Rev.1.10 Jun. 2026

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

List of Abbreviations

Abbreviations	Description
ADG	Audio Clock Generator
AES-ACC	Advanced Encryption Standard Accelerator
AOPS	Always On Persistent State
APMU	Advanced Power Management Unit
APSREG	AP-System register
AP-System Core	AP-System Core
AVS	Adaptive Voltage Scaling
AXI-bus	AXI-bus
GSX domain AXI	Graphics domain AXI
HSC domain AXI	High speed Communication domain AXI
IMP domain AXI	IMP domain AXI
MM domain AXI	Main Memory domain AXI
Peripheral domain AXI	Peripheral domain AXI
RT domain AXI	Real Time domain AXI
Slave Access Bus	Slave Access Bus
VC domain AXI	Video Codec domain AXI
VIO domain AXI	Video IO domain AXI
VIP domain AXI	Vision IP Processor domain AXI
BKBUF	Back-up Buffer
BOOTROM	Boot ROM
CCI	Cache Coherent Interconnect
CKM	Clock Monitor in Slave Access Bus domain
CKM3DG	Clock Monitor in GSX (Graphics) domain
CKMCNR	Clock Monitor in IMP (CNN) domain
CKMCR52	Clock Monitor in RT (CR52) domain
CKMDSP	Clock Monitor in IMP (DSP) domain
CKMHSC	Clock Monitor in HSC (High speed Communication) domain
CKMIR	Clock Monitor in IMP domain
CKMMM	Clock Monitor in Main Memory domain
CKMPE0	Clock Monitor in Peripheral domain
CKMRT	Clock Monitor in RT (Real Time) domain
CKMVC	Clock Monitor in VC (Video Codec) domain
CKMVIO	Clock Monitor in VIO (Video IO) domain
CKMVIP	Clock Monitor in VIP (Vision Processor) domain
CMT0	Compare Match Timer Type0
CMT1	Compare Match Timer Type1
CMT2	Compare Match Timer Type2
CMT3	Compare Match Timer Type3
CPG	Clock Pulse Generator

CRC	Cyclic Redundancy Check
CSI2	CSI2
CVE	Computer Vision Engine
DBE	JTAG Port Selector
DBG	Debug & Trace
DBSC5	External Bus Controller for SDRAM
DDRPHY	DDRPHY
DOC	Display Output Checker
DOF or UMF	Dense type of Optical Flow vectors generation
DPAD	Display Unit PAD
DSI/CSI-2-TX	DSI/CSI-2 TX
DTA	Debug Trace Agent
DU	Display Unit
EAVB	EthernetAVB
ECM	Error Control Module
E-FUSE	E-FUSE
ETSN	EthernetTSN
FBA	Field BIST Activator
FBABUS	FBA Bus Module
FBC	Field BIST controller
FBJ	JTAG Sequencer
FCPRC, FCPRS	Data Compression Processor
FCPVD, FCPVX	Frame Compression Processor for VSP
FLXA	FlexRay
Generic counter	Generic counter
GPTP	gPTP
HSCIF	High Speed Serial Communication Interface with FIFO
HSSTP	High Speed Serial Trace Port
I2C	I2C Bus Interface
ICUMX	Intelligent Cryptographic Unit/Master Extension
IMP CNN	Convolution Neural Network, Convolutional Neural Network
IMP core	IMP core
IMP DMAC	IMP DMAC
IMP PSC	IMP PSC
IMPSLV	IMPSLV
IMR-LX6	IMR-LX6
INTC	Interrupt Controller
ISP Core	Image Signal Processor

iVCP1E	Video Encoding Processor for Inter-device Video Transfer
LIFEC	Life Cycle
MFIS	Multifunctional Interface
MMC	SD Card/MMC Interface
MSIOF	Clock-Synchronized Serial Interface with FIFO
MTI	Measurement Trace Interface
OCDIDCMP	On-Chip Debug ID Comparator
OTP	One time program Memory
PCIEC	PCIe Controller
PFC	Pin Function
PWM	Pulse Width Modulation
RFSO	Failure Self-Detection Output
RGX	3D Graphics Processing Unit
RPC-IF	SPI Multi I/O Bus Controller
RS-CANFD	CANFD Interface
RSENS	Remote sense
RT-DMAC	Direct Memory Access Controller
RT-VRAM	RT-VRAM
RWDT	RCLK Watchdog Timer
SCEG	Secure Boot Engine
SCIF	Serial Communication Interface with FIFO
SCMT	System Timer
SLIM-IMP DMAC	Slim-IMP DMAC
SMD	Structure from motion engines
SSIU	Serial Sound Interface Unit
SUCMT	System Up-Time Clock
SWDT	System Watchdog Timer
SYSC	System Controller
SYS-DMAC	Direct Memory Access Controller
TMU	Timer Unit
TPU	16-Bit Timer Pulse Unit
TSC	Thermal Sensor Controller
VDSP	Vision DSP
VIN	Video Input Module
VSPD, VSPX	Video Signal Processor

List of Pin Replacements

Original Name	Replacement
SSI_SDATA	SSI_SD
AUDIO_CLK	AUDIO_CLKIN
PRESETZ	PRESET#
TPU0TO, TPU0_TO	TPU0TOn (n = 0 to 3)
RPC_RESET	RPC_RESET#
DCUTRST_N_LPDRST_N	DCUTRST#_LPDRST#
PRESETOUT_N	PRESETOUT#

List of Function Name Replacements

Original Name	Replacement
EtherAVB	EthernetAVB
VIN0 - VIN7 (in Chapter 9)	VIN0 - VIN7
VIN10 - VIN17 (in Chapter 9)	VIN8 - VIN15
VIN[0].ch[0] - VIN[0].ch[7] (in Chapter 56)	VIN0 - VIN7
VIN[1].ch[0] - VIN[1].ch[7] (in Chapter 56)	VIN8 - VIN15

List of Power Name Replacements

Original Name	Replacement
VDDQ18_CPGPLLn	VDD18_CPGPLLn
VDD_CPGPLLmin	VDD18_CPGPLLn min
VDDQVA_SD	VDDQ18_33_SDHI
VDD18_PCIE0	VDDQ18_PCIEn (n = 0)
VDD18_DSI	VDDQ18_DSIn (n=0,1)
VDD18_CSI0, VDD18_CSI1	VDDQ18_CSIn (n=0,1)
VDDQ_DDR0,VDDQ_DDR1	VDDQX_DDR0, VDDQX_DDR1
VDDQ18_THS1	VDDQ18

1. Overview

1.1 Introduction

The R-Car Series, 4th Generation are SoCs that feature the basic functions for next-generation ADAS(Advanced Driver Assistance System) products.

- Quad 1.0 GHz Arm® Cortex®-A76 cores, 4 cores x 1 cluster
- 3 x 1.4 GHz Arm® Cortex®-R52 core,
  Hardware Lock step is supported.
- Low Power Mode support
- Memory controller for LPDDR4x-4266/LPDDR5-6400
- Image recognition engine (IMP-X7),
- Image signal processor (ISP) x 1 channel,
- Video Output (4 lanes x 1 channel MIPI-DSI), Switchable to CSI2 interface 2.5 Gbps/lane
- Video Input (4 lanes × 2 channels MIPI-CSI2) 2.5 Gbps(D-PHY)/lane
- 1 channel FlexRay (A, B 2 channels) interface
- eMMC
- PCI Express Gen4.0 interface, (Dual lane)
- ICUMX
- AES Accelerator (x 8 channels)
- Video processing units,
- CAN FD interface x 4 channels
- Gbit-EtherAVB x 3 channels.
- Vision-IP
- PAP System

- Use TSMC 7nm process technology
- AVS (Adaptive Voltage Scaling) option supports optimization of power consumption for each SoC
- ISO26262 standard compliant for functional safety
- 19x19 mm2 FCBGA package with 729 pins
- Maximum operating temperature is Tj=125 degreeC (Ta=105 degreeC for AEC-Q100 Grade 2)

Remarks: For items noted as "option", please contact a Renesas Electronics sales representative.

1.1.1 R-Car V4M Series Lineup

V4M variants specification difference

Specification		R-Car V4M-7	R-Car V4M-5	R-Car V4M-3	R-Car V4M-2
Parts Number		R8A779H2	R8A779H3	R8A779H4	R8A779H5
Number of Cortex-A76 Max Operating frequency (PLL2/Z0φ)		4 x 1.0 GHz	4 x 0.8GHz	3 x *1 0.933 GHz	3 x *1 0.933GHz
Number of Cortex-R52 Max Operating frequency (PLL6/ZRxφ(x=0-2))		3 x 1.4 GHz	3 x 1.1 GHz	3 x 0.9 GHz	2 x *2 0.9GHz
Number of VDSP core		2	2	1*3	1*3
GPU Max Operating frequency (PLL4/ZGφ)		1.0 GHz	0.75 GHz	0.5 GHz	Not Support
DRAM Max Operating frequency (PLL3/ZB3φ)	LP5	800 MHz	625 MHz	600 MHz	600 MHz
	LP4	1066.66 MHz	833.33 MHz	800 MHz	800 MHz
Identification Register Address: OTP_MEM_1 + H'144 OTPMONITOR17.ID_Reg[7:0]		0x00	0x01	0x02	0x04

Notes.

Access to the modules or channels that have been removed from the R-Car V4M-7 product specifications is prohibited. If the user accesses these modules or channels, the correct operation of the LSI is not guaranteed.

*1: V4M-3 and V4M-2 do not support Cortex-A76 CPU core3, and operation is not guaranteed if accessed.

*2: V4M-2 does not support Cortex-R52 core2, and operation is not guaranteed if accessed.

*3: V4M-3 and V4M-2 do not support VDSP1, and operation is not guaranteed if accessed.

1.2 List of Specifications

1.2.1 Arm-based Application system Core

Item	Description
System CPU	• Quad Core Arm Cortex-A76 (quad core per cluster) 1.0 GHz L1 : I/ 64 KB per core [w/ Parity] D/64 KB per core [w/ ECC] L2 : 256 KB per core [w/ ECC] L3 : 512 KB per cluster [w/ ECC]

1.2.2 Arm-based Realtime Core

Item	Description
Realtime Core	• Arm Cortex-R52 1.4 GHz • L1 I/D cache 32K/32K bytes (ECC) • ATCM/BTCM/CTCM (16K/16K/16K bytes) (ECC) • Three CPU with Dual Lock-Step supported • Armv8-R architecture

1.2.3 Debug and Trace

Item	Description
Debug and Trace	• JTAG interface Supports dedicated 5-pin JTAG, SWD, and LPD*1 Additional pin-multiplexed 1-JTAG port. • The cross trigger function between following IPs Cortex-A76 CPU core Cortex-R52 CPU core Vision DSP (CEVA-SP500™) IMP CoreSight ICUMX PAP System • Tracing function 10 Gbps or 5 Gbps HSSTP output bandwidth through PCIe*2 32 Gbps or 16 Gbps ETR output bandwidth through PCIe*4 32 Kbyte embedded trace FIFO for Cortex-A76 32 Kbyte embedded trace FIFO for Cortex-R52 32 Kbyte embedded trace FIFO for CoreSight 16 Kbyte embedded trace FIFO for Vision DSP (CEVA-SP500™) System Trace Macrocell (ISP/MTI, AXI Masters) • Secure debug Debugging is disabled if ICUMX and Life Cycle are used in Secure LCS*6 and it can be enabled with secure debugging authentication.

*1: LPD stands for Low Pin Debug, which is used for ICUMX
*2: Available bandwidth selectable from either 5Gbps per lane or 2.5Gbps per lane
*4: Available bandwidth selectable from either 16Gbps per lane or 8Gbps per lane
*6: ICUMX and Life Cycle define Life Cycle State (LCS). Secure (SE) LCS is one of Life Cycle states.

1.2.4 CPU Core Peripherals

Item	Description
Clock Pulse Generator (CPG)	• Generates the clocks from external clock (EXTAL) – Maximum Cortex-A76 clock: 1000 MHz – Maximum Cortex-R52 clock: 1400 MHz – Maximum AXI-bus clock: 400 MHz – Maximum SDRAM bus clock: 800 MHz or 1066 MHz (LPDDR5-6400 Mbps, LPDDR4x-4266 Mbps) – Maximum media clock: 533 MHz – Maximum Vision IP clock: 640 MHz • System-CPU shut down mode control supported • Module-standby mode supported (to see Chapter 9. Module Standby, Software Reset) • Includes module reset registers to control reset operation of individual on-chip peripheral modules
System Controller (SYSC)	• Shuts down and restores power to target modules Target modules: – Cortex-A76 (with independent shutting down of each CPUs and SCU+L3 cache) (*1) – 3D Graphics Engine – Vison DSP (CEVA-SP500™) – IMP-X7-SS – ISP (*1): SCU and L3 cache are treated as one power-domain. When CPU is working, SCU+L3 cache can't be powered off. • Low leakage standby mode supported
RESET	• Includes one reset-signal external output port for external modules • Includes Boot Address Register etc.
Pin function controller (PFC)	• Setting multiplexed pin functions for LSI pins Function of the LSI pin selectable by setting the registers in the PFC module • Module selection Enable and disable the functions of LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module. • Pull-up/down control for each LSI pin On/off and up/down of the pull register on each LSI pin can be controlled by setting the registers in the PFC module.
General-purpose I/O (GPIO)	• General-purpose I/O ports • Supports GPIO interrupts
Thermal sensor / Core Voltage Monitor (THS/CVM)	• 2 channels of thermal sensor • Programmable 3 temperature level for the sensor, to indicate the temperature level • Interrupt to CPU/ECM when the temperature reaches programmed • This module detects the lower or upper value of VDD’s voltage and notifies the state thereof • Includes voltage monitoring module that measures the voltage supply inside the LSI

1.2.5 External Bus Module

Item	Description
External Flash Controller	• Supports Hyper Flash memory or QSPI flash memory Maximum Frequency 160 MHz (320 MB/s) for Hyper Flash, Maximum Frequency 133 MHz (133 MB/s) for QSPI (QSPI0) • Dual QSPI operation for two 4-bit serial flash memories is also available; 80 MHz (160 MB/s) for Dual QSPI (QSPI0+QSPI1).
External Bus Controller for LPDDR5/4x (DBSC5)	• 2x 16-bit bus DRAM interfaces • 2 x channels 16-bit bus per DRAM interface • LPDDR4x-4266/LPDDR5-6400 can be connected directly • Memory Size: Up to 8 GB(*) • Auto Refresh/Self Refresh/Partial Array Self Refresh supported • Auto Pre-charge Mode • DDR Back Up supported Cache memory for DDR-Memory access efficiency (*) LPDDR4X-SDRAM compliant with JEDEC JESD209-4C and JEDEC JESD209-4-1A. (One LPDDR4X-SDRAM can be connected to one channel. two 16bit channels within a pair must have same sizes. Support memory with sizes from 2 Gbits to 16 Gbits per 16 bits channel per rank.) LPDDR5-SDRAM compliant with JEDEC JESD209-5B (One LPDDR5-SDRAM can be connected to one channel. two 16bit channels within a pair must have same sizes. Support memory with sizes from 2 Gbits to 32 Gbits per 16 bit channel per rank.) 2 ranks/channel support. (Two ranks must have same sizes.)

1.2.6 Internal Bus Module

Item	Description
AXI-bus	• On-chip main bus – Bus protocol: AXI3 with QoS control – Frequency: 400 MHz – Bus width: 512 bits/256 bits/128 bits
Direct Memory Access Controller for System (SYS-DMAC)	• 24 channels for PER0 domain (SYDM) with Dual core lock step • Address space: 1 TBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,215 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)
Boot	• System startup with selectable boot mode at power-on reset • In on-chip ROM boot, Hyper Flash or QSPI serial ROM boot is supported • Program downloaded to internal memory Autorun function for the downloaded program • Secure boot supported. Integrity check of boot image is proceeded before executing • On secure chip, boot operation is restricted to on-chip ROM boot mode • About the detail information of BOOT, refer to Chapter 31. Boot
Realtime Direct Memory Access Controller (RT-DMAC)	• 32 channels for Realtime domain with Dual core lock step • Address space: 1 TBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,215 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)
IPMMU	• An IPMMU is a memory management unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks

Item	Description
Interrupt Controller (INTC)	• 6 interrupt pins which can detect external interrupts • Fall/rise/high level/low level detection is selectable • On-chip peripheral interrupts: Priority can be specified for each module • 16 software interrupts that have been generated and 6 private peripheral interrupts supported • 32-level priority selectable • Trust Zone supported • ITS (Interrupt Translation Service) support (for Message Signal Interrupt from PCI-Express)
Multifunctional Interface (MFIS)	• Interrupt generation between SYS domain and RT domain • Fifteen external source bits for controlling 32 Ktypes of interrupts • Lock function for exclusive access support
Error Control Module (ECM)	• Error checking function control and arbitrate error signal from other module

1.2.7 Internal Memory

Item	Description
RT-VRAM	2 Mbytes, each 1 Mbytes in compatible mode and 28 Mbytes cache in extended mode
System RAM	1 Mbytes

1.2.8 Graphics Units

Item	Description	
3D Graphics Engine (GSX)	• Imagination Technologies PowerVR BXS-4-64 GPU • 64 FLOPs/clk (FP32) • System Level Cache provides cashing of all types of workload data. 64 Kbytes capacity • OpenGL ES 3.2 supported	
Display Unit (DU)	MIPI-DSI interface	The following is Key features of the DSI/CSI-2-TX Transmitter module. Supports 1 channel (4 lane x 1 channel) interface • Supports MIPI DSI version 1.3.1 Supports MIPI D-PHY 2.5 Gbps with de-skew function (for 2.5 G) • Supports MIPI CSI2 version 1 Supports MIPI D-PHY 2.5 Gbps with de-skew function
	DSI	• Supports D-PHY specification version 1.2 • Protocol Interface Video mode and Packet Generation from Input Video signal Supports RGB format (16 bpp, 18 bpp, 18 bpp Loosely and 24 bpp) Supports YCbCr 4:2:2 format (16 bpp) Supports Blanking Packet or LP-11 selection during each of HSA, HBP and HFP Blanking interval Not supports Burst transfer mode Not supports Interlaced Video Not supports 3D control payload Supports Command Packet Tx/Rx (maximum one packet per frame on blanking period) • Supports Command mode which supports Command Packet Tx/Rx by Register • Supports automated insertion of EoTp
	CSI2	• Supports D-PHY specification version 1.2 • Protocol Interface Video mode and Packet Generation from Input Video signal through DU (Display Unit). Supports RGB565/666/888 Supports YUV422 8 bit Not support Interlaced Video Not support Interleaving Not support Line Start Packet and Line End Packet Supports Tx Command Packet (maximum one packet per frame on working Video Interface) • Supports Command Transfer mode which supports Tx/Rx Command Packet by Register
Display Output Checker (DOC) (safety function option)	• The DOC allows to check whether the display content (warning, light, and so on) is correctly output by the Display Unit (DU)	

Video Input Module(VIN) (MIPI-CSI2 interface)	• 2 channels (4 lane x 2 channels) • 2.5 Gbps/Lane(D-PHY) RAW data (ISP) RAW8, RAW10*, RAW12*, RAW14* (HDR sensor Input), RAW16* (HDR sensor Input), RAW20* (HDR sensor Input), RAW24* (HDR sensor Input) are supported *: RAW10, RAW12, RAW14, RAW16, and RAW20, RAW24 can be input only via ISP module. YUV420 8/10bit, YUV422 8/10bit, RGB565, RGB888, Embedded 8bit, User Defined 8bit are supported

1.2.9 Video Processing

Item	Description
Video Signal Processor (VSPD)	VSPD has the following features. 1 set of VSPD is integrated. (1) Supports various data formats and conversion • Supports YCbCr444/422/420, RGB, αRGB, αplane • Color space conversion and changes to the number of colors by dithering • Color keying • Supports combination between pixel alpha and global alpha • Supports generating pre multiplied alpha (2) Video processing • Blending of 5 picture layers and raster operations (ROPs) • Vertical flipping in case of output to memory (3) Direct connection to display module • Supports 6,144 pixels in horizontal direction • Writing back image data which is transferred to Display Unit (DU) to memory (4) Supports DISCOM function • Support 2 sets of DISCOM per 1 VSPD • Support same size with VSPD • CRC calculation area is configurable • Support detection of unmatching the expectation CRC value • Support detection of matching image data over multiple frames for detecting image frozen • Support both RGB and YCbCr color space
Video Encoding Processor for inter-device video transfer (iVCP1E)	• Support H.264/AVC with 8/10/12-bit depth • Low-latency encoding with precise CBR (Constant Bit Rate) control • Support 1,920 x 1,080 resolution • Data handling on a picture-by-picture basis Use the software from Renesas to handle iVCP1E functions.
IMR-LX6	• 4 Image Renders for camera image distortion correction application • Pixel Performance: 533 Mpixel/sec (peak@533MHz) per one IMR-LX6 • Rotator/Scaler function support (2 channels) – YUV422 semi-planar input mode – 3 x 3 Gaussian Filter on the Scaler function Stride setting should be extended to support 4K width input
ISP (Image Signal Processor)	• Defect Pixel Correction • Noise Filter • Local Tone Mapping • Histogram Generation (4 colors x 256 bin) • Demosaicing • Color Correction • Dual Video Output (Human Vision and Machine Vision)

1.2.10 Sound Interface

Item	Description
Serial Sound Interface (SSI)	• TDM format is supported. • Monaural mode (8 bits or 16 bits) is supported • Operating mode: non-compressed mode (Not support compressed mode) • Supports versatile serial audio formats (I2S/left justified/right justified) • Supports master/slave functions • Programmable word clock, bit clock generation functions.
Audio Clock Generator (ADG)	• 1 channel • Supplying Audio Clock to SSI (Serial Sound Interface)

1.2.11 Storage

Item	Description
Multi Media Card Interface (MMC)	• 1 channel • eMMC 5.01 base, support HS400 class transfer rate

1.2.12 Network

Item	Description
CAN-FD	• 4 interfaces CANFD instance • Data phase max 8 Mbps
PCIE Controller	• PCI Express Base Specification Revision 4.0 • PHY integrated • Operates as a PCI Express Endpoint or a PCI Express Root Port • 2 lanes x 1 channel
Ethernet AVB-IF	• Supports IEEE802.1BA, IEEE802.1AS, IEEE802.1Qav and IEEE1722 functions • Supports transfer at 1000 Mbps and 100 Mbps • Magic packet detection • Supports Reception Filtering to separate streaming frames from different sources • Supports interface conforming to IEEE802.3 PHYRGMII (Reduced Gigabit Media Independent Interface) • RGMII v1.3 • 3 channels
FlexRay	• 2 channels (A, B interfaces) • Comply with FlexRay protocol specification v2.1 • Data transfer rate: up to 10 Mbps on each channel

1.2.13 Timer

Item	Description
RCLK Watchdog Timer	• 1 channel • Internal 16 bits watchdog timer operated by RCLK • Programmable overflow time period: more than 1 hour count capable
16-Bit Timer Pulse Unit (TPU)	• 4 channels 16 bits timers • Each channel outputs PWM
System Watchdog Timer	• 1 channel • Internal 16 bits watchdog timer • Programmable overflow time period: more than 1 hour count capable initial counter value 171[s]
Window WDT	• 7 channels (4 channels for Arm Cortex-A76 CPU cores, 3 channels for Arm Cortex-R52 cores) • Window watchdog function; Window & 75% interrupt • Generates Reset or NMI on error detection • 3 start mode selectable (Automatic, Intelligent automatic, software trigger) • Configuration can be done by configuration terminals (flash/mask option or clamp) information
Compare Match Timer Type0 (CMT0)	• 2 channels • 32 bits timer (16 bits/32 bits can be selected) • Source clock: RCLK clock • Compare match function provided • Interrupt requests
Compare Match Timer Type1/2/3 (CMT1/2/3)	• 8 channels • 48 bits timer (16 bits/32 bits/48 bits can be selected) • Source clock: RCLK/system clock • Compare match function provided • Interrupt requests
System Timer	• 32 bits timer, 1 channel (16 bits/32 bits is selectable) • Compare match function provided • Interrupt requests
System up-time clock	• 1 channel • Internal 32 bits timer • Programmable overflow time period: maximum 24 hours
Timer Unit (TMU)	• 15 channels • 32 bits timer • Auto-reload type 32 bits down counter • Internal prescaler • Interrupt request • 4 channels for input capture

1.2.14 Peripheral Module

Item	Description
ICUMX	• The ICUMX integrates an Intelligent Cryptographic Unit Processor (ICUP) that controls the ICUMX sub-system and runs the user-defined security services • The ICUMX includes an accelerator that supports a block cipher algorithm based on the AES (Advanced Encryption Standard, FIPS PUB 197) and supports DMA transfer for AES block data • The ICUMX integrates several public key cryptographic algorithms like RSA, ECC • The ICUMX integrates an accelerator that supports HASH function based on SHA-1, SHA-224, SHA-256 (Secure Hash Algorithm, FIPS-PUB 180) and SHA-3 (Secure Hash Algorithm, FIPS PUB 202) • The ICUMX integrates a true random number generator • The ICUMX can be used as a slave peripheral to run security services upon request. The ICUMX handles processing of other user-defined security services (for example, checking contents of memory for completeness and integrity) and operates as a master handling procedures to strengthen measures for security • The ICUMX has exclusive read access and programming access to a specific area of memory which holds confidential data (keys and certificates) and highly confidential code for operating security services • The ICUMX zeroizes key materials in FA mode
AES accelerator	Accelerating AES encryption/decryption operation for high speed communication • Support 128 bits and 256 bits key length • Support operation mode, ECB, CBC, CMAC, XTS, CTR and GCM Key management function protects encryption keys from being exposed on memory or falsified by other functions
I2C Bus Interface (I2C)	• 4 channels for open drain buffer • NXP I2C bus interface method supported • Master/slave functions • Multi-master functions • Fast mode plus compatible • Programmable clock generation from the system clock • Master and Slave function DMA supported

Item	Description
Serial communication interface with FIFO (SCIF)	• 4 channels • Asynchronous, clock-synchronized modes • Asynchronous serial communication mode The SCIF performs serial data communication based on a character-by-character asynchronous system. This feature enables serial data communication with standard asynchronous communication chips that support Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). There is a choice of eight serial data transfer formats. — Data length: 7 bits or 8 bits — Stop bits: 1 bit or 2 bits — Parity: Even/odd/none — Receive error detection: Parity, framing, and overrun errors — Break detection: A break is detected when a framing error lasts for more than 1 frame length at Space 0 (low level). When a framing error occurs, a break can also be detected by reading the RX pin level directly from the serial port register (SCSPTR). • Clock synchronous serial communication mode The SCIF performs serial data communication synchronized with a clock. This feature enables serial data communication with other LSIs that support synchronous communication. There is a single serial data communication format for clock synchronous serial communication. — Data length: 8 bits — Receive error detection: Overrun errors • Full-duplex communication capability The SCIF has an independent transmitter and receiver that enable simultaneous transmission and reception. The transmitter and receiver both have a 16-stage FIFO buffer structure, enabling continuous serial data transmission and reception. • On-chip baud rate generator, enabling any bit rate to be selected The SCIF enables choice of a clock source for transmission/reception: a clock from the on-chip baud rate generator based on the internal clock or an external clock. • 8 interrupt sources • The SCIF has eight types of interrupt sources. receive-data-ready, receive-FIFO-data-full, break, transmit-FIFO-data-empty, transmit-end, receive-error, overrun-error and time-out and enables any of them to be requested independently.
Serial Communication Interface with FIFO (SCIF)	• DMA data transfer When the transmit FIFO register is empty or the receive FIFO register has received data, issuing a DMA transfer request activates the DMA controller (DMAC) to execute a data transfer. • The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available • In asynchronous mode, a receive data ready (DR) or a timeout error (TO) can be detected during reception

Item	Description
Clock-Synchronized Serial Interface with FIFO (MSIOF)	• 6 channels • Max. speed: 40 MHz for Master Reception or Master Transmission • Max. speed: 60 MHz for Slave Reception • Max. speed: 25 MHz for Slave Transmission • Internal 32 bits x 256-stage transmit FIFOs/internal 32 bits x 256-stage receive FIFOs • Supports master and slave modes • Internal prescaler • Supports serial formats: IIS, SPI (master and slave modes) • Interrupt request, DMAC request
High Speed Serial Communication Interface with FIFO (HSCIF)	• 4 channels • Asynchronous serial communication mode • Capable of full-duplex communication • On-chip baud rate generator, enabling any bit rate to be selected • Eight interrupt sources • DMA data transfer • Modem control functions (HRTS# and HCTS#) are stored • The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available • A receive data ready (DR) or a timeout error (TO) can be detected during reception
PWM	• 5 channels • High-level width (10 bits) of PWM output can be set. • Output cycle periods (10 bits) of PWM can be set. • Periods in the range from two to 2^{24} x 1024 cycles of the SASYNCPERD4φ clock can be set. • Continuous pulse or single pulse output selectable

1.2.15 Special Edition Modules

Item	Description
Image Processing Unit (IMP-X7)	• 2 Image Processor Cores • 4 CVe clusters • 2 Mbyte local memory • 2 DMAC for transferring image data from DDR to local memory in IMP-X7 • 1 IMP PSC for image scaling engine • 1 CNN engine (included 2 DSP(CEVA-SP500™). There are (2MB + 0.5MB= 2.5MB) memory per a CNN.)
Vision IP	• Structure from Motion engine • Dense Optical Flow engine
PAPSystem	• Custom logic for Vision computing • PAP Sub-System consist of PAP, Host-REG, PAP-DMAC and PAP-BUSs
CRC	The cyclic redundancy check (CRC) block is a function block to generate and check CRC codes of input data via the APB bus. The 32 bits Ethernet polynomial (CRC-32-IEEE 802.3) is used as the generator polynomial. The CRC codes based on this generator polynomial are stored in the register.
Failure Self-Detection Output (RFSO)	This module distinguishes between permanent failure and temporary failure detected by CPU or other important circuit module; moreover, detects time-out error in the process of detecting failures. The failure of CPU or other important circuit will be detected by other circuit (Runtime Test). Also, this module will be used for managing FTTI of this LSI.

y	—	—	0.14
y1	—	—	0.20

1.5 Power Control

1.5.1 Power domain structure

R-Car V4M SoC consists from three kinds of power domains, which are Always ON, C4 and PSO (Power Shut OFF).
Table 11.1 (Power Domain Structure) shows the detail definition of each power domain.
PSO corresponds with A3*, A2*. A1* as shown in Table 11.1.
Table 11.1.2.1 (Function located on Always ON power domain), Table 11.1.2.2 (Function located on C4 power domain) and Table 11.1.2.3 (Function located on PSO) show the relationship between functions and its power domain.

Always ON
- Always Power ON.

C4
- Power ON when the chip operation mode is Full Run Mode.
- Power ON or OFF when the chip operation mode is Low Power Mode.

PSO (Power Shut OFF)
- Power ON or OFF when the chip operation mode is Full Run Mode.
- Power OFF when the chip operation mode is Low Power Mode.

1.5.2 Chip mode transition

Figure 1.5.2.1 and Figure 1.5.2.2 show the chip mode transition specification on selecting ICUMX or Cortex-R52 as a master boot processor, respectively.

As shown in Figure 1.5.2.1 and Figure 1.5.2.2. "C5" means "Always ON".

Low Power Mode:
All modules in PSO domain are power-off condition by register settings. Each module in C4 domain can be power-off condition by register settings.
In Low Power Mode, ICUMX and Cortex-R52 core0 can control only modules in C5 domain.
Chapter 11. System Controller (SYSC) shows how to turn on C4, which leads chip mode transition from Low Power Mode to Full Run Mode.

Full Run Mode:
All modules in not only C5 but also C4 domain are power-on condition by register settings.
Setting registers described in Chapter 11. System Controller (SYSC) turns on corresponding power domains, which can activate all CPUs and modules in PSO domain.

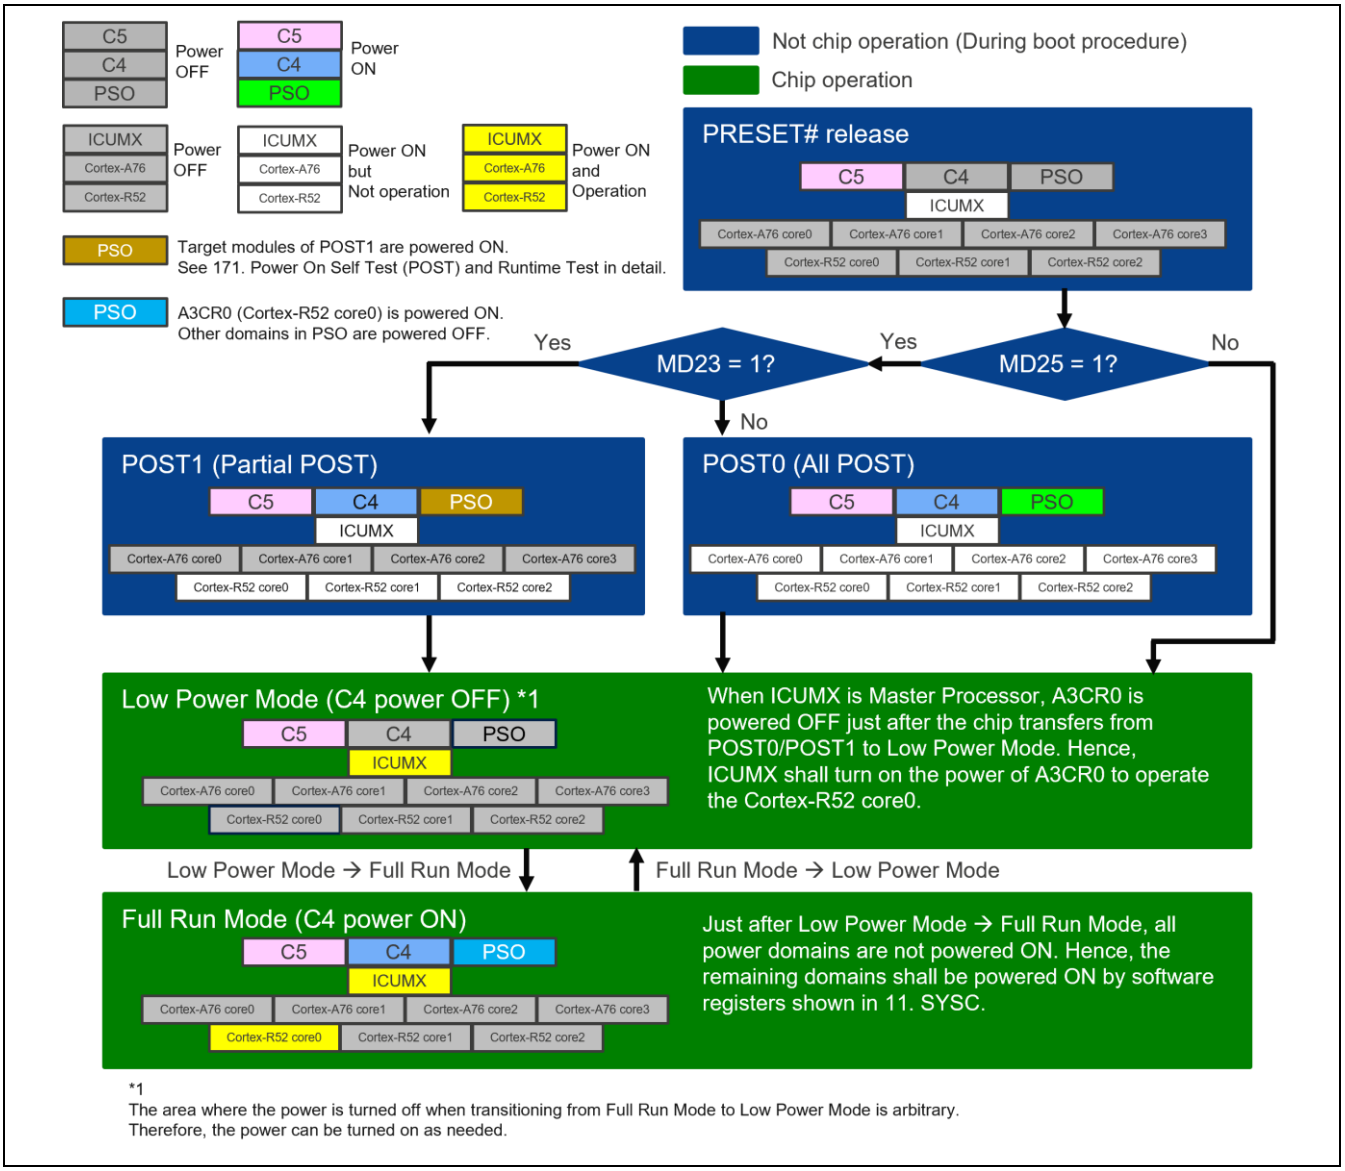

Figure 1.5.2.1 R-CarV4M chip mode transition (Master Processor = ICUMX)

Notes:
"C5" is equal to "Always ON".

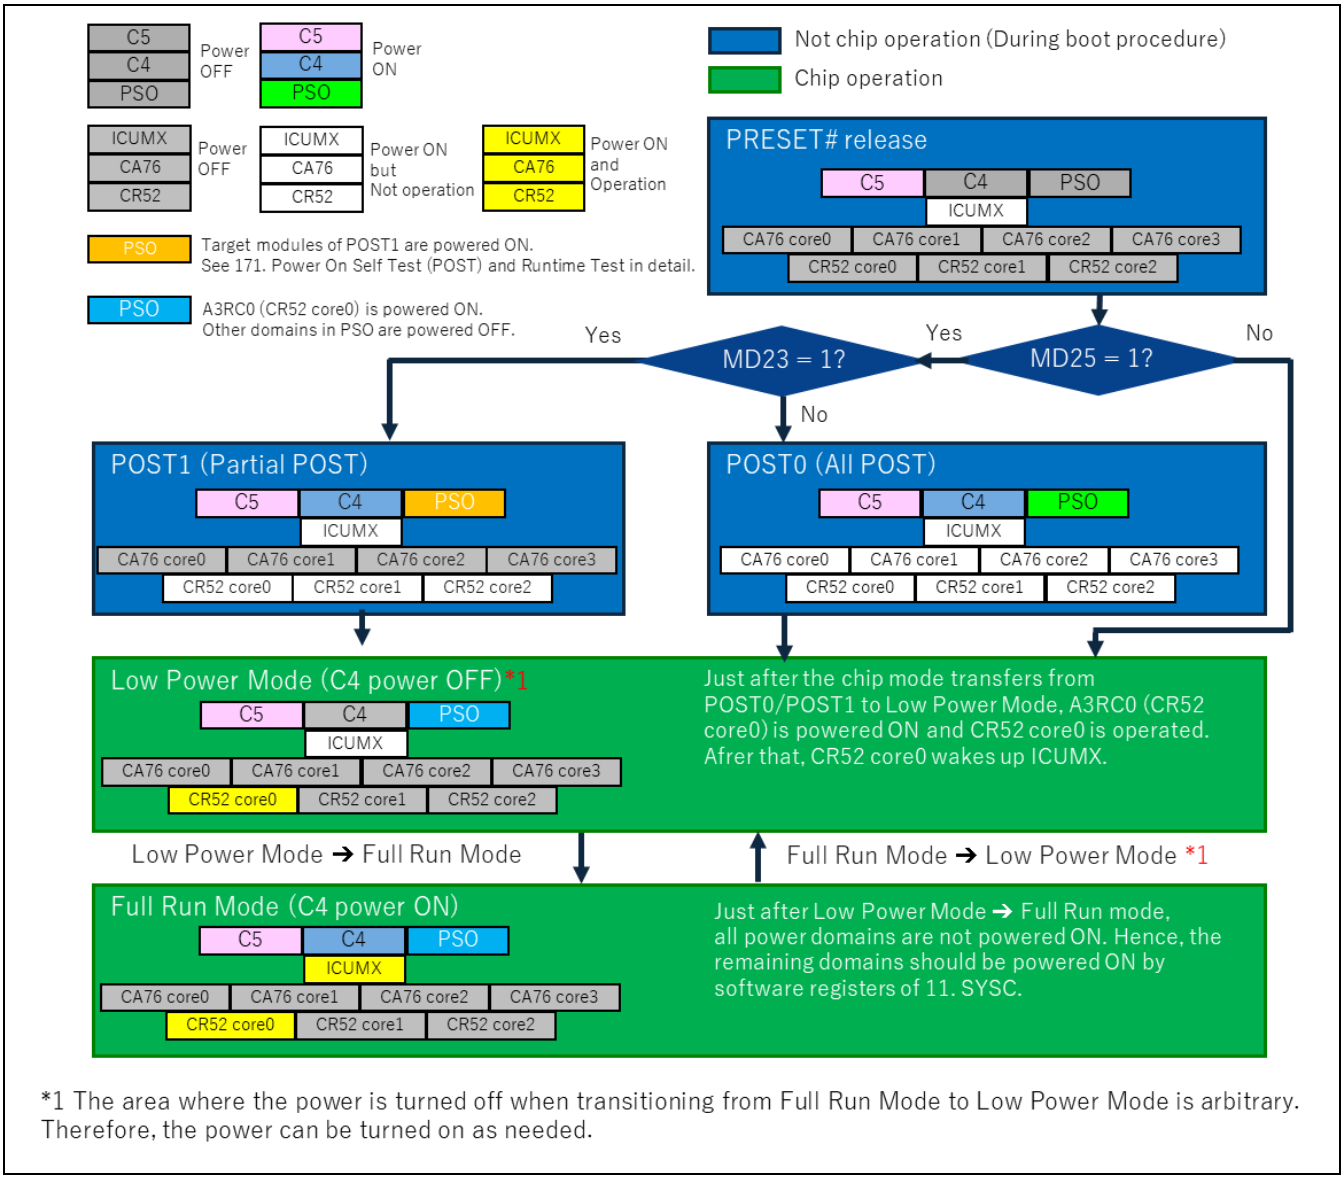

Figure 1.5.2.2 R-CarV4M chip mode transition (Master Processor = Cortex-R52 core 0)

Notes:
"C5" is equal to "Always ON".

POST0:
When the chip boot procedure is started from Cold startup, all modules shall be tested by POST (Power on Self Test) according to Functional Safety instruction. See Chapter 171. Power On Self Test (POST) and Runtime Test about the detail description related to POST0.

POST1:
When the chip boot procedure is re-executed by POR (Power On Reset shown in Table 14.1.1), it is not mandatory to execute the POST0 for all modules. The target of POST1 is modules which are categorized to ASIL-D. When the POST0 is re-executed for all modules again, there are high possibilities that the chip power consumption is increased. The POST1 is effective for solving it. See Chapter 171. Power On Self Test (POST) and Runtime Test about the detail description related to POST1.

Full Run Mode → Low Power Mode

- When the chip power consumption increases so largely in Full Run Mode, the power consumption can be reduced by the mode transition from Full Run Mode to Low Power Mode. The mode transition can be executed by turning off C4 and PSO domain. See Chapter 11. System Controller (SYSC) about a usage of turning off their domains. In addition, see Section 1.5.4 before executing the mode transition.

- Just after mode transition from Full Run Mode to Low Power Mode, any clocks which are provided for all modules in C4 and PSO domain are still provided. The clocks can be stopped for the further power consumption reduction (See Section 1.5.3.).

- The area where the power is turned off when transitioning from Full Run Mode to Low Power Mode is arbitrary. Therefore, the power can be turned on as needed.
  As an example of use, when controlling the power supply with Cortex-R52, it is necessary to turn on "1 Cortex-R52 core" at least.
-

Low Power Mode → Full Run Mode

- When it is judged the chip power consumption is reduced as expected, the chip mode can transition from Low Power Mode to Full Run Mode by turning on C4 domain. See Chapter 11. System Controller (SYSC) about a usage of turning on C4 domain. In addition, see Section 1.5.4. before executing the mode transition.

