	32	H'20	32	H'30	32
H'01	1	H'11	5	H'21	60	H'31	300
H'02	2	H'12	10	H'22	120	H'32	600
H'03	3	H'13	15	H'23	180	H'33	900
H'04	4	H'14	20	H'24	240	H'34	1200
H'05	5	H'15	25	H'25	300	H'35	1500
H'06	6	H'16	30	H'26	360	H'36	1800
H'07	7	H'17	35	H'27	420	Other case	1
H'08	8	H'18	40	H'28	480		
H'09	9	H'19	45	H'29	540		
H'0A	10	H'1A	50	H'2A	600		
Other case	1	H'1B	55	Other case	1		
		H'1C	60				
		Other case	1				

154.3.3.3 Notes on Register Access

SWTCSRA: Bits TME, CKS0

SWTCSRB: Bits CKS1

After writing a value in this register, it is possible to read that value 2 cycles in counter input clock (OSCCLK) after writing has finished. And 2 cycles of OSCCLK need to be inputted until the set-up value is reflected.

SWTCNT: Bits 15 to 0

After writing a value in this register, it is possible to read that value 2 cycles in counter input clock (OSCCLK) after writing has finished. And 2 cycles of OSCCLK need to be inputted until the set-up value is reflected. Writing to this register, once started, is protected from further write operations until the writing operation has been completed. Read SWTCSRA. If WRFLG is 0, the next value can be written in SWTCNT.

The writing procedure to SWTCNT, SWTCSRA, and SWTCSRB differs from that of other registers with the purpose of preventing an unintended write. The procedure for writing to these registers is given below.

Writing to SWTCNT, SWTCSRA, and SWTCSRB

- These registers must be written by a long word transfer instruction. They cannot be written by a byte or word transfer instruction.
- When writing to SWTCNT, set the upper byte to H'5A5A and transfer the lower byte as the write data. When writing to SWTCSRA and SWTCSRB, set the upper byte to H'A5A5A5 and transfer the lower byte as the write data.

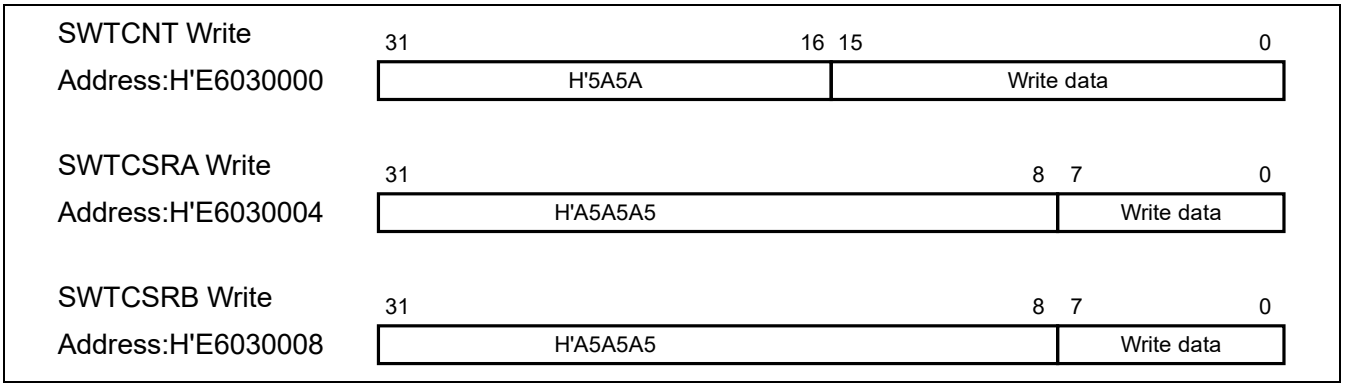

Figure 154.3.3.1 Writing to SWTCNT, SWTCSRA, and SWTCSRB

154.3.4 Usage Notes

No description on this section.

154.3.5 Safety Mechanisms

154.3.5.1 Power-On test

This module is protected by Power-On test.

155. Timer Unit (TPU, CMT0, CMT1, TMU, SCMT, SUCMT, ...)

Timer Unit module is a module composed of TPU, CMT0, CMT1, TMU, SCMT, and SUCMT.

Refer to following section for the detailed function.

- TPU:155.1 16-Bit Timer Pulse Unit (TPU)
- CMT0:155.2 Compare Match Timer Type0 (CMT0)
- CMT1:155.3 Compare Match Timer Type1 (CMT1)
- TMU:155.4 Timer Unit (TMU)
- SCMT:155.5 System Timer (SCMT)
- SUCMT: 155.6 System Up-Time Clock (SUCMT)

155.1 16-Bit Timer Pulse Unit (TPU)

155.1.1 Overview

This LSI has a 16-bit timer pulse unit (TPU), which consists of four 16-bit timers.

Internal clock: SASYNCPERD4φ

155.1.1.1 Features

The TPU has the following features.

- Four timers are incorporated.
- Four pulse outputs are possible.
- Each timer of the TPU has four general registers (TGRAn, TGRBn, TGRCn, and TGRDn) for each timer. TGRAn enables an output compare setting. TGRBn, TGRCn and TGRDn in each timer can be used as timer-counter clearing registers. TGRCn and TGRDn can also be used as buffer registers.
- The following operations can be set for each timer.
  Waveform output on compare match: output of a 0 or 1 or toggling of output is selectable.
  Counter clearing operation: Counters can be cleared in response to a compare match.
  PWM mode allows the output of a PWM waveform with any duty cycle.
  The four outputs can be used to produce PWM output in up to four phases.
- A stepping motor control mode is available for timer 0.
- Buffer operation can be set for each timer.
- Automatic rewriting of values in output compare registers is possible.
- One interrupt request from TPU
  Enabling or disabling of compare match and counter overflows as interrupt sources can be set independently for each timer.
  In stepping motor control mode, enabling or disabling of state transitions, requests for data, and overflows of data as interrupt sources is possible for timer 0.

Table 155.1.1.1 shows the TPU functions.

Table 155.1.1.1 TPU Functions

Item		Timer 0	Timer 1	Timer 2	Timer 3
Counter clock		Internal clock/1 Internal clock/4 Internal clock/16 Internal clock/64	Internal clock/1 Internal clock/4 Internal clock/16 Internal clock/64	Internal clock/1 Internal clock/4 Internal clock/16 Internal clock/64	Internal clock/1 Internal clock/4 Internal clock/16 Internal clock/64

155.1.1.2 Block Diagram

Figure 155.1.1.1 is a block diagram of the TPU.

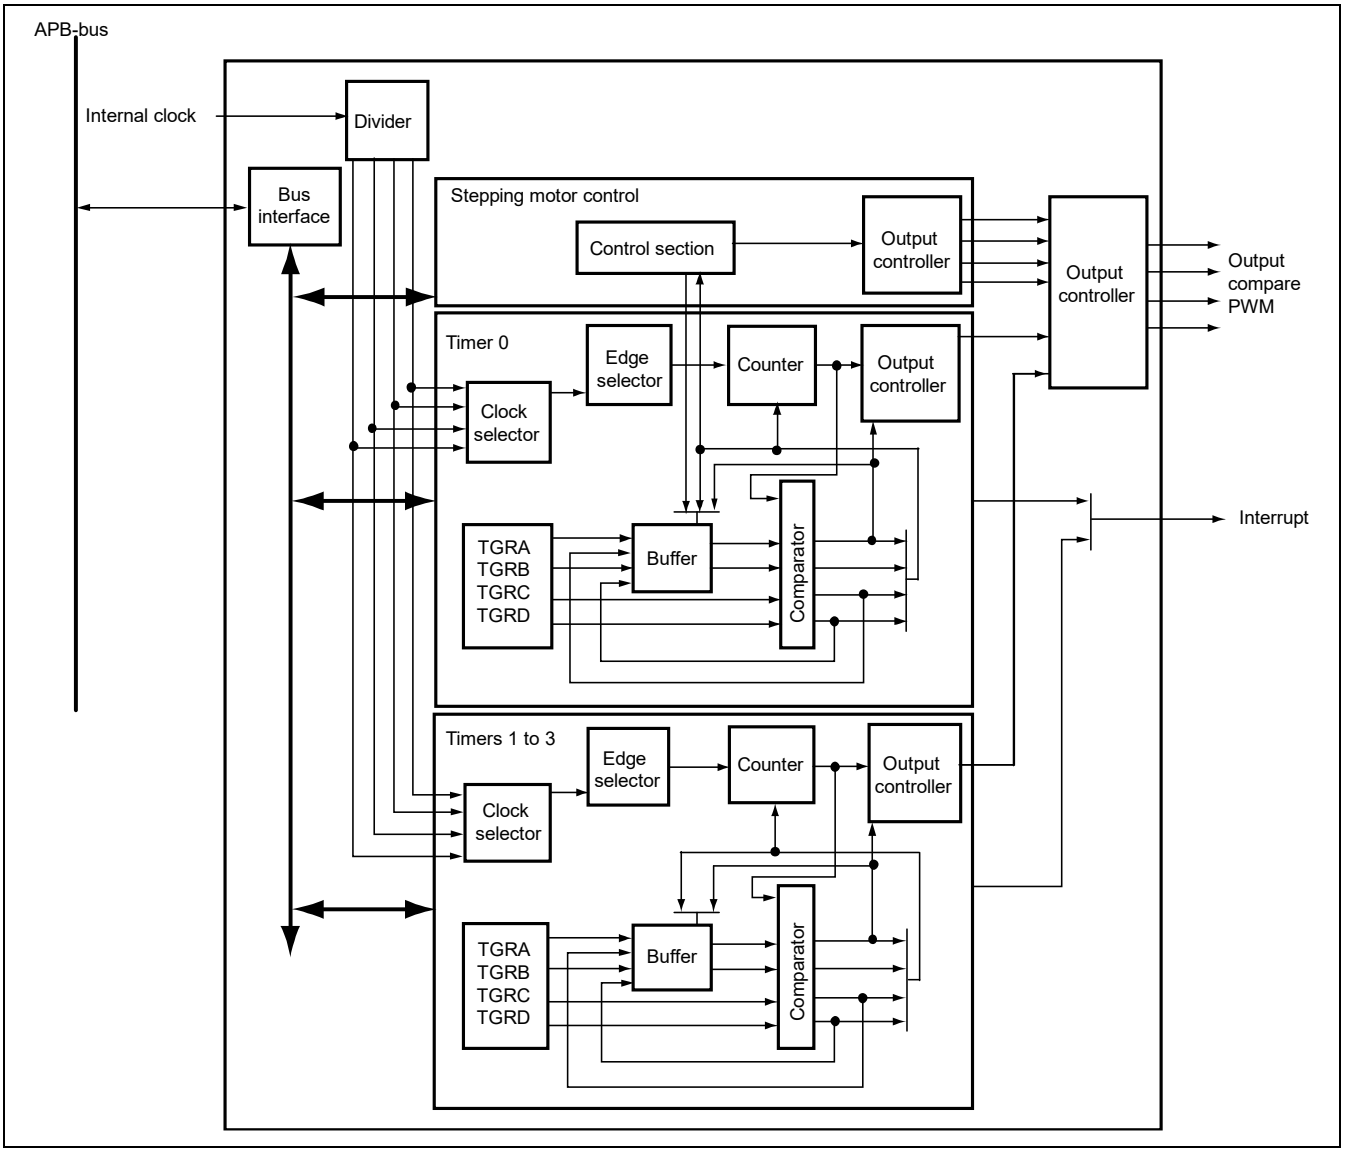

Figure 155.1.1.1 Block Diagram of the TPU

155.1.1.3 External Pins

Table 155.1.1.2 shows the pin configuration of the TPU.

Table 155.1.1.2 Pin Configuration

Module	Timer	Pin Name	Function	I/O	Description
TPU	0	TPU0TO0	TPU output compare match 0	Output	TGRA0 output compare output/ PWM output pin/pattern output pin 0 in stepping motor control mode
	1	TPU0TO1	TPU output compare match 1	Output	TGRA1 output compare output/ PWM output pin/pattern output pin 1 in stepping motor control mode
	2	TPU0TO2	TPU output compare match 2	Output	TGRA2 output compare output/ PWM output pin/pattern output pin 2 in stepping motor control mode
	3	TPU0TO3	TPU output compare match 3	Output	TGRA3 output compare output/ PWM output pin/pattern output pin 3 in stepping motor control mode

155.1.1.4 Register Configuration

Table 155.1.1.3 shows the TPU register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a word (16 bits). Operation cannot be guaranteed if the register is not accessed as a word.

Table 155.1.1.4 shows the register states in each operating mode.

Table 155.1.1.3 Register Configuration

155.1.2 Register Description

Registers in the TPU are allocated to and arranged in the address space of the internal bus.

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. When the bit is reserved, the write value should always be 0. Writing 1 to these bits can cause a malfunction of TPU.

—/W: Write-only. The read value is undefined.

155.1.2.1 Timer Control Register n (TCRn) (n = 0 to 3)

TCRn is provided for each of timers 0 to 3 and is used to control TCNT. TCRn is initialized to H'0000 by a reset.

Writing to TCRn is only allowed only when TCNTn is stopped.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
7 to 5	CCLR[2:0]	000	R/W	Counter Clear Specify the TCNTn clearing source. 000: TCNTn clearing disabled 001: TCNTn cleared in response to TGRAn compare match 010: TCNTn cleared in response to TGRBn compare match 011: Setting prohibited 100: TCNTn clearing disabled 101: TCNTn cleared in response to TGRCn compare match 110: TCNTn cleared in response to TGRDn compare match 111: Setting prohibited
4, 3	CKEG[1:0]	00	R/W	Clock Edge Select the input clock edge for counting up. Counting of both edges by the internal clock has the same effect as halving the cycle of the input clock (e.g., the rate of counting both edges of Internal clock/4 is same as the rate of counting rising edges of Internal clock/2). When the phase coefficient mode is selected, this setting is ignored. 00: Count rising edges 01: Count falling edges* 1X: Count both edges* [Legend] X: Don't care Note: * If the input clock is Internal clock/1, the timer does not operate with this setting.
2 to 0	TPSC[2:0]	000	R/W	Timer Prescaler Select the clock for counting by TCNTn. The clock source can be selected independently for each timer. Table 155.1.2.1 shows the clock sources that can be set for each timer. For more information on count clock selection, see Table 155.1.2.2.

155.1.2.2 Timer Mode Register n (TMDRn) (n = 0 to 3)

TMDRn is provided for each of timers 0 to 3, and is used to specify the operating mode of the corresponding timer. TMDRn is initialized to H'0000 by a reset.

Writing to TMDRn is only allowed when TCNTn is stopped.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	BFWT	BFB	BFA	—	MD[2:0]		
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
6	BFWT	0	R/W	Buffer Write Timing Specifies when to update TGRAn and TGRBn when TGRCn and TGRDn are in use as compare match buffers. When TGRCn and TGRDn are not in use as compare match buffer registers, this has no effect. 0: TGRAn and TGRBn are rewritten on a compare match with the counters. 1: TGRAn and TGRBn are rewritten on clearing of the counter.
5	BFB	0	R/W	Buffer Operation B Specifies operation mode of TGRBn. 0: TGRBn is in normal operation. 1: TGRBn and TGRDn are used for buffered operation.
4	BFA	0	R/W	Buffer Operation A Specifies operation mode of TGRAn. 0: TGRAn normal operation. 1: TGRAn and TGRCn are used for buffered operation.
3	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
2 to 0	MD[2:0]	000	R/W	Timer Operating Mode Specifies the timer operating mode. 000: Normal operation 001: Setting prohibited 010: PWM mode 011 to 111: Setting prohibited

155.1.2.3 Timer I/O Control Register n (TIORn) (n = 0 to 3)

TIORn is provided for each of timers 0 to 3, and is used to control the corresponding TPU0TO0 to TPU0TO3 pins. TIORn is initialized to H'0000 by a reset.

Writing to TIORn is only allowed when TCNTn is stopped. Note that the setting of TMDRn may affect TIORn.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
2 to 0	IOA[2:0]	000	R/W	I/O Control Bits IOA2 to IOA0 specify the functions of TGRAn and the TPU0TO0 to TPU0TO3 pins. For details, see Table 155.1.2.3.

155.1.2.4 Timer Interrupt Enable Register n (TIERn) (n = 0 to 3)

TIERn is provided for each of timers 0 to 3 and is used to enable or disable the sources of interrupt requests for the corresponding timer. TIERn is initialized to H'0000 by a reset. Bits 8 to 13 are only present in timer 0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
13	TMDOFE	0	R/W	Motor Control Data Transfer Overflow Detection Enable This bit enables or disables interrupt request in response to the state of the TMDOFS flag in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMDOFS flag disabled 1: Interrupt request in response to the TMDOFS flag enabled
12	TMDRFE	0	R/W	Motor Control Data Transfer Request Detection Enable This bit enables or disables interrupt request in response to the state of the TMDRFS flag in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMDRFS flag disabled 1: Interrupt request in response to the TMDRFS flag enabled
11	TMS1ER	0	R/W	Motor Control Deceleration Transition Detection Enable This bit enables or disables interrupt request in response to the state of the TMCFR flag in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMCFR flag disabled 1: Interrupt request in response to the TMCFR flag enabled
10	TMS1ET	0	R/W	Motor Control Normal Transition Detection Enable This bit enables or disables interrupt request in response to the state of the TMCFT flag in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMCFT flag disabled 1: Interrupt request in response to the TMCFT flag enabled
9	TMS1EA	0	R/W	Motor Control Acceleration Transition Detection Enable This bit enables or disables interrupt request in response to the state of the TMCFA flag in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMCFA flag disabled 1: Interrupt request in response to the TMCFA flag enabled

Bit	Bit Name	Initial Value	R/W	Description
8	TMS1ES	0	R/W	Motor Control Stop Transition Detection Enable This bit enables or disables interrupt request in response to the state of the TMCFS flag in the stepping motor control mode of timer 0, This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. 0: Interrupt request in response to the TMCFS flag disabled 1: Interrupt request in response to the TMCFS flag enabled
7 to 5	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
4	TC1EV	0	R/W	Overflow Interrupt Enable This bit enables or disables the interrupt request in response to the state of the TCFV flag. 0: Interrupt request in response to the TCFV flag disabled 1: Interrupt request in response to the TCFV flag enabled
3	TG1ED	0	R/W	TGR Interrupt Enable D. This bit enables or disables interrupt request in response to the state of the TGFD bit. 0: Interrupt request in response to the TGFD bit disabled 1: Interrupt request in response to the TGFD bit enabled
2	TG1EC	0	R/W	TGR Interrupt Enable C This bit enables or disables interrupt request in response to the state of the TGFC bit. 0: Interrupt request in response to the TGFC bit disabled 1: Interrupt request in response to the TGFC bit enabled
1	TG1EB	0	R/W	TGR Interrupt Enable B This bit enables or disables interrupt request in response to the state of the TGFB bit. 0: Interrupt request in response to the TGFB bit disabled 1: Interrupt request in response to the TGFB bit enabled
0	TG1EA	0	R/W	TGR Interrupt Enable A This bit enables or disables interrupt request in response to the state of the TGFA bit. 0: Interrupt request in response to the TGFA bit disabled 1: Interrupt request in response to the TGFA bit enabled

155.1.2.5 Timer Status Registers n (TSRn) (n = 0 to 3)

TSRn is provided for each of timers 0 to 3 and indicates the state of the corresponding timer. TSRn is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
13	TMDOFS	0	R/WC0	Motor Control Data Transfer Overflow Detection This flag indicates that a data transfer overflow has been detected in the stepping motor control mode of timer 0. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMDOFS bit after reading the TMDOFS bit while TMDOFS is set to 1 [Setting condition] When the DMA transfer overflow occurs
12	TMDRFS	0	R/WC0	Motor Control Data Transfer Request Detection This flag indicates that a data transfer request interrupt has been detected in the stepping motor control mode of timer 0. If DMA transfer is not in use, data are written to TGRD0 in response to this interrupt. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMDRFS bit after reading the TMDRFS bit while TMDRFS is set to 1 [Setting condition] When data transfer request occurs
11	TMCFR	0	R/WC0	Motor Control Deceleration Transition Detection This flag indicates that the current sequence state of timer 0 in the stepping motor control mode is the deceleration state. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMCFR bit after reading TMCFR bit = 1 [Setting condition] When the sequence state is shifted to the deceleration state
10	TMCFT	0	R/WC0	Motor Control Normal Transition Detection This flag indicates that the current sequence state of timer 0 in the stepping motor control mode is the normal state. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMCFT bit after reading TMCFT bit = 1 [Setting condition] When the sequence state is shifted to the normal state

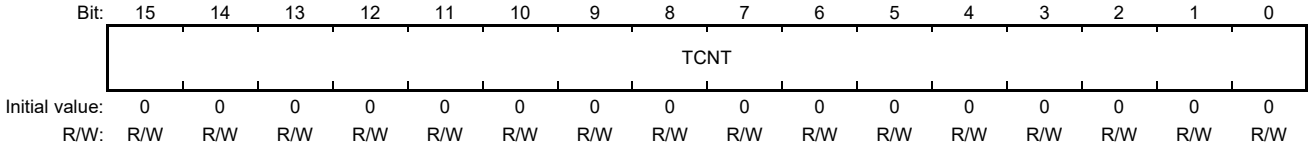
Bit	Bit Name	Initial Value	R/W	Description
9	TMCFA	0	R/WC0	Motor Control Acceleration Transition Detection This flag indicates that the current sequence state of timer 0 in the stepping motor control mode is the acceleration state. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMCFA bit after reading TMCFA bit = 1 [Setting condition] When the sequence state is shifted to the acceleration state
8	TMCFS	0	R/WC0	Motor Control Stop Transition Detection This flag indicates that the current sequence state of timer 0 in the stepping motor control mode is the stop state. This bit is reserved in timers 1 to 3, is always read as 0, and cannot be modified. [Clearing condition] Writing 0 to the TMCFS bit after reading TMCFS bit = 1 [Setting condition] When the sequence state is shifted to the stop state
7 to 5	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
4	TCFV	0	R/WC0	Overflow This flag indicates that TCNTn has overflowed. [Clearing condition] Writing 0 to the TCFV bit after reading TCFV bit = 1 [Setting condition] When the value of TCNTn overflows (when its value changes from H'FFFF to H'0000)
3	TGFD	0	R/WC0	Compare Flag D This flag indicates that the values of TCNTn and TGRDn have matched (a compare match). [Clearing condition] Writing 0 to the TGFD bit after reading TGFD bit = 1 [Setting condition] When the values of TCNTn and TGRDn have matched
2	TGFC	0	R/WC0	Compare Flag C This flag indicates that the values of TCNTn and TGRCn have matched (a compare match). [Clearing condition] Writing 0 to the TGFC bit after reading TGFC bit = 1 [Setting condition] When the values of TCNTn and TGRCn have matched

Bit	Bit Name	Initial Value	R/W	Description
1	TGFB	0	R/WC0	Compare Flag B This flag indicates that the values of TCNTn and TGRBn have matched (a compare match). [Clearing condition] Writing 0 to the TGFB bit after reading TGFB bit = 1 [Setting condition] When the values of TCNTn and TGRBn have matched
0	TGFA	0	R/WC0	Output Compare Flag A This flag indicates that the values of TCNTn and TGRAn have matched (a compare match). [Clearing condition] Writing 0 to the TGFA bit after reading TGFA bit = 1 [Setting condition] When the values of TCNTn and TGRAn are matched

155.1.2.6 Timer Counter n (TCNTn) (n = 0 to 3)

TCNTn is a 16-bit counter, and is provided for each of timers 0 to 3.

TCNTn is initialized to H'0000 by a reset.

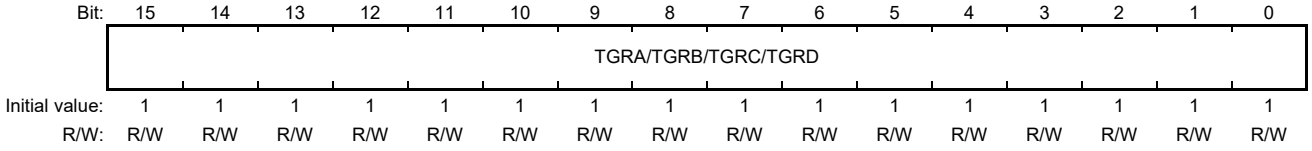


Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TCNT	All 0	R/W	Timer Counter Bits

155.1.2.7 Timer General Register A to D (TGRAn/TGRBn/TGRCn/TGRDn) (n = 0 to 3)

TGRAn, TGRBn, TGRCn and TGRDn are 16 bits general registers that are provided for each of timers 0 to 3. TGRCn and TGRDn can be designated for operation as buffer registers*. TGR is initialized to H'FFFF by a reset.

Note: * The combinations of TGR registers and buffer registers are TGRAn with TGRCn and TGRBn with TGRDn.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TGRA/TGRB/ TGRC/TGRD	All 1	R/W	Timer General Register Bits

155.1.2.8 Timer Start Register (TSTR)

TSTR is used to start or stop the timer counter (TCNTn) of timers 0 to 3.

TSTR is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TMST	CST3	CST2	CST1	CST0
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
4	TMST	0	R/W	Motor Control Sequence Start Selects whether to start or stop the motor control sequence. This bit is cleared to 0 when the timer has shifted to the stop state after motor control operation was started. 0: Stops motor control sequence 1: Starts motor control sequence
3	CST3	0	R/W	Counter Start Selects whether to start or stop the TCNT3 operation. 0: Stops the TCNT3 counting operation 1: Starts the TCNT3 counting operation
2	CST2	0	R/W	Counter Start Selects whether to start or stop the TCNT2 operation. 0: Stops the TCNT2 counting operation 1: Starts the TCNT2 counting operation
1	CST1	0	R/W	Counter Start Selects whether to start or stop the TCNT1 operation. 0: Stops the TCNT1 counting operation 1: Starts the TCNT1 counting operation
0	CST0	0	R/W	Counter Start Selects whether to start or stop the TCNT0 operation. 0: Stops the TCNT0 counting operation 1: Starts the TCNT0 counting operation

155.1.2.9 Motor Control Setting Register (TMIR)

TMIR is used to configure operation in the motor control mode.

TMIR is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TDMAE	MTRPAT DOWN	MTRPATKIND [1:0]		MTRON
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
4	TDMAE	0	R/W	Selection of DMA Use Selects whether to use DMA for step interval input (writing to TGRD0) in the motor control mode. 0: DMA is not used. 1: DMA is used. Note: It is possible to write this register only Stepping-Motor Control Mode. Please fix this bit to 1'b0 other than Stepping-Motor Control Mode. Operation is not guaranteed if this bit is set to 1'b1 other than Stepping-Motor Control Mode.
3	MTRPAT DOWN	0	R/W	Operation and Stop Patterns Transition Ascending/Descending Select Selects the direction of transitions within operation and stop patterns as ascending or descending in the motor control mode. 0: Ascending 1: Descending
2, 1	MTRPAT KIND[1:0|	00	R/W	Operation and Stop Pattern Type Select Selects the number of patterns in the cycles of stop and start patterns in the motor control mode. 00: Four 01: Eight 10: Setting prohibited 11: Setting prohibited
0	MTRON	0	R/W	TPU Mode/Stepping Motor Control Mode Select 0: TPU mode 1: Stepping motor control mode Note: This bit also controls a selecting signal to switch TPU0TO0 to TPU0TO3 outputs. Set this bit to 1 after making initial settings for the pattern cycle. Do not modify this bit during the counter operation.

155.1.2.10 Motor Deceleration (Stop) Transition Register (TMRR)

TMRR is used to place timer 0 in to the deceleration state from the normal state, in the motor control mode.

TMRR is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REDUON0	REDUON

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
1	REDUON0	0	R/W	This bit is used to force a transition of timer 0 to the deceleration (or stop) state from the normal state in motor control mode. Note that the state transition only proceeds when pattern 0 is the currently specified pattern. Setting this bit has no effect if timer 0 is not in the normal state. This bit is automatically cleared to 0 when the state of timer 0 shifts to the stop state. 0: No operation 1: Timer 0 is forcibly placed in the deceleration (or stop) state from the normal state.
0	REDUON	0	R/W	This bit is used to force a transition of timer 0 to the deceleration (or stop) state from the normal state in motor control mode. Setting this bit has no effect if timer 0 is not in the normal state. This bit is automatically cleared to 0 when the state of timer 0 shifts to the stop state. 0: No operation 1: Timer 0 is forcibly placed in the deceleration (or stop) state from the normal state.

155.1.2.11 Motor Control Status Register (TMSR)

TMSR is a read-only register that indicates the sequence state in motor control mode.

TMSR is initialized to H'0001 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SITR	SITT	SITA	SITS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
3	SITR	0	R	This bit indicates the sequence state in motor control mode. 1: The sequence state is deceleration. 0: The sequence state is not deceleration.
2	SITT	0	R	This bit indicates the sequence state in motor control mode. 1: The sequence state is normal. 0: The sequence state is not normal.
1	SITA	0	R	This bit indicates the sequence state in motor control mode. 1: The sequence state is acceleration. 0: The sequence state is not acceleration.
0	SITS	1	R	This bit indicates the sequence state in motor control mode. 1: The sequence state is stop. 0: The sequence state is not stop.

155.1.2.12 Motor Operation Pattern Storing Register 0 (TMMPR0)

TMMPR0 is used to set motor operation patterns [3] to [0] in motor control mode.

TMMPR0 is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

				MP00: TPU0TO0 output value in motor operation pattern [0]

155.1.2.13 Motor Operation Pattern Storing Register 1 (TMMPR1)

TMMPR1 is used to set motor operation pattern [7] to [4] in motor control mode.

TMMPR1 is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

155.1.2.14 Motor Stop Pattern Storing Register 0 (TMSPR0)

TMSPR0 is used to set motor stop pattern (3) to (0) in motor control mode.

TMSPR0 is initialized to H'0000 by a reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

155.1.2.15 Motor Stop Pattern Storing Register 1 (TMSPR1)

TMSPR1 is used to set motor stop pattern (7) to (4) in motor control mode.

TMSPR1 is initialized to H'0000 by a reset.

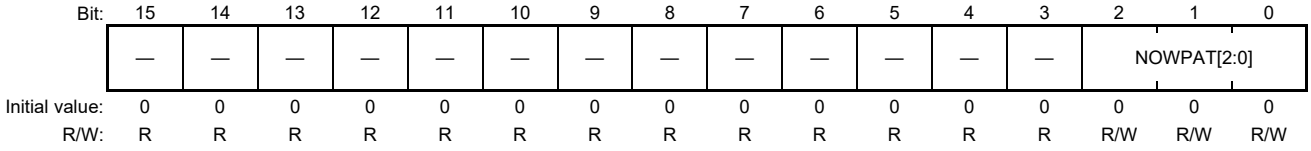
155.1.2.16 Motor Output Pattern Storing Register (TMOPR)

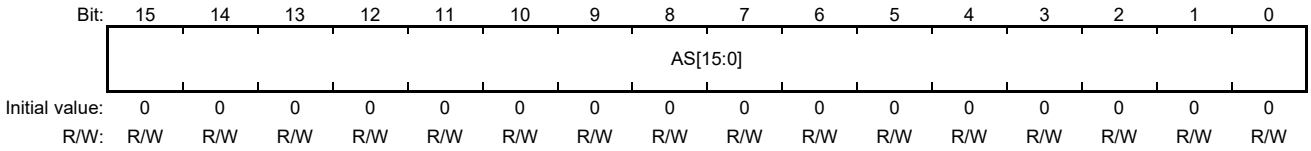
TMOPR is used to specify the motor output pattern in motor control mode. When read, it indicates the pattern currently being output. Writing to this register while the sequence is in the stop state leads to output of the pattern with the corresponding number. TMOPR is initialized to H'0000 by a reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
2 to 0	NOWPAT [2:0]	000	R/W	In motor control mode, Reading: The pattern number currently being output is read. Writing: If the sequence is in the stop state, the pattern corresponding to the written pattern number is output.

155.1.2.17 Motor Acceleration Step Count Register (TMASR)

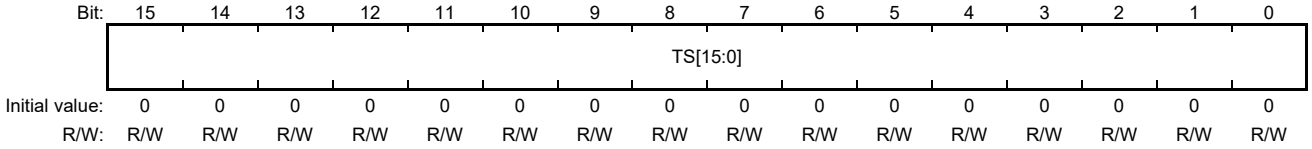
TMASR is used to set the number of steps in the acceleration state of motor control mode. TMASR is initialized to H'0000 by a reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	AS[15:0]	H'0000	R/W	Specify the number of steps in the acceleration state of motor control mode. When the setting is H'0000, the acceleration state is skipped.

155.1.2.18 Motor Normal the Number of Steps Register (TMTSR)

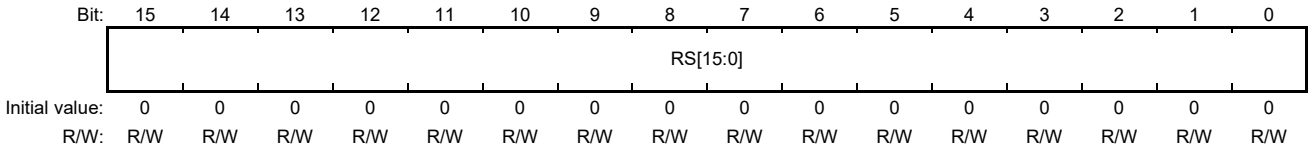
TMTSR is used to set the number of steps in the normal state of motor control mode. TMTSR is initialized to H'0000 by a reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TS[15:0]	H'0000	R/W	Specify the number of steps in the normal state of motor control mode. When the setting is H'0000, the normal state is maintained until 1 is written to the REDUON0 bit or REDUON bit in TMRR.

155.1.2.19 Motor Deceleration the Number of Steps Register (TMRSR)

TMRSR is used to set the number of steps in the deceleration state of motor control mode. TMRSR is initialized to H'0000 by a reset.

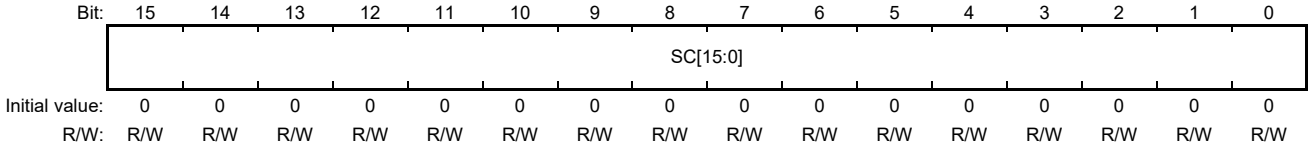


Bit	Bit Name	Initial Value	R/W	Description
15 to 0	RS[15:0]	H'0000	R/W	Specify the number of steps in the deceleration state of motor control mode. When the setting is H'0000, the deceleration state is skipped.

155.1.2.20 Motor Control Sequence Counter Register (TMSCR)

TMSCR indicates or controls the value of the sequence counter in motor control mode. Writing to this register is only allowed when the motor control mode is in use and the current state is the normal state.

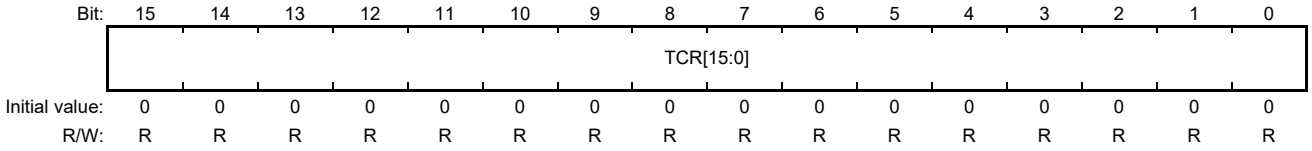
TMSCR is initialized to H'0000 by a reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	SC[15:0]	H'0000	R/W	Value of Sequence Counter in Motor Control Mode Reading: The value of the sequence counter is read. Writing: Writing is only allowed in the normal state. The written value is directly stored in the sequence counter.

155.1.2.21 Motor Control Normal Counter Register (TMTCR)

TMTCR is a read-only register that indicates the number of steps in the normal state of motor control mode. TMTCR is initialized to H'0000 by a reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TCR[15:0]	H'0000	R	Indicate the number of steps in the normal state of motor control mode.

			1		Toggle output on compare match with TGRAn.*
	1	0	0	Always output 1	
			1	Initial output from the TPU0TO0 to TPU0TO3 pins is 1	Output 0 on compare match with TGRAn.
		1	0		Output 1 on compare match with TGRAn.*
			1		Toggle output on compare match with TGRAn.*

Note: * This setting is prohibited in PWM mode.

155.1.3 Operation

155.1.3.1 Overview

An overview of operation in the various modes is given below.

(1) Ordinary Operation

Each timer has TCNT and TGR registers. TCNTn counts up, and is capable of free-running operation and counting to define periods corresponding to register settings.

(a) Buffered Operation

When a compare match occurs, the buffer register value in the corresponding timer is transferred to TGR. Either a compare match or clearing of the counter can be selected as the trigger that defines the timing of updating from a buffer register.

(b) PWM Mode

In PWM mode, a PWM waveform is output. The duty cycle can be set by TGR. PWM waveforms with duty cycles in the range from 0 to 100% can be output in accord with the settings of TGRAn and TGRBn.

(c) Stepping Motor Control Mode

Pre-defined patterns can be output from TPU0TO3 to TPU0TO0 by placing timer 0 to stepping motor control mode.

155.1.3.2 Basic Functions

(1) Counter Operation

When a bit from among CST3 to CST0 in TSTR is set to 1, the TCNTn for the corresponding timer starts counting. A TCNTn can operate as a free-running counter, periodic counter, and so on.

(a) Example of Procedure for Setting up Counter Operations

Figure 155.1.3.1 shows an example of the procedure for setting up counter operation.

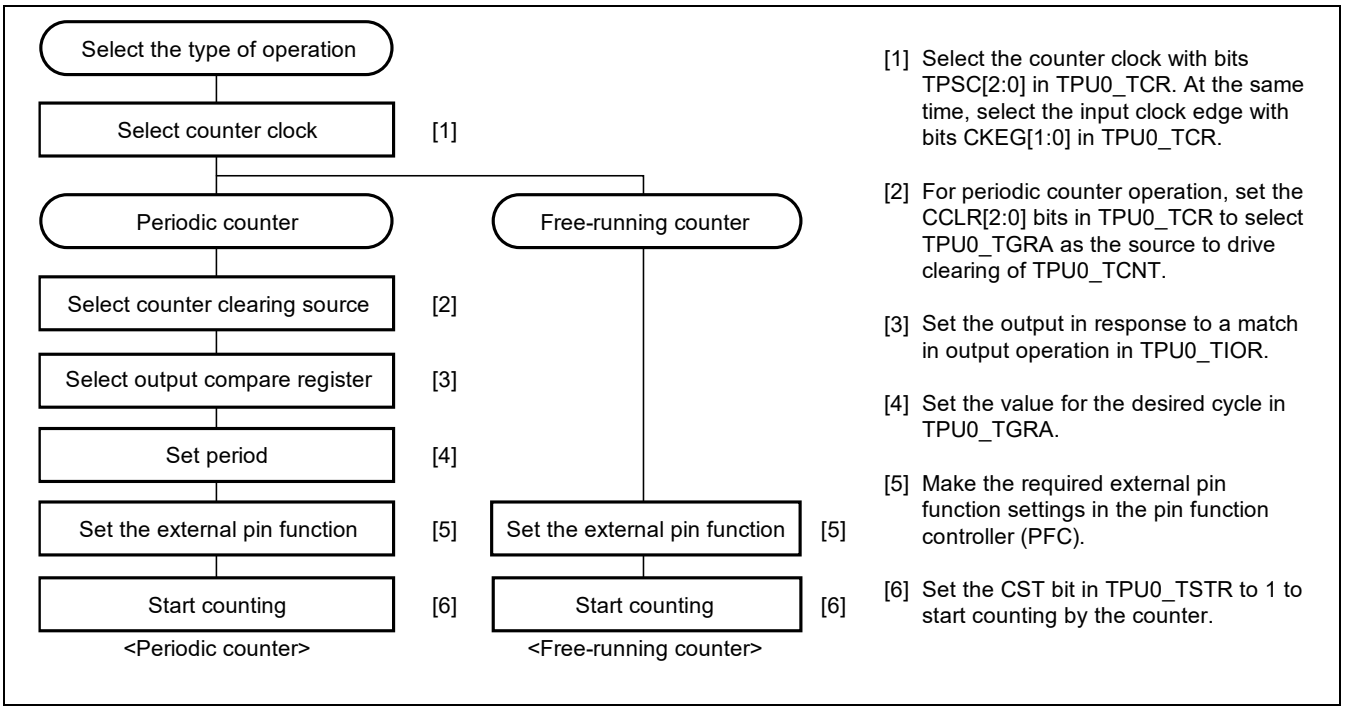

Figure 155.1.3.1 Example of Procedure for Setting up Counter Operation

(b) Free-Running Counter Operation and Periodic Counter Operation

Immediately after a reset, the TCNTn counters are all designated as free-running counters. When the relevant bit in TSTR is set to 1, the corresponding TCNTn starts counting up as a free-running counter. When TCNTn has overflowed (when its value changes from H'FFFF to H'0000), the TCFV bit in TSRn is set to 1. After it overflows, TCNTn starts counting up again from H'0000.

Figure 155.1.3.2 illustrates free-running counter operation.

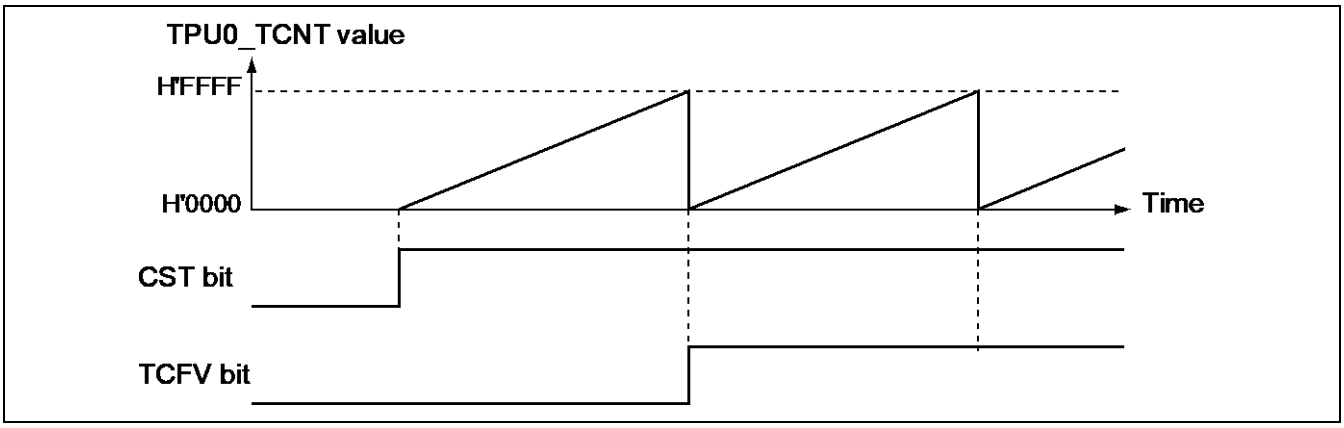

Figure 155.1.3.2 Free-Running Counter Operation

When a compare match is selected as the source to drive clearing of TCNTn, the TCNTn counter for the relevant timer operates as a periodic counter (counting a period defined by a general register). The TGR register for setting the period is designated as the output compare register, and counter clearing in response to a compare match is selected by means of bits CCLR[2:0] in TCRn. After the settings have been made, TCNTn starts counting as a periodic counter when the corresponding bit in TSTR is set to 1. When the counted value matches the value in the selected TGR, the TGF bit in TSRn is set to 1 and TCNTn is cleared to H'0000.

After a compare match, TCNTn starts counting up again from H'0000.

Figure 155.1.3.3 illustrates periodic counter operation.

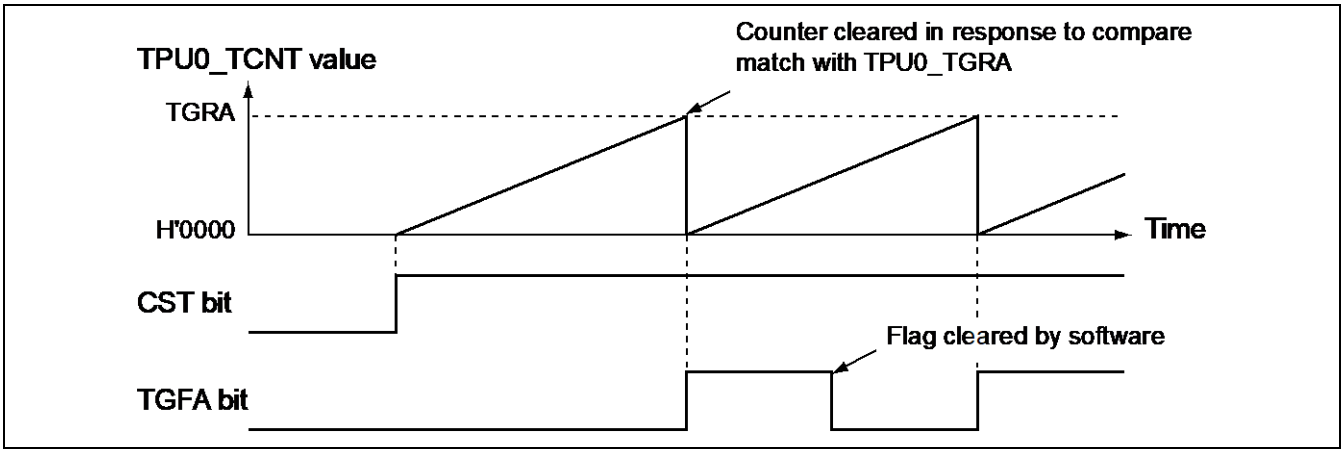

Figure 155.1.3.3 Periodic Counter Operation

(2) Waveform Output by Compare Match

The TPU can be set for the output of logical 0 or 1, or toggling of the output on the output pin in response to a compare match with TGRAn.

(a) Example of Procedure for Setting up Waveform Output under Compare Match Control

Figure 155.1.3.4 shows an example of the procedure for setting up waveform output under compare match control.

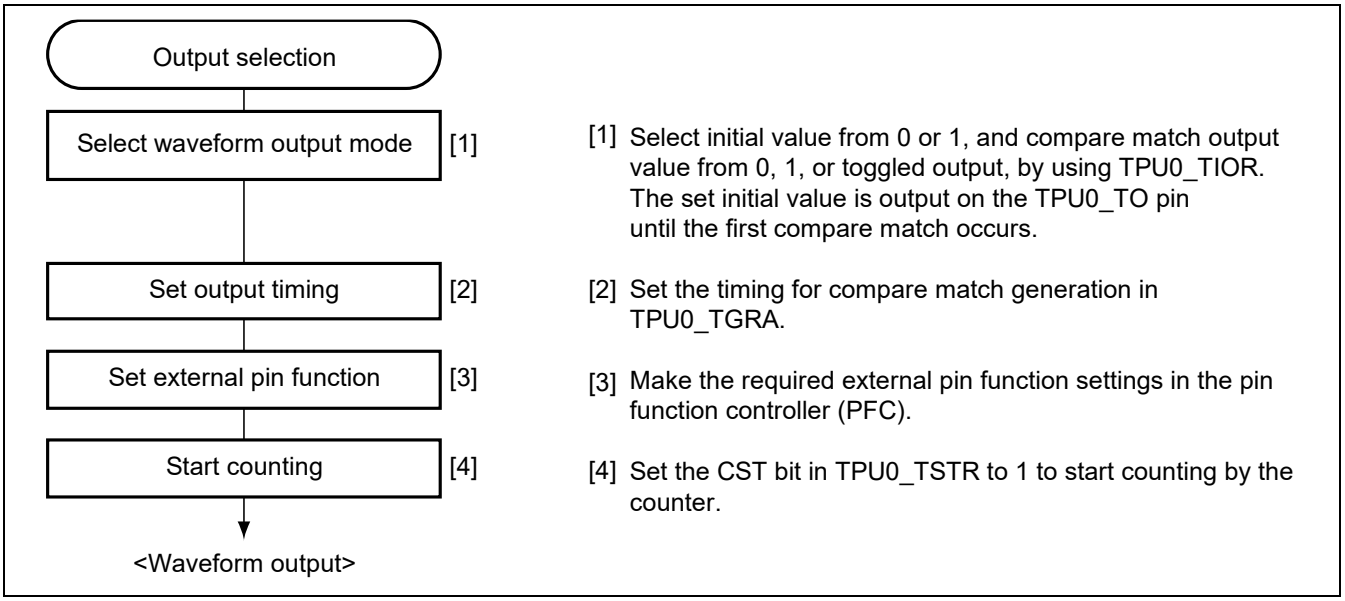

Figure 155.1.3.4 Example of Procedure for Setting up Waveform Output under Compare Match Control

(b) Examples of Waveform Output Operation

Figure 155.1.3.5 shows an example of the output of 0 or 1.