- If any clocks which are provided for all modules in C4 and PSO domain are stopped, the clocks shall be supplied with the corresponding modules by software registers in Chapter 8. Clock Pulse Generator (CPG). See Section 1.5.3. in detail.

1.5.3 Stopping unused clocks in Low Power Mode

Following clocks are allowed to be stopped in Low Power Mode, because any modules which are summarized in Table 11.1.2.2 (Function located on C4 power domain) and Table 11.1.2.3 (Function located on PSO) are powered OFF.

Table 1.5.3.1 Clocks which are allowed to be stopped in Low Power Mode

Clock	Clock divider shown in Figure 8.1.1	Clock control register shown in 8.2 (*1)
ZGφ	3DGE divider	FRQCRB
ZDφ	DSU divider	FRQCRB
ZR1φ	RT-CPU divider1	FRQCRC0
ZC0φ	SYS-CPU divider0	FRQCRC0
ZC1φ	SYS-CPU divider1	FRQCRC0
ZR2φ	RT-CPU divider2	FRQCRC1
ZC2φ	SYS-CPU divider2	FRQCRC1
ZC3φ	SYS-CPU divider3	FRQCRC1
ZXφ	AXCC divider	CPGMA0CKSTPCR
S0_VIOφ	Common divider	CPGMA0CKSTPCR
S0_VCφ	Common divider	CPGMA0CKSTPCR
SV_VIPφ	Common divider	CPGMA0CKSTPCR
SV_IRφ	Common divider	CPGMA0CKSTPCR
IMPASRCφ	IMPASRC divider	CPGMA0CKSTPCR
IMPBSRCφ	IMPBSRC divider	CPGMA0CKSTPCR
VIOSRCφ	VIOSRC divider	CPGMA0CKSTPCR
VCSRCφ	VCSRC divider	CPGMA0CKSTPCR
MSOφ	MSIOF divider	MSOCKCR
CSIφ	CSI divider	CSICKCR
DSIEXTφ	DSIEXT divider	DSIEXTCKCR
ADGHφ	ADGH divider	ADGHCKCR

1.5.4 Usage Notes

Before the mode transition b/w Full Run Mode → Low Power Mode, all functions operation which are located on C4 and PSO power domain shall be stopped to avoid the system deadlock. See each chapter about the usage of stopping the functions.

1.6 Sequence of Activation for the R-Car V4M

The following describes the initialization sequence of R-Car V4M.

(1) Selection of Master Boot Processor and External Boot Device

Select the master boot processor by placing the required levels on the MD6 and MD7 pins and external boot device by placing the required levels on the MD1, MD2, MD3 and MD4 pins before booting up the LSI. For details, see Chapter 31. Boot.

Note: The following steps from (2) to (6) are not included in the sequence described in Chapter 31. Boot because these steps are not relevant to booting. Note, however, those steps (2) to (6) shall be executed before restoring the power supply to modules, including CPUs other than the master boot processor, to which the power has been cut off.

(2) Stopping the RWDT and System WDT

To prevent the watchdog timer issuing an unexpected reset or interrupt while the activation sequence is in progress, be sure to disable the RCLK watchdog timer (RDWT) and System watchdog timer (System WDT). Enable their operation at an appropriate time after the activation sequence is completed. For details, see Chapter 14. Reset (RST), Chapter 15. Interrupt Controller (INTC), Section 154.1. RCLK Watchdog Timer, and Section 154.3. SystemWatchDog Timer.

Notes: Use the RWTCSRA register to disable the RWDT. Since the detailed specifications of the System WDT are not disclosed in this manual, contact us to inquire about the details or use the sample driver included in the board support package (BSP).

Currently, the reset and interrupt signals caused by the watchdog timer overflowing are initially masked in R-Car V4M. Accordingly, this step of disabling the watchdog timers within the activation sequence is not mandatory.

(3) Selecting the Functions of Multiplexed Pins

When a pin function other than that selected by the initial setting is to be used, set the relevant registers in the pin function controller (PFC). Note that, before setting these registers, the LSI multiplexed pin setting register (PMMR) shall be appropriately set to prevent incorrect writing to registers. For details, see Chapter 7. Pin Function Controller (PFC).

Note: When a GPIO function which is different from that selected by the initial setting is to be used, it is necessary to set the GPIO attributes before setting the pin function controller.

(4) Initial Settings for Operating Frequency Required by the Main Processor, Cache, MMU, and Interrupt Controller

Make initial settings for operating frequency required by the master processor, cache, MMU, and interrupt control. The operating frequencies are set by using the registers FRQCRC0, FRQCRC1, PLL2CR0, PLL2CR1, PLL6CR0, and PLL6CR1 (for Cortex-A76 and Cortex-R52). The details of the functional specifications for the CPU cores, cache, MMU, and interrupt control are not included in this manual. Please refer to the following references.

References: ARM® Architecture Reference Manual ARMv8, for ARMv8-A architecture profile

Arm® Cortex®-A76 Core Technical Reference Manual, Revision: r4p1

Arm® DynamIQ™ Shared Unit Technical Reference Manual, Revision: r4p1

GICv3 and GICv4 Software Overview

(5) Initial Settings for Memory Controllers

When a program is to be stored in and runs from SDRAM, make initial settings for the required registers in the DBSC. For activation sequence, see Chapter 33. External Bus Controller for SDRAM (DBSC5).

Note: Each product has different initial setting. Renesas is preparing the document of each product.

(6) QoS Setting

(7) Settings for Restoring Power Supply to Functional Modules to Be Used Immediately After Activation

In the initial state, power may not be supplied to some modules to be used. Accordingly, for modules to be used immediately after activation, set the control registers in the system controller (SYSC) as required and read the status registers to check that the power supply has been restored. For details on the sequence for restoring the power supply, see Chapter 11. System Controller (SYSC).

(8) Settings for Release from the Module Reset State and the Supply of Clock Signals to Functional Modules to Be Used Immediately After Activation (Other Than CPUs)

Depends on module, in the initial state, clock signals may not be being supplied to all modules to be used. Accordingly, for modules to be used immediately after activation, set the Clock Control registers (Section 8.2. Register Description in Chapter 8. Clock Pulse Generator (CPG)) for the respective modules in the clock pulse generator (CPG) or set the MSTPCRn registers (n = 0 to 29) in the module standby and software reset control block of the CPG. For details, see Chapter 8. Clock Pulse Generator (CPG) and Chapter 9. Module Standby and Software Reset.

All registers above can be protected from unexpected write operation. See Section 8.4.1. and Section 8.4.2. for the registers in Chapter 8. Clock Pulse Generator (CPG). In addition, see Section 9.4.1. and Section 9.4.2. for the registers in Chapter 9. Module Standby, Software Reset.

(9) Setting of Boot Address of the CPU (as Required)

To switch the boot address to an area in the DDR memory to which high-speed access is possible, start by downloading the required program to the specified area and set the starting address for execution in the boot address register (CR52BAR, CR52BARP, RVBARLCz, RVBARHCz, RVBARPLCz or RVBARPHCz) for the relevant CPU. This setting is not required if the boot address is not to be changed. For details, refer to Chapter 10. Advanced Power Management Unit.

(10) Restoring the Power Supply to A CPU and Releasing CPUs from the Reset State

Before using Cortex-A76 CPU cores, start by checking the PRR register described in Chapter 16. Multifunctional Interface (MFIS) to confirm which CPU is available for use. If activation of a CPU disabled by the PRR register is attempted, the clock pulse generator may not operate properly.*[1]

To use a CPU (Cortex-A76), set 1 to WUP_REQ bit of PWRCTRLCz in the APMU module. When the power status needs to be confirmed, the status can be confirmed by WUP_REQ bit of PWRCTRLCz. For details, refer to Chapter 10. Advanced Power Management Unit.

Notes: 1. This step can be skipped if you already know which CPU is available for use.

(11) Adaptive voltage scaling (AVS) support [for specific customer only]

Adaptive voltage scaling (AVS) mitigates power variation in SoC level via adjusting VDD voltage. Chapter 12. Adaptive Voltage Scaling (AVS) shows the details of AVS feature [for specific customers only]

(12) Cortex-A76 frequency settings

Cortex-A76 operates at 1.0 GHz.

2. Area Map

Regarding section 2, refer to EXCEL file “002_R-CarV4M_Address_Map_r1p10.xlsx”.

To access to 40bits address area from masters who can use only 32bits address, please use IPMMU (section 19).

3. Pin Assignment

3.1 Pin Assignment

For details, refer to 003_R-CarV4M_pin_arrangement_r0p40.xlsx.

3.2 Mode Pin Settings

Table 3.1 TEST3, TEST2, TEST1 Settings

TEST3	TEST2	TEST1	Test Mode Select
0	0	0	User Mode*

*Other settings are prohibited.

Table 3.2 BSMODE Settings

BSMODE	JTAG Pin Operating Mode Switching
0	Normal operation
1	Operates in boundary scan mode. When PRESET# is at low level, pin IO control is disabled.

Table 3.3 MD0 Settings

MD0	Free Run Mode / Step Up mode Selection

5. AP-System Core

5.1 Overview

The AP-System core is a core block equipped with Arm® Cortex®-A76. For details on the functions of Cortex-A76, see the relevant Technical Reference Manual.

5.1.1 Features

5.1.1.1 Cortex-A76 CPU Cluster

Table 5.1 shows the features of Cortex-A76 CPU cluster in the AP-System Core.

Table 5.1 **Features of the AP-System Core Block (Cortex-A76)**

	R-Car V4M
Version	r4p1 (Cortex-A76 CPU core) r4p1 (DynamIQ Shared Unit)
# of Cores	R-CarV4M-7: 4 x Cortex-A76 CPU core R-CarV4M-5: 4 x Cortex-A76 CPU core R-CarV4M-3: 3 x Cortex-A76 CPU core (Not support Core 3) R-CarV4M-2: 3 x Cortex-A76 CPU core (Not support Core 3)
Cluster Structure	R-CarV4M-7,V4M-5: 1 x (4-core/cluster) R-CarV4M-3,V4M-2: 1 x (3-core/cluster)
L1 Cache	I=64KB [w/ Parity] + D=64KB [w/ ECC]
L2 Cache	256 KB [w/ ECC]
L3 Cache	512 KB [w/ ECC]
ECC	Supported
MMU	Supported
NEON/VFP	NEON supported (Advanced SIMD) VFP supported
Cryptography Extension (Optional)	Supported
Max. Frequency	R-CarV4M-7: 1000 MHz R-CarV4M-5: 800 MHz R-CarV4M-3: 933 MHz R-CarV4M-2: 933 MHz
Operating Clock	CPU core: ZC0ϕ, ZC1ϕ, ZC2ϕ, and ZC3ϕ CPU Cluster: ZDϕ
	L2-Tag RAMs: ZC0ϕ, ZC1ϕ, ZC2ϕ, and ZC3ϕ L2-Data RAMs: 2-divided clock of ZC0ϕ, ZC1ϕ, ZC2ϕ, and ZC3ϕ
	L3-Tag RAMs: ZDϕ L3-Data RAMs: 2-divided clock of ZDϕ
	ACE bus: ZXϕ
Low Power Mode	Sleep mode (each CPU) Core standby mode (each CPU) Cortex-A76 CPU cluster power down mode (CPU cores in cluster and L3 cache shutdown: A2 = OFF)
Private Peripherals	Arm-based Generic Timer supported

5.1.1.2 AP Interconnect (AXCC)

AP Interconnect is an interconnect for AP System Core. It connects one ACE master and two AXI slaves.

Table 5.2 shows the module connection of each port.

The bus interconnect is connected to the CPU Clusters, Main Memory Domain AXI and Peripheral Domain AXI.

Table 5.2 Module Connection of Each Port

	R-Car V4M
Slave port 0	Cortex-A76 CPU Cluster 0 ACE
Master port 0	Peripheral Domain AXI
Master port 1	Main Memory Domain AXI

5.1.1.3 Generic Counter

For the general explanation about the Generic Counter, and the details of the relation between the Generic Counter and the Generic Timer, refer to the ARM manual[1]. This chapter explains the frequency for count-up of the Generic Counter. The Generic Counter serves as the CoreSight Timestamp function as well as the Generic Timer.

5.1.2 Block Diagram

Figure 5.1 shows the block diagram of the AP-System Core.

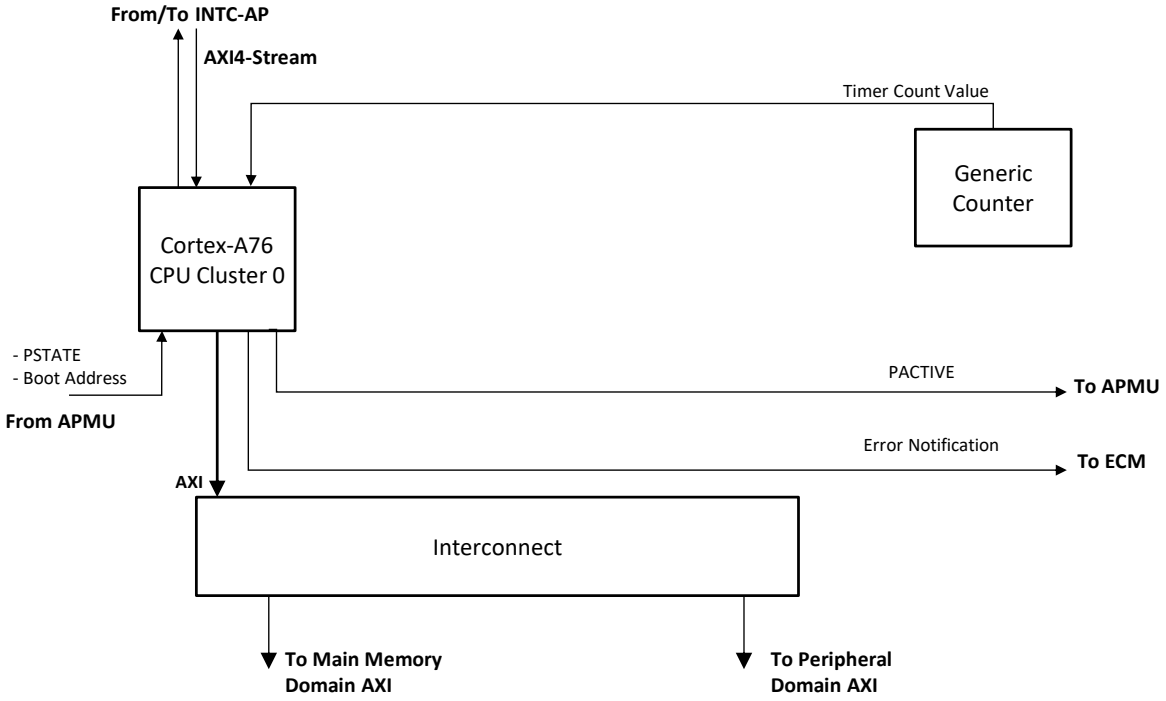

Figure 5.1 Ap-System Core Block Diagram

5.1.3 External Pins

In the AP-System Core, there are no external pins.

5.1.4 Register Configuration

Table 5.3 Base Address

Please refer to sheet “Base Address” of the file “R-CarV4M_UM_005_AP_System_Core_r1p10.xlsx”.

Table 5.4 Register Configuration

Please refer to sheet “Register Configuration” of the file “R-CarV4M_UM_005_AP_System_Core_r1p10.xlsx”.

Table 5.6 Register Configuration (Generic Counter – Control Base: Arm-based registers)

Register Name	Abbreviation	R/W	Offset	Initial value	Size	R-Car V4M
Counter Control Register	CNTCR	R/W	H’0000	H’0000 0000	32	√

Counter ID Register 11	CounterID11	R	H'1FFC	H'0000 00B1	32	√

Note: For details, refer to Arm architecture reference manual (DDI0487B_b_armv8_arm.pdf), Appendix I1 System Level Implementation of the Generic Timer.

5.1.5 Connected Module

Table 5.8 shows the connected modules to the AP-System Core. As for the features of the connected modules, refer to the chapter for each module.

Table 5.8 Connected Modules

Module Name	Connected Module Name	Connected Module Function
AP-System Core	APMU	CPU power on/off sequence Boot address setting CPU reset control
	CPG	Clock supply
	SYSC	Power switch control
	RST	CPU reset control
	ECM	Error signal control
	INTC-AP	Interrupt handling
	AXI-bus	On-chip Interconnect bus
	DBSC5	External bus controller
	Debug and Trace	Debug function

5.1.6 Reference

[1] ARM® Architecture Reference Manual ARMv8, for ARMv8-A architecture profile, Issue B.b
[2] Arm® DynamIQ™ Shared Unit Technical Reference Manual, Revision: r4p1
[3] Arm® Cortex®-A76 Core Technical Reference Manual, Revision: r4p1

5.2 Register Description

As for register description of AP-System Core, refer to the following documents.

- ARM® Architecture Reference Manual ARMv8, for ARMv8-A architecture profile, Issue B.b
- Arm® DynamIQ™ Shared Unit Technical Reference Manual, Revision: r4p1
- Arm® Cortex®-A76 Core Technical Reference Manual, Revision: r4p1

Register descriptions of other registers are shown in the following subclauses.

Please refer to sheet “Register Description” of the file “R-CarV4M_UM_005_AP_System_Core_r1p10.xlsx”.

5.3 Operation

5.3.1 Boot Address Setting

Cortex-A76 supports only AArch64 mode, the boot address is controlled by RVBARL/HCx registers in APMU. For the initial value and details of these registers, refer to Section 10, Advanced Power Management Unit.

5.3.2 Power-Up/Down Mechanism

Each core has the following power modes.

- ON mode
- OFF mode
- OFF_EMU mode
- Pseudo OFF mode

And, each cluster has the following power modes.

- ON mode
- OFF mode
- FUNC_RET mode
- MEM_RET mode
- L3 cache partial power down mode
- Pseudo OFF mode

The detail of the above power modes is described in Section 10.3.1. And, the power mode transition sequence is described in Section 10.3.2.

5.3.3 Switching Between AArch32 and AArch64

There is no operation to switch between AArch32 and AArch64 with warm reset because Cortex-A76 does not support AArch32 in EL1, EL2, and EL3.

5.3.4 System Address Map

5.3.4.1 Overview

The AXCC has the system address map. The address spaces defined in this map are split into 7 regions. The connection to each master port is defined by the value of ADDRMAP[39:0] in advance.

Table 5.11 is System Address Map of AXCC

Table 5.11 System Address Map for AXCC

Address Region	Address Range	Destination
Region 0	H'00 0000 0000 to H'00 3FFF FFFF	Master port 0 (Peripheral)
Region 1	H'00 4000 0000 to H'00 BFFF FFFF	Master port 1 (Main Memory)
Region 2	H'00 C000 0000 to H'00 DFFF FFFF	Master port 0 (Peripheral)
Region 3	H'00 E000 0000 to H'00 E62F FFFF	Master port 0 (Peripheral)
Region 4	H'00 E630 0000 to H'00 E63F FFFF	Master port 1 (System RAM)
Region 5	H'00 E640 0000 to H'00 FFFF FFFF	Master port 0 (Peripheral)
Region 6	H'01 0000 0000 to H'0F FFFF FFFF	Master port 1 (Main Memory)

5.3.5 Frequency for Counting Up of Generic Counter

The generic timer counts up by one every clock edge of SASYNCRTφ clock continuously.

5.3.6 How to Start a Generic Counter

Set bit 0 in CNTCR to 1 to start the Generic Counter when the CPU is placed in the secure mode.

5.4 Usage Notes

5.4.1 Reserved

5.4.2 Reset Restriction for AXCC

The all of the Cortex-A76 CPU cores and cluster shall be reset when the AXCC is reset. The reasons are the following:

- There are safety mechanisms in ACE Bus on CPU side and AXCC side. They count the number of transactions. In master side the number is add to USER signal. In slave side, the USER signal is compared with its number. The numbers in both sides shall be reset simultaneously to prevent a false safety error.

When you reset a Cortex-A76 CPU core, caches inside the core need to be invalidated in advance. However, if the caches cannot be invalidated for some reasons (e.g. CPU hang-up), not only the corresponding core but also all other Cortex-A76 CPU cores and cluster, and AXCC need to be reset.

5.4.3 Register Initialization Before C4 power on

The registers in the Table 5.13 shall be initialized by Cortex-R52 before C4 power on.

Table 5.13 The registers that need to be initialized before C4 power on

Register name	Register address	Setting value
APSREG_AP_CLUSTER*n*_AUX0 (*n* is cluster number [0])	H'E628_*n*010 (*n* is cluster number [0])	H'0000_0003
APSREG_AXCC_AUX	H'E628_9010	H'0000_0001

5.4.4 Virtual Memory Extensions for ARMv8.1

The Distributed Virtual Memory extensions for ARMv8.1 is not supported.

5.4.5 Prevention of unexpected phenomenon due to CPU speculative access

For Cortex-A76, set Device Memory and Execute Never, or do not map the speculative access prohibited regions*1 in MMU page translation table.

Note *1: Other than RAM/ROM regions that are permitted to be accessed from the CPU and can access randomly.

5.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

5.5.1 Cortex-A76 CPU Cluster

5.5.1.1 Overview

Cortex-A76 CPU Cluster has safety mechanisms such as parity, error correction code and hardware redundancy.

Table 5.14 shows ECC and parity safety mechanism list for memories of Cortexa-A76.

Table 5.14 ECC/Parity list for memories (Cortex-A76)

RAM	Protection Type	Correction Behaviour*1	Uncorrectable Error Behaviour
L1 instruction cache tag	Parity	The line that contains the error is invalidated from the L1 instruction cache and fetched again from the subsequent memory system.	-
L1 instruction cache data	SED	The line that contains the error is invalidated from the L1 instruction cache and fetched again from the subsequent memory system.	-
MMU translation cache	Parity	Entry invalidated, new pagewalk started to refetch the entry.	-
L1 data cache tag	SECDED	The cache line that contains the error gets evicted, corrected inline, and refilled to the core.	Fatal RAM error is flagged to ECM.
L1 data cache data	SECDED	The cache line that contains the error gets evicted, corrected inline, and refilled to the core.	Synchronous Data Abort, Prefetch Abort SystemError Interrupt. Fatal RAM error is flagged to ECM.
L2 cache tag	SECDED	Tag is corrected inline.	Fatal RAM error is flagged to ECM.
L2 cache data	SECDED	Data is corrected inline.	Synchronous Data Abort, Prefetch Abort or System Error Interrupt. Fatal RAM error is flagged to ECM.
L2 TQ data	SECDED	Data is corrected inline.	Fatal RAM error is flagged to ECM.
L3 cache data Long-term data buffer	SECDED	Data is corrected inline.	Data is marked as poisoned, abort is generated when poisoned data is consumed. Fatal RAM error is flagged to ECM.

L3 cache tag	SECDED	The value is corrected and written back to the RAM. The lookup is replayed.	The line is invalidated. Fatal RAM error is flagged to ECM.
Snoop filter	SECDED	The value is corrected and written back to the RAM. The lookup is replayed.	Fatal RAM error is flagged to ECM.

*1: RAM error is flagged to ECM if ERR0CTLR.CFI bit is set

5.5.1.2 Parity

(1) Overview

Parity check is applied to the following internal RAMs in the AP-System Core.

— L1 instruction cache tag RAM, L1 instruction cache data RAM and MMU translation cache RAM in Cortex-A76.

(2) Hardware Description

As for register description of the AP-System Core, refer to the following documents.

Reference [3].

A parity error is treated as a correctable error. A correctable error is reported separately from uncorrectable error, where uncorrectable error is detected by ECC protection whenthe register in Cortex-A76 CPU core is set as follows:
— ERR0CTLR = H'0000 0105
By this setting, "RAM Error" in Figure 5.2 represents only the correctable error.

For more details of the error type definition and the error reporting, refer to chapter A8 "Reliability, Availability, and Serviceability (RAS)" in Reference [3].

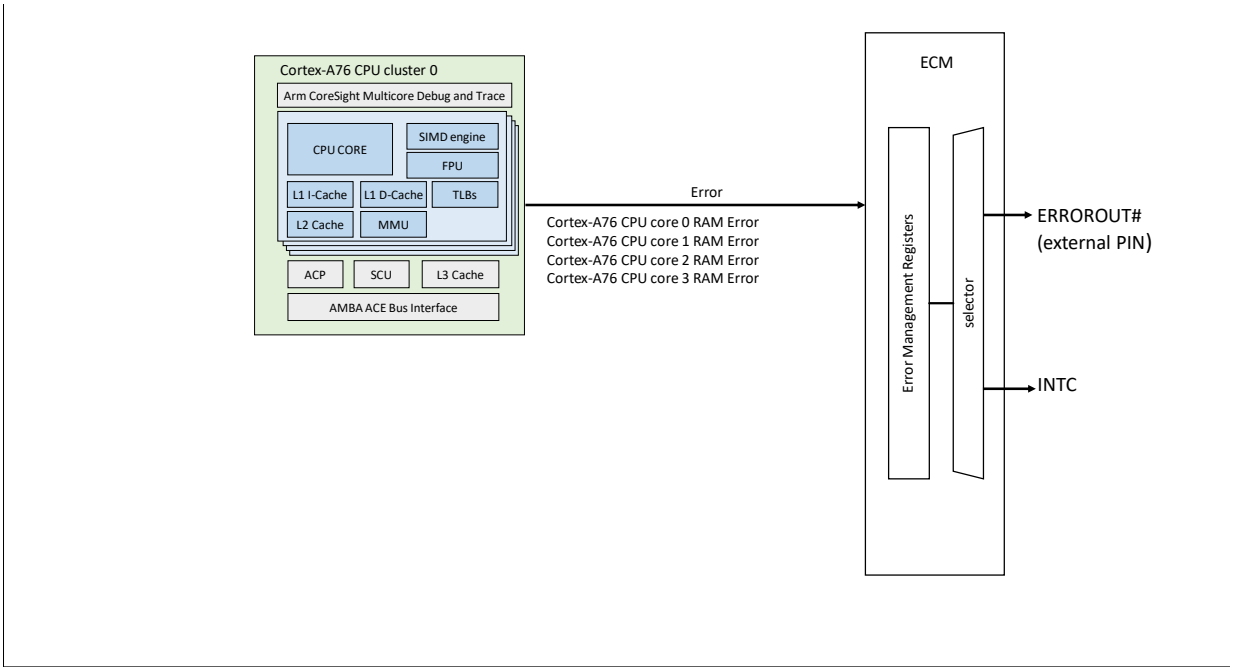

Figure 5.2 Parity check for AP-System Core

The following internal RAMs in Cortex-A76 CPU core (Table 5.15) are protected by parity checking.

Table 5.15 Parity protection (Cortex-A76)

RAM	Protection method	Error signals
L1 instruction cache tag RAM	1 parity bit	Cortex-A76 CPU core *n* RAM Error (correctable error)
L1 instruction cache data RAM	SED (parity)	Cortex-A76 CPU core *n* RAM Error (correctable error)
MMU translation cache RAM	2 interleaved parity bits	Cortex-A76 CPU core *n* RAM Error (correctable error)

Note: *n* is core number [0-3].
Note: For details of parity protection, refer to chapter A8 “Reliability, Availability, and Serviceability (RAS)” in Reference [3].

5.5.1.3 Error Correction Code (ECC)

(1) Overview

ECC protection is applied to the following RAMs.
— L1 data cache tag RAM and L1 data cache data RAM in Cortex-A76.
— L2 cache tag RAM, L2 cache data RAM, and L2 TQ RAM in Cortex-A76.
— L3 tag RAM, L3 data RAM, SCU snoop filter RAM, and SCU Long-Term Data Buffer RAM in Cortex-A76.

(2) Hardware Description

As for register description of the AP-System Core, refer to Reference [2] and Reference [3].

Cortex-A76 CPU cluster supports three types of errors: correctable error (single-bit ECC error), uncorrectable error (double-bit ECC error on tag RAM or snoop filter RAM) and deferred error (double-bit ECC error on data RAM or SCU Long-Term Data Buffer RAM, where the chunk of data with the error is marked as poisoned).

A correctable error and an uncorrectable error are reported separately when the registers in Cortex-A76 CPU cluster are set as follows:
— ERR0CTLR = H’0000 0105
— ERR1CTLR = H’0000 0105
By this setting, “RAM Error” in Figure 5.3 represents only the correctable error, “RAM Fatal Error” represents only the uncorrectable error. Deferred error is not reported to ECM and “RAM Fatal Error” will be reported when poisoned data are consumed by CPU.

For more details of the error type definition and the error reporting, refer to section A5.5 “L3 cache ECC and parity” in Reference [2] and chapter A8 “Reliability, Availability, and Serviceability (RAS)” in Reference [3].

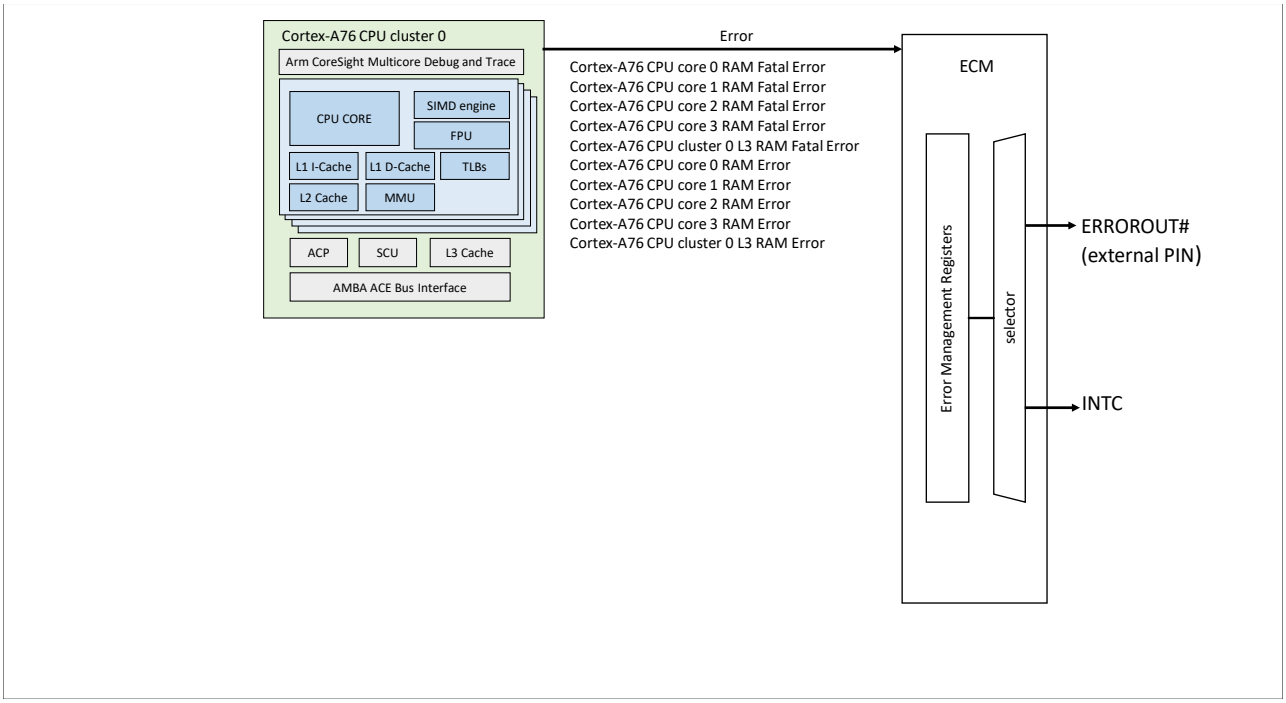

Figure 5.3 ECC Protection for AP-System Core

The following internal RAMs in Cortex-A76 CPU cluster (Table 5.16) are protected by ECC.

Table 5.16 ECC protection (Cortex-A76 CPU cluster)

RAM	Protection method	Error signals
L1 data cache tag RAM	SECDED (ECC)	Cortex-A76 CPU core *n* RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU core *n* RAM Error (correctable error)
L1 data cache data RAM	SECDED (ECC)	Cortex-A76 CPU core *n* RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU core *n* RAM Error (correctable error)
L2 cache tag RAM	SECDED (ECC)	Cortex-A76 CPU core *n* RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU core *n* RAM Error (correctable error)
L2 cache data RAM	SECDED (ECC)	Cortex-A76 CPU core *n* RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU core *n* RAM Error (correctable error)
L2 TQ data RAM	SECDED (ECC)	Cortex-A76 CPU core *n* RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU core *n* RAM Error (correctable error)
L3 tag RAM	SECDED (ECC)	Cortex-A76 CPU cluster *m* L3 RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU cluster *m* L3 RAM Error (correctable error)
L3 data RAM	SECDED (ECC)	Cortex-A76 CPU cluster *m* L3 RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU cluster *m* L3 RAM Error (correctable error)
SCU snoop filter RAM	SECDED (ECC)	Cortex-A76 CPU cluster *m* L3 RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU cluster *m* L3 RAM Error (correctable error)
SCU Long-Term Data Buffer RAM	SECDED (ECC)	Cortex-A76 CPU cluster *m* L3 RAM Fatal Error (uncorrectable error) / Cortex-A76 CPU cluster *m* L3 RAM Error (correctable error)

Note: *m* is cluster number [0] and *n* is core number [0-3].
Note: For details of ECC protection, refer to section A5.5 “L3 cache ECC and parity” in Reference [2] and chapter A8 “Reliability, Availability, and Serviceability (RAS)” in Reference [3].

5.5.1.4 ACE Bus Protection

Please refer to 5.5.2.3(1).

5.5.1.5 AXI4-Stream Bus Protection

(1) Overview

AXI4-Stream Bus are protected by EDC and ORDER gen/check.

(2) Hardware Description

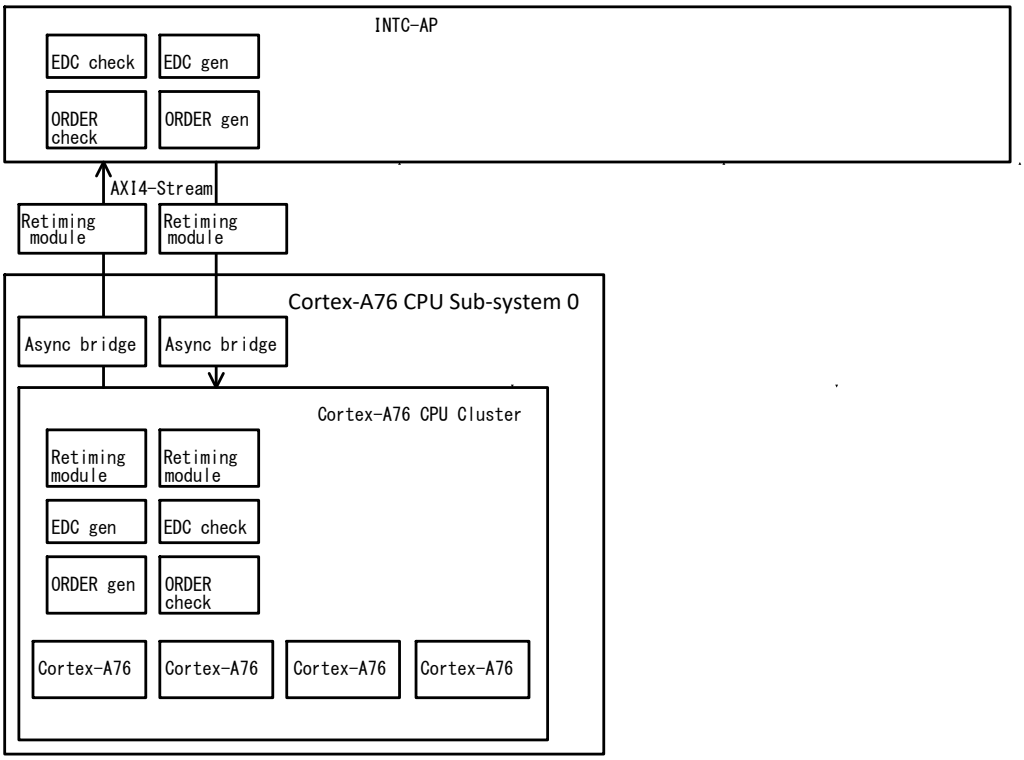

Figure 5.7 Block diagram of AXI4-Stream with safety mechanisms

[EDC protection between AP-System Core and INTC-AP]

EDC protection are implemented to protect each AXI4-Stream channel between AP-System Core and INTC-AP.

[ORDER gen/check]

The purpose of ORDER check is to detect the fault of AXI4-Stream Asynchronous bridges.

ORDERgen generates an incremental counter value for each transaction. Then, the counter value is attached to AXI4-Stream USER signal as a part of AXI4-Stream transaction. *ORDERchk* also generates an incremental counter value for each received transaction and compare this counter value with the value attached in USER signal. If 2 counter values are different, an error is informed to ECM module.

ORDER generator and ORDER checker are implemented as a pair for each AXI4-Stream channel.

5.5.1.6 P-channel Interface Protection

P-channel interface is used to communicate between APMU and Cortex-A76. And Safety Mechanism for this interface is implemented in APMU and Cortex-A76. The block diagram is shown in Figure 5.9.

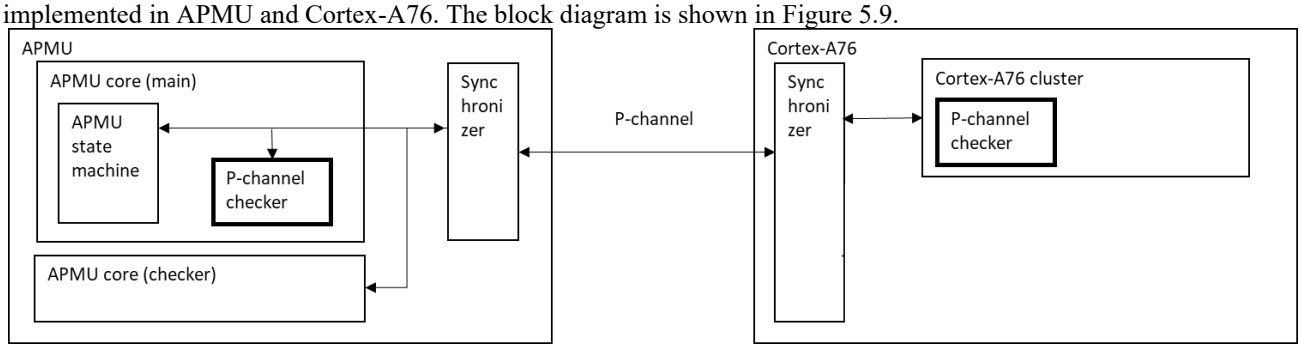

Figure 5.9 Safety Mechanism for P-channel between APMU and Cortex-A76

(1) Safety Mechanism in Cortex-A76 side

This Safety Mechanism can find two types of errors. The first is parity error and the second is P-channel signal protocol error. If either one error is detected, Cortex-A76 notifies error detection to ECM.

1. Parity error for P-channel signal

   A parity bit is added to P-channel signal from APMU to Cortex-A76. The parity checking logic is implemented in Cortex-A76. It detects the parity error.

2. P-channel protocol error

   Toggle ordering of P-channel signals is defined by Arm. About the detail, refer to AMBA Low Power Interface Specification. This mechanism detects failing of this ordering. For example, when PREQ signal from APMU is asserted, it has to be kept asserted until PACCEPT or PDENY signal from Cortex-A76 core is asserted. If PREQ signal are negated before PACCEPT or PDENY signal are asserted, this mechanism judges it as P-channel protocol error.

(2) Safety Mechanism in APMU side

This Safety Mechanism can find three types of errors.

1. P-channel protocol error
2. P-channel corruption error
3. FSM deadlock error

The error detection flag is stored to FSM Lock Register for each FSM. This register is in APMU. When error detection flag is set, 1 is set to each bit of ERRSTSR, and APMU notifies error detecting to ECM.

For more details, please refer to Section 10.5.3.

5.5.1.7 Generic Counter Interface Protection

(1) Overview

Hardware Redundancy is applied to detect the fault of Generic Counter Interface between Generic Counter and AP-System Cores or Realtime Core.

(2) Hardware Description

Generic Counter Interface, Async. Absorber, and Gray code to Binary code converter are duplicated. If the difference between two values of output from two converters is more than 1, an error is notified to ECM. The block diagram is shown in Figure 5.11.

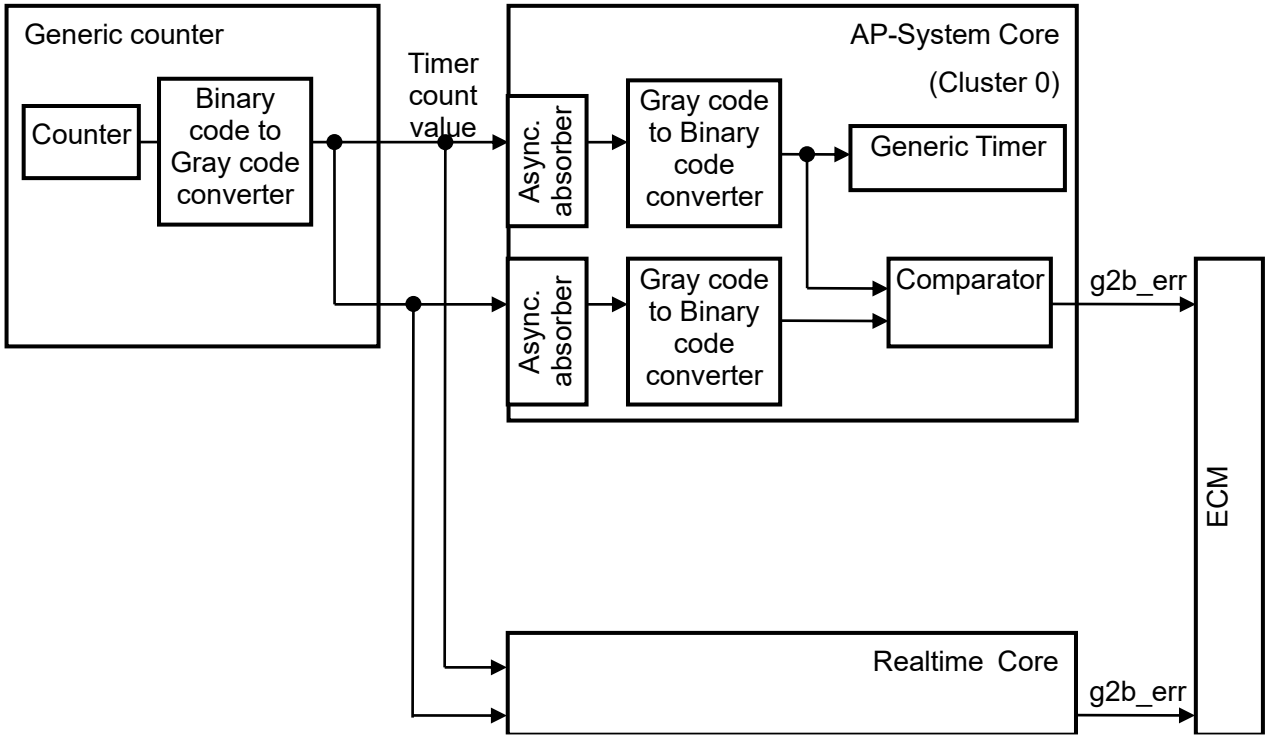

Figure 5.11 Generic Counter Interface Protection

5.5.1.8 Debug Authentication Status Register Check

(1) Overview

This safety mechanism is a periodical check executed by software on the SoC.
This safety mechanism detects faults of debug authentication signals between the Debug module and the AP-System Core by checking whether the debug authentication status register value and the expected one match. These faults could cause unintended activation of debug mode of the AP-System Core.

(2) Hardware Description

None.

5.5.2 AP Interconnect (AXCC)

5.5.2.1 Overview

Figure 5.13 shows the block diagram of AXCC module with Safety Mechanisms implemented.

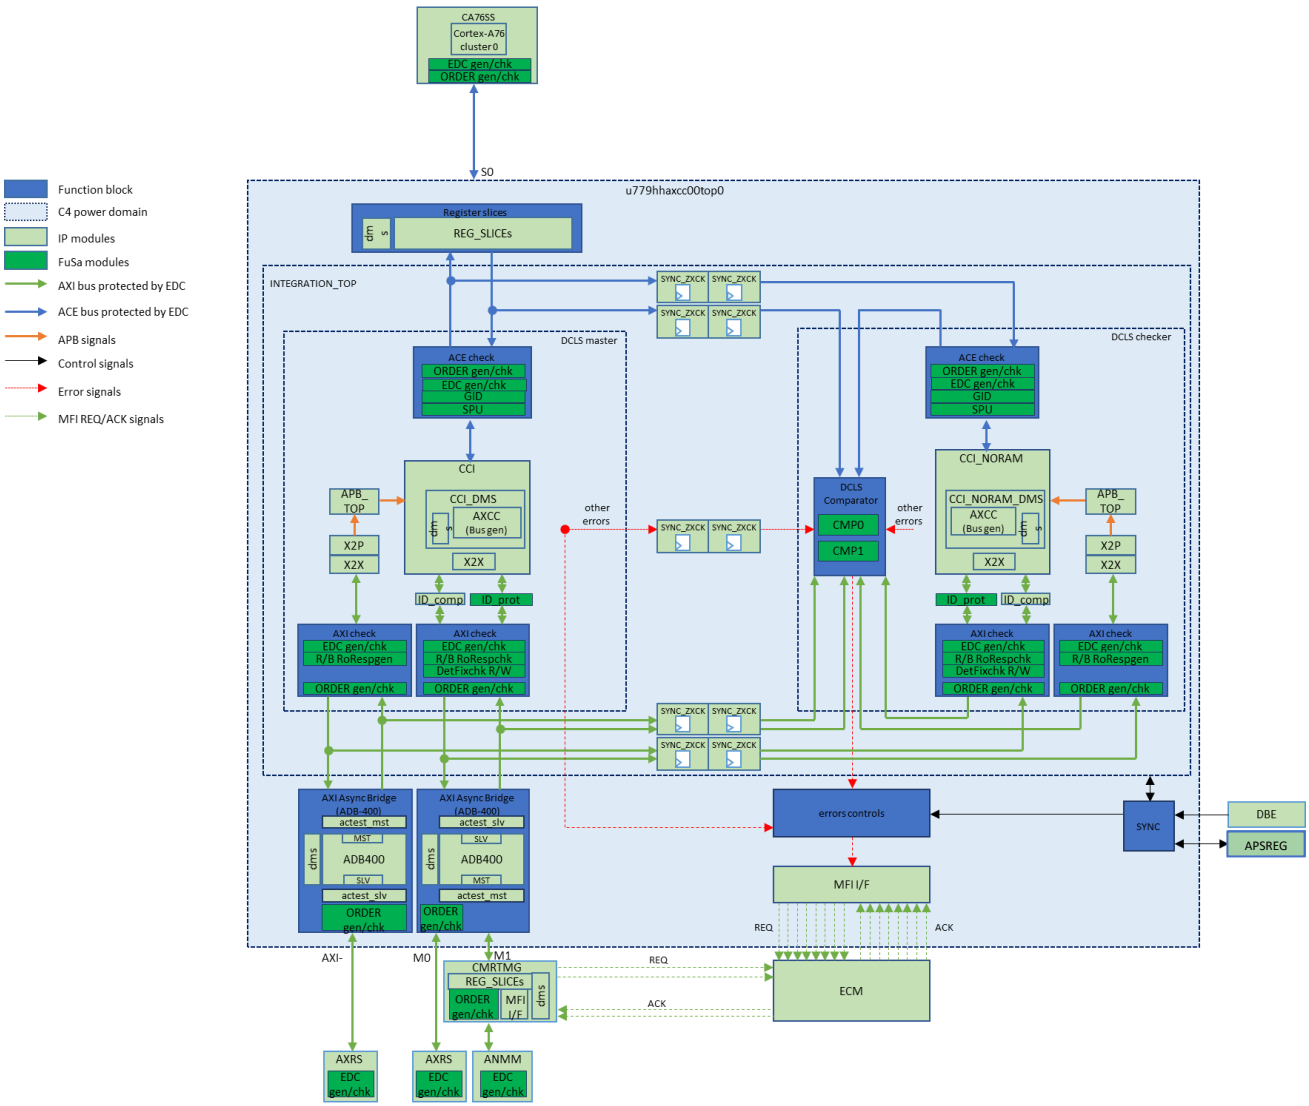

Figure 5.13 Block diagram of AXCC module with safety mechanisms

5.5.2.2 Reserved section

5.5.2.3 Bus Protection

(1) Bus protection for ACE protocol

(a) Overview

EDC protection is implemented to protect ACE Slave Interface between Cortex-A76 CPU cluster and AXCC

W/RACK check is implemented in ACE Slave Interface to detect error when no outstanding but having response.

MPU Wrapper: Region ID protection and ORDER gen/check function, as below:

- Region ID protection is implemented to protect memory access from Cortex-A76 CPU cores to memory.
- ORDER gen/check is implemented to detect faults of FIFO read/write pointers in ACE Asynchronous bridges.

(b) Hardware Description

[EDC protection between Cortex-A76 CPU cluster and AXCC]

EDC protection are implemented to protect AXI channel (AR, AW, R, W, B) between Cortex-A76 CPU cluster and AXCC.

[W/RACK check]

Figure 5.15 shows the AXCC WACK/RACK check diagram. WACK/RACK safety mechanism at ACE Slave Interfaces is used to detect error when no outstanding transactions (counter value of DMS function) but having response (WACK/RACK assert).

When an error detected, AXCC sub-system informs to ECM module.

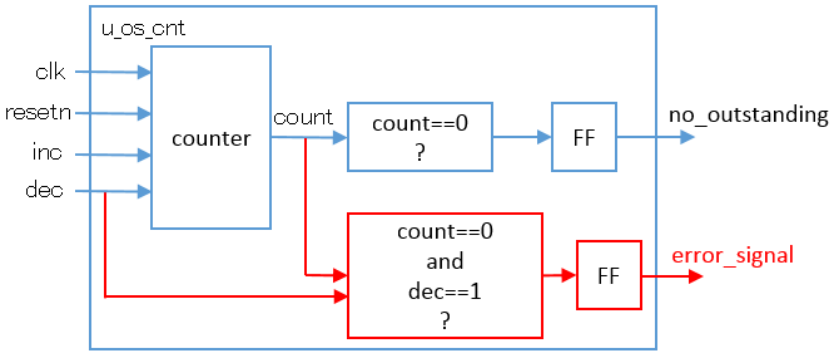

Figure 5.15 AXCC W/RACK check diagram

[ORDER gen/check]

Figure 5.16 shows the block diagram of ORDER check.

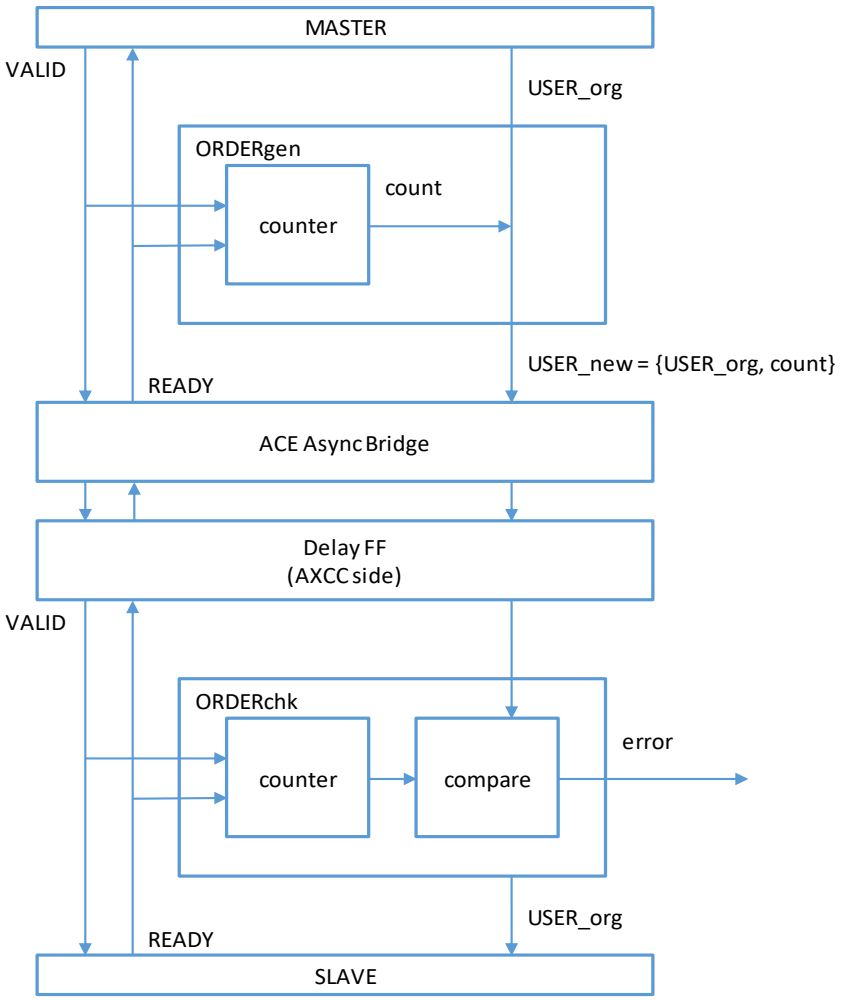

Figure 5.16 AXCC ORDER gen/check diagram

The purpose of ORDER check is to detect the wrong order of transaction of ACE Asynchronous bridges.

ORDERgen generates an incremental counter value for each transaction. Then, the counter value is attached to ACE USER signal as a part of ACE transaction. *ORDERchk* also generates an incremental counter value for each received transaction and compare this counter value with the value attached in USER signal. If 2 counter values are different, an error is informed to ECM module.

ORDER generator and ORDER checker are implemented as a pair for each ACE channel (AR, AW, R, W, B).

[Region ID protection]

Figure 5.18 and Figure 5.19 show the AXCC Region ID diagram. To achieve freedom from interference, the Region ID (RGID) protection concept is implemented. Region ID protection described in “18.5.9 Region ID protection”. For AP System Core, we applied it to AXCC.

Cortex-A76 CPU Cluster attaches Region ID in PA (physical address) bit [39:36]. MPU wrapper (included Region ID checker) compares Region ID of CPU’s transaction with authorized Region ID and only Authorized Region

ID can pass MPU. If the Region ID of CPU's transaction is not same Authorized Region ID, the transactions are protected and the CPU Cluster cannot issue transaction.

AXCC MPU GID Register 0 controls this protection feature. If bit 0 of this register is 1, any access with Region ID=0 is allowed. If bit 1 is 1, Region ID=1 is allowed, and same rule can be applied to bit 2-15 as well. If the access is not allowed, Region ID will be replaced with bit 16-19 of AXCC MPU GID Register.

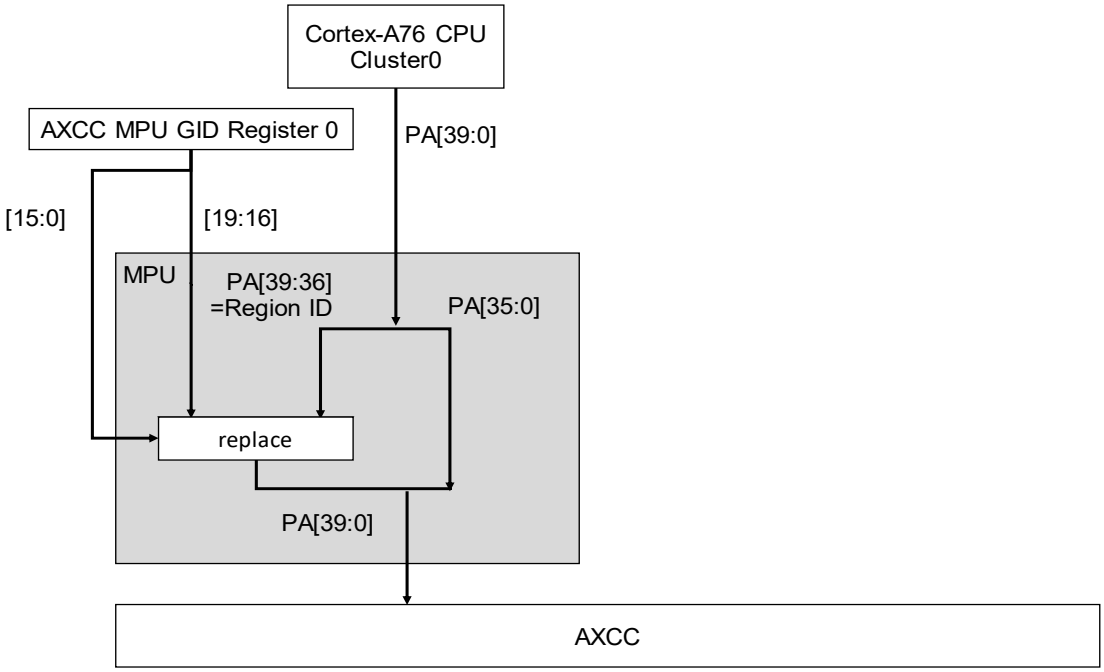

Figure 5.18 AXCC Region ID check & replacement

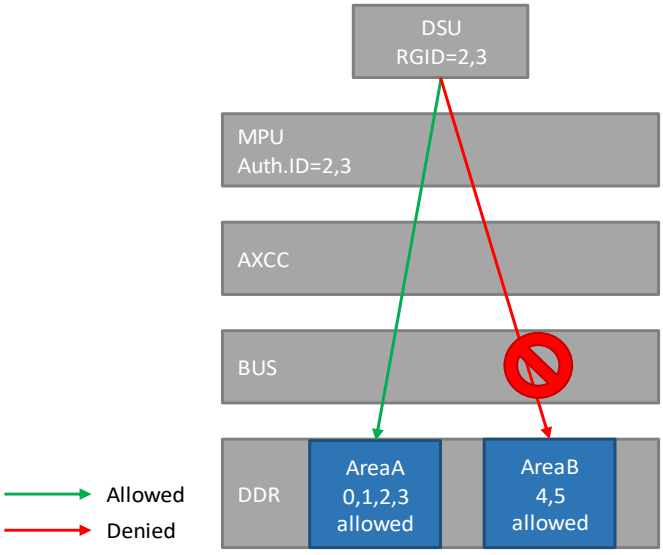

Figure 5.19 AXCC Region ID diagram

Note:

(1) Cortex-A76 CPU Cluster can have multiple Region ID.

(2) MPU has Authorized Region ID register (The register setting shall be set by Cortex-R52 before start Cortex-A76 CPU Cluster).

(3) The cache contents (L1/L2/L3) shall be flushed before changing RGID setting.

(4) When an access is protected by MPU, (i.e., when the replaced Region ID is output from MPU), the CPU cluster which issued that illegal access needs to be reset immediately. To do this, the replaced Region ID must be denied by all slave I/F.

(2) Bus protection for AXI protocol

(a) Overview

AXCC has two AXI master interfaces (M0 and M1) and one AXI slave interface (APB). The AXI interfaces are protected by following safety mechanism:

- EDC protection
- Routing Response check
- ORDER check
- Bus timeout detection
- Region ID
- Source ID
- AXI ID Duplication

(b) Hardware Description

Figure 5.21 shows Bus protection implemented in AXCC.

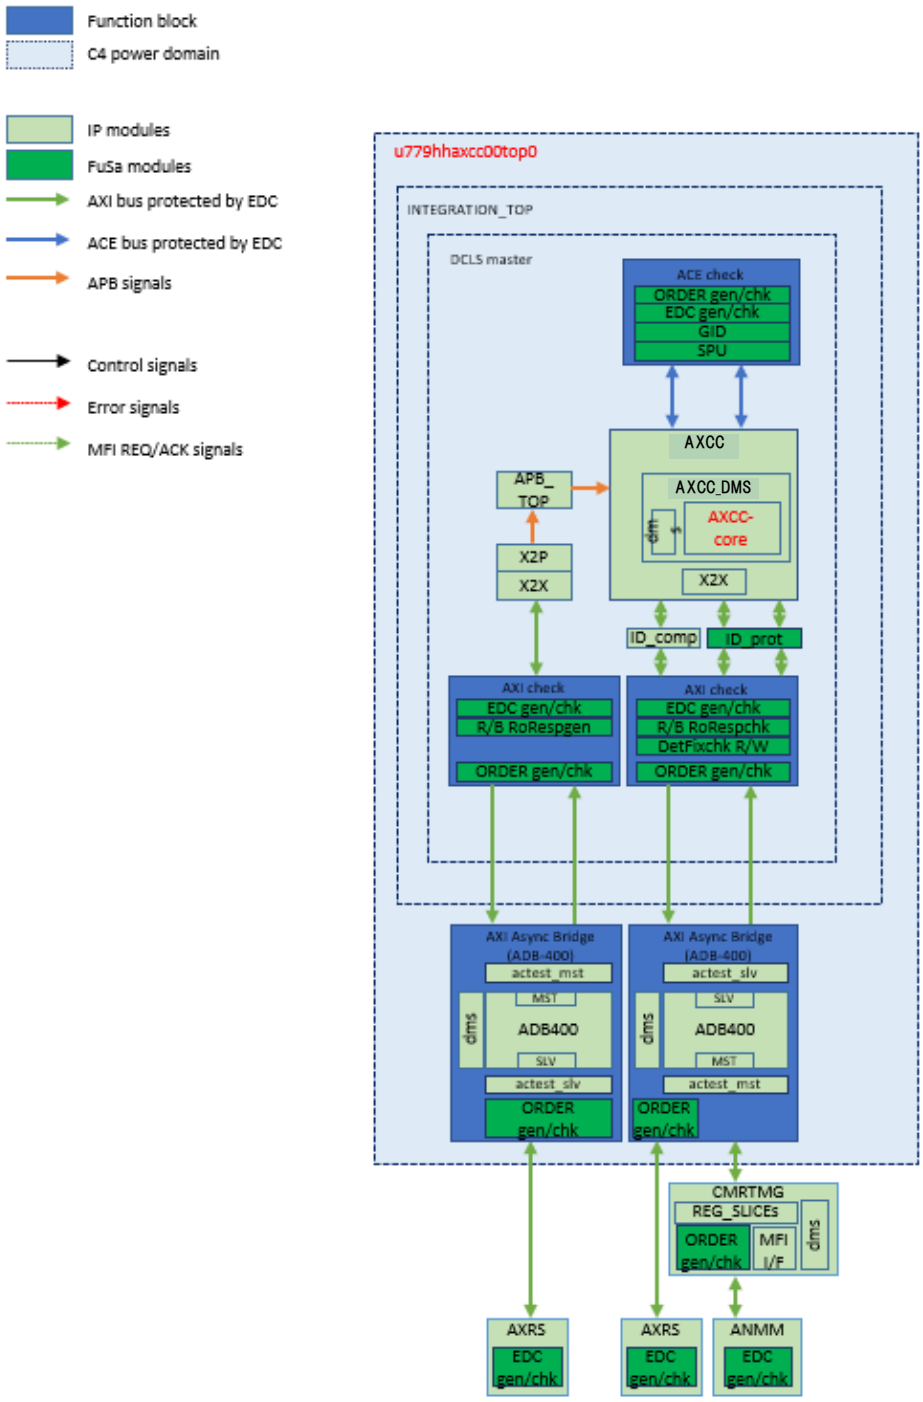

Figure 5.21 AP Interconnect Bus protection diagram

[Bus timeout detection]

Bus timeout detection (DetFIX) function which provides request timeout, illegal response. For detail, see “Section 15.4.5.5, DetFIX (inc. timeout counter)”.

[ORDER check]

Figure 5.22 shows the block diagram of ORDER check:

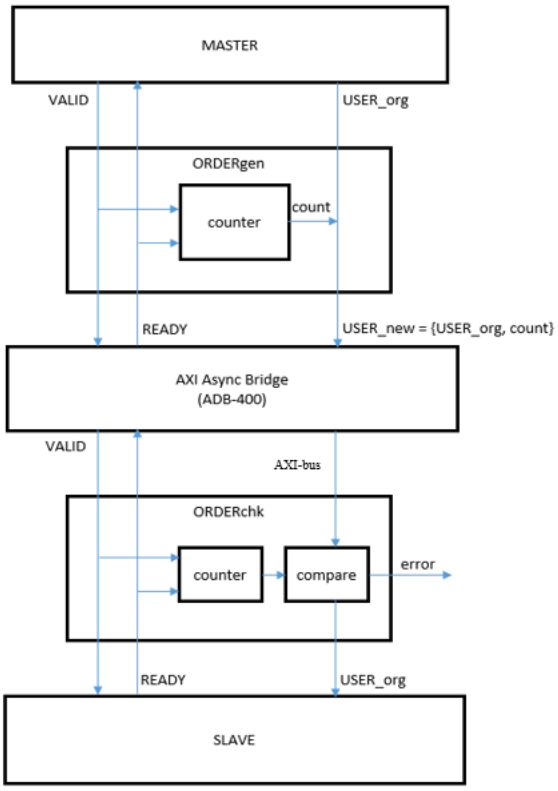

Figure 5.22 AP Interconnect ORDER check for AXI diagram

The purpose of ORDER check is to detect the fault of FIFO read/write pointer in AXI Asynchronous bridges.

ORDERgen generates an incremental counter value for each transaction. Then, the counter value is attached into AXI USER signal as a part of AXI transaction. ORDERchk also generates an incremental counter value for each received transaction and compare this counter value with the value attached in USER signal. If two counter values are different, an error is informed to ECM module.

For M0 and APB interfaces, ORDER generator and ORDER checker are implemented inside AXCC as a pair for each AXI channel (AR/AW/W/R/B).

For M1 interfaces, ORDER generator and ORDER checker are implemented inside AXCC and re-timing module for master port of AXCC as a pair for each AXI channel (AR/AW/W/R/B)

[Region ID]

This part is same as “For ACE protocol”. Please refer to “Region ID” section of “For ACE protocol”.

[Source ID]

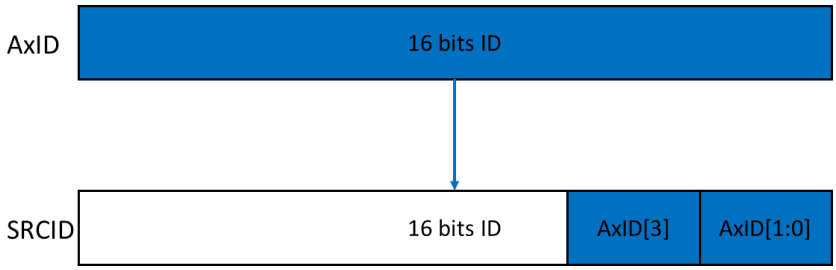

Figure 5.23 Configuration for Source ID

Figure 5.23 shows the Configuration for Source ID. The purpose of Source ID is to identify which Cortex-A76 CPU Cluster is accessing to bus system. It is used for BUS safety mechanism and debug purpose. For more detail, please refer to 18 AXI-bus.

Table 5.20 shows the Source ID for each Cortex-A76 CPU Cluster (AR/AW channel). It is just for the device (AXI protocol) access. For normal access, bit 0 is don't care. It means, cluster number can be recognized, but core number cannot be recognized.

Table 5.20. Source ID of each Cortex-A76 CPU core

Cortex-A76 CPU core	Source ID (binary value)
Core 0	B'00001000
Core 1	B'00001001
Core 2	B'00001010
Core 3	B'00001011

AXI Master interface uses AXI4 protocol, this protocol does not support ID for W channel. In this case, the ID's value is fixed by B'00001000.

For M0 interface, there is ID compress function to compress ID bit width from 12 to 8 bit. These bits are protected by xID protection function from bus system. But protected ID width is only 8 bit. Therefore, ID compress function is required.

[EDC protection between AXCC and AXI (Slave Access Bus/CPU domain AXI)]

EDC protection are implemented to protect all AXI channels (AR/AW/W/R/B) between AXCC AXI Master/Slave Interface and Slave Access Bus/CPU domain AXI.

[Routing Response Gen and Check (RoRespgen and RoRespchk)]

The purpose of Routing Response gen and check are to protect AXI channels (R/B) between AXCC and AXI-BUS.

Routing Response gen records the Source ID from ARUSER/AWUSER and attaches the Source ID on RUSER/BUSER when R/B arrives at the Routing Response gen. Routing Response check compares Source ID and the ID which are attached on RUSER/BUSER. If 2 values are different, an error is informed to ECM module.

For AXCC AXI Master/Slave interface, Routing Response gen and check are implemented. For more details, please refer to “18.5 Safety Mechanism for AXI-bus”.

[ID Protection]

Figure 5.25 shows the ID protection for AXI Master Interface. For AXI Master Interface 1 and AXI Master Interface 2, AXI_xID[7:0] are protected by EDC and AXI_xID[11:8] are protected by signal duplication.

The error signal is connected to other EDC errors.

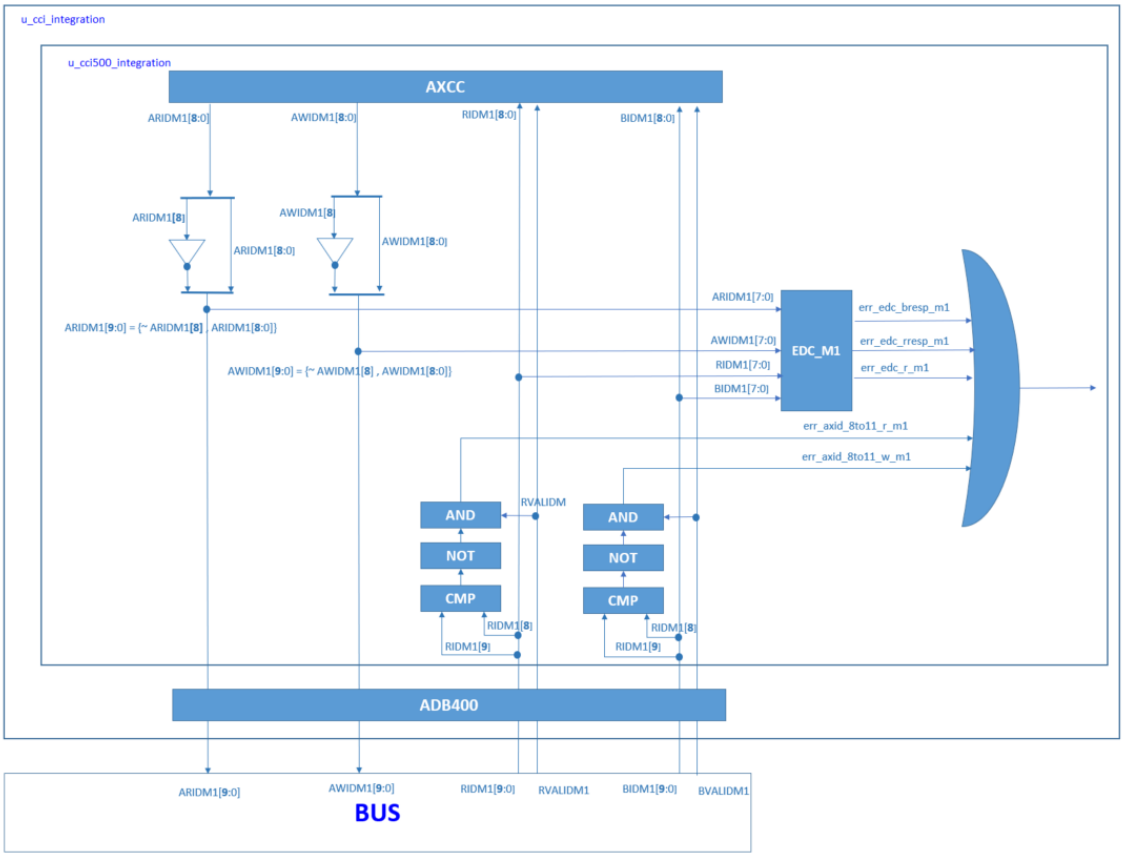

Figure 5.25 ID Protection for AXI Master Interface

5.5.2.4 Hardware Redundancy (DCLS)

(1) Overview

Figure 5.27 shows the dual core lockstep (DCLS) architecture is applied to the AP Interconnect (AXCC).

(2) Hardware Description

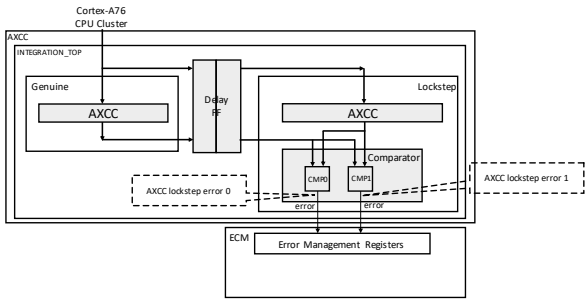

Figure 5.27 Block diagram of AXCC with DCLS mechanism

The dual core lockstep (DCLS) exists in the AP interconnect (AXCC) in order to check the malfunction of this module. When an error related to this is detected, the error is reported to the ECM module.

DCLS are implemented for AXCC:

- EDC generators/checkers, ORDER generators/checkers, GID and DetFix checkers are included in the target of DCLS.
    - Once the output values from the checker and master do not match, the comparator outputs an error signal. The comparator itself (called comparator 0) is also the target of duplication (called comparator 1).

Figure 5.29 shows DCLS structure implemented in AXCC in order to mitigate Common Cause Failure (CCF) by following key points:

- Two comparators are implemented. Comparator 0 and Comparator 1 are located in Checker. Errors from 2 comparators are informed to ECM independently.
- DCLS Checker, Comparator 0 and Comparator 1 are separated from DCLS Master by spatial separation.
- Two clock cycles delay for inputs of DCLS Cheker. Two clock cycles delay for output of DCLS Master.
- Clock tree is separated for DCLS Master and DCLS checker.

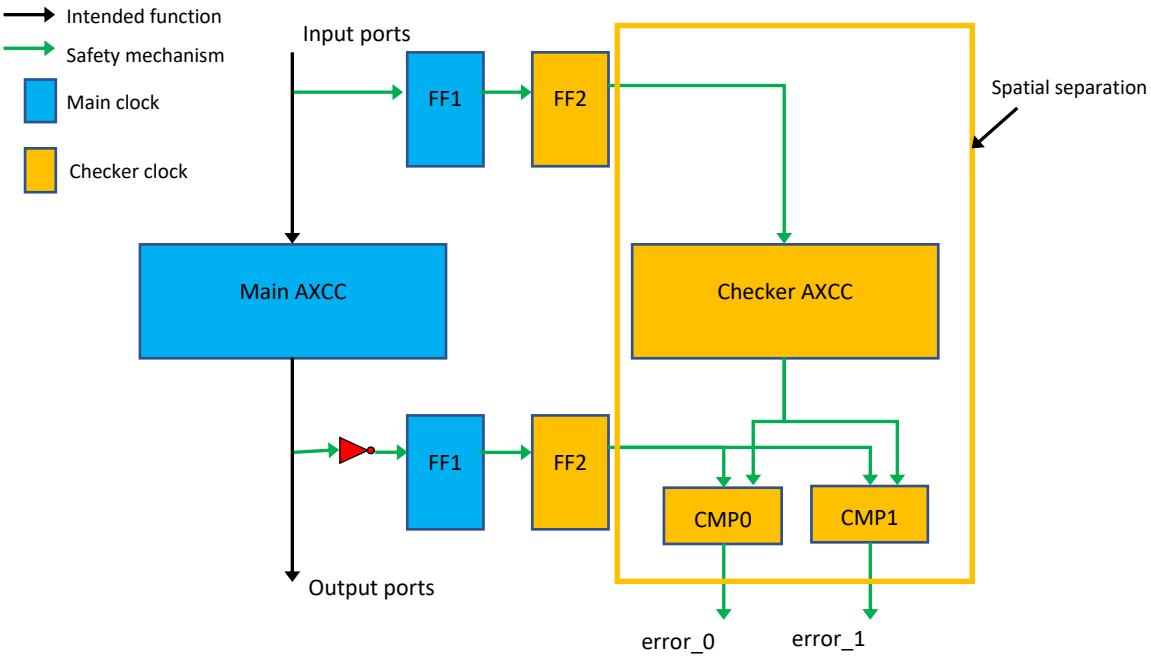

Figure 5.29 DCLS structure of AXCC

5.5.2.5 Other Error notification

RAM is not implemented for AXCC.

5.5.3 Memory protection system

5.5.3.1 Overview

AP System Core has the following safety mechanisms. Figure 5.31 shows block diagram of AP system Core with the safety mechanisms. The safety mechanisms are as follows:

- Runtime Test
- AXCC DCLS
- ACE/AXI4Stream/AXI EDC
- ACE/AXI4Stream/AXI ORDER check for Retiming and Async Register slice
- RGID
- Common AXI bus protection

"RGID" is for freedom from interference (FFI). The others are for fault detection. For "Common AXI bus protection", please refer to Section 18 AXI Bus.

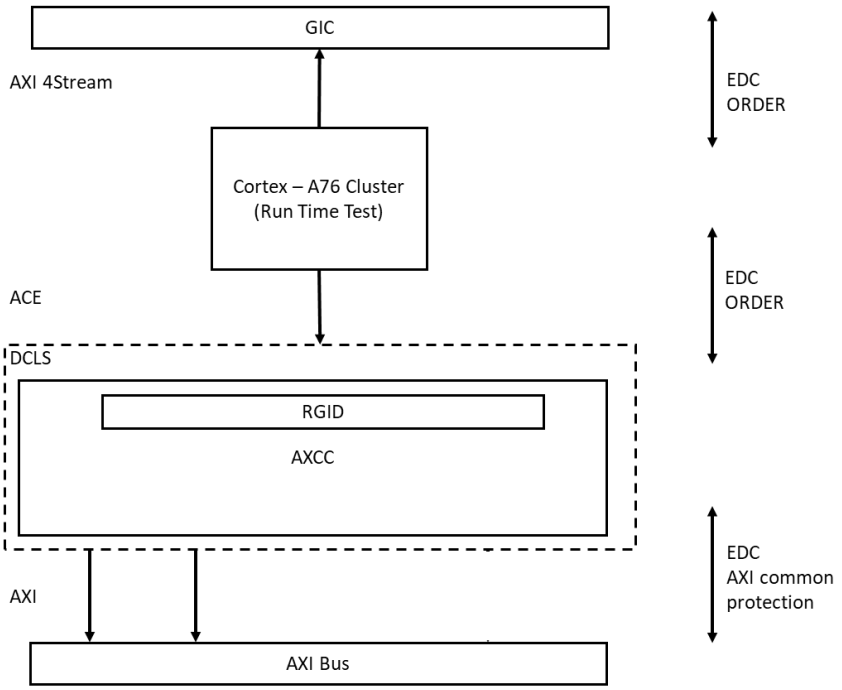

Figure 5.31 Block diagram of AP system core safety mechanisms

5.5.3.2 Hardware Description

Table 5.22 shows summary of Safety Mechanisms.

Table 5.22 Safety mechanism list

Safety Mechanism	Target module
Runtime Test	Cortex-A76 Cluster
DCLS	AXCC
BUS EDC	ACE/AXI4Stream/AXI
ORDER check	ACE/AXI4Stream/AXI
RGID	Bus Region ID protection

Fault point and detection functions are following:

- Failures Runtime Test area of the cluster are detected by Runtime Test.
- Failure within the DCLS area of the AXCC is detected by DCLS.
- Failures inside ACE/AXI4Stream/AXI are detected by EDC.
- Infringement between different ASILs is protected by RGID.

5.5.3.3 Usage Notes

When changing the RGID setting, all of the CPU cache shall be flushed.

5.5.4 Generic Counter

5.5.4.1 Overview

Figure 5.33 shows safety mechanism in Generic Counter. Hatching modules in the figure are safety mechanism.

The list of safety mechanisms in the Generic Counter is as follows.

- Hardware Redundancy for Generic Counter
- Hardware Redundancy for Generic Counter Interface
- EDC for Bus protection

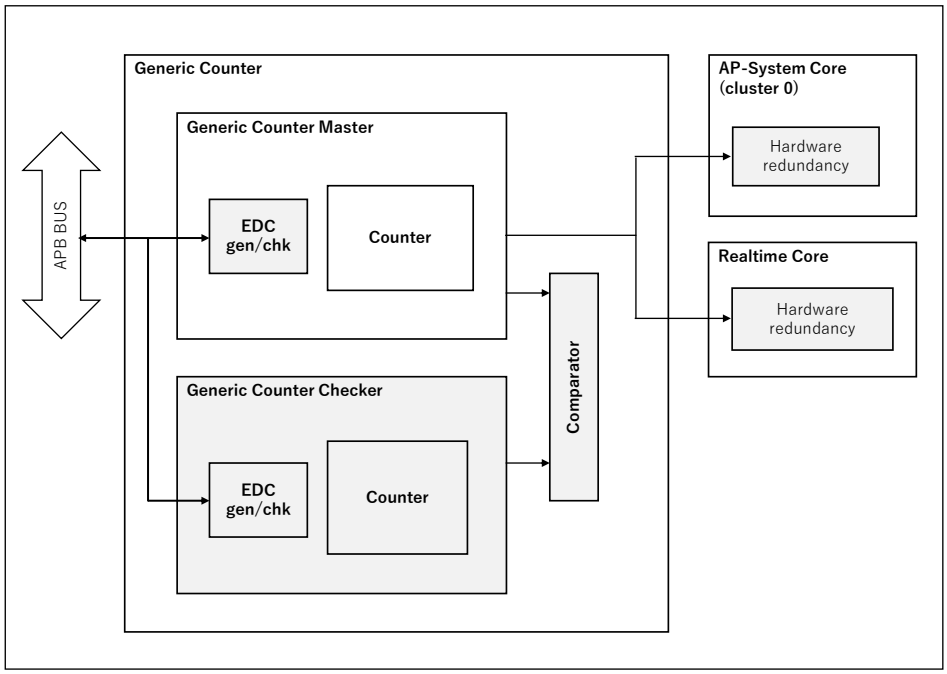

Figure 5.33 Generic Counter block diagram for safety mechanism

5.5.4.2 Hardware Redundancy for generic counter

(1) Hardware Description

Redundant logic exists in the generic counter in order to check the malfunction of this module. Figure 5.34 shows hardware redundancy for Generic Counter. When an error related to this is detected, the error is reported to the ECM modules.

Even if an error is detected in the counter logic circuit, the counter continues to count up.

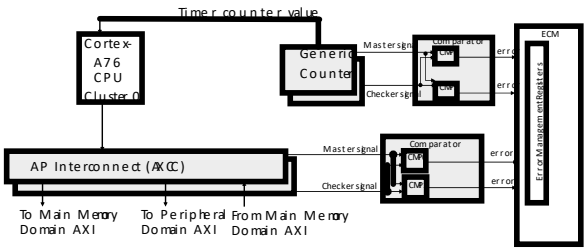

Figure 5.34 DCLS for AP-Syste

5.5.4.3 Hardware Redundancy for Generic Counter Interface.

Refer to section 5.5.1.8 for detail of hardware redundancy for generic counter interface.

5.5.4.4 Bus Protection

(1) Hardware Description

Figure 5.35 shows a block diagram of bus protection for Generic Counter. Address and data signals are protected by EDC protection for DED scheme. EDC checker (EDCchk) and EDC generator (EDCgen) are implemented in both Generic Counter Master and Generic Counter Checker, and the error in EDCgen or EDCchk can be detected as hardware redundancy error for Generic Counter.

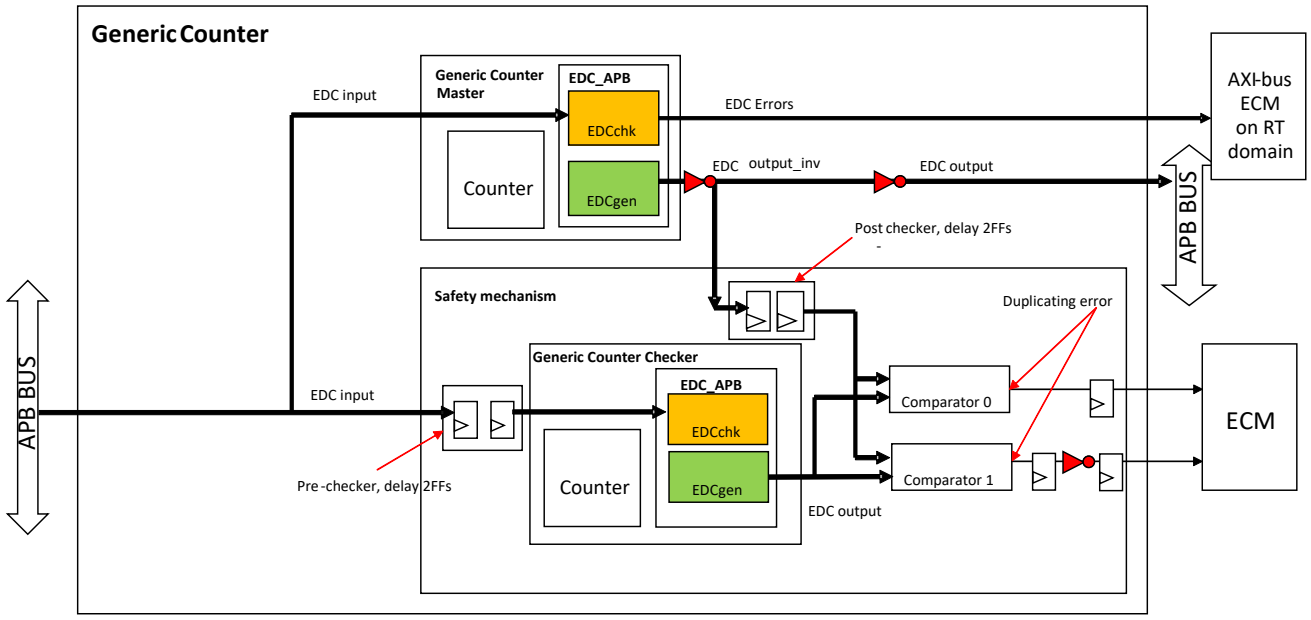

Figure 5.35 Bus protection for Generic counter

6. Realtime Core

6.1 Overview

The Realtime core is a core block equipped with Arm® Cortex®-R52. For details on the functions of Cortex-R52, see the relevant Technical Reference Manual.

6.1.1 Features

Table 6.1 shows the feature of the Realtime Core.

Table 6.1 Feature of the Realtime Core Block (Cortex-R52)

	R-Car V4M
Version	r1p4
Cluster ID	V4M-7,5,3: Cluster 0, Cluster 1, Cluster 2 V4M-2: Cluster 0, Cluster 1
Number of CPUs	V4M-7,5,3: 3 x CPU with dual core lock step V4M-2: 2 x CPU with dual core lock step
Number of Clusters	V4M-7,5,3: 3 x Cluster V4M-2: 2 x Cluster
L1 cache (per each Cortex-R52 CPU cluster)	I$ = 32KB (8 KB × 4 way, 64-byte lines) [w/ECC] D$ = 32KB (8 KB × 4 way, 64-byte lines) [w/ECC]
L2 cache	None
TCM support	ATCM 16KB [w/ECC] BTCM 16KB [w/ECC] CTCM 16KB [w/ECC]
ECC	Supported
MPU	24 regions
NEON™/VFP	NEON supported (Advanced SIMD) VFP supported
Operating clock	CPU core: V4M-7: 1.4 GHz V4M-5: 1.1 GHz V4M-3: 0.9GHz V4M-2: 0.9GHz (V4M-7,5,3: ZR0ϕ for Cluster 0, ZR1ϕ for Cluster 1, ZR2ϕ for Cluster 2 V4M-2: ZR0ϕ for Cluster 0, ZR1ϕ for Cluster 1)
	AXI bus: 400 MHz (S0D2ϕ)
Low power mode	Sleep mode (Clock stop by WFI) Core standby mode (Before boot) Core powerdown mode (A3CR* power domain is OFF)
Private peripherals	General Interrupt Controller, Generic Timer, Write buffer

Note: For details, refer to Reference [1].