In this example, TCNTn has been designated as a free-running counter, and settings have been made so that 1 or 0 is output in response to compare match A. When the set level is the same as the level on the pin, the level on the pin does not change.

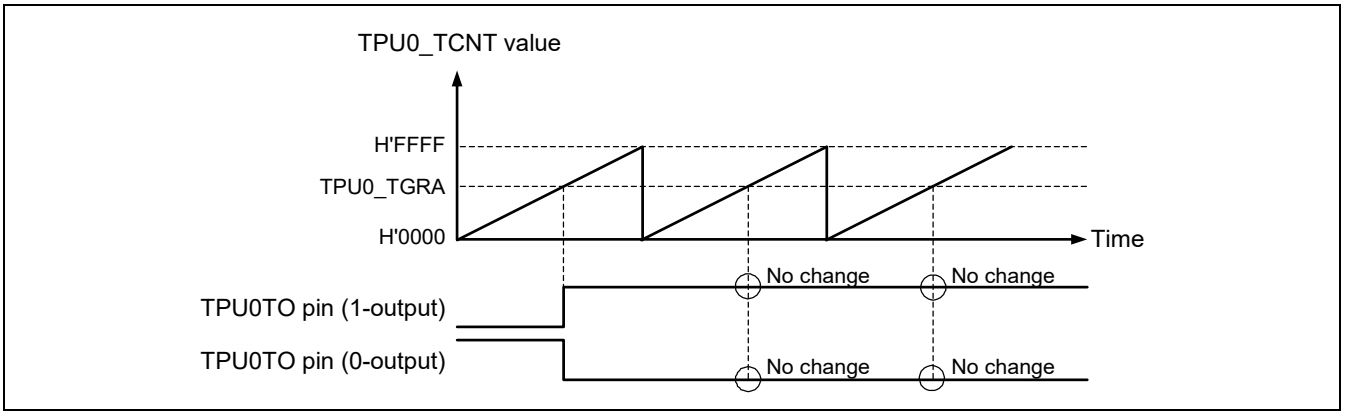

Figure 155.1.3.5 Example of Output of 0 or 1

Figure 155.1.3.7 shows an example of toggled output.

In this example, TCNTn has been designated as a periodic counter (with counter clearing handled by compare match B), and settings have been made so that the output is toggled in response to compare match A.

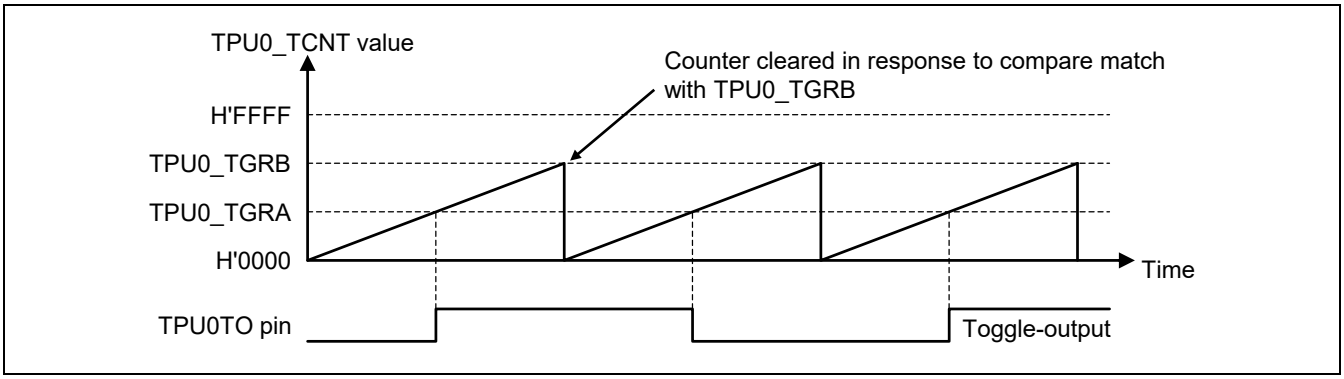

Figure 155.1.3.6 Example of Toggled Output Operation

155.1.3.3 Buffered Operation

TGRCn and TGRDn can be used as buffer registers.

Table 155.1.3.1 shows the register combinations used in buffered operation.

Table 155.1.3.1 Register Combinations in Buffered Operation

Timer General Register	Buffer Register
TGRAn	TGRCn
TGRBn	TGRDn

When a compare match occurs, the value in the buffer register for the corresponding timer is transferred to the timer general register. Either a compare match or clearing of the counter can be selected as the trigger that defines the timing of updating from a buffer register.

This operation is illustrated in Figure 155.1.3.7.

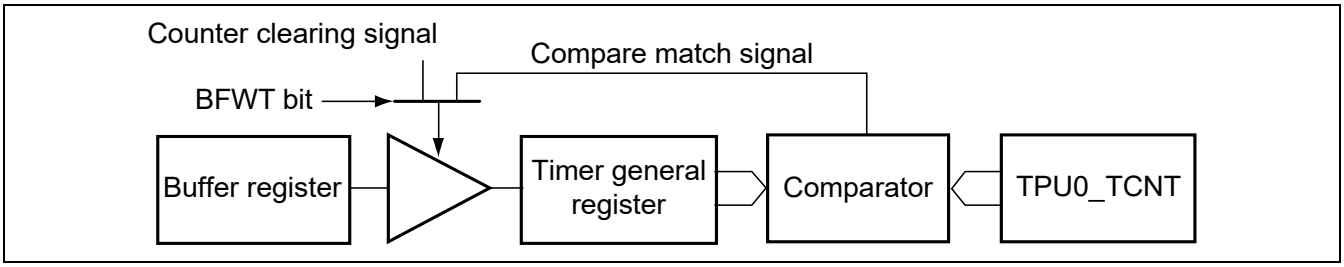

Figure 155.1.3.7 Buffered Compare Match Operation

(1) Example of Procedure for Setting up Buffered Operation

Figure 155.1.3.8 shows an example of the procedure for setting up buffered operation.

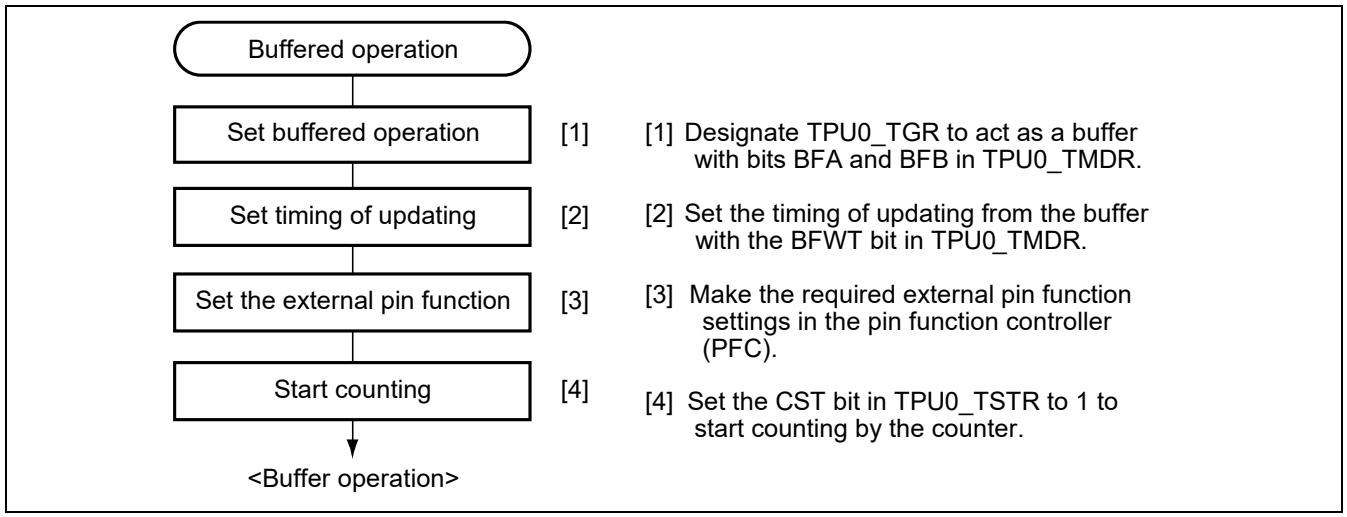

Figure 155.1.3.8 Example of Procedure for Setting up Buffered Operation

(2) Examples of Buffered Operation

Figure 155.1.3.9 shows an example of operation in which PWM mode has been designated for timer 0, and buffered operation has been designated for TGRAn and TGRCn. The settings used in this example are for clearing of TCNTn in response to compare match B, output of 1 (on the TPU0TO0 to 3 for the selected timer) on compare match A, output of 0 as the initial value by clearing the counter, and the timing for updating from the buffer register as clearing of the counter.

When compare match A occurs, the output changes. When counter clearing is generated by a match with TGRBn, the output changes and the value in buffer register TGRCn is simultaneously transferred to the timer general register TGRAn. This operation is repeated every time compare match A occurs.

For details on the PWM mode, see section 155.1.3.4, PWM Mode.

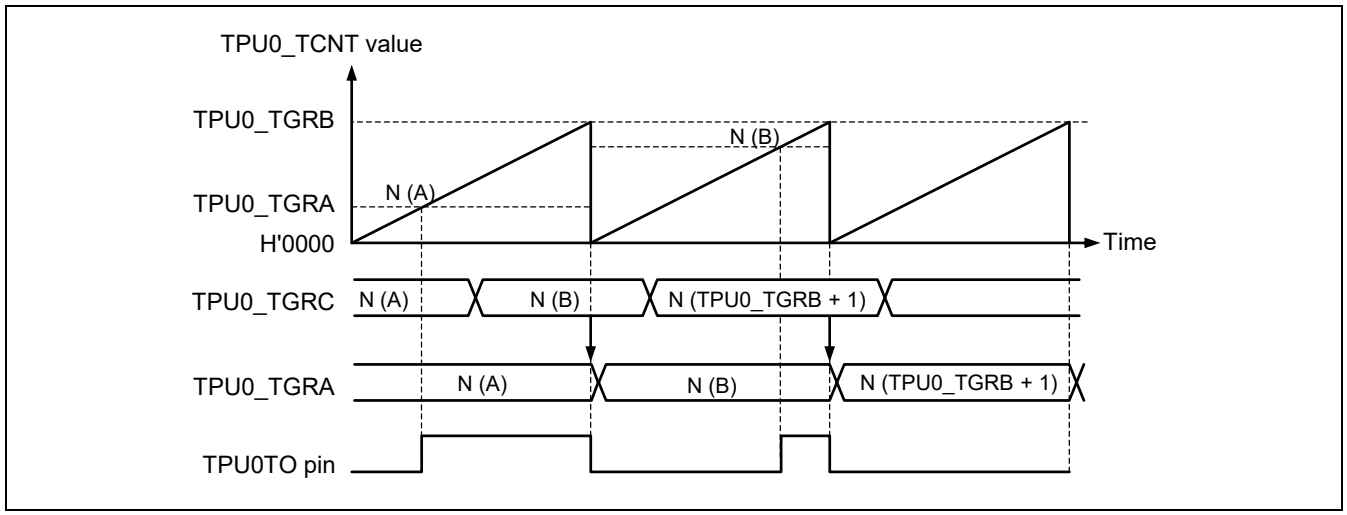

Figure 155.1.3.9 Example of Buffer Operation

155.1.3.4 PWM Mode

In PWM mode, PWM waveforms are output from the output pins. The output of 0 or 1 can be selected as the response to a compare match with the given TGRAn.

Designating TGRBn compare match as the counter clearing source enables setting of the overall cycle in that register. All timers can be independently placed in PWM mode.

PWM output is generated from the output pins by using TGRAn and TGRBn to control the duty cycle and period, respectively. The initial output specified by TIORn is output on the output pin by counter clearing in response to a compare match with the period register. Be sure to set TIORn so that the initial output level is different from the compare match output. Selecting the same level or toggled output leads to no operation.

Conditions for 0% and 100% duty cycles are shown below.

- 0% duty cycle: The setting of the duty-cycle register (TGRAn) being equal to that of the period register plus one (TGRBn + 1)
- 100% duty cycle: The setting of the duty-cycle register (TGRAn) being 0

(1) Example of Procedure for Setting up PWM Mode Operation

Figure 155.1.3.10 shows an example of the procedure for setting up the PWM mode operation.

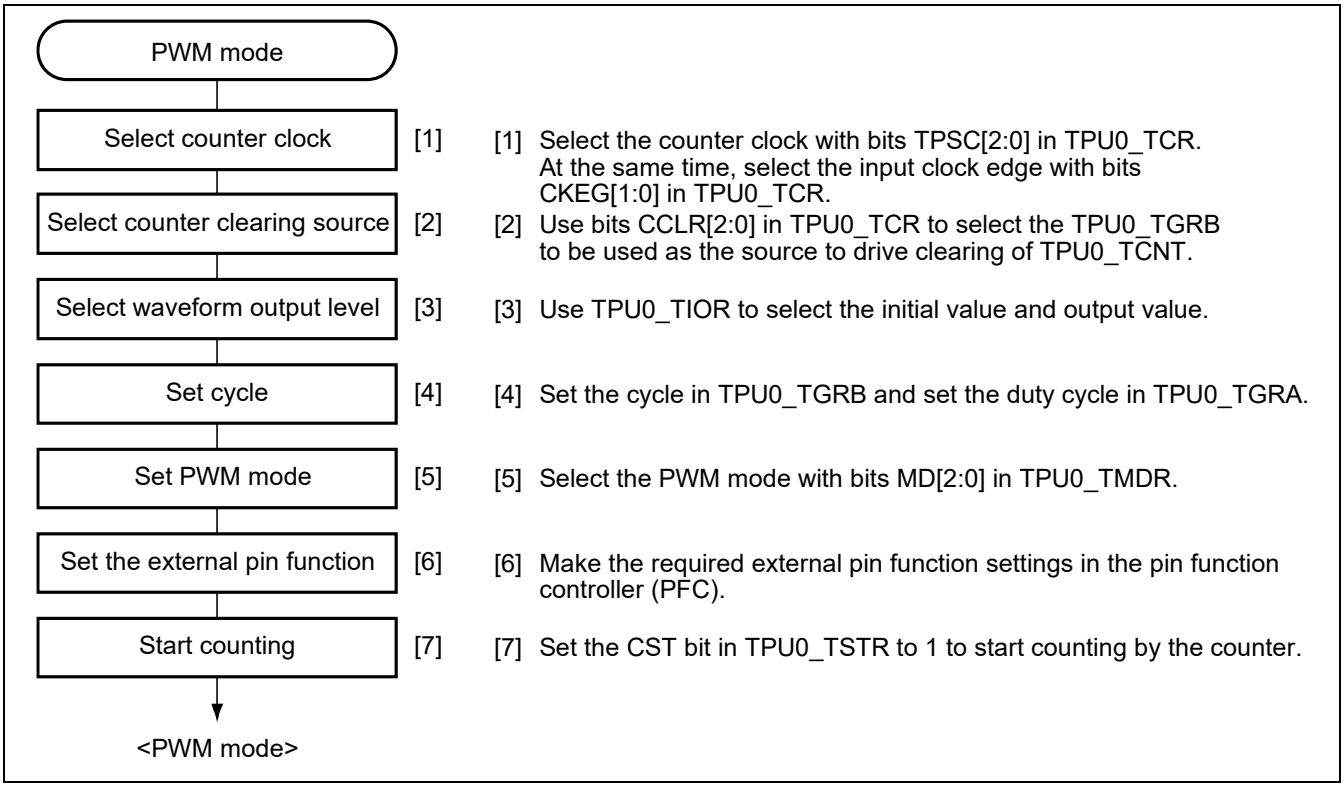

Figure 155.1.3.10 Example of Procedure for Setting up PWM Mode Operation

(2) Examples of PWM Mode Operation

Figure 155.1.3.11 shows an example of PWM mode operation.

In this example, compare match with TGRBn is set as the source to drive clearing of TCNTn, 0 is set as the initial output value for TGRAn, and 1 is set as the output value on a compare match with TGRAn.

In this case, the value set in TGRBn defines the cycle time (period), and the value set in TGRAn defines the duty cycle.

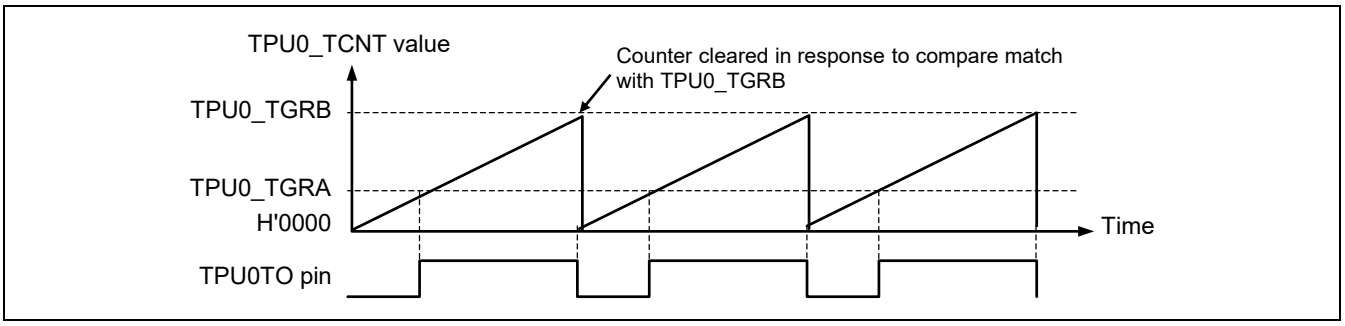

Figure 155.1.3.11 Example of PWM Mode Operation (1)

Figure 155.1.3.12 shows an example of PWM waveform output with 0% and 100% duty cycles in PWM mode.

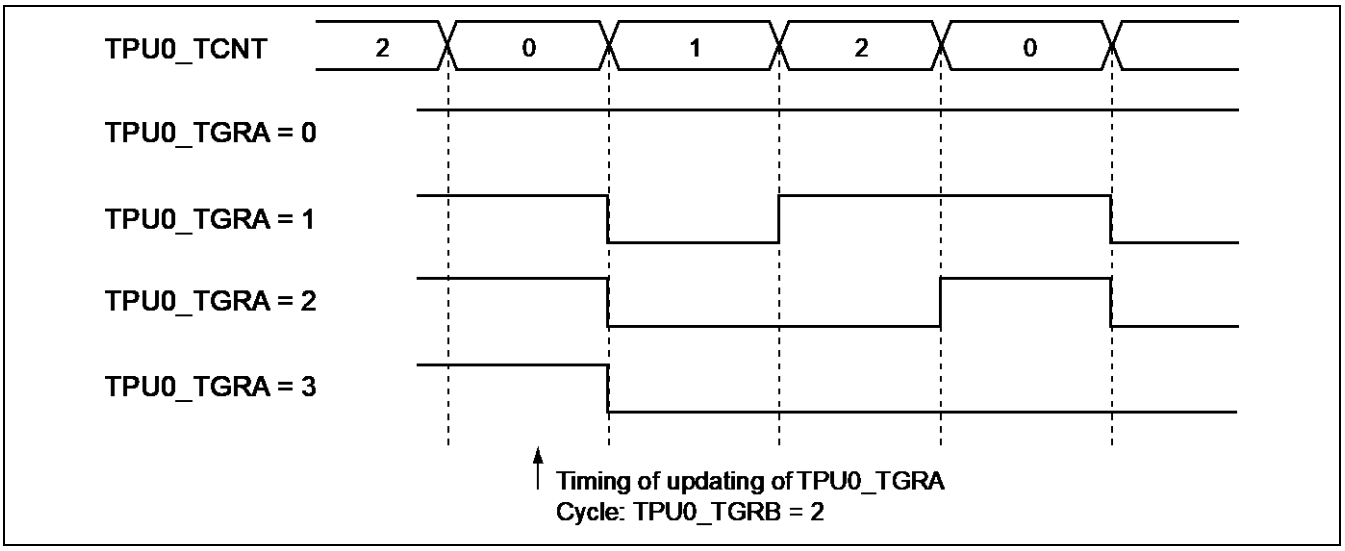

Figure 155.1.3.12 Example of PWM Mode Operation (2)

155.1.3.5 Stepping-Motor Control Mode

(1) Features of Stepping-Motor Control Mode

- This mode is for the output of signals for stepping-motor control on four pins and is only available for timer 0.
- States of the output pins change in response to compare matches with the counter of timer 0.
- By using the DMAC or an interrupt to rewrite the values of the compare-match registers, the intervals between transitions of the states of the output pins can be specified as desired.
- Specified patterns are output on the output pins.
- Four or eight patterns can be selected.
- The pattern-number counter is incremented or decremented by 1 on every compare match with the counter on timer 0. When the pattern-number counter overflows in normal mode, its value returns to 0. When the pattern-number counter underflows, its value becomes 3 (for a four-pattern cycle) or 7 (for an eight-pattern cycle).
- Patterns consist of stop patterns and operating patterns. Operating patterns are output while the counter is running, and stop patterns are output while the counter is stopped.
- While the counter is running, operation is in three states (the acceleration, deceleration, and normal states). Only for acceleration and deceleration, the interval between changes of pattern can be controlled.
- The acceleration or deceleration state can be skipped by writing H'0000 to TMASR and TMRSR.
- TMRR can be used to force a transition from the normal to the deceleration state.

(2) Glossary

Sequence State: The four states in the sequence, i.e. the acceleration, normal, deceleration, and stop states

Sequence Counter: Counter to control transitions to next sequence states
The sequence counter is decremented with every compare match with the counter of timer 0 and, when the value reaches 1, the control state will make the transition to the next state in the sequence on a further compare match with the counter of timer 0.

Auto Mode: Mode of operation when a value other than H'0000 has been written to TMTSR
The number of pattern transitions in the normal state corresponding to the setting of TMTSR, and this is followed by an automatic transition to the deceleration state (or, if TMRSR = H'0000, a transition to the stop state).

Manual Mode: Mode of operation when H'0000 has been written to TMTSR. In this case, the transition from the normal to the deceleration state (or the stop state if TMRSR = H'0000) is not made unless 1 is written to the REDUON0 and REDUON bits in TMRR.

Pulse Mode: Mode of operation when H'0000 has been written to TMASR and TMRSR. Operation is only in the normal state, so the output pattern is changed with a constant interval.

Step: The pattern is changed with every compare match with the counter of timer 0. Step refers to the interval of time between the change to one pattern and the change to the next.

Operation Pattern: The four-bit patterns for output from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states. 8 types of Operation Pattern are set by TMMPR0 and TMMPR1. “[ ]” in Figure 155.1.3.13, Figure 155.1.3.15, Figure 155.1.3.17, Figure 155.1.3.19 to Figure 155.1.3.22 and Table 155.1.3.5 means 8 types of Operation Pattern set by TMMPR0 and TMMPR1.

Stop Pattern: The four-bit patterns for output from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state. 8 types of Operation Pattern are set by TMSPR0 and TMSPR1. “( )” in Figure 155.1.3.13,

Figure 155.1.3.15, Figure 155.1.3.17, Figure 155.1.3.19 to Figure 155.1.3.22 and Table 155.1.3.5 means 8 types of Operation Pattern set by TMMPR0 and TMMPR1.

(3) Setting up Basic Motor Control Operation

An example of operation in stepping motor control is shown in Figure 155.1.3.13.

Stepping-motor control mode allows the output of patterns with a variable step interval.

"( )" in Figure 155.1.3.13 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1.

"[ ]" in Figure 155.1.3.13 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states set by TMMPR0 and TMMPR1.

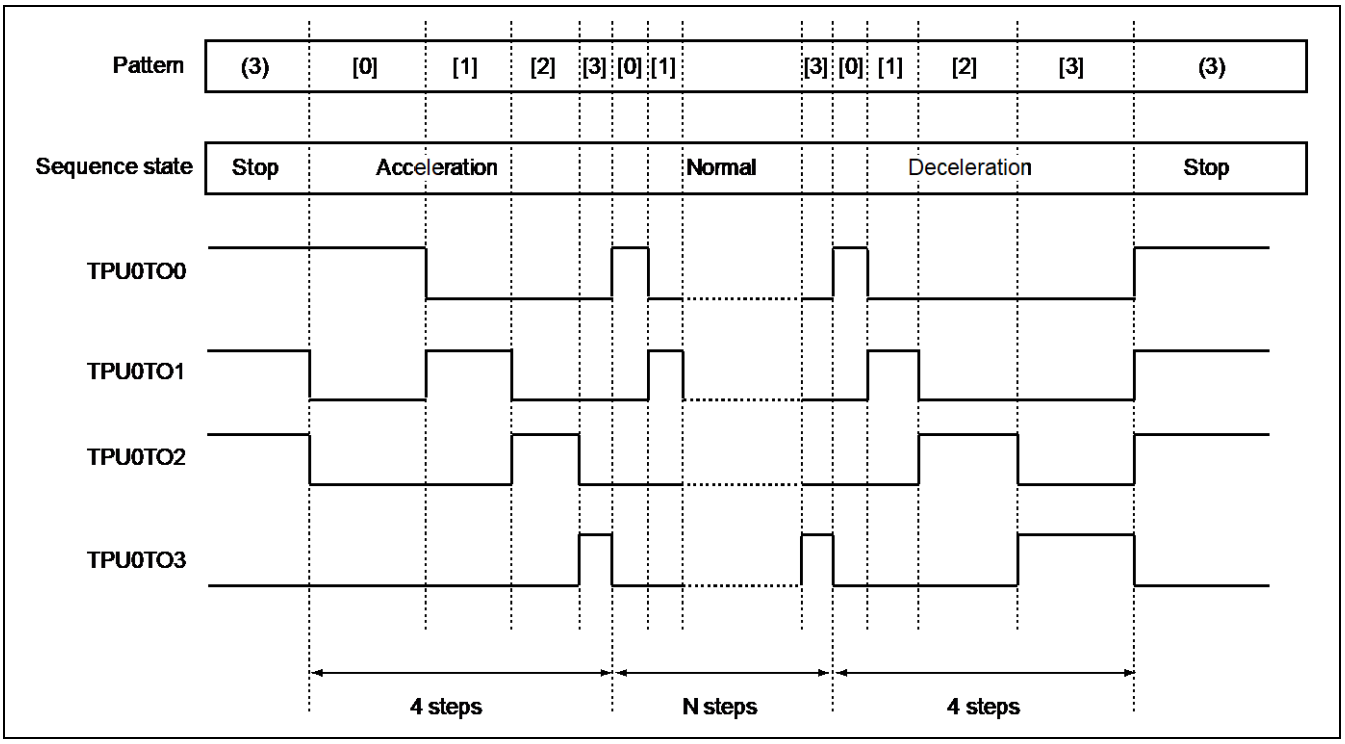

Figure 155.1.3.13 Example of Stepping-Motor Control

(a) Compare Match Settings for Timer 0

For stepping motor control, set TCR0 and TMDR0 as follows:

Table 155.1.3.2 Compare Match Settings for Timer 0

Register	Setting	Description
TCR0	B'0000 0000 0100 0xxx	CCLR[2:0] bits = B'010 CKEG[1:0] bits = B'00 TPSC[2:0] bits = B'xxx (optional)
TMDR0	B'0000 0000 0110 0000	BFWT bit = 1 BFB bit = 1 BFA bit = 0 MD[2:0] bits = B'000

[Legend]
x: Don't care.

With the above settings, TGRD0 is used as a buffer register for TGRB0, and the contents of the general register are rewritten when the timer counter is cleared. The step interval can be changed by using DMA transfer or interrupt control to write a desired value to TGRD0.

The TPSC [2:0] bits in TCR0 are for a timer prescaler setting. The step interval is calculated from the following formula.

[Calculation example]

With Internal clock at 99MHz, B'011 as the value of TPSC[2:0] in TCR0, H'1425 as the value of TGRD0, the result is 15ns × 64 × 5157 (H'1425) = 4950720ns ≅ 4.95ms. That is, the pattern will change after approximately 4.95ms.

(b) Sequence State and the Number of Steps

In stepping-motor control mode, operation is in three states (acceleration, normal, and deceleration) while the counter is running. In the acceleration and deceleration states, the step interval can be changed. Accordingly, the value of TGRD0 must be changed the same number of times as the patterns are changed.

In the normal state, the step interval cannot be changed. So, TGRD0 is only set once for a period in the normal state.

The numbers of steps in the acceleration, normal, and deceleration states are set in TMASR, TMTSR, and TMRSR, respectively. If H'0000 is written to TMASR or TMRSR, the corresponding state is skipped. Furthermore, the manual mode can be selected by writing H'0000 to TMTSR. In this mode, the transition from normal mode can only be initiated by changing the value in TMRR.

Table 155.1.3.3 gives descriptions of the sequence states and Figure 155.1.3.14 shows the transitions between sequence states.

Table 155.1.3.3 Description of Sequence States

		Description	
Start/Stop	**State**	**Step Interval**	**Definition in TGRD0**
Start	Acceleration	Variable	The number of steps specified for this state
	Normal	Fixed	Only once
	Deceleration	Variable	The number of steps specified for this state
Stop	Stop	—	—

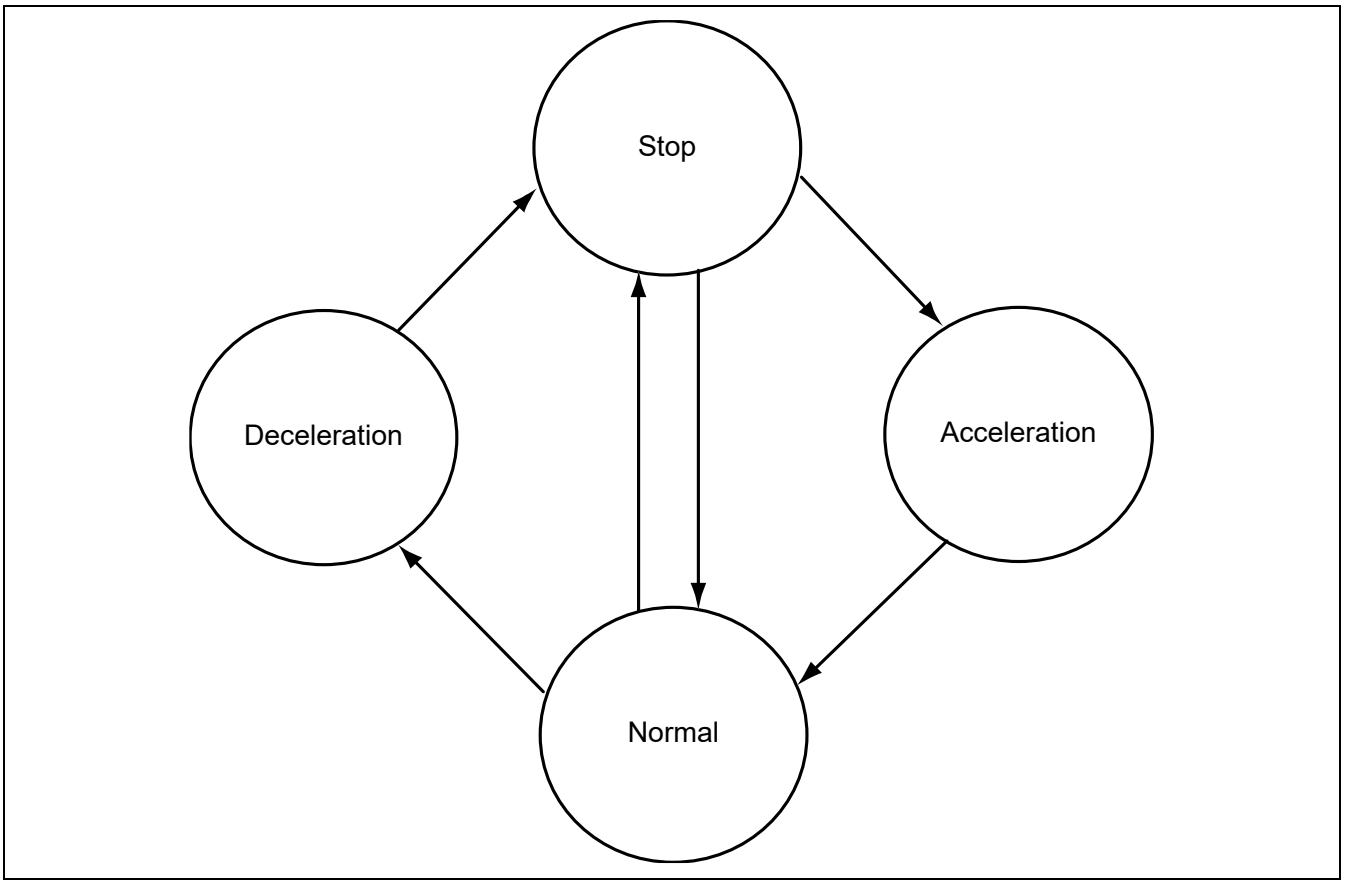

Figure 155.1.3.14 Sequence State Transition

(c) Setting of the Step Interval

Direct memory access or interrupt-driven transfer can be used to set the step interval

- DMA transfer

Setting the TDMAE bit in TMIR to 1 selects the use of DMA transfer to modify the step interval.

The number of requests for DMA transfer is given by TMASR + 1 (to transfer the step interval for the normal state) + TMRSR. The step intervals must be defined in sequence from the address indicated by the DMA source address register. Figure 155.1.3.15 shows an example of timing in operation with DMA transfer requests used to set the step intervals. "( )" in Figure 155.1.3.15 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. "[ ]" in Figure 155.1.3.15 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states set by TMMPR0 and TMMPR1. Figure 155.1.3.16 shows the corresponding definitions of step intervals in the address map.

Table 155.1.3.4 lists an example of the DMA settings.

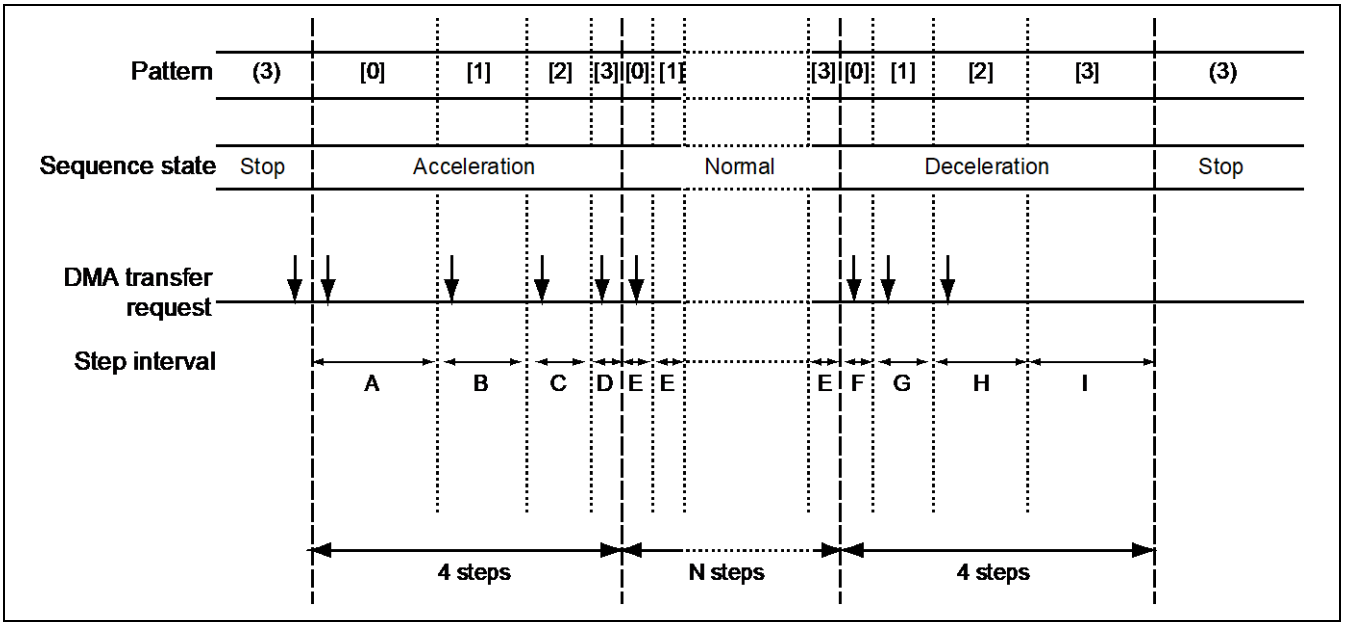

Figure 155.1.3.15 Operation with DMA Transfer Requests Used to Adjust the Step Interval

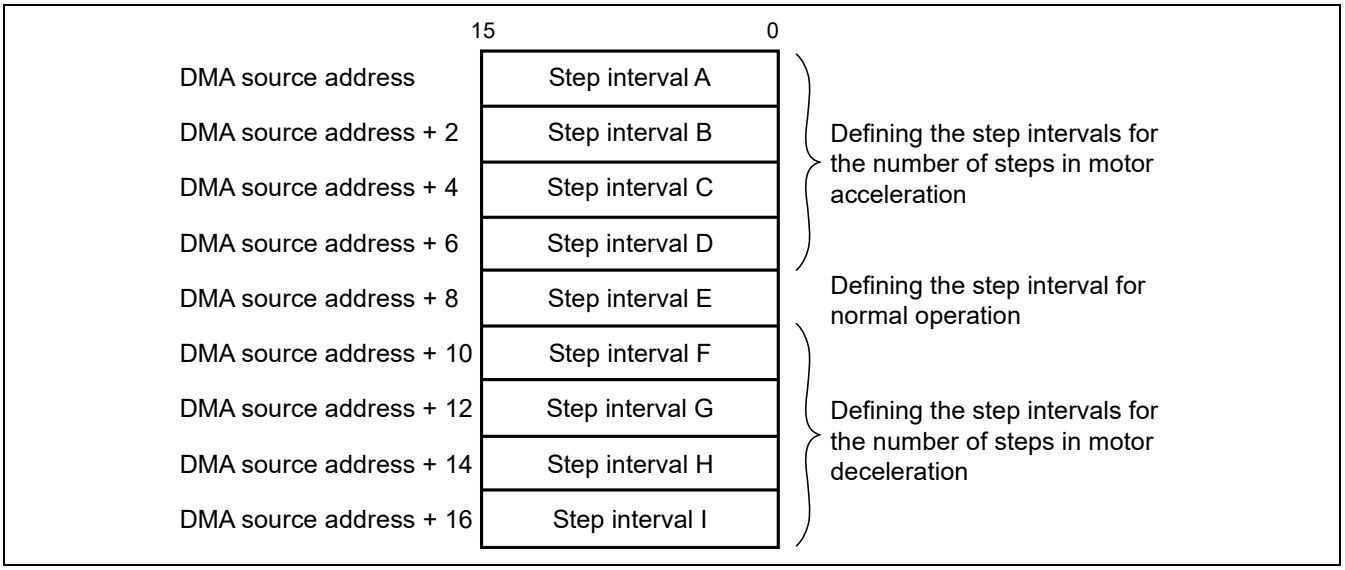

Figure 155.1.3.16 Address Map of Step Interval Definitions for the Example of Operation

Table 155.1.3.4 DMA Settings

DMA Register	Setting	Description
DMA source address register	H'XXXX XXXX	Address where the table of step intervals starts
DMA destination address register	H'E6E8 0034	Address of TGRD0
DMA transfer count register	H'0000 0000	(Setting for the maximum number of transfer operations) *
DMA transfer count register B	H'XXXX XXXX	The number of DMA transfer requests is set in the higher- and lower-order 16 bits. (for Figure 155.1.3.15, H'0009 0009)
DMA channel control register	H'E6E8 80*C	Reload mode: Use source address registers (SARs) as the source for reloading. Fixed destination address. Incrementation of source addresses. The DMA extension resource selector is used. DMA transfer is in word (two-byte) units. The other bits are in the default settings.
DMA extension resource selector	H'17 in the bit field for the selected DMA channel	Select TPU
DMA operation register	H'0001	Permits DMA transfer on all channels. The other bits are in the default settings

Note: * Transfer is stopped when the value of the DMA transfer counter reaches 0, so change the value of the DMA transfer counter back to 1 after TPU-related operations are finished.

- Interrupt-driven transfer

Setting the TMDRFE bit in TIER0 to 1 allows the use of interrupt-driven transfer to change the step interval.

TMASR−1 + 1 (to transfer the step interval in the normal state) + TMRSR gives the number of times TGRD0 must be written to by interrupt-driven transfer.

This method is unlike DMA transfer in that an interrupt is not generated when the initial transfer is required. The initial value should thus be written to TGRD0 before counter operation starts.

Once interrupt generation starts, the interrupt handler writes the step intervals to TGRD0 and writes 0 to the TMDRFS bit after reading it as 1.

Figure 155.1.3.17 shows an example of timing in operation with interrupt-driven transfer used to set the step intervals. “( )” in Figure 155.1.3.17 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. “[ ]” in Figure 155.1.3.17 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states set by TMMPR0 and TMMPR1.

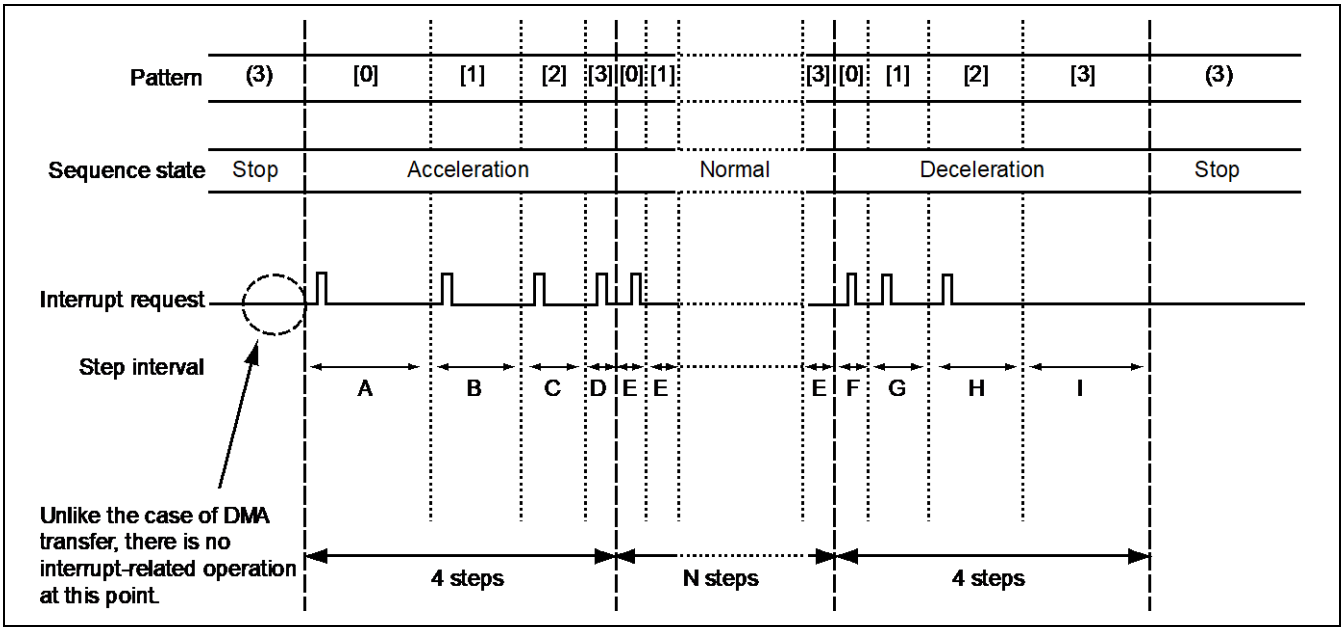

Figure 155.1.3.17 Interrupt-Driven Adjustment of the Step Interval

The step-intervals in the example of operation shown in Figure 155.1.3.17 are defined in the following stages.

Write step interval A to TGRD0 before starting the counter. Write step interval B to TGRD0 in response to the first interrupt. Write step interval C to TGRD0 in response to the second interrupt. Write step interval D to TGRD0 in response to the third interrupt.	Defining the step intervals for the number of steps in motor acceleration
Write step interval E to TGRD0 in response to the forth interrupt.	Defining the step interval for normal operation
Write step interval F to TGRD0 in response to the fifth interrupt. Write step interval G to TGRD0 in response to the sixth interrupt. Write step interval H to TGRD0 in response to the seventh interrupt. Write step interval I to TGRD0 in response to the eighth interrupt.	Defining the step intervals for the number of steps in motor deceleration

(d) Pattern Setting

In stepping-motor control mode, each four-bit value for output on pins TPU0TO0 to TPU0TO3 is regarded as a single pattern. The patterns are in a sequence, and a compare match with the timer counter triggers each transition to the next pattern.

The following rules apply to pattern transfer.

- Either a four- or an eight-pattern cycle may be used. The number is determined by the MTRPATKIND bit in TMIR0.
- Each pattern is indicated by a pattern number. The current pattern number is either incremented or decremented on each compare match with the timer counter. Incrementation or decrementation of the pattern numbers is determined by the MTRPATDOWN bit in TMIR0.
- The pattern-number counter returns to 0 when it overflows. When it underflows, the pattern number becomes three (for a four-pattern cycle) or seven (for an eight-pattern cycle).
- Operating patterns are defined as the output patterns in the acceleration, normal, and deceleration states, and stop patterns are defined as the output patterns in the stop state. In transitions from an operating pattern to a stop pattern, the pattern number remains the same. In transitions from a stop pattern to an operating pattern, the current pattern number changes to that of the next pattern.

The operating patterns are set in TMMPR0 and TMMPR1, and the stop patterns are set in TMSPR0 and TMSPR1.

Table 155.1.3.5 lists the order of patterns for different settings of the MTRPATDOWN and MTRPATKIND bits in TMIR.

Table 155.1.3.5 Settings of the MTRPATDOWN and MTRPATKIND Bits in TMIR and Orders of Patterns

TMIR		Example of Pattern Order
MTRPATDOWN Bit	MTRPATKIND Bits	(Operating Pattern [ ], Stop Pattern ( ))
0	B'00	[0] → [1] → [2] → [3] → [0] → [1] → [2] → [3] → (3) → [0]
1		[0] → [3] → [2] → [1] → [0] → [3] → [2] → [1] → (1) → [0]
0	B'01	[0] → [1] → [2] → [3] → [4] → [5] → [6] → [7] → (7) → [0]
1		[0] → [7] → [6] → [5] → [4] → [3] → [2] → [1] → (1) → [0]

(e) Specifying the Output Pattern in the Stop State

Specifying a pattern number in the NOWPAT [2:0] bits of TMOPR while output is in the stop state leads to output of the corresponding pattern on pins TPU0TO3 to TPU0TO0. The initial value is 0.

(f) Selecting the Stepping-Motor Control Mode

Stepping-motor control by the TPU circuit is selected by setting the MTRON bit in TMIR to 1. The output on pins TPU0TO3 to TPU0TO0 is switched to the output corresponding to stepping-motor control.

Switching should proceed while the motor is stopped.

The stop pattern specified as pattern 0 in TMOPR is output after switching. Therefore, verify the value in TMOPR or write the desired pattern to TMOPR.

(g) Starting Stepping-Motor Control

Stepping-motor control is started by setting the TMST bit in TSTR to 1. This bit is automatically cleared (to 0) in the stop state after motor-control operations are over.

(h) Example of the Procedure for Setting up Stepping-Motor Control

Figure 155.1.3.18 is a flowchart of stepping-motor control.