6.1.2 Block Diagram

Figure 6.1 shows the block diagram of Realtime Core.

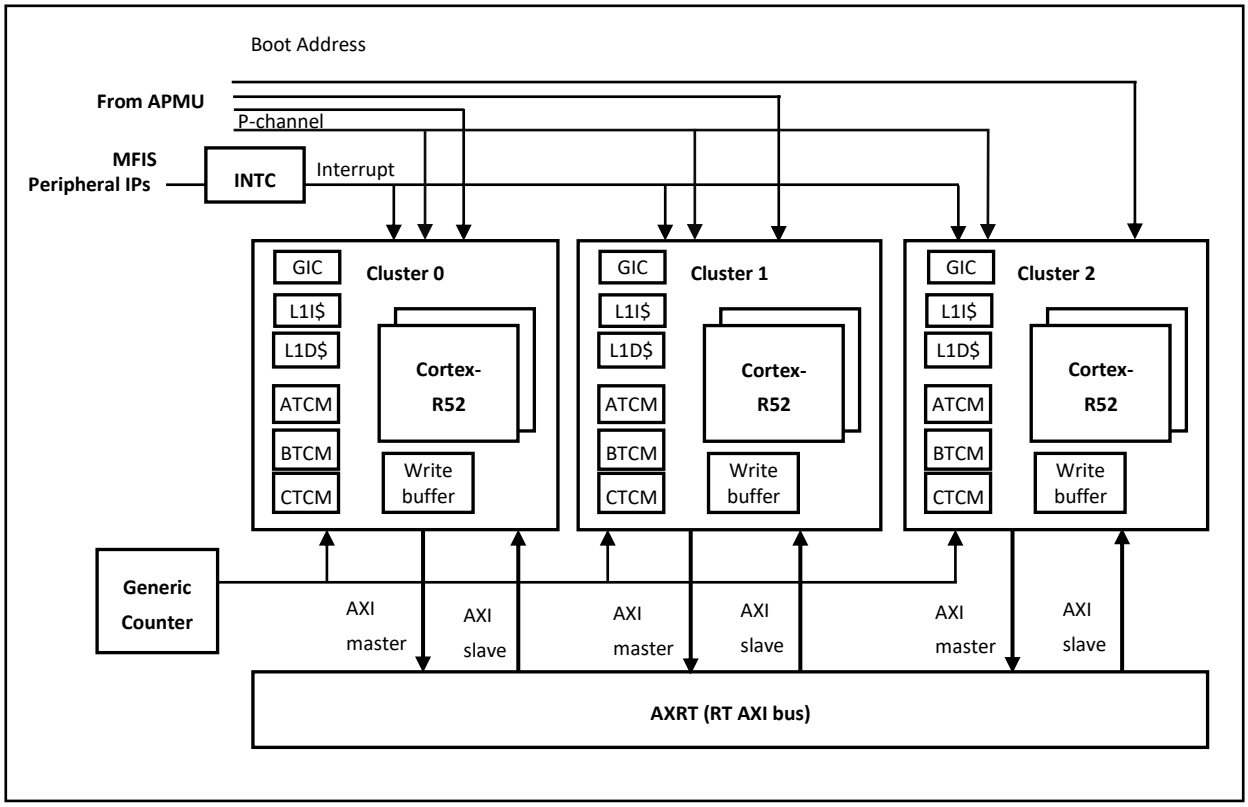

Figure 6.1 Realtime Core block diagram

6.1.3 External Pins

There are no external pins in this module.

6.1.4 Register Configuration

Table 6.2 shows the register address map of the Realtime Core. Only the access to the address defined below is allowed. Those areas are accessible only by the own Realtime Core. For example, the registers of the Cortex-R52 CPU core 1 can be accessed by the Cortex-R52 CPU core 1, only.

Table 6.2 Address Map of Realtime Core

Address Range	Target module	Note
0xF000_0000 – 0xF01F_FFFF	Generic Interrupt Controller (GIC)	For details, refer to section 9 in Reference [1]
0xF020_0000 – 0xF020_0FFF	Write Buffer	-
0xE628_0000 – 0xE62B_FFFF	APSREG	-

As for the Register configuration of Write Buffer registers, refer to R-CarV4M_UM_006_Realtime_Core_r0p41.xlsx.

6.1.5 Connected Module

Table 6.3 shows the connected modules to the Realtime Core. As for the features of the connected modules, refer to the chapter for each module.

Table 6.3 Connected Modules

Module Name	Connected Module Name	Connected Module Function
Realtime Core	CPG	Clock control, power management
	SYSC	Power management
	RST	Reset
	ECM	Error Control Management
	APMU	Advanced Power Management Unit
	AXRT	RT(Real Time) domain AXI
	Generic Counter (AP-System Core)	Generic Counter
	Debug and Trace	Debug
	MFIS	Multifunctional interface

6.1.6 Reference document

[1] Arm Cortex-R52 Processor Technical Reference Manual Revision r1p4

[2] ARM® Architecture Reference Manual Supplement ARMv8, for the ARMv8-R AArch32 architecture profile, A.b

[3] AMBA AXI and ACE Protocol Specification.

[4] AMBA Low Power Interface Specification

6.2 Register Description

Refer to R-CarV4M_UM_006_Realtime_Core_r0p41.xlsx

6.3 Operation

6.3.1 Boot Address Setting

The boot address of Realtime Core can be controlled by Boot Address Register (BAR) in Advanced Power Management Unit (APMU) module. About the initial value of these registers, refer to Section 10, Advanced Power Management Unit (APMU).

Notice: APMU supports Reset Vector Base Address Register (RVBAR) that can also change the boot address of Realtime Core. However, in R-Car product, it must not be used to avoid confliction with BAR.

By default (MPU OFF), the area from H'8000_0000 to H'FFFF_FFFF is Execute-never. Therefore, we cannot use RVBAR for Secure boot whose boot address is H'EB10_0000. If boot address is from H'0000_0000 to H'7FFF_FFFF, software can use RVBAR. But in that case, please do not use BAR.

6.3.2 MPU (Memory Protection Unit) setting

Table 6.4, Table 6.5, Table 6.6 and Table 6.7 show the default memory map of Realtime Core. In the case of boot from Cortex-R52, MPU is set by the code in mask ROM as shown in Table 6.8.

Table 6.4 Default Memory Map in Hypervisor mode (EL2) of instruction access (MPU OFF)

Address Range	Instruction caching (HSCTLR.I)		Execute-never (XN)
	Enabled	Disabled	
H'0000_0000 to H'7FFF_FFFF	Normal memory, Non-sharable, Write-Through Cacheable	Normal memory, Non-cacheable	Instruction execution permitted
H'8000_0000 to H'FFFF_FFFF	-	-	Execute-never

Note: For details, refer to Reference [1].

Table 6.5 Default Memory Map in Hypervisor mode (EL2) of data access (MPU OFF)

Address Range	Data caching (HSCTLR.C)	
	Enabled	Disabled
H'0000_0000 to H'3FFF_FFFF	Normal memory, Non-sharable, Write-Back, Write-Allocate Cacheable	Normal memory, Shareable, Non-cacheable
H'4000_0000 to H'5FFF_FFFF	Normal memory, Non-sharable, Write-Through Cacheable	Normal memory, Shareable, Non-cacheable
H'6000_0000 to H'7FFF_FFFF	Normal memory, Sharable, Non-cacheable	Normal memory, Shareable, Non-cacheable
H'8000_0000 to H'BFFF_FFFF	Device-nGnRE	Device-nGnRE
H'C000_0000 to H'FFFF_FFFF	Device-nGnRnE	Device-nGnRnE

Note: For details, refer to Reference [1].

Table 6.6 Default Memory Map in EL1 of instruction access (MPU OFF)

Address Range	Instruction caching (SCTLR.I)		Execute-never (XN)
	Enabled	Disabled	
H'0000_0000 to H'7FFF_FFFF	Normal memory, Non-sharable, Write-Through Cacheable	Normal memory, Non-cacheable	Instruction execution permitted
H'8000_0000 to H'FFFF_FFFF	-	-	Execute-never

Note: For details, refer to Reference [1].

Table 6.7 Default Memory Map in EL1 of data access (MPU OFF)

Address Range	Data caching (SCTLR.C)	
	Enabled	Disabled
H'0000_0000 to H'3FFF_FFFF	Normal memory, Non-sharable, Write-Back, Write-Allocate Cacheable	Normal memory, Shareable, Non-cacheable
H'4000_0000 to H'5FFF_FFFF	Normal memory, Non-sharable, Write-Through Cacheable	Normal memory, Shareable, Non-cacheable
H'6000_0000 to H'7FFF_FFFF	Normal memory, Sharable, Non-cacheable	Normal memory, Shareable, Non-cacheable
H'8000_0000 to H'BFFF_FFFF	Device-nGnRE	Device-nGnRE
H'C000_0000 to H'FFFF_FFFF	Device-nGnRnE	Device-nGnRnE

Note: For details, refer to Reference [1].

Table 6.8 Memory Map (after ROM boot)

Address Range	Memory Attribute	Instruction Execution
H'0000 0000 to H'3FFF FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'4000 0000 to H'BFFF FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'C000 0000 to H'DFFF FFFF	Device-nGnRnE, Non-sharable	Execute Never
H'E000 0000 to H'E3FF FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'E400 0000 to H'E4FF FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'E500 0000 to H'E62F FFFF	Device-nGnRnE, Non-sharable	Execute Never
H'E630 0000 to H'E63F FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'E640 0000 to H'EB0F FFFF	Device-nGnRnE, Non-sharable	Execute Never
H'EB10 0000 to H'EB12 7FFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'EB12 8000 to H'EB1F FFFF	Device-nGnRnE, Non-sharable	Execute Never
H'EB20 0000 to H'EB2F FFFF	Normal memory, Non-sharable, Write-Back, Read/Write allocate	Instruction execution permitted
H'EB30 0000 to H'FFFF FFFF	Device-nGnRnE, Non-sharable	Execute Never

6.3.3 Power-Up/Down Mechanism

The Realtime Core supports the following five power modes.

- Core Standby mode
- Sleep mode (clock stop)
- Normal operation mode
- Core powerdown mode (A3CR* domain power is off)
- Debug over Core powerdown mode

Core Standby mode is a power mode before Cortex-R52 CPU core is booted. Cortex-R52 CPU core 0 is in Core Standby mode only in ICUMX boot. Other Cortex-R52 CPU cores are in Core Standby mode before they are woken up. Each Cortex-R52 CPU core is under reset and there is no operation in Core Standby mode. The Cortex-R52 CPU core leaves Core Standby mode when Cortex-R52 CPU core is woken up by ICUMX, AP-System Core or other Cortex-R52 CPU cores. After leaving Core Standby mode, it is impossible to go back to this mode.

Cortex-R52 CPU cores enter Sleep mode when CPU executing WFI instruction. Clock to CPU is stopped to save the power consumption until CPU receives a wake-up request.

In Core powerdown mode, CPU core power domain (A3CR* power domain) is powered-off. Core powerdown mode has less power than Sleep mode. Debug over Core powerdown mode is for debug Core powerdown mode.

Refer to section 10.3.2.5 for power control operation.

6.3.4 Write Buffer

The Write Buffer is a buffer equipped between Cortex-R52 core and AXI master port. Under the following [Condition], the write requests which the target address are successive can be merged by using the write buffer. Write buffer has three merge slots. Each merge slot can store up to 128-byte data. Figure 6.2 shows the block diagram of the Write Buffer.

[Condition]

A write request which fulfills both conditions:

- Access to Normal memory (Not to Device memory) (AWCACHE[1] = B'1)
- Normal access (Not Exclusive access) (AWLOCK = B'0)

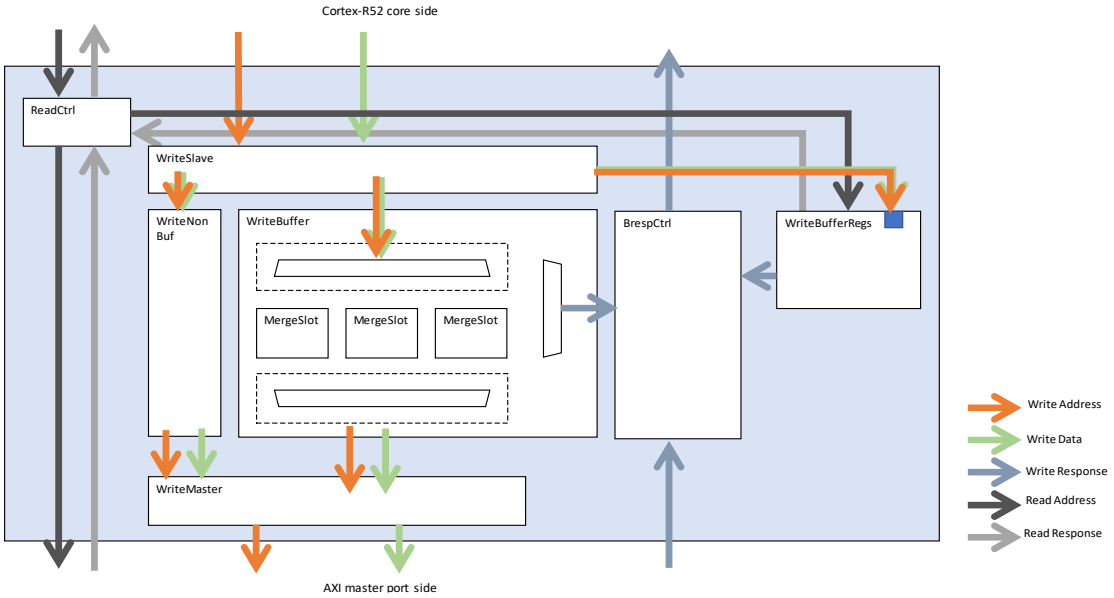

Figure 6.2 Block Diagram of Write Buffer

Once the write data is stored to the write buffer, the write response is returned to the bus master interface of Realtime Core before receiving the response from the target modules. When the corresponding response from the target modules are returned with the bus error attribute (DECERR/SLVERR), the interrupt related to this error can be asserted and notified to ECM.

To enable the write buffer, Realtime Core sets 1'b1 to WBCTLR register. For data eviction operation, there are two cases. In the first case, automatic eviction occurs for each slot individually when the slot becomes full or timeout occurs. Where, timeout period is 256 cycles of CPU clock (ZR0ϕ, ZR1ϕ and ZR2ϕ) after the last data is stored into the slot. In the second case, Realtime Core sets 1'b1 to WBSYNCR register to execute memory barrier operation accompanied with the data eviction from all slots in the write buffer. In order to complete the write transactions when the write buffer is used, data eviction operation from the write buffer is needed.

For details of the registers related to the write buffer, refer to Section 6.2.

Note: The data cache in Cortex-R52 always has Write-Though behavior. Enabling the write buffer might help AXI master write performance improvement.

6.3.5 Private Peripheral Modules

The private peripheral modules in Realtime Core are operated at ZR0ϕ, ZR1ϕ and ZR2ϕ.

6.3.5.1 Base Address

Base address of private peripheral modules is defined by hardware. In R-Car products, the base address is “H’F000 0000”.

6.3.6 Configuration signals setting

Table 6.9 shows the configuration signals setting of Cortex-R52. For details of these signals, refer to Section A.4 (Configuration inputs) in Reference [1].

Table 6.9 Configuration signals setting (Cortex-R52)

Configuration Signal	Value	Description
CFGENDIANESS0	B'0	Little endian boot.
CFGAXISTCMBASEADDR[31:24]	H'E4	Base address of the TCMs on system address map (access via AXIS IF).
CFGCLUSTERUTID[1:0]	B'00 B'01 B'02	Cluster unique transaction identifier for the purpose of interconnect protection (Not used). Cluster 0: B'00 Cluster 1: B'01 Cluster 2: B'02
CFGDBGROMADDRV	B'1	Top-level debug ROM table address enable.
CFGDBGROMADDR[31:12]	H'F8000	Top-level debug ROM table base address on system address map.
CFGFLASHBASEADDR[31:27]	B'00000	Base address of the Flash interface (No Flash memory).
CFGFLASHEN0	B'0	Flash interface is disabled (No Flash memory).
CFGFLASHPROTEN	B'0	Flash memory protection is disabled (No Flash memory).
CFGFLASHPROTIMP	B'0	Flash memory protection is not support (No Flash memory).
CFGFLASHIMP	B'0	Flash region is not implemented in memory map (No Flash memory).
CFGLLPPIMP	B'0	LLPP region is not implemented in memory map.
CFGLLPPBASEADDR[31:12]	H'00000	Base address of the LLPP (Not used).
CFGLLPPSIZE[3:0]	H'0000	Region size of the LLPP (Not used).
CFGMRPEN	B'0	Memory reconstruction port is disabled.
CFGMPIDRAFF1[7:0]	H'00 H'01 H'02	Cluster ID at affinity level 1. Cluster 0: H'00 Cluster 1: H'01 Cluster 2: H'02
CFGMPIDRAFF2[7:0]	H'00	Cluster ID at affinity level 2.
CFGPERIPHBASE[31:21]	H'780	Base address of the GIC Distributor Unit (GDU) registers is 0xF000_0000.
CFGRAMPROTEN	0/1	RAM (caches and TCMs) memory protection enable out of reset. This port can be controlled by APMU's CR52CR register. Default is 1'b1.
CFGTCMBOOT0	0/1	ATCM enabled and at address 0x0 out of reset. This port can be controlled by APMU's CR52CR register. Default is 1'b0.
CFGTHUMBEXCEPTIONS0	0	Instruction set state is A32 at power on reset.
CFGVECTABLE0[31:5]	Any	Vector table base address out of reset. This port can be controlled by APMU's RVBAR register. Default is 0x0.

Note: For details of APMU registers, refer to Section 10, Advanced Power Management Unit (APMU).

6.4 Usage Notes

6.4.1 Interrupt handling for Realtime Core

Cortex-R52 does not support NMI (Non-Maskable Interrupt). EXTPPI[0] is used to connect NMI pin from INTC-EX. Table 6.10 shows ID number.

Table 6.10 EXTPPI (not allocated PPI) assignment

EXTPPI	ID number	Description
EXTPPI[0]	ID16	NMI interrupt from INTC-EX
EXTPPI[5:1]	ID17 – ID21	Not used
EXTPPI[7:6]	ID28 – ID29	Not used
EXTPPI[8]	ID31	Not used

For SPI (Shared Peripheral Interrupts), SGI (Software Generated Interrupts), and allocated PPI (Private Peripheral Interrupts), refer to Reference [1] – Section 9. About SPI number of each module, refer to Section 15.4.2.

6.4.2 Accessing to TCM regions

Notice: During Cortex-R52's reset is asserted, accessing TCM is not allowed. Before Cortex-R52's reset is asserted, accessing TCM has to be stopped. Before accessing TCM is started, checking Cortex-R52's reset negating is necessary.

6.4.2.1 Accessing to TCM regions by CPU

Realtime Core can access to its TCMs directly. Software has to set the base address, size of each TCM and enable it by writing to IMP_ATCMREGIONR, IMP_BTCMREGIONR, IMP_CTCMREGIONR. Base address must be size-aligned. Separate enable bits are provided to enable the TCMs in EL2 and/or EL1/EL0. For details, refer to Section 7.2 (TCM memory) in Reference [1].

6.4.2.2 Accessing to TCM regions via AXIS interface

The TCM address range (16MB region) defined in system address map is from H'E400 0000 to H'E4FF FFFF. Table 6.11 describes the valid TCM regions for each Cortex-R52 (Core 0, Core 1, Core 2). Those regions are accessed via AXIS port. Accessing to reserved areas will cause DECERR.

Table 6.11 TCM region address

TCM region	Address range	Size	Target
ATCM	H'E400 0000 to H'E400 3FFF	16KB	Cortex-R52 CPU core 0
Reserved	H'E400 4000 to H'E40F FFFF	-	
BTCM	H'E410 0000 to H'E410 3FFF	16KB	Cortex-R52 CPU core 0
Reserved	H'E410 4000 to H'E41F FFFF	-	
CTCM	H'E420 0000 to H'E420 3FFF	16KB	Cortex-R52 CPU core 0
Reserved	H'E420 4000 to H'E42F FFFF	-	
Reserved	H'E430 0000 to H'E43F FFFF	-	
ATCM	H'E440 0000 to H'E440 3FFF	16KB	Cortex-R52 CPU core 1
Reserved	H'E440 4000 to H'E44F FFFF	-	
BTCM	H'E450 0000 to H'E450 3FFF	16KB	Cortex-R52 CPU core 1
Reserved	H'E450 4000 to H'E45F FFFF	-	
CTCM	H'E460 0000 to H'E460 3FFF	16KB	Cortex-R52 CPU core 1
Reserved	H'E460 4000 to H'E46F FFFF	-	
Reserved	H'E470 0000 to H'E47F FFFF	-	
ATCM	H'E480 0000 to H'E480 3FFF	16KB	Cortex-R52 CPU core 2
Reserved	H'E480 4000 to H'E48F FFFF	-	
BTCM	H'E490 0000 to H'E490 3FFF	16KB	Cortex-R52 CPU core 2
Reserved	H'E490 4000 to H'E49F FFFF	-	
CTCM	H'E4A0 0000 to H'E4A0 3FFF	16KB	Cortex-R52 CPU core 2
Reserved	H'E4A0 4000 to H'E4AF FFFF	-	
Reserved	H'E4B0 0000 to H'E4BF FFFF	-	
Reserved	H'E4C0 0000 to H'E4FF FFFF	-	

Access control checks can be enabled for AXIS transactions by programming IMP_SLAVEPCTLR.TCMACCLVL. Access control allows either all transactions or only privileged transactions to access the TCM. If a transaction is not permitted, the AXIS generates a SLVERR response.
Privileged of transactions that access TCM can be overwritten by Cortex-R52 Secure Auxiliary Configuration Register (H'E62A 0010) bit 31 (for read transactions) and bit 30 (for write transactions). When those 2 bits are set to 1, accesses (read/write) to TCM always have privileged permission (ARPROT[0]/AWPROT[0] = 1). This register can be accessed only in secure mode.

When an external agent or core attempts to write to the TCM through the AXIS interface and there is a pending write to the same TCM line from the core locally, the AXIS interface returns a SLVERR. This is to indicate a software error because more than one agent are writing to the same TCM line (even if the bytes do not overlap) because there is no guarantee in which order the memory is updated.

[Restriction]
The AXIS implements a subset of the AXI transactions, the Accelerator Coherency Port Interface Restrictions, that are described in *AMBA® AXI™ and ACE™ Protocol Specification AXI3™, AXI4™, and AXI4-Lite™ ACE and ACE-Lite™.* For details of restrictions, refer to Appendix B (*Accelerator Coherency Port Interface Restrictions*) in Reference [3].

The AXIS interface supports two below burst lengths only:
- 16-byte transaction: AxLEN[7:0]=0x00, AxADDR[3:0] = 4'b0000
- 64-byte transaction: AxLEN[7:0]=0x03, AxADDR[5:0] = 6'b000000

For all other combinations of AxLEN and AxADDR, AXIS generates an error SLVERR.

Accessing TCMs with transactions whose AxSIZE[2:0] != 3'b100 and/or AxBURST[1:0] != 2'b01 is also not supported. An error will be notified to ECM when AXIS interface receives such illegal transactions. For details, refer to Section 6.5.3 in this document.

6.4.3 Watchdog Timer

Cortex-R52 does not support watchdog timer. Consider choosing watchdog timers outside of Cortex-R52.

6.4.4 Exclusive operation usage restriction

Exclusive operation using LDREX and STREX instruction pair is supported only in RT-VRAM area, SDRAM area (H'4000 0000 to H'BFFF FFFF) and System RAM area. Exclusive operation to other areas is not supported.

NOTE: Because Cortex-A76+AXCC changes ARch transaction ID and AWch transaction ID, so please don't use Store-Exclusive and Load-Exclusive instruction to access RT-VRAM from Cortex-A76. But Cortex-R52 has no this kind of issue. So Cortex-R52 can use Store-Exclusive and Load-Exclusive instruction to access RT-VRAM

6.4.5 AxPROT[1] overwrite function on AXI Master interface

Cortex-R52 always issues secure transactions (AxPROT[1] = 0) to AXI Master interface. Realtime Core has feature to change from secure transactions to Non-secure transactions (AxPROT[1] = 1) by writing 0 to register (address 0xFFC43018). This register can be changed from 1 (default value) to 0 only. Before changing this register from 1 to 0, it's mandatory to flush all data in Cortex-R52 Store Buffer and in Write Buffer to external memory. Software can use "DSB" instruction to flush all data in Cortex-R52 Store Buffer, then use Write Buffer Sync Operation Register to flush all data in Write Buffer to external memory. Refer to the Register (Section Write Buffer Sync Operation Register(WBSYNCR)).

6.4.6 Prevention of unexpected phenomenon due to CPU speculative access

For Cortex-R52, configure MPU before enabling MPU and caches by HSCTLR or SCTLR register. For MPU setting, set Device Memory and Execute Never to the speculative access prohibited regions*1. Until finish of these MPU setting and enabling, set 1 (Stops supply of the clock signal to the corresponding module.) to PCIE related bits in Module Stop Control Register (MSTPCR). Until finish of these MPU setting and enabling, PCIe related bits in AXI-Bus ICISTPSTHSC0 Register may be 1 (Error flag set by access to the corresponding module when clock is stopped). Then clear these bits to 0 after finish of these MPU setting and enabling.

Note *1: Other than RAM/ROM regions that are permitted to be accessed from the CPU and can access randomly.

6.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

6.5.1 Overview

Realtime Core system is equipped with various Safety Mechanism. Figure 6.3 shows Safety Mechanisms implemented in Realtime Core.

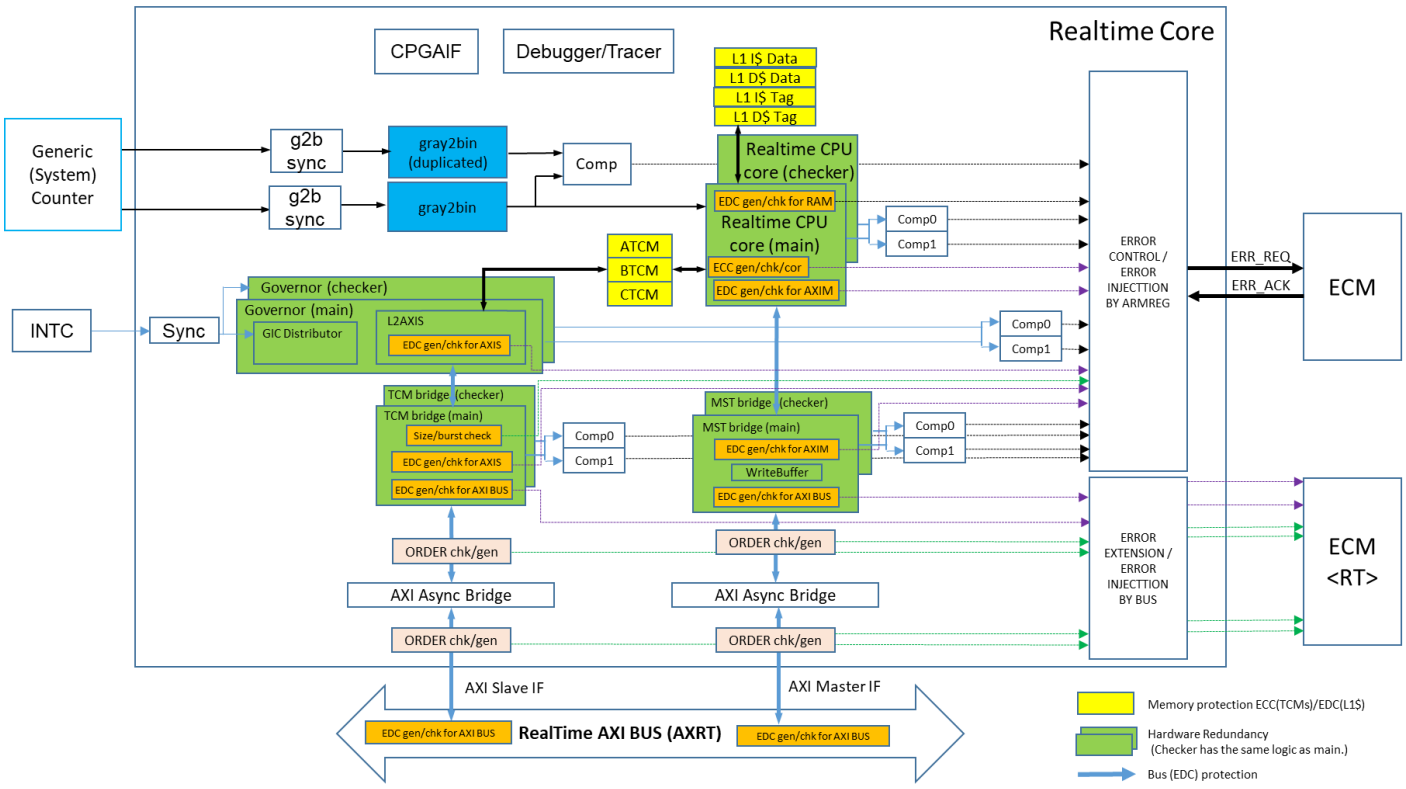

Figure 6.3 Realtime Core block diagram with Safety Mechanisms

6.5.2 Error Correction Code (ECC)

6.5.2.1 Overview

ECC protection is applied to the following RAMs.

- L1 D-cache Tag RAM
- L1 D-cache Data RAM
- L1 I-cache Tag RAM
- L1 I-cache Data RAM
- ATCM
- BTCM
- CTCM

6.5.2.2 Related Registers

About the related registers, refer to Reference [1] and Reference [2].

6.5.2.3 Hardware Description

Figure 6.4 shows the block diagram of the Realtime Core.
All L1 Cache and TCM memories in Realtime Core is implemented with ECC protection.

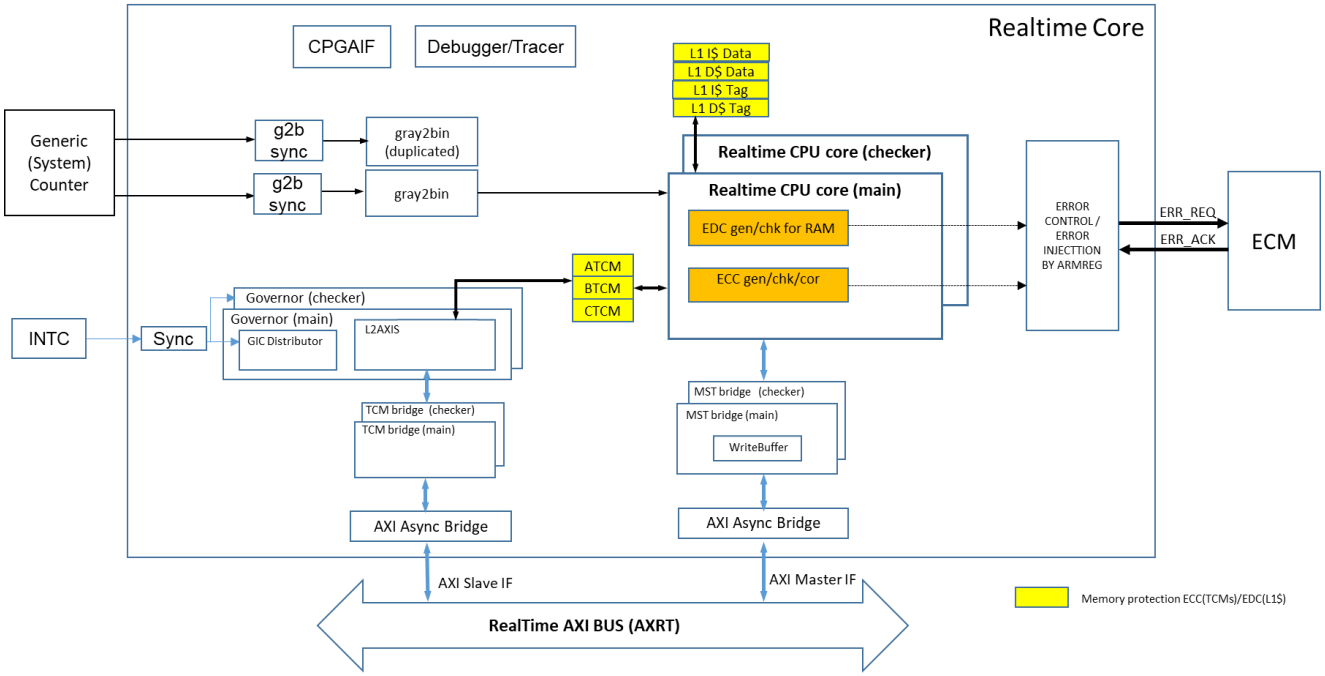

Figure 6.4 Realtime Core Memory Protection diagram

- TCMs memories are protected by SEC-DED error correction code (ECC) checking.
- L1 Cache memories are protected by DED ECC. Errors that are detected in the instruction and data cache are always correctable by invalidating the cache, flushing the core pipeline, re-fetching and executing the failed instruction. This is feasible because the caches implement Write-Through caching and can never hold

dirty data. This behavior allows the failing cache line to be read from main memory. Single-bit and double-bit hard errors are handled by cache logic to prevent repeatedly correcting the same error.

- Address decode and white noise protection are built into the ECC scheme. A fault in RAMs might also result in no lines being selected which might result in reading either all zeros or all ones. Such faults are referred to as white noise.
- TCM & L1 Cache hard error protection is implemented to avoid processor livelock.
- When an error in the RAM is detected, Realtime Core informs the ECM module of the error.

Table 6.12 ECC Protection of Realtime Core

RAM	Protection method	Correction Behavior	Uncorrectable Error Behavior
L1 I-cache Tag RAM	DED ECC	Correction of both single and double-bit errors is achieved by invalidating the cacheline. A subsequent access fetches the data from external memory and no longer receives the error.	-
L1 I-cache Data RAM	DED ECC	Correction of both single and double-bit errors is achieved by invalidating the cacheline. A subsequent access fetches the data from external memory and no longer receives the error.	-
L1 D-cache Tag RAM	DED ECC	Correction of both single and double-bit errors is achieved by invalidating the cacheline. A subsequent access fetches the data from external memory and no longer receives the error.	-
L1 D-cache Data RAM	DED ECC	Correction of both single and double-bit errors is achieved by invalidating the cacheline. A subsequent access fetches the data from external memory and no longer receives the error.	-
ATCM	SECDED	Correct single-bit errors in each ECC chunk	Detect double bit errors in each ECC chunk and flag to ECM.
BTCM	SECDED	Correct single-bit errors in each ECC chunk	Detect double bit errors in each ECC chunk and flag to ECM.
CTCM	SECDED	Correct single-bit errors in each ECC chunk	Detect double bit errors in each ECC chunk and flag to ECM.

6.5.3 Bus Protection

6.5.3.1 Overview

- Signal Integrity Protection is implemented to protect AXI Interface between Realtime Core CPU & AXI bus bridges.
- Bus timeout detection is implemented in AXI-bus master Interface to detect transactions that fail to complete within a programmable time limit.
- EDC protection is implemented to protect AXI Interface between Realtime Core and RT (Realtime) domain AXI (AXRT).
- ORDER check is implemented to detect faults of FIFO read/write pointers in AXI Asynchronous bridges.
- SIZE-BUSRT check is implemented in AXI Slave interface (AXIS) to detect illegal AxSIZE/AxBURST transactions.

6.5.3.2 Related Registers

About the related registers, refer to Reference [1] and Reference [2].

6.5.3.3 Hardware Description

Figure 6.5 shows Bus protection implemented in Realtime Core.

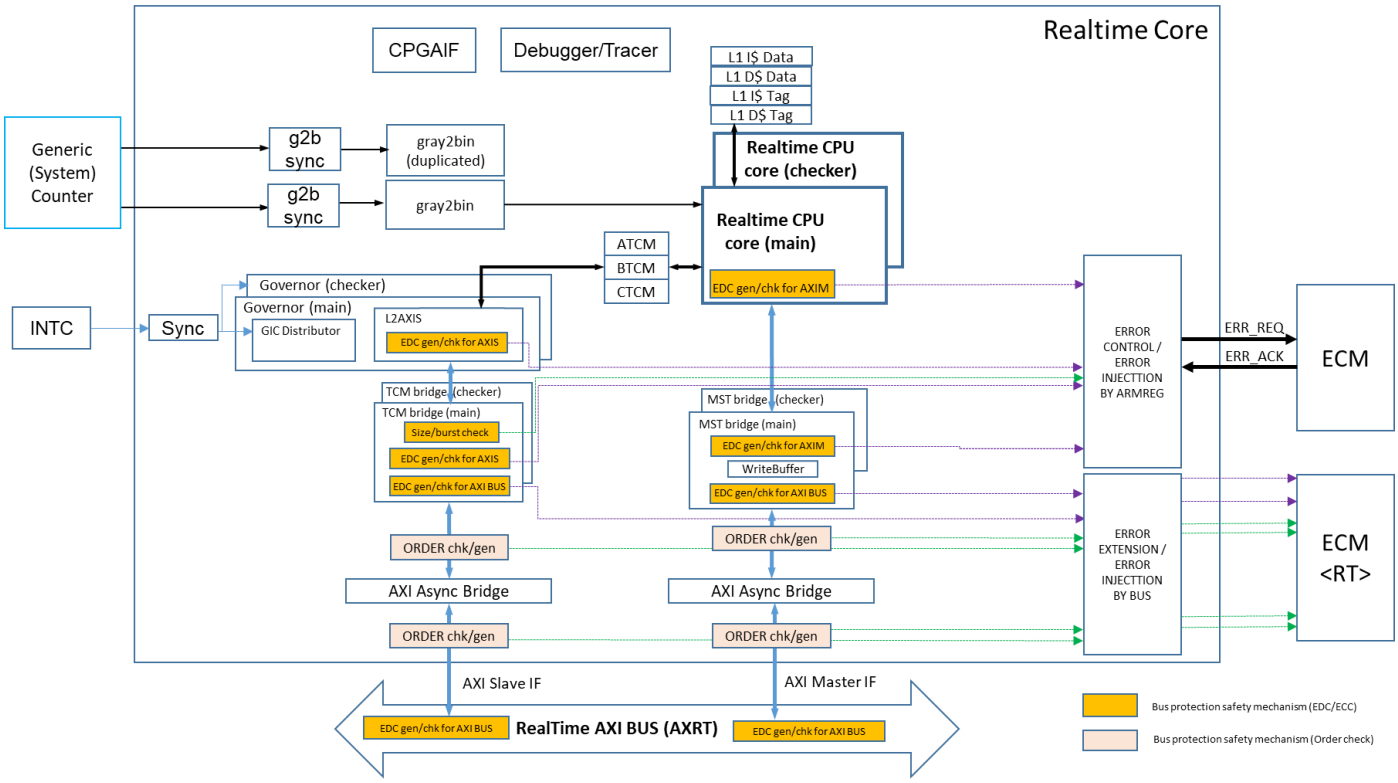

Figure 6.5 Realtime Core Bus protection diagram

[Signal Integrity Protection]

- Parity protection using an odd parity scheme on the handshake signals (xVALID/xREADY).
- ECC protection for DED scheme on payload signals.
- ECC protection for SECDED scheme on address and data signals.

For details, refer to Section 7.9.4 (Bus protection) in Reference [1].

When an Error is detected, Realtime Core inform ECM module of the error.

[Bus timeout detection]

When a transaction presented on a master port (AXIM) fails to complete, that is, a response is not received or an address or write data is not accepted resulting in a response not being received, within a programmable time limit, an error is signaled.

For details, refer to Section 7.11 (Bus timeouts) in Reference [1].

When an Error is detected, Realtime Core inform ECM module of the error.

[ORDER check]

Figure 6.6 shows the block diagram of ORDER check.

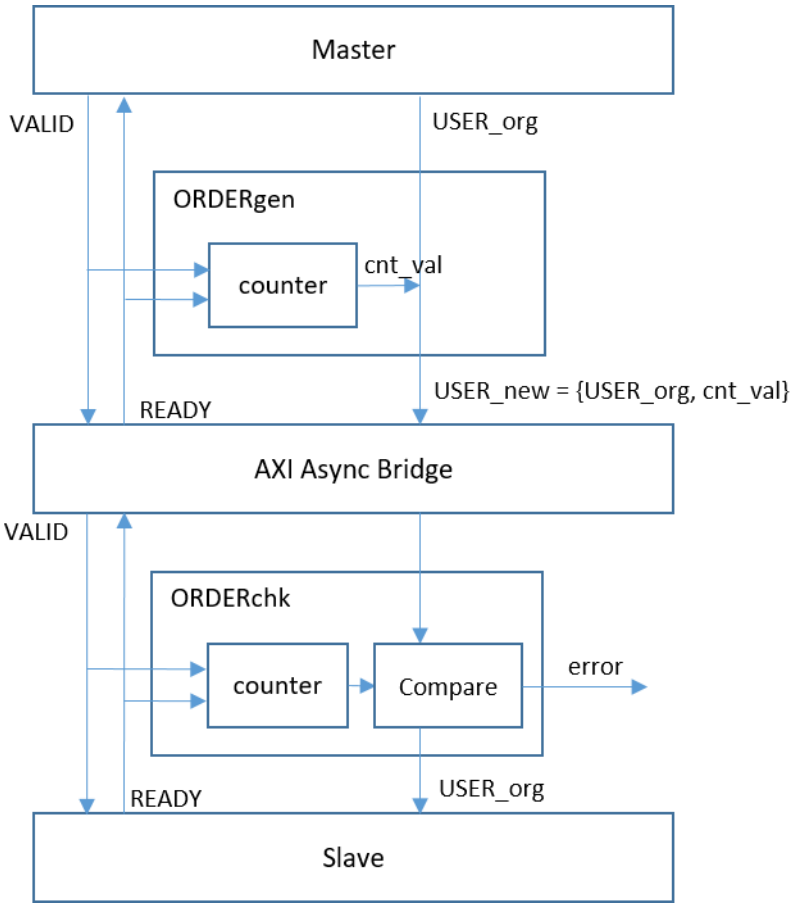

Figure 6.6 Realtime Core ORDER check diagram

- The purpose of ORDER check is to detect the fault of AXI Asynchronous bridges.
- *ORDERgen* generates an incremental counter value for each transaction. Then, the counter value is attached to AXI USER signal as a part of AXI transaction. *ORDERchk* also generates an incremental counter value for each received transaction and compare this counter value with the value attached in USER signal. If 2 counter values are different, an error is informed to AXI-bus ECM on RT domain.
- ORDER generator and ORDER checker are implemented as a pair for each AXI channel (AR/AW/W/R/B).

[SIZE-BURST check]

Realtime Core AXI Slave interface (AXIS) supports only a subset of AXI transactions, the Accelerator Coherency Port Interface Restrictions. Realtime Core implements a logic called SIZE-BURST check to detect the illegal transactions. When AXIS receives a transaction whose ARSIZE/AWSIZE is not 0x4 (16-byte) and/or ARBURST/AWBURST is not 0x1 (INCR), an error is informed to ECM module.

[EDC protection between Realtime Core and RT (Realtime) domain AXI (AXRT)]

- EDC protection is implemented to protect all AXI channels (AW/W/B/AR/R) between Realtime Core AXI Master/Slave Interfaces and AXRT.

6.5.4 Hardware Redundancy (DCLS)

6.5.4.1 Overview

The dual core lock step (DCLS) architecture is implemented in Realtime Core.

6.5.4.2 Related Registers

Table 6.13 Related Registers

Register Name	Abbreviation
Cortex-R52 Comparator Enable Register	CR52CMPEN

6.5.4.3 Hardware Description

The function is realized by running duplicated CPU core, write buffer. The checker core has the same input of main core, and the checker write buffer has the same input of main write buffer.

When the output of main core and checker core, and/or the output of main write buffer and checker write buffer are different, an error is detected. The Realtime Core sends a notification of the error to the ECM module. To enable the DCLS operation, writing 1 to bit 0 of CR52CMPEN register is required.

Figure 6.7 shows block diagram of the Realtime Core (Cortex-R52).

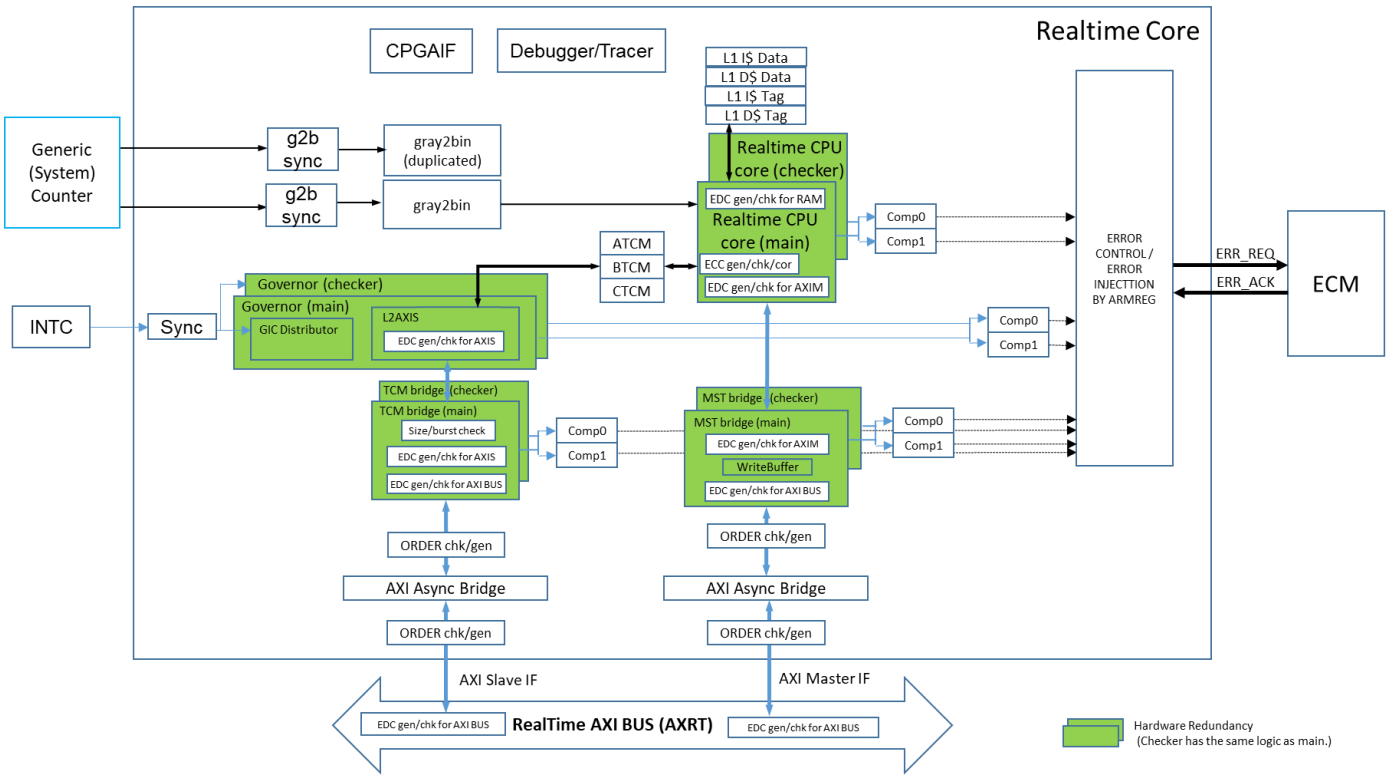

Figure 6.7 Hardware Redundancy of Realtime Core (Cortex-R52)

- DCLS is implemented for Realtime CPU and Write Buffer.
- EDC generators and checkers are included in the target of DCLS.
- Two comparators are implemented for each pair of Master core and Checker core. Each comparator notifys the error to ECM independently. Comparator 0 (Comp0) is put at Master while Comparator 1 (Comp1) is put at Checker core. Refer to Figure 6.8 in this document for more detail.

Table 6.14 shows register setting

Table 6.14 Realtime Core Hardware Redundancy Register Configuration

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size	R-Car V4M
Cortex-R52 Comparator Enable Register	CR52CMPEN	R/W	H'E617 0328	H'0000 0000	32	√

(1) Cortex-R52 Comparator Enable Register (CR52CMPEN)

This register is a 32-bit writable/readable register that controls the DCLS operation in Realtime Core. This register is accessed only in secure mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	NSRCMPEN	CMPEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	0	R	Reserved. These bits are always read as 0. The write value should always 0.
1	NSRCMPEN	0	R/W	Enable Non-safety related activity checking. 0: Disable Non-safety related activity checking. 1: Enable Non-safety related activity checking. Notice: Please do not set this bit to 1 when debug is enabled.
0	CMPEN	0	R/W	Enable DCLS operation. Setting this bit to enable or disable DCLS operation in Realtime Core. 0: Disable DCLS operation in Realtime Core. 1: Enable DCLS operation in Realtime Core.

When NSRCMPEN is set to 1, Realtime Core detects the toggles of non-safety related operations and/or signals, for examples, Debug Trace data, Debug APB interface, etc. Such events are informed to ECM.
Notice:

1. Because of asynchronous reset assertion, it may cause different behavior for between Master core and Checker core when reset is asserted. Therefore, CMPEN & NSRCMPEN must be enabled after power reset (at initialization step) and must be disabled before issuing Software reset to Realtime Core.
2. NSRCMPEN shall not be set to 1 if debug is enabled. Where, debug is disabled only when mode pin setting is {MDT0, MD21, MD20, MD11, MD10} = 5'b00000. Othewise (at least one of these mode pins is set to 1), debug is enabled.

6.5.5 Generic Counter Interface Protection

6.5.5.1 Overview

Hardware Redundancy is applied to detect if a fault of Generic Counter Interface between Generic Counter and Realtime Core.

6.5.5.2 Related Registers

Table 6.15 Related Registers

Register Name	Abbreviation
Generic Counter Error Enable Register	GCNTERREN

6.5.5.3 Hardware Description

Generic Counter Interface, synchronizers & Gray to Binary converter are duplicated. The outputs of primary Gray to Binary converter and duplicated Gray to Binary converter are compared in each CPU clock cycle. If the values of two converters are different more than 1 or 3 (programmable), an error is notified to ECM.

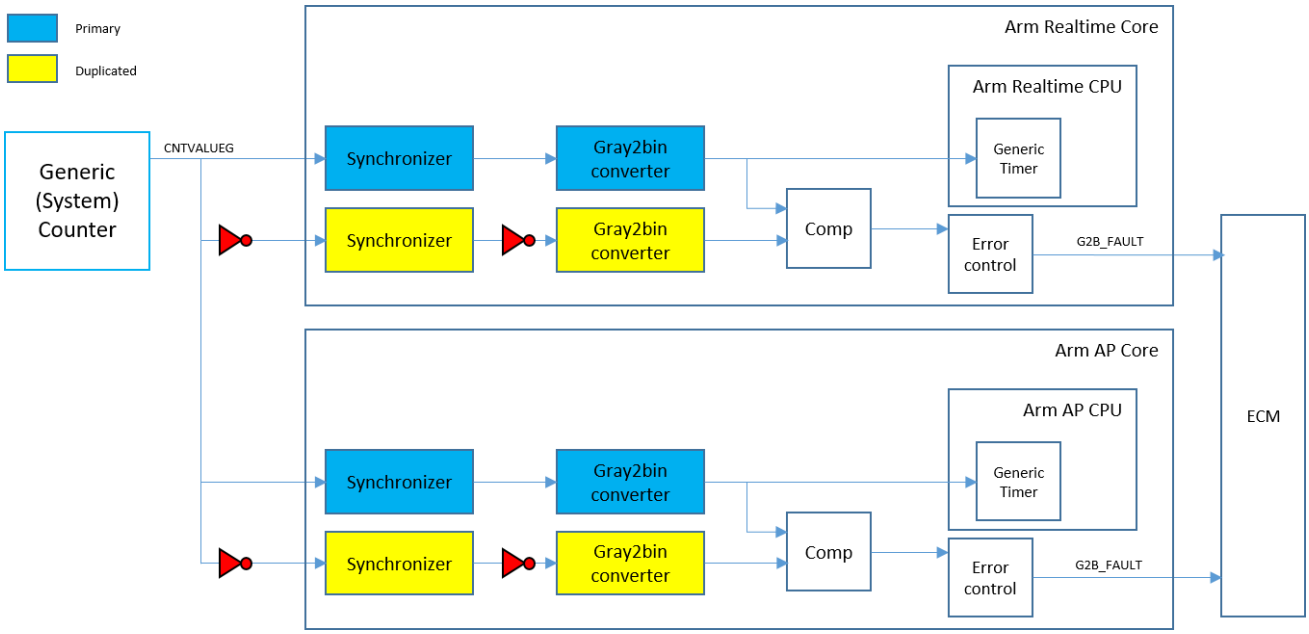

Figure 6.8 Realtime Core Generic Counter interface protection

Table 6.16 shows register setting.

Table 6.16 Realtime Core Generic Counter interface protection register configuration.

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size	R-Car V4M

31 to 1	-	0	R	Reserved These bits are always read as 0. The write value should always 0.
0	GCNTERREN	0	R/W	Enable error notification of Generic Counter interface protection between Generic Counter and Realtime Core 0: Disable Generic Counter interface protection error 1: Enable Generic Counter interface protection error

6.5.6 Address Feedback

6.5.6.1 Overview

Cortex-R52 has method to detect the faults in the memory address decoder that are built into ECC scheme. The following is memories are applied address decode detection.

- L1 D-cache Tag RAM
- L1 D-cache Data RAM
- L1 I-cache Tag RAM
- L1 I-cache Data RAM
- ATCM
- BTCM
- CTCM

6.5.6.2 Related Register

Please refer to 6.5.2.2 for more detail.

6.5.6.3 Hardware Description

Figure 6.9 shows the block diagram of address decode detection in the Realtime Core.

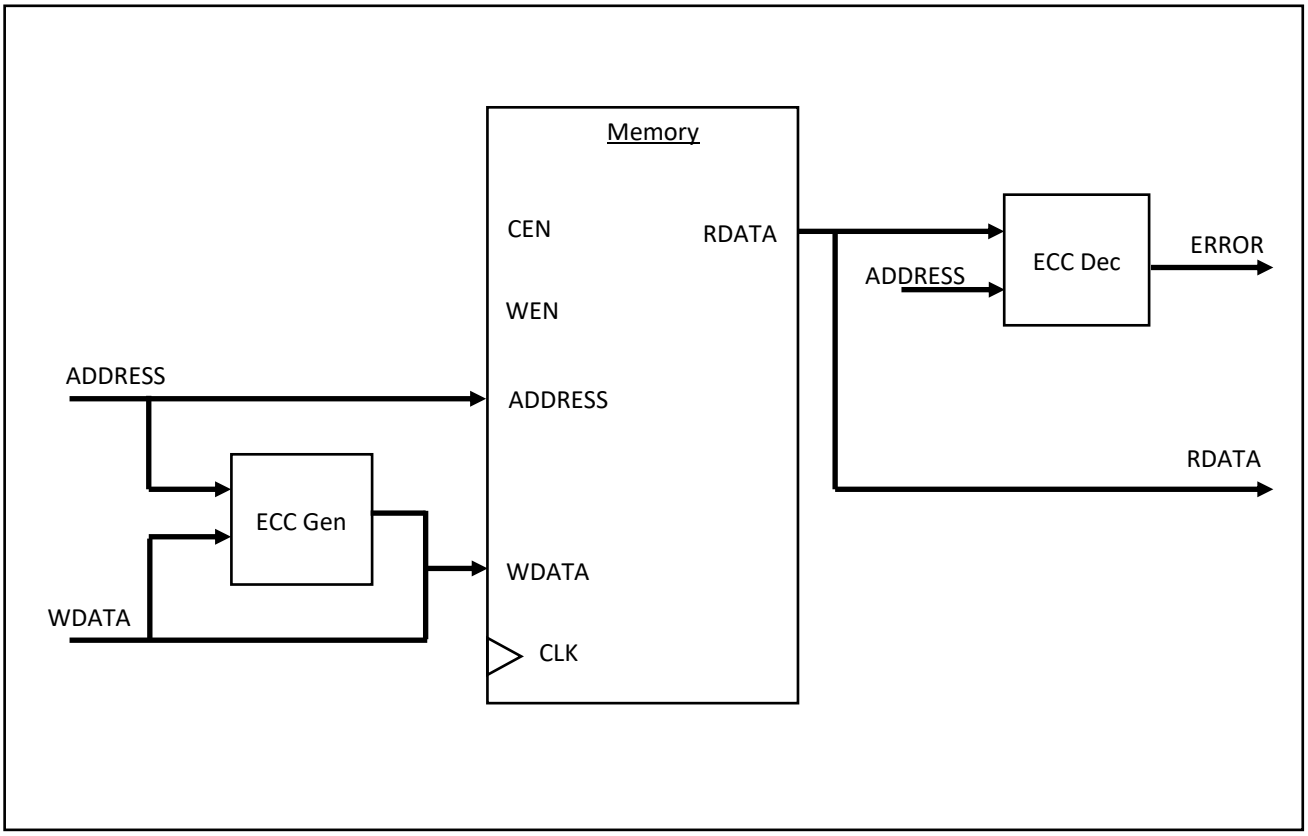

Figure 6.9 Realtime Core memory address decode detection

6.5.7 Other Error notification

6.5.7.1 Overview

Realtime Core supports to notify several types of Errors/Events to ECM. Software can use these Errors/Events notification as needed.

- When Write Buffer is enabled, once the write data is stored to the Write Buffer, the write response is returned to the bus master interface of Realtime Core before receiving the response from the target modules. When the corresponding response from the target modules are returned with the bus error attribute (DECERR/SLVERR), the interrupt related to this error can be asserted and notified to ECM.

6.5.8 P-channel Interface Protection

6.5.8.1 Overview

P-channel interface is used to communicate between APMU and Cortex-R52 which use to control power ON/OFF of Cortex-R52. And Safety Mechanism for this interface (P-channel checker) is implemented to APMU and Cortex-R52. Refer to Reference [4] for more detail. The block diagram is shown in Figure 6.10.

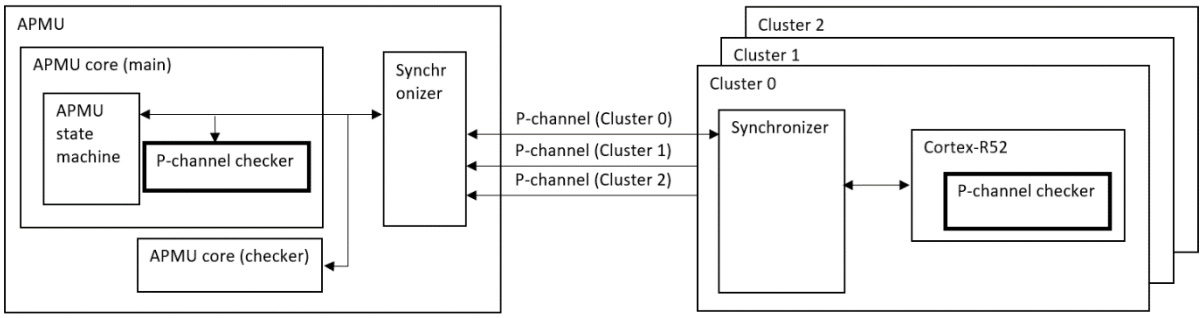

Figure 6.10 Safety Mechanism for P-channel between APMU and Cortex-R52

6.5.8.2 Related Register

About the related registers, refer to Section 10 APMU.

6.5.8.3 Hardware Description

This Safety Mechanism detects two types of errors. The first is parity error, the second is P-channel signal protocol error. If any of the errors are detected, Cortex-R52 notifies error detection to ECM.

1. Parity error for P-channel signal.

A parity bit is added to P-channel signal from APMU to Cortex-R52. The parity checking logic is implemented in Cortex-R52. It detects the parity error.

2. P-channel protocol error

Toggle ordering of P-channel signals is defined by Arm. Refer to Reference [4] for more detail. This mechanism detects failing of this ordering. For example, when PREQ signal from APMU is asserted, it must be kept asserted until PACCEPT or PDENY signal from Cortex-R52 core is asserted. If PREQ signal are negated before PACCEPT or PDENY signal are asserted, this mechanism judges it as P-channel protocol error.

7. Pin Function (PFC/GPIO)

7.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The pin function controller (PFC) is a module that consists of registers for selecting the function of the multiplexed pins and controlling the pull-up resistor on each LSI pin.

7.1.1 Features

- Setting multiplexed pin functions for LSI pins
  Function of the R-Car V4M pin selectable by setting the registers in the PFC module
- Bus Domain access: Please refer section 18 – AXI-bus
- DRV control for each LSI pin
  DRV control resistors can control the driving abilities of pins.
- TDSEL control for each LSI pin
  TDSEL control registers can control the driving abilities of pins in use for the SDHI.
  TDSEL control resistors on each LSI pin can be controlled by setting the registers in the PFC module.
  (Selection is handled by the return path for SDHI clock drive select register TDSEL0-1.).
- Pull-up/down control for each LSI pin.
  PUEN registers can on/off control of the pull resistors.
  On/off of the pull resistors on each LSI pin can be controlled by setting the registers in the PFC module.
  PUD registers can pull-up/pull-down control of the pull resistors.
  Pull-up/Pull-down control resistors on each LSI pin can be controlled by setting the registers in the PFC module.
- Module selection
  Module Select Register can select the group for multiple LSI pins with multiplexed pin functions.
  Enable and disable the functions of R-Car V4M LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module.
- Notes on configuring multiplexed pin functions
  The multiplexed LSI pins (MODSELn, GPSRn, IPiSRn i = 0 - 3) must be set in the initial sequence (*).
  Switching multiplexed LSI pins during operation is not guaranteed.

R-CarV4M product have 9 port groups GPIO group 0-7, System group 0.

(1) Clock Supply

PFC clock supply is shown in the following table.

Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name

7.1.4 Register Configuration

All the registers in the PFC are mapped into the APB bus space. Table 7.2 shows the configuration of the registers provided in the PFC. Details on each register in the PFC are given in sections 7.2.

Regarding the GPIO Group and System Group, the GPIO Group refers to a group of pins that can be switched between GPIO and other functions using the PFC function, while the System Group refers to a group of dedicated pins that do not have GPIO functionality.

The register configurations of R/W registers area, SET registers area and CLR registers area in GPIO group 0 to 8 and System group are the same. Also, the register configurations of R/W registers area, SET registers area and CLR registers area in System group are the same.

Table 7.2 Configuration of Registers in PFC

	Bus Domain	Group	Registers Area	Access Type	Address
PFC0	Bus Domain 0	GPIO Group 0	R/W registers area	Read or Write	H'E605 0000 to H'E605 01FF

7.2 Register Description

[Legend]

Initial value:	Register value after a reset
- :	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. The write value should always be 0.
n:	Number of GPIO Group, it's value is in the range 0 to 9.

All the bits are active high unless otherwise specified, and deactivated on reset.

All access to registers is made in longword units.

The write value to a reserved bit shall always be 0.

[Register access type and access mode]

Register access type is decoded by address offset, and selected by address check.

- R/W : Read-Write enabled register.

  Offset: H'000
- SET : Controled per bit. Write case, applied bit is "1" then "1", or applied bit is "0" then keep value. Read case, return Reg value. (HWM described as WriteOnly)

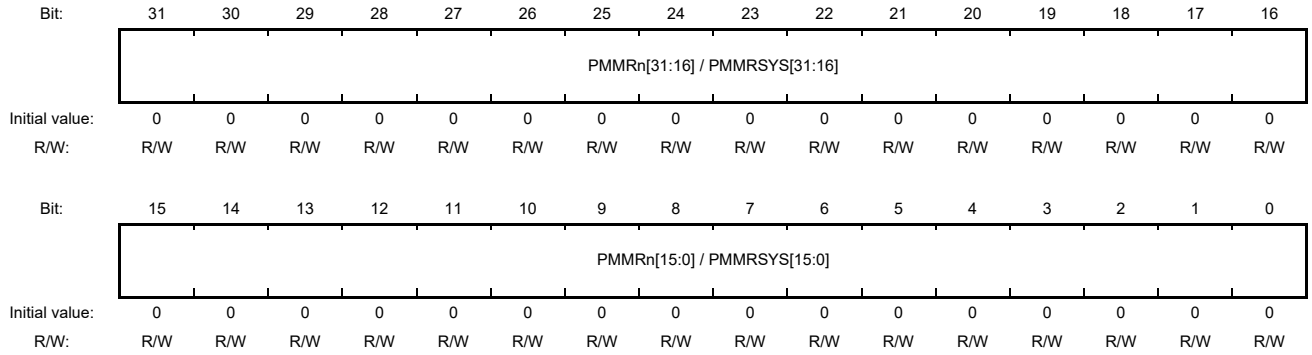
  Offset: H'200
- CLR : Controled per bit. Write case, applied bit is "1" then "0", or applied bit is "0" then keep value. Read case, return Reg value. (HWM described WriteOnly)

  Offset: H'400
- Reserved:

  Offset: H'600

7.2.1 LSI Multiplexed Pin Setting Mask Register (PMMRn / PMMRSYS)

Function: PMMRn / PMMRSYS enables / disables writing to the multiplexed pin setting registers.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PMMRn[31:0]	H'0000 0000	R/W	Multiplexed Pin Setting Mask Writing a value to any register from among the GPIO/peripheral function select register GPSR, peripheral function select registers, DRV control registers, TDSEL control register, POWER Condition control register, LSI pin pull-enable register PUEN, LSI pin pull-up/down control register PUD, and Module Select Register MODSEL Bus Domain Protection Register DMPR, Port Safe state Select Register PSSR and Port Safe state Enable Register PSER is enabled by writing the inverse of the value to this register.

Note: This register must be set before setting each of the GPIO / peripheral function select register GPSR, peripheral function select registers, DRV control register, TDSEL control register, POWER Condition control register, LSI pin pull-enable register PUEN and LSI pin pull-up/down control register PUD, Module Select Register MODSEL, Bus Domain Protection Register DMPR, Port Safe state Select Register PSSR and Port Safe state Enable Register PSER.

Note: For detailed configuration between the PMMRn/PMMRSYS registers and pins, refer to Table 7.60 (Configuration of Registers in PMMRn, DMiPRn, PMMRSYS and DMPRSYS).

7.2.2 LSI Multiplexed Pin Setting Mask Enable Register (PMMERn / PMMERSYS)

Function: PMMERn / PMMERSYS performs enables / disables control of the PMMR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PMMERn[0] / PMMERSYS[0]
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	—	R	—
0	PMMERn	1	R/W	Multiplexed Pin Setting Mask Enable 0: PMMR function is disabled. 1: PMMR function is enabled.

7.2.3 Bus Domain Protection Register 0-3 (DM0PRn , DM1PRn , DM2PRn , DM3PRn / DM0PRSYS , DM1PRSYS , DM2PRSYS , DM3PRSYS)

Function: DMiPRn / DMiPRSYS enables / disables writing to the registers from bus domain.

Note: i = 0 to 3 (Bus Domain)

PFC supports Bus Domain Protection, allowing access control at both the domain units and terminal units. Access permissions for each terminal are set using this register. This register controls the registers managed by the LSI Multiplexed Pin Setting Mask Register (PMMRn / PMMRSYS), excluding Peripheral Function Select Registers 0-3 (IP0SRn, IP1SRn, IP2SRn, IP3SRn).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMiPRn[31:16] / DMiPRSYS[31:16]															
R/W:	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMiPRn[15:0] / DMiPRSYS[15:0]															
R/W:	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1

Note: *1 R/W. Be able to write only from Bus domain 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DM0PRn[31:0], DM0PRSYS[31:0]	H'FFFF FFFF	R/W	Bus Domain Protection 0: Disable write to register 1: Enable write to register DMiPRn / DMiPRSYS and FILCLKSELn are not include in the potection target.
	DM1PRn[31:0], DM2PRn[31:0], DM3PRn[31:0], DM1PRSYS[31:0], DM2PRSYS[31:0], DM3PRSYS[31:0]	H'0000 0000	R/W	

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

Note: DMiPRn applies to pins where GPIO functions are multiplexed with other functions, while DMiPRSYS applies to dedicated pins without GPIO multiplexing and is used to control registers such as the DRV Control Register, the pull-enable register, and the pull-up/down control register.

Note: For detailed configuration between the DMiPRn/ DMPRSYS registers and pins, refer to Table 7.60 (Configuration of Registers in PMMRn, DMiPRn, PMMRSYS and DMPRSYS).

Table 7.60 Configuration of Registers in PMMRn, DMiPRn, PMMRSYS and DMPRSYS

7.2.5 Peripheral Function Select Register 0-3 (IP0SRn , IP1SRn , IP2SRn , IP3SRn)

Function: IPiSRn selects the functions of the multiplexed LSI pins.

Note: i = 0 to 3 (Bus Domain)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IPiSRn[31:16]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IPiSRn[15:0]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: i = 0 to 3

Bit	R/W	Description
31 to 0	R/W	The functions of the LSI pins are selected according to the table below.

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

Table 7.10 Configuration of Registers in IP0SR0 , IP1SR0 , IP2SR0

		Register Value [4 bits]

7.2.6 DRV Control Register 0-3 (DRV0CTRLn , DRV1CTRLn , DRV2CTRLn , DRV3CTRLn / DRV0CTRLSYS , DRV1CTRLSYS)

Function: DRViCTRLn / DRVjCTRLSYS controls the driving abilities of pins. This setting is related to only the output.

Note: i = 0 to 3 (Bus Domain) , j= 0 to 1 (Bus Domain)

Table 7.19 DRV truth table

Output buffer

DRV1	DRV2	DRV3	Drive capability		
			Voltage type		
			for 1.8V/3.3V	for 1.8V/2.5V	for 3.3V
L	L	L	Invalid	Invalid	Invalid
H	L	L	2/8	2/8	2/8
L	H	L	3/8	3/8	3/8
H	H	L	4/8	4/8	4/8
L	L	H	5/8	5/8	5/8
H	L	H	6/8	6/8	6/8
L	H	H	7/8	7/8	7/8
H	H	H	Full	Full	Full

Output buffer

DRV1	DRV2	Drive capability
		Voltage type
		for 1.8V
L	L	1/4
H	L	2/4
L	H	3/4
H	H	Full

The initial value of DRViCTRLn as following:

-IO 1.8V/3.3V : b'110

-IO 2.5V/3.3V : b'110

-IO 3.3V : b'110

-IO 1.8V (DCUTDO_LPDO, DCURDY#_LPDCLKOUT) : b'11

-IO 1.8V (Other than DCUTDO_LPDO, DCURDY#_LPDCLKOUT) : b'10

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DRViCTRLn[31:16] / DRVjCTRLSYS[31:16]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

7.2.7 POWER Condition Control Register (POCn)

Function: Each bit in POCn must be set according to IO voltage level that is supplied to the pin.
About the how to switch voltage value, refer at “7.3.10 Switching signal level voltage”.

0: 1.8V 1: 3.3V

Supply voltage	Setting register	Usage
1.8V	0	Possible
1.8V	1	Possible (limited*)
3.3V	0	Do not set (broken)
3.3V	1	Possible

* : Only the operation to capture Mode Pin value is guaranteed. Other usage is not guaranteed.

0: 1.8V 1: 2.5V

Supply voltage	Setting register	Usage
1.8V	0	Possible
1.8V	1	Possible (limited*)
2.5V	0	Do not set (broken)
2.5V	1	Possible

* : Only the operation to capture Mode Pin value is guaranteed. Other usage is not guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POCn[31:16]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POCn[15:0]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

Note: The power domain is common for each function.

Note: When any GPIO are not used, they must be set POC register’s bits fitting with their Power Domain.

Note: No register setting is necessary in case of supplying 3.3V or 2.5V.

7.2.10 Module Select Register (MODSELn)

Function: MODSELn selects the group for multiple LSI pins with multiplexed pin functions.

The I2C cell uses two Pins of CLK and data, and STBN for making it unused is shared by two Pins of CLK and data, so the MODSELn register has 2 bits for one function.

In order to apply domain control, bit assignment is set to Port Group (GPIO).

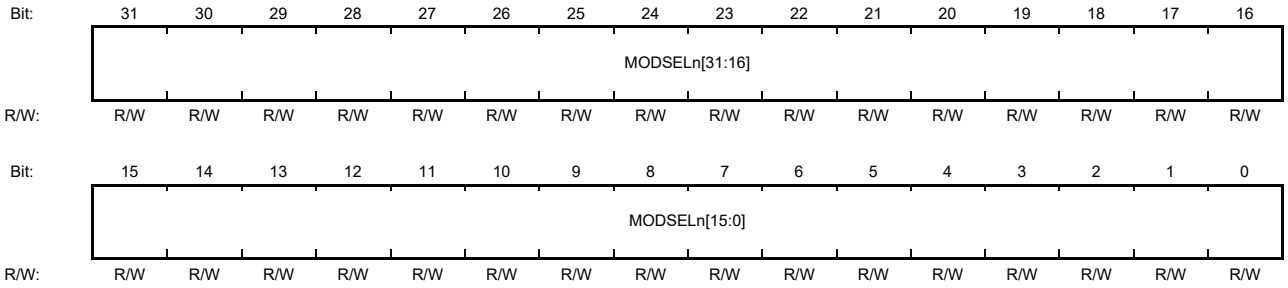

Table 7.45 Configuration of Registers in MODSEL

	MODSEL4	Initial value	Description
bit31	—	—	—
bit30	—	—	—

bit11	—	—	—
bit10	—	—	—
bit9	—	—	—
bit8	—	—	—
bit7	SDA3	0	0 : GPIO mode 1 : I2C mode
bit6	SCL3	0	0 : GPIO mode 1 : I2C mode
bit5	SDA2	0	0 : GPIO mode 1 : I2C mode
bit4	SCL2	0	0 : GPIO mode 1 : I2C mode
bit3	SDA1	0	0 : GPIO mode 1 : I2C mode
bit2	SCL1	0	0 : GPIO mode 1 : I2C mode
bit1	SDA0	0	0 : GPIO mode 1 : I2C mode
bit0	SCL0	0	0 : GPIO mode 1 : I2C mode

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

7.2.11 TDSEL Control Register 0-1 (TD0SELn , TD1SELn / TD0SELSYS , TD1SELSYS)

Function: TDiSELn / TDiSELSYS controls the driving abilities of pins in use for the SDHI.
This function is delay adjustment of the SDHI clock return path for the LSI inside.
Note: i = 0 to 1

TDiSEL1	TDiSEL0	TDOUT Target delay
L	L	10pF (@1.8V operation)
H	L	20pF (@1.8V operation)
L	H	30pF (@1.8V operation)
H	H	40pF (@1.8V operation)

Note: TDiSEL1 SD0TDSEL1
TDiSEL0 SD0TDSEL0

The value of these bit must be 00.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7.2.12 General IO / Interrupt Switching Register (IOINTSELn)

IOINTSELn selects either general input/output mode or interrupt input mode for each of the port pins 0 to 31 of the GPIO group. When general input / output mode is selected for a port, it is also necessary to select either input or output mode for the port using the corresponding bit in the general input/output switching register. When interrupt input mode is selected for a port, the setting of the general input / output switching register for the port is ignored.

[Hardware default value:H'0000 0000 = general input / output mode is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7.2.13 General Input/Output Switching Register (INOUTSELn)

INOUTSELn is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register. Specifically, INOUTSEL selects either general input or general output mode for a port using the bit corresponding to the port number. The INOUTSEL bits can be written to only when the corresponding bits in the general IO/interrupt switching register are 0. Note that after general input/output mode is changed to interrupt input mode, INOUTSEL retains the setting but is read as 0.

[Hardware default value: H'0000 0000 = general input mode is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INOUTSELn[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INOUTSELn [31:0]	H'0000 0000	R/W	Selects either general input mode or general output mode for each port using the bits corresponding to the port numbers. 0: General input mode 1: General output mode

Note: Unused bits should be set to the initial values.

7.2.14 General Output Register (OUTDTn)

OUTDTn is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. Specifically, the value of the bit in OUTDTn corresponding to the port number is inverted or not inverted depending on the setting of the positive/negative logic select register before being output from the corresponding port pin. Note that the polarity of the output signal should previously be set using the corresponding bit in the positive/negative logic select register. This register must be set after the output data select register is appropriately set to choose level of output data.

[Hardware default value: H'0000 0000 = 0 is output from all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTn[31:0]	H'000 00000	R/W	Allows the port to output the value set in the bit corresponding to the port number when the port is appropriately set by IOINTSEL, INOUTSEL and OUTDTSEL. 0: 0 is output. 1: 1 is output.

Note: The values set in OUTDT are not directly output from the GPIO pins; the above set values are processed according to the settings of the positive / negative logic select register before being output.
Unused bits should be set to the initial values.
About write of output data: Output data can be selected exclusively of OUTDT or OUTDTH / OUTDTL, based on OUTDTSEL setting.
About read of output data: Either of OUTDT and OUTDTH / OUTDTL read as the actual output data.

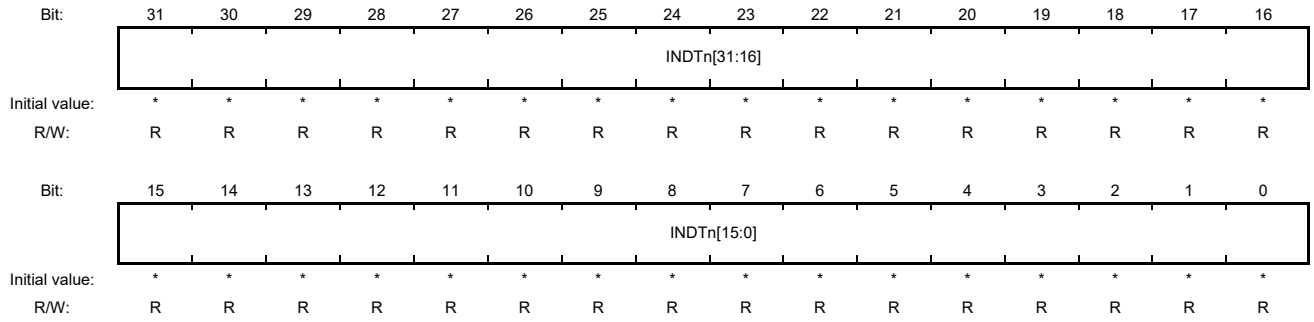
7.2.15 General Input Register (INDTn)

INDTn is a register that can read the status of General-Purpose Input / Output Ports.

Each bit reflects the value received through the corresponding port pin.

Note that when a bit in the positive / negative logic select register is 1, the corresponding bit in INDT indicates the inverted value of the input signal.

[Hardware default value: state of the signals input to the port pins.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INDTn[31:0]	*	R	Each bit reflects the value received through the corresponding port pin. 0: Input is 0. (assuming positive logic) 1: Input is 1. (assuming positive logic)

Note: Unused bits should be set to the initial values.
* State of the signals input to the port pins.

7.2.16 Interrupt Display Register (INTDTn)

INTDTn is valid only when interrupt input mode is selected by the general IO/interrupt switching register. Specifically, when an interrupt is input via a port pin when INTDTn is valid, the bit in INTDTn corresponding to the port indicates whether the port has received an interrupt input or not. In interrupt input mode, the polarity and detection conditions (one edge/both edge or level) of the external input signal can be set for each port pin. Before using a port pin for interrupt input, the corresponding bits in the positive/negative logic select register and edge/level select register (one edge/both edge register should be appropriately configured if edge detection mode is selected) should be set, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in INTDTn holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block.

To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in INTDTn currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in INTDTn does not use the FF to hold the input. Therefore, when an external input signal is stopped, the corresponding bit in INTDTn is cleared automatically. When all the bits in INTDTn are turned off (= 0), the GPIO stops outputting all the interrupt signals.

[Hardware default value: H'0000 0000 = no interrupt signals are input from ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTDTn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTDTn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTDTn[31:0]	H'0000 0000	R	Each bit indicates the input of an interrupt signal on the corresponding port pin. 0: No interrupt signal has been input. 1: Interrupt signal has been input.

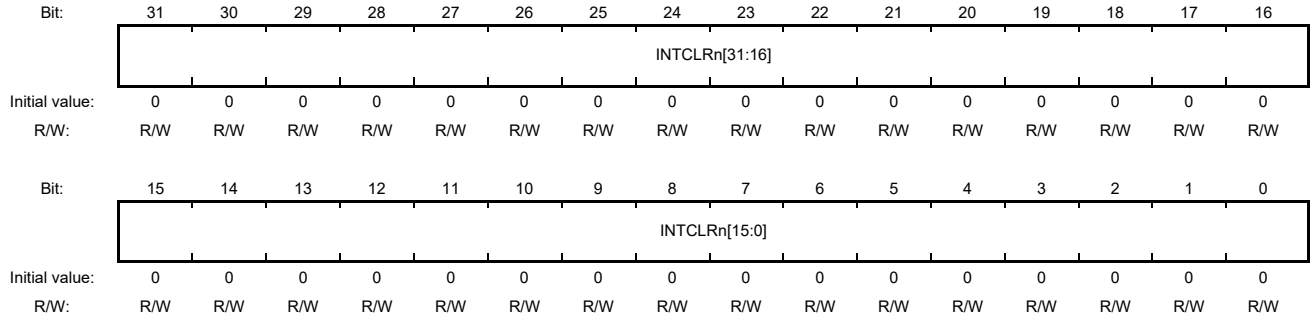
Conditions of Indicating Interrupt Input:

1. For level-sensitive interrupt input (EDGLEVEL = 0)
   - External input signals are constantly monitored and indicated. (When the negative logic is selected, the inverted value of the external input signal is indicated.)
2. For edge-sensitive interrupt input (EDGLEVEL = 1)
   - Clearing condition: When the interrupt clear register is cleared, indication is cleared regardless of the positive / negative logic select register.
   - Setting condition: With the positive logic (POSNEG = 0), when the rising edge of an external interrupt signal is detected, the interrupt input is indicated. With the negative logic (POSNEG = 1), when the falling edge is detected, the interrupt input is indicated. With both edge mode (BOTHEDGE = 1), when either the rising or falling edge, the interrupt input is indicated.

7.2.17 Interrupt Clear Register (INTCLRn)

When the interrupt display register is currently indicates the reception of the interrupt input on the port for which the edge detection is selected by the edge/level select register (with configuring for one edge/both edge select register) in interrupt input mode, INTCLRn clears the indication. Specifically, writing 1 to the bits in INTCLRn corresponding to port numbers can clear the corresponding bits in the interrupt display register. However, when the interrupt display register is currently indicates the reception of the interrupt input on the port for which the level detection is selected by the edge/level select register, writing 1 to the corresponding bits in INTCLRn cannot clear the corresponding bits in the interrupt display register. Only writing 1 to INTCLRn is effective; INTCLRn is always read as 0.

[Hardware default value: H'0000 0000 = interrupt indication is cleared for no ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTCLRn [31:0]	H'0000 0000	R/W	Writing 1 to bits corresponding to port numbers clears the corresponding bits in the interrupt display register. 0: No effect 1: Interrupt display register bit is cleared.

Note: Unused bits should be set to the initial values.

7.2.18 Interrupt Mask Register (INTMSKn)

INTMSKn masks the interrupt requests indicated by the interrupt display register of GPIO.ch. Interrupts can be separately masked using the corresponding bits in INTMSKn. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'0000 0000 = all the ports are masked.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTMSKn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTMSKn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSKn [31:0]	H'0000 0000	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values.

7.2.19 Interrupt Mask Clear Register (MSKCLRn)

MSKCLRn cancels masks that are set by the interrupt mask register of GPIO.ch*A. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLRn. Only writing 1 to MSKCLRn is effective; MSKCLRn is always read as 0.

[Hardware default value: H'0000 0000 = alternative interrupt masks are cleared for no ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSKCLRn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSKCLRn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

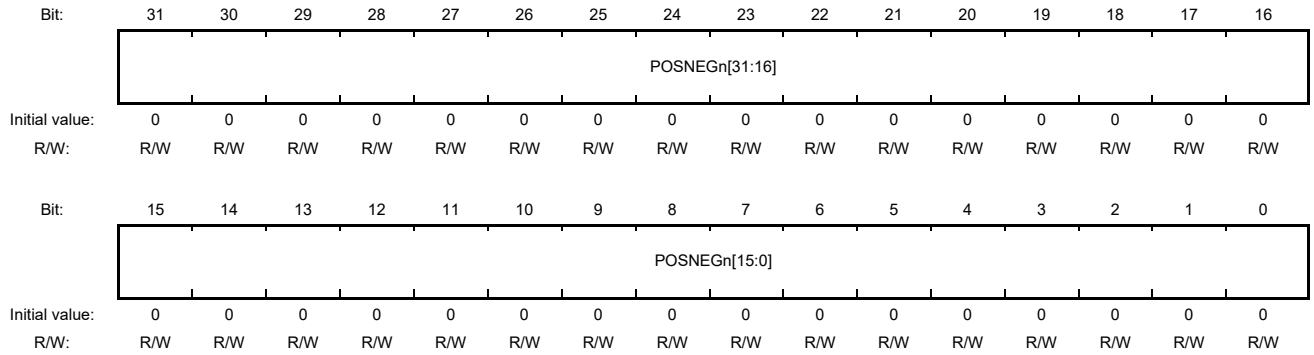
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLRn [31:0]	H'0000 0000	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. (When GPIO is not selected by the pin multiplex settings, do not cancel the alternative interrupt mask.)

7.2.20 Positive / Negative Logic Select Register (POSNEGn)

POSNEGn selects the polarity (positive or negative logic) of each port pin in general input mode, general output mode, or interrupt input mode. POSNEGn should be set before mode selection.

[Hardware default value: H'0000 0000 = positive logic is selected for all the ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	POSNEGn [31:0]	H'0000 0000	R/W	Selects the polarity (positive or negative logic) of each port pin. 0: Positive logic 1: Negative logic

Note: Unused bits should be set to the initial values.

7.2.21 Edge / level Select Register (EDGLEVELn)

EDGLEVELn is valid only for the ports for which interrupt input mode is selected by the general IO/interrupt switching register. Specifically, EDGLEVELn selects the detection conditions (edge or level) of the interrupt input signal on each port pin for which interrupt input mode is selected. EDGLEVELn should be set before selection of interrupt input mode.