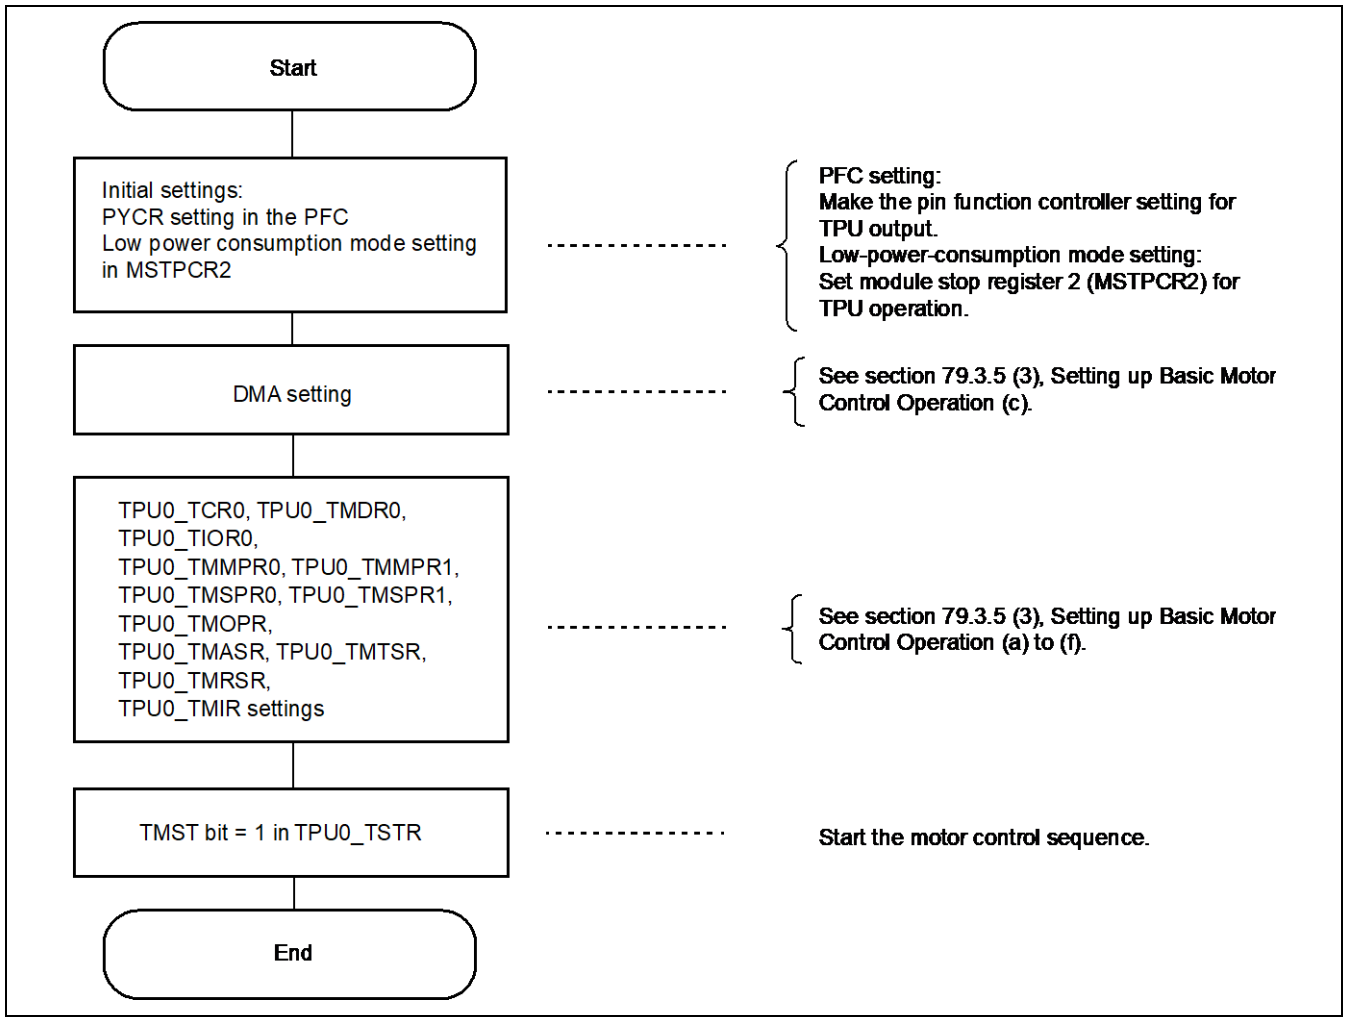

Figure 155.1.3.18 Flowchart

(4) Changing the Number of Steps in the Normal State.

The number of steps in the normal state is set in TMTSR. The operations for changing the number of steps are described under (a) and (b) below.

In manual mode (TMTSR = H'0000), the operation under (a) is the only way of switching from the normal state.

(a) Changes by TMRR

Writing 1 to the REDUON0 bit or the REDUON bit in TMRR initiates the transition to the deceleration state (or, if TMRSR = H'0000, to the stop state).

Table 155.1.3.6 describes how operation in response to the writing of 1 to the REDUON0 bit varies with the operating state. Table 155.1.3.7 describes how operation in response to the writing of 1 to the REDUON bit varies with the operating state.

Table 155.1.3.6 Timing of Writing 1 to the REDUON0 Bit and Operation

Timing of Writing 1 to the REDUON0 Bit	Operation
Acceleration	Operation continues normally until the end of acceleration. Control then enters the normal state.
Normal	Control remains in the normal state until the pattern number becomes [0]. The transition to the deceleration state (or the stop state if TMRSR is H'0000) follows the end of this step in the normal state.
Deceleration	Writing 1 to the bit has no effect on deceleration.
Stop	TMRR is cleared to H'0000 after control has made the transition from the normal or deceleration state to the stop state. When 1 is written to the REDUON0 bit after control is in the stop state, the sequence in the next round of motor control continues until the pattern number in the normal state becomes [0]. The transition to the deceleration state (or the stop state if TMRSR is H'0000) is made at the end of this step in the normal state.

Table 155.1.3.7 Timing of Writing 1 to the REDUON Bit and Operation

Timing to Write 1 in REDUON Bit	Operation
Acceleration	Operation continues normally until the end of acceleration.
Normal	The transition to the deceleration state (or the stop state if TMRSR is H'0000) is made after a single step in the normal state.
Deceleration	Writing 1 to the bit has no effect on deceleration.
Stop	TMRR is cleared to H'0000 after control has made the transition from the normal or deceleration state to the stop state. When 1 is written to the REDUON0 bit after control is in the stop state, the sequence in the next round of motor control continues until it enters the normal state. The transition to the deceleration state (or the stop state if TMRSR is H'0000) is made at the end of a single step in the normal state.

(b) Changing the Number of Steps by Changing the Value in TMSCR

In auto mode (i.e. when TMTSR ≠ H'0000), TMSCR indicates the remaining number of steps in the current state.

When the control sequence is in the normal state, the number of steps can be changed by writing the desired number of steps. Writing is ineffective in states other than the normal state.

Do not write to this register when control is in manual mode (TMTSR = H'0000).

(5) Acquiring the Number of Steps in the Normal State

In the stop state, TMTCR can be read to acquire the number of steps in the normal state of the immediately preceding sequence.

(6) Pulse Mode

Writing H'0000 to TMASR and TMRSR selects operation in the normal state alone, with a constant step interval. That is, operation starts with the step interval defined for the normal mode and the interval does not subsequently change. This is referred to as pulse mode operation.

Examples of pulse-mode operation are described below.

(a) Single-Pulse Shifts in Pulse Mode and Auto Mode

Table 155.1.3.8 gives an example of register settings for single-pulse steps in auto mode.

Figure 155.1.3.19 is a timing chart for single-pulse shifts in auto mode. “( )” in Figure 155.1.3.19 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. “[ ]” in Figure 155.1.3.19 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the normal states set by TMMPR0 and TMMPR1.

Table 155.1.3.8 Register Settings to Select One Pulse as the Number of Steps in Auto Mode

Register Setting Value	Contents
TMASR: H'0000	No acceleration state
TMTSR: H'0001	Only one step in the normal state
TMRSR: H'0000	No deceleration state

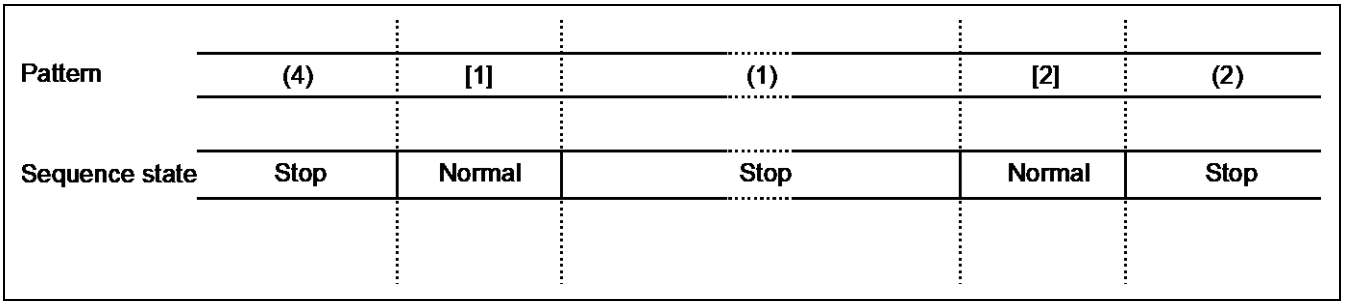

Figure 155.1.3.19 Timing of Single-Pulse Shifts in Auto Mode

(b) Single-Pulse Shifts in Pulse Mode and Manual Mode

In manual mode, setting the REDUON0 or REDUON bit in TMRR to 1 while the sequence is in the normal state enables a single pulse shift.

Table 155.1.3.9 gives an example of register settings for single-pulse steps in manual mode.

Figure 155.1.3.20 is a timing chart for single-pulse shifts in manual mode. "( )" in Figure 155.1.3.20 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. "[ ]" in Figure 155.1.3.20 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the normal states set by TMMPR0 and TMMPR1.

Table 155.1.3.9 Register Settings to Select One Pulse as the Number of Steps in Manual Mode

Register Setting Value	Contents
TMASR: H'0000	No acceleration state
TMTSR: H'0000	Looping in the normal state
TMRSR: H'0000	No deceleration state

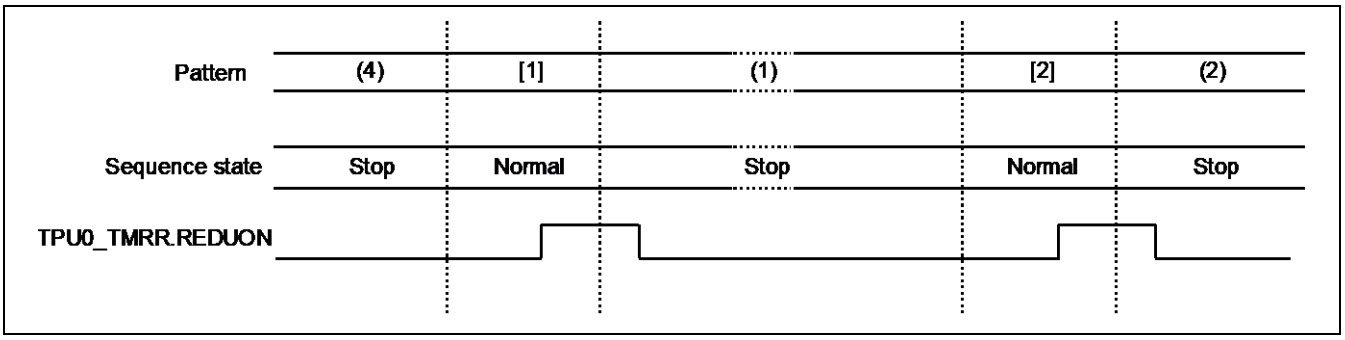

Figure 155.1.3.20 Timing of Single-Pulse Shifts in Manual Mode

(7) Interrupts

Timer 0 has six added interrupt conditions for use with stepping-motor control mode.

The interrupt conditions are described below.

(a) Detection of Overflows of Data Transferred for Motor Control

Setting the TMDOFE bit in TIER0 to 1 selects the detection of overflows of data transferred for motor control (motor control data transfer overflows). Here, overflow refers to the condition where buffer-related operation, i.e. the transfer of the data from TGRD0, is delayed; that is, when the operation TGRD0→ TGRB0 is delayed. To cancel this interrupt, write 0 to the TMDOFS bit of TSR0 after having read it as 1.

Figure 155.1.3.21 shows an example of DMA transfer where an overflow in data transfer for motor control occurs and detection of overflows has been enabled. "( )" in Figure 155.1.3.21 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. "[ ]" in Figure 155.1.3.21 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states set by TMMPR0 and TMMPR1.

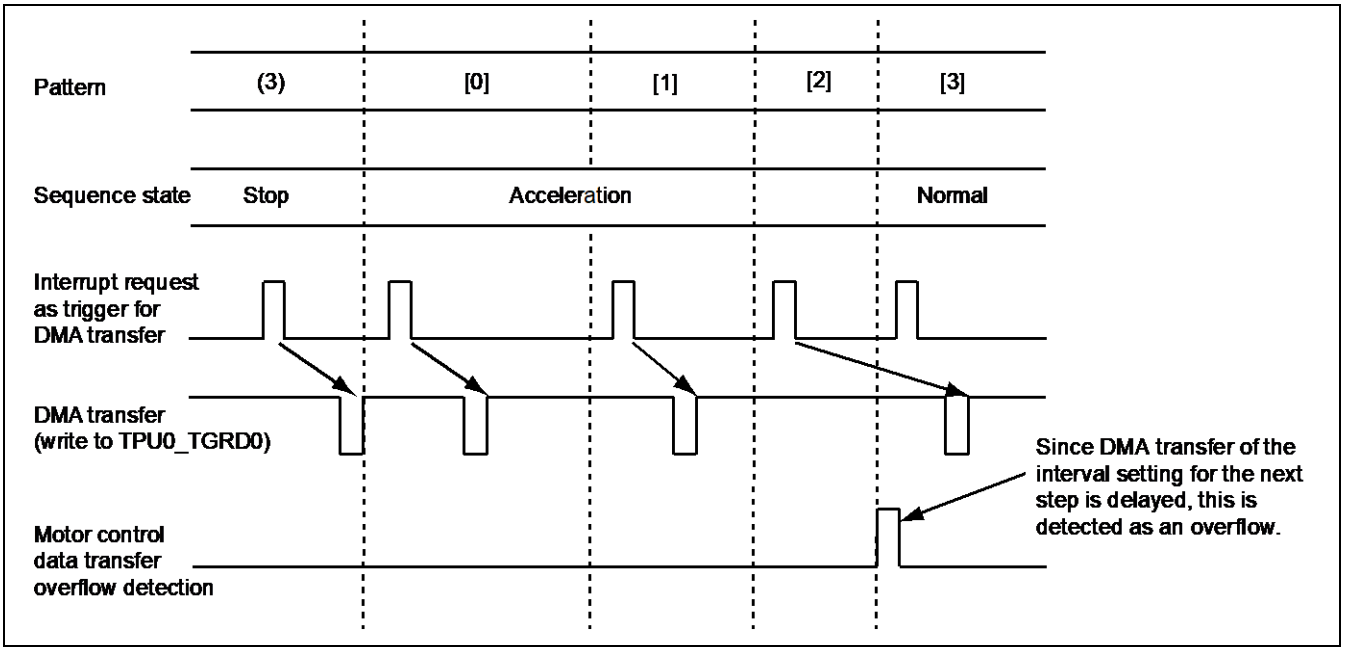

Figure 155.1.3.21 DMA Transfer with Detection of Motor Control Data Transfer Overflows Enabled

Since this interrupt is for use in the debugging of defective operation, normal operation will not be restored even if it is detected.

(b) Detection of Requirement for Transfer of Motor control Data

Detection of requirements for the transfer of motor control data (detect motor control data transfer request) is enabled by setting the TMDRFE bit of TIER0. This interrupt is generated when the next pattern interval is to be changed from the current interval. On detection of this interrupt, the handler should write the setting for the next interval to TGRD0 and then write 0 to the TMDRFS bit of TSR0 after having read it as 1.

This interrupt is not available if DMA transfer has been selected (the TDMAE bit in TMIR = 1).

See Figure 155.1.3.17 for an example of usage of this interrupt.

(c) Detecting the Transition to Deceleration

Setting the TMS1ER bit in TIER0 to 1 enables detection of the transition to deceleration. The handler should clear the TMCFR flag of TSR0 by writing 0 to the bit after having read it as 1.

(d) Detecting the Transition to the Normal State

Setting the TMS1ET bit in TIER0 to 1 enables detection of the transition to the normal state. The handler should clear the TMCFT flag of TSR0 by writing 0 to the bit after having read it as 1.

(e) Detecting the Transition to Acceleration

Setting the TMS1EA bit in TIER0 to 1 enables detection of the transition to acceleration. The handler should clear the TMCFA flag of TSR0 by writing 0 to the bit after having read it as 1.

(f) Detecting the Transition to the Stop State

Setting the TMS1ES bit in TIER0 to 1 enables detection of the transition to the stop state. The handler should clear the TMCFS flag of TSR0 by writing 0 to the bit after having read it as 1.

(8) Checking the State of Operation

Read TMSR and TMSCR to check the current state of operations. TMSCR indicates the value resulting from decrementation (on every compare match with the timer counter) from the values in the number of steps register (TMASR, TMTSR, or TMRSR) during sequence transitions.

Figure 155.1.3.22 shows how the values in TMSR and TMSCR vary through the four states. "( )" in Figure 155.1.3.22 means Stop Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the stop state set by TMSPR0 and TMSPR1. "[ ]" in Figure 155.1.3.22 means Operation Pattern outputted from TPU0TO0, TPU0TO1, TPU0TO2, and TPU0TO3 in the acceleration, normal, and deceleration states set by TMMPR0 and TMMPR1. As is shown in the figure, the current step within the overall sequence of state transitions can be estimated by, for example, reading TMSR = H'0008 and TMSCR = H'0003 in the interval indicated in the figure below.

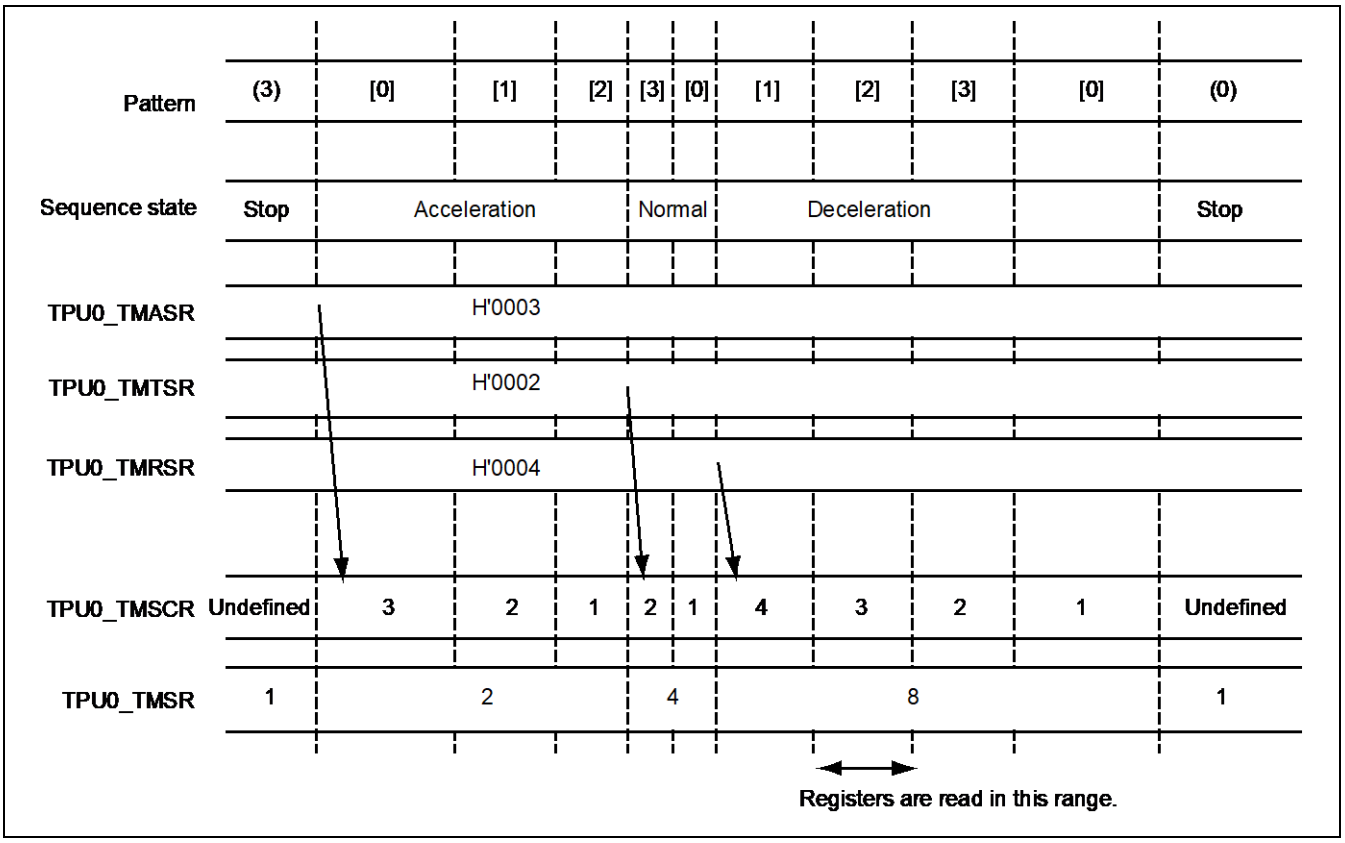

Figure 155.1.3.22 Values of TMSR and TMSCR

155.1.4 Usage Notes

No description on this section.

155.1.5 Safety Mechanisms

This module is treated as non-safety-related function in case of the products supporting functional safety. So, there is no special spec Requirement for Safety mechanisms.

155.2 Compare Match Timer Type0 (CMT0)

155.2.1 Overview

Compare Match Timer Type0 (CMT0) is a 32-bit compare match timer of two channel.

155.2.1.1 Features

- Two channels
- 16 bits/32 bits can be selected as counter size (bit-width).
- Provided with 32-bit constant registers and 32-bit up counters that can be written or read at any time.
- Following four clocks can be selected as counter clocks:
  — RCLK: 1/1, 1/8, 1/32, and 1/128
- One-shot operation or free-running operation is selectable.
- Compare match or overflow can be selected as interrupt source.
- Counter operation can be enabled or disabled at the time of debugging of CPU core using the debugging mode operation selector.

155.2.1.2 Block Diagram

Figure 155.2.1.1 shows a block diagram of the CMT0.

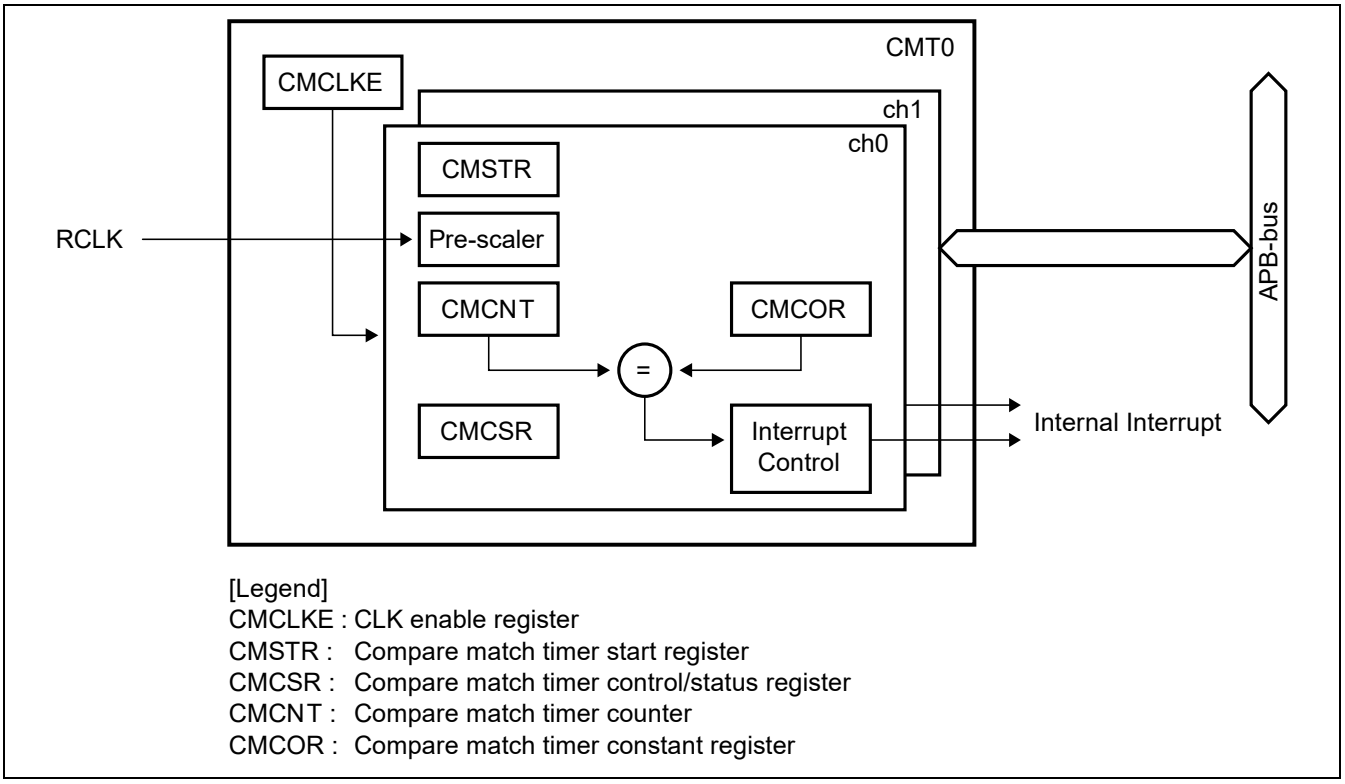

Figure 155.2.1.1 Block Diagram of CMT0

155.2.1.3 Register Configuration

Table 155.2.1.1 shows the CMT0 register configuration. Table 155.2.1.2 shows the register states in each operating mode. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

Table 155.2.1.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size	R-Car V4M
CLK enable register	CMCLKE	R/W	H'E60F 1000	32	√
Compare match timer start register 0	CMSTR0	R/W	H'E60F 0500	32	√
Compare match timer control/status register 0	CMCSR0	R/W*	H'E60F 0510	32	√
Compare match timer counter 0	CMCNT0	R/W	H'E60F 0514	32	√
Compare match timer constant register 0	CMCOR0	R/W	H'E60F 0518	32	√
Compare match timer start register 1	CMSTR1	R/W	H'E60F 0600	32	√
Compare match timer control/status register 1	CMCSR1	R/W*	H'E60F 0610	32	√

155.2.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value
R/W: Bit or field is readable and writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R: Read-only. The write value should always be initial value.
All access to register is made in longword units.

155.2.2.1 CLK Enable Register (CMCLKE)

CMCLKE is a 32-bit register, which specifies clock supply to each channel. When there are unused channels, set 0 to this register, for stop supplying clock to the channel. It is prohibited to stop clock supply, while counter is working.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 7	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
6	Ch1clke	1	R/W	0: Clock isn't supplied to ch1. 1: Clock is supplied to ch1.
5	Ch0clke	1	R/W	0: Clock isn't supplied to ch0. 1: Clock is supplied to ch0.
4 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

155.2.2.2 Compare Match Timer Start Registers 0 and 1 (CMSTR0, CMSTR1)

CMSTRn (n = 0 and 1) is a 32-bit register which specifies the operation of compare match timer counters (CMCNTn).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STR0	1	R/W	Count Start These bits specify start/halt of compare match timer counter (CMCNTn). 0: CMCNTn halts 1: CMCNTn starts counting

155.2.2.3 Compare Match Timer Control/Status Registers 0 and 1 (CMCSR0, CMCSR1)

CMCSRn (n = 0 and 1) is a 32-bit register that indicates the occurrence of compare matches, enables interrupts, and sets the counter input clocks.

Do not change bits other than the CMF and OVF bits, while compare match timer counter (CMCNTn) is under counting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	CMF	OVF	WRFLG	—	—	—	CMS	CMM	—	—	CMR[1:0]		DBGIVD	CKS[2:0]		
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	1	1	1	1
R/W:	R/WC0	R/WC0	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	CMF	0	R/WC0	Compare Match Flag This flag indicates whether values of the compare match timer counter (CMCNTn) and compare match timer constant register (CMCORn) have matched or not. Software cannot write 1 to the bit. When one-shot is selected for the counter operation, counting resumes by clearing this bit. 0: CMCNTn and CMCORn values have not matched. [Clearing condition] Write 0 to CMF 1: CMCNTn and CMCORn values have matched. Note: Only 0 can be written to clear the flag.
14	OVF	0	R/WC0	Overflow Flag This flag indicates whether the compare match timer counter (McCants) has overflowed or not. Software cannot write 1 to this bit. 0: CMCNTn has not overflowed. [Clearing condition] Write 0 to OVF 1: CMCNTn has overflowed. Note: Only 0 can be written to clear the flag.
13	WRFLG	0	R	Write State Flag Write access to CMCNTn is prohibited, while this this bit is 1. Further behavior is not guaranteed, if data is written while this bit is 1. This bit indicates CMCNTn is in synchronization period for setting previously written data. Confirm that this flag is 0, before writing to CMCNTn.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	CMS	0	R/W	Compare Match Timer Counter Size Specify whether the compare match timer counter (CMCNTn) is used as a 16-bit counter or a 32-bit counter. This bit specifies the valid size of compare match timer constant register (CMCORn). 0: Operates as a 32-bit counter. 1: Operates as a 16-bit counter. Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.
8	CMM	1	R/W	Compare Match Mode Specify counter operation mode. 0: One-shot operation 1: Free-running operation Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.
7, 6	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5, 4	CMR[1:0]	00	R/W	Compare Match Request These bits enable or disable an internal interrupt request in a compare match. 00: Disables an internal interrupt request. 01: Setting prohibited 10: Enables an internal interrupt request. 11: Setting prohibited Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.
3	DBGIVD	1	R/W	Debug Mode Operation Select Sets the counter operation in debug mode. 0: Stops the counter operation in debug mode. 1: Enables the counter operation even in debug mode. Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.
2 to 0	CKS[2:0]	111	R/W	Clock Select These bits select the input clock to CMCNTn. When the count start bit (STR0) in CMSTRn is set to 1, CMCNTn begins incrementing with the clock selected by these bits. 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: RCLK/8 101: RCLK/32 110: RCLK/128 111: RCLK/1 Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.

155.2.2.4 Compare Match Timer Counters 0 and 1 (CMCNT0, CMCNT1)

CMCNTn (n = 0 and 1) is a 32-bit register that is used as an up-counter.

To specify counter operation, set compare match timer control/status register n (CMCSRn), before starting operation of corresponding channel.

When the 16-bit counter operation is selected by the CMS bit, bits 31 to 16 of this register become invalid. When data is written to this register in 16-bit mode, write H'0000 to the upper 16 bits.

When CMCNTn is read during the counter operation, the read value may be wrong because different clock is used between counter and bus-interface. For exact value, read this register continuously, until same values are read from this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMCNT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT [31:0]	H'0000 0000	R/W	Compare match timer counter bit31 to 0 Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.

155.2.2.5 Compare Match Timer Constant Registers 0 and 1 (CMCOR0, CMCOR1)

CMCORn (n = 0 and 1) is a 32-bit register that sets the compare match period with CMCNTn.

When the 16-bit counter operation is selected by the CMS bit in CMCSRn, bits 15 to 0 of this register become valid. Write H'0000 to upper 16bits in 16-bit counter operation.

An overflow is detected when CMCNTn is cleared to 0 and this register is H'FFFF FFFF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMCOR[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCOR [31:0]	H'FFFF FFFF	R/W	Compare match timer constant register bit31 to 0 Note: Refer to section 155.2.3.5, CMT0 Register Access, for the note regarding writing to or reading from this bit.

155.2.3 Operation

155.2.3.1 Counter Operation

The CMT0 starts the operation of the counter by writing 1 to the STR0 bit in CMSTRn after each register has been set. Complete all of the settings before starting the operation. Do not change the register settings other than clearing flag bits, during the compare match timer n (CMCNTn) is under operation.

The counter operates in one of two ways.

- One-Shot Operation

  One-shot operation is selected by setting the CMM bit in CMCSRn to 0. When the value in CMCNTn matches the value in CMCORn, the value in CMCNTn is cleared to H'0000 0000 and the CMF bit in CMCSRn is set to 1. Counting by CMCNTn stops after CMCNTn has been cleared.

  Counting by CMCNTn will be resumed after CMCSRn.CMF bit has been cleared.

  To detect an overflow interrupt, set the value in CMCORn to H'FFFF FFFF. When the value in CMCNTn matches the value in CMCORn, CMCNTn is cleared to H'0000 0000 and the CMF and OVF bits in CMCSRn are set to 1.

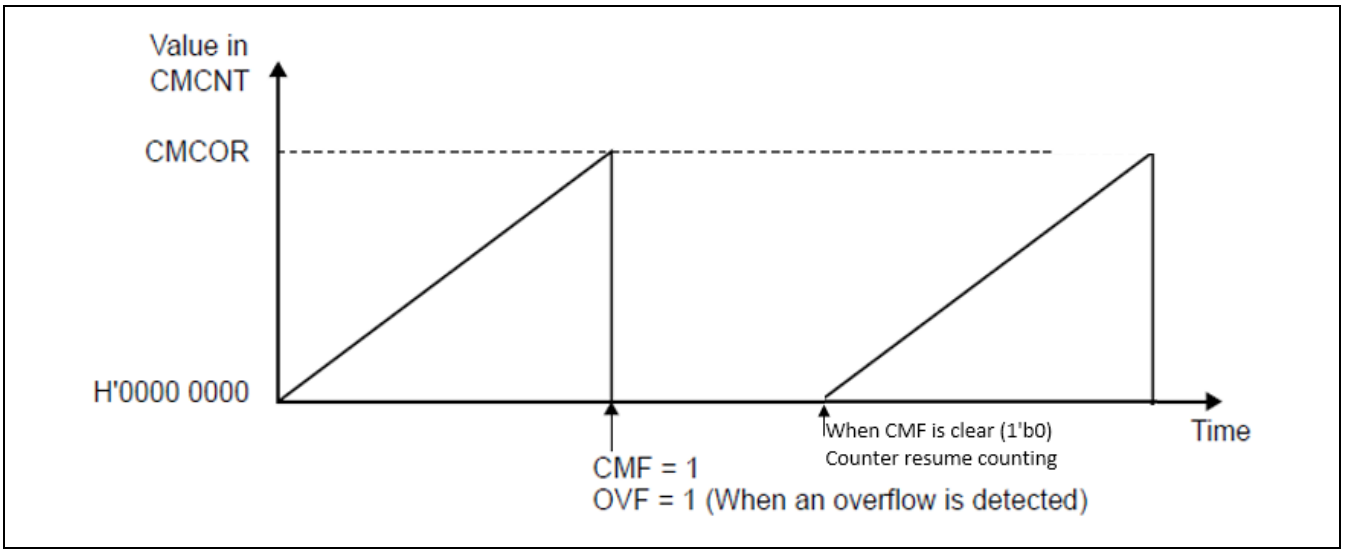

Figure 155.2.3.1 Counter Operation (One-Shot Operation)

- Free-Running Operation

  Free-running operation is selected by setting the CMM bit in CMCSRn to 1. When the value in CMCNTn matches the value in CMCORn, CMCNTn is cleared to H'0000 0000 and the CMF bit in CMCSRn is set to 1. CMCNTn resumes counting-up after it has been cleared.

  To detect an overflow interrupt, set CMCORn to H'FFFF FFFF. When the values in CMCNTn and CMCORn match, CMCNTn is cleared to H'0000 0000 and the CMF and OVF bits in CMCSRn are set to 1.

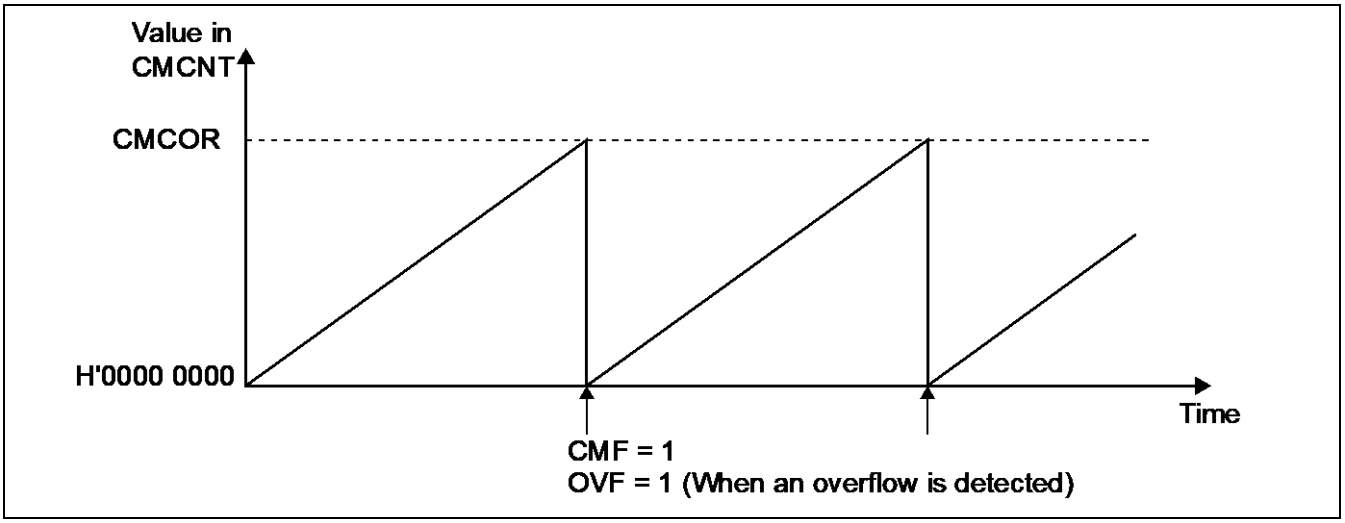

Figure 155.2.3.2 Counter Operation (Free-Running Operation)

155.2.3.2 Counter Size

In this module, the size of the counter can be selected from 16, or 32 bits. This is selected by the CMS bit in CMCSRn.

When the 16-bit size is selected, H'0000 should be used as upper 16 bits of write data to CMCORn. To detect an overflow interrupt, CMCORn must be set to H'0000 FFFF.

155.2.3.3 Timing for Counting by CMCNTn

In this module, the clock for the counter can be selected from among the following:

- RCLK: 1/1, 1/8, 1/32, and 1/128

The clock for the counter is selected by the CKS bits in CMCSRn. CMCNTn is incremented at the rising edge of the selected clock.

155.2.3.4 Internal Interrupt Request to CPU

By CMR bits in CMCSRn, internal interrupt request to the CPU at a compare match can be asserted.

To clear an internal interrupt request to the CPU in Free-Running Operation, the CMF bit should be set to 0. Set the CMF bit to 0 in the handling routine for the CMT0 interrupt.

To clear an internal interrupt request to the CPU with resuming count-up in One-Shot Operation, the CMF bit should be set to 0 while keeping 1 in STR0 bit in CMSTRn. Set the CMF bit to 0 while keeping 1 in STR0 bit in the handling routine for the CMT0 interrupt.

To clear an internal interrupt request to the CPU without resuming count-up in One-Shot Operation, the CMF bit should be set to 0 after setting STR0 bit in CMSTRn to 0. Set the CMF bit to 0 after setting STR0 bit to 0 in the handling routine for the CMT0 interrupt.

155.2.3.5 CMT0 Register Access

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK) after writing has finished. And it takes 2 cycles in counter input clock (RCLK), for reflecting written data to counter behavior.

CMCSRn: Bits CKS, CMM, CMS, CMR, DBGIVD

CMCORn: Bits 31 to 0

CMSTRn: Bit STR0

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK) after writing has finished. And it takes 2 cycles in counter input clock (RCLK), for reflecting written data to counter behavior.

And for following registers, write access is prohibited, while previously written data is under writing. Do not perform next write access, while CMCSRn.WRFLG is 1.

CMCNT*: Bits 31 to 0

155.2.3.6 Compare Match Flag Set/Clear Timing

The CMF bit in CMCSRn is set to 1 by the compare match signal generated when CMCORn and CMCNTn match. The compare match signal is generated upon the final state of the match (timing at which the CMCNTn value is updated to 0). Consequently, after CMCORn and CMCNTn match, a compare match signal will not be generated until a CMCNTn counter clock is input. Figure 155.2.3.3 shows the set timing of the CMF bit.

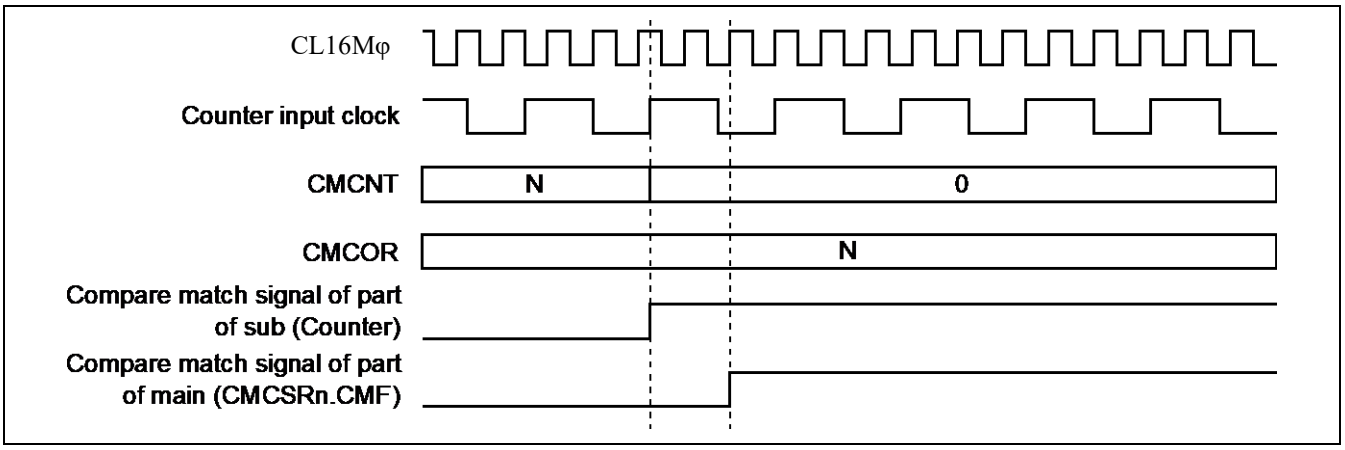

Figure 155.2.3.3 CMF Set Timing

Set the CMF bit as 0. The CMF flag is cleared immediately.

155.2.3.7 CMT0 Usage

Take the following steps to use the CMT0.

1. Clear the STR0 bit in CMSTRn to 0 to temporarily stop counting.
   (Confirm that RCLK was input more than 2 cycles.)
2. Write H'0000 0000 on CMCNTn.
3. Set counter size, compare match mode, type of counter clock and interrupt request and clear the bit of OVF and CMF in CMCSRn.
4. Set the value on CMCORn.
5. Confirm that CMCSRn.WRFLG is 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the STR0 bit in CMSTRn to 1.
   (Refer to section 155.2.3.5, CMT0 Register Access)

155.2.3.8 Module Stop/ CMCLKE Setting

When counter is not used, clock of this module can be stopped by CMCLKE register. Confirm that, following conditions are satisfied, before stopping counter's clock.

- CMSTRn.STR0 bit is 0
- CMCSRn.WRFLG is 0
- 3 or more cycles have passed in RCLK, since the last Register access

155.2.4 Usage Notes

No description on this section.

155.2.5 Safety Mechanisms

155.2.5.1 Power-On test

This module is protected by Power-On test.

155.3 Compare Match Timer Type1 (CMT1/2/3)

155.3.1 Overview

This section is written to introduce about CMT1/2/3, total include 24 channels, CMT2/3 are exactly same as CMT1, CMT1's usage are introduced here in, refer to 155.3.1.3 for CMT2/3 register address.

155.3.1.1 Features

- Eight channels
- 16 bits/32 bits/48 bits can be selected as counter size (bit-width).
- 48-bit constant registers and 48-bit up counters that can be written or read at any time.
- For channel 0 to 4, following eleven clocks can be selected as counter clock.
  - CPEXϕ: 1/8, 1/32, and 1/128
  - RCLK: 1/1, 1/8, 1/32, and 1/128
  - Pseudo 32 kHz: 1/1, 1/8, 1/32, and 1/128
- For channel 5 to 7, following four clocks can be selected as counter clock.
  - RCLK: 1/1,1/8, 1/32, and 1/128
- One-shot operation or free-running operations are selectable.
- Compare match can be used as interrupt source.
- Support Module standby mode.
- RCLK-synchronous counter start/stop mode for channel 0
- Counter operation can be enabled or disabled at the time of debugging of CPU core using the debugging mode operation selector.

155.3.1.2 Block Diagram

Figure 155.3.1.1 shows a block diagram of the CMT1.

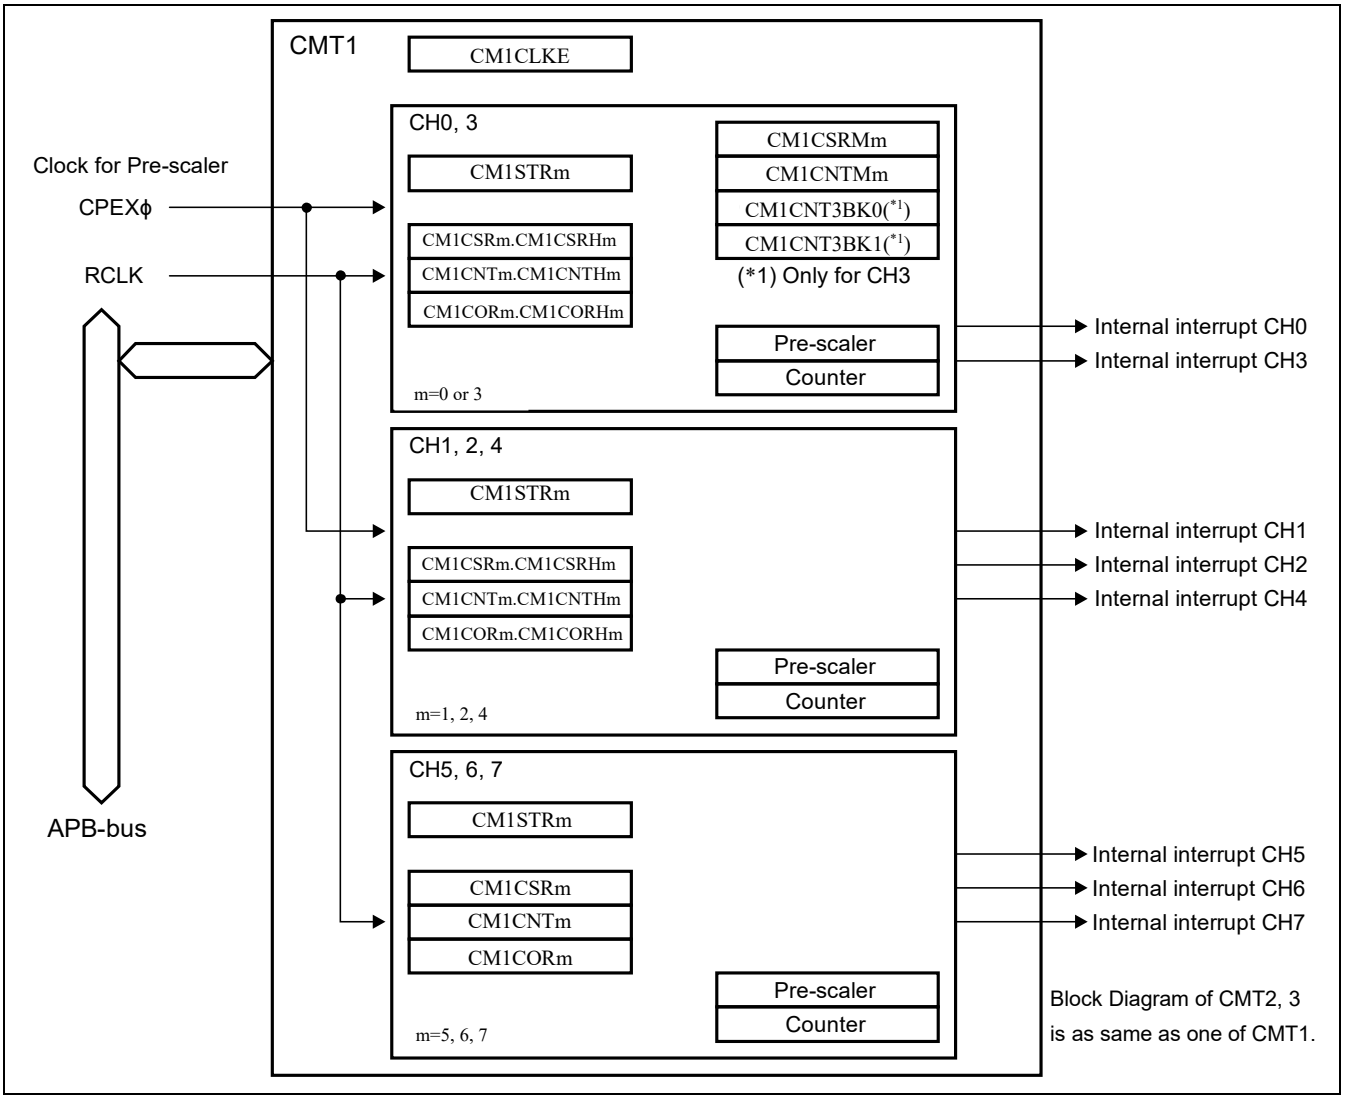

Figure 155.3.1.1 Block Diagram of CMT1/2/3

155.3.1.3 Register Configuration

Table 155.3.1.1 shows the CMT1/2/3 register configuration.Table 155.3.1.2 shows the register states in each operating mode. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

155.3.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be initial value.

All access to register is made in longword units.

155.3.2.1 CLK Enable Register n (CMnCLKE) (n = 1 to 3)

CMnCLKE is a 32bits register, which specify clock supply to each channel. When there are unused channels, set ‘0’ as this register, to stop supplying clock to the channel. It is prohibited to stop clock supply, while counter is working.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

155.3.2.2 Compare Match Timer n Start Register m (CMnSTRm) (n = 1 to 3) (m = 0 to 7)

CMnSTRm (n = 1 to 3) (m = 0 to 7) is a 32-bit register which specify the operation of compare match timer counter (CMnCNTm). Refer to section 155.3.3.5, Register Access, for register value update timing.

(1) CMnSTR0 (n = 1 to 3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

155.3.2.3 Compare Match Timer Control/Status n Register m (CMnCSRm) (n = 1 to 3) (m = 0 to 7)

CMnCSRm (n = 1 to 3) (m = 0 to 7) is a 32-bit register that indicates the occurrence of compare match, enable interrupt and set the counter input clock.

Do not change bits other than the CMF and OVF bits, while compare match timer counter (CMnCNTm) is under counting.

Note: * Refer to section 155.3.3.5, Register Access, for the note regarding writing to or reading form the following bits.

- CMnCSR0.CH0SSIE
- CMnCSRm.CMS
- CMnCSRm.CMM
- CMnCSRm.CMR [1:0]
- CMnCSRm.DBGIVD
- CMnCSRm.CKS [2:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	CMF	0	R/WC0	Compare Match Flag This flag indicates whether values of the compare match timer counter (CMnCNT0) and compare match timer constant register (CMnCOR0) have matched or not. Software cannot write 1 to the bit. When one-shot is selected for the counter operation, counting resumes by clearing this bit. 0: CMnCNT0 and CMnCOR0 values have not matched [Clearing conditions] • Write 0 to this bit 1: CMnCNT0 and CMnCOR0 values have matched Note: Only 0 can be written to clear the flag.
14	OVF	0	R/WC0	Overflow Flag This flag indicates whether the compare match timer counter (CMnCNT0) has overflowed or not. Software cannot write 1 to this bit. 0: CMnCNT0 has not overflowed [Clearing conditions] • Write 0 to this bit 1: CMnCNT0 has overflowed Note: Only 0 can be written to clear the flag.
13	WRFLG	0	R	Write State Flag Write access to CMnCNT0 is prohibited, while this bit is 1. Further behavior is not guaranteed, if data is written while this bit is 1. This bit indicates CMnCNT0 is in synchronization period for setting previously written data. Confirm that this flag is 0, before writing to CMnCNT0.
12	CH0STTF	0	R/WC0	Channel 0 Start Flag When RCLK-synchronous channel 0 counter start/stop mode is selected, this flag indicates whether the counter in channel 0 started on detecting an RCLK rising edge after 1 was written to the STR0 bit in CMnSTR0. 0: Channel 0 counter has not started. [Clearing condition] • Write 0 to CH0STTF. 1: Channel 0 counter has started. Note: Only 0 can be written to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
11	CH0STPF	0	R/WC0	Channel 0 Stop Flag When RCLK-synchronous channel 0 counter start/stop mode is selected, this flag indicates whether the counter in channel 0 stopped on detecting an RCLK rising edge after 1 was written to the STR0 bit in CMnSTR0. 0: Channel 0 counter has not stopped. [Clearing condition] • Write 0 to CH0STPF. 1: Channel 0 counter has stopped. Note: Only 0 can be written to clear the flag.
10	CH0SSIE	0	R/W	Channel 0 Start/Stop Interrupt Enable When RCLK-synchronous channel 0 counter start/stop mode is selected, this bit enables or disables an interrupt due to the start or stop of the counter in channel 0. 0: Disables an interrupt due to start or stop of channel 0 counter. 1: Enables an interrupt due to start or stop of channel 0 counter.
9	CMS	0	R/W	Compare Match Timer Counter Size This bit and CMnCSRH0.CMSH select whether the compare match timer counter 0 (CMnCNTH0 [15:0], and CMnCNT0 [31:0]) is used as a 16-bit counter, a 32-bit counter, or a 48-bit counter. This bit also specifies valid size of the compare match timer constant register 0 (CMnCORH0 [15:0], and CMnCOR0 [31:0]). CMnCSRH0[9].CMSH, and CMnCSR0[9].CMS: 1x: Operates as a 48-bit counter 00: Operates as a 32-bit counter 01: Operates as a 16-bit counter
8	CMM	1	R/W	Compare Match Mode Specify operation mode of the counter. 0: One-shot operation 1: Free-running operation
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5, 4	CMR[1:0]	00	R/W	Compare Match Request These bits enable or disable internal interrupt request in a compare match. 00: Disables internal interrupt request 01: Setting prohibited 10: Enables an internal interrupt request 11: Setting prohibited
3	DBGIVD	1	R/W	Debug Mode Operation Select Sets the counter operation in debugging mode. 0: Stops the counter operation in debugging mode. 1: Continues the counter operation even in debugging mode.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CKS[2:0]	111	R/W	Clock Select These bits and CMnCSRH0.CKSH select the clock input to CMnCNT0. 155.3.2.5 Compare Match Timer n Counter m (CMnCNTm) (n = 1 to 3) (m = 0 to 7)

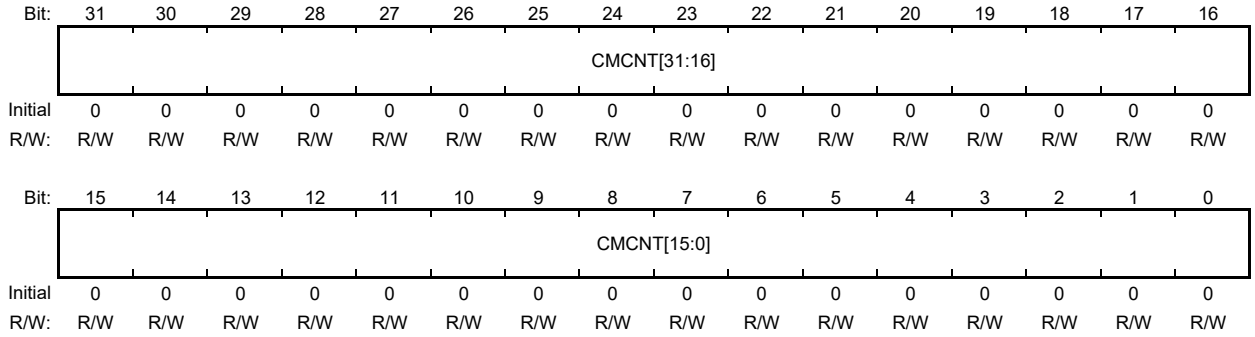
CMnCNTm (n = 1 to 3) (m = 0 to 7) is a 32-bit register which is used as an up-counter of each channel.

To specify counter operation, set compare match timer control/status register n (CMnCSRm), before starting operation of corresponding channel. When the 16-bit counter operation is selected by the CMnCSRHm.CMSH and CMnCSRm.CMS bits, bits 31 to 16 of this register is invalid. When data is written to this register in 16-bit mode, write H'0000 to the upper 16 bit.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT [31:0]	All 0	R/W	Compare match timer counter bit31 to 0 Note: For access to this register, refer to section 155.3.3.5, Register Access.

155.3.2.6 Compare Match Timer n Counter H m (CMnCNTHm) (n = 1 to 3) (m = 0 to 4)

CMnCNTHm (n = 1 to 3) (m = 0 to 4) is a 32-bit register which is used as an up-counter for channel0 to 4.

To specify counter operation, set compare match timer control/status register n (CMnCSRm/CMnCSRHm), before starting operation of corresponding channel. When the 48-bit counter operation is selected by the CMnCSRHm.CMSH and CMnCSRm.CMS bits, bits 15 to 0 of this register become valid as the upper 16-bit of 48-bit counter. The value written to this register is reflected to counter behavior, when lower data is written to CMnCNTm. Write the upper data to this register first. The value is not reflected to counter's behavior, if data is not written to CMnCNTm later.

When reading the value of 48-bit counter, upper 16-bit can be read out by reading bits 15 to 0 of this register. At the same time of the reading, the value of 48-bit counter is stored to the read-buffer. After reading CMnCNTHm, lower 32-bit can be read out by reading CMnCNTm.

Note: If CMnCNTm is read out before reading CMnCNTHm, the read out value of 48-bit counter may not be correct.

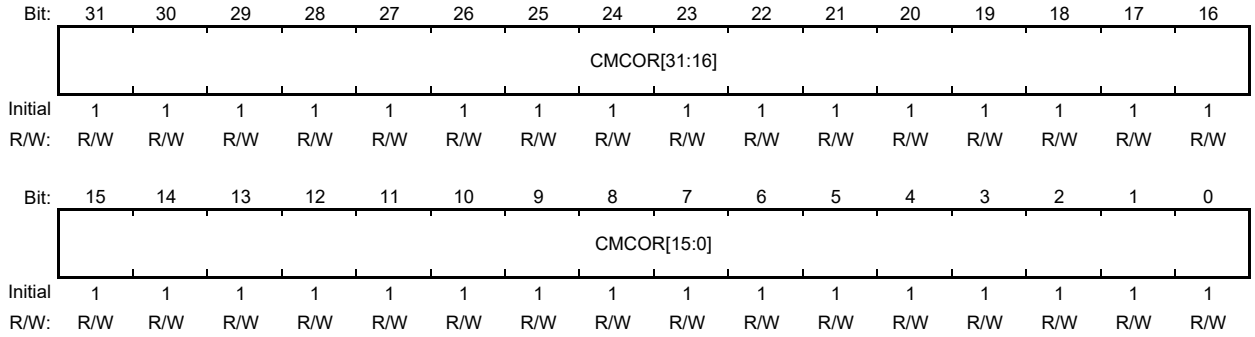
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	CMCNTH [15:0]	All 0	R/W	Compare match timer counter H bit15 to 0 Note: For access to this register, refer to section 155.3.3.5, Register Access.

155.3.2.7 Compare Match Timer n Constant Register m (CMnCORm) (n = 1 to 3) (m = 0 to 7)

CMnCORm is a 32-bit register which specify the compare match period of CMnCNTm for each channel.

When the 16-bit counter operation is selected by the CMnCSRHm.CMSH and CMnCSRm.CMS bits, bits 31 to 16 of this register is invalid. When data is written to this register in 16-bit operation mode, write H'0000 as upper 16bit.

An overflow is detected when CMnCNTm is cleared to 0 and this register is H'FFFF FFFF (when the 16-bit counter operation it is H’0000 FFFF).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCOR [31:0]	All 1	R/W	Compare match timer constant register bit31 to 0 Note: For access to this register, refer to section 155.3.3.5, Register Access.

155.3.2.8 Compare Match Timer n Constant Registers H m (CMnCORHm) (n = 1 to 3) (m = 0 to 4)

CMnCORHm is a 32-bit register which specify the compare match period with CMnCNTHm for channel0 to 4.

When the 48-bit counter operation is selected by the CMnCSRHm.CMSH and CMnCSRm.CMS bits, bits 15 to 0 of this register become valid as the upper 16-bit of 48-bit counter.

An overflow is detected when CMnCNTHm is cleared to 0 and this register is H'FFFF.

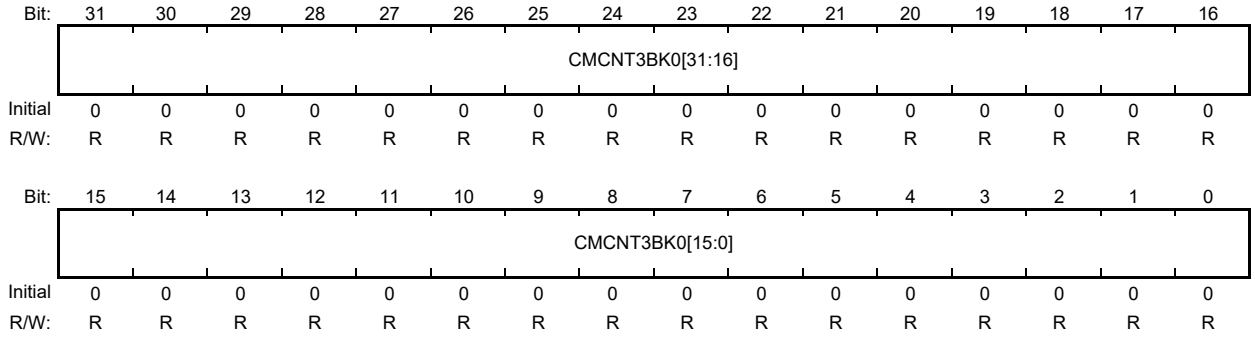
155.3.2.9 Compare Match Timer n Counter 3 Backup 0 (CMnCNT3BK0) (n = 1 to 3)

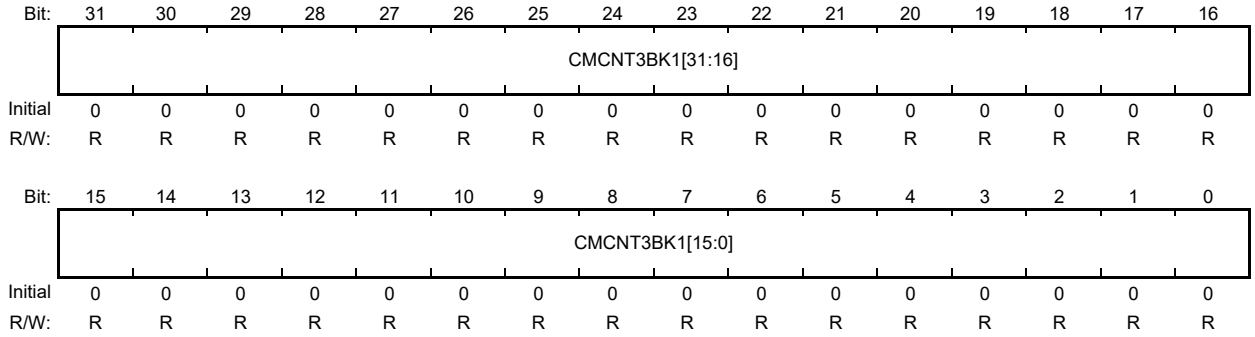
CMnCNT3BK0 is a 32-bit register which stores a copy of the CMnCNT3 value immediately after the counter in channel 0 stops in RCLK-synchronous channel 0 counter start/stop mode.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT3BK 0[31:0]	All 0	R	Compare match timer counter 3 backup 0 bit31 to 0

155.3.2.10 Compare Match Timer n Counter 3 Backup 1 (CMnCNT3BK1) (n = 1 to 3)

CMnCNT3BK1 is a 32-bit register which stores a copy of the CMnCNT3 value immediately after the counter in channel 0 starts in RCLK-synchronous channel 0 counter start/stop mode.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNT3BK 1[31:0]	All 0	R	Compare match timer counter 3 backup 1 bit31 to 0

155.3.2.11 Compare Match Timer n Match Control/Status Register m (CMnCSRMm) (n = 1 to 3) (m = 0 and 3)

CMnCSRMm is a 32-bit register which resets to compare match timer match counter, and sets the counter start/halt. This register is only present in channels 0 and 3.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

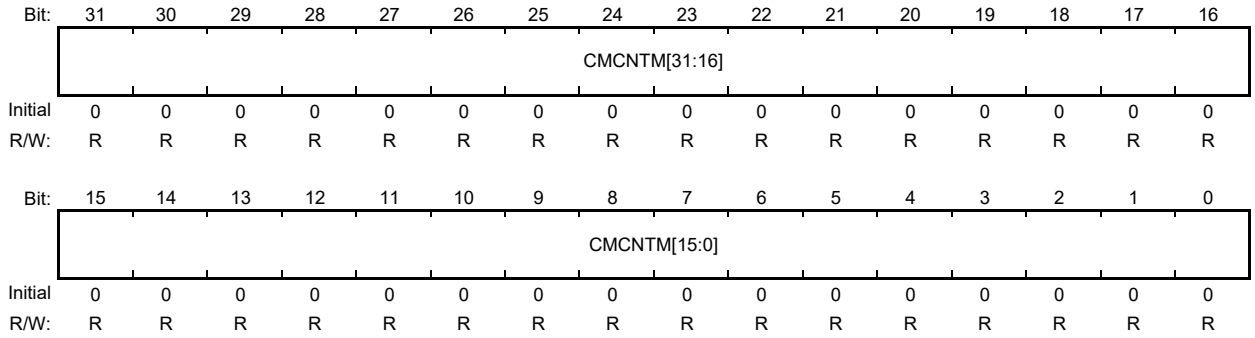
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	WRFLG	0	R	Write state flag. When this Bit is 1, CMnCNTMm cannot be cleared. After CMnCNTMm is cleared, this bit become 1 for a while (*), for indicating synchronization period. Needs to confirm this flag is 0 or wait the period enough when continuously clearing. Note: * In the maximum, "Counter input clock 6 cycle " • Counter input clock CMnCSRm.CKS2 = 0: CPEXϕ CMnCSRm.CKS2 = 1: RCLK
14 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CMPCLR	0	R/W	Counter Clear [When writing] 0: No operation 1: Clears counter When CMPCLR and CMPSTART are written 1 at the same time, the counter starts after clearing the counter. [When reading] This bit is always read as 0.
0	CMPSTART	0	R/W	Count Start This bit specifies start/halt of the compare match timer match counter (CMnCNTMm) of each channel. 0: CMnCNTMm Halts 1: CMnCNTMm Starts counting

155.3.2.12 Compare Match Timer n Match Counter m (CMnCNTMm) (n = 1 to 3) (m = 0 and 3)

CMnCNTMm is a 32-bit register which is used as an up-counter. This register is only present in channels 0 and 3.

A counter operation is set by the compare match timer match control/status register (CMnCSRMm). After the counter CMnCNTm starts, this counter increases whenever at a compare match.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMCNTM [31:0]	All 0	R	Compare match timer match counter bit31 to 0

155.3.3 Operation

155.3.3.1 Counter Operation

The CMT1 starts the operation of the counter by writing H'1 to the STR0 bit in CMnSTRm after each register has been set. Complete all of the settings before starting the operation. Do not change the register settings other than clearing flag bits, while the compare match timer (CMnCNTm) is under operation.

The counter operates in one of two ways.

- One-Shot Operation

  One-shot operation is selected by setting the CMM bit in CMnCSRm to H'0. When the value in CMnCNTm matches the value in CMnCORm, the value in CMnCNTm is cleared to H'0000 0000 and the CMF bit in CMnCSRm is set to H'1. Counting by CMnCNTm stops after CMnCNTm has been cleared.

  Counting by CMnCNTm will be resumed after CMnCSRm.CMF bit has been cleared.

  To detect an overflow interrupt, set the value in CMnCORm to H'FFFF FFFF. When the value in CMnCNTm matches the value in CMnCORm, CMnCNTm is cleared to H'0000 0000 and the CMF and OVF bits in CMnCSRm are set to H'1.

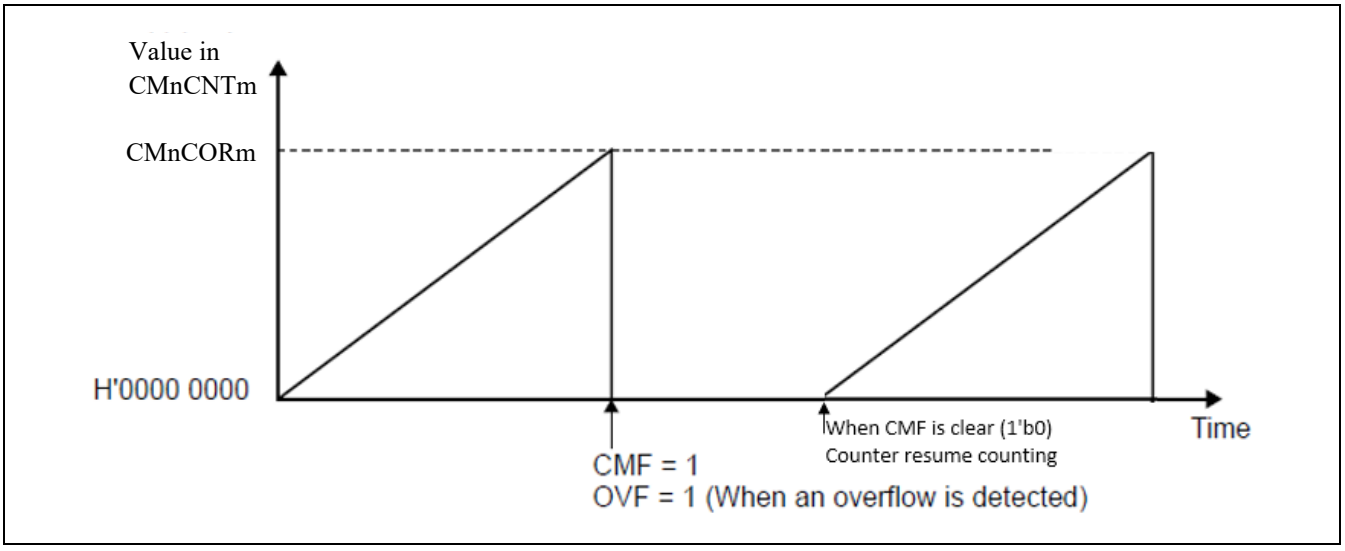


Figure 155.3.3.1 Counter Operation (One-Shot Operation)

- Free-Running Operation

  Free-running operation is selected by setting the CMM bit in CMnCSRm to H'1. When the value in CMnCNTm matches the value in CMnCORm, CMnCNTm is cleared to H'0000 0000 and the CMF bit in CMnCSRm is set to H'1. CMnCNTm resumes counting-up after it has been cleared.

  To detect an overflow interrupt, set CMnCORm to H'FFFF FFFF. When the values in CMnCNTm and CMnCORm match, CMnCNTm is cleared to H'0000 0000 and the CMF and OVF bits in CMnCSRm are set to H'1.

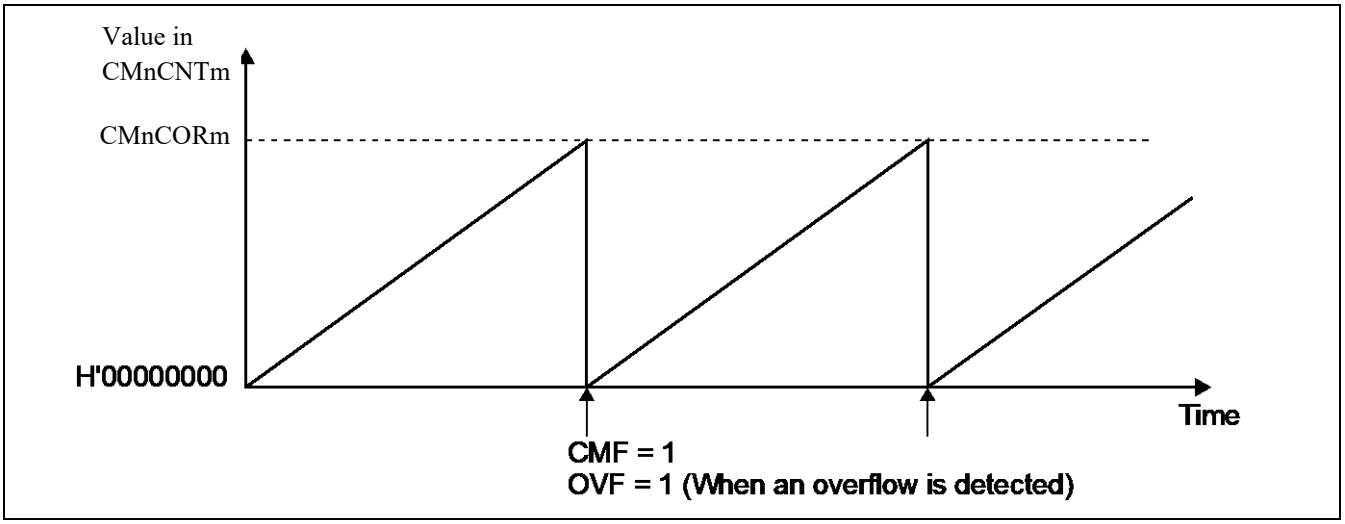

Figure 155.3.3.2 Counter Operation (Free-Running Operation)

155.3.3.2 Counter Size

In this module, the size of the counter can be selected from 16, 32, or 48 bits. This is selected by the CMS bit in CMnCSRm and CMSH bit in CMnCSRHm.

When the 16-bit/32-bit size is selected, upper 32 bits/16 bits of CMnCORm is ignored. To detect an overflow interrupt, the value 1 must be set to valid bits of CMnCORm.

(for example, H'0000 0000 FFFF, H'0000 FFFF FFFF)

155.3.3.3 Timing for Counting by CMnCNTm

In this module, the clock for the counter can be selected from among the following:

Channels 0 to 4:	CPEXϕ clock:	1/8, 1/32, and 1/128
	RCLK:	1/1, 1/8, 1/32, and 1/128
	Pseudo 32-kHz:	1/1, 1/8, 1/32 and 1/128
Channel 5 to 7:	RCLK:	1/1, 1/8, 1/32, and 1/128

For details of CPEXϕ and RCLK, refer to section 8, Clock Pulse Generator (CPG).

Pseudo 32-kHz is a clock, which is generated inside this module. Refer to section 155.3.3.8, Pseudo 32-kHz Counter.

The clock for the counter is selected by the CKS bits in CMnCSRm and CKSH bit in CMnCSRHm. CMnCNTm is incremented at the rising edge of the selected clock.

155.3.3.4 Internal Interrupt Request to CPU

By CMR bits in CMnCSRm, internal interrupt request to the CPU at a compare match can be asserted.

To clear an internal interrupt request to the CPU in Free-Running Operation, the CMF bit should be set to H'0. Set the CMF bit to H'0 in the handling routine for the CMTn interrupt.

To clear an internal interrupt request to the CPU with resuming count-up in One-Shot Operation, the CMF bit should be set to H'0 while keeping H'1 in STR0 bit in CMnSTRm. Set the CMF bit to H'0 while keeping H'1 in STR0 bit in the handling routine for the CMTn interrupt.

To clear an internal interrupt request to the CPU without resuming count-up in One-Shot Operation, the CMF bit should be set to H'0 after setting STR0 bit in CMnSTRm to H'0. Set the CMF bit to H'0 after setting STR0 bit to H'0 in the handling routine for the CMTn interrupt.

155.3.3.5 Register Access

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK) after writing has finished. And it takes 2 cycles in counter input clock (RCLK), for reflecting written data to counter behavior.

- CMnCSRm: Bits CH0SSIE(ch0), CMS, CMM, CMR[1:0], DBGIVD, CKS[2:0]
- CMnCORm, CMnCORHm
- CMnSTRm: Bit STR0RS, STR0
- CMnCSRMm: Bit CMPCLR, CMPSTART

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK or CPEXϕ) after writing has finished. And it takes 2 cycles in counter input clock (RCLK or CPEXϕ), for reflecting written data to counter behavior. After writing data to this register, next write access is prohibited, until CMnCSRm.WRFLG become 0.

- CMnCNTm, CMnCNTHm

155.3.3.6 Compare Match Flag Set/Clear Timing

The CMF bit in CMnCSRm is set to 1 by the compare match signal generated when CMnCORm and CMnCNTm match. The compare match signal is generated upon the final state of the match (timing at which the CMnCNTm value is updated to H'0000). Consequently, after CMnCORm and CMnCNTm match, a compare match signal will not be generated until a CMnCNTm counter clock is input. Figure 155.3.3.3 shows the set timing of the CMF bit.

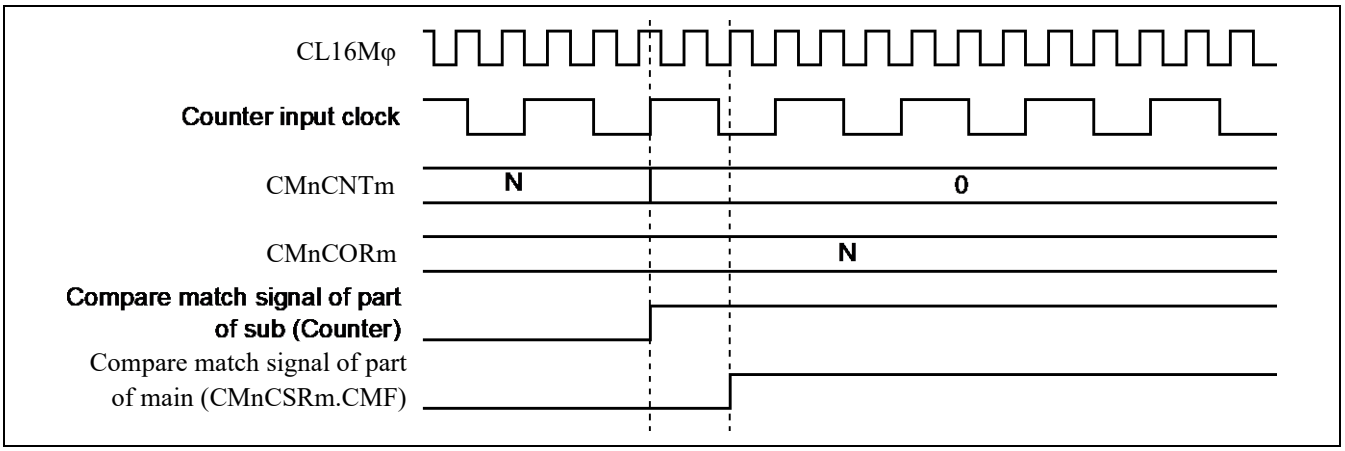

Figure 155.3.3.3 CMF Set Timing

Set the CMF bit to 0. The CMF flag is cleared immediately.

155.3.3.7 RCLK-Synchronous Counter Start/Stop Mode in Channel 0

The CMT1 provides the RCLK-synchronous counter start/stop mode in channel 0, in which channels 0 and 3 can be used together for time measurement.

Figure 155.3.3.4 shows a flow chart for preparation.

Figure 155.3.3.5 shows a flow chart for starting measurement.

Figure 155.3.3.6 shows a flow chart for stopping measurement.

Figure 155.3.3.7 shows a timing chart when measurement starts.

Figure 155.3.3.8 shows a timing chart when measurement stops.

Figure 155.3.3.9 shows how to calculate the time measured by the counters.

(((2) - (1)) + ((6) - (4) - 1)) × Tapc + ((5) - (3)) × Tr
Tapc : Cycle of main clock 1/2
Tr : Cycle of RCLK

Figure 155.3.3.9 Calculation of Time Measured by Counters

155.3.3.8 Pseudo 32-kHz Counter

Pseudo 32-kHz clock is created inside this module, based on RCLK by Pseudo 32-kHz Counter. By removing 3 edge of RCLK every 128 cycle, Pseudo 32-kHz clock is generated. By this edge removing, frequency of this clock becomes 128/131 of RCLK.

155.3.3.9 CMT1 Usage

Take the following steps to use the CMT1.

1. Clear the STR0 bit in CMnSTRm to 0 to temporarily stop counting.
   (Confirm that Counter input clock was input more than 2 cycles.)
2. Write H'0000 0000 on CMnCNTm.
3. Set counter size, compare match mode, kind of count clock and interrupt request and clear the bit of OVF and CMF in CMnCSRm.
4. Set the value on CMnCORm.
5. Confirm that CMnCSRm.WRFLG is 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the STR0 bit in CMnSTRm to 1 (refer to section 155.3.3.5, Register Access).

155.3.3.10 Module Stop/ CMnCLKE Setting

When counter is not used, clock of this module can be stopped by CMnCLKE register. Confirm that, following conditions are satisfied, before stopping counter’s clock.

- CMnSTRm.STR0 bit is 0
- CMnCSRm.WRFLG is 0
- 3 or more cycles have passed in Counter input clock since the last Register access

155.3.4 Usage Notes

No description on this section.

155.3.5 Safety Mechanisms

155.3.5.1 Power-On test

This module is protected by Power-On test.

155.4 Timer Unit (TMU)

155.4.1 Overview

This LSI includes a 32-bit timer unit (TMU) with 15 channels (channels 0 to 14).
Channels 0 to 2, 3 to 5, 6 to 8, 9 to 11 and 12 to 14 are grouped into timers 0, 1, 2, 3, 4 respectively.
For channels 0 to 2, SASYNCRTΦ is provided as a base clock. For channels 3 to 14, SASYNCPERD2Φ is provided.

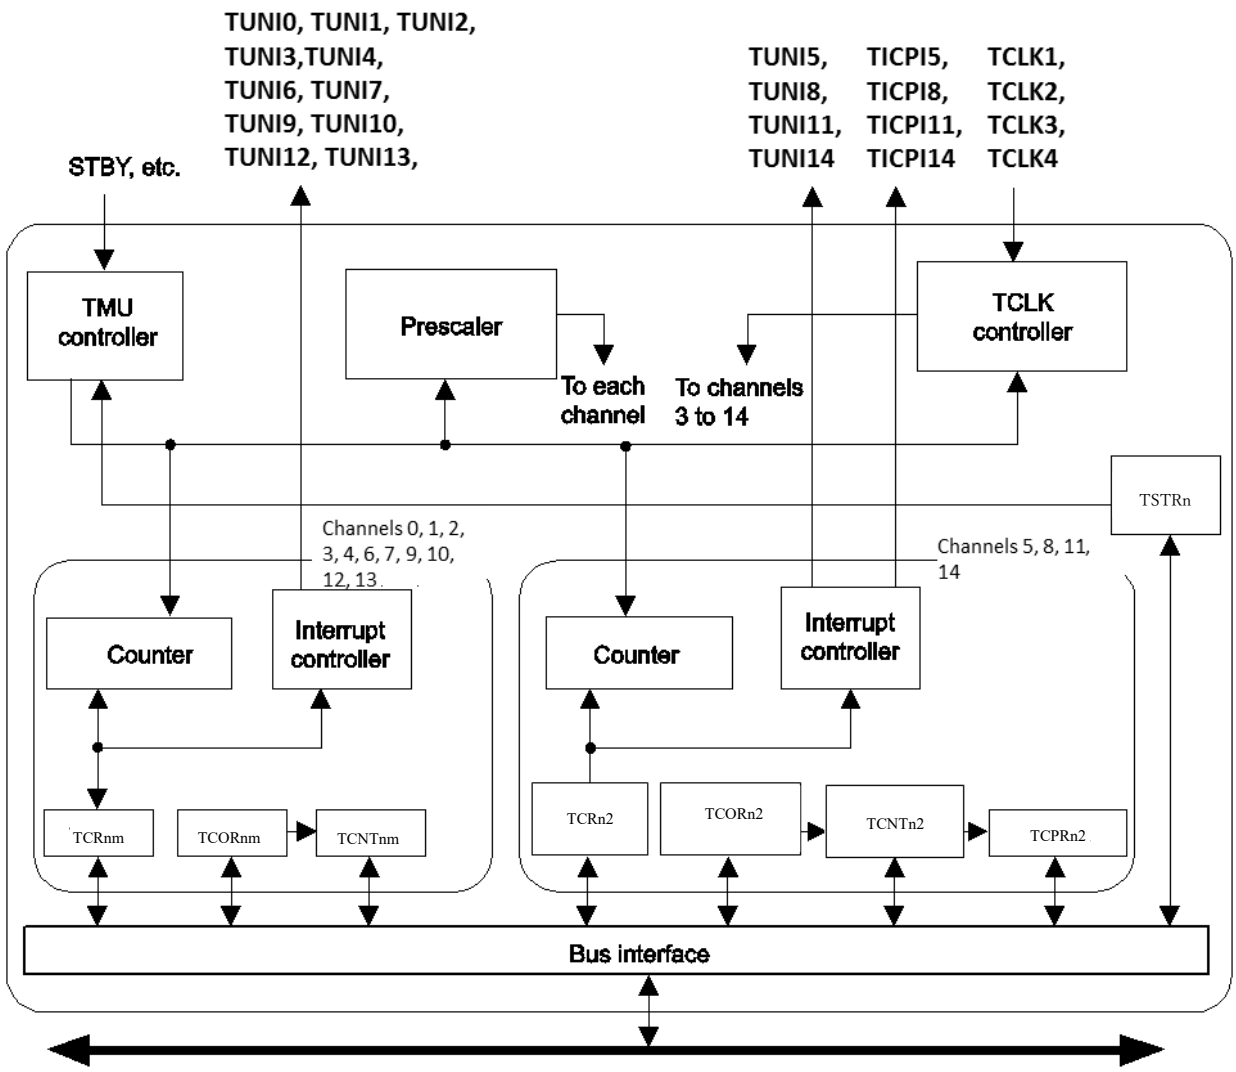
155.4.1.1 Features

TMU has the following features:

- Auto-reload type 32-bit down counter is provided for each channel.
- Input capture function provided: Channels 5, 8, 11 and 14.
- Selection of rising edge or falling edge as external clock input edge when external clock is selected or input capture function is used: Channels 3 to 14
- 32-bit timer constant register for auto-reload use, readable/writable at any time, and 32-bit down-counter are provided for each channel.
- Selection of five counter input clocks: Channels 0 to 2.
  Five peripheral clocks (SASYNCRTΦ/4, SASYNCRTΦ/16, SASYNCRTΦ/64, SASYNCRTΦ/256, and SASYNCRTΦ/1024).
- Selection of six counter input clocks: Channels 3 to 5.
  External clock (TCLK1), and five peripheral clocks (SASYNCPERD2Φ/4, SASYNCPERD2Φ/16, SASYNCPERD2Φ/64, SASYNCPERD2Φ/256, and SASYNCPERD2Φ/1024).
- Selection of six counter input clocks: Channels 6 to 8.
- External clock (TCLK2), and five peripheral clocks (SASYNCPERD2Φ/4, SASYNCPERD2Φ/16, SASYNCPERD2Φ/64, SASYNCPERD2Φ/256, and SASYNCPERD2Φ/1024).
- Selection of six counter input clocks: Channels 9 to 11.
  External clock (TCLK3), and five peripheral clocks (SASYNCPERD2Φ/4, SASYNCPERD2Φ/16, SASYNCPERD2Φ/64, SASYNCPERD2Φ/256, and SASYNCPERD2Φ/1024).
- Selection of six counter input clocks: Channels 12 to 14.
  External clock (TCLK4), and five peripheral clocks (SASYNCPERD2Φ/4, SASYNCPERD2Φ/16, SASYNCPERD2Φ/64, SASYNCPERD2Φ/256, and SASYNCPERD2Φ/1024).
- Two interrupt sources.
  One underflow source (each channel) and one input capture source (channels 5, 8, 11 and 14).

155.4.1.2 Block Diagram

Figure 155.4.1.1 shows block diagrams of TMU.



[Legend]
TSTRn: Timer start register n
TCORnm: Timer constant register n m
TCNTnm: Timer counter n m
TCRnm: Timer control register n m
TCPRnm: Input capture register n m (channels 5, 8, 11 and 14 only)

Figure 155.4.1.1 Block Diagram of TMU

155.4.1.3 External Pins

Table 155.4.1.1 shows the pin configuration of the TMU.

Table 155.4.1.1 Pin Configuration

Name	Abbreviation	I/O	Function	R-Car V4M
Clock input 1	TCLK1	Input	External clock input pin for channels 3 to 5. Input capture control input pin for channel 5.	√
Clock input 2	TCLK2	Input	External clock input pin for channels 6 to 8. Input capture control input pin for channel 8.	√
Clock input 3	TCLK3	Input	External clock input pin for channels 9 to 11. Input capture control input pin for channel 11.	√
Clock input 4	TCLK4	Input	External clock input pin for channels 12 to 14. Input capture control input pin for channel 14.	√

155.4.1.4 Register Configuration

The TMU has the following registers. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

Table 155.4.1.2 Register Configurations

Channel	Name	Abbreviation	R/W	Address	Size	Power-on Reset/ Software Reset	Module Standby

155.4.2 Register Description

Registers in the TMU are allocated to and arranged in the address space of the internal bus.

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. When the bit is reserved, the write value should always be 0. Writing 1 to these bits can cause a malfunction of TMU.

—/W: Write-only. The read value is undefined.

155.4.2.1 Timer Start Registers (TSTRn) (n = 0 to 4)

TSTRn are 8-bit readable/writable registers that select whether to run or halt the TCNTnm.

- (TSTR0)

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	STR02	STR01	STR00

1	STR41	0	R/W	Counter Start 41 Selects whether to run or halt TCNT41. 0: TCNT41 count halted 1: TCNT41 counts
0	STR40	0	R/W	Counter Start 40 Selects whether to run or halt TCNT40. 0: TCNT40 count halted 1: TCNT40 counts

155.4.2.2 Timer Constant Register n m (TCORnm) (n = 0 to 4) (m = 0 to 2)

TCORnm are 32-bit readable/writable registers. After underflow has been generated according to the result of the TCNTnm countdown, the value of TCORnm is set to TCNTnm and TCNTnm continues countdown from the value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCORnm(n = 0 to 4)(m = 0 to 2)[31:16]

155.4.2.3 Timer Counter n m (TCNTnm) (n = 0 to 4) (m = 0 to 2)

TCNTnm are 32-bit readable/writable registers that count down upon the input clock selected using the bits TPSC2 to TPSC0 in TCRnm.

When a TCNTnm countdown results in an underflow, the UNF in TCRnm of corresponding channel is set. At the same time, the value of TCORnm is set to TCNTnm and TCNTnm continues countdown from that value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TCNTnm(n = 0 to 4)(m = 0 to 2)[31:16]

155.4.2.4 Timer Control Register n m (TCRnm) (n = 0 to 4) (m = 0 to 2)

TCRnm are 16-bit readable/writable registers that select a count clock and edge when an external clock is selected, and control an interrupt generation when the flag that indicates the generation of a TCNTnm is set to 1.

TCRn2 of channels 5, 8, 11 and 14 control the input capture function and generation of an interrupt during the input capture.

- Bit assgiment for non input capture function

	—	—	—	—	—	—	ICPF	UNF	ICPE		UNIE	CKEG		TPSC		
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	ICPF*1	0	R/W*3	Input Capture Interrupt Flag Status flag, provided in channels 5 and 8, 11, 14 only, which indicates the occurrence of input capture. 0: No input capture has occurred [Clearing condition] When 0 is written to ICPF 1: Input capture has occurred [Setting condition] When an input capture occurs*2
8	UNF	0	R/W	Underflow Flag Status flag which indicates the occurrence of a TCNTnm underflow. 0: TCNTnm has not underflowed [Clearing condition] When 0 is written to UNF 1: TCNTnm has underflowed [Setting condition] When TCNTnm underflows*2
7, 6	ICPE*1	00	R/W*3	Input Capture Control A function of channels 5, 8, 11, 14: determines whether the input capture function can be used, and when used, whether or not to enable interrupts. Use the CKEG bits to designate use of either the rising or falling edge of the TCLK pin to set the values of TCNT12, TCNT22, TCNT32 and TCNT42 to TCPR12, TCPR22, TCPR32 and TCPR42 respectively. Only when the ICPF bits in TCR12, TCR22, TCR32 and TCR42 are 0, the values of TCNT12, TCNT22, TCNT32 and TCNT42 are set to TCPR12, TCPR22, TCPR32 and TCPR42. When the ICPF bit is set to 1, neither TCPR12, TCPR22, TCPR32 and TCPR42 is set even when input capture is generated. 00: Input capture function is not used. 01: Reserved (setting prohibited). 10: Input capture function is used. Interrupt due to input capture (TICPI5, TICPI8, TICPI11 and TICPI14) is not enabled. 11: Input capture function is used. Interrupt due to input capture (TICPI5, TICPI8, TICPI11 and TICPI14) is enabled.
5	UNIE	0	R/W	Underflow Interrupt Control Controls enabling of interrupt generation when the status flag (UNF) indicating TCNTnm underflow has been set to 1. 0: Interrupt due to underflow (TUNI) is not enabled 1: Interrupt due to underflow (TUNI) is enabled

Bit	Bit Name	Initial Value	R/W	Description
4, 3	CKEG	00	R/W	Clock Edge Select an input edge of the external clock when the external clock is selected, or when the input capture function is used. 00: Count/capture register set on rising edge 01: Count/capture register set on falling edge Other: Count/capture register set on both rising and falling edge
2 to 0	TPSC	000	R/W	Timer Pre-scaler 2 to 0 Select the TCNTnm count clock. 000: Count on (input-clock)/4 001: Count on (input-clock)/16 010: Count on (input-clock)/64 011: Count on (input-clock)/256 100: Count on (input-clock)/1024 101: Setting prohibited 110: Setting prohibited 111: Count on external clock Channels 3 to 5 TCLK1, channels 6 to 8 TCLK2, channels 9 to 11 TCLK3, channels 12 to 14 TCLK4 Not usable in channels 0, 1, 2. Note: Input-clock is SASYNCRTΦ for channel 0/1/2, SASYNCPERD2Φ for channel 3/4/5/6/7/8/9/10/11/12/13/14.

Notes: 1. This bit is reserved in channels 0, 1, 2, 3, 4, 6, 7, 9, 10, 12 and 13 (initial value is 0 and read-only).
2. Writing 1 does not change the value.
3.These bits of channels 5, 8, 11 and 14 are R/W, other channels are R.

155.4.2.5 Input Capture Register n m (TCPRnm) (n = 1 to 4) (m = 2)

TCPR12, TCPR22, TCPR32 and TCPR42 are read-only 32-bit registers used for the input capture function provided only in channels 5, 8, 11 and 14. The ICPE and CKEG bits in TCR12, TC22, TCR32 and TCR42 control the input capture function. When an input capture occurs, the value of TCNT12 is copied to TCPR12, the value of TCNT22 is copied to TCPR22, the value of TCNT32 is copied to TCPR32, the value of TCNT42 is copied to TCPR42. The values of TCNT12, TCNT22, TCNT32 and TCNT42 are set in TCPR12, TCPR22, TCPR32 and TCPR42, respectively, only when the ICPF bits in TCR12, TCR22, TCR32 and TCR42 are 0.

155.4.3 Operation

Each channel has a 32-bit timer counter (TCNTnm) and 32-bit timer constant register (TCORnm). TCNTnm counts down. The auto-reload function enables synchronized counting and external-event counting. Channels 5, 8, 11 and 14 have the input capture function.

155.4.3.1 Counter Operation

When the bits STR00 to STR42 in TSTR0 to TSTR4 are set to 1, TCNTnm of corresponding channel starts counting. When TCNTnm underflows, the UNF flag of corresponding TCRnm is set. In this case, if the UNIE bit in TCRnm is set to 1, an interrupt request is sent to the CPU. Also, the value is copied from TCORnm to TCNTnm and the down-count operation is continued (Auto reload function).

(1) Procedure for setting count operation

Figure 155.4.3.1 shows an example of the procedure for setting the count operation.

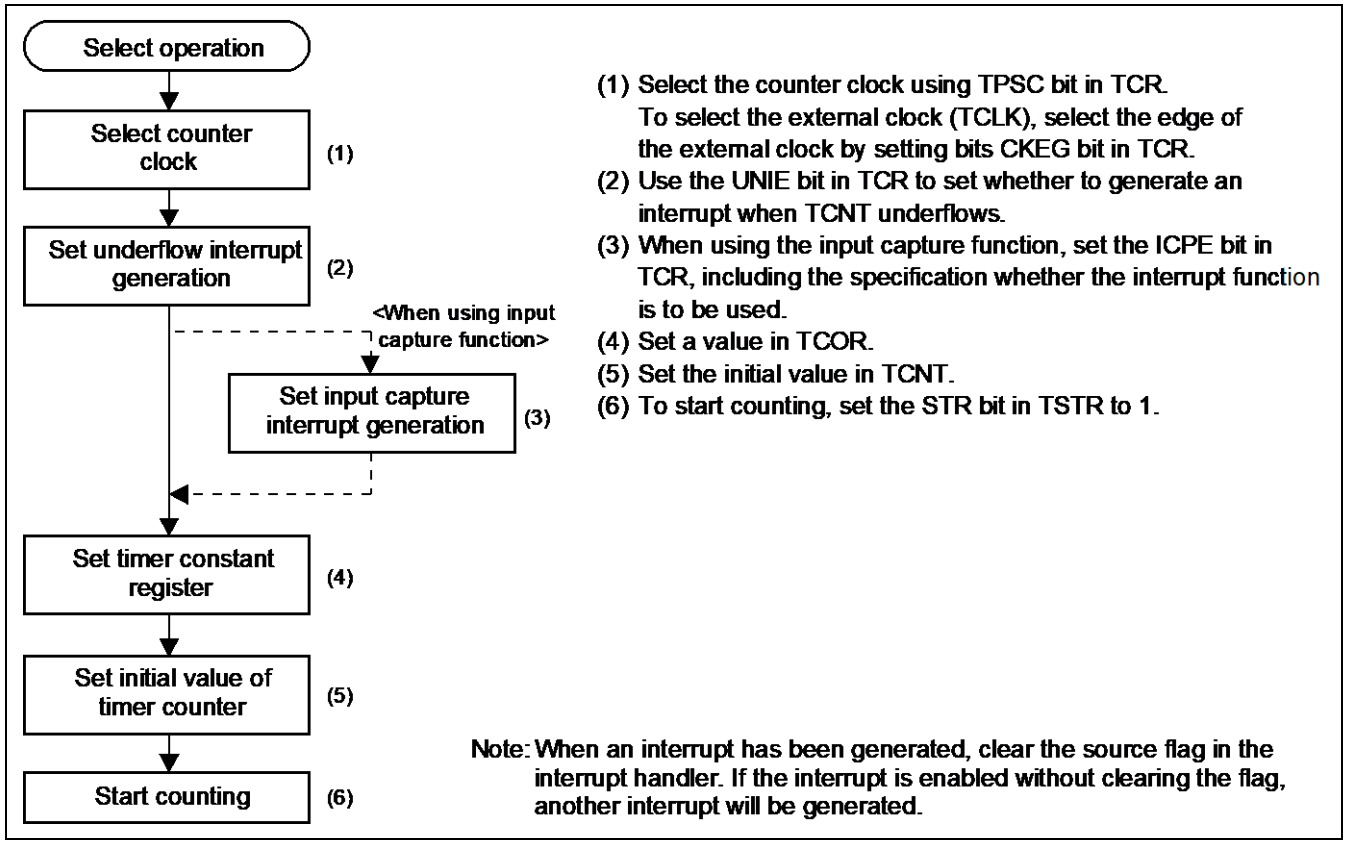

Figure 155.4.3.1 Procedure for Setting Count Operation

(2) Auto-reload count operation

Figure 155.4.3.2 shows the TCNTnm auto-reload operation.