[Hardware default value: H'0000 0000 = level detection is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDGLEVELn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EDGLEVELn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

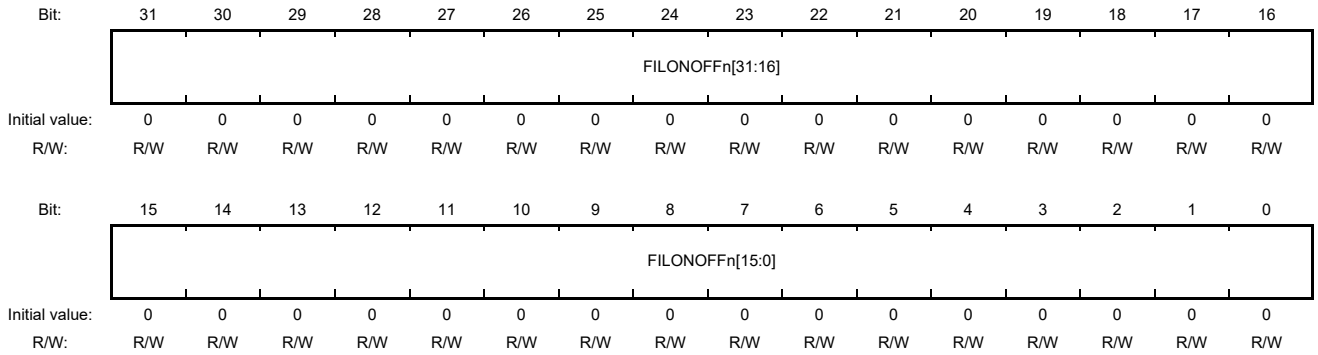
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDGLEVELn [31:0]	H'0000 0000	R/W	Selects the level or edge as detection conditions of the interrupt input signal on each port pin for which interrupt input mode is selected. 0: Level 1: Edge

Note: Unused bits should be set to the initial values.

7.2.22 Chattering Prevention On / Off Register (FILONOFFn)

FILONOFFn prevents chattering input to the port pins of each GPIO group. For details, refer to section 7.3.6, Handling of Input Signals on Port Pins.

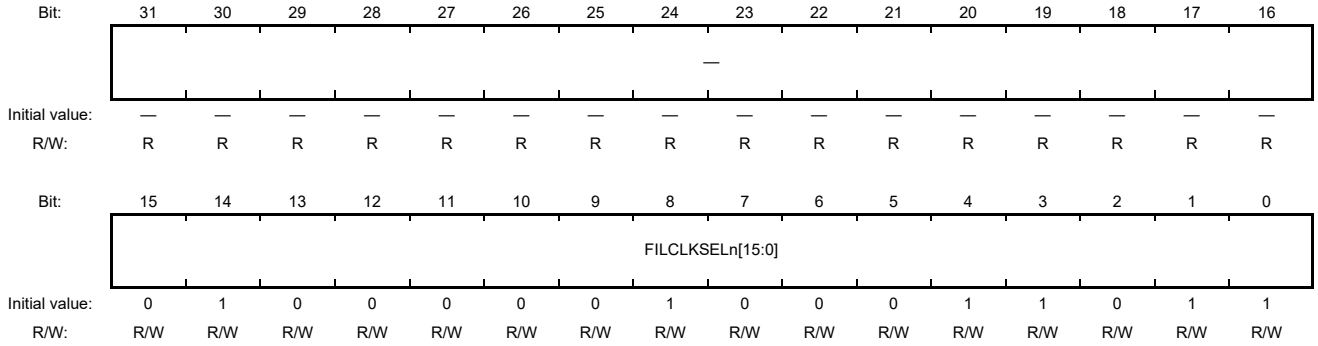
[Hardware default value: H'0000 0000 = chattering prevention function is turned off for all the ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FILONOFFn [31:0]	H'0000 0000	R/W	Enables or disables the chattering prevention function. 0: Chattering prevention function is disabled. 1: Chattering prevention function is enabled

7.2.23 Chattering Prevention Clock Select Register (FILCLKSELn)

FILCLKSELn controls the division ratio of clock CPϕ for prevent chattering input to the port pin GPIO group.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	—	R	—
15 to 0	FILCLKSELn [15:0]	H'411B	R/W	Set the division ratio of filter CLOCK. d: CPϕ / (d + 1) d is setting value

7.2.24 Output Data Select Register (OUTDTSELn)

OUTDTSELn is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. OUTDTSELn selects if OUTDTn or OUTDTHn / OUTDTLn will be the output data of GPIO. When choosing OUTDTn, configuration is performed as described in section 7.2.14, General Output Register (OUTDTn). When choosing OUTDTHn / OUTDTLn, output data will be output by writing the appropriate data to the corresponding bits in OUTDTHn or OUTDTLn. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be set before writing data to OUTDTHn / OUTDTLn registers.

[Hardware default value: H'0000 0000 = Out data register is used to output data.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTSELn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTSELn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTSELn [31:0]	H'0000 0000	R/W	Choosing whether output data is output by general output register OUTDTn or output data high register OUTDTHn / output data low register OUTDTLn. 0: General output register is used to output the data. 1: Output data high register and output data low register is used to output the data.

Note: Unused bits should be set to the initial values.

7.2.25 Output Data High Register (OUTDTHn)

OUTDTHn is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSELn is configured to choose OUTDTHn / OUTDTLn register to output the data of GPIO. Only writing 1 to OUTDTHn is effective. Otherwise, setting makes no changes. Reading OUTDTHn returns the values of the latest data set to OUTDTHn or OUTDTLn right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written and read after output data select register OUTDTSELn is set. Reading OUTDTHn without appropriately configuring OUTDTSELn can return value of OUTDTn register.

[Hardware default value: H'0000 0000 = 0 is output from all the port swith setting OUTDTSELn.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTHn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTHn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTHn [31:0]	H'0000 0000	R/W	Outputting high value data. 0: Invalid data. 1: Valid data.

Note: Unused bits should be set to the initial values.

7.2.26 Output Data Low Register (OUTDTLn)

OUTDTLn is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSELn is configured to choose OUTDTHn / OUTDTLn register to output the data of GPIO. Only writing 0 to OUTDTLn is effective. Otherwise, setting makes no changes. Reading OUTDTLn returns the values of the latest data set to OUTDTLn or OUTDTHn right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written or read after output data select registers OUTDTSELn is set. Reading OUTDTHn without appropriately configuring OUTDTSELn can return value of OUTDTn register.

[Hardware default value: H'0000 0000 = 0 is output from all the ports with setting OUTDTSELn.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTLn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTLn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTLn [31:0]	H'0000 0000	R/W	Outputting low value data. 0: Valid data. 1: Invalid data.

Note: Unused bits should be set to the initial values.

7.2.27 One Edge / Both Edge Select Register (BOTHEDGEn)

BOTHEDGEn is valid only when the edge detection mode is selected by the edge/level select registers. Specially, BOTHEDGEn selects the detection condition (one edge or both edges) of the interrupt input signal on each port pin for which interrupt input mode (selected by the general IO/interrupt switching registers) and edge detection mode are selected. BOTHEDGEn should be set before selection of interrupt input mode.

[Hardware default value: H'0000 0000 = both edge detection mode is disabled for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BOTHEDGEn[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BOTHEDGEn [31:0]	H'0000 0000	R/W	Selecting one edge or both edge detection condition of the interrupt input signal on each port pin for which interrupt input mode and edge detection mode are selected. 0: One edge. 1: Both edges.

Note: Unused bits should be set to the initial values.

7.2.28 General Input Enable register (INENn)

Create registers that can control IE in GPIO.

Assign 1 bit of register to 1 pin for IE of all pins to which GPIO is assigned. Also,as before, in order to maintain SW compatibility, set the initial value of IE to High (input ON) state.

The register specifications are shown below.

Create one register (32 bits) for each Port Group.

Setting value: 0 = Input Enable Off / 1 = Input Enable ON

Initial value: 0 = Input Enable OFF

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INENn[31:16]

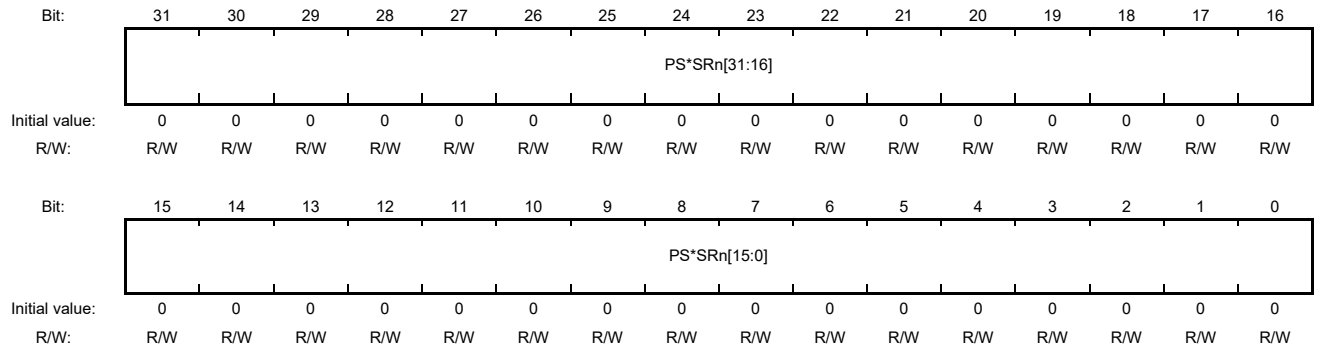
7.2.29 Port Safe state Select Register0-1 (PS0SRn , PS1SRn)

Registers (PS*SRn) that select 4 types of Port Safe State (initial state or HiZ or Pull-Down or Pull-Up) with 2 bits.

Note: * 0 to 1



Note: It applies to Pin which multiplex with GPIO function

Note: About precautions of this register, refer to “7.4.2 Notes for PS0SRn/PS1SRn/PSERn”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PS*SRn[m×2+1:m×2] m = 0 to 15	b’00	R/W	b'00=initial state b'01=HiZ b'10=Pull-Down b'11=Pull-Up

7.3 Operation

7.3.1 Overview

This is recomendation of Pin Function setting flow, “Figure7.3 Recomendation of Pin Function setting flow”.

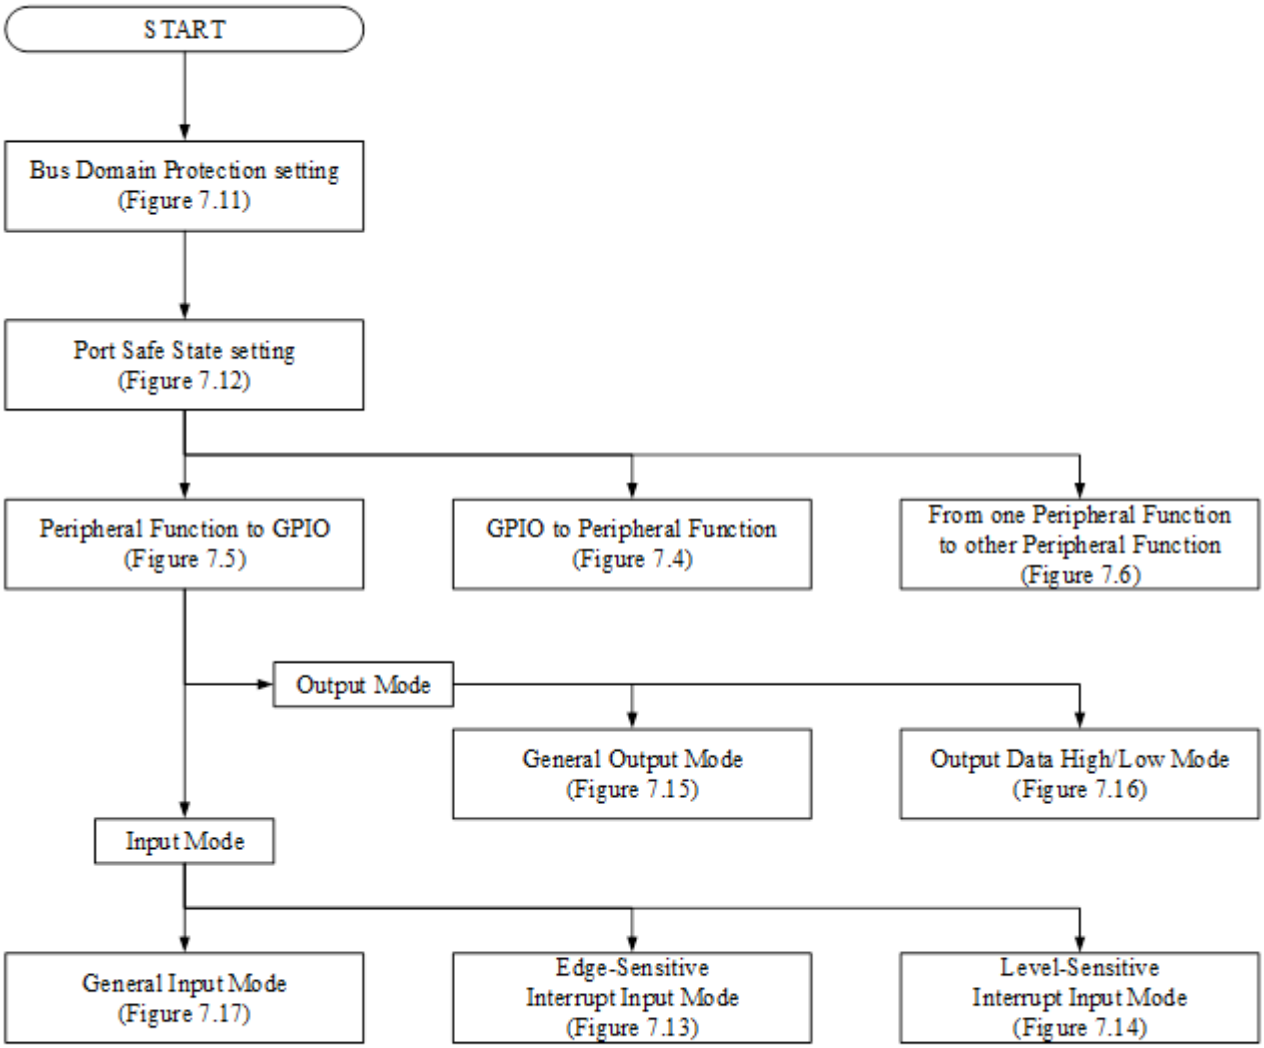

Figure 7.3 Recomendation of Pin Function setting flow

7.3.2 Function Setting for Multiplexed Pins

Setting the LSI multiplexed pin setting mask register (PMMRn) is necessary before setting each of the GPIO/peripheral function select register GPSRn, peripheral function select registers IP0SRn to IP3SRn, DRV control registers DRV0CTRLn to DRV3CTRLn, TDSEL control registers TD0SELn and TD1SELn, POWER Condition control registers POCn and Module select register MODSELn. Specifically, the inverse of the value to be set in the select register must be written to the LSI multiplexed pin setting mask register. Otherwise, the GPIO/peripheral function select register (GPSRn) and peripheral function select registers 0 to 3 (IP0SRn to IP3SRn) cannot be set.

Caution…

Some input functions is assigned to more than one pin. Only activate one single pin to one given peripheral input function. Do not activate a input function on multiple pins at the same time. Do not set peripheral selection to a place where the peripheral function is not assigned.

Ex) HSCIF3_A and HSCIF3_B

HSCIF3 is assigned to the following pins on this device. However, HSCIF3 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

(1) Procedure for changing pin function from GPIO to peripheral function

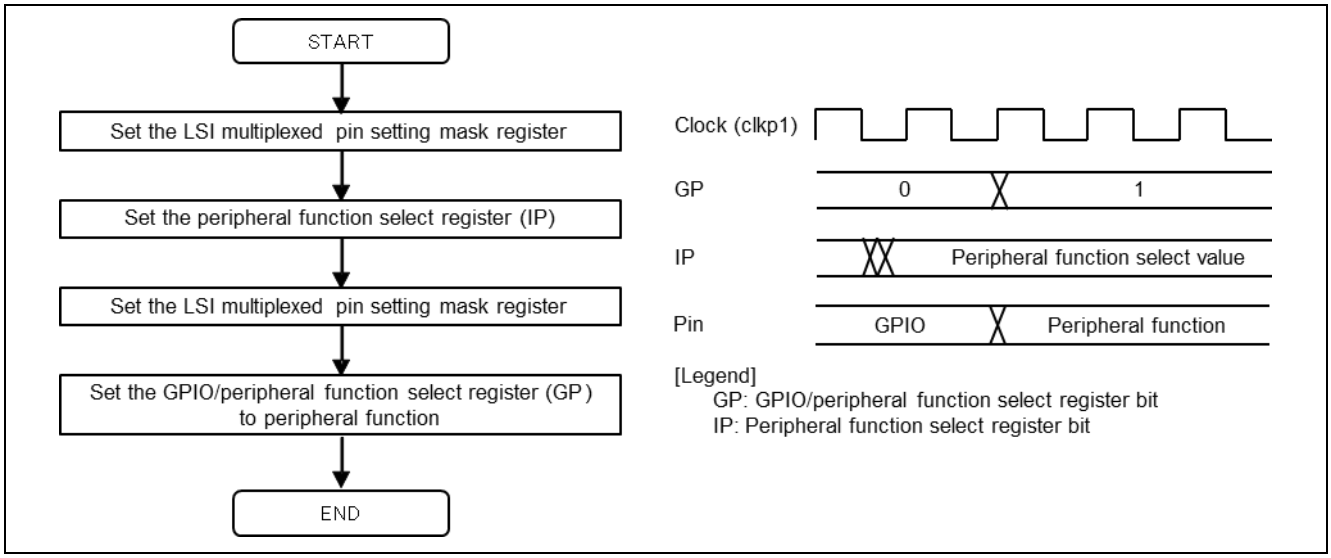

Figure 7.4 Procedure for Changing Pin Function from GPIO to Peripheral Function

(2) Procedure for changing pin function from peripheral function to GPIO

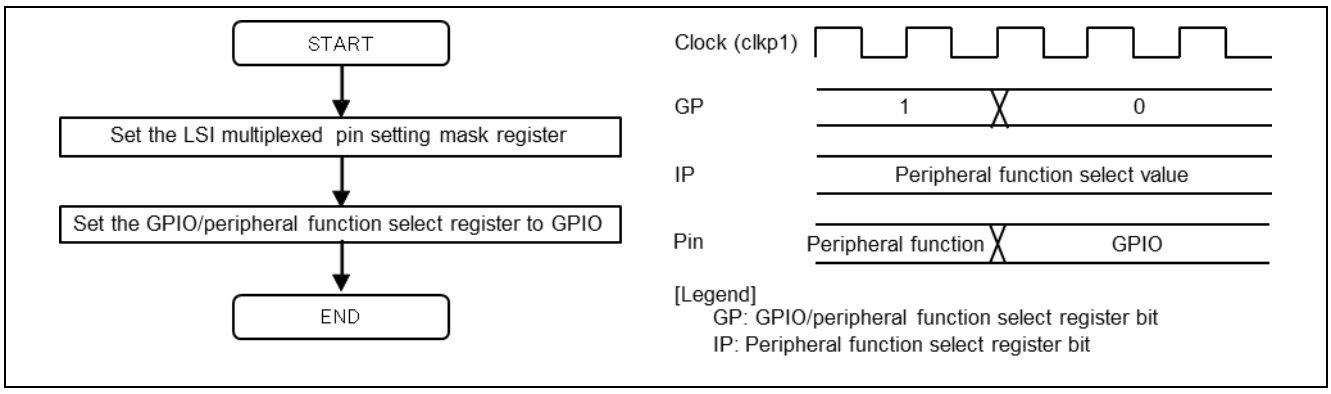

Figure 7.5 Procedure for Changing Pin Function from Peripheral function GPIO

(3) Procedure 1 for changing pin function from one peripheral function to another peripheral function

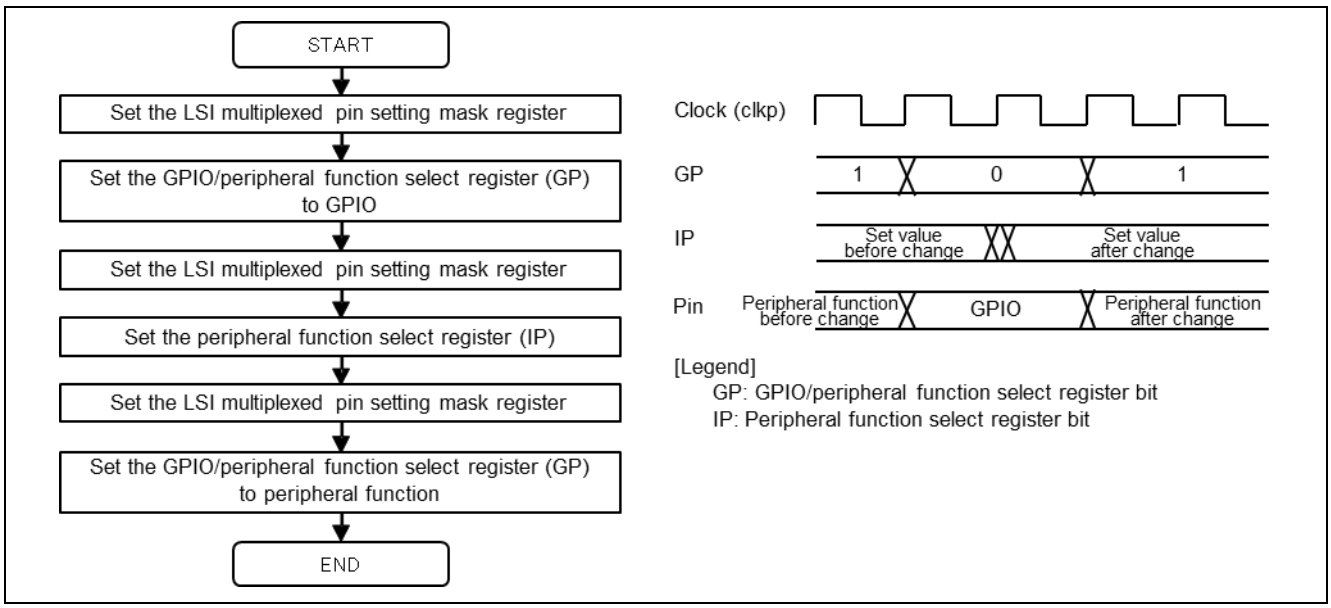

Figure 7.6 Procedure for Changing Pin Function from One Peripheral Function to Another Peripheral Function (with GPIO Setting)

7.3.3 Setting Pull-Up / Down Resistors

The LSI pin pull-on / off control register (PUENn) and pull-up / down control register (PUDn) areused.

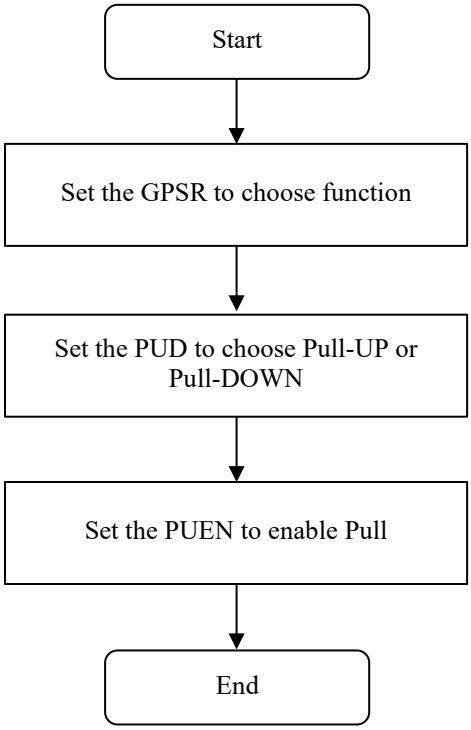

Figure 7.7 Procedure for setting Pull-UP/DOWN

7.3.4 Port Pin Specifications

Each GPIO group is provided with up to 32 port pins for general input / output and external interrupt input ports. Table 7.50 specifies these pins.

- Either general input / output mode or interrupt input mode can be set for each port.
- In general input mode, the polarity of input signals can be set for each port.
- In general output mode, the polarity of output signals can be set for each port.
- In interrupt input mode, the polarity of interrupt signal can be set for each port.
  In interrupt input mode, the detection conditions of interrupt signals can be set for each port.

7.3.5 Operations in Each Mode

(1) Mode Switching

Two registers are used to switch modes of the general IO/interrupt input pins of the GPIO groups. Each register is provided with up to 32 bits each controlling one of the GPIOn* port pins. The general IO/interrupt switching register is first used to select either general input/output mode or interrupt input mode for each port pin. When general input/output mode is selected, the setting of the relevant bit in the second register, i.e., the general input/output switching register, is used. Specifically, when a bit in the general input/output switching register is set for general output mode, the corresponding port pin is turned to the output direction and the route is formed so that the set value in the corresponding bit in the general output register should be output via the pin. Likewise, when set for the general input mode, the corresponding port pin is turned to the input direction and the route is formed so that the value received via the pin should be indicated by the corresponding bit in the general input register. When interrupt input mode is selected, the corresponding port pin is turned to the input direction and the route is formed so that the reception of the signal input via the pin should be indicated by the interrupt display register. Here, the setting of the second register, i.e., the general input/output switching register, is invalid.

Note: * n = 0 to 7 (The groups GP4 to GP7 have no interrupt input mode.)

(2) General Input / Output Mode

When setting a port for general input, set high value to INEN to enable general input. When a port is set for general input/output mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as a general input/output pin. In general input/output mode, either mode can be selected using the corresponding bit in the general input/output switching register. When a port is set for general output mode, the port outputs the value set in the corresponding bit in the general output register or output data high/output data low register with appropriate configuring in output data select register. Here, the polarity of the actual output signal is determined by the setting of the corresponding bit in the positive/negative logic select register. When a port is set for general input mode, the polarity of the input signal is also determined by the setting of the corresponding bit in the positive/negative logic select register. The general input register indicates the value accordingly. Note that the general input register does not hold the input signal using the FF.

(3) Interrupt Input Mode

When a port is set for interrupt input mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as an interrupt input pin. In interrupt input mode, when the port receives an external interrupt, the corresponding bit in the interrupt display register indicates the input of an interrupt signal on the corresponding port pin, and an interrupt signal is output to the interrupt control block. In this mode, the polarity and detection conditions (edge or level) of the external input signal can be set for each port. The corresponding bits in the positive/negative logic select register and edge/level select register, one edge/both edge select register should be used to set the polarity and detection conditions, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in the interrupt display register holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block. To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in the interrupt display register currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in the interrupt display register does not use the FF to hold the input.

Interrupts indicated by the interrupt display register can be separately masked using the corresponding bits in the interrupt mask register. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register depending on the interrupt mask register is used.

7.3.6 Handling of Input Signals on Port Pins

(1) Chattering

In general input mode and interrupt input modes, a filtering function can be used for the port pins 0 to 7 of each GPIO group to prevent external chattering input. Specifically, when a bit in the chattering prevention on / off register is set to use the function, the external input to the corresponding port pin is sampled four consecutive times based on the filter clock signal, which is internally generated by the GPIO. The external input is canceled except when the active input is detected four consecutive times. Therefore, when a filtering function is used, input to the port pins 0 to 7 of each GPIO group need to be at least four sampling clock cycles long (The sampling clock is generated from peripheral clock/k, where k is determined by FILCLKSELn).

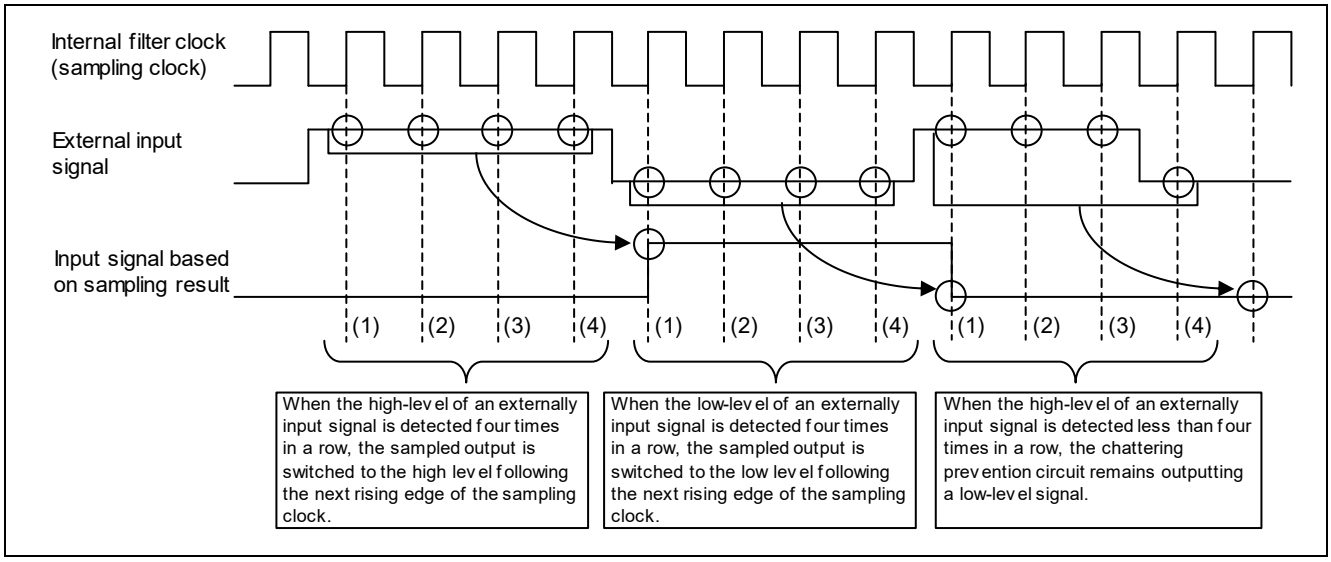

Figure 7.8 Sampling Timing Chart

(2) Input Signal Synchronization

Ingeneral input mode and interrupt input mode, external input signals on all port pins are synchronized with the GPIO clock (CPϕ).

7.3.7 Interrupt Display Timing Charts

Figure 7.9 shows the interrupt display timing and Figure 7.10 shows the note on the timing. In both figures, the positive logic and edge-sensitive input are assumed.

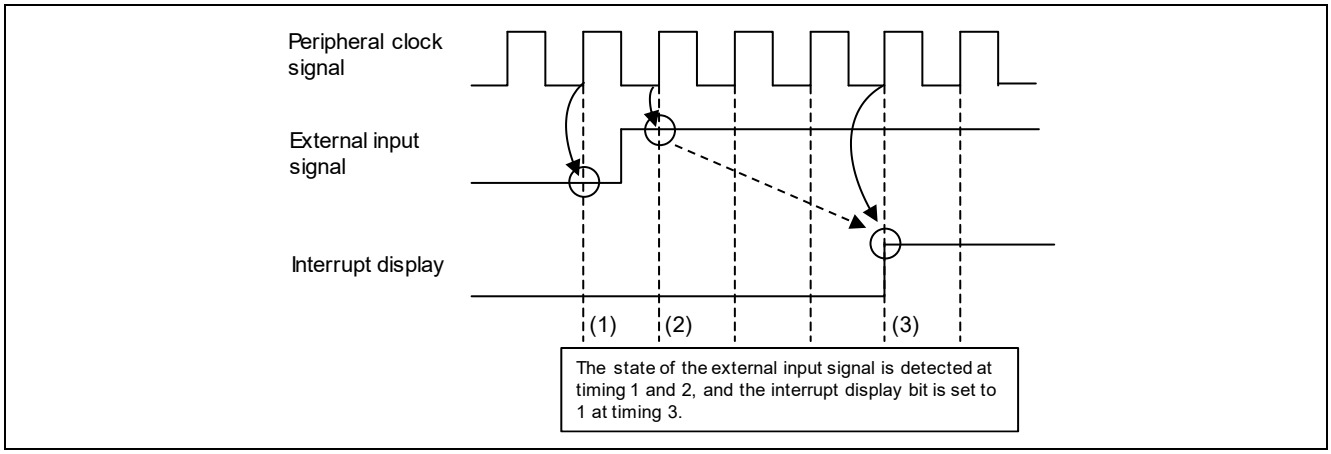

Figure 7.9 Interrupt Display Timing

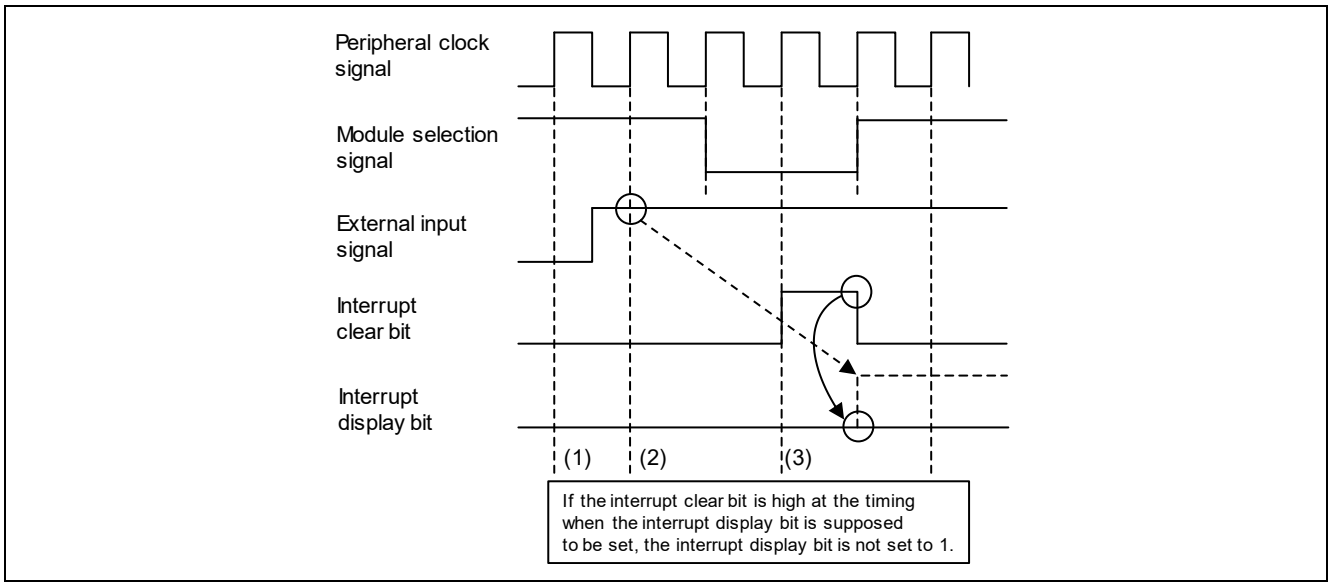

Figure 7.10 Note on Interrupt Display Timing

7.3.8 Using GPIO

The following sections describe how to use the GPIO. If the GPIO is not used according to the procedures shown here, operations are not guaranteed.

(1) Setting Bus Domain Protection

For setting Bus Domain Protection, refer to the procedure shown in Figure 7.11.

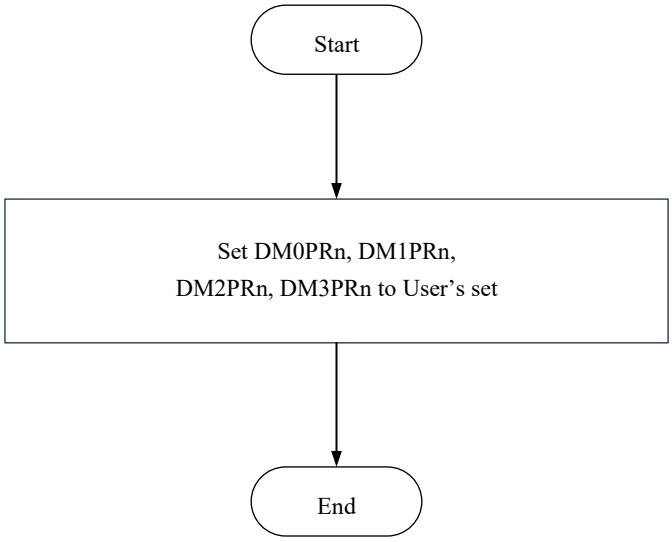

Figure 7.11 Setting flow of Bus Domain Protection

(2) Setting Port Safe State

For setting Port Safe State, refer to the procedure shown in Figure 7.12.

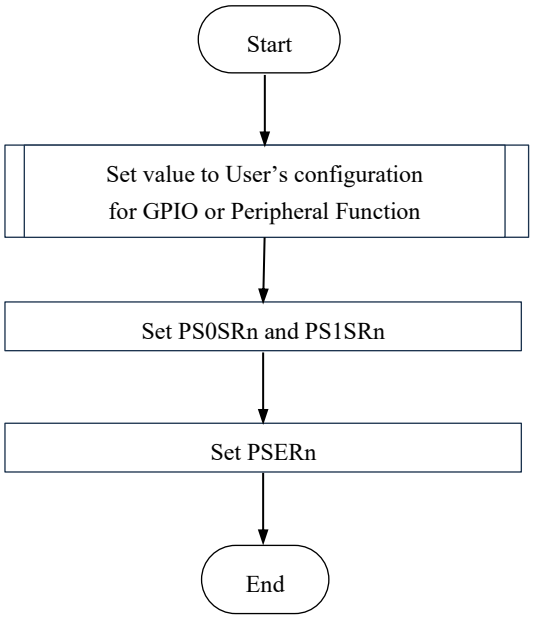

Figure 7.12 Setting flow of Port Safe State

(3) Setting Edge-Sensitive Interrupt Input Mode

For setting edge-sensitive interrupt input mode, refer to the procedure shown in Figure 7.13.

Note that an unexpected interrupt might be generated in the module if setting (1), (2), (3) or (4) in the flowchart is changed. When changing the setting, (5) and (6) should be done.

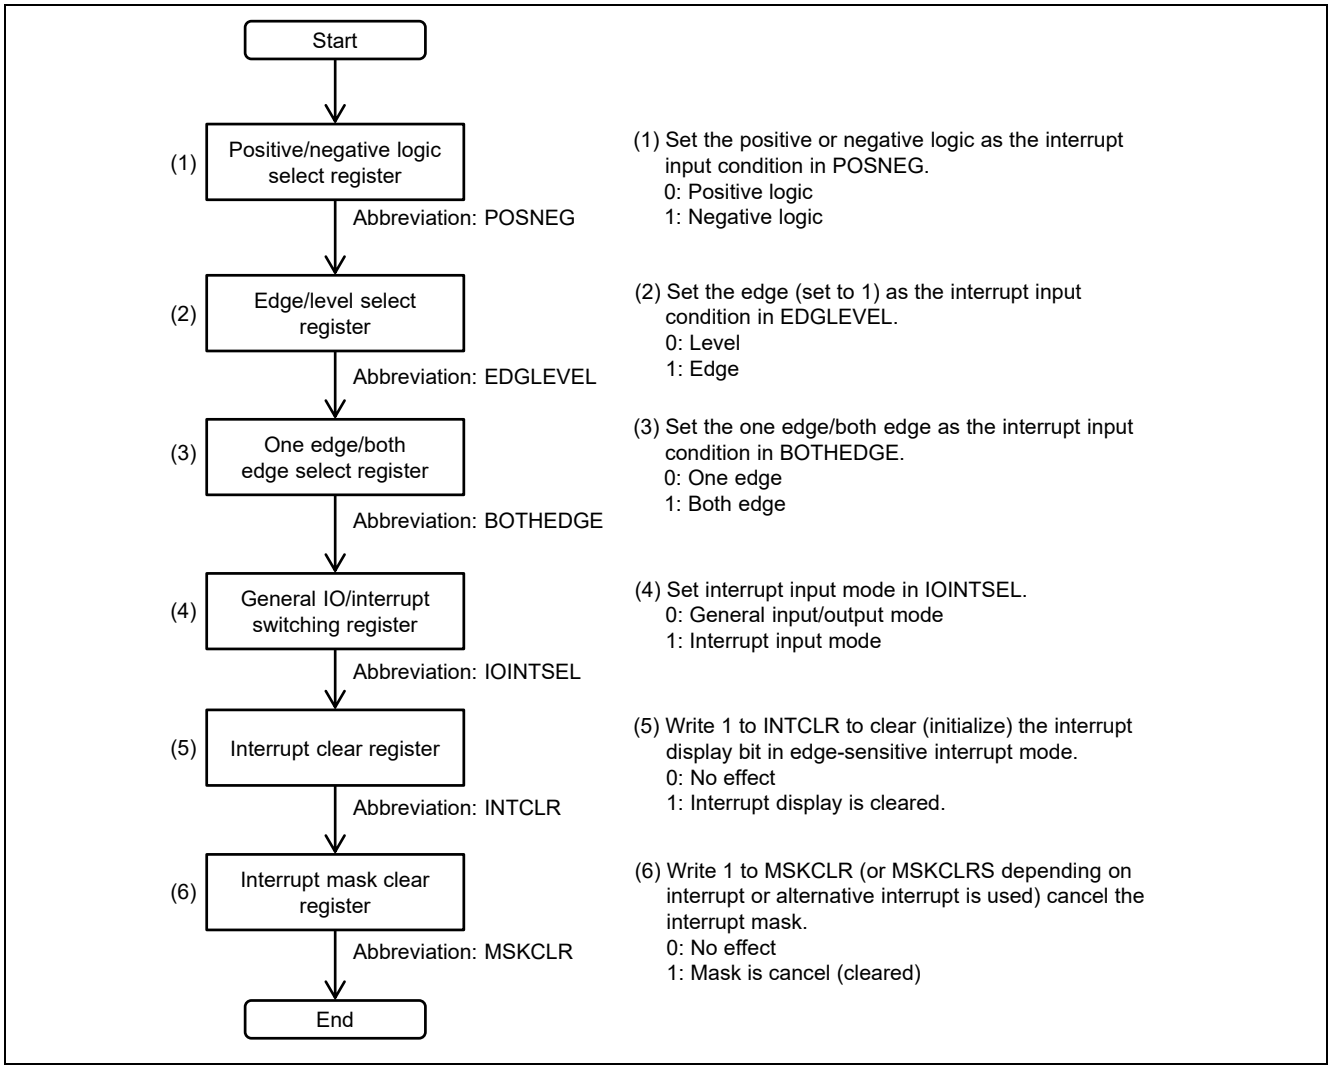

Figure 7.13 Flowchart of Setting the GPIO to Edge-Sensitive Interrupt Input Mode

(4) Setting Level-Sensitive Interrupt Input Mode

For setting level-sensitive interrupt input mode, refer to the procedure shown in Figure 7.14.

Note that when an external level-sensitive interrupt input signal is stopped, the corresponding interrupt is canceled automatically. Inlevel-sensitive interrupt input mode, the interrupt clear register is invalid.

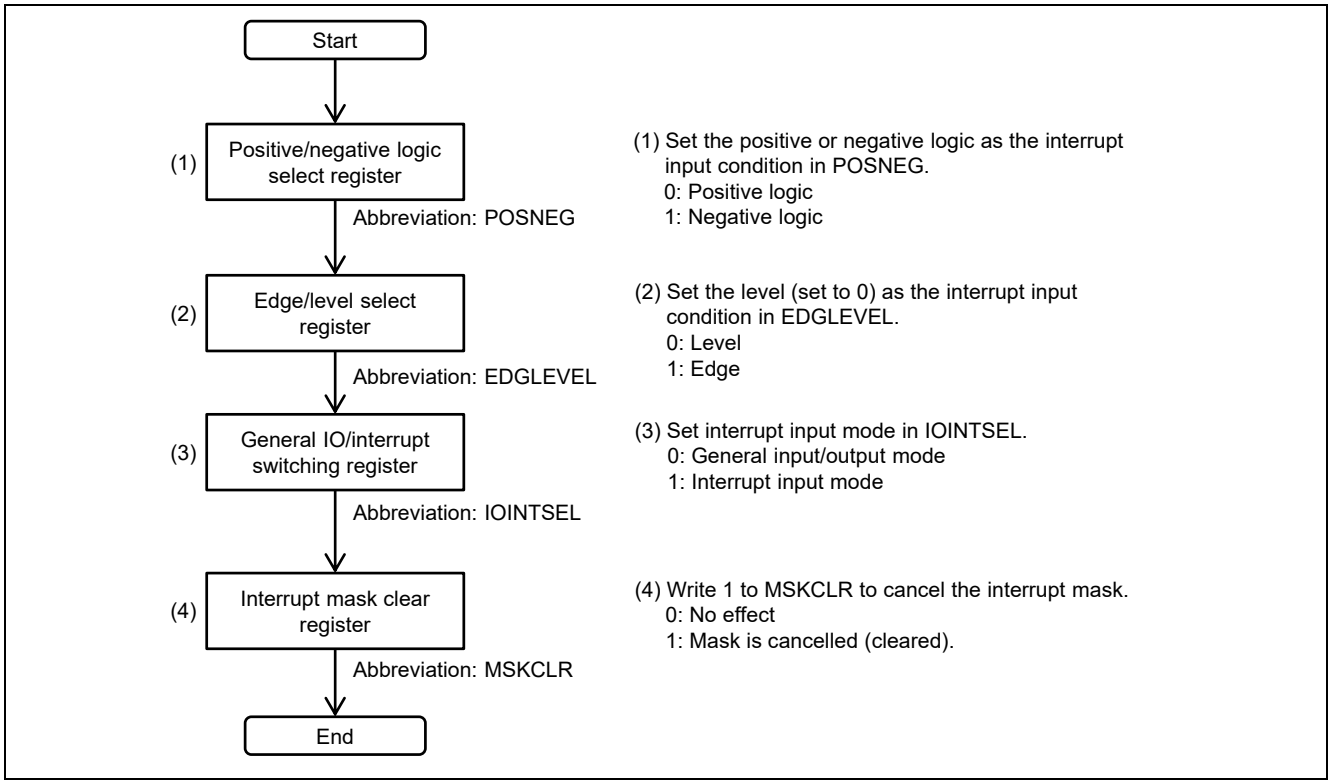

Figure 7.14 Flowchart of Setting the GPIO to Level-Sensitive Interrupt Input Mode

(5) Setting General Output Mode

For setting general output mode, refer to the procedure shown in **Figure 7.15**.