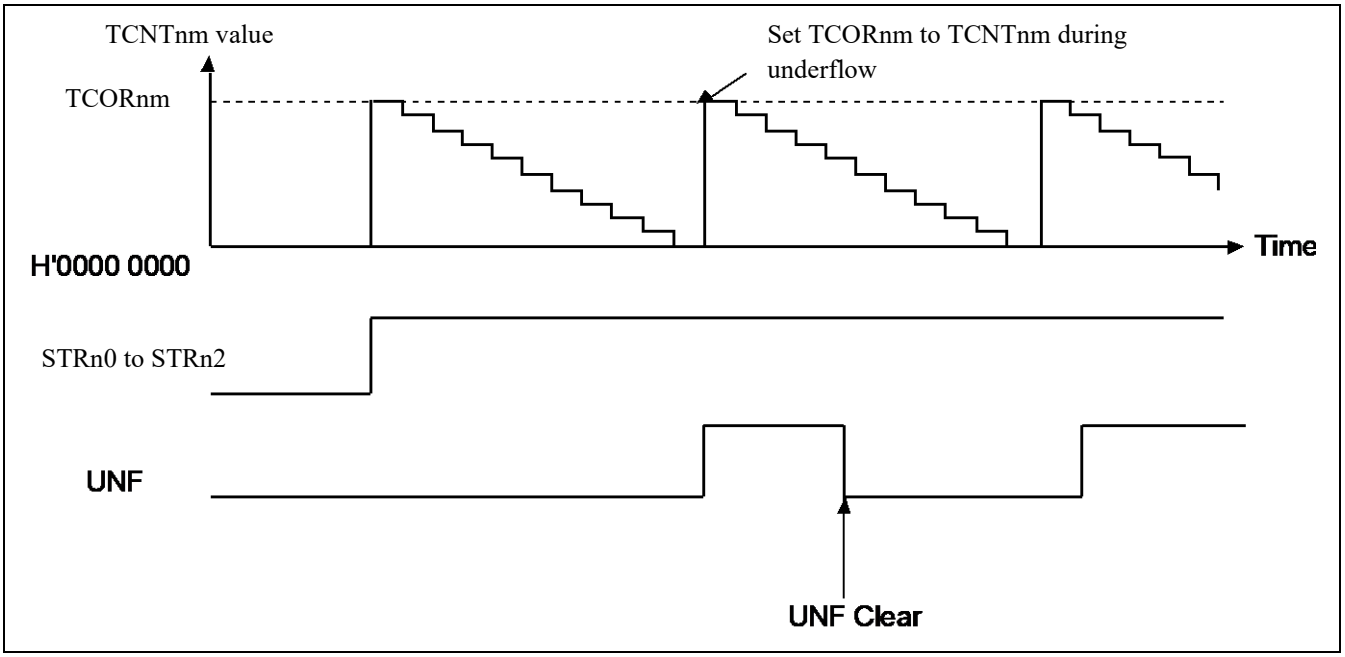

Figure 155.4.3.2 TCNTnm Auto-Reload Operation

(3) TCNTnm count timing

- Internal clock operation

  Five clocks (SASYNCRTΦ/4, SASYNCRTΦ/16, SASYNCRTΦ/64, SASYNCRTΦ/256, SASYNCRTΦ/1024) and five clocks (SASYNCPERD2Φ/4, SASYNCPERD2Φ/16, SASYNCPERD2Φ/64, SASYNCPERD2Φ/256, SASYNCPERD2Φ/1024) that are created by dividing peripheral clocks are selected as count clocks by setting bits TPSC2 to TPSC0 in TCRnm.

  Figure 155.4.3.3 show the timing.

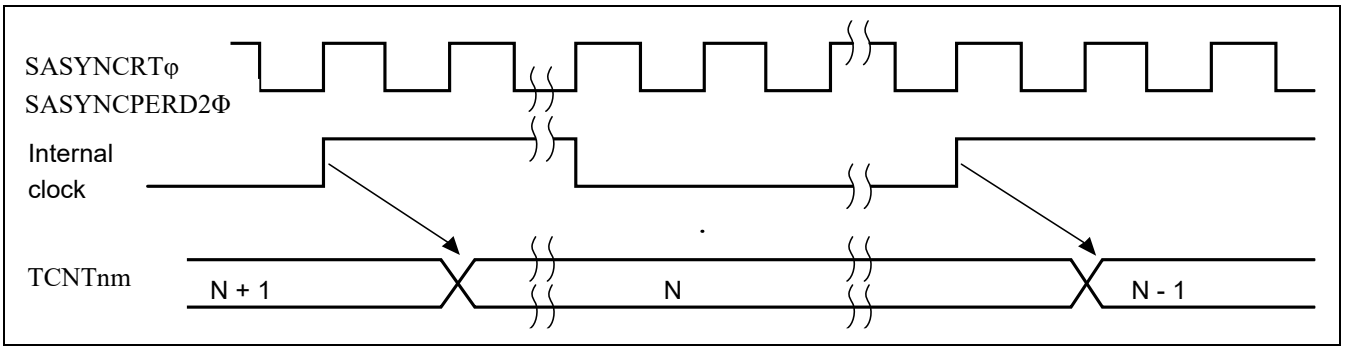

Figure 155.4.3.3 Count Timing when Internal Clock is Operating

- External clock operation
  Set the bits TPSC2 to TPSC0 in TCRnm to select the external clock pin (TCLK) as the timer clock. Use the bits CKEG1 and CKEG0 in TCRnm to select the detection edge. Rise, fall, or both can be selected.
  Figure 155.4.3.4 show the timing for both-edge detection.

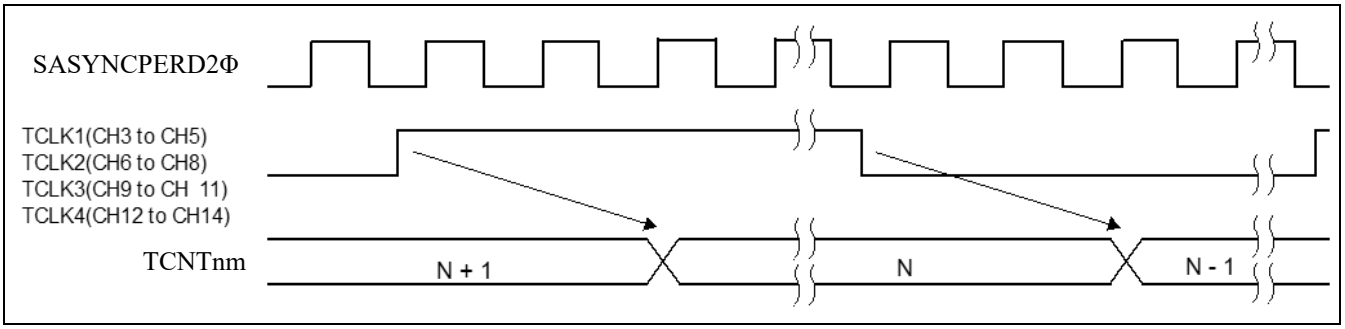

Figure 155.4.3.4 Count Timing when External Clock is Operating

155.4.3.2 Input Capture Function

Channels 5, 8, 11 and 14 have the input capture function. When using the input capture function, follow the procedure shown below.

1. Set the timer operating clock as an internal clock with bits TPSC2 to TPSC0 in TCRn2.
2. Set use of the input capture function and whether to generate an interrupt on using it with bits ICPE1 and ICPE0 in TCRn2.
3. Specify either rising edge or falling edge of the TCLK1 (channel 5), TCLK2 (channel 8) , TCLK3 (channel 11) and TCLK4 (channel 14) pin to be used to set the value of TCNTn2 to TCPR12, TCPR22, TCPR32 and TCPR42 with bits CKEG1 and CKEG0 in TCRn2.

Only when an input capture is occurred and the ICPF bits in TCR12, TCR22, TCR32 and TCR42 are 0, the values of TCNT12, TCNT22, TCNT32 and TCNT42 are set in TCPR5, TCPR8, TCPR11 and TCPR14, respectively.

Figure 155.4.3.5 shows the operating timing when the input capture function is used (the rising edge of TCLK1/2/3/4 is used).

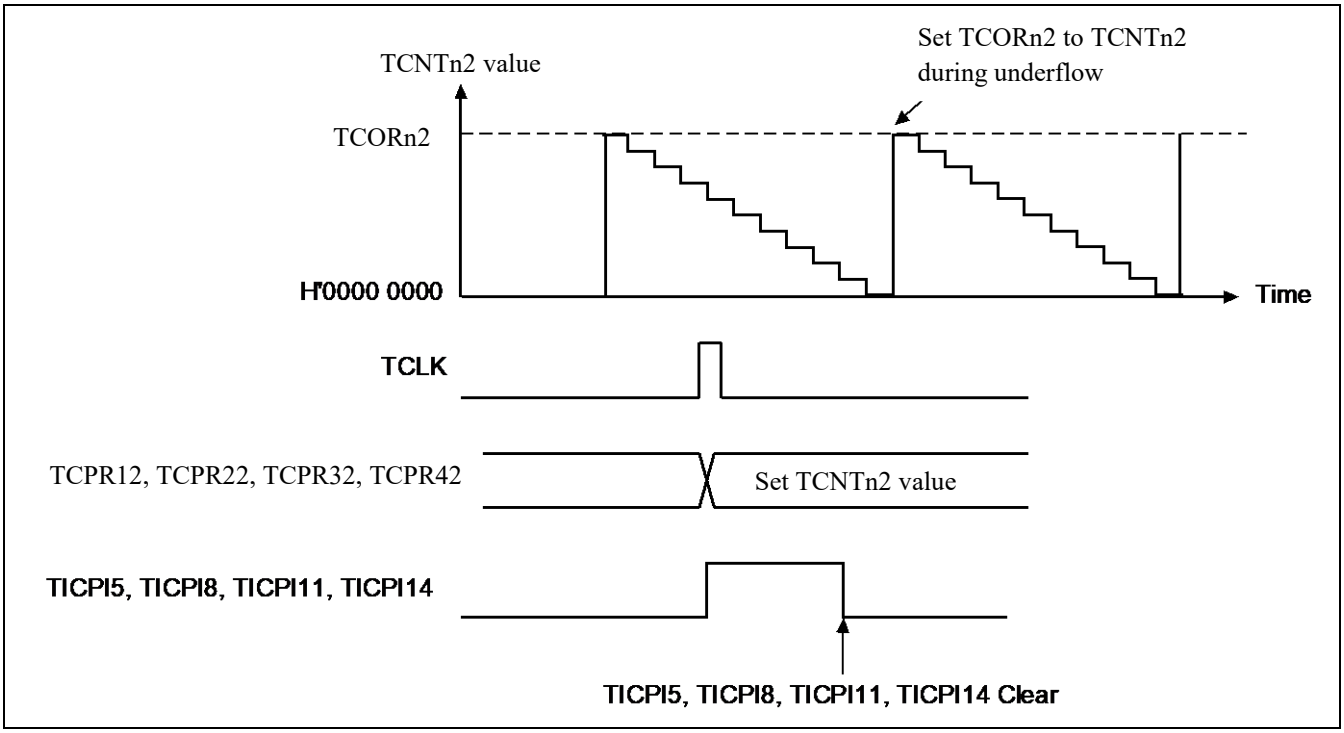

Figure 155.4.3.5 Operating Timing when Using Input Capture Function

155.4.3.3 Interrupt

The TMU interrupt sources are underflow interrupt or input capture interrupt when the input capture function is used. The underflow interrupt is generated at each channel. The input capture interrupt is generated at channels 5, 8, 11, 14 only.

An underflow interrupt request is generated (for each channel) when both the UNF bit and the interrupt enable bit for that channel are set to 1.

When the input capture function is used and the input capture request is generated, an interrupt request is generated if the ICPF bit in TCR12 or TCR22 or TCR32 or TCR42 is 1 and the input capture control bits ICPE1 and ICPE0 in TCR12 or TCR22 or TCR32 or TCR42 are 11.

Table 155.4.3.1 shows the TMU interrupt sources.

Table 155.4.3.1 TMU Interrupt Sources

Channel	Interrupt Sources	Description
0	TUNI0	Underflow interrupt 0
1	TUNI1	Underflow interrupt 1
2	TUNI2	Underflow interrupt 2
3	TUNI3	Underflow interrupt 3
4	TUNI4	Underflow interrupt 4
5	TUNI5	Underflow interrupt 5
	TICPI5	Input capture interrupt 5
6	TUNI6	Underflow interrupt 6
7	TUNI7	Underflow interrupt 7
8	TUNI8	Underflow interrupt 8
	TICPI8	Input capture interrupt 8

Channel	Interrupt Sources	Description
9	TUNI9	Underflow interrupt 9
10	TUNI10	Underflow interrupt 10
11	TUNI11	Underflow interrupt 11
	TICPI11	Input capture interrupt 11
12	TUNI12	Underflow interrupt 12
13	TUNI13	Underflow interrupt 13
14	TUNI14	Underflow interrupt 14
	TICPI14	Input capture interrupt 14

155.4.4 Usage Notes

155.4.4.1 Writing to Registers

When writing to the TMU registers, clear the start bits (STR42 to STR00) of the corresponding TSTR channel to stop the timer counting.

Writing to TSTR and clearing bits UNF and ICPF in TCRnm can be executed during counting. To clear flags UNF and ICPF during counting, do not change the values of bits other than those to be cleared.

155.4.4.2 Reading TCNTnm Register

Reading from TCNTnm is performed synchronously with the timer count operation. When timer counting and register read processing are performed simultaneously, the value before TCNTnm counting down is read.

155.4.4.3 External Clock Frequency

The frequency of external clock (TCLK1/2/3/4) for each channel should be SASYNCPERD2Φ/4 or less.

155.4.5 Safety Mechanisms

155.4.5.1 Power-On test

This module is protected by Power-On test.

155.5 System Timer (SCMT)

155.5.1 Overview

System Timer is a 32-bit compare match timer of one channel.

155.5.1.1 Features

- One channel is implemented.
- 16 bits/32 bits can be selected.
- Provided with 32-bit constant registers and 32-bit up-counters that can be written or read at any time.
- Allows selection among four counter input clocks
  — OSCCLK: 1/1, 1/8, 1/32, and 1/128
- One-shot operation or free-running operation is selectable.
- Compare match or overflow can be selected as interrupt source.
- Counter operation can be enabled or disabled at the time of debugging of CPU core using the debugging mode operation selector.

155.5.1.2 Block Diagram

Figure 155.5.1.1 shows a block diagram of the System Timer.

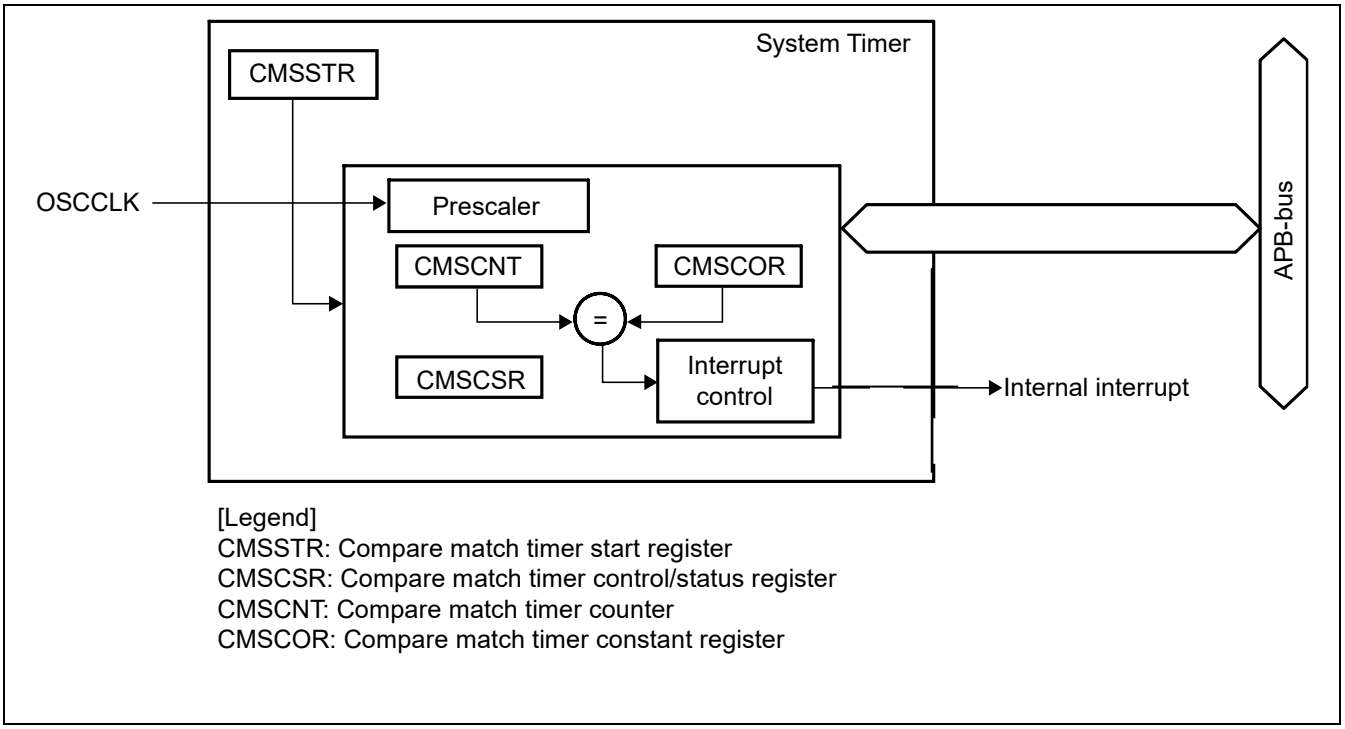

Figure 155.5.1.1 Block Diagram of System Timer

155.5.1.3 Register Configuration

Table 155.5.1.1 shows the System Timer register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access CMSSTR and CMSCSR as a word (16 bits). Operation cannot be guaranteed if CMSSTR and CMSCSR are not accessed as a word. Access CMSCNT and CMSCOR as a longword (32 bits). Operation cannot be guaranteed if CMSCNT and CMSCOR are not accessed as a longword.

Table 155.5.1.1 Register Configurations

Register Name	Abbreviation	R/W	Address	Access Size	Initial value after Power-On Reset
Compare match timer start register	CMSSTR	R/W	H'E604 0000	16	H’0000
Compare match timer control/status register	CMSCSR	R/W*1	H'E604 0040	16	H'012F
Compare match timer counter	CMSCNT	R/W	H'E604 0044	32	H’0000 0000
Compare match timer constant register	CMSCOR	R/W	H'E604 0048	32	H'0144 3FCF

Note: 1. Except for bit [15:14] that are R/WC0 register.

Table 155.5.1.2 shows the register states in each operating mode.

Table 155.5.1.2 Register States in Each Operating Mode

Register Abbreviation	Power-on Reset/Software Reset *1
CMSSTR	Initialized
CMSCSR	Initialized
CMSCNT	Initialized
CMSCOR	Initialized

Note: 1. For details, refer to 'General Part Section 14. Reset (RST) and '9. Module Standby, Software Reset.

155.5.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be initial value.

155.5.2.1 Compare Match Timer Start Register (CMSSTR)

CMSSTR is a 16-bit register which specify whether the compare match timer counter (CMSCNT) is operated or halted.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	STR5	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STR5	0	R/W	Count Start Specify halt/counting of compare match timer counter (CMSCNT). 0: CMSCNT Halts. 1: CMSCNT starts counting.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

155.5.2.2 Compare Match Timer Control/Status Register (CMSCSR)

CMSCSR is a 16-bit register that indicates the occurrence of compare matches, enables interrupts, and sets the counter input clocks.

Do not change bits other than the CMF and OVF bits, while the compare match timer counter (CMSCNT) is under operating.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMF	OVF	WRFLG	—	—	—	CMS	CMM	—	—	CMR[1:0]		DBGIVD	CKS[2:0]

Bit	Bit Name	Initial Value	R/W	Description
15	CMF	0	R/WC0	Compare Match Flag This flag indicates whether the values of the compare match timer counter (CMSCNT) and the compare match timer constant register (CMSCOR) have matched or not. Software cannot write 1 to the bit. When one-shot is selected for the counter operation, counting resumes by clearing this bit. 0: CMSCNT and CMSCOR values have not matched. [Clearing condition] • Write 0 to CMF 1: CMSCNT and CMSCOR values have matched. * Only 0 can be written, for flag clearing.
14	OVF	0	R/WC0	Overflow Flag This flag indicates whether the compare match timer counter (CMSCNT) has overflowed or not. Software cannot write 1 to this bit. 0: CMSCNT has not overflowed. [Clearing condition] • Write 0 to OVF 1: CMSCNT has overflowed. * Only 0 can be written, for flag clearing.
13	WRFLG	0	R	Write State Flag When this bit is 1, write access to CMSCNT is prohibited. If it isn't maintained, operation isn't secured. This bit indicates the period that the writing to CMSCNT is masked for synchronization after the writing to CMSCNT. Confirm that this flag is 0 when CMSCNT is written to continuously.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	CMS	0	R/W	Compare Match Timer Counter Size This bit selects whether the compare match timer counter (CMSCNT) is used as a 16-bit counter or 32-bit counter. This register setting becomes the valid bit-size for the compare match timer constant register (CMSCOR). 0: Operates as a 32-bit counter. 1: Operates as a 16-bit counter. Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.
8	CMM	1	R/W	Compare Match Mode Specify operation mode of the counter. 0: One-shot operation 1: Free-running operation Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.
7	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	CMR[1:0]	10	R/W	Compare Match Request These bits enable or disable an internal interrupt request at a compare match. 00: Disables an internal interrupt request. 01: Setting prohibited 10: Enables an internal interrupt request. 11: Setting prohibited
3	DBGIVD	1	R/W	Debug Mode Operation Select This bit sets counter operation when in debug mode. 0: Stops counter operation when in debug mode. 1: Enables counter operation even when in debug mode. Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.
2 to 0	CKS[2:0]	111	R/W	Clock Select These bits select the clock input to CMSCNT. When the count start bit (STR5) in CMSSTR is set to 1, CMSCNT begins incrementing with the clock selected by these bits. 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: clock/8 101: clock/32 110: clock/128 111: clock/1 Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.

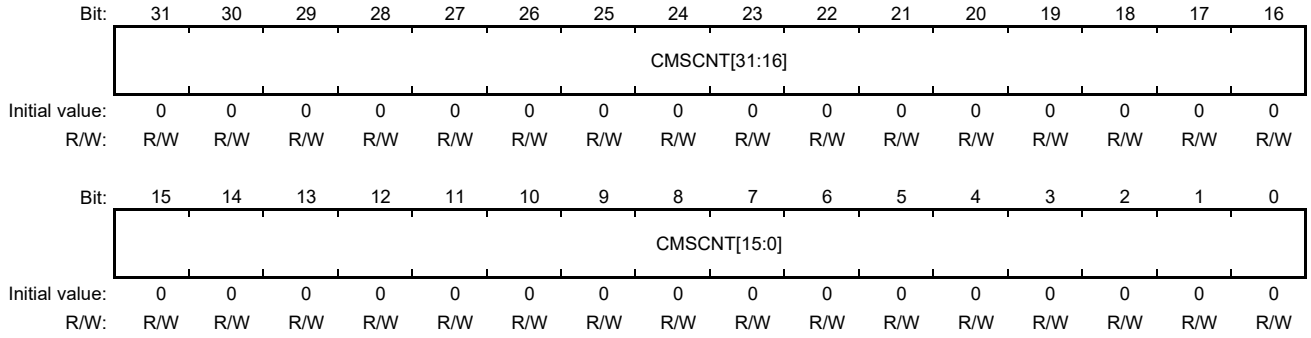
155.5.2.3 Compare Match Timer Counter (CMSCNT)

CMSCNT is a 32-bit register which is used as an up-counter.

To specify counter operation, set compare match timer control/status register (CMSCSR), before starting operation.

When the 16-bit counter operation is selected by the CMS bit, bits 31 to 16 of this register is invalid. When data is written in 16-bit mode, write H'0000 as upper 16-bits data.

When CMSCNT is read during the counter operation, the read value may be wrong because of an asynchronous clock between counter and bus-interface. For exact value, read this register continuously, until same values are read from this register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMSCNT [31:0]	All 0	R/W	Compare match timer counter bit 31 to 0 Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.

155.5.2.4 Compare Match Timer Constant Register (CMSCOR)

CMSCOR is a 32-bit register which specify the compare match period with the compare match timer counter (CMSCNT).

The initial value of this register is H'0144 3FCF.

When the 16-bit counter operation is selected by the CMS bit in the compare match timer control/status register (CMSCSR), bits 15 to 0 of this register become valid. When data is written to this register in 16-bit mode, write H'0000 as upper 16-bits data.

An overflow is detected when CMSCNT is cleared to 0 and this register is set to H'FFFF FFFF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMSCOR[31:16]															
Initial value:	0	0	0	0	0	0	0	1	0	1	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	1	1	1	1	1	1	1	1	0	0	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMSCOR [31:0]	H'0144 3FCF	R/W	Compare match timer constant register bit31 to 0 Note: When Write or Read in this bit, refer to 155.5.3.5 Register Access.

155.5.3 Operation

155.5.3.1 Counter Operation

System Timer starts the operation of the counter by writing 1 to the STR5 bit in CMSSTR after each register has been set. Complete all of the settings before starting the operation. Do not change the register settings other than by clearing flag bits during the compare match timer (CMSCNT) operation.

The counter operates in one of two ways.

- One-Shot Operation

  One-shot operation is selected by setting the CMM bit in CMSCSR to 0. When the value in CMSCNT matches the value in CMSCOR, the value in CMSCNT is cleared to H'0000 0000, and the CMF bit in CMSCSR is set to 1. Counting by CMSCNT stops after CMSCNT has been cleared.

  Counting by CMSCNT will be resumed after CMSCSR.CMF bit has been cleared.

  To detect an overflow interrupt, set the value in CMSCOR to H'FFFF FFFF. When the value in CMSCNT matches the value in CMSCOR, CMSCNT is cleared to H'0000 0000 and the CMF and OVF bits in CMSCSR are set to 1

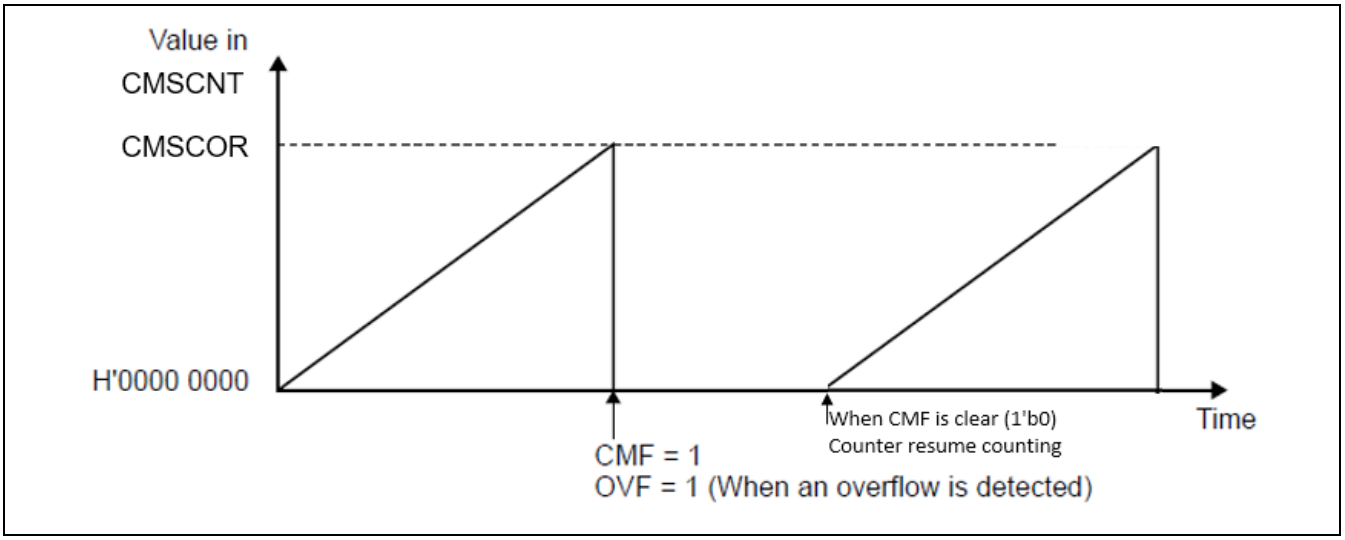

Figure 155.5.3.1 Counter Operation (One-Shot Operation)

- Free-Running Operation

  Free-running operation is selected by setting the CMM bit in CMSCSR to 1. When the value in CMSCNT matches the value in CMSCOR, CMSCNT is cleared to H'0000 0000 and the CMF bit in CMSCSR is set to 1. CMSCNT resumes counting-up after it has been cleared.

  To detect an overflow interrupt, set CMSCOR to H'FFFF FFFF. When the values in CMSCNT and CMSCOR match, CMSCNT is cleared to H'0000 0000 and the CMF and OVF bits in CMSCSR are set to 1.

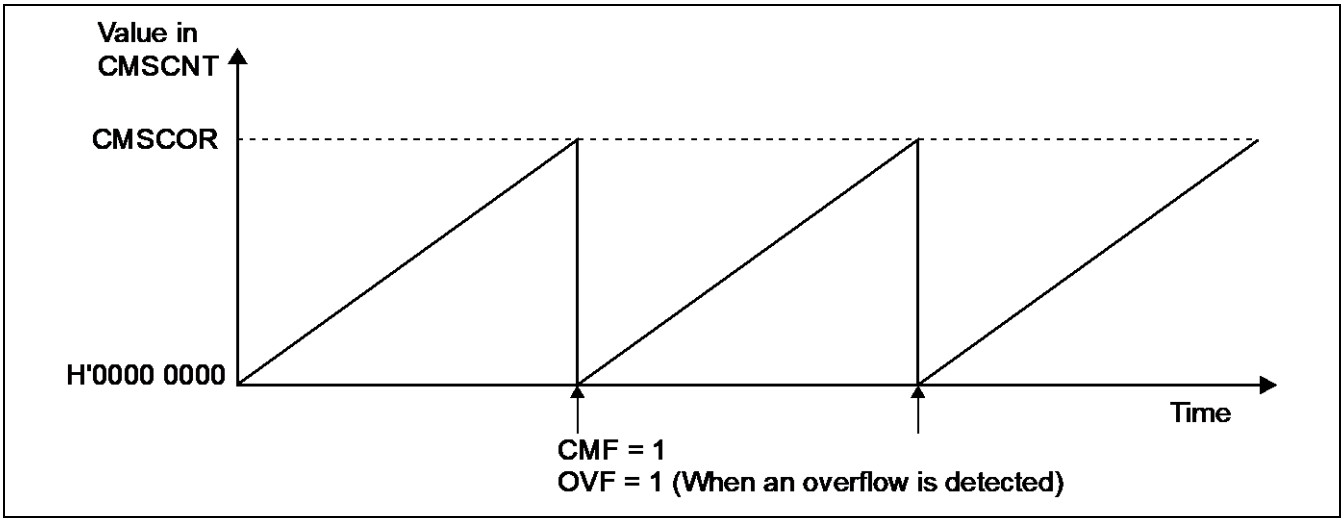

Figure 155.5.3.2 Counter Operation (Free-Running Operation)

155.5.3.2 Counter Size

In this module, the size of the counter can be selected from 16 or 32 bits. This is selected by the CMS bit in CMSCSR.

When the 16-bit size is selected, use H'0000 for upper 16-bit of write data for CMSCOR. To detect an overflow interrupt, CMSCOR must be set to H'0000 FFFF.

155.5.3.3 Timing for Counting by CMSCNT

In this module, the clock for the CMSCNT counter can be selected from following clocks:

- OSCCLK: 1/1, 1/8, 1/32, and 1/128

The clock for the counter is selected by the CKS bits in CMSCSR. CMSCNT is incremented at the rising edge of the selected clock.

155.5.3.4 Internal Interrupt Request to CPU

The setting of the CMR bits in CMSCSR selects the sending of an internal interrupt request to the CPU at a compare match.

To clear an internal interrupt request to the CPU in Free-Running Operation, the CMF bit should be set to b'0. Set the CMF bit to b'0 in the handling routine for the System Timer interrupt.

To clear an internal interrupt request to the CPU with resuming count-up in One-Shot Operation, the CMF bit should be set to b'0 while keeping b'1 in STR5 bit in CMSSTR. Set the CMF bit to b'0 while keeping b'1 in STR5 bit in the handling routine for the System Timer interrupt.

To clear an internal interrupt request to the CPU without resuming count-up in One-Shot Operation, the CMF bit should be set to b'0 after setting STR5 bit in CMSSTR to b'0. Set the CMF bit to b'0 after setting STR5 bit to b'0 in the handling routine for the System Timer interrupt.

155.5.3.5 Register Access

After writing to following registers, written data can be read 2 cycles in counter input clock (OSCCLK) after writing has finished. And it takes 2 cycles in counter input clock (OSCCLK), for reflecting written data to counter behavior.

CMSCSR: Bits CKS, CMM, CMS, CMR, DBGIVD
CMSCOR: Bits 31 to 0
CMSSTR: Bit STR5

After writing to following registers, written data can be read 2 cycles in counter input clock (OSCCLK) after writing has finished. And it takes 2 cycles in counter input clock (OSCCLK), for reflecting written data to counter behavior.

And for following registers, write access is prohibited, while previously written data is under writing. Do not perform next write access, while CMSCSR. WRFLG is 1.

CMSCNT: Bits 31 to 0

155.5.3.6 Compare Match Flag Set/Clear Timing

The CMF bit in CMSCSR is set to 1 by the compare match signal generated when CMSCOR and CMSCNT match. The compare match signal is generated upon the final state of the match (timing at which the CMSCNT value is updated to H'0000 0000). Consequently, after CMSCOR and CMSCNT match, a compare match signal will not be generated until a CMSCNT counter clock is input. Figure 155.5.3.3 shows the set timing of the CMF bit.

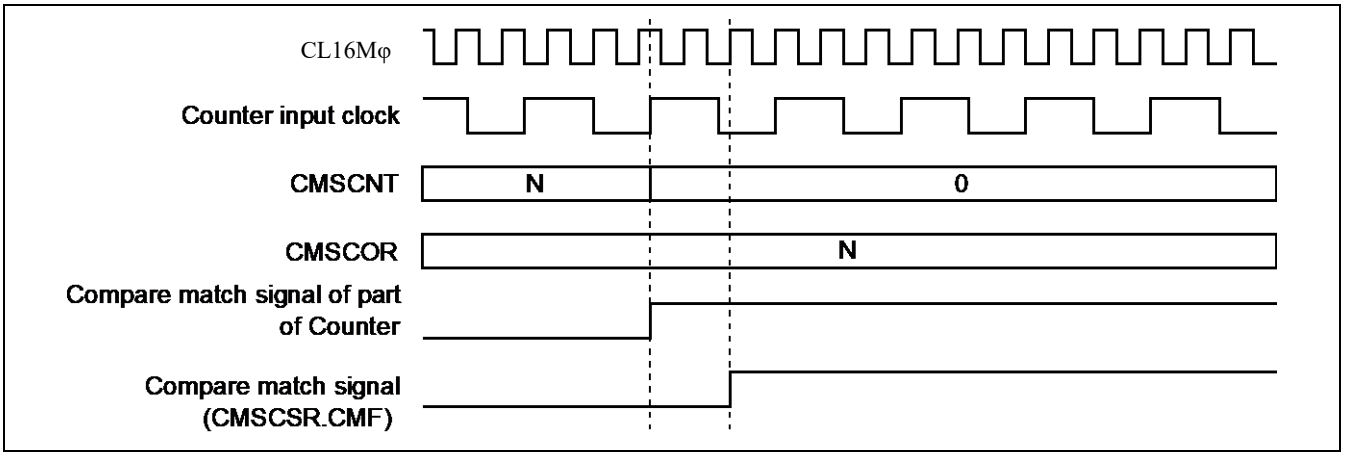

Figure 155.5.3.3 CMF Set Timing

Set the CMF bit as 0. The CMF flag is cleared immediately.

155.5.3.7 System Timer Usage

Take the following steps to use the System Timer.

1. Clear the STR5 bit in CMSSTR to 0 to temporarily stop counting.
   (Confirm that OSCCLK was input more than 2 cycles.)
2. Write H'0000 0000 on CMSCNT.
3. Set counter size, compare match mode, kind of count clock and interrupt request and clear the bit of OVF and CMF in CMSCSR.
4. Set the value on CMSCOR.
5. Confirm that CMSCSR. WRFLG becomes 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the STR5 bit in CMSSTR to 1.
   (Refer to 155.5.3.5 Register Access)

155.5.4 Usage Notes

No description on this section.

155.5.5 Safety Mechanisms

155.5.5.1 Power-On test

This module is protected by Power-On test.

155.6 System Up-Time Clock (SUCMT)

155.6.1 Overview

System Up-Time Clock is an internal 32-bit compare match timer of one channel.

155.6.1.1 Features

- One channel is installed.
- 16 bits/32 bits can be selected as counter size (bit-width).
- Provided with 32-bit constant registers and 32-bit up-counters that can be written or read at any time.
- Following four clocks can be selected as counter clocks.
  - RCLK: 1/1, 1/8, 1/32, and 1/128
- One-shot operation or free-running operation is selectable.
- Compare match or overflow can be selected as interrupt source.
- Module standby mode can be set.
- Counter operation can be enabled or disabled at the time of debugging of CPU core using the debugging mode operation selector.

155.6.1.2 Block Diagram

Figure 155.6.1.1 shows a block diagram of the System Up-Time Clock.

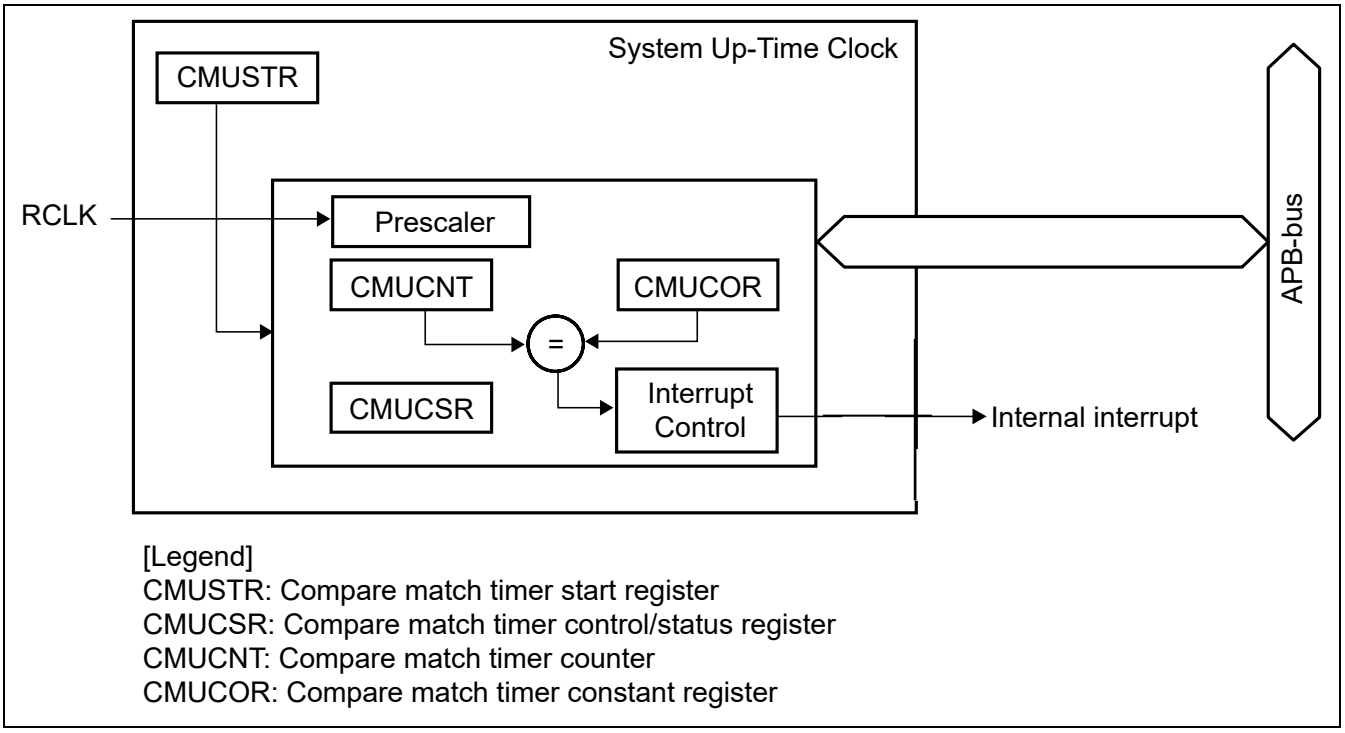

Figure 155.6.1.1 Block Diagram of System Up-Time Clock

155.6.1.3 Register Configuration

Table 155.6.1.1 shows the System Up-Time Clock register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access CMUSTR and CMUCSR as a word (16 bits). Operation cannot be guaranteed if CMUSTR and CMUCSR are not accessed as a word. Access CMUCNT and CMUCOR as a longword (32 bits). Operation cannot be guaranteed if CMUCNT and CMUCOR are not accessed as a longword.

Table 155.6.1.1 Register Configurations

Register Name	Abbreviation	R/W	Address	Access Size	Initial value after Power-On Reset
Compare match timer start register	CMUSTR	R/W	H'E61D 0000	16	H’0000
Compare match timer control/status register	CMUCSR	R/W*1	H'E61D 0040	16	H'010F
Compare match timer counter	CMUCNT	R/W	H'E61D 0044	32	H’0000 0000
Compare match timer constant register	CMUCOR	R/W	H'E61D 0048	32	H'FFFF FFFF

Note: 1. Except for bit [15:14] that are R/WC0 register.

Table 155.6.1.2 shows the register states in each operating mode.

Table 155.6.1.2 Register States in Each Operating Mode

Register Abbreviation	Power-on Reset/Software Reset *1	Module Standby
CMUSTR	Initialized	Retained
CMUCSR	Initialized	Retained
CMUCNT	Initialized	Retained
CMUCOR	Initialized	Retained

Note: 1. For details, refer to ‘General Part Section 14. Reset (RST) and ‘9. Module Standby, Software Reset

155.6.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.
—: Undefined value
R/W: Bit or field is readable and writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R: Read-only. The write value should always be initial value.

155.6.2.1 Compare Match Timer Start Register (CMUSTR)

CMUSTR is a 16-bit register that selects whether the compare match timer counter (CMUCNT) is operated or halted.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	STR5	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STR5	0	R/W	Count Start These bits specify start/halt of compare match timer counter (CMUCNT). 0: CMUCNT halts. 1: CMUCNT starts counting.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

155.6.2.2 Compare Match Timer Control/Status Register (CMUCSR)

CMUCSR is a 16-bit register which indicates the occurrence of compare matches, enables interrupts, and sets the counter input clocks.

Do not change bits other than the CMF and OVF bits, while the compare match timer counter (CMUCNT) is under operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMF	OVF	WRFLG	WERR	—	—	CMS	CMM	—	WER	CMR[1:0]		DBGIVD	CKS[2:0]		
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	1	1	1	1
R/W:	R/WC0	R/WC0	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	CMF	0	R/WC0	Compare Match Flag This flag indicates whether the values of the compare match timer counter (CMUCNT) and the compare match timer constant register (CMUCOR) have matched or not. Software cannot write 1 to the bit. When one-shot is selected for the counter operation, counting resumes by clearing this bit. 0: CMUCNT and CMUCOR values have not matched. [Clearing condition] • Write 0 to CMF 1: CMUCNT and CMUCOR values have matched.
14	OVF	0	R/WC0	Overflow Flag This flag indicates whether the compare match timer counter (CMUCNT) has overflowed or not. Software cannot write 1 to this bit. 0: CMUCNT has not overflowed. [Clearing condition] • Write 0 to OVF 1: CMUCNT has overflowed.
13	WRFLG	0	R	Write State Flag When this bit is 1, write access to CMUCNT is prohibited. If it isn't maintained, operation isn't secured. This bit indicates the period that the writing to CMUCNT is masked for synchronization after the writing to CMUCNT. Confirm that this flag is 0 when CMUCNT is written to continuously.
12	WERR	0	R	Write Access Error Flag This flag indicates whether or not the write access from the public domain. Software cannot write 1 to this bit. 0: Public domain has not Write access [Clearing condition] • Read register 1: Public domain has Write access
11 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	CMS	0	R/W	Compare Match Timer Counter Size This bit selects whether the compare match timer counter (CMUCNT) is used as a 16-bit counter or 32-bit counter. This register setting becomes the valid bit-size for the compare match timer constant register (CMUCOR). 0: Operates as a 32-bit counter. 1: Operates as a 16-bit counter. Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.

Bit	Bit Name	Initial Value	R/W	Description
8	CMM	1	R/W	Compare Match Mode This bit selects one-shot operation or free-running operation of the counter. 0: One-shot operation 1: Free-running operation Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	WER	0	R/W	Write Access Error Request This bit Write Access Error interrupt request at the public domain. 0: Disables an internal interrupt request. 1: Enables an internal interrupt request. Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.
5, 4	CMR[1:0]	00	R/W	Compare Match Request These bits enable or disable an internal interrupt request at a compare match. 00: Disables an internal interrupt request. 01: Setting prohibited 10: Enables an internal interrupt request. 11: Setting prohibited Note1: When various standby modes are canceled by the System Up-Time Clock, these bits should be set to B'10. Note2: When Write or Read in this bit, refer to 155.6.3.5 Register Access.
3	DBGIVD	1	R/W	Debug Mode Operation Select This bit sets counter operation when in debug mode. 0: Stops counter operation when in debug mode. 1: Enables counter operation even when in debug mode. Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.
2 to 0	CKS[2:0]	111	R/W	Clock Select These bits select the clock input to CMUCNT. When the count start bit (STR5) in CMUSTR is set to 1, CMUCNT begins incrementing with the clock selected by these bits. 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: RCLK/8 101: RCLK/32 110: RCLK/128 111: RCLK/1 Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.

Note: * Only 0 can be written, for flag clearing.

155.6.2.3 Compare Match Timer Counter (CMUCNT)

CMUCNT is a 32-bit register which is used as an up-counter.

To specify counter operation, set compare match timer control/status register n (CMUCSR), before starting operation of corresponding channel.

When the 16-bit counter operation is selected by the CMS bit, bits 31 to 16 of this register become invalid. When data is written to this register in 16-bit mode, write H'0000 as upper 16bits

When CMUCNT is read during counter operation, the read value may be wrong because different clock is used between counter and bus-interface. For exact value, read this register continuously, until same values are read from this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMUCNT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMUCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMUCNT [31:0]	All 0	R/W	Compare match timer counter bit31 to 0 Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.

155.6.2.4 Compare Match Timer Constant Register (CMUCOR)

CMUCOR is a 32-bit register which specify the compare match period with the compare match timer counter (CMUCNT).

When the 16-bit counter operation is selected by the CMS bit in the compare match timer control/status register (CMUCSR), bits 15 to 0 of this register become valid. Write H'0000 to upper 16bits in 16-bit counter operation.

An overflow is detected when CMUCNT is cleared to 0 and this register is set to H'FFFF FFFF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMUCOR[31:16]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMUCOR[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMUCOR [31:0]	All 1	R/W	Compare match timer counter bit31 to 0 Note: When Write or Read in this bit, refer to 155.6.3.5 Register Access.

155.6.3 Operation

155.6.3.1 Counter Operation

System Up-Time Clock starts the operation of the counter by writing 1 to the STR5 bit in CMUSTR after each register has been set. Complete all of the settings before starting the operation. Do not change the register settings other than by clearing flag bits during the compare match timer (CMUCNT) operation.

The counter operates in one of two ways.

- One-Shot Operation

  One-shot operation is selected by setting the CMM bit in CMUCSR to H'0. When the value in CMUCNT matches the value in CMUCOR, the value in CMUCNT is cleared to H'0000 0000, and the CMF bit in CMUCSR is set to 1. Counting by CMUCNT stops after CMUCNT has been cleared.

  Counting by CMUCNT will be resumed after CMUCSR.CMF bit has been cleared.

  To detect an overflow interrupt, set the value in CMUCOR to H'FFFF FFFF. When the value in CMUCNT matches the value in CMUCOR, CMUCNT is cleared to H'0000 0000 and the CMF and OVF bits in CMUCSR are set to 1

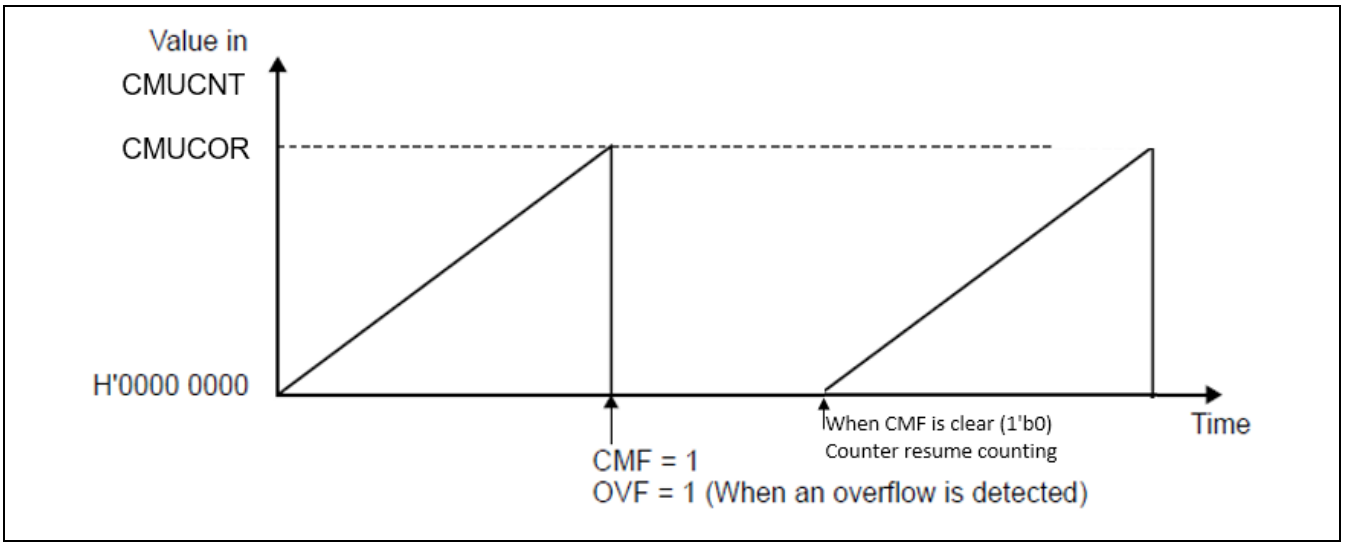

Figure 155.6.3.1 Counter Operation (One-Shot Operation)

- Free-Running Operation

  Free-running operation is selected by setting the CMM bit in CMUCSR to 1. When the value in CMUCNT matches the value in CMUCOR, CMUCNT is cleared to H'0000 0000 and the CMF bit in CMUCSR is set to 1. CMUCNT resumes counting-up after it has been cleared.

  To detect an overflow interrupt, set CMUCOR to H'FFFF FFFF. When the values in CMUCNT and CMUCOR match, CMUCNT is cleared to H'0000 0000 and the CMF and OVF bits in CMUCSR are set to 1.

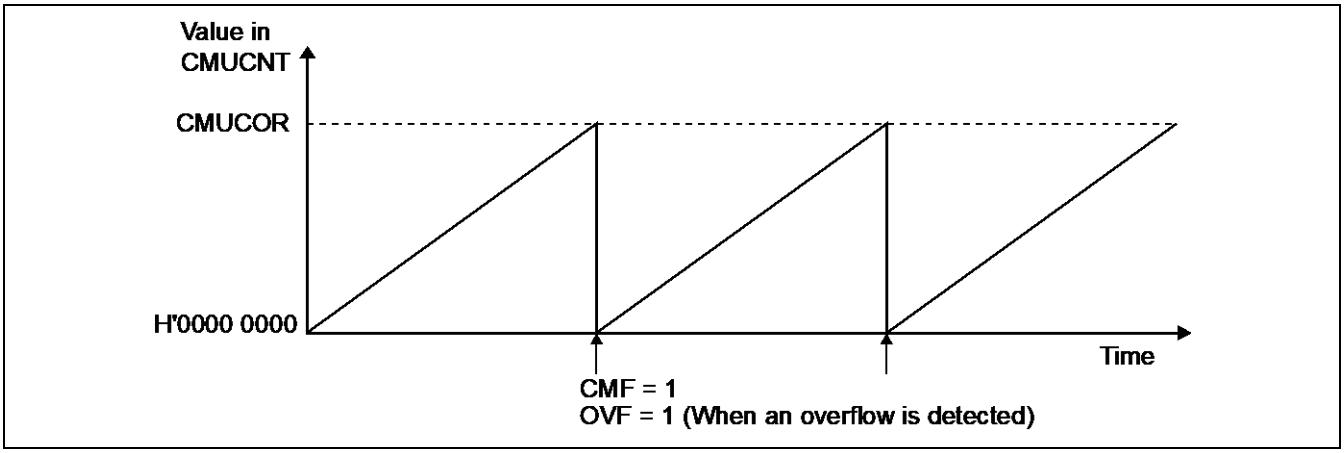

Figure 155.6.3.2 Counter Operation (Free-Running Operation)

155.6.3.2 Counter Size

In this module, the size of the counter can be selected from either 16, or 32 bits. This is selected by the CMS bit in CMUCSR.

When the 16-bit size is selected, H'0000 should be used as upper 16bit of write data to CMUCOR. To detect an overflow interrupt, CMUCOR must be set to H'0000 FFFF.

155.6.3.3 Timing for Counting by CMUCNT

In this module, the clock for the CMUCNT counter can be selected from following clocks:

- RCLK: 1/1, 1/8, 1/32, and 1/128

The clock for the counter is selected by the CKS bits in CMUCSR. CMUCNT is incremented at the rising edge of the selected clock.

155.6.3.4 Internal Interrupt Request to CPU

By CMR bits in CMUCSR, interrupt request to CPU can be asserted, at a compare match.

To clear an internal interrupt request to the CPU in Free-Running Operation, the CMF bit should be set to 0. Set the CMF bit to 0 in the handling routine for the System Up-Time Clock interrupt.

To clear an internal interrupt request to the CPU with resuming count-up in One-Shot Operation, the CMF bit should be set to 0 while keeping 1 in STR5 bit in CMUSTR. Set the CMF bit to 0 while keeping 1 in STR5 bit in the handling routine for the System Up-Time Clock interrupt.

To clear an internal interrupt request to the CPU without resuming count-up in One-Shot Operation, the CMF bit should be set to 0 after setting STR5 bit in CMUSTR to 0. Set the CMF bit to 0 after setting STR5 bit to 0 in the handling routine for the System Up-Time Clock interrupt.

155.6.3.5 Register Access

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK) after writing has finished. And it takes 2 cycles in counter input clock (RCLK), for reflecting written data to counter behavior.

CMUCSR: Bits CKS, CMM, CMS, WER, CMR, DBGIVD
CMUCOR: Bits 31 to 0
CMUSTR: Bit STR5

After writing to following registers, written data can be read 2 cycles in counter input clock (RCLK) after writing has finished. And it takes 2 cycles in counter input clock (RCLK), for reflecting written data to counter behavior.

And for following registers, write access is prohibited, while previously written data is under writing. Do not perform next write access, while CMUCSR.WRFLG is 1.

CMUCNT: Bits 31 to 0

155.6.3.6 Compare Match Flag Set/Clear Timing

The CMF bit in CMUCSR is set to 1 by the compare match signal generated when CMUCOR and CMUCNT match. The compare match signal is generated upon the final state of the match (timing at which the CMUCNT value is updated to H'0). Consequently, after CMUCOR and CMUCNT match, a compare match signal will not be generated until a CMUCNT counter clock is input. Figure 155.6.3.3 shows the set timing of the CMF bit.

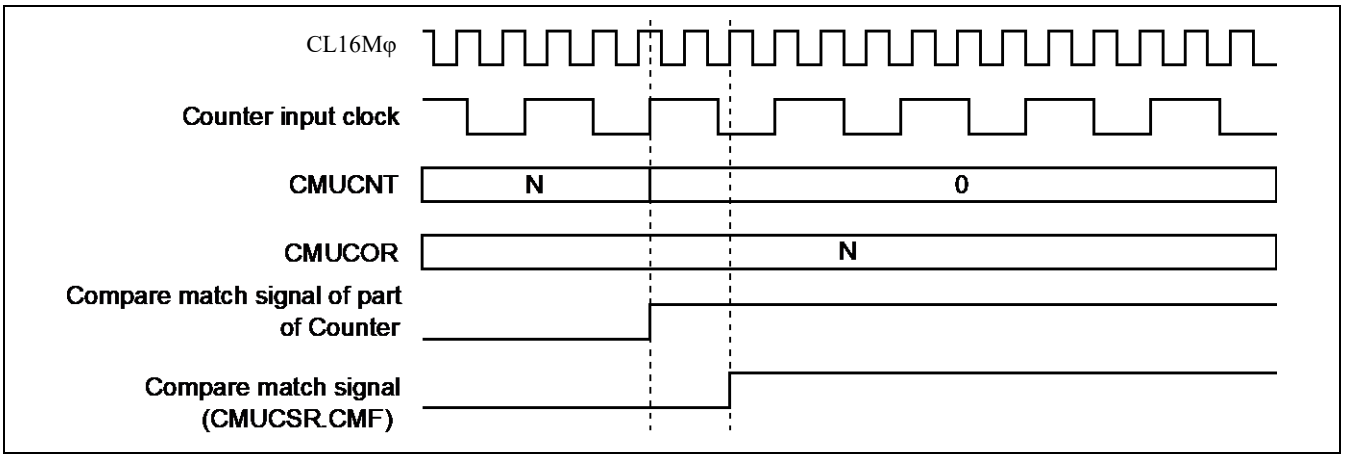

Figure 155.6.3.3 CMF Set Timing

Set the CMF bit to 0. The CMF flag is cleared immediately.

155.6.3.7 System Up-Tim Clock Usage

Take the following steps to use the System Up-Time Clock.

1. Clear the STR5 bit in CMUSTR to 0 to temporarily stop counting.
   (Confirm that RCLK was input more than 2 cycles.)
2. Write H'0000 0000 on CMUCNT.
3. Set counter size, compare match mode, kind of count clock and interrupt request and clear the bit of OVF and CMF in CMUCSR.
4. Set the value on CMUCOR.
5. Confirm that CMUCSR.WRFLG becomes 0.
   If WRFLG is 1, wait until it'll be 0.
6. Start the counting by setting the STR5 bit in CMUSTR to 1.
   (Refer to 155.6.3.5 Register Access)

155.6.4 Usage Notes

No description on this section.

155.6.5 Safety Mechanisms

This module is treated as non-safety-related function in case of the products supporting functional safety. So, there is no special spec Requirement for Safety mechanisms.

168. Boundary Scan

168.1 Overview

Example Boundary Scan is a test method defined by IEEE Std 1149.1.
It is used for testing interconnections between devices mounted on printed circuits boards.
GEN4 complies with the IEEE Std 1149.1-2001.

Boundary Scan generic issues (e.g. explanation of each instruction, state transition diagram of TAP controller, etc.) are not described in this document.

168.2 JTAG interface

Communication with a Boundary Scan host test system is executed via the JTAG interface, as described in the following table.

Table 168.1 JTAG interface

Port	Signal	Recommendation if unused
DCUTDI_LPDI	Data input	Open
DCUTDO_LPDO	Data output	Open
DCUTCK_LPDCLK	Clock	Open
DCUTMS	Mode	Open
DCUTRST#_LPDRST#	Reset	Open

168.3 Entering Boundary Scan mode

Boundary Scan mode is entered by setting BSMODE = 1 (VDDQ18).
Note that the sequence of setting BSMODE is different depending on the value of MD25 pin. For details, refer to Figure 168.1a and Figure 168.1b. After entering Boundary Scan Mode, keep BSMODE high until the power is off.

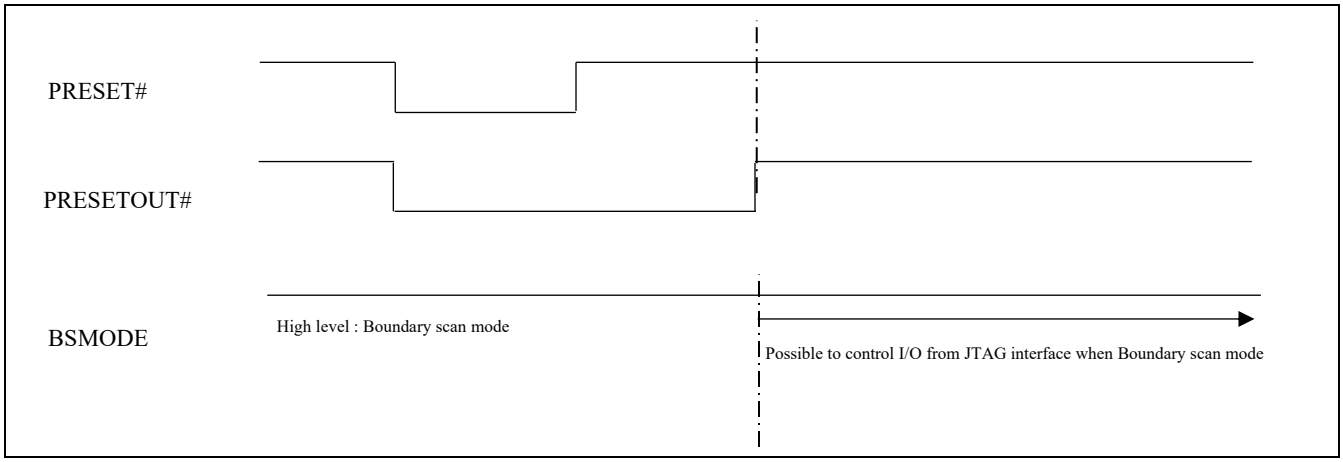

Figure 168.1a Setting of BSMODE signal (MD25 = 0)

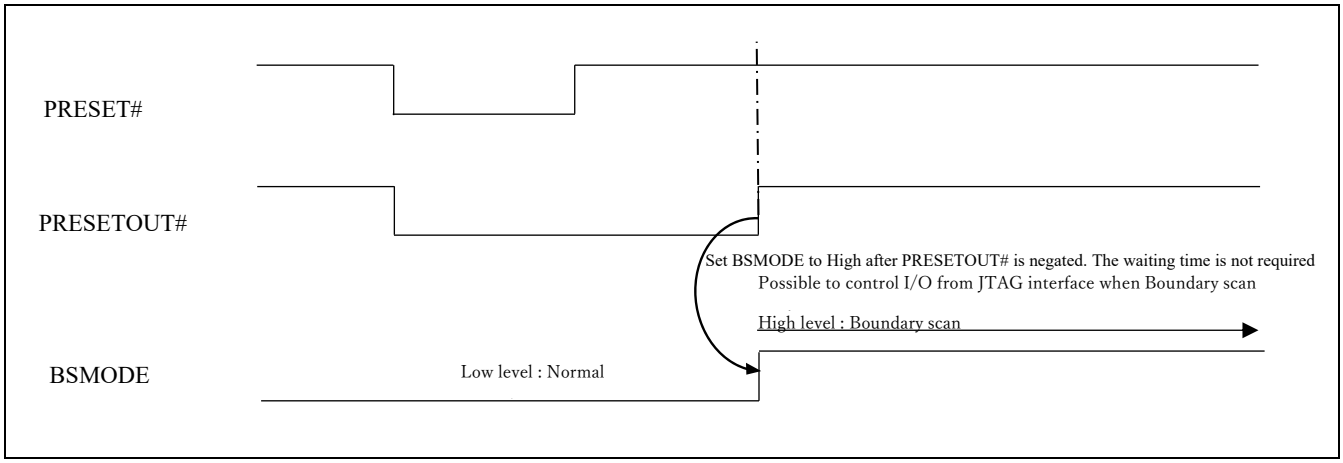

Figure 168.1b Setting of BSMODE signal (MD25 = 1)

As the normal boot operation will be executed in case the BSMODE is selected, it is recommended to stop boot rom execution by one of the following methods:

1) Execute BSCAN mode only with an empty boot flash device.
2) Select SCIF boot mode without providing a boot code. Boot rom execution will stop at the "Please Send" stage.

168.4 Boundary Scan features

The table below shows the IEEE1149.1-2001 instructions and instruction codes for GEN4.

Table 168.2 Boundary scan instruction codes

	Instruction code	
Instruction	**Bit [7:0]**	**Notes**
BYPASS	B' 1111 1111	
EXTEST	B' 0000 0000	
SAMPLE/PRELOAD	B' 0100 0000	
IDCODE	B' 0101 0101	

168.5 Boundary Scan applicable pins

Note: The ports of the Boundary Scan applicable pins don't need to be configured by use of any port configuration register during Boundary Scan.

Boundary Scan (EXTEST) is applicable to all pins except pins indicated in the following table.

Table 168.3 Boundary Scan inapplicable pins

Type	Pin Name
Reset	PRESET#
Test pins	TEST1, TEST2, TEST3
Mode control	BSMODE
JTAG interface	DCUTCK_LPDCLK, DCUTDO_LPDO, DCURDY#_LPDCLKOUT, DCUTDI_LPDI, DCUTMS, DCUTRST#_LPDRST#
Clock inputs/outputs	XTAL, EXTAL, EXTALR
LPDDR4X/LPDDR5 interface	All LPDDR4X/LPDDR5 interface pins
PCIeGen4 interface	PCIeGen4 interface pins except for PCIE0_CLKREQ#
CSI2 interface	All CSI2 interface pins
DSI interface	All DSI interface pins
SYSTEM interface	SYSTEM interface pins except for PRESETOUT#, AVS1, AVS0, ERROROUT#, ERROROUTC#

168.6 Device ID Register (DID)

The GEN3 specific ID code is provide by the device identification register DID. The value of DID is read with IDCODE instruction and cannot be accessed by CPU.

168.6.1 DID – Boundary Scan ID Register

This register stores the boundary scan ID.

Access: This register cannot be read by the CPU.

Address: -

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RN[3:0]				PN[15:4]											
Initial value:	0	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PN[3:0]				MID[10:0]											BIT0
Initial value:	*	*	*	*	0	1	0	0	0	1	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RN[3:0]	H'0	R	Revision number
27 to 12	PN[15:0]	H'85D9	R	Product number
11 to 1	MID[10:0]	H'447	R	Manufacturer ID: H'447 = {MID[10:0] + 1}
0	BIT0		R	

168.7 Usage Notes

1. Once a instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert a instruction that has no effect on chip operation (such asBYPASS) between the instructions.

2. To start the system in boundary scan mode, de-assert DCUTRST#_LPDRST# while PRESET# is high. Also be sure toset DCUTMS to high before de-asserting DCUTRST#_LPDRST# and ensure that DCUTMS remains high for 600 ns + five DCUTCK_LPDCLK clock cycles after de-asserting DCUTRST#_LPDRST#.

3. For details of boundary scan timing constraint, see **Section 200, Electrical Characteristics**.

4. If serial transfer is performed exceeding the number of bits of the register connected between TDI and DCUTDO_LPDO, the data that is input from TDI is output from DCUTDO_LPDO as is.

5. If the serial transfer sequence is corrupted, be sure to assert DCUTRST#_LPDRST#. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.

6. Data is output via DCUTDO_LPDO at the falling edge of DCUTCK_LPDCLK.

7. To facilitate debugging, route DCUTRST#_LPDRST# on the board in such a way that patterns can be easily cut.

8. For IO pins that have POCn(POWER Condition Control Register) specifications in PFC section, Boundary Scan only supports the supply voltage setting on the higher voltage side as indicated by POCn register initial value.

169. HSSTP

169.1 Overview

HSSTP (High Speed Serial Trace Port) is a replacement for existing parallel data output port suitable for transmitting high bandwidth data off-chip such as from Arm's Embedded Trace Macrocells. This will lower ASIC pin count.

169.1.1 Features

- Serial interface
  - 10Gbps*6 or 5Gbps output bandwidth through PCIE ch0

- The trace data output from following IPs:
  - Cortex-A76, Cortex-R52, System Trace Macrocell
- Supported trace format mode
  - Continuous mode*3
- Supported data width setting on TPIU*4
  - 32bit

Notes:

*3: Trace output from TPIU
When using HSSTP, please do not use either Bypass mode or Normal mode in the trace formatter of TPIU.
For more details, please refer to chapter 9 on Arm CoreSight SoC-400 r3p2 Technical Reference Manual.

*4: Please set Current Port Size Register in each TPIU.

*6: The effective throughput is 10Gbps.

169.1.2 Block Diagram

Figure 169.1 shows the block diagram of HSSTP for 2-lane.
The dotted line means the boundary of the clock domain, ZTRφ, ZSφ and PCI PIPEφ are the names of clock domains.

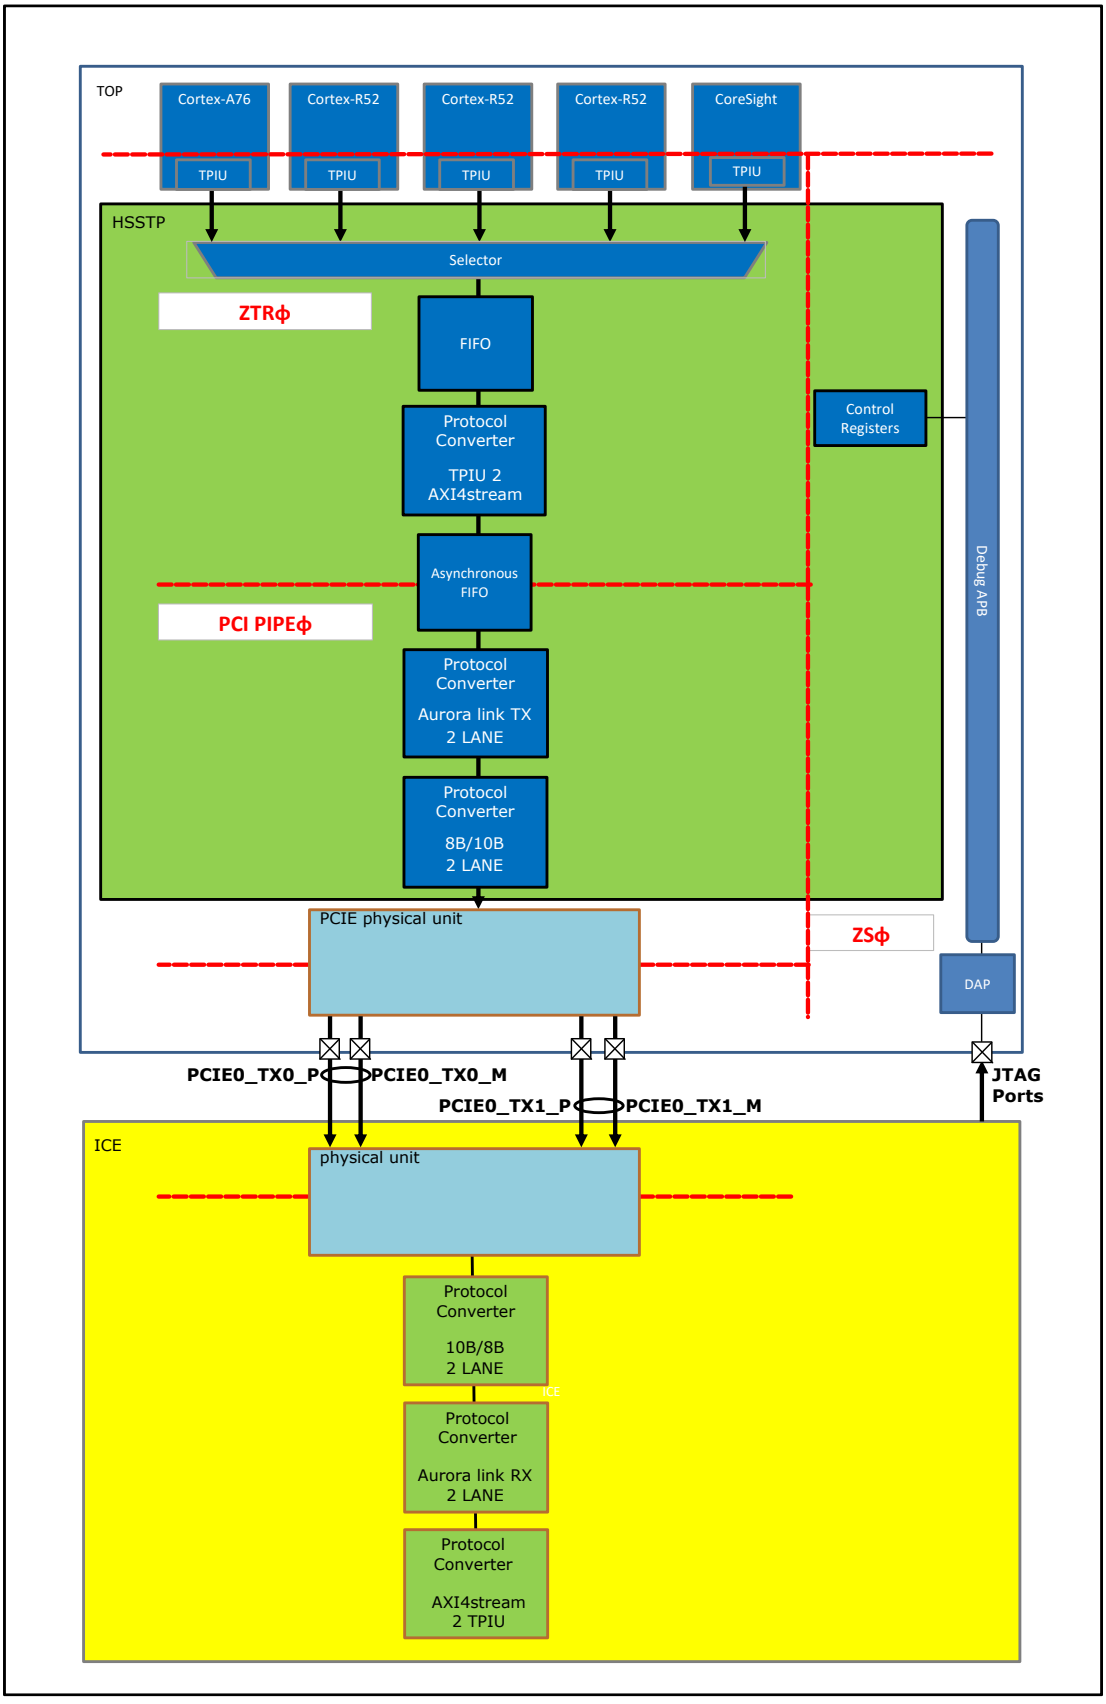

Figure 169.1 HSSTP Block Diagram when using PCIE physical unit for 2-lane

[Abbreviation in block diagram]

APB:	Advanced Peripheral Bus
DAP:	Debug Access Port
FIFO:	First-In First-Out
HSSTP:	High Speed Serial Trace Port
ICE:	In-Circuit Emulator
JTAG:	Joint Test Action Group
PCIE:	Peripheral Component Interconnect Express
RX:	Receiver
TPIU:	Trace Port Interface Unit
TX:	Transmitter

169.1.3 External Pins

(1) Serial interface Pins

HSSTP is implemented with PCIE physical unit. Since this product has 2 sets of 2-lane PCIE interface (PCIE0 as ch0, PCIE1 as ch1). When HSSTP uses a PCIE output, the PCIE function cannot be used for ch0. When using 2-lane PCIE interface, please use PCIE0. Please refer to chapter 104. PCIe Controller for more details.

169.1.4 Register Configuration

Please do not access to registers not listed below. Operations to undefined addresses are not guaranteed.

[Legend]
Initial value: Register value after a reset
-: Undefined value
R/W: Readable/writable. The written value can be read.
R: Read-only. The write value should always be the initial value.
W: Write-only. The read value is undefined.

(1) HSSTP Register Configuration

One Aurora links is installed for using 2-lane PCIE physical unit.
Register Base Address when using 2-lane PCIE physical unit:
CPU View H’F822 0000
Debugger View H’8022 0000

Table 169.1 Register summary

(1) Register Summary

(2) DBE registers configuration related to HSSTP

DBE has trace pin control and debugging status registers for chip-specific debug features. DBGREG2 and DBGREG9 in DBE are the HSSTP related registers. It is possible to write to DBGREG2 (Debug Function Selection Register), only after writing a key code to the DBGREG9 (KEY register). Please refer to the section 169.3.1 HSSTP start-up sequence for the detailed access sequence for more information.

Table 169.2 Register summary

Name of Register	Abbreviation	R/W	Address (CPU/ Debugger View)	Initial Value	Size
Debug Function Selection Register	DBGREG2	R/W	H'E610 0024	H'0000 0000	32
KEY register	DBGREG9	R/W	H'E610 0040	H'0000 0000	32

(3) Physical unit registers configuration related to HSSTP

HSSTP shares PCIE physical unit with PCIE LINK. The setting to PCIE physical unit is required before using the HSSTP function. For details of PCIE register, please refer to the section 169.3.1 (1) HSSTP with PCIE0 physical unit for 2-lane.

169.2 Register Description

This section describes the register specification not described in the Arm HSSTP Specification.

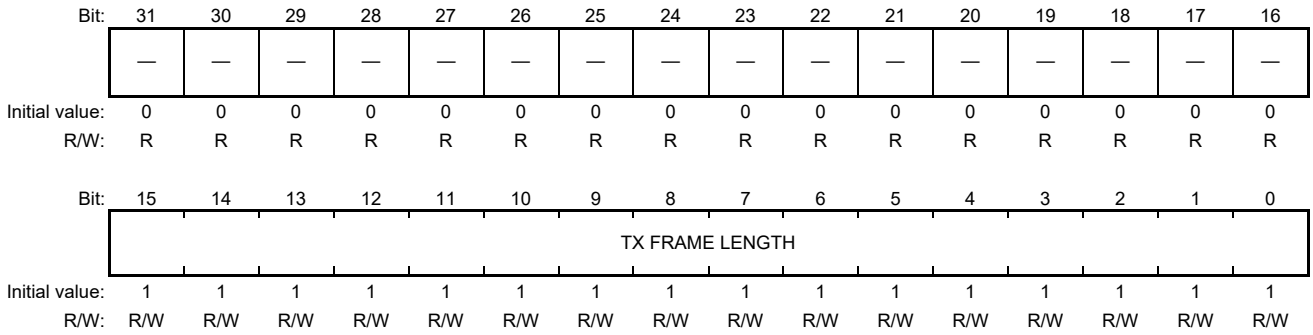
169.2.1 PHY Clock Synchronization Register 2 (PCSR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CC_DURATION					
Initial value:	0	0	0	1	1	0	1	0	0	0	0	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	Reserved	B’000	R/W	Reserved These bits are always read as initial value. The write value should always be initial value.
28	Reserved	B’1	R/W	Reserved This bit is always read as initial value. The write value should always be initial value.
27 to 24	Reserved	H’A	R/W	Reserved These bits are always read as initial value. The write value should always be initial value.
23 to 22	Reserved	B’00	R/W	Reserved These bits are always read as initial value. The write value should always be initial value.
21 to 16	CC_DURATION	H'06	R/W	The output period of Clock Compensation (CC_DURATION cycles in PCI PIPEφ)
15 to 0	Reserved	H'0000	R/W	Reserved These bits are always read as initial value. The write value should always be initial value.

169.2.2 TX FRAME LENGTH Register (TXFLR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Reserved	H'0000	R	Reserved These bits are always read as initial value. The write value should always be initial value.
15 to 0	TX_FRAME_LENGTH	H'FFFF	R/W	The frame length of Aurora frame. This bit field represents number of cycles per Aurora frame. Number of cycles per Aurora frame is INT(TX_FRAME_LENGTH/2+1). In 2-lane case, size of Aurora frame is INT(TX_FRAME_LENGTH/2+1)*4 [byte]. In 4-lane case, size of Aurora frame is INT(TX_FRAME_LENGTH/2+1)*8 [byte].

169.2.3 Trace Source Select Register (TSSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	Trace Source Select					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	Reserved	All 0	R/W	Reserved These bits are always read as initial value. The write value should always be initial value.
5 to 0	Trace_Source_Select	H'1	R/W	Trace source selection When using PCIE physical unit for 2-lane H'0: CoreSight is selected. H'1: Cortex-A76 is selected. H'2: Reserved. H'3: Cortex-R52 #0 is selected. H'4: Cortex-R52 #1 is selected. H'5: Cortex-R52 #2 is selected. Others: Reserved for future use.

169.2.4 Aurora PHY Control Register (APCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TISD REN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	Reserved	All 0	R	Reserved for future use.
28 to 24	Reserved	All 0	R/W	Reserved for future use.
23 to 17	Reserved	All 0	R	Reserved for future use.
16	Reserved	0	R/W	Reserved for future use.
15 to 9	Reserved	All 0	R	Reserved for future use.
8	Reserved	0	R/W	Reserved for future use.
7 to 4	Reserved	All 0	R	Reserved for future use.
3	TISDREN	0	R/W	Tx Driver Enable 0: Disabled (default) 1: Enabled
2 to 0	Reserved	All 0	R	Reserved for future use.

169.2.5 Aurora PHY Status Register (APSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	COSPLOCK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	Reserved	All 0	R	Reserved for future use.
0	COSPLOCK	0	R	PLL Lock Detect 0: Unlocked 1: Locked

169.2.6 PLL Lock Management Register (PLMR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	Reserved	All 0	R	Reserved for future use.
0	LTS	0	R/W	Reserved for future use.

169.2.7 Mode Control Register (MCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	Reserved	All 0	R/W	Reserved for future use.
5 to 4	ECP_lane_select	* B’00	R/W	B’00: ECP is output from Lane0. (Set this value when CRC is embedded.) B’01: ECP is output from Lane1. (Set this value When CRC is not embedded.) B’10: Reserved. B’11: Reserved.
3	CRC_octets	B’0	R/W	B’0: (Set this value when CRC is embedded.) B’1: (Set this value when CRC is not embedded.)
2	CRC_EN	B’1	R/W	B’0: CRC is not embedded in trace data frame. B’1: CRC is embedded in trace data frame.
1 to 0	Reserved	All 0	R/W	Reserved. These bits are always read as initial value. The write value should always be initial value.

169.3 Operation

The HSSTP start-up sequence is described in this section.

169.3.1 HSSTP start-up sequence

(1) HSSTP with PCIE0 physical unit for 2-lane

Table 169.3 Start-up sequence for HSSTP with PCIE0 physical unit

Procedure		Software Setting	HSSTP Status	PCIE physical unit Status	Note
Category	No				
PCIE physical unit Initialization.	0	PCIe Reference Clock Gen setting (depends on board)	Stopped	Power Down	-
	1	DBE setting for PCIE physical unit selection. DBGREG9 (KEY Register) Address: 0xE6100040 Write 0x0000A500 to DBGREG9 (1st step to allow the access to DBGREG2) Write 0x0000A501 to DBGREG9 (2nd step to allow the access to DBGREG2) DBGREG2 (Debug Function Selection Register) Address: 0xE6100024 Write 0b01 to Bit [1:0] (for using PCIE0 physical unit)	Stopped	Power Down	DAP accesses via AXI-AP.
	2	Release MSTP on PCIE0 physical unit MSTPCR6 Address: 0xE6152D18 Prepare the write value for the following steps: 1. Read MSTPCR6. We call the value (A). 2. Clear Bit [24] of (A) to 0. We call the value (B). 3. Inverse all bits of (B). We call the value (C). CPGWPR Address: 0xE6150000 Write (C) to CPGWPR MSTPCR6 Address: 0xE6152D18 Write (B) to MSTPCR6 MSTPSR6 Address: 0xE6152E18 Poll Bit [24] until 0 (for confirming MSTP release)	Stopped	Power Down	DAP accesses via AXI-AP.
	3	PCIE physical unit mode setting Step1. PCIE physical unit 2-lane mode PCIEMSR0 Address: 0xE65D6200 Write 0x00000011 Step2. PCIE0 physical unit reset negate SRSTCLR6 Address: 0xE6152C98 Prepare the write value for the following steps: 1. Prepare 0x00000000 as (A) 2. Set Bit [24] of (A) to 1. We call the value (B). 3. Inverse all bits of (B). We call the value (C). CPGWPR Address: 0xE6150000 Write (C) to CPGWPR SRSTCLR6 Address: 0xE6152C98 Write (B) to SRSTCLR6 Step3. Start initialization sequence on PCIE0 physical unit PCIE0 PHY RSTCTRL1 Address: 0xE65D6214 Write 0x00000000	Stopped	Mode setting and reset clear	DAP accesses via AXI-AP.
	4	PCIE0 LINK setting Step1. PLL lock PCIE0 MPLLABCTRL2P0 Address: 0xE65D70C4 Poll Bit [5] until 1 Bit [4] indicates that the PLL for PCIE physical unit is locked. Step2. Physical unit ready PCIE0 TRNSREQP0 Address: 0xE65D7020 Poll Bit [3:2] until 0b00 Bit [3:2] indicates that PCIE physical unit is ready.	Stopped	PLL on PCIE physical unit locked.	DAP accesses via AXI-AP.

Procedure Category	No	Software Setting	HSSTP Status	PCIE physical unit Status	Note
	5	PCIE0 physical unit setting * If the clock frequency of Aurora link does not have to be changed from 125MHz, this item is not necessary. PCIE0 PHY CNFGP0 Address: 0xE65D62C4 Write 0b0101 to Bit [11:8] Write 0b1010 to Bit [3:0] Bit [11:10] is clock frequency of lane-1 Bit [9:8] is clock frequency of lane-0 0b01: 250MHz, 0b00: 125MHz (The clock frequency is changed from 125MHz (5Gbps) to 250MHz (10Gbps).) Bit [3:2] is width of lane-1 Bit [1:0] is width of lane-0 0b10: 32bit PCIE0 PHY TXACKSTSCLR Address: 0xE65D7104 Write 0x00010001 PCIE0 PHY OVRDEN2 Address: 0xE65D71BC Write 12'hFFF to Bit [29:18]	Stopped	PLL on PCIE physical unit locked.	DAP accesses via AXI-AP.
	7	PHYENABLE assert (software setting) APCR offset: 0x630 Write 1 to Bit [3]	Stopped	PLL on PCIE physical unit locked.	-
	8	Poll COSPLLLOCK APSR offset: 0x638 Poll Bit [0] until 1 (PLL Lock Detection)	Stopped	PLL on PCIE physical unit locked.	
HSSTP Initialization	9	STP_PWRUP assert STPCR offset: 0x504 Write 1 to Bit [0]	/SP/ is sent to PCIE physical unit. (/SP/=/K28.5/D10.2/D10.2/D10.2)	/SP/ is sent to the outside of the LSI.	-
	10	Register initial setting Update the settings upon necessity. PCSR offset: 0x50C Bit [15:0] is clock compensation (CC) generation interval. Initial value: 0x2710 CC is inserted every 0x2710*2 Byte data out. LLIR offset: 0x510 Bit [30:22] is VERIFY_LEN. Bit [21:13] is BOND_LEN. Bit [12:0] is ALIGN_LEN. Initial value: 0x20201370 VERIFY_LEN: 0x080 BOND_LEN: 0x100 ALIGN_LEN: 0x1370 LLIR2 *4 offset: 0x51C Bit [15:12] is VERIFY_MUL. Bit [11:8] is BOND_MUL. Bit [7:4] is ALIGN_MUL. Initial value: 0x00000401 VERIFY_MUL: 0x0 BOND_MUL: 0x4 ALIGN_MUL: 0x0 TSSR offset: 0x5C0 Bit [3:0] is Trace Source Select 0x0: System Trace Macrocell is selected. 0x1: Cortex-A76 (Initial value) 0x2: Reserved. 0x3: Cortex-R52 #0 is selected. 0x4: Cortex-R52 #1 is selected. 0x5: Cortex-R52 #2 is selected. PCSR2 offset: 0x540 Bit [21:16] is the output period of the CC. Initial value: 0x06 TXFLR offset: 0x544 Bit [15:0] is frame size Initial value: 0xFFFF MCR offset: 0x550 With CRC Bit [7:0] 0x04 Without CRC Bit [7:0] 0x18	/SP/ is sent to PCIE physical unit. (/SP/=/K28.5/D10.2/D10.2/D10.2)	/SP/ is sent to the outside of the LSI.	-

Procedure Category	No	Software Setting	HSSTP Status	PCIE physical unit Status	Note
	11	STP_nRST negate STPCR offset: 0x504 Write 1 to Bit [2] * Please don't control both STP_PWRUP and STP_nRST at the same time.	Align + Verify started	/SP/ is sent to the outside of the LSI.	-
	12	Poll LANE_UP STPSR offset: 0x500 Poll Bit [0] until 1 (LANE_UP [0])	Align completed (Verification pattern = /V/I/I/I/)	Verification pattern is sent to the outside of the LSI.	-
	13	Poll CHANNEL_UP STPSR offset: 0x500 Poll Bit [6] until 1 (CHANNEL_UP [0])	Verify completed /I/ pattern is sent to PCIE physical unit. A clock compensation (CC) pattern is inserted in transmission data.	/I/ pattern is sent to the outside of the LSI.	If VERIFICATION PATTERN is not recognized by RX (ICE) side and CHANNEL_UP is not asserted, the following procedure should be executed. (1) Assert STP_nRST (2) ALIGN_LEN and VERIFY_LEN (3) Go back to procedure No.11 “STP_nRST negate”
Trace Transmission Setting	14	STP_nSWRST negate STPCR offset: 0x504 Write 1 to Bit [3]	Releasing reset to TPIU interface	/I/ pattern is sent to the outside of the LSI.	-
	15	STP_EN assert STPCR offset: 0x504 Write 1 to Bit [1]	Ready to receive the trace information from TPIU	/I/ pattern is sent to the outside of the LSI.	-
Coresight Trace Setting	-	Transmission setting of the TPIU It is possible to set the procedure either before No.9 “STP_PWRUP assert” or after No.15 “STP_EN assert” because clock is supplied to all TPIU. If it is set before No.9, TPIU output will start after assertion of STP_EN. If it is set after No.15, TPIU output will start immediately.	The trace data received from selected TPIU, and sent to PCIE physical unit.	The trace data received from HSSTP begins to send to the outside of the LSI.	-

169.4 Usage Notes

It is prohibited to change DBGREG2 to change the PCIE physical unit selection while STPCR Bit [2] (nRST) is NOT zero.

169.5 Safety Mechanisms

No description on this section.

170. Debug and Trace

170.1 Overview

This module provides the debug and trace function for the processors including Cortex CPUs.

170.1.1 Features

- JTAG interface
  - Supports dedicated 5-pin JTAG and LPD[*1] (1.8V interface)
  - Additional pin-multiplexed 1-JTAG port (3.3V interface)
    - JTAG I/F for PAP
    - The JTAG I/F for GPU is not supported in R-Car V4H and V4M.
- The cross trigger function between following IPs:
  - Cortex-A76
  - Cortex-R52
  - VDSP 0/1
  - IMP DTA
  - CoreSight
  - ICUMX
- Tracing function
  - 10Gbps or 5Gbps HSSTP output bandwidth through PCIe 2-lane[*2] (full run mode only)
  - 32Gbps or 16Gbps ETR output bandwidth through PCIe 2-lane[*4] (full run mode only)
    - Trace capture using external DRAM via ETR (low power mode only)
  - 32-Kbyte embedded trace FIFO for Cortex-A76 CPU cluster
  - 32-Kbyte embedded trace FIFO for Cortex-R52
  - 32-Kbyte embedded trace FIFO for CoreSight
  - 16-Kbyte embedded trace FIFO for VDSP
  - System Trace Macrocell (ISP/MTI, AXI Masters, IMP DTA)
    - An additional STM for IMP DTA
    - STM3 for MTI isn't used in R-Car V4H and V4M.
  - CRC calculation for trace data
- Secure debug
  - Debugging is disabled if ICUMX and Life Cycle are used in Secure LCS[*6] and it can be enabled with secure debugging authentication.
  - Secure debug authentication is performed with ICUMX via Main-JTAG. Sub-JTAG is disconnected until the authentication completes.
  - On Chip Debug ID (OCDID) authentication. Debugger can't be connected unless this ID authentication passes.
  - JTAG debugger connection isn't allowed when the FUSE bit named 'fuse_jtag_debug_disable' is set to 1.

Note:
*1: LPD stands for Low Pin Debug, which is used for ICUMX
*2: Available bandwidth selectable from either 5Gbps per lane or 2.5Gbps per lane

*4: Available bandwidth selectable from either 16Gbps per lane or 8Gbps per lane
*6: ICUMX and Life Cycle define Life Cycle State (LCS). Secure (SE) LCS is one of Life Cycle states.