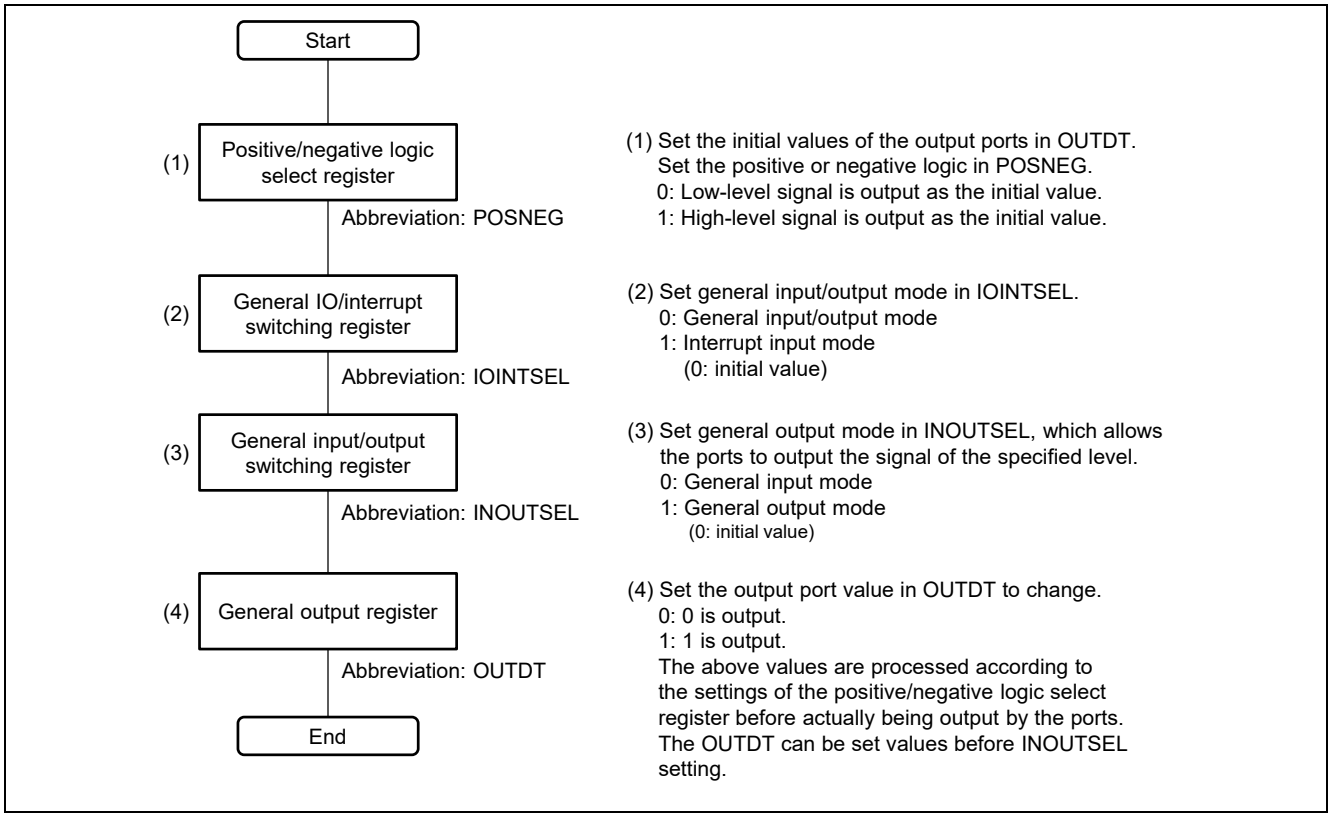

Figure 7.15 Flowchart of Setting the GPIO to General Output Mode

(6) Setting Output data high / Output data low Mode

For setting output data high / output data low mode, refer to the procedure shown in Figure 7.16.

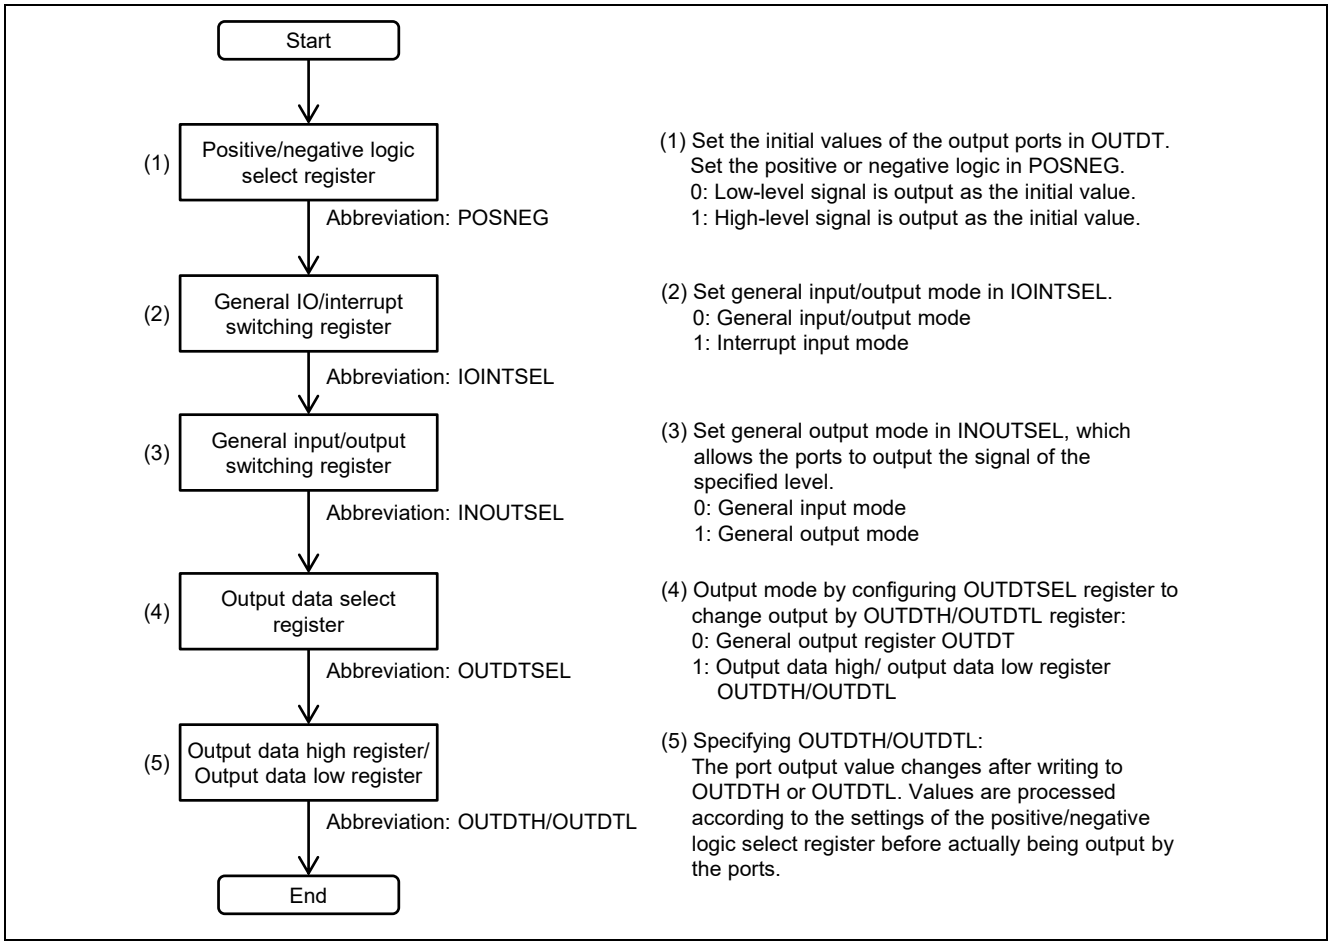

Figure 7.16 Flowchart of Setting the GPIO to Output data high / Output data low Mode

(7) Setting General Input Mode

For setting general input mode, refer to the procedure shown in Figure 7.17.

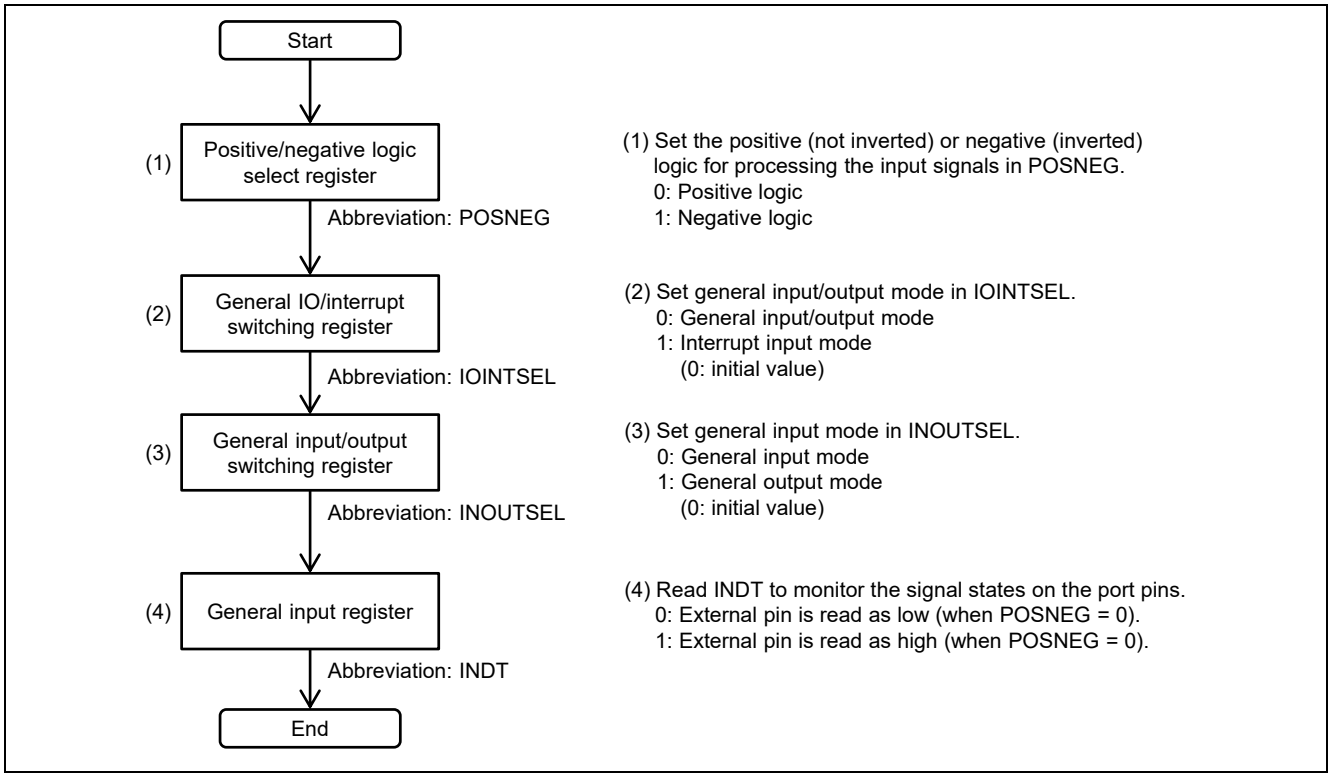

Figure 7.17 Flowchart of Setting the GPIO to General Input Mode

7.3.9 Port Safe State Function

To keep safe operating state (Port Safe State) in case of failure, and then stop it, Port Safe State operate to receive fault information from ECM and make Pin for each domain.

Output trouble information signal for each domain from ECM. This is received by the PFC, and it is controlled for each Pin so that it becomes Port Safe State.

Registers (PSSR 0, 1) that select 4 types of Port Safe State with 2 bits. Provide a register (PSER) to enable / disable this register.

Table 7.51 Port Safe State function

INPUT			OUTPUT
PSERn	PS1SRn		
bit[m*+16]	bit[m*×2+1]	bit[m*×2]	Port Safe State
0	*	*	Port Safe State is disable
1	0	0	Initial state = ON
1	0	1	HiZ = ON
1	1	0	Pull Down = ON
1	1	1	Pull Up = ON

Note: * m = 0 to 15

INPUT			OUTPUT
PSERn	PS0SRn		
bit[m*]	bit[m*×2+1]	bit[m*×2]	Port Safe State
0	*	*	Port Safe State is disable
1	0	0	Initial state = ON
1	0	1	HiZ = ON
1	1	0	Pull Down = ON
1	1	1	Pull Up = ON

Note: * m = 0 to 15

7.3.10 Switching signal level voltage

This is setting flow of POCn register to switch voltage 3.3/2.5V to 1.8V.
Initial setting value of POCn is available in “7.2.7 POWER Condition Control Register”.

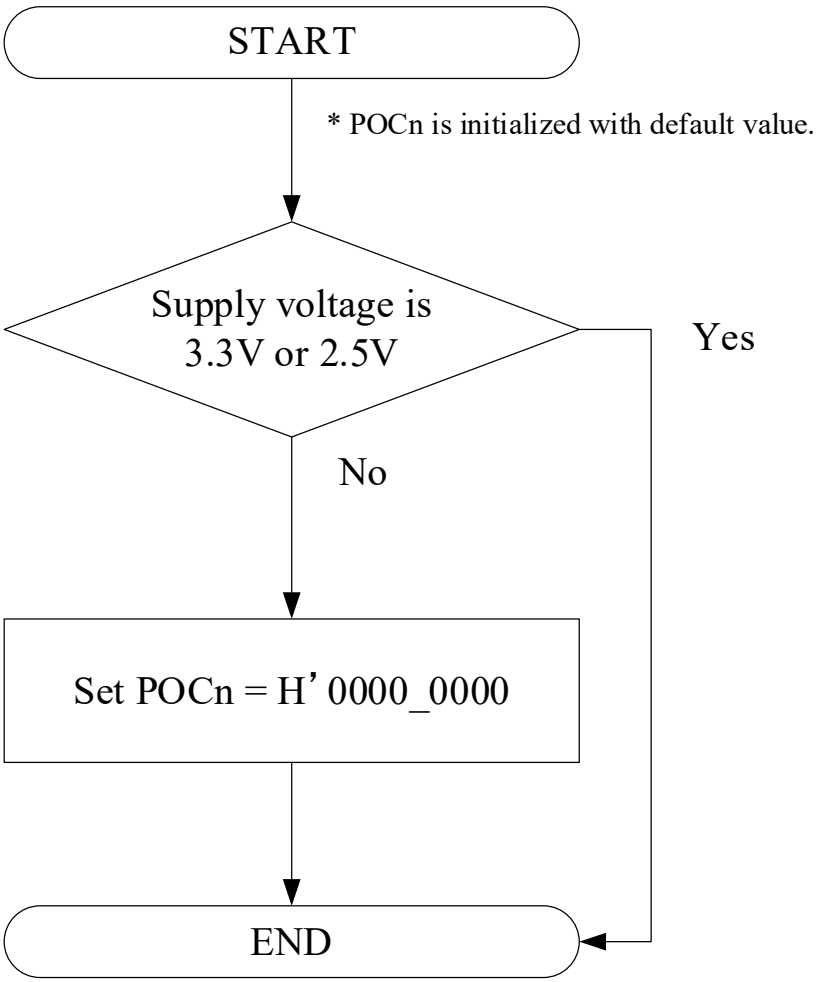

Figure 7.18 Voltage switching flow

7.4 Usage Notes

7.4.1 Notes for asserted PRESET#

When PRESET# is asserted, a small glitch may occur at the pin configured to the peripheral output function.
Please be aware of this behavior if the connected device expects to continue the stable state at the PRESET# asserted timing.
If the timing of the PRESET# can be determined in advance, please set the pin to GPIO mode upfront of the PRESET# to avoid the situation.

7.4.2 Notes for PS0SRn/PS1SRn/PSERn

The registers “PS0SRn/PS1SRn/PSERn” are only supporting condition stating when ECM find any error cause on supporting pins. These are not supporting countermeasure of any gridges on pins.

8. Clock Pulse Generator (CPG)

8.1 Overview

This LSI has a clock pulse generator (CPG). The CPG consists of oscillators, PLL circuit n (n = 1,2,3,4,5,6,7), clock dividers, and control circuit. The CPG generates various clocks used by this LSI.

8.1.1 Features

(1) Clock Generate

CPG generates various clocks for LSI internal operation. As shown in Figure 8.1.2, PLL circuit n (n = 1,2,3,4,5,6,7) and oscillators generate the clocks. Some PLLs support not only integer multiplication mode also SSCG (Down spread or Center spread), fractional multiplication mode, which is a technique to reduce EMI (Electromagnetic Interference). The detail specification is shown in 8.1.5.

Table 8.1.1 PLL circuit n (n = 1,2,3,4,5,6,7) configuration

PLL circuit n	SSCG (Spread Spectrum Clock Generator) (*1)	Fractional Multiplication (*2)
PLL2, PLL6	Support (Down spread)	Support
PLL4	Support (Down spread)	Support
PLL1	Support (Down spread, Center spread)	Support
PLL3	Not support	Support
PLL5, PLL7	Not support	Not support

Notes (1)

SSCG = Spread Spectrum Clock Generator.
It modulates the output clock frequency over a small range, spreading the energy and reducing the energy peak.
Down spread: Down spread spectrum clocking modulates below the nominal clock frequency.
Center spread: Center spread spectrum clocking modulates evenly above and below the nominal clock frequency.

Notes (2)

The fractional multiplication divider divides the frequency of the input signal by a tunable fractional value.

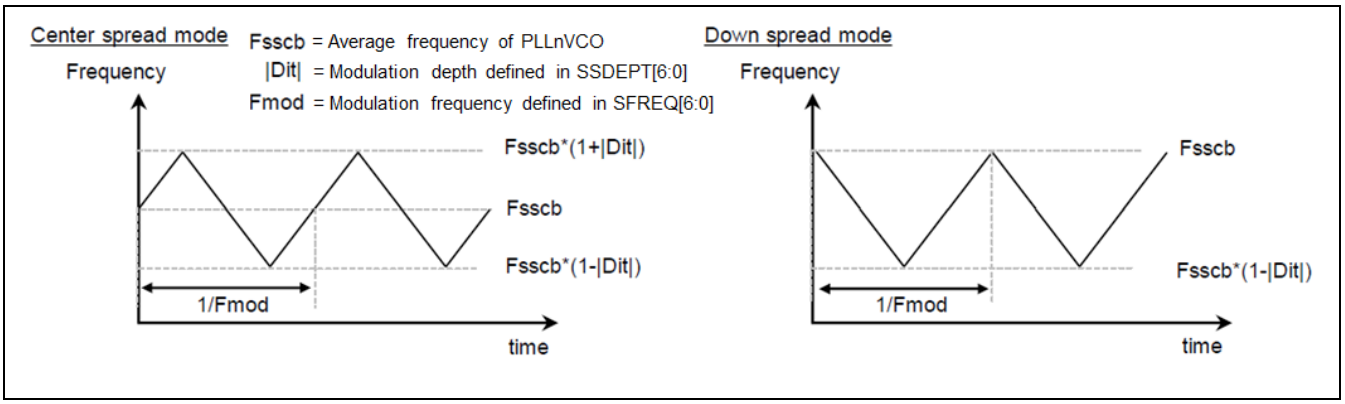

Figure 8.1.1 Image diagram of SSCG (Down spread and Center spread)

(2) Clock Control

CPG controls the clock supply and frequency according to the module status (power supply status, etc.). There are clock dividers as shown in Figure 8.1.2.

(3) Clock Monitor [Functional Safety]

To achieve ASIL-D requirement, Clock Monitor is located both on CPG internal and some domains (Slave Access Bus domain, Main Memory domain, RT (Real Time) domain, Peripheral domain, HSC (High Speed Communication) domain). The detail specification is shown in 8.5.2.

(4) Bus Access Protection [Functional Safety]

Register access protection is applied for registers shown in 8.2. In addition, the function is a safety mechanism to guarantee “Freedom From Interference (FFI)”. The detail specification is described in 8.5.3.

8.1.2 Block Diagram

The block diagram is shown in Figure 8.1.2. See 8.1.4 for the frequency and target modules of each clock.

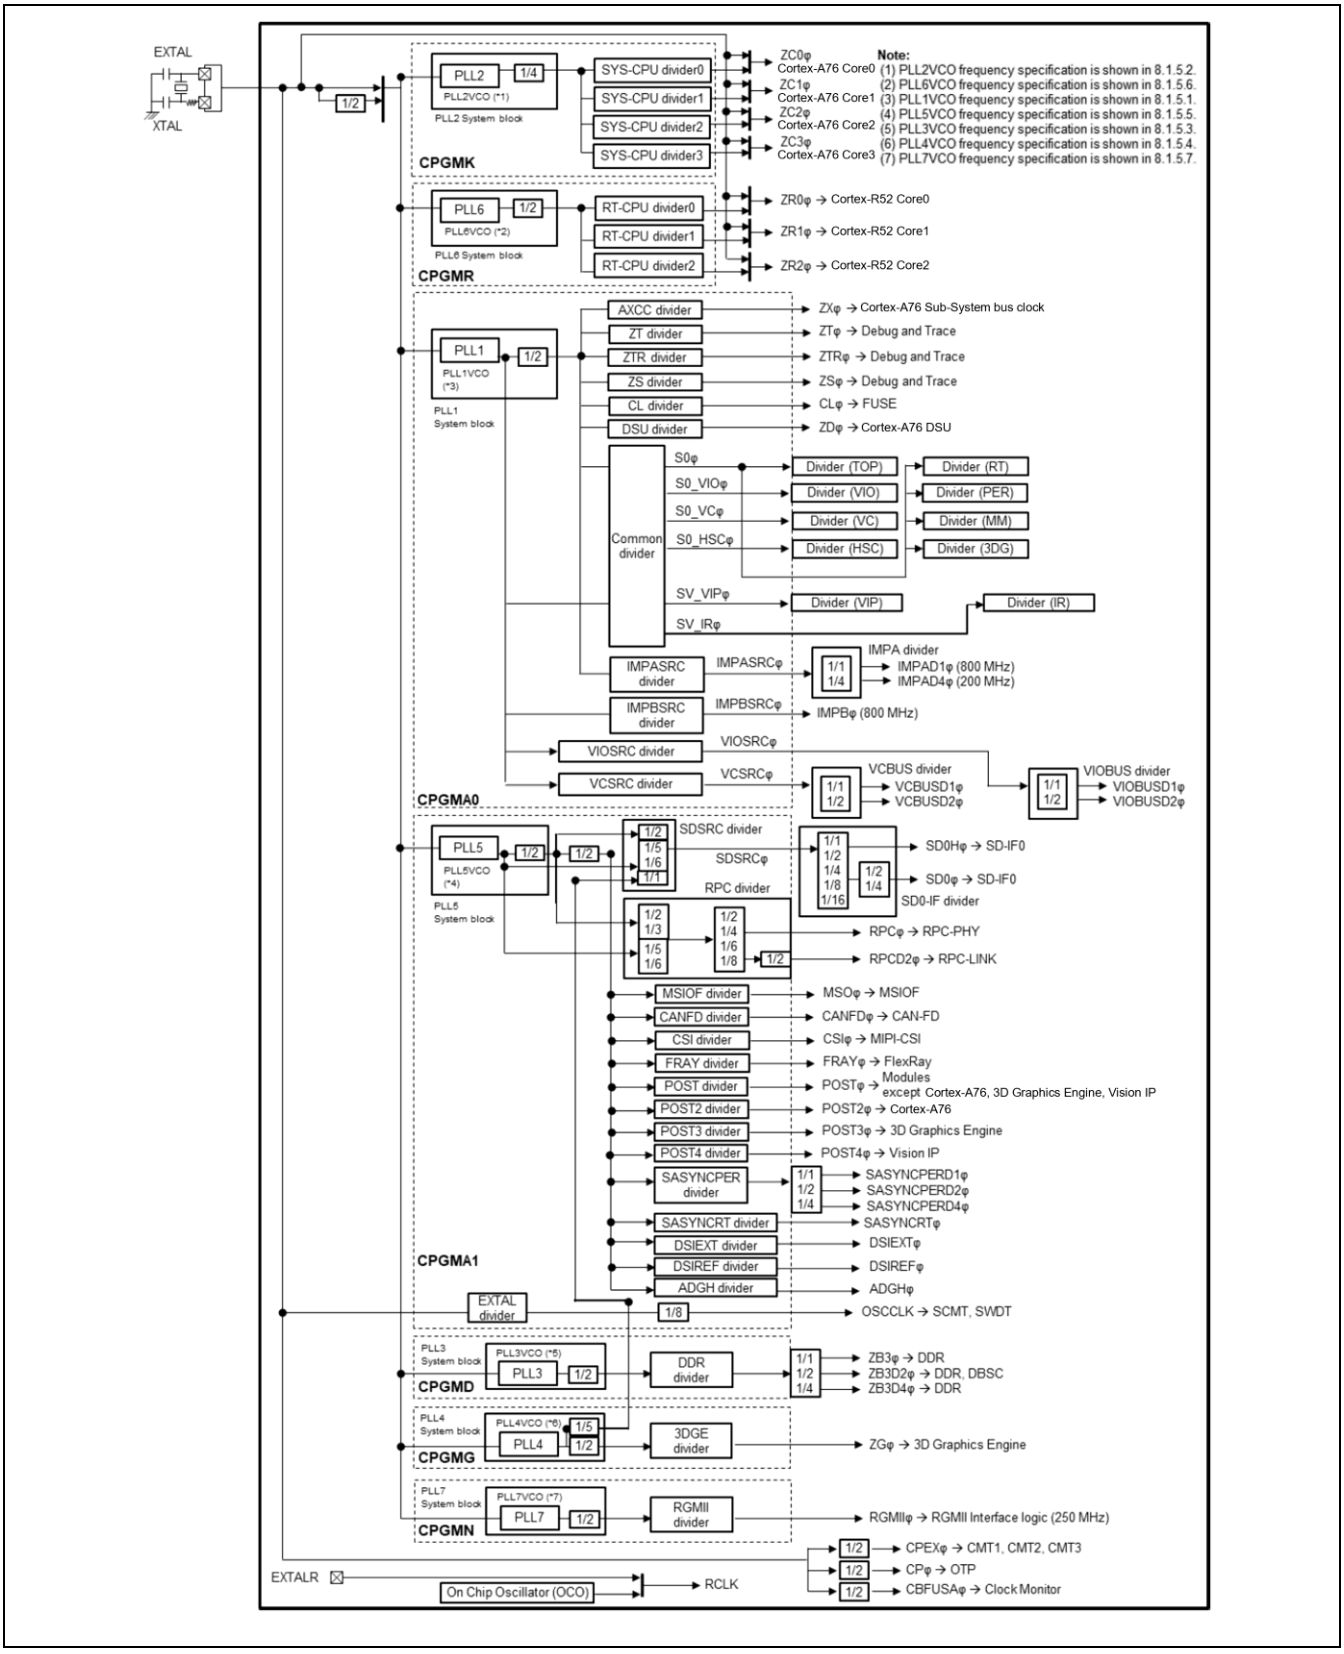

Figure 8.1.2 Block Diagram of CPG

(1) PLL circuit 1 (PLL1)

- PLL1 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.1).
- SSCG (Center spread, Down spread) and Fractional Multiplication function are supported.

(2) PLL circuit 2 (PLL2)

- PLL2 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.2).
- The multiplication ratio is set by the PLL2CR0, PLL2CR1 software register.
- SSCG (Down spread) and Fractional Multiplication function are supported.

(3) PLL circuit 3 (PLL3)

- PLL3 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.3).
- The multiplication ratio is set by the PLL3CR0 software register.
- SSCG function is not supported. It is allowed to select a Fractional Multiplication mode.

(4) PLL circuit 4 (PLL4)

- PLL4 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.4).
- The multiplication ratio is set by the PLL4CR0, PLL4CR1 software register.
- SSCG (Center spread) and Fractional Multiplication function are supported.

(5) PLL circuit 5 (PLL5)

- PLL5 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.5).
- Both of SSCG and Fractional Multiplication function are not supported.

(6) PLL circuit 6 (PLL6)

- PLL6 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.6).
- The multiplication ratio is set by the PLL6CR0, PLL6CR1 software register.
- SSCG (Down spread) and Fractional Multiplication function are supported.

(7) PLL circuit 7 (PLL7)

- PLL7 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio (See 8.1.5.7).
- Both of SSCG and Fractional Multiplication function are not supported.

(8) SYS-CPU divider0

- The SYS-CPU0 divider divides PLL2 output clock.
- This divider generates the core clock (ZC0φ) for Cortex-A76 Core0.
- The division ratio and stop control is set by the FRQCRC0 software register.

(9) SYS-CPU divider1

- The SYS-CPU divider divides PLL2 output clock.
- This divider generates the core clock (ZC1φ) for Cortex-A76 Core1.
- The division ratio and stop control is set by the FRQCRC0 software register.

(10) SYS-CPU divider2

- The SYS-CPU divider divides PLL2 output clock.
- This divider generates the core clock (ZC2φ) for Cortex-A76 Core2.
- The division ratio and stop control is set by the FRQCRC1 software register.

(11) SYS-CPU divider3

- The SYS-CPU divider divides PLL2 output clock.
- This divider generates the core clock (ZC3φ) for Cortex-A76 Core3.
- The division ratio and stop control is set by the FRQCRC1 software register.

(12) RT-CPU divider 0

- The RT-CPU divider divides PLL6 output clock.
- This divider generates the Cortex-R52 Core0 clock (ZR0φ).
- The division ratio is set by the FRQCRC0 software register.

(13) RT-CPU divider 1

- The RT-CPU divider divides PLL6 output clock.
- This divider generates the Cortex-R52 Core1clock (ZR1φ).
- The division ratio and stop control is set by the FRQCRC0 software register.

(14) RT-CPU divider 2

- The RT-CPU divider divides PLL6 output clock.
- This divider generates the Cortex-R52 Core2 clock (ZR2φ).
- The division ratio and stop control is set by the FRQCRC1 software register.

(15) AXCC divider

- The AXCC divider divides PLL1 output clock.
- The divider generates AXCC clock (ZXφ).
- The division ratio is fixed as shown in Table 8.1.4a. The stop control is set by CPGMA0CKSTPCR software register.

(16) DSU divider

- The DSU divider divides PLL1 output clock.
- The divider generates DSU clock (ZDφ).
- The division ratio is fixed as shown in Table 8.1.4a. The stop control is set by FRQCRB software register.

(17) ZT / ZTR / ZS divider

- The ZT / ZTR / ZS divider divides PLL1 output clock.
- The divider generates debug function clocks (ZTφ, ZTRφ, and ZSφ).
- The division ratio for ZTφ, ZTRφ, and ZSφ is set by the FRQCRB software register.

(18) CL divider

- The CL divider divides PLL1 output clock. The divider generates FUSE clock (CLφ). The division ratio is fixed as shown in Table 8.1.4a.

(19) Common divider

- The Common divider divides PLL1 output clock.
- The divider generates various system clocks (The frequency and the target modules are shown in Table 8.1.4a).

・ Divider (TOP) generates S0D2φ, S0D3φ, and S0D4φ by dividing S0φ.
・ Divider (VIO) generates S0D1_VIOφ, S0D2_VIOφ, S0D4_VIOφ, and S0D8_VIOφ by dividing S0_VIOφ.
・ Divider (VC) generates S0D1_VCφ, S0D2_VCφ, and S0D4_VCφ by dividing S0_VCφ.
・ Divider (HSC) generates S0D1_HSCφ, S0D2_HSCφ, S0D4_HSCφ, and S0D8_HSCφ by dividing S0_HSCφ.
・ Divider (RT) generates S0D2_RTφ, S0D3_RTφ, S0D4_RTφ, S0D6_RTφ and S0D24_RTφ by dividing S0φ.
・ Divider (PER) generates S0D2_PERφ, S0D3_PERφ, S0D4_PERφ, S0D6_PERφ, S0D12_PERφ and S0D24_PERφ by dividing S0φ.
・ Divider (MM) generates S0D2_MMφ and S0D4_MMφ by dividing S0φ.
・ Divider (3DG) generates S0D2_U3DGφ and S0D4_U3DGφ by dividing S0φ.
・ Divider (VIP) generates SVD1_VIPφ and SVD2_VIPφ by dividing SV_VIPφ.
・ Divider (IR) generates SVD1_IRφ and SVD2_IRφ by dividing SV_IRφ.

(20) IMPASRC / IMPA divider

- The IMPA divider divides IMPASRCφ and generates the IMPAD1φ clock for IMPAD4φ divider.
- The division ratio is fixed as shown in Table 8.1.4a.

(21) IMPBSRC divider

- The IMPBSRC divider divides PLL1 output clock and generates the IMPBφ clock for IMPBφ divider.
- The division ratio is fixed as shown in Table 8.1.4a.

(22) VIOSRC / VIOBUS divider

- The VIOBUS divider divides VIOSRCφ and generates the VIOBUSD1φ, VIOBUSD2φ clock.
- The division ratio is fixed as shown in Table 8.1.4a.

(23) VCBUS divider

- The VCBUS divider divides VCSRCφ and generates the VCBUSD1φ, VCBUSD2φ clock.
- The division ratio is fixed as shown in Table 8.1.4a.

(24) SDSRC divider

- The SDSRC divider divides PLL5 output clock and generates the SDSRCφ clock for SD0-IF divider.
- The division ratio is set by the SD0CKCR and CKSRCSELCR register (See 8.2.24, 8.2.34).

(25) SD0-IF divider

- The SD0-IF divider divides SDSRCφ and generates the SD0Hφ / SD0φ clocks for SDHI.
- The division ratio is set by the SD0CKCR and CKSRCSELCR register (See 8.2.24, 8.2.34).

(26) RPC divider

- The RPC divider divides PLL5 output clock, and generates the RPCφ, RPCD2φ clocks for RPC-IF.
- The division ratio is set by the RPCCKCR register (See 8.2.25).

(27) MSIOF divider

- The MSO divider divides PLL5 output clock and generates the MSOφ clock for MSIOF module.
- The division ratio is set by the MSOCKCR register (See 8.2.27).

(28) CANFD divider

- The CANFD divider divides PLL5 output clock and generates the CANFDφ clock for CAN-FD module.
- The division ratio is set by the CANFDCKCR register (See 8.2.26).

(29) CSI divider

- The CSI divider divides PLL5 output clock and generates the CSIφ clock for MIPI-CSI2 module.
- The division ratio is set by the CSICKCR register (See 8.2.28).

(30) FRAY divider

- The FRAY divider divides PLL5 output clock and generates the FRAYφ clock for FlexRay module.
- The division ratio is fixed as shown in Table 8.1.4e.

(31) POST divider

- The POST divider divides PLL5 output clock and generates the POSTφ clock during Power on Self Test (POST) executing for modules except Cortex-A76, 3D Graphics Engine, Vision IP.
- The division ratio is set by the POSTCKCR register (See 8.2.30).

(32) POST2 divider

- The POST2 divider divides PLL5 output clock and generates the POST2φ clock during Power on Self Test (POST) executing for Cortex-A76.
- The division ratio is set by the POST2CKCR register (See 8.2.31).

(33) POST3 divider

- The POST3 divider divides PLL5 output clock and generates the POST3φ clock during Power on Self Test (POST) executing for 3D Graphics Engine.
- The division ratio is set by the POST3CKCR register (See 8.2.32).

(34) POST4 divider

- The POST4 divider divides PLL5 output clock and generates the POST4φ clock during Power on Self Test (POST) executing for Vision IP.
- The division ratio is set by the POST4CKCR register (See 8.2.33).

(35) SASYNCPER divider

- The SASYNCPER divider divides PLL5 output clock and generates the SASYNCPERDnφ (n = 1,2,4), clocks for modules which cannot allow the clock (S0Dn_PER (n = 2,3,4,6,12,24)) with SSCG and Fractional Multiplication.
- The division ratio is fixed as shown in Table 8.1.4e.

(36) SASYNCRT divider

- The SASYNCRT divider divides PLL5 output clock and generates the SASYNCRTφ, clocks for modules which cannot allow the clock (S0Dn_RT (n = 2,3,4,6,24)) with SSCG and Fractional Multiplication.
- The division ratio is fixed as shown in Table 8.1.4e.

(37) DSIEXT divider

- The DSIEXT divider divides PLL5 output clock and generates the DSIEXTφ clock.
- The division ratio is set by the DSIEXTCKCR register (See 8.2.29).

(38) DSIREF divider

- The DSIREF divider divides PLL5 output clock and generates the DSIREFφ clock.
- The division ratio is fixed as shown in Table 8.1.4e.

(39) ADGH divider

- The ADGH divider divides PLL5 output clock and generates the ADGHφ clock.
- The division ratio is fixed as shown in Table 8.1.4e.

(40) EXTAL divider

- The EXTAL divider divides EXTAL (EXTAL or EXTAL/2) and generates the OSCCLK. The divider specification is shown in Table 8.1.4e (Note 5).

(41) DDR divider

- The DDR clock divider divides PLL3 output clock and generates DDR and DBSC clock (ZB3φ, ZB3D2φ, ZB3D4φ).
- The division ratio for ZB3φ, ZB3D2φ, ZB3D4φ is set by the FRQCRD register (See 8.2.11).

(42) 3DGE divider

- The 3DGE clock divider divides PLL4 output clock and generates ZGφ.
- The division ratio and the stop control are set by the FRQCRB register (See 8.2.8).

(43) On Chip Oscillator

- By controlling MD29, the clock generated from On Chip Oscillator (OCO) is output as RCLK. See the Table 8.1.5.8 about MD29 setting.

8.1.3 External Pins

Table 8.1.3 lists the CPG pin configuration.

Table 8.1.3 Pin Configuration and Functions of CPG

Name	I/O	Function
EXTALR	Input	Clock input pin. Used as an external clock input pin and as clock source of RCLK.
XTAL	Input	Clock input pin. Outputs amplified negative feedback of EXTAL.
EXTAL	Input	Clock input pin. Used as an external clock input pin.
MD0	Input	Mode 0. Step-up mode
MD1	Input	Mode 1. Boot Device select (*1)
MD2	Input	Mode 2. Boot Device select (*1)
MD3	Input	Mode 3. Boot Device select (*1)
MD4	Input	Mode 4. Boot Device select (*1)
MD10	Input	Mode 10. Debug Mode select (*2)
MD11	Input	Mode 11. Debug Mode select (*2)
MD13	Input	Mode 13. PLL multiplication ratio setting
MD14	Input	Mode 14. PLL multiplication ratio setting
MD17	Input	Mode 17. DDR clock frequency setting
MD18	Input	Mode 18. SSCG enable / disable for PLL1

MD21	Input	Mode 21. Debug Mode select (*2)
MD23	Input	Mode 23. POST target select (*3)
MD25	Input	Mode 25. Field BIST enable / disable control
MD29	Input	Mode 29. RCLK reference clock select
MD36	Input	Mode 36. SSCG enable / disable for PLL1
MD37	Input	Mode 37. SSCG enable / disable for PLL1
MDT0	Input	MDT0. Debug Mode select (*2)

Notes:
1) It is used by not only CPG also Boot function. See Table 31.1 Mode Pin Configuration (1).
2) It is used by not only CPG also Debug and Trace. See 170 Debug and Trace (Table JTAG selection table).
3) See Table 171.2.

8.1.4 List of Clock Outputs

Table 8.1.4a Lists of CPG clocks generated from PLL1

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum (*3)	Initial	
ZXφ	AXCC divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Cortex-A76 Sub-System
ZDφ	DSU divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Cortex-A76 Sub-System
ZSφ	ZS divider	Variable See 8.2.7	266.66 MHz	266.66 MHz (*1)	Debug and Trace
ZTφ	ZTR divider	Variable See 8.2.7	533.33 MHz	533.33 MHz (*1)	Debug and Trace
ZTRφ	ZS divider	Variable See 8.2.7	533.33 MHz	533.33 MHz (*1)	Debug and Trace
S0φ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Source of any dividers for system clock shown in Figure 8.1.1.
S0D2φ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	Slave Access Bus (*2).
S0D3φ	Common divider	Fixed PLL1VCO(*4) / 12	266.66 MHz	266.66 MHz	Slave Access Bus (*2).
S0D4φ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	Slave Access Bus (*2).
S0_VIOφ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Source of any dividers for system clock shown in Figure 8.1.1
S0D1_VIOφ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	VIO (Video IO) domain bus (*2), VSPX, FCPVX, ISP
S0D2_VIOφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	VIO (Video IO) domain bus (*2), IPMMU, FCPVX, DSI, CSI-2, ISP
S0D4_VIOφ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	VIO (Video IO) domain bus (*2), IPMMU, FCPVX, VIN, DSI, VSPX
S0D8_VIOφ	Common divider	Fixed PLL1VCO(*4) / 32	100.00 MHz	100.00 MHz	VIO (Video IO) domain bus (*2), DSI, CSI-2
VIOSRCφ	VIOBUS divider	Fixed PLL1VCO(*4) / 6	533.33 MHz	533.33 MHz	Source of VIOBUSD1 and VIOBUSD2 shown in Figure 8.1.1
VIOBUSD1φ	VIOBUS divider	Fixed PLL1VCO(*4) / 6	533.33 MHz	533.33 MHz	DU, DOC, VSPD, FCPVD, MIPI-DSI
VIOBUSD2φ	VIOBUS divider	Fixed PLL1VCO(*4) / 12	266.66 MHz	266.66 MHz	VIO (Video IO) domain bus (*2), DU, DOC, VSPD, FCPVD, MIPI-DSI
S0_VCφ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Source of any dividers for system clock shown in Figure 8.1.1
S0D1_VCφ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	There are not any modules which use the clock.
S0D2_VCφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	VC (Video Codec) domain bus (*2), IPMMU
S0D4_VCφ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	VC (Video Codec) domain bus (*2), IPMMU
VCSRCφ	VCBUS divider	Fixed PLL1VCO(*4) / 6	533.33 MHz	533.33 MHz	Source of VCBUSD1 and VCBUSD2 shown in Figure 8.1.1
VCBUSD1φ	VCBUS divider	Fixed PLL1VCO(*4) / 6	533.33 MHz	533.33 MHz	VC (Video Codec) domain bus (*2), iVCP1E, IMR-LX4, IPMMU
VCBUSD2φ	VCBUS divider	Fixed PLL1VCO(*4) / 12	266.66 MHz	266.66 MHz	VC (Video Codec) domain bus (*2), iVCP1E, IMR-LX4, IPMMU
S0D2_MMφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	Main Memory domain bus (*2), IPMMU, DBSC
S0D4_MMφ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	Main Memory domain bus (*2), IPMMU
S0D2_U3DGφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	GSX (Graphics) domain bus (*2), IPMMU, 3D Graphics Engine
S0D4_U3DGφ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	GSX (Graphics) domain bus (*2), IPMMU
S0D2_RTφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	RT (Real Time) domain bus (*2), Cortex-R52, CoreSight, RTDMAC, IPMMU, RT-VRAM, Life Cycle, CRC, ICUMX, WCRC3, WRC2, WRC1, WRC0
S0D3_RTφ	Common divider	Fixed PLL1VCO(*4) / 12	266.66 MHz	266.66 MHz	RT (Real Time) domain bus (*2), INTC
S0D4_RTφ	Common divider	Fixed PLL1VCO(*4) / 16	200 MHz	200 MHz	RT (Real Time) domain bus (*2), Cortex-R52, CoreSight, RTDMAC, IPMMU, RT-VRAM, Life Cycle, CRC, ICUMX, WCRC3, WRC2, WRC1, WRC0, ECM
S0D6_RTφ	Common divider	Fixed PLL1VCO(*4) / 24	133.33 MHz	133.33 MHz	RT (Real Time) domain bus (*2), INTC, TMU
S0D24_RTφ	Common divider	Fixed PLL1VCO(*4) / 96	33.33 MHz	33.33 MHz	There are not any modules which use the clock.