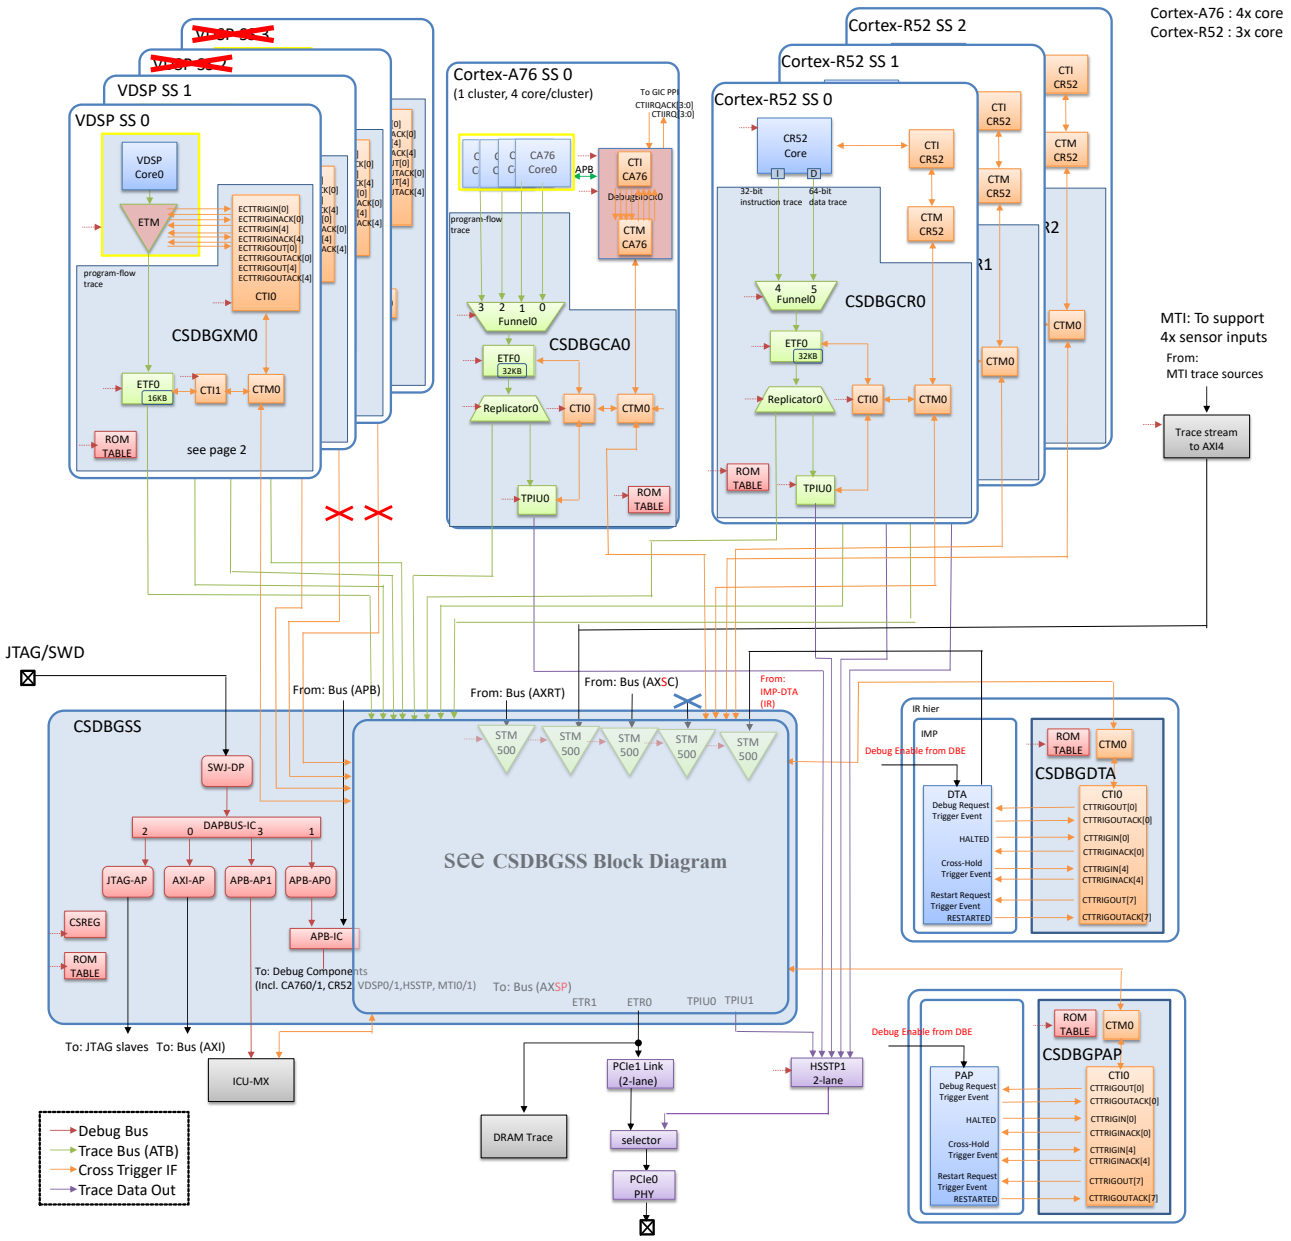

Figure 170.1 CoreSight Sub-System Block Diagram

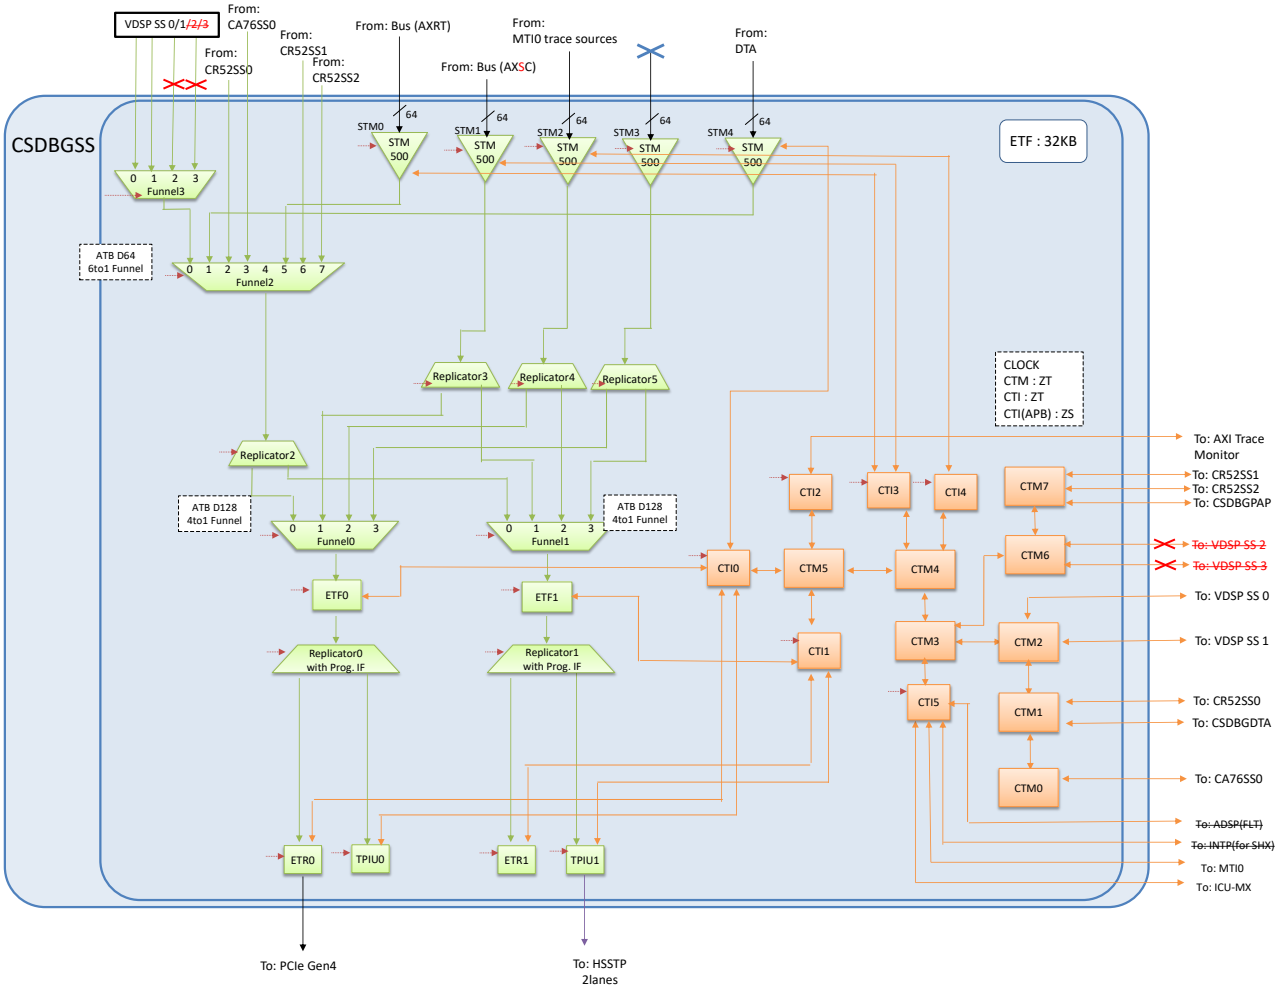

Figure 170.2 CSDBGSS Block Diagram

170.1.3 JTAG Pins

5-pin JTAG and SWD are supported as dedicated JTAG port. Sub-JTAG is additional JTAG ports as pin-multiplexed pins. Main-JTAG ports support 1.8V only. Sub-JTAG ports support 3.3V only. Each JTAG port can be connected to different TAP controller through MD pins. Refer to JTAG selection tables in Table 170.1.

Table 170.1 JTAG pin and LPD pin for R-Car V4H and V4M

IF	Pin name	I/O	Function			
			JTAG IF	JTAG IF for ICUMX	LPD IF for ICUMX	SWD
Main-JTAG	DCUTRST#_LPDRST#	Input	TRST#	DCUTRST#	LPDRST#	-
	DCUTCK_LPDCLK	Input	TCK	DCUTCK	LPDCLK	SWCLK
	DCUTMS	I/O	TMS	DCUTMS	-	SWDIO
	DCUTDI_LPDI	Input	TDI	DCUTDI	LPDI	-
	DCUTDO_LPDO	Output	TDO	DCUTDO	LPDO	-
	DCURDY#_LPDCLKOUT	Output	-	DCURDY#	LPDCLKOUT	-
Sub-JTAG	RXDB_EXTFXR	Input	TRST#	-	-	-
	TPU0TO1	Input	TCK	-	-	SWCLK
	FXR_TXDB	I/O	TMS	-	-	SWDIO
	CANFD2_TX	Input	TDI	-	-	-
	TPU0TO0	Output	TDO	-	-	-
	FXR_TXENB#	Output	-	-	-	-

170.1.4 Register Configuration

Do not write to addresses other than those listed below, otherwise normal operation cannot be guaranteed. Values read from other addresses are undefined.

[Legend]
Initial value: Register value after a reset
-: Undefined value
R/W: Readable/writable. The written value can be read.
R: Read-only. The write value should always be the initial value.
-/W: Write-only. The read value is undefined.

(2) CSreg Register Configurations

CSreg is the collection of control registers for chip-specific debug features. These registers can be accessed from both Debugger and CPU via Debug-APB.

Table 170.3 CSreg register configurations

Name of Register	R/W	CPU view Address	Debugger view Address	Initial Value	Access Size
PMUSNAPSHOTREQ Register	R/W	H' F81F 0800	H' 801F 0800	H'0000 0000	32
PMUSNAPSHOTACK Register	R	H' F81F 0804	H' 801F 0804	H'0000 000X	32
CSREG_E00 Register	R/W	H' F81F 0E00	H' 801F 0E00	H'0000 001F	32

(3) TDBG Register Configurations

TDBG is the collection of trace pin control registers and debugging status registers for chip-specific debug features. Only after write operation to the KEY bit in DBGREG9 is done, it is possible to write to DBGREG2. Note that asserting KEY bit in DBGREG9 register requires two phases of writing as describing in section 170.2.20

Table 170.4 TDBG register configurations

Name of Register	Abbreviation	R/W	Address (CPU/ Debugger View)	Initial Value	Access Size
Debug Register 1	DBGREG1	R	H'E610 0020	H'X00X 0000*	32
Debug Register 2	DBGREG2	R/W	H'E610 0024	H'0000 0000	32
Debug Register 4	DBGREG4	R	H'E610 002C	H'00XX XXXX*	32
Debug Register 9	DBGREG9	R/W	H'E610 0040	H'0000 0000	32

* The initial value is determined by input of LSI pin.

170.1.5 Connected Module

Table 170.5 Connected module

Module name	Connected module name	Function of connected module
CoreSight	AP-System Core	Processor
	Arm Realtime Core	Processor
	IMP	Image recognition engine
	HSSTP	High Speed Serial Trace Port
	CPG	Clock Pulse Generator
	PFC	Pin function
	PAP	PAP-System
	MTI	Measurement Transmission Interface
	ICUMX	Processor
	VDSP	Processor

170.1.6 Part Number and TARGETID

Part number is a product identification. This number is stored in Peripheral Identification Registers of ROM Table and TARGETID Register. Debugger reads those registers to identify the product. Each product has unique value of part number as shown in Table 170.6:

Note: Refer to Arm CoreSight Architecture Specification v2.0 for more detail information.

Table 170.6 Part Number and TARGETID

Forth Generation of R-Car Series Products	Part Number	TARGETID
R-Car V4M	H'051	H'0051 0447

170.2 Register Description

170.2.1 CoreSight & CPU Debug Resource Registers

Refer to following manuals for generic CoreSight components.

- Arm Architecture Reference Manual, Armv8 for ARMv8-A architecture profile (ARM DDI 0487B.b)
- Arm DynamIQ Shared Unit Technical Reference Manual (ARM 100453_0401_03_en, Revision: r4p1)
- Arm Cortex-R52 Processor Technical Reference Manual (ARM 100026_0103_00_en, Revision: r1p3)
- Arm CoreSight SoC-400 Technical Reference Manual (ARM 100536_0302_01_en, Revision: r3p2)
- Arm CoreSight Trace Memory Controller Technical Reference Manual (ARM DDI 0451, Revision: r0p1)
- Arm CoreSight STM-500 System Trace Macrocell Technical Reference Manual (ARM DDI 0528B, Revision: r0p1)

170.2.2 PMUSNAPSHOTREQ Register

Address CPU view: H' F81F 0800 Debugger view: H' 801F 0800

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									-	-	-	-	-	-	-	CA760_ DSU0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	Reserved	H'0000_000	R/W	Reserved
0	CA760_DSU0	0	R/W	Write signal value of PMUSNAPSHOTREQ to CA760 DSU0

170.2.3 PMUSNAPSHOTACK Register

Address CPU view: H' F81F 0804 Debugger view: H' 801F 0804

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									-	-	-	-	-	-	-	CA760_ DSU0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	-	-	-	-
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	Reserved	H'0000_000	R	Reserved
0	CA760_DSU0	-	R	Read signal value of PMUSNAPSHOTACK from CA760 DSU0

170.2.4 CSREG_E00 Register

Address CPU view: H' F81F 0E00 Debugger view: H' 801F 0E00

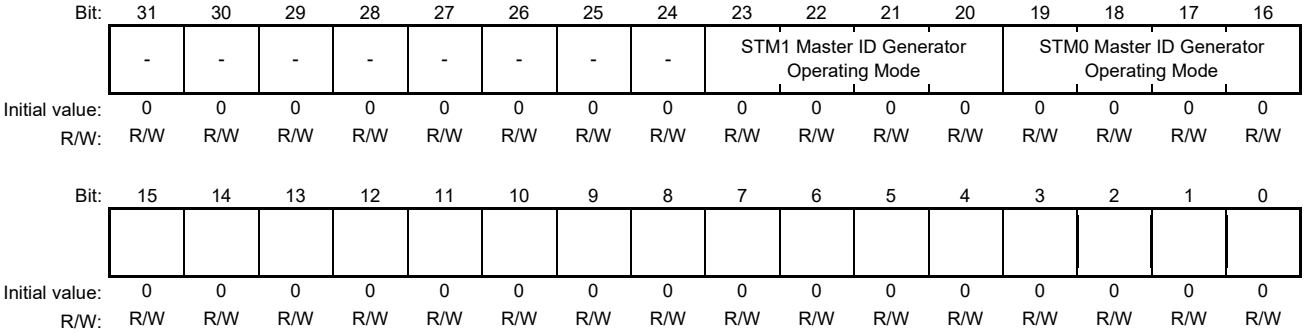
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	STM4 FIXED AWBURST enable	STM3 FIXED AWBURST enable	STM2 FIXED AWBURST enable	STM1 FIXED AWBURST enable	STM0 FIXED AWBURST enable
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	H'00000000	R/W	Reserved
4	STM4_FIXED_AWBURST_enable	B'1	R/W	Override AWBURST at input of STM4 to FIXED type. 0: disable 1: enable
3	STM3_FIXED_AWBURST_enable	B'1	R/W	Override AWBURST at input of STM3 to FIXED type. 0: disable 1: enable
2	STM2_FIXED_AWBURST_enable	B'1	R/W	Override AWBURST at input of STM2 to FIXED type. 0: disable 1: enable
1	STM1_FIXED_AWBURST_enable	B'1	R/W	Override AWBURST at input of STM1 to FIXED type. 0: disable 1: enable
0	STM0_FIXED_AWBURST_enable	B'1	R/W	Override AWBURST at input of STM0 to FIXED type. 0: disable 1: enable

170.2.5 CSREG_E01 Register

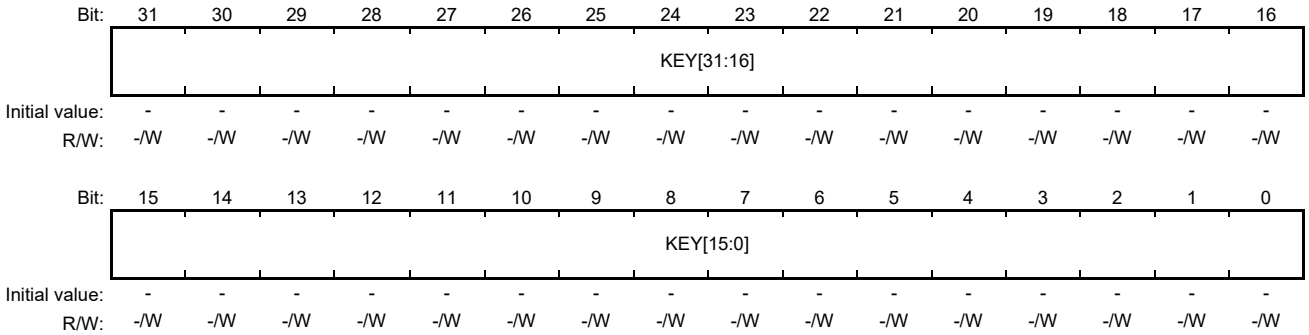
Address CPU view: H' F81F 0E04 Debugger view: H' 801F 0E04



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Reserved	H'00	R/W	Reserved
23 to 20	STM1_Master_ID_Generator_Operating_Mode	H'0	R/W	4'b0000: Normal Mode 4'b0001: Burst Mode
19 to 16	STM0_Master_ID_Generator_Operating_Mode	H'0	R/W	See above
15 to 0	Reserved	H'00	R/W	Reserved

170.2.6 LOCKACCESS Register

Address CPU view: H' F81F 0FB0 Debugger view: H' 801F 0FB0



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	KEY[31:0]	-	W	Lock Access Register. See CoreSight Architecture Specification

170.2.7 LOCKSTATUS Register

Address CPU view: H' F81F 0FB4 Debugger view: H' 801F 0FB4

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	JEP106 ID code[3:0]				Part No.1[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	H'000000	R	Reserved
7 to 4	JEP106_ID_code[3:0]	H'3	R	JEDEC code
3 to 0	Part_No.1[3:0]	H'F	R	part number of the component

170.2.10 Peripheral ID2 Register

Address CPU view: H' F81F 0FE8 Debugger view: H' 801F 0FE8

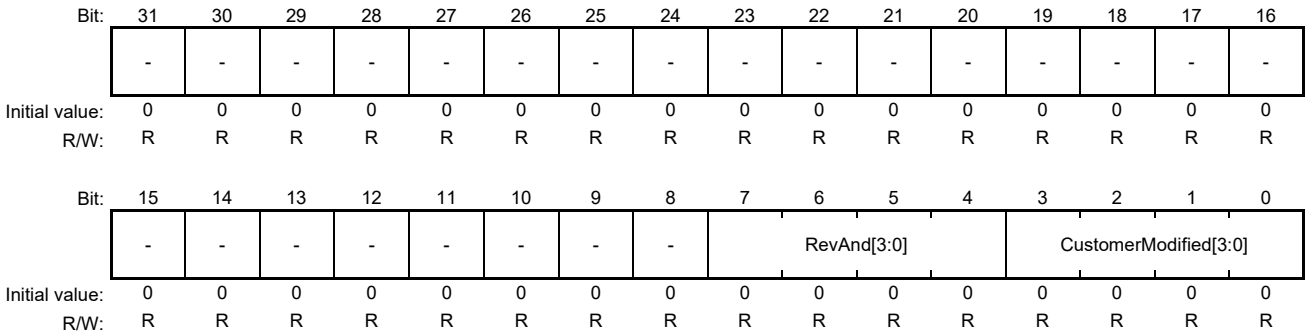
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Rev[3:0]				-	JEP106 ID code[6:4]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 4	Rev[3:0]	H’1	R	Revision
3	—	B'1	R	
2 to 0	JEP106_ID_code[6:4]	H'2	R	JEDEC code

170.2.11 Peripheral ID3 Register

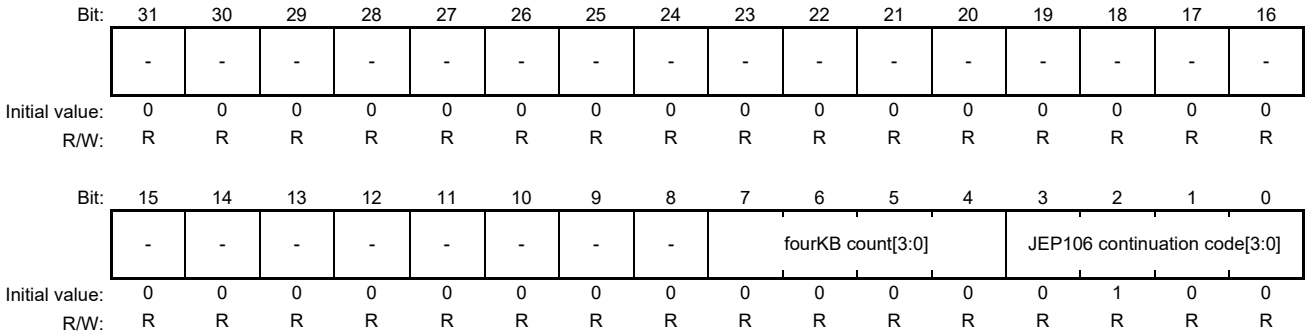
Address CPU view: H' F81F 0FEC Debugger view: H' 801F 0FEC



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 4	RevAnd[3:0]	H'0	R	Indicates that there are no errata fixes to this component
3 to 0	CustomerModified[3:0]	H'0	R	Indicates that the customer has not modified this component

170.2.12 Peripheral ID4 Register

Address CPU view: H' F81F 0FD0 Debugger view: H' 801F 0FD0



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 4	fourKB_count[3:0]	H'0	R	Indicates that the device only occupies 4KB of memory
3 to 0	JEP106_continuation_code[3:0]	H'4	R	JEDEC code

170.2.13 Component ID0 Register

Address CPU view: H' F81F 0FF0 Debugger view: H' 801F 0FF0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Preamble[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 0	Preamble[7:0]	H'0D	R	component identification code

170.2.14 Component ID1 Register

Address CPU view: H' F81F 0FF4 Debugger view: H' 801F 0FF4

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Component class[3:0]				Preamble[3:0]			
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 4	Component_class[3:0]	H'F	R	Class of the component
3 to 0	Preamble[3:0]	H'0	R	component identification code

170.2.15 Component ID2 Register

Address CPU view: H' F81F 0FF8 Debugger view: H' 801F 0FF8

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Preamble[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 0	Preamble[7:0]	H'05	R	component identification code

170.2.16 Component ID3 Register

Address CPU view: H' F81F 0FFC Debugger view: H' 801F 0FFC

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	Preamble[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	1	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'000000	R	Reserved
7 to 0	Preamble[7:0]	H'B1	R	component identification code

170.2.17 Debug Register 1 (DBGREG1)

This register is intended to reflect the values entered into external pins. The values for external pins are set when initialization is performed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MD11	MD10	MD21	MD20	-	-	-	-	-	-	-	-	-	-	-	MDT[0]
Initial value:	Undefined	Undefined	Undefined	Undefined	0	0	0	0	0	0	0	0	0	0	0	Undefined
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	MD11	Undefined	R	The value of the MD11 pin input is reflected in the initial value.
30	MD10	Undefined	R	The value of the MD10 pin input is reflected in the initial value.
29	MD21	Undefined	R	The value of MD21 pin input is reflected in the initial value.
28	MD20	Undefined	R	The value of MD20 pin input is reflected in the initial value.
27 to 18	-	All 0	R	Reserved These bits are always read as 0.
17	-	0	R	Reserved This bit is always read as 0.
16	MDT[0]	Undefined	R	The value of the MDT0 pin input is reflected in the initial value.
15 to 0	-	All 0	R	Reserved These bits are always read as 0.

170.2.18 Debug Register 2 (DBGREG2)

This register is for setting the PCIe Trace port to enable or disable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
															DMON2EN	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 2	-	All 0	R	Reserved Initial value = all 0.
1 to 0	DMON2EN	All 0	R/W	Selects the 2-lane HSSTP or not used 11: Reserved 10: Reserved 01: 2-lane HSSTP uses PCIE port0 trace output 00: PCIE trace output isn't used by HSSTP

170.2.19 Debug Register 4 (DBGREG4)

This is a status register showing debug features are enable or disable. It is possible to perform read operations only from the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	CRIMP_HNIDEN	CRIMP_HIDEN	CRIMP_NIDEN	CRIMP_DBGEN	PAP_NIDEN	PAP_DBGEN	DTA_NIDEN	DTA_DBGEN	VDSP_SPNIDEN	VDSP_SPIDEN	VDSP_NIDEN	VDSP_DBGEN
Initial value:	0	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved These bits are always read as 0.
27	CRIMP_HNIDEN	*1	R	Indicates disable or enable of the HNIDEN of Cortex-R52 2(for IMP). 0: Disable 1: Enable
26	CRIMP_HIDEN	*1	R	Indicates disable or enable of the HIDEN of Cortex-R52 2(for IMP). 0: Disable 1: Enable
25	CRIMP_NIDEN	*1	R	Indicates disable or enable of the NIDEN of Cortex-R52 2(for IMP). 0: Disable 1: Enable
24	CRIMP_DBGEN	*1	R	Indicates disable or enable of the DBGEN of Cortex-R52 2(for IMP). 0: Disable 1: Enable
23	PAP_NIDEN	*1	R	Indicates disable or enable of the NIDEN of PAP. 0: Disable 1: Enable
22	PAP_DBGEN	*1	R	Indicates disable or enable of the DBGEN of PAP. 0: Disable 1: Enable
21	DTA_NIDEN	*1	R	Indicates disable or enable of the NIDEN of DTA. 0: Disable 1: Enable
20	DTA_DBGEN	*1	R	Indicates disable or enable of the DBGEN of DTA. 0: Disable 1: Enable

Bit	Bit Name	Initial Value	R/W	Description
19	VDSP_SPNIDEN	*1	R	Indicates disable or enable of the SPNIDEN of VDSP. 0: Disable 1: Enable
18	VDSP_SPIDEN	*1	R	Indicates disable or enable of the SPIDEN of VDSP. 0: Disable 1: Enable
17	VDSP_NIDEN	*1	R	Indicates disable or enable of the NIDEN of VDSP. 0: Disable 1: Enable
16	VDSP_DBGEN	*1	R	Indicates disable or enable of the DBGEN of VDSP. 0: Disable 1: Enable
15 to 13	-	All 0	R	Reserved These bits are always read as 0.
12	CS_DEVEN	*1	R	Indicates disable or enable of the DAP_DEVICEEN of CoreSight. 0: Disable 1: Enable
11	CS_SPNIDEN	*1	R	Indicates disable or enable of the SPNIDEN of CoreSight. 0: Disable 1: Enable
10	CS_SPIDEN	*1	R	Indicates disable or enable of the SPIDEN of CoreSight. 0: Disable 1: Enable
9	CS_NIDEN	*1	R	Indicates disable or enable of the NIDEN of CoreSight. 0: Disable 1: Enable
8	CS_DBGEN	*1	R	Indicates disable or enable of the DBGEN of CoreSight. 0: Disable 1: Enable
7	CR_HNIDEN	*1	R	Indicates disable or enable of the HNIDEN of Cortex-R52 0, Cortex-R52 1. 0: Disable 1: Enable
6	CR_HIDEN	*1	R	Indicates disable or enable of the HIDEN of Cortex-R52 0, Cortex-R52 1. 0: Disable 1: Enable
5	CR_NIDEN	*1	R	Indicates disable or enable of the NIDEN of Cortex-R52 0, Cortex-R52 1. 0: Disable 1: Enable
4	CR_DBGEN	*1	R	Indicates disable or enable of the DBGEN of Cortex-R52 0, Cortex-R52 1. 0: Disable 1: Enable
3	CA_SPNIDEN	*1	R	Indicates disable or enable of the SPNIDEN of Cortex-A76. 0: Disable

Bit	Bit Name	Initial Value	R/W	Description
				1: Enable
2	CA_SPIDEN	*1	R	Indicates disable or enable of the SPIDEN of Cortex-A76. 0: Disable 1: Enable
1	CA_NIDEN	*1	R	Indicates disable or enable of the NIDEN of Cortex-A76. 0: Disable 1: Enable
0	CA_DBGEN	*1	R	Indicates disable or enable of the DBGEN of Cortex-A76. 0: Disable 1: Enable

Note: *1 Depends on the setting of the MD21, MD20, MD11,MD10,MDT[1:0] pins and Security state.

170.2.20 Debug Register 9 (DBGREG9)

This register has a key role in preventing invalid access. It is possible to perform read/write operations only from the CPU. DBGREG2 can only be written when the KEY bit in DBGREG9 is updated as below procedure.

First, write H'A500 to DBGREG9[15:0]. This enables to write to DBGREG9[0]. Then, write H'A501 to DBGREG9[15:0]. After this writing is done, DBGREG2 can be written.

It is recommended to clear the KEY bit in DBGREG9 after finishing writing to DBGREG2. To clear KEY bit in DBGREG9, write H'0000_0000 to DBGREG9.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AID[7:0]								-	-	-	-	-	-	-	KEY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	AID[7:0]	H'00	R/W	KEY Bit Write Aid Use this bit to write a bit pattern (H'A5) to be written to the KEY bit.
7 to 1	-	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	KEY	0	R/W	DBGREG2 access control Provides access control to the DBGREG2. 0: It is not possible to perform write operations to the DBGREG2. 1: It is possible to perform write operations to the DBGREG2. When writing 1 to this bit, be sure to write H'A5 to the AID bits at the same time.

170.3 Operation

170.3.1 JTAG Selection

When LCS is not Secure LCS, both Main-JTAG and Sub-JTAG can be selected through MD pins.

-: No connection with TAP controller

*1: Don't care

Table 170.7 JTAG selection table (LCS is NOT equal to Secure LCS)

MDT0	MD21	MD20	MD11	MD10	Main-JTAG	Sub-JTAG
0	0	0	0	0	-	Normal Function
				1	Reserved	Reserved
			1	0	ICUMX JTAG	Normal Function
				1	ICUMX LPD	Normal Function
		1	0	0	ICUMX JTAG	CoreSight
				1	ICUMX LPD	CoreSight
			1	*1	Reserved	Reserved
	1	0	0	0	CoreSight	Normal Function
				1	Reserved	Reserved
			1	*1	Reserved	Reserved
		1	*1	*1	Reserved	Reserved
1	0	0	0	0	VDSP0	Normal Function
				1	VDSP1	Normal Function
			1	0	Reserved	Reserved
				1	Reserved	Reserved
		1	0	0	CoreSight	VDSP0
				1	CoreSight	VDSP1
			1	0	Reserved	Reserved
				1	Reserved	Reserved
	1	0	0	0	PAP	Normal Function
				1	Reserved	Reserved
			1	*1	Reserved	Reserved
		1	0	0	CoreSight	PAP
				1	Reserved	Reserved
			1	*1	Reserved	Reserved

When LCS is Secure LCS, Main-JTAG can be selected through MD pins and debug authentication is performed via Main-JTAG.

-: No connection with TAP controller

*1: Don't care

*2: Sub-JTAG is disconnected during the authentication. After the authentication, Sub-JTAG is connected and internal debug authentication signals are asserted.

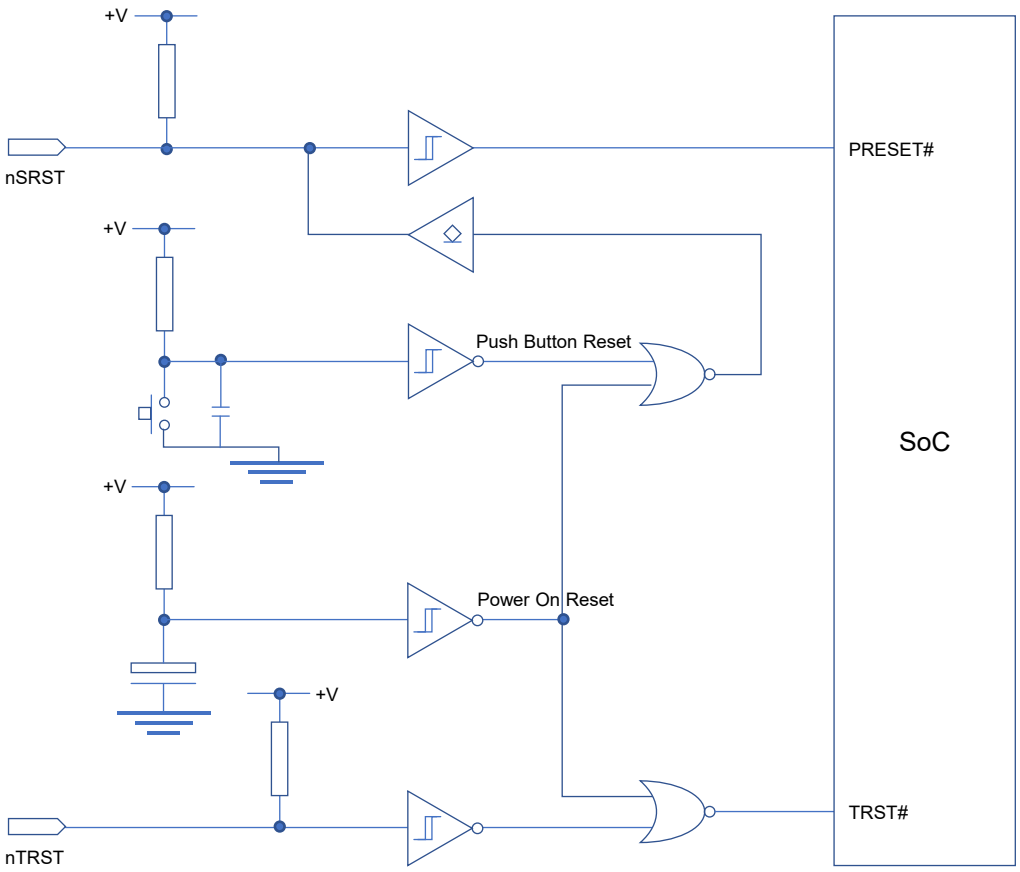
*3: VDSPs and PAP don't have authentication register. They can't be connected to main-JTAG.

Table 170.8 JTAG selection table (LCS is equal to Secure LCS)

MDT0	MD21	MD20	MD11	MD10	Main-JTAG	Sub-JTAG
0	0	0	0	0	-	Normal Function
				1	Reserved	Reserved
			1	0	ICUMX JTAG	Normal Function
				1	ICUMX LPD	Normal Function
		1	0	0	ICUMX JTAG	*2
				1	ICUMX LPD	*2
			1	*1	Reserved	Reserved
	1	0	0	0	CoreSight	Normal Function
				1	Reserved	Reserved
			1	*1	Reserved	Reserved
		1	*1	*1	Reserved	Reserved
1	0	0	0	*1	*3	Reserved
			1	*1	Reserved	Reserved
		1	0	0	CoreSight	*2
				1	CoreSight	*2
			1	*1	Reserved	Reserved
	1	0	0	0	*3	Reserved
				1	Reserved	Reserved
			1	*1	Reserved	Reserved
		1	0	0	CoreSight	*2
				1	Reserved	Reserved
			1	*1	Reserved	Reserved

170.3.2 JTAG Reset Circuit Logic

When designing a target hardware on which the debugger can be used, a pull-up resistor must be included on both PRESET# and TRST# signals. Apply a low level to TRST# at power-on.



Example Reset Circuit Logic

The table shows the pin processing for TRST# pin on both Main-JTAG and Sub-JTAG.

MDT0	MD21	MD20	MD11	MD10	Main-JTAG	Sub-JTAG	Debugger connection required or not	TRST# Pin Processing	Debugger connection required or not	TRST# Pin Processing
							Main-JTAG	Main-JTAG	Sub-JTAG	Sub-JTAG
0	0	0	0	0	-	Normal Function	Do not connect	PU, PD or OPEN *3	Do not connect	*4
				1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
			1	0	ICUMX JTAG	Normal Function	Connect	*2	Do not connect	*4
				1	ICUMX LPD	Normal Function	Connect	*2	Do not connect	*4
		1	0	0	ICUMX JTAG	CoreSight	Connect	*2	Connect	*2
				1	ICUMX LPD	CoreSight	Connect	*2	Connect	*2
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
	1	0	0	0	CoreSight	Normal Function	Connect	*2	Do not connect	*4
				1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
		1	*1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
1	0	0	0	0	VDSP0	Normal Function	Connect	*2	Do not connect	*4
				1	VDSP1	Normal Function	Connect	*2	Do not connect	*4
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
		1	0	0	CoreSight	VDSP0	Connect	*2	Connect	*2
				1	CoreSight	VDSP1	Connect	*2	Connect	*2
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
	1	0	0	0	PAP	Normal Function	Connect	*2	Do not connect	*4
				1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
		1	0	0	CoreSight	PAP	Connect	*2	Connect	*2
				1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting
			1	*1	Reserved	Reserved	prohibited MD setting	prohibited MD setting	prohibited MD setting	prohibited MD setting

*1: Don’t care

*2: Follow the example of reset circuit logic

*3: When OPEN, enable the built-in Pull Up.

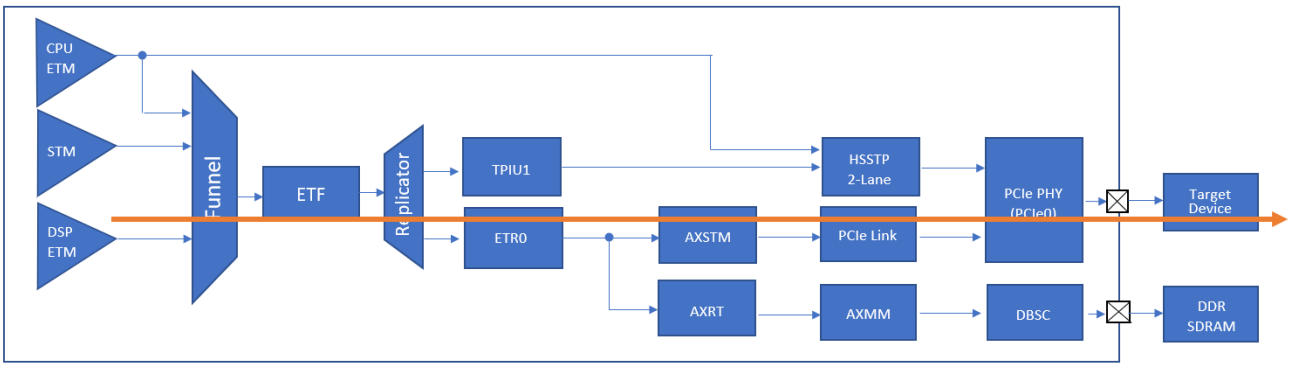
*4: Follow processing as a functional pin

170.3.3 Trace Output Selection

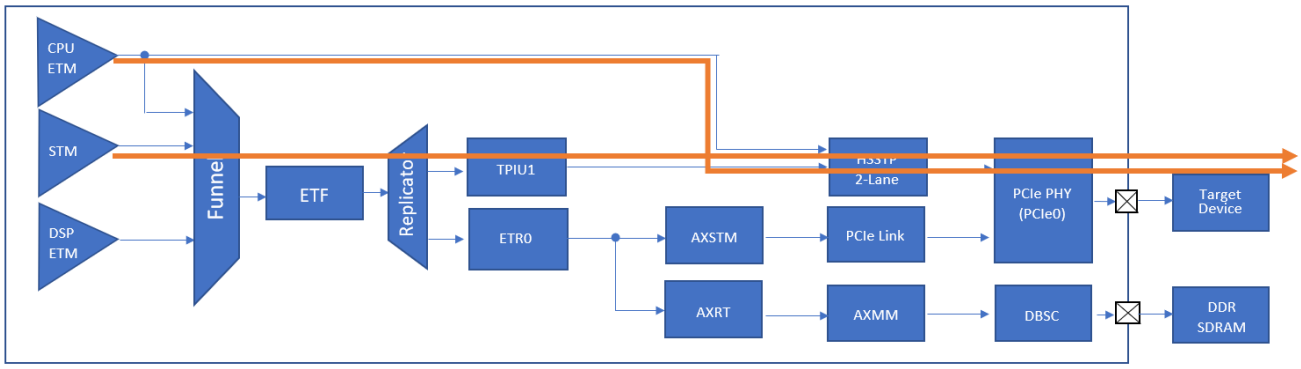
The supported 3 trace output port possibilities are summarized. The 1x trace can be selected from PCIe trace or HSSTP trace. See also Section 170.3.4 HSSTP PCIE channel selection for HSSTP trace.

[1x Trace]

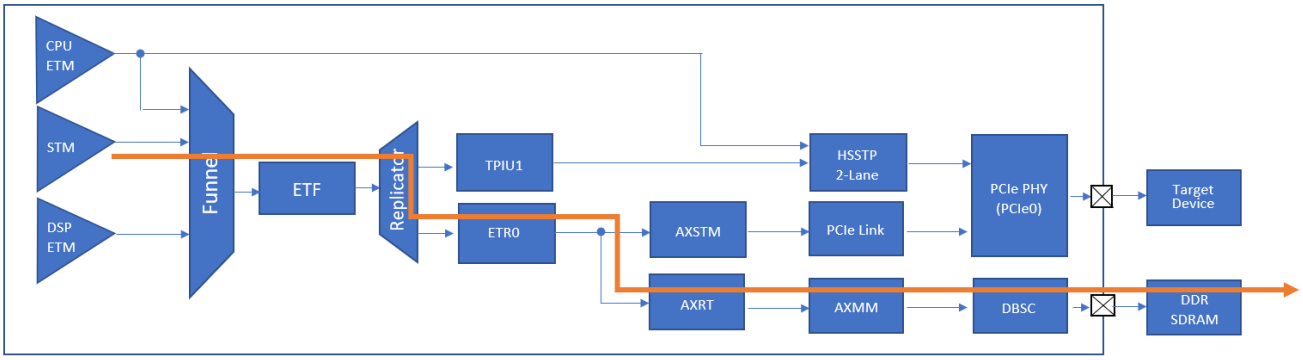
- 32Gbps or 16Gbps PCIe 2-lane Trace
  (1) CSDBGSS/ETR0 -> PCIe Link/PHY -> PCIe0
- 10Gbps or 5Gbps HSSTP 2-lane Trace
  (2) CSDBGSS/TPIU1 -> HSSTP Link/PCIe PHY -> PCIe0
  CSDBGCA0/TPIU0 -> HSSTP Link/PCIe PHY -> PCIe0
  CSDBGCR0/TPIU0 -> HSSTP Link/PCIe PHY -> PCIe0
  CSDBGCR1/TPIU0 -> HSSTP Link/PCIe PHY -> PCIe0
  CSDBGCR2/TPIU0 -> HSSTP Link/PCIe PHY -> PCIe0
- Trace capture using external DRAM via ETR
  (3) CSDBGSS/ETR0 -> DBSC -> DDR SDRAM



(1) PCIe 2-lane Trace (PCIe0)



(2) HSSTP 2-lane Trace (PCIe0)



(3) Trace capture using external DRAM via ETR

Figure 170.3 Trace Path

170.3.4 STM Master ID Mapping

STM-500 is used for system trace to output some information from CPU and monitor the contents stored in memories such as DDR memories and internal SRAMs by utilizing DMA transfer. Following table lists of Master ID value (output of STM) to identify the master module sending the transaction to STM-500 in each product.

STM0 is used by the masters which can access to STM0 via AXRT (AXI bus of RT hierarchy). STM1 is dedicated for Vision IP.

Table 170.9 STM Master ID Mapping

Master Name	STM Number	Secure Access	Master_ID
Cortex-R52 SS0	STM0	Secure	H'03
Cortex-R52 SS1	STM0	Secure	H'04
Cortex-R52 SS2	STM0	Secure	H'05
Cortex-A76 Core#0_0	STM0	Secure	H'08
Cortex-A76 Core#0_1	STM0	Secure	H'09
Cortex-A76 Core#0_2	STM0	Secure	H'0A
Cortex-A76 Core#0_3	STM0	Secure	H'0B
SYS-DMAC1 PER/RT-DMAC0 PER	STM0	Secure	H'31
SYS-DMAC2 PER/RT-DMAC1 PER	STM0	Secure	H'34
RT-DMAC2 PER	STM0	Secure	H'37
RT-DMAC3 PER	STM0	Secure	H'3A
Cortex-R52 SS0	STM0	Non-secure	H'03
Cortex-R52 SS1	STM0	Non-secure	H'04
Cortex-R52 SS2	STM0	Non-secure	H'05
Cortex-A76 Core#0_0	STM0	Non-secure	H'08
Cortex-A76 Core#0_1	STM0	Non-secure	H'09
Cortex-A76 Core#0_2	STM0	Non-secure	H'0A
Cortex-A76 Core#0_3	STM0	Non-secure	H'0B
IMP0/IMP1 #0	STM0	Non-secure	H'10
IMP0/IMP1 #1	STM0	Non-secure	H'11
IMP0/IMP1 #2	STM0	Non-secure	H'12
IMP0/IMP1 #3	STM0	Non-secure	H'13
IMP0/IMP1 #4	STM0	Non-secure	H'14

IMP0/IMP1 #5	STM0	Non-secure	H'15
IMP0/IMP1 #6	STM0	Non-secure	H'16
IMP0/IMP1 #7	STM0	Non-secure	H'17
IMP0/IMP1 #8	STM0	Non-secure	H'18
IMP0/IMP1 #9	STM0	Non-secure	H'19
UMFL0	STM1	Non-secure	H'20
SMPS0	STM1	Non-secure	H'22
SMPO0	STM1	Non-secure	H'24
SYS-DMAC1 PER/RT-DMAC0 PER	STM0	Non-secure	H'31
SYS-DMAC2 PER/RT-DMAC1 PER	STM0	Non-secure	H'34
RT-DMAC2 PER	STM0	Non-secure	H'37
RT-DMAC3 PER	STM0	Non-secure	H'3A

Note : *1: SYS-DMAC and RT-DMAC are not distinguishable. Either one DMA Controller is expected to use at the same time.

170.3.5 HSSTP PCIE Channel Selection

DBGREG2.DMON2EN can select which PCI-express channel via 2-lane HSSTP is used.

170.3.6 Cross Trigger Connection

This section shows the cross trigger connections.

170.3.8 AXI Trace Monitor

The AXI transactions issued by the master IPs that access the DDR main memory always pass through AXMM, which is one of AXI bus components in R-Car V4H and V4M. The AXMM incorporates a monitor function which can trace AXI write transactions. Address and data can be traced w/wo timestamp information. Enabling/disabling timestamp can be selected by register setting. The AXMM duplicates the AXI write transactions and diverts them to the PCIe trace output for debugging purpose.

The AXI trace monitor consists of AXI_Trace_Guard, AXI_Trace_W, RAM and AXI_Trace_R. The AXI_Trace_Guard controls acknowledge signal not to stall the accesses for DDR main memory excessively. The following two different modes are provided and either of them can be selected by register setting;

1. The AXI trace is suspended not to affect the accesses for DDR main memory when trace path is stalled (ex. RAM/BUF full due to PCIe not responding).
2. The AXI trace isn't suspended even if trace path is stalled. This mode does affect the accesses for DDR main memory (i.e. invasive to application behavior).

The AXI_Trace_W writes the trace data into RAM. The AXI_Trace_R reads the trace data from RAM, packetizes it and transmits it out towards the PCIe trace output. The AXI_Trace_W and the AXI_Trace_R provide the same function as the Arm's CoreSight components: STM and TMC (ETR). The AXI trace monitor generates trace packets and formats them. The trace packets which conform to MIPI System Trace Protocol version 2 (STPv2) are formatted into 16-byte frames (CoreSight Trace Formatter).

- RAM size (intermediate trace memory): 512-bit * 128-word
- Buffer size (buffer for AXI transaction output stage): 256-byte

The AXMM can filter the AXI write transactions by trace source and write address. The filtering function is divided into the two parts. One (pre-filter) is implemented in the access protection block and the other (post_filiter) in AXI_Trace_W.

The registers STMPFLTM0-7 having 256-bits in total are used to enable/disable this trace monitor for each AXI master. 256 different SRC_IDs are assigned to all AXI masters in R-Car V4H and V4M. The pre-filtering functions based on Region ID/Sec ID (STMPFLTRS) and DRAM/SYSRAM area (STMPFLTDA/STMPFLTSA) are provided as well. The registers STMFLT0-15 are used to set the 16 different post filtering conditions.

Types of Pre-filters

1. SRC_ID Filter

The registers STMPFLTM0-7 having 256-bits in total are used to enable/disable this trace monitor for each AXI master. 256 different SRC_IDs are assigned to all AXI masters in R-Car V4H and V4M. As for the assignment of SRC_IDs, refer to chapter 18. AXI-Bus.

As an example, here is the STMPFLTM0-7 register setting to enable this trace monitor for the AXI masters having SRC_ID = 1 and 32:
STMPFLTM0 = 0x0000_0002
STMPFLTM1 = 0x0000_0001
STMPFLTM2-7 = 0x0000_0000

2. Access Authentication Filter

The pre-filtering function based on Region ID/Sec ID is provided as well. The STMPFLTRS[15:0] bit field corresponds to 16 Region IDs and STMPFLTRS[19:16] to 4 Sec IDs. For each Region ID/Sec ID, this trace monitor can be enabled/disabled.

3. System RAM Filter

The pre-filtering function based on SYSRAM area is also provided. The STMPFLTSA[15:0] bit field corresponds to 16 access protect areas of System RAM. For each protect area of System RAM, this trace monitor can be enabled/disabled.

4. DRAM Filter

The pre-filtering function based on DRAM area is provided as well. The number of the protect areas for DRAM is

64. STMPFLTDAH is used for the protected areas 63-32 and STMPFLTDAL for the protected areas 31-0. For each protect area of DRAM, this trace monitor can be enabled/disabled.

The AXI_Trace_Guard has the control registers which can be accessed from CPU. Those registers can be accessed from DEBUG_APB ('XMON_STM0' in CoreSight address map) only when a control bit is set (STMFLTIDR/DBGALLOW = 1). The AXI_Trace_W has the control registers (REG_STM) which can be accessed from DEBUG_APB ('XMON_STM0' in CoreSight address map). The AXI_Trace_R also has the control register (REG_TMC) which can be accessed from DEBUG_APB ('XMON_CTRL0' in CoreSight address map).

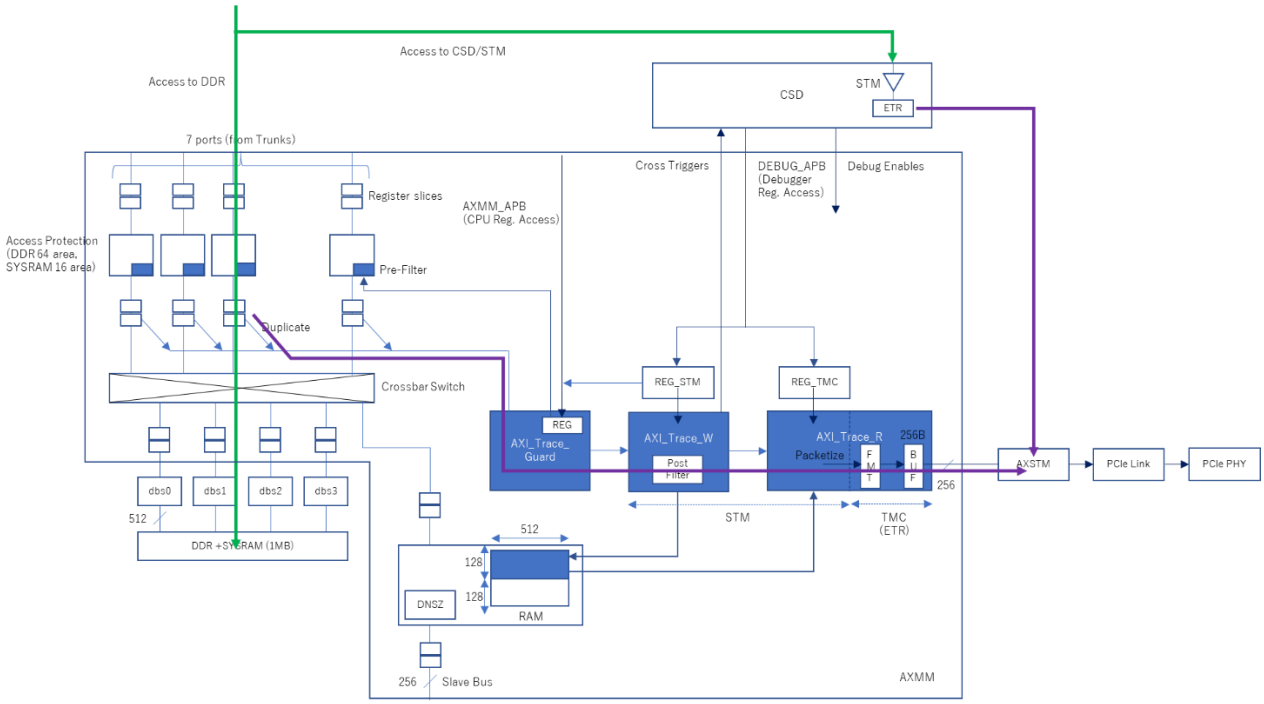

Figure 170.4 AXI Trace Monitor in AXMM

[Example of Initial Register Setting]

The guard control, STM/TMC control and filtering control registers need to be set before enabling STM and TMC. The unlocking is required in prior to register setting.

1. Unlock Control Register Access
   DBGALLOW bit in STMFLTIDR
   LAR for STM and TMC

2. Set Guard Control Registers
   STMGCTR0 to control the invasion for AXI bus
   STMGCTR1 for AWREADY negate control

3. Set STM/TMC Control Registers
   STMAUXCR for STM FIFO auto-flush control
   STMTCSR to specify TRACE ID
   RSZ (RAM Size register)
   DBA (Data Buffer Address register)
   RWP (RAM Write Pointer register)
   AXICTL for AWCACHE/AWPROT control bits
   FFCR to enable formatting

4. Set Filtering Control Registers
   Prefiltering
      Master ID prefiltering (STMPFLTM)
      Region ID and Sec ID prefiltering (STMPFLTRS)
      DRAM Area prefiltering (STMPFLTDA)
      SYSRAM Area prefiltering (STMPFLTSA)
   Post filtering (STMFLT)

5. Enable STM/TMC
   STMTCSR to enable STM
   CTL to enable TMC trace capture

170.4 Usage Notes

170.4.1 TRST control in no JTAG selection

Refer to 170.3.2 JTAG Reset Circuit Logic.

170.4.2 Pseudo Power Down

Pseudo Power down is not supported at debugging.

170.4.3 Warm Reset Request from Cortex-A76

There is a register bit to request a warm reset against Cortex-A76 (CWRR, bit[1] in EDPRCR). But a bit setting by external debugger doesn't have any effect in R-Car V4H and V4M, and Cortex-A76 warm reset doesn't take place.

170.4.4 Debug & Trace on VDSP Power Shut Off

Debugger isn't allowed to access VDSP when VDSP is powered off or under reset state. Power-shut-off isn't allowed when VDSP debug and trace function is in use.

170.4.5 Software Reset

The software reset for CoreSight Debug, by setting bit 30 in SFTRST register No. 3, can't be used in user and in debug modes.

170.4.6 Debug & Trace Continuity after NSI Reset

The debug and trace function can't be continued after NSI reset except for Cortex-A76/Cortex-R52.

170.4.7 Debug & Trace Continuity after Power-on Reset

When a power-on reset is asserted during Cortex-R52's debug and trace, the Cortex- R52's debug and trace can't be continued after power-on reset. This is because many of Cortex- R52's debug resources are powered off during power-on reset. But setting of Reset Vector Break can be preserved. So, re-setting of previous debugger setting is possible after Reset Vector Break.

When a power-on reset is asserted during Cortex-A76's debug and trace, the Cortex-A76's debug and trace can't be continued after power-on reset. This is because all of Cortex-A76's debug resources are powered off during power-on reset. Reset Vector Break is not supported for Cortex-A76 because the core can't be selected as a master boot processor in R-Car V4M.

170.4.8 Debug Resource Access Restriction

Any operation to debug resource of Cortex-R52, except for setting of Reset Vector Break, is prohibited while the core is powered off.

Any operation to debug resource of Cortex-A76 is prohibited while the core is powered off or in Runtime Test.

170.4.9 Access to debug resource of Cortex-R52 in core standby mode

When Cortex-R52 processor is in 'core standby mode', clock supply to the debug resource of Cortex-R52 is stopped. Any access to the debug resource of Cortex-R52 from external debugger or any other processor is prohibited. For example, when ICUMX processor is selected as a master boot processor, Cortex-R52 processors (core 1, core 2) are in 'core standby mode' unless booted by another processor. The reset vector catch setting for Cortex-R52 processor (core 0) is possible when Cortex-R52 processor is selected as a master boot processor.

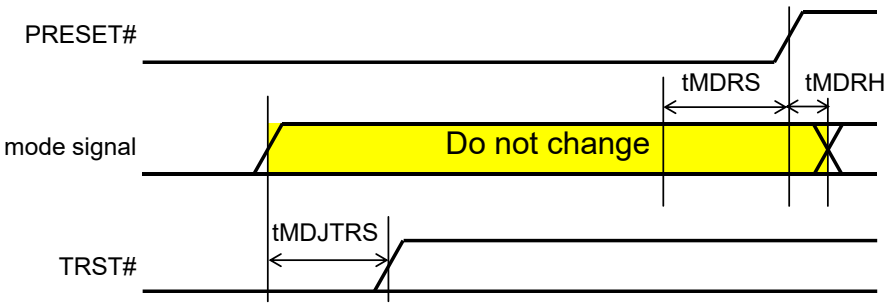
170.4.10 Applying a low level to TRST# at power-on

Apply a low level to TRST# at power-on. However, it is not necessary to apply a low level in the following cases.

- For Main-JTAG TRST# when VDSP0 or VDSP1 is connected to Main-JTAG (when (MDT0, MD21, MD20, MD11, MD10) = (10000), (10001))
- For Sub-JTAG TRST# when VDSP0 or VDSP1 is connected to Sub-JTAG (when (MDT0, MD21, MD20, MD11, MD10) = (10100), (10101))

170.4.11 Mode Signal Timing Requirements for TRST# and PRESET#

When TRST# is deasserted before PRESET# is deasserted, make sure that the mode signal value does not change during the period from when TRST# is deasserted to when PRESET# is deasserted.
The setup time of mode signal for TRST# deassert (tMDJTRS) is the same as tMDRS. For tMDRS, refer to chapter 200. Electrical Characteristics.



170.5 Safety Mechanisms

Nothing special to describe for Debug and Trace as it is a non-safety related module.

171. Power On Self Test (POST) and Runtime Test

171.1 Power On Self Test (POST)

171.1.1 Overview

The POST is a safety mechanism to detect faults before the SoC is used. This safety mechanism is executed only once when power is supplied to the SoC. The POST is performed using the field BIST*1 modules.
The logic and memory built-in self tests (BISTs) are executed consecutively on the specified hierarchies within the POST operation. The memory BIST is applied to all RAMs. The order of tests and setting values for tests are written on the ROM, and the tests are executed according to the contents of the ROM.

Note *1: The field BIST is a collective term for the POST and Runtime Test.

171.1.2 Hardware Description

Glossary

Term	Contents
SCAN TEST	It will test the logic section. This test can achieve high fault coverage (90% or more), but need the test pattern of each test target. It uses in the Runtime Test.
Logic BIST	It will test the logic section. This test uses random pattern generator. Therefore, there is no need to have a test pattern of each test target. It uses in the POST.
Memory BIST	It will test the memory (RAM) section. This test uses an algorithm test pattern generator to achieve full fault coverage. It uses in both POST and Runtime Test.

171.1.2.1 Features

POST performs test by dividing the CHIP in multiple hierarchies.

There are 2 types of hierarchy ("Stop" and "Boot start").
When POST detects fault in "Stop" hierarchy, SoC boot is stopped and error is notified to external device.
On the other hand, SoC boot is not stopped regardless of POST results of "Boot start" hierarchy.
In this case, the Fault occurrence shall be confirmed by using software. For details, see the section 171.1.2.4 Register Configuration.

POST is splitted into 46 hierarchies.
POST runs the Logic BIST and Memory BIST.

Table 171.1 Hierarchy of POST

No.	Hierarchy Name	Description	Power Domain	Hierarchy Type	Test Coverage(*)
1	TOP	TOP Hierarchy	C5	Stop	(90%)
2	VIO	Video IO Hierarchy	C5, C4	Boot start	(90%)
3	ISP0	Video IO Hierarchy (ISP0)	A3ISP0	Boot start	(60%)
4	VC	Video Codec Hierarchy	C5, C4	Boot start	(90%)
5	IMR0(IMR0)	Video Codec Hierarchy (IMR0(IMR0))	A3IMR0	Boot start	(60%)
6	IMR1(IMR1)	Video Codec Hierarchy (IMR1(IMR1))	A3IMR1	Boot start	(60%)
7	IMR2(IMS0)	Video Codec Hierarchy (IMR2(IMS0))	A3IMR2	Boot start	(60%)
8	IMR3(IMS1)	Video Codec Hierarchy (IMR3(IMS1))	A3IMR3	Boot start	(60%)
9	MM	Main Memory Hierarchy	C5	Stop	(90%)
10	DBSC0	Main Memory Hierarchy (DBSC0)	C5	Stop	(90%)
11	DDR	Main Memory Hierarchy (DDR)	C5	Stop	(90%)
12	IR	Image Recognition Hierarchy	C5	Boot start	(90%)
13	A3IR Bus	Image Recognition Hierarchy (A3IR Bus)	C4	Boot start	(90%)
14	IMP0	Image Recognition Hierarchy (IMP core0)	A2IMP01	Boot start	(60%)
15	IMP1	Image Recognition Hierarchy (IMP core1)	A2IMP01	Boot start	(60%)
16	OCV0	Image Recognition Hierarchy (OCV core0)	A2CV0	Boot start	(60%)
17	OCV1	Image Recognition Hierarchy (OCV core1)	A2CV1	Boot start	(60%)
18	OCV2	Image Recognition Hierarchy (OCV core2)	A2CV2	Boot start	(60%)
19	OCV3	Image Recognition Hierarchy (OCV core3)	A2CV3	Boot start	(60%)
20	DP0	Image Recognition Hierarchy (IMP DMAC0, IMP PSC0)	A2PSC	Boot start	(60%)
21	DP1	Image Recognition Hierarchy (IMP DMAC1)	A2DMA	Boot start	(60%)
22	CNN	Image Recognition Hierarchy (IMP CNN)	A1CN0	Boot start	(60%)
23	DSP0	Image Recognition Hierarchy (DSP0)	A1DSP0	Boot start	(60%)
24	DSP1	Image Recognition Hierarchy (DSP1)	A1DSP1	Boot start	(60%)
25	CNRAM	Image Recognition Hierarchy (CNRAM)	A2CN0	Boot start	(60%)
26	IMPRAM	Image Recognition Hierarchy (IMPRAM)	C4	Boot start	(60%)
27	RT	RealTime Hierarchy	C5	Stop	(90%)
28	Cortex-R52	RealTime Hierarchy (Cortex-R52)	C5, A3CR0, A3CR1, A3CR2	Stop	(90%)
29	CA76SS0 C4	Cortex-A76 CPU Sub-system Hierarchy (C4 domain)	C4	Boot start	(90%)
30	CA76SS0 Cluster0	Cortex-A76 CPU Cluster 0 Hierarchy (A2 domain)	A2E0D0	Boot start	(60%)
31	CA76SS0 Core0	Cortex-A76 CPU Core 0 Hierarchy (A1 domain)	A1E0D0C0	Boot start	(60%)
32	CA76SS0 Core1	Cortex-A76 CPU Core 1 Hierarchy (A1 domain)	A1E0D0C1	Boot start	(60%)
33	CA76SS0 Core2	Cortex-A76 CPU Core 2 Hierarchy (A1 domain)	A1E0D0C2	Boot start	(60%)

No.	Hierarchy Name	Description	Power Domain	Hierarchy Type	Test Coverage(*)
34	CA76SS0 Core3	Cortex-A76 CPU Core 3 Hierarchy (A1 domain)	A1E0D0C3	Boot start	(60%)
35	PER	Peripheral-DMAC Hierarchy	C5	Boot start	(90%)
36	HSC	High Speed Communication Hierarchy	C5, C4	Boot start	(90%)
37	PVD0	3D Graphics (RGX PVD0) Hierarchy	A23DGB	Boot start	(60%)
38	PVD1	3D Graphics (RGX PVD1) Hierarchy	A23DGB	Boot start	(60%)
39	PVD2	3D Graphics (RGX PVD2) Hierarchy	A33DGA	Boot start	(60%)
40	PVD	3D Graphics (CONST RGX Bridge) Hierarchy	C4	Boot start	(60%)
41	PVC	3D Graphics (CONST) Hierarchy	C5, C4	Boot start	(90%)
42	VIP	Vision IP Hierarchy	C5, C4	Boot start	(90%)
43	UMFL0	Vision IP Hierarchy (Optical Flow 0)	A3VIP0	Boot start	(60%)
44	SMPS0	Vision IP Hierarchy (SMPS0)	A3VIP2	Boot start	(60%)
45	SMPO0	Vision IP Hierarchy (SMPO0)	A3VIP2	Boot start	(60%)
46	PAP	Vision IP Hierarchy (PAP)	A3DUL	Boot start	(60%)

(*) SM coverage is important, not hierarchical coverage.

The POST is automatically applied on all hierarchies by setting the levels on the mode pins MD25 to high (1) and the levels on the mode pins MD23 to low (0).
The POST is automatically applied on partial hierarchies by setting the levels on the mode pins MD25 to high (1) and the levels on the mode pins MD23 to high (1).

POST is started at different time for different domains to reduce the rush current during power up of the SoC.

Table 171.2 Pin function of POST

Pins		POST
MD25	MD23	Description
0	-	No operation
1	0	The test is executed on all hierarchies.
1	1	The test is executed on partial hierarchies.

171.1.2.2 Block Diagram

Figure 171.1 shows the block diagram of field BIST system.

The field BIST modules is constituted by one of field BIST controller (FBC) and each hierarchy of the field BIST activators (FBAs), JTAG-sequencer (FBJs).

(1) Field BIST controller (FBC)

- Create a POST start signal.
  Notifies the finish of POST to the clock pulse generator (CPG)
- Interrupt Controller (INTC) interface
  "Field BIST pre" signal is Test ready.
  "Field BIST finish" signal is Test finish.
  These signals asserted at the time of Runtime Test.
- Error Control Module (ECM) interface
  "fbc_rt_fail" is Test Fail for Runtime Test.
  "fbc_rt_overerr" is Time out Error for Runtime Test.
  "fbc_rt_saftyerr" is Bus Error for Runtime Test.

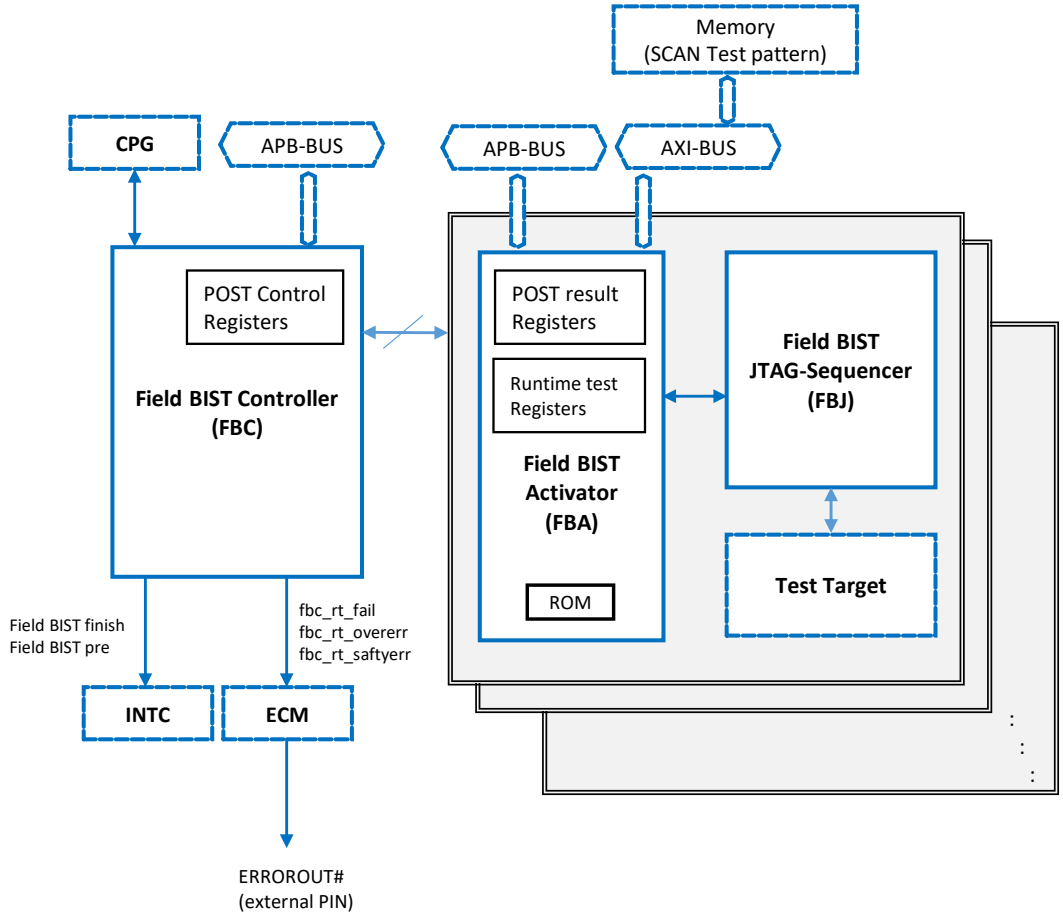


Figure 171.1 Overview of Field-BIST system

(2) Field BIST Activator (FBA)
Test procedures and test conditions are written in the ROM.
Reads the external memory SCAN pattern at AXI bus, transfer to FBJ.
Stored in the register to the test results SISR (Single Input Signature Register).

(3) JTAG Sequencer (FBJ)
Run the test of the test target by issuing the test code.

171.1.2.3 External Pins

When POST detect fault in "STOP" hierarchy, the PRESETOUT# signal is not de-asserted.
On the other hand, when POST detects no fault or detects fault only in "Boot start" hierarchy, the PRESETOUT# signal is de-asserted.

171.1.2.4 Register Configuration

(1) FBA registers
Most of the registers works at the initial value.
The FBA registers are used for the scan test in the runtime test and for the memory built-in self test (MBIST).
Renesas Electronics provides the setting values of the registers.

(a) **Hierarchy registers**

Table 171.3 Register Configuration (Hierarchy)

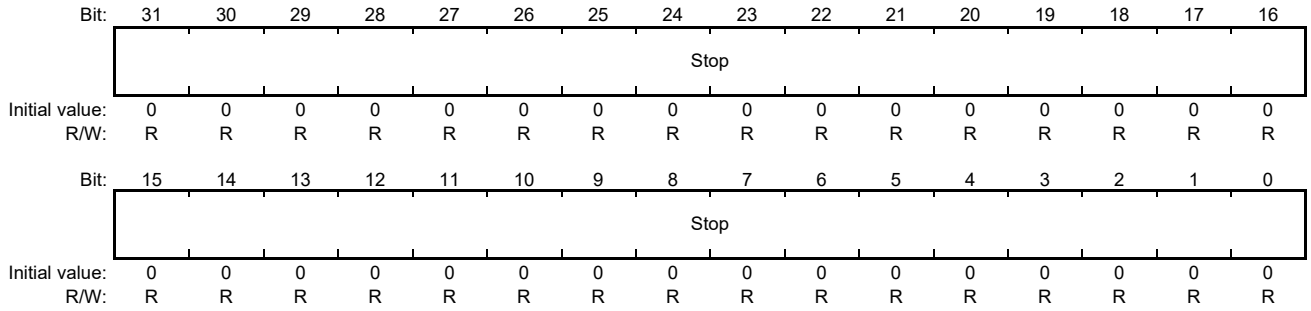
Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	R-rst_T	1	R	BIST Redundant result. (Safety function) 0: pass 1: fail
11	-	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
10 to 8	error_T	011	R	BIST error. 000: Pass. 001: Fail. 010: TimeOut. (FieldBIST internal WDT) 100: BUS error. This error occurs when a slave error or decoder error is detected in the read response RRESP on the AXI bus.
7 to 4	testnum_T	0000	R	Number of tests.
3 to 2	status_R	00	R	BIST Redundant status (Safety function) 00: unexec. 01: wait. (preparing for execution of a test) 10: exec. 11: finish.
1 to 0	status_T	00	R	BIST status. 00: unexec. 01: wait. (preparing for execution of a test) 10: exec. 11: finish.

(2) Counter Value for Power On Self Test (PSTCNT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Stop	All 0	R	FieldBIST internal WDT (high counter) stop value.

FieldBIST internal WDT is made of a down counter.
Time-out error occurs when the WDT is zero.

171.1.2.7 Debugger Usage Note

Reset vector catch works when POST is enabled. For the reset release order, release TRST# first, then PRESET#. Set the reset vector catch between these two resets. POST after power-on reset in debug mode is emulation (dummy). The reset vector catch setting is not deleted, and the reset vector catch is possible.

[POST execution/skip conditions]
When MD25 = 0, POST is not executed.
When MD25 = 1,
  When not in debug mode (mode pin setting {MDT0, MD21, MD20, MD11, MD10} = 5'b00000), POST is executed.
  When in debug mode
    When the mode pin setting is that CoreSight is connected to Main-JTAG,
      POST is skipped when TRST# is released before PRESET#.
      POST is executed when PRESET# is released before TRST#.
    When the mode pin setting is that CoreSight is connected to Sub-JTAG,
      POST is skipped when TRST# is released before PRESET#.
      POST is executed when PRESET# is released before TRST#.
    When the mode pin setting is that CoreSight is connected neither to Main-JTAG nor Sub-JTAG, POST is executed.

Note: "POST is skipped" differs from "POST is not executed" in that the Self Test is not performed, but the POST execution period is kept.

171.2 Runtime Test

171.2.1 Overview

The Runtime Test is a safety mechanism to detect faults during the SoC is used. This safety mechanism needs to be periodically executed by software. The Runtime Test is performed using the field BIST[*1] modules.

Note *1: The field BIST is a collective term for the POST and Runtime Test.

171.2.2 Hardware Description

171.2.2.1 Runtime Test

This module is a safety mechanism in case of functional safety supported product. The function of Runtime Test shares the hardware configuration with POST. See the section on POST for hardware configuration.

Runtime Test is only run for a specified hierarchy when power is supplied to a specified hierarchy.

Scan tests are applied to logic blocks to accomplish a high failure coverage. The memory built-in self test (MBIST) is applied as shown in Table 171.6.

Accomplishing failure coverage of at least 90% by the scan tests requires many test patterns in almost every hierarchy, leading to the tests taking a longer time (Hardware processing time is within 10ms. In addition, software processing time is required.).

Tests require that the normal operation of the hierarchies that are their targets be stopped, and having them out of operation for long periods affects system performance. The time-sliced method can be used to reduce this effect where this is not allowable. (For example, the time-sliced method is to divide the test in about 2ms.)

Before executing Runtime Test, set module stop control register "for target module of Runtime Test" to stop, except Cortex-A76. For details, refer to section 9 Module Standby, Software Reset.

Before executing Runtime Test, set software reset register "for target module of Runtime Test" to reset, except Cortex-A76 and Vision-IP (except PAP). For details, refer to section 9 Module Standby, Software Reset.

Do not access modules in Runtime Test

(A) Features
Runtime Test performs test by dividing the CHIP in multiple hierarchies.

Runtime Test is applied into 26 hierarchies.
Table 171.6 is a list of the Runtime test methods for the respective hierarchies.

The field BIST (*1) circuit has two modes of operation for Runtime Test: ROM batch mode and single-step mode.

In ROM batch mode, some tests execute in sequence according to information in the ROM.
Control of the Software is only once, but test time is longer.
This mode is recommended to use for MBIST and couldn't be used for scan test because there are no ROM for scan test.

In Single-step mode, each tests executes independently by using register data and scan pattern in RAM.
Each test could take short time but control of software is required multiple times.
This mode should be used for scan test and is not recommended to use for MBIST.

Note *1: The field BIST is a collective term for POST and Runtime Test.

R-Car V4M all of the hierarchy to adopt the Time-sliced test.

Running scan tests requires the writing of test patterns provided by Renesas Electronics to the memory in advance.
Align the test patterns with a 128-byte boundary in 32-bit address range.

Table 171.6 Hierarchy of Runtime Test

No.	Hierarchy Name	Description	Runtime Test	Runtime Test MBIST

(B) Interrupt Signals

The following interrupt signals and error interrupt signals are provided.

(1) Interrupt Signals (the logical OR of interrupt signals of each hierarchy)

"Field BIST finish"
Test completed.
"Field BIST pre"
Test preparation completed.

(2) Interrupt Signals (the independent interrupt signal for each hierarchy)

"Field BIST finish"
Test completed.
"Field BIST pre"
Test preparation completed.

(3) Error interrupt signals (the logical OR of interrupt signals of each hierarchy)

"Field-BIST controller.rt_fail"
The result of the test was failure.
"Field-BIST controller.rt_overerr"
Timeout. (There is no response from the Test Target)
"Field-BIST controller.rt_saftyerr"
Bus error.

(4) Error interrupt signals (the independent interrupt signal for each hierarchy)

"Field-BIST controller.rt_fail"
The result of the test was failure.
"Field-BIST controller.rt_overerr"
Timeout. (There is no response from the Test Target)
"Field-BIST controller.rt_saftyerr"
Bus error.

When use the interrupt signals of (1) or (3), if multiple hierarchies issue interrupts simultaneously, the first to be issued will be in effect because the logical OR of the interrupt signals is taken.
To check the detailed Field BIST finish interrupt, read the RTTFINISH1, RTTFINISH2 and RTTFINISH3 registers.

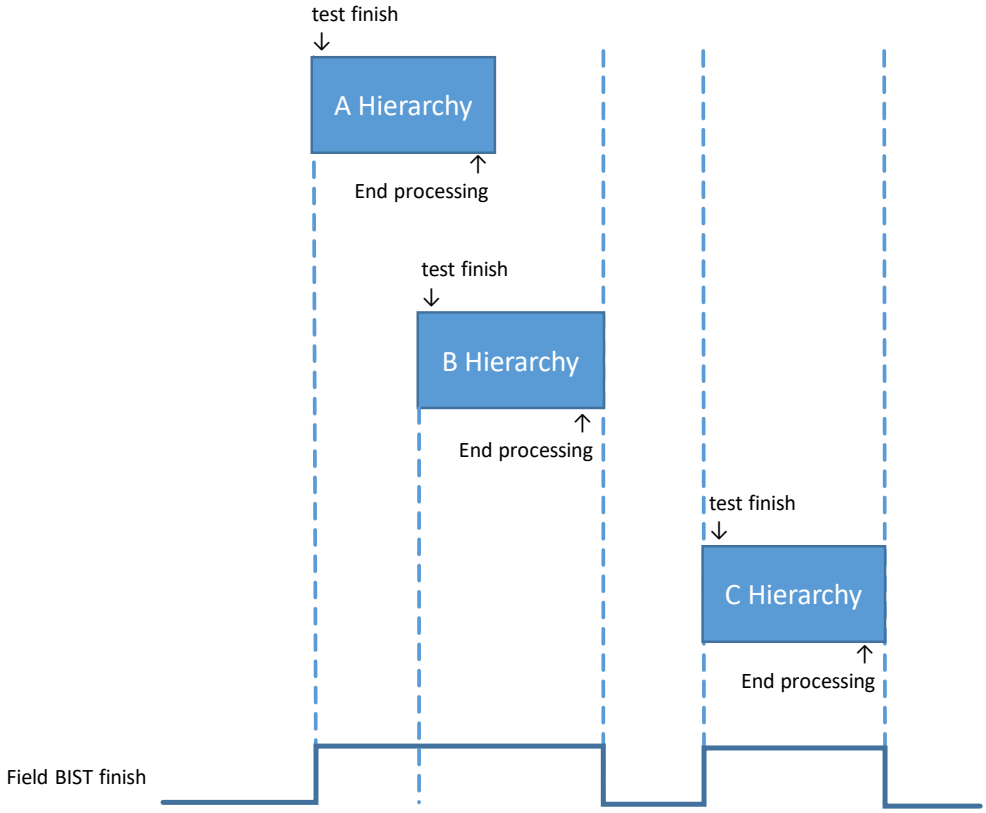

Figure 171.2 Interrupt Signal for example

(C) Register Configuration

Table 171.7 Register Configuration

Register Name	Abbreviation	R/W	Address[11:0]	Initial Value	Access Size
Runtime Test parameter					
Execution option	RTTEX	R/W	H'000	H'0000 0000	32

Note: * See section 171.2.2.1 Runtime Test (D) (30) to (32).

(D) Register Description

(1) Execution option (RTTEX)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	SLFR	SLFE	-	-	-	-	KCD							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	STM			INTM		SSZ	TR	WM	TM	STP	EX
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
29	SLFR	0	R/W	Self-Check Counter Reset for field BIST activator. 0: Counter Reset 1: Counter not Reset
28	SLFE	0	R/W	Execution of Self-Check for Field BIST activator. 0:Not Execution of Self-Check for Field BIST activator. 1:Execution of Self-Check for Field BIST activator.
27 to 24	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
23 to 16	KCD	All 0	R/W	Key Code H'5A: Effective execution of Run Time Test H'F1: Effective execution of Self-Check for field BIST activator. Other: No reaction.
15 to 11	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
10 to 8	STM	000	R/W	Single Step Test Mode. Valid only when STP=1. Other state can be anything 001: LBIST. 010: MBIST. 011: SCAN. Other: Do not use.
7 to 6	INTM	All 0	R/W	Interrupt mask 00: non mask *1: Always mask(fba_rt_pre and fba_rt_finish are not assert) 10: Only at the time of the fail(fba_rt_finish are not assert at fail)
5	SSZ	0	R/W	SCAN Pattern size Valid only when STM=011. Other state can be anything. 0: 32bit mode 1: 16bit mode
4	TR	0	R/W	Select the value of the timer 0: ROM 1: register
3	WM	0	R/W	Wfi mask 0: not mask 1: mask
2	TM	0	R/W	Mask the judgment of timer 0: not mask 1: mask

Bit	Bit Name	Initial Value	R/W	Description
1	STP	0	R/W	Single Step Mode. 0: ROM batch mode. 1: Single Step Mode.
0	EX	0	R/W	Execution of Runtime Test. 0:Not Execution of Runtime Test. 1:Execution of Runtime Test.

Note *1: SLFR and SLFE bit of the RTTEX are effective only when KCD bit is H'F1.

(2) Memory information (1) (RTTMI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	RPROT			MADDR(upper)							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MUNIT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
26 to 24	RPROT	000	R/W	Protection type of MEMORY. [26]RPROT[2] 0: Data access, 1: Instruction access. [25]RPROT[1] 0: Secure access, 1: Non-secure access. [24]RPROT[0] 0: Unprivileged access, 1: Privileged access.
23 to 16	MADDR(upper)	00000000	R/W	Memory upper address[39:32] that stores the SCAN pattern.
15 to 0	MUNIT	H'0000	R/W	Number of units (1 unit = 128 Byte).

Write the values separately provided by Renesas Electronics.

(3) Memory information (2) (RTTMI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MADDR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MADDR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MADDR	All 0	R/W	Memory address that stores the SCAN pattern.

(4) Expected value of SISR (1) (RTTSISR1)

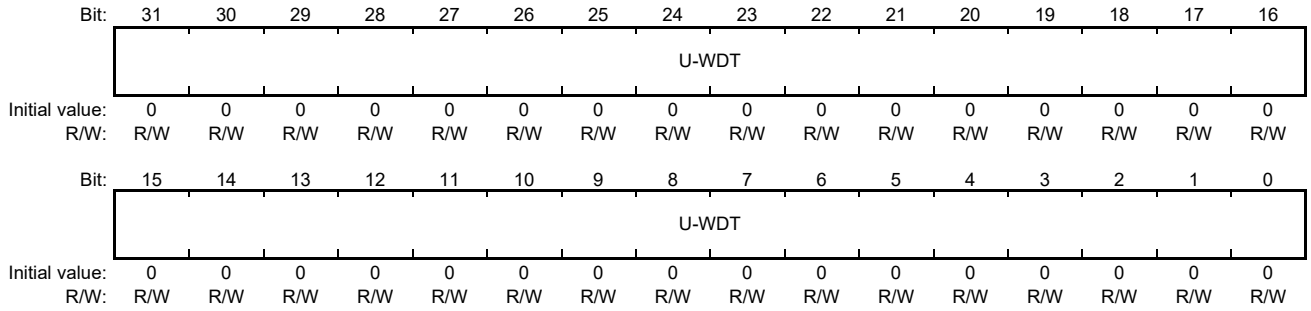
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	SISR1			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SISR1															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
19 to 0	SISR1	All 0	R/W	SISR-TEST#1 Expected value.

The packed result (SISR)
Write the values separately provided by Renesas Electronics.

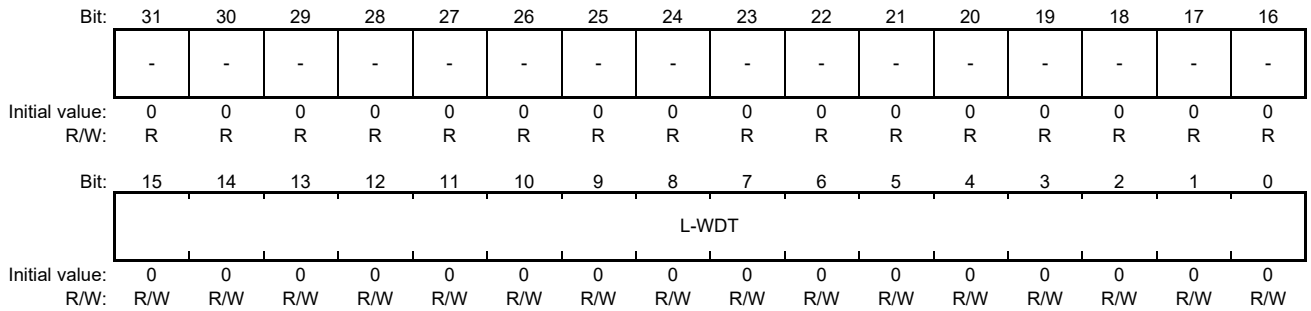
(5) Upper counter of WDT (RTTUC)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	U-WDT	All 0	R/W	Upper counter of Watchdog Timer.

This register is used to detect timeout in the runtime test.
The timeout occurs when the runtime test is not completed within the number of counts specified in RTTUC x RTTDC cycles of the clock signal (66 MHz) dedicated to the POST.
Write the values separately provided by Renesas Electronics.

(6) Lower counter of WDT (RTTDC)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
15 to 0	L-WDT	All 0	R/W	Lower counter of Watchdog Timer.

Write the values separately provided by Renesas Electronics.

(7) Single Step Mode setting register0 (Test clock condition 1) (RTTSET0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	test clock															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	test clock															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	test clock	All 0	R/W	Test setting input. (Test clock selection for user domain)

Write the values separately provided by Renesas Electronics.

(8) Single Step Mode setting register1 (Test clock condition 2) (RTTSET1)

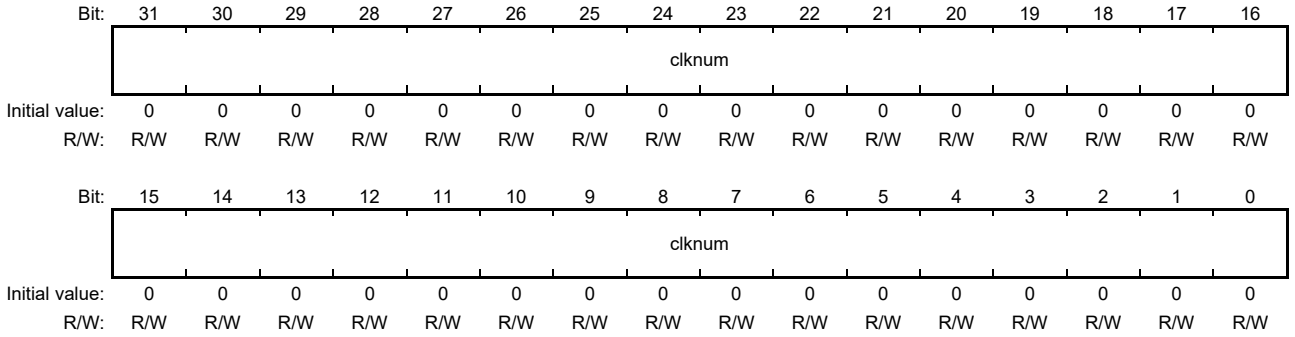
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	reset	tt
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
1	reset	0	R/W	Test setting input. (Reset test enable) 0: Reset test disabled 1: Reset test enabled
0	tt	0	R/W	Test setting input. (Test clock selection for test domain) 0: Selected other clock 1: Selected test clock for test Domain

Write the values separately provided by Renesas Electronics.

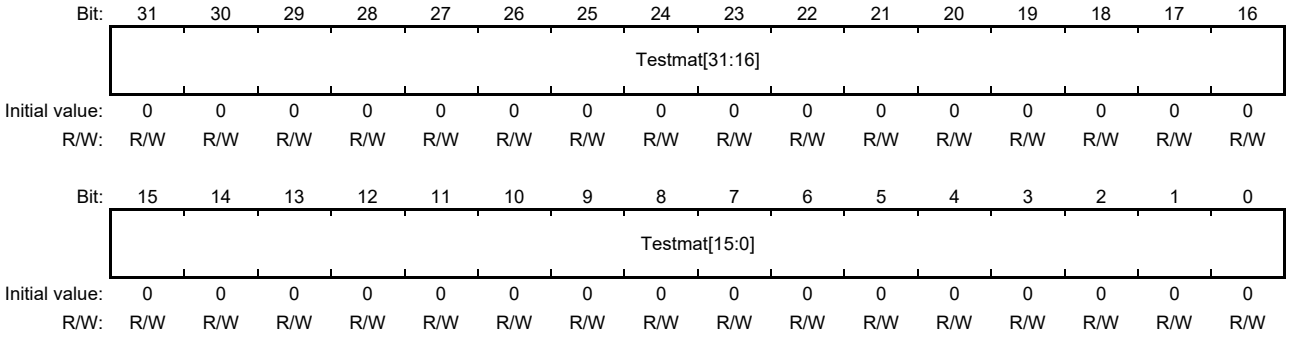
(9) Single Step Mode setting register32 (Memory BIST condition) (RTTSET32)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	clknum[31:0]	All 0	R/W	Test setting input. (Test cycle of MBIST)

Write the values separately provided by Renesas Electronics.

(10) Single Step Mode setting register33 (Memory BIST condition) (RTTSET33)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[31:0]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(11) Single Step Mode setting register34 (Memory BIST condition) (RTTSET34)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[63:48]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[63:32]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(12) Single Step Mode setting register35 (Memory BIST condition) (RTTSET35)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[95:80]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[79:64]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[95:64]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(13) Single Step Mode setting register36 (Memory BIST condition) (RTTSET36)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[127:112]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[111:96]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[127:96]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(14) Single Step Mode setting register37 (Memory BIST condition) (RTTSET37)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[159:144]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[143:128]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[159:128]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(15) Single Step Mode setting register38 (Memory BIST condition) (RTTSET38)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[191:176]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[175:160]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[191:160]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(16) Single Step Mode setting register39 (Memory BIST condition) (RTTSET39)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[223:208]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[207:192]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[223:192]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(17) Single Step Mode setting register40 (Memory BIST condition) (RTTSET40)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Testmat[255:240]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Testmat[239:224]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Testmat[255:224]	All 0	R/W	Test setting input. (Test target bridge selection of MBIST)

Write the values separately provided by Renesas Electronics.

(18) Single Step Mode setting register41 (Memory BIST condition) (RTTSET41)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	apbsel	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	apbsel						mbsel				coreselect					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved The bit or field is readable only. When writing to the register, write 0 to it.
17 to 10	apbsel	All 0	R/W	Test setting input. (Test target APG selection of MBIST)
9 to 6	mbsel	All 0	R/W	Test setting input. (Test domain selection of MBIST)
5 to 0	coreselect	All 0	R/W	Test setting input. (MBIST target CORE selection)

Write the values separately provided by Renesas Electronics.

(19) Single Step Mode setting register42 (Memory BIST condition) (RTTSET42)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	Y address													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	X address													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved The bit or field is readable only. When writing to the register, write 0 to it.
29 to 16	Y address	All 0	R/W	Test setting input. (Y address of MBIST)
15 to 14	-	All 0	R	Reserved The bit or field is readable only. When writing to the register, write 0 to it.
13 to 0	X address	All 0	R/W	Test setting input. (X address of MBIST)

Write the values separately provided by Renesas Electronics.

(20) Single Step Mode setting register43 (Memory BIST condition) (RTTSET43)

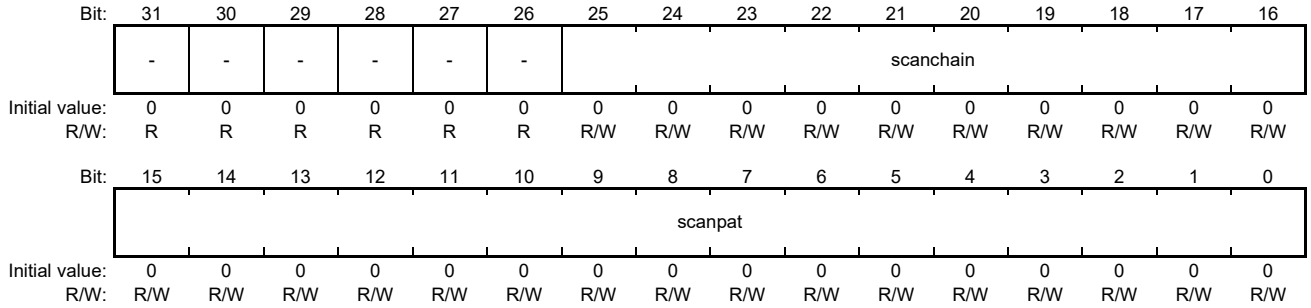
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	XY														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XY		Z address													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	-	0	R	Reserved The bit or field is readable only. When writing to the register, write 0 to it.
30 to 14	XY	All 0	R/W	Test setting input. (XY of multiplication of MBIST)
13 to 0	Z address	All 0	R/W	Test setting input. (Z address of MBIST)

Write the values separately provided by Renesas Electronics.

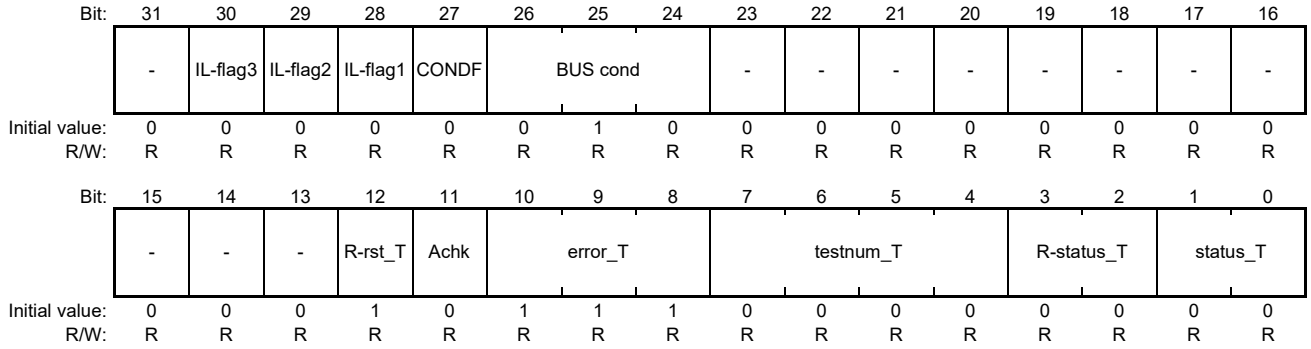
(21)Single Step Mode setting register44 (SCAN test condition) (RTTSET44)



Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
25 to 16	scanchain	All 0	R/W	Test setting input for hardware-SCAN. (Chain length)
15 to 0	scanpat	All 0	R/W	Test setting input for hardware-SCAN. (Pattern count)

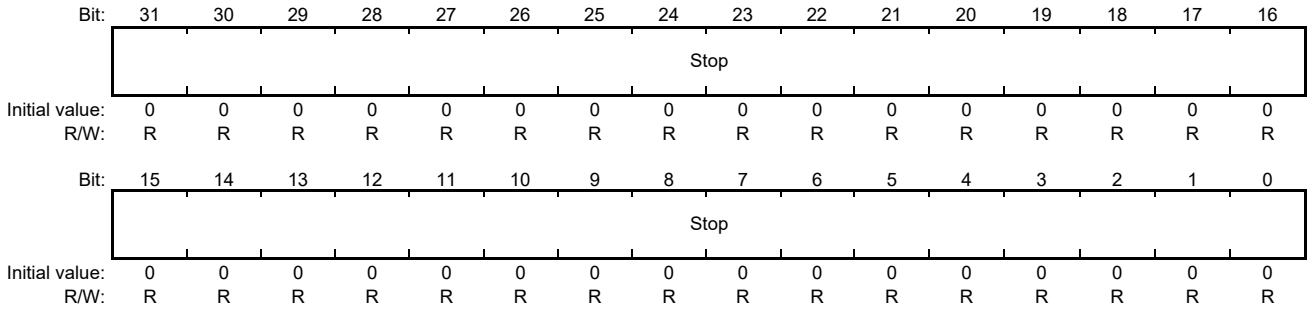
Write the values separately provided by Renesas Electronics.

(22)Total Test result for Runtime Test (RTTRSTT)



Bit	Bit Name	Initial Value	R/W	Description
31	-	0	R	Reserved. The bit is always read as 0. The write value should always be 0.
30	IL-flag3	0	R	Runtime Test Illegal suspension flag-3
29	IL-flag2	0	R	Runtime Test Illegal suspension flag-2
28	IL-flag1	0	R	Runtime Test Illegal suspension flag-1
27	CONDF	0	R	Debug monitor of FieldBIST condition. 0: not response. 1: responded
26 to 24	BUS cond	010	R	Debug code of BUS condition. [26] AXI BUS busy. [25] Waiting for response BUS. [24] SCAN pattern request.
23 to 13	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
12	R-rst_T	1	R	BIST Redundant result (Safety function) 0: Pass 1: Fail
11	Achk	0	R	Debug code of address check. 0: normal 1: warning
10 to 8	error_T	111	R	BIST error. 000: Pass. 001: Fail. 010: TimeOut. 100: BUS error.
7 to 4	testnum_T	0000	R	Number of tests.
3 to 2	R-status_T	All 0	R	BIST redundant status. (Safety function) 00: unexec. 01: wait. 10: exec. 11: finish.
1 to 0	status_T	00	R	BIST status. 00: unexec. 01: wait. 10: exec. 11: finish. Note:* When status_T in the RTTRSTT register is 01:wait or 10:exec, do not clear EX bit of the RTTEX register. The status is in the finish state until the next RTT execute.

(23) Counter Value for Runtime Test (RTTCNT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Stop	All 0	R	WDT (high counter) stop value.

(24) Expected value reverse for Self-Check (SLFRVS)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	REVERS			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	REVERS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
19 to 0	REVERS	All 0	R/W	Expected value reverse for Self-Check SISR

(25) Self-check result (SLFRST)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SCNT						STS		-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	SCNT	All 0	R	Self-Check counter
25 to 24	STS	00	R	Self-Check status 00: unexec 01: exec 11: finish
23 to 1	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
0	STR	0	R	Self -Check Result 0: Pass 1: Fail

Note *1: In case of the SLFR bits of the RTTEX register is 1B'1, SCNT bit returns to 1.
In case of the SLFR bits of the RTTEX register is 1B'0, SCNT bit is count up.

(26) Dummy Error set (ERRSET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	DSB	DST	DSF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved. The bit or field is readable only. When writing to the register, write 0 to it.
2	DSB	0	R/W	Dummy set BUS-Error (set of fbc_rt_safetyerr)