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum (*3)	Initial	
S0D2_PERφ	Common divider	Fixed PLL1VCO(*4) / 8	400.00 MHz	400.00 MHz	Peripheral domain bus (*2)
S0D3_PERφ	Common divider	Fixed PLL1VCO(*4) / 12	266.66 MHz	266.66 MHz	Peripheral domain bus (*2), RPC-IF, SYS-DMAC, IPMMU, SDHI
S0D4_PERφ	Common divider	Fixed PLL1VCO(*4) / 16	200.00 MHz	200.00 MHz	ADG, SYS-DMAC
S0D6_PERφ	Common divider	Fixed PLL1VCO(*4) / 24	133.33 MHz	133.33 MHz	Peripheral domain bus (*2), SYS-DMAC, IPMMU, I2C, ADG, FlexRay
S0D12_PERφ	Common divider	Fixed PLL1VCO(*4) / 48	66.66 MHz	66.66 MHz	Peripheral domain bus (*2), RPC-IF
S0D24_PERφ	Common divider	Fixed PLL1VCO(*4) / 96	33.33 MHz	33.33 MHz	RPC-IF
S0_HSCφ	Common divider	Fixed PLL1VCO(*4) / 4	800.00 MHz	800.00 MHz	Source of any dividers for system clock shown in Figure 8.1.1
S0D1_HSCφ	Common divider	Fixed PLL1VCO(*4) / 4	800 MHz	800 MHz	Ethernet AVB, Ethernet TSN
S0D2_HSCφ	Common divider	Fixed PLL1VCO(*4) / 8	400 MHz	400 MHz	HC (High speed Communication) domain bus (*2), PCI Express, IPMMU
S0D4_HSCφ	Common divider	Fixed PLL1VCO(*4) / 16	200 MHz	200 MHz	HC (High speed Communication) domain bus (*2), Ethernet AVB, Ethernet TSN, PCI Express, IPMMU
S0D8_HSCφ	Common divider	Fixed PLL1VCO(*4) / 32	100 MHz	100 MHz	Ethernet AVB, Ethernet TSN
SV_IRφ	Common divider	Fixed PLL1VCO(*4) / 5	640 MHz	640 MHz	Source of any dividers for system clock shown in Figure 8.1.1
SVD1_IRφ	Common divider	Fixed PLL1VCO(*4) / 5	640 MHz	640 MHz	IMP domain bus (*2), IPMMU, Image Processing (IMP) Unit
SVD2_IRφ	Common divider	Fixed PLL1VCO(*4) / 10	320 MHz	320 MHz	IMP domain bus (*2), IPMMU, Image Processing (IMP) Unit
IMPASRCφ	Common divider	Fixed PLL1VCO(*4) / 4	800 MHz	800 MHz	Source of any dividers for system clock shown in Figure 8.1.1
IMPAD1φ	Common divider	Fixed PLL1VCO(*4) / 4	800 MHz	800 MHz	Image Processing (IMP) Unit.
IMPAD4φ	Common divider	Fixed PLL1VCO(*4) / 16	200 MHz	200 MHz	Image Processing (IMP) Unit.
IMPBSRCφ	Common divider	Fixed PLL1VCO(*4) / 4	800 MHz	800 MHz	Source of any dividers for system clock shown in Figure 8.1.1
IMPBφ	Common divider	Fixed PLL1VCO(*4) / 4	800 MHz	800 MHz	Image Processing (IMP) Unit.
SV_VIPφ	Common divider	Fixed PLL1VCO(*4) / 5	640 MHz	640 MHz	Source of any dividers for system clock shown in Figure 8.1.1
SVD1_VIPφ	Common divider	Fixed PLL1VCO(*4) / 5	640 MHz	640 MHz	VIP (Vision IP Processor) domain bus (*2), IPMMU, Vision IP
SVD2_VIPφ	Common divider	Fixed PLL1VCO(*4) / 10	320 MHz	320 MHz	VIP (Vision IP Processor) domain bus (*2), IPMMU, Vision IP
CLφ	CL divider	Fixed PLL1VCO(*4) / 96	33.33 MHz	33.33 MHz	FUSE.
CL16Mφ	Common divider	Fixed PLL1VCO(*4) / 192	16.66 MHz	16.66 MHz	CMT0, CMT1, CMT2, CMT3, SCMT, INTC-EX, APMU, Slave access bus (*2), PFC, SYSC, AVS, THS, CPG
CL16M_MMφ	Common divider	Fixed PLL1VCO(*4) / 192	16.66 MHz	16.66 MHz	DDR, DBSC
CL16M_RTφ	Common divider	Fixed PLL1VCO(*4) / 192	16.66 MHz	16.66 MHz	Life Cycle, SWDT, TMU, WDT, RCLK Watchdog Timer, Cortex-R52, WWDT
CL16M_PERφ	Common divider	Fixed PLL1VCO(*4) / 192	16.66 MHz	16.66 MHz	HSCIF, SCIF, SYS-DMAC, FlexRay
CL16M_HSCφ	Common divider	Fixed PLL1VCO(*4) / 192	16.66 MHz	16.66 MHz	Ether TSN

Note: 1. These clocks are oscillated in the debug mode. Otherwise, they are stopped.

Note: 2. The bus structure is shown in Figure 18-1 Block diagram of AXI-Bus.

Note: 3. It shows a maximum frequency during PLL1 integer multiplication mode. The maximum frequency is increased by 1.0 % during PLL1 SSCG (Center spread) mode.

Note 4
See Table 8.1.5.1

Table 8.1.4b Lists of CPG clocks generated from PLL2

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum	Initial	
ZC0φ	SYS-CPU divider0	Variable	V4M-7: 1000 MHz V4M-5: 800 MHz V4M-3: 933 MHz V4M-2: 933 MHz	1000 MHz	Cortex-A76 Core0
ZC1φ	SYS-CPU divider1	Variable	V4M-7: 1000 MHz V4M-5: 800 MHz V4M-3: 933 MHz V4M-2: 933 MHz	1000 MHz	Cortex-A76 Core1
ZC2φ	SYS-CPU divider2	Variable	V4M-7: 1000 MHz V4M-5: 800 MHz V4M-3: 933 MHz V4M-2: 933 MHz	1000 MHz	Cortex-A76 Core2
ZC3φ	SYS-CPU divider3	Variable	V4M-7: 1000 MHz V4M-5: 800 MHz V4M-3: Not support V4M-2: Not support	1000 MHz	Cortex-A76 Core3

Note) The "multiplication ratio" must be set so as not to exceed the maximum frequency value of each product. Operation cannot be guaranteed if the maximum frequency is exceeded.

Table 8.1.4c Lists of CPG clocks generated from PLL3

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum *	Initial	
ZB3φ	DDR divider	Variable	V4M-7: LP5: 800MHz LP4: 1066.66MHz V4M-5: LP5: 625MHz LP4: 833.33MHz V4M-3: LP5: 600MHz LP4: 800MHz V4M-2: LP5: 600MHz LP4: 800MHz	1066.66 MHz (*4)	DDR
ZB3D2φ	DDR divider	Variable	V4M-7: LP5: 800MHz LP4: 533.33MHz V4M-5: LP5: 625MHz LP4: 416.66MHz V4M-3: LP5: 600MHz LP4: 400MHz V4M-2: LP5: 600MHz LP4: 400MHz	533.33 MHz (*4)	DDR, DBSC
ZB3D4φ	DDR divider	Variable	V4M-7: LP5: 400MHz LP4: 266.66MHz V4M-5: LP5: 312.5MHz LP4: 208.33MHz V4M-3: LP5: 300MHz LP4: 200MHz V4M-2: LP5: 300MHz LP4: 200MHz	266.66 MHz (*4)	DDR

Note The "multiplication ratio" must be set so as not to exceed the maximum frequency value of each product. Operation cannot be guaranteed if the maximum frequency is exceeded.

4. The initial frequency depends on the setting of MD17 and MD19. See 8.1.5.3.

Table 8.1.4d Lists of CPG clocks generated from PLL4

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum *	Initial	
ZGφ	3DGE divider	Variable	V4M-7: 1000 MHz V4M-5: 750 MHz V4M-3: 500 MHz V4M-2: Not support	600 MHz	3D Graphics Engine

Note The “multiplication ratio” must be set so as not to exceed the maximum frequency value of each product. Operation cannot be guaranteed if the maximum frequency is exceeded.

Table 8.1.4e Lists of CPG clocks generated from PLL5

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum	Initial	
SDSRCφ	SDSRC divider	Variable	800 MHz	800 MHz	SD0-IF divider
SD0Hφ	SD0-IF divider	Variable	800 MHz	Stopped	SDHI
SD0φ	SD0-IF divider	Variable	200 MHz	50 MHz	SDHI
RPCφ	RPC divider	Variable	320 MHz	(*5)	RPC-IF
RPCD2φ	RPC divider	Variable	160 MHz	(*5)	RPC-IF
MSOφ	MSO divider	Variable	133.33 MHz	12.5 MHz	MSIOF
CANFDφ	CANFD divider	Variable	80 MHz	12.5 MHz	CAN-FD
CSIφ	CSI divider	Variable	25 MHz	Stopped	MIPI-CSI2
FRAY	FRAY divider	Fixed PLL5VCO(*7) / 40	80 MHz	80 MHz	FlexRay
POST2φ	POST2 divider	Variable	133.33 MHz	133.33 MHz	Clock during Power on Self Test (POST) for Cortex-A76
POST3φ	POST3 divider	Variable	66.66 MHz	66.66 MHz	Clock during Power on Self Test (POST) for 3D Graphics Engine
POST4φ	POST4 divider	Variable	66.66 MHz	66.66 MHz	Clock during Power on Self Test (POST) for Vision IP
POSTφ	POST divider	Variable	66.66 MHz	66.66 MHz	Clock during Power on Self Test (POST) for modules except Cortex-A76, 3D Graphics Engine, Vision IP
SASYNCRTφ	SASYNCRT divider	Fixed PLL5VCO(*7) / 192	16.66 MHz	16.66 MHz	RT (Real Time) domain bus, Life Cycle, SWDT, TMU, WDT, WWDT, RWDT
SASYNCPERD1φ	SASYNCPER divider	Fixed PLL5VCO(*7) / 12	266.66 MHz	266.66 MHz	HSCIF, SCIF, CAN-FD
SASYNCPERD2φ	SASYNCPER divider	Fixed PLL5VCO(*7) / 24	133.33 MHz	133.33 MHz	Peripheral domain bus, TMU, HSCIF, SYS-DMAC, CAN-FD
SASYNCPERD4φ	SASYNCPER divider	Fixed PLL5VCO(*7) / 48	66.66 MHz	66.66 MHz	Peripheral (PeriE/PeriW) domain bus, SCIF, SYS-DMAC, TPU, PWM
DSIEXTφ	DSIEXT divider	Variable	800 MHz	800 MHz	DSI
DSIREFφ	DSIREF divider	Fixed PLL5VCO(*7) / 192	16.66 MHz	16.66 MHz	DSI
ADGHφ	ADGH divider	Fixed PLL5VCO(*7) / 4	800 MHz	800 MHz	There are not any modules which use the clock.
OSCCLK	EXTAL divider	Fixed(*6)	131.57 kHz	(*6)	SCMT, SWDT

Note 5. The frequency of RPCφ depends on the value of MD4, MD3, MD2 and MD1.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = L, RPCφ = 320 MHz, RPCD2φ = 160MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = H, RPCφ = 160 MHz, RPCD2φ = 80MHz.
When MD4 = L, MD3 = H, MD2 = L, MD1 = L, RPCφ = 80 MHz, RPCD2φ = 40MHz.
In the other cases of MD4, MD3, MD2 and MD1 setting, RPCφ = 80 MHz, RPCD2φ = 40MHz.

Note 6. The initial value depends on MD14, MD13.

MD14	MD13	EXTAL (MHz)	EXTAL divider		OSCCLK	
			Fixed division ratio	Frequency (MHz)	Fixed division ratio	Frequency (kHz)
0	0	16.66	× 1/16	1.04	× 1/8	130.20
0	1	20.00	× 1/19	1.05	× 1/8	131.57
1	0	Setting prohibited	Setting prohibited	Setting prohibited	Setting prohibited	Setting prohibited
1	1	33.33	× 1/32	1.04	× 1/8	130.20

Note 7 PLL5 multiplication ratio
PLL5VCO = (PLL5 reference clock) x (PLL5 multiplication ratio)

MD14:13	PLL5 reference clock [MHz]	PLL5 multiplication ratio
B'00	16.66	192
B'01	20	160
B'11	16.66	192

Table 8.1.4f Lists of CPG clocks generated from PLL6

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum *	Initial	
ZR0φ	RT-CPU divider0	Variable	V4M-7: 1400 MHz V4M-5: 1100 MHz V4M-3: 900 MHz V4M-2: 900 MHz	1400 MHz	Cortex-R52 Sub-System 0
ZR1φ	RT-CPU divider0	Variable	V4M-7: 1400 MHz V4M-5: 1100 MHz V4M-3: 900 MHz V4M-2: 900 MHz	1400 MHz	Cortex-R52 Sub-System 1
ZR2φ	RT-CPU divider0	Variable	V4M-7: 1400 MHz V4M-5: 1100 MHz V4M-3: 900 MHz V4M-2: Not support	1400 MHz	Cortex-R52 Sub-System 2

Note The "multiplication ratio" must be set so as not to exceed the maximum frequency value of each product. Operation cannot be guaranteed if the maximum frequency is exceeded.

Table 8.1.4g Lists of CPG clocks generated from PLL7

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum	Initial	
RGMIIφ	RGMII divider	Variable PLL7VCO(*10) / 8	250 MHz	250 MHz	RGMII interface logic

Note 10 PLL7 multiplication ratio
PLL7VCO = (PLL7 reference clock) x (PLL7 multiplication ratio)

MD14:13	PLL7 reference clock	PLL7 multiplication ratio
B'00	16.66	120
B'01	20	100
B'11	16.66	120

Table 8.1.4h Lists of CPG other clocks

Name	Clock Source	Frequency			Target modules
		Dividing ratio	Maximum	Initial	
CPEXφ	EXTAL	Fixed (*9)	16.66 MHz	(*7)	CMT1, CMT2, CMT3
CPφ	EXTAL	Fixed (*9)	16.66 MHz	(*7)	OTP
CBFUSAφ	EXTAL	Fixed (*9)	16.66 MHz	(*7)	Clock Monitor
RCLK	EXTALR / OCO (*8)	Fixed 1/1	32.8 KHz	32.8 KHz	CMT0, CMT1, CMT2, CMT3, INTC-EX, Life Cycle, WDT, RCLK Watchdog Timer, ICUMX, WWDT, Clock Monitor, DOC, Image Processing (IMP) Unit

Note 7. CPEXφ = EXTAL/2, CPφ = EXTAL/2,CBFUSAφ = EXTAL/2. EXTAL value depends on MD14, MD13 as shown in Table 8.1.4e (Note 6).

Note 8. The initial value depends on MD29.
When MD29 = L, RCLK is EXTALR.
When MD29 = H, RCLK is OCO

Note 9 EXTAL / 2

8.1.5 Clock Operating Modes

8.1.5.1 PLL1 Multiplication Ratio

- PLL1 initial multiplication ratio and initial state (SSCG mode or fractional multiplication mode) can be selected through MD pins as shown in Table 8.1.5.1.
- The PLL1 parameter cannot be changed by software registers (PLL1CR0 and PLL1CR1).

Table 8.1.5.1 PLL1 Initial Parameter Setting

MD pins		PLL1 reference clock (*1) [MHz]	PLL1 parameter settings (*2)									
MD18:37:36	MD14:13 (*4)		SSMODE [2:0]	SSFREQ [6:0]	SSDEPT [6:0]	Mode (*3)	NI[7:0]	NF[24:0]	PLL1VCO [MHz] (*6)	PLL1VCO (min) [MHz]	PLL1VCO (max) [MHz]

Note 1. When “MD14=1 and MD13=1”, the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 Detail calculation and parameter description are shown in 8.2 Register Description (PLL1CR0, PLL1CR1).
Note 3 FRAC = Fractional Multiplication mode, SSCG = SSCG mode. Ex) “FRAC=ON” means “Fractional Multiplication mode is enabled”.
Note 4 “[MD14:MD13] = B’10” setting is prohibited because the system operation cannot be guaranteed.
Note 5 In case of the integer and fractional multiplication mode (SSMODE = 3’b000 and 3’b100), these values are not valid.
Note 6
See 8.1.12 PLL1 Control Register 0 (PLL1CR0)
Note 7
SSMODE[2:0] = 3’b110 (Down spread)
SSDEPT[6:0] = B'0010100 (-1.0%)
- PLL1VCO(min) = PLL1VCO[MHz] x (1 - SSDEPT[6:0])
- PLL1VCO(max) = PLL1VCO[MHz]

Note 8
SSMODE[2:0] = 3’b111 (Center spread)
SSDEPT[6:0] = B'0010100 (0.5%)
- PLL1VCO(min) = PLL1VCO[MHz] x (1 - SSDEPT[6:0])
- PLL1VCO(max) = PLL1VCO[MHz] x (1 + SSDEPT[6:0])

Note 9
SSMODE[2:0] = 3’b111 (Center spread)
SSDEPT[6:0] = B'0101000 (1.0%)
- PLL1VCO(min) = PLL1VCO[MHz] x (1 - SSDEPT[6:0])
- PLL1VCO(max) = PLL1VCO[MHz] x (1 + SSDEPT[6:0])

8.1.5.2 PLL2 Multiplication Ratio

- PLL2 initial multiplication ratio and initial state (integer mode) can are shown in Table 8.1.5.2. PLL2 is initially operated with the integer mode.

- The PLL2 parameter can be changed by software registers. The parameter setting must be executed under PLL standby mode (See 8.3.1). The PLL2 parameter setting of SSCG (Center spread) is prohibited as shown in Table 8.1.1.

- When the PLL2VCO is changed by the software registers, PLL2VCO frequency range must be set as the below.

  1. Integer multiplication mode → 2000.000 MHz ≦ PLL2VCO ≦ 4000.000 MHz
  2. Fractional multiplication mode → 2000.000 MHz ≦ PLL2VCO ≦ 3910.000MHz
  3. SSCG mode (Down spread) → 2000.000 MHz ≦ PLL2VCO ≦ 3910.000MHz

Table 8.1.5.2 PLL2 Initial Parameter Setting (Initial parameters)

MD14:13 (*3)	PLL2 reference clock (*1) [MHz]	PLL2 parameter setting (*2)					
		SSMODE [2:0]	SSFREQ [6:0]	SSDEPT [6:0]	PLL2VCO [MHz] (*5)	NI[7:0]	NF[24:0]
B'00	16.66	B'000	(*4)	(*4)	4000.000	D'119	H'0000000
B'01	20.00	B'000	(*4)	(*4)	4000.000	D'99	H'0000000
B'11	16.66	B'000	(*4)	(*4)	4000.000	D'119	H'0000000

Note 1. When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 Detail calculation and parameter description are shown in 8.2 Register Description (PLL2CR0, PLL2CR1).
Note 3 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 4 In case of the integer multiplication mode (SSMODE = 3'b000), SSFREQ and SSDEPT value are not enable.
Note 5
8.2.14 PLL2 Control Register 0 (PLL2CR0)

8.1.5.3 PLL3 Multiplication Ratio

- The integer multiplication and fractional multiplication mode are supported for PLL3. The SSCG mode setting is prohibited because DDR operation cannot be guaranteed.

- Table 8.1.5.3a shows an initial parameter setting of PLL3. The initial parameter is same in all cases of Mode Pins. After the chip is booted, the parameter can be changed by PLL3CR0 and FRQCRD software registers so that ZB3φ clock frequency corresponds with Table 8.1.5.3c. PLL3VCO frequency range is 2000.0 MHz ~ 4266.7 MHz.

Table 8.1.5.3a PLL3 Parameter Setting (Initial parameters)

MD27:22:19:17	MD14:13 (*3)	PLL3 reference clock (*1) [MHz]	PLL3 parameter setting (*2)			
			SSMODE [2:0]	PLL3VCO [MHz] (*5)	NI[7:0]	NF[24:0]
- (*4)	B'00	16.66	B'000	3200.000	D'95	H'0000000
	B'01	20.00	B'000	3200.000	D'79	H'0000000
	B'11	16.66	B'000	3200.000	D'95	H'0000000

Note 1. When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 Detail calculation and parameter description are shown in 8.2 Register Description (PLL3CR0, PLL3CR1).
Note 3 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 4 Initial parameter is same in all cases of Mode Pins (MD27, MD22, MD19, MD17).
Note 5
8.2.16 PLL3 Control Register 0 (PLL3CR0)

Table 8.1.5.3b DDR Mode

MD27:22	PLL3VCO [MHz]
B'00	LPDDR5
B'01	LPDDR4X
B'10	Setting prohibited
B'11	Setting prohibited

Table 8.1.5.3c DDR Frequency

MD19:17	LPDDR5	LPDDR4X
B'00	6400 Mbps (ZB3φ = 800.00 MHz) (*1)	4266 Mbps (ZB3φ = 1066.66 MHz) (*2)
B'01	6000 Mbps (ZB3φ = 750.00 MHz) (*1)	3733 Mbps (ZB3φ = 933.33 MHz) (*2)
B'10	5500 Mbps (ZB3φ = 687.50 MHz) (*1)	3200 Mbps (ZB3φ = 800.00 MHz) (*2)
B'11	4800 Mbps (ZB3φ = 600.00 MHz) (*1)	2133 Mbps (ZB3φ = 533.33 MHz) (*2)

Note 1 When selecting LPDDR5, clock frequency is increased by 8 times when the clock is provided for DDR.
Note 2 When selecting LPDDR4X, clock frequency is increased by 4 times when the clock is provided for DDR.

Notification
When PLL1 is under SSCG (Down spread) mode, PLL3VCO frequency should be change so that "ZB3D2φ ≦ 2 × S0D2_MMφ" relationship can be kept. According to DBSC specification, the system operation cannot be guaranteed if the relationship is not kept.

8.1.5.4 PLL4 Multiplication Ratio

- PLL4 initial multiplication ratio and multiplication mode are shown in Table 8.1.5.4. The integer multiplication mode is set as the initial parameter setting.

- The PLL4 parameter can be changed by software registers. After the chip is booted, PLL4 parameter can be changed from the integer multiplication mode to fractional multiplication mode or SSCG mode (Down spread) by PLL4CR0 and PLL4CR1.

- When the PLL4VCO is changed by the software registers, PLL4VCO frequency range must be set as the below.

  1. Integer multiplication mode → 2000.000 MHz ≦ PLL4VCO ≦ 4000.000 MHz
  2. Fractional multiplication mode → 2000.000 MHz ≦ PLL4VCO ≦ 3910.000 MHz
  3. SSCG mode (Down spread) → 2000.000 MHz ≦ PLL4VCO ≦ 3910.000 MHz

Table 8.1.5.4 PLL4 Initial Parameter Setting (Initial parameters)

MD14:13 (*3)	PLL4 reference clock (*1) [MHz]	PLL4 parameter setting (*2)					
		SSMODE [2:0]	SSFREQ [6:0]	SSDEPT [6:0]	PLL4VCO [MHz] (*5)	NI[7:0]	NF[24:0]
B'00	16.66	B'000	(*4)	(*4)	4000.000	D'119	H'0000000
B'01	20.00	B'000	(*4)	(*4)	4000.000	D'99	H'0000000
B'11	16.66	B'000	(*4)	(*4)	4000.000	D'119	H'0000000

Note 1 When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 Detail calculation and parameter description are shown in 8.2.19 and 8.2.20.
Note 3 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 4 In case of the integer multiplication mode (SSMODE = 3'b000), SSFREQ and SSDEPT value are not enable.
Note 5
8.2.20 PLL4 Control Register 1 (PLL4CR1)

8.1.5.5 PLL5 Multiplication Ratio

- There are no control registers for PLL5. The PLL5VCO frequency must be always 3200 MHz because all the modules operation which are shown in Table 8.1.4e cannot be guaranteed.

- Only the integer multiplication mode is supported because the modules operation cannot be guaranteed during the fractional multiplication mode and SSCG mode.

Table 8.1.5.5 PLL5VCO Initial frequency

MD14:13 (*2)	PLL5 reference clock (*1) [MHz]	PLL5VCO [MHz] (*3)
B'00	16.66	3200.000
B'01	20.00	3200.000
B'11	16.66	3200.000

Note 1. When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 3 PLL5 multiplication ratio
PLL5VCO = (PLL5 reference clock) x (PLL5 multiplication ratio)

8.1.5.6 PLL6 Multiplication ratio

- PLL6 initial multiplication ratio and initial state are shown in Table 8.1.5.6. PLL6 is initially operated with the integer mode.

- The PLL6 parameter can be changed by software registers. The parameter setting must be executed under PLL standby mode (See 8.3.1). The PLL6 parameter setting of SSCG (Center spread) is prohibited as shown in Table 8.1.1.

- When the PLL6VCO is changed by the software registers, PLL6VCO frequency range must be set as the below.
  1. Integer multiplication mode → 2000.000 MHz ~ 2800.000 MHz
  2. Fractional multiplication mode → 2000.000 MHz ~ 2740.000 MHz
  3. SSCG mode (Down spread) → 2000.000 MHz ~ 2740.000 MHz

Table 8.1.5.6 PLL6 Initial Parameter Setting

MD14:13 (*3)	PLL6 reference clock (*1) [MHz]	PLL6 parameter setting (*2)					
		SSMODE [2:0]	SSFREQ [6:0]	SSDEPT [6:0]	PLL6VCO [MHz] (*5)	NI[7:0]	NF[24:0]
B'00	16.66	B'000	(*4)	(*4)	2800.000	D'83	H'0000000
B'01	20.00	B'000	(*4)	(*4)	2800.000	D'69	H'0000000
B'11	16.66	B'000	(*4)	(*4)	2800.000	D'83	H'0000000

Note 1. When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 Detail calculation and parameter description are shown in Sec.8.2.21 and Sec.8.2.22.
Note 3 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 4 In case of the integer multiplication mode (SSMODE = 3'b000), SSFREQ and SSDEPT value are not enable.
Note 5
8.2.21 PLL6 Control Register 0 (PLL6CR0)

8.1.5.7 PLL7 Multiplication Ratio

- There are no control registers for PLL7. The PLL7VCO frequency must be always 2000 MHz because RGMII operation which are shown in Table 8.1.4g cannot be guaranteed.

- Only the integer multiplication mode is supported because the modules operation cannot be guaranteed during the fractional multiplication mode and SSCG mode.

Table 8.1.5.7 PLL7VCO Initial frequency

MD14:13 (*2)	PLL7 reference clock (*1) [MHz]	PLL7VCO [MHz] (*3)
B'00	16.66	2000.000
B'01	20.00	2000.000
B'11	16.66	2000.000

Note 1. When "MD14=1 and MD13=1", the reference clock is EXTAL x 1/2 (= 33.33 x 1/2). When the other mode setting, it is EXTAL x 1/1.
Note 2 "[MD14:MD13] = B'10" setting is prohibited because the system operation cannot be guaranteed.
Note 3 PLL7 multiplication ratio PLL7
PLL7VCO = (PLL7 reference clock) x (PLL7 multiplication ratio)

8.1.5.8 EXTAL/XTAL Pin Settings

EXTAL/XTAL settings can be selected by MD9 setting as shown in Table 8.1.5.8.

Table 8.1.5.8 EXTAL/XTAL Pin Settings

MD9	MD9 Settings
0	Inputs an external clock to the EXTAL pin.
1	Connects the crystal resonator to the EXTAL and XTAL pins.

8.1.5.9 Clock Source of RCLK

Clock source of RCLK can be selected by MD29 setting as shown in Table 8.1.5.9.

Table 8.1.5.9 MD29 Settings

MD29	MD29 Settings
0	EXTALR select.
1	On-Chip-Oscillator (OCO) select.

8.1.5.10 Step-up Mode

The MD0 pin selects either Free-running mode or Step-up mode. In Step-up mode, the frequency of the LSI-internal clocks is increased step by step at booting up of the LSI by the RESET# pin so that the power consumption increases gradually.

Table 8.1.5.10 MD0 Settings

MD0	MD0 Settings
0	Free-running mode
1	Step-up mode.

8.1.6 Register Configuration

8.1.6.1 Register Configuration for CPG

- The base-address of CPG is H'E615 0000, which is expressed as "CPGA" in Area map.
- CPG has Bus Access Protection function (DxWACRA (x = 0, 1, 2, 3)) for each register. See 8.4.2 in detail.

Table 8.1.6.1a Register Configuration for CPG

Register Name (Abbreviation)	R/W	Address	Initial value	Access Size	Corresponding DxWACRA (x = 0, 1, 2, 3)
CPGWPR	R/W	H'E615 0000	H'00000000	32	DxWACRA00[0]

Write Access Protect Control/Status Register (CPGWPTCSR)	R/W	H’E615 0748	H’00000002	32	DxWACRA14[18]

Note 1. There are no protect registers (DxWACRA (x = 0, 1, 2, 3)) for Read Only register.
Note 2 DxWACRA (x = 0, 1, 2, 3) registers can be accessed only by Domain 0.
Note 3 Initial values depend on MD pins. See each section in Sec.8.2 Register Description
Note 4 FSRCHKRAn and FSRCHKRAn (n = 0 to 29) → Initial value is “Undefined value”.

Table 8.1.6.1b Register Configuration for CPG internal Clock Monitor

Register Name (Abbreviation)	R/W	Address	Initial value	Access Size	DxWACRA (x = 0, 1, 2, 3)

Note 1 There are no protect registers (DxWACRA (x = 0, 1, 2, 3)) for registers related to Clock Monitor like registers shown in 8.1.6.2.

8.1.6.2 Register Configuration for Clock Monitor

(1) Clock Monitor in Slave Access Bus domain

- The base-address of CPG is H'E607 0000. The address map for clock monitor in Slave Access Bus domain is assigned from H'E607 0000 to H'E607 1FFF.
- There are no protect registers (DxWACRA (x = 0, 1, 2, 3)) for the registers.

Table 8.1.6.2.1 Register Configuration

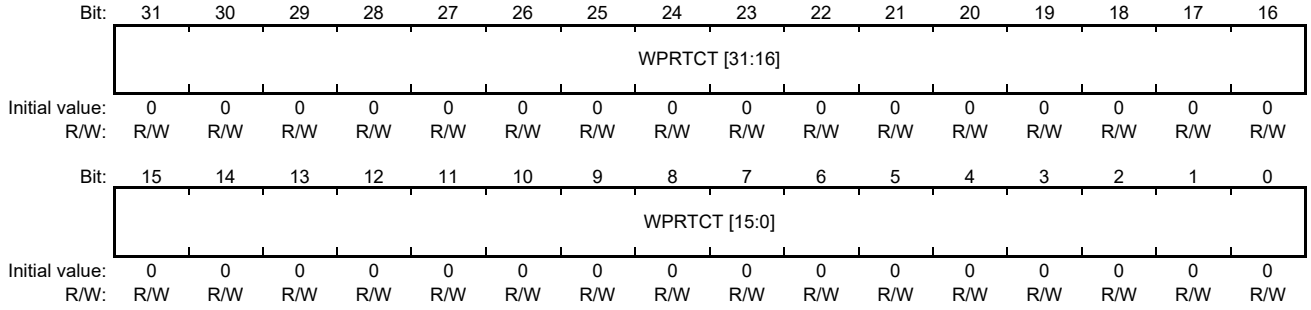
8.2 Register Description

Legend for Register Description
Initial value : Register value after a reset
– : Undefined value
R/W : Readable/writable. The written value can be read.
R : Read-only.
W : Write-only. The read value is undefined.

(Under construction)

8.2.1 CPG Write Protect Register (CPGWPR)

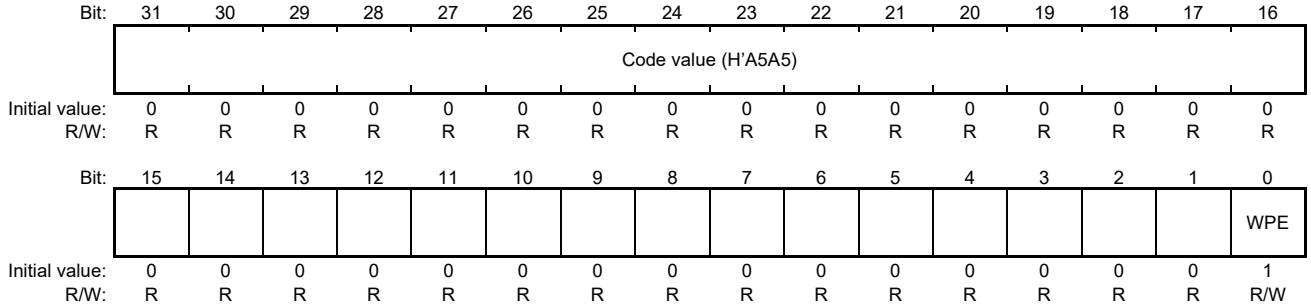
CPGWPR is a 32-bit readable/writable register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WPRTCT [31:0]	All 0	R/W	Writing a value to CPG registers is enabled by writing the inverse of the value to this register.

8.2.2 CPG Write Protect Control Register (CPGWPCR)

CPGWPR is a 32-bit readable/writable register. See 8.4.1 in detail.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Code value (H'A5A5). When read, return 0.
15 to 1	-	All 0	R	Reserved. This bit is always read as 0. The write value should always be 0.
0	WPE	1	R/W	Write protect enable. 0: Disable the write protect. 1: Enable the write protect.

8.2.3 Backup Buffer Access Protect Register (BKBAPR)

BKBAPR is a 32-bit readable/writable register. The usage method is described in 37.3.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BKB APR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved. This bit is always read as 0. The write value should always be 0.
0	BKBAPR	0	R/W	Enables or disables protection of the data storage in the Backup Buffer. 0: Enables protection of the data storage in the Backup Buffer. 1: Disables protection of the data storage in the Backup Buffer. Note) Don't access the Backup Buffer while protection of the stored data is enabled (BKBAPR = 1'b0).

8.2.4 Functional Safety Reset Check Register A (FSRCHKRAn (n = 0 to 29))

FSRCHKRAn is a 32-bit readable register. Each bit of these registers can be set by writing 1 to the corresponding bit of FSRCHKSETRn. Each bit is cleared by the reset signal of the module assigned to each bit. Each bit can be also cleared by writing 1 to the corresponding bit of FSRCHKCLRRn. Unknown value is read from reserved bits. These registers can be used to check whether the reset signal of each module is issued or not for the purpose of functional safety on the reset function.

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

8.2.5 Functional Safety Reset Check Register B (FSRCHKRBn (n= 0 to 29))

FSRCHKRBn is a 32-bit readable register. Each bit of these registers can be set by writing 1 to the corresponding bit of FSRCHKSETRn. Each bit is cleared by the reset signal of the module assigned to each bit. Each bit can be also cleared by writing 1 to the corresponding bit of FSRCHKCLRRn. Unknown value is read from reserved bits. These registers can be used to check whether the reset signal of each module is issued or not for the purpose of functional safety on the reset function.

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

8.2.6 Functional Safety Reset Check Set Register (FSRCHKSETRn (n = 0 to 29))

FSRCHKSETRn is a 32-bit writable register. When writing 1 to the designated bit of FSRCHKSETRn, the corresponding bits of both FSRCHKRAn and FSRCHKRBn are set to 1. Writing 0 to each bit of FSRCHKSETRn does not change the values of FSRCHKRAn and FSRCHKRBn.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSETm (31 to 0)	-	W	When writing 1 to RSETm of FSRCHKSETRn, RCHKm bits of both FSRCHKRAn and FSRCHKRBn are set to 1. Writing 0 to each bit of FSRCHKSETRn does not change the values of FSRCHKRAn and FSRCHKRBn.

8.2.7 Functional Safety Reset Check Clear Register (FSRCHKCLRRn (n = 0 to 29))

- FSRCHKCLRRn is a 32-bit writable register. When writing 1 to the designated bit of FSRCHKCLRRn, the corresponding bits of both FSRCHKRAn and FSRCHKRBn are cleared to 0. Writing 0 to each bit of FSRCHKCLRRn does not change the values of FSRCHKRAn and FSRCHKRBn. Some modules may have two or more reset signals. In such cases, the reset signals correspond to multiple bits of the FSRCHKRAn and FSRCHKRBn registers.

- Some modules have two or more reset signals. In such cases, the reset signals correspond with multiple bits of the FSRCHKRAn and FSCHKRBn.

Bit	Bit Name	Initial Value	R/W	Description
31	KICK	0	R/W	KICK bit. Setting 1 to this register activates the FRQCRB, FRQCRC0, FRQCRC1 setting. - 1'b0: Does not activate the FRQCRB, FRQCRC0, FRQCRC1 settings. - 1'b1: Activates the FRQCRB, FRQCRC0, FRQCRC1 settings. This bit is automatically cleared to 0 when the frequency division setting is completed after 1 is written to this bit.
30	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
29	ZGSTP	0	R/W	Stop control bit for 3D Graphics Engine clock (ZGφ). - 1'b0: Supplies ZGφ - 1'b1: Stops ZGφ.
28 to 24	ZGFC [4:0]	5'b10000	R/W	3D Graphics Engine clock (ZGφ) Frequency division ratio. As shown in Table 8.1.4d, the Maximum clock frequency is 1000 MHz. ZGFC[4:0] shall be set so that ZGφ frequency doesn't exceed 1000 MHz. 5'b00000 → ZGφ = (PLL4VCO x 1/2) x 32/32 5'b00001 → ZGφ = (PLL4VCO x 1/2) x 31/32 ----- 5'b10000 → ZGφ = (PLL4VCO x 1/2) x 16/32 ----- ----- 5'b11110 → ZGφ = (PLL4VCO x 1/2) x 2/32 5'b11111 → ZGφ = (PLL4VCO x 1/2) x 1/32
23 to 20	ZTRFC [3:0]	4'b0001	R/W	Debug Trace port clock (ZTRφ) Frequency division ratio. As shown in Table 8.1.4a, the Maximum clock frequency is 533.33 MHz. ZTRFC[3:0] should be set so that ZTRφ frequency doesn't exceed 533.33 MHz. ZTRFC[3:0] = 4'b0000: ZTRφ frequency = (PLL1VCO x 1/2) x 1/2 ZTRFC[3:0] = 4'b0001: ZTRφ frequency = (PLL1VCO x 1/2) x 1/3 ZTRFC[3:0] = 4'b0010: ZTRφ frequency = (PLL1VCO x 1/2) x 1/4 ZTRFC[3:0] = 4'b0011: ZTRφ frequency = (PLL1VCO x 1/2) x 1/6 ZTRFC[3:0] = 4'b0100: ZTRφ frequency = (PLL1VCO x 1/2) x 1/8 ZTRFC[3:0] = 4'b0101: ZTRφ frequency = (PLL1VCO x 1/2) x 1/12 ZTRFC[3:0] = 4'b0110: ZTRφ frequency = (PLL1VCO x 1/2) x 1/16 Other setting is prohibited.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	ZTFC [3:0]	4'b0001	R/W	Debug Trace bus clock (ZTφ) Frequency division ratio. As shown in Table 8.1.4a, the Maximum clock frequency is 533.33 MHz. ZTFC[3:0] should be set so that ZTφ frequency doesn't exceed 533.33 MHz. ZTFC[3:0] = 4'b0000: ZTφ frequency = (PLL1VCO x 1/2) x 1/2 ZTFC[3:0] = 4'b0001: ZTφ frequency = (PLL1VCO x 1/2) x 1/3 ZTFC[3:0] = 4'b0010: ZTφ frequency = (PLL1VCO x 1/2) x 1/4 ZTFC[3:0] = 4'b0011: ZTφ frequency = (PLL1VCO x 1/2) x 1/6 ZTFC[3:0] = 4'b0100: ZTφ frequency = (PLL1VCO x 1/2) x 1/8 ZTFC[3:0] = 4'b0101: ZTφ frequency = (PLL1VCO x 1/2) x 1/12 ZTFC[3:0] = 4'b0110: ZTφ frequency = (PLL1VCO x 1/2) x 1/16 Other setting is prohibited.
15 to 12	ZSFC [3:0]	4'b0011	R/W	Debug Trace bus clock (ZSφ) Frequency division ratio. As shown in Table 8.1.4a, the Maximum clock frequency is 266.66 MHz. ZSFC[3:0] should be set so that ZSφ frequency doesn't exceed 266.66 MHz. ZSFC[3:0] = 4'b0000: ZSφ frequency = (PLL1VCO x 1/2) x 1/2 ZSFC[3:0] = 4'b0001: ZSφ frequency = (PLL1VCO x 1/2) x 1/3 ZSFC[3:0] = 4'b0010: ZSφ frequency = (PLL1VCO x 1/2) x 1/4 ZSFC[3:0] = 4'b0011: ZSφ frequency = (PLL1VCO x 1/2) x 1/6 ZSFC[3:0] = 4'b0100: ZSφ frequency = (PLL1VCO x 1/2) x 1/8 ZSFC[3:0] = 4'b0101: ZSφ frequency = (PLL1VCO x 1/2) x 1/12 ZSFC[3:0] = 4'b0110: ZSφ frequency = (PLL1VCO x 1/2) x 1/16 Other setting is prohibited.
11 to 5	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
4	ZDSTP	0	R/W	Stop control bit for Cortex-A76 Sub system clock (ZDφ). - 1'b0: Supplies ZDφ - 1'b1: Stops ZDφ.
3 to 0	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

8.2.9 Frequency Control Register C0 (FRQCRC0)

FRQCRC0 is a 32-bit readable/writable register. This register specifies the frequency division ratios of Cortex-R52 clock (ZR0φ, ZR1φ), Cortex-A76 clock (ZC0φ, ZC1φ). When division ratio or stop control of these clocks is changed, any other clock division ratio or stop control should be changed by FRQCRB register before FRQCRB.KICK bit is set to 1.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	KICK	0	R/W	KICK bit. Setting 1 to this register activates the FRQCRD setting. - 1'b0: Does not activate the FRQCRD settings. - 1'b1: Activates the FRQCRD settings. This bit is automatically cleared to 0 when the frequency division setting is completed after 1 is written to this bit.
30 to 4	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
3 to 0	ZB3FC [3:0]	4'b0000	R/W	ZB3φ, ZB3D2φ, ZB3D4φ clock for DDR/DBSC frequency division ratio is set (*1). ZB3D2 clock settings, see chapter U61.3.3

ZB3FC [3:0]	ZB3φ [MHz]	ZB3D4φ [MHz]
0000	(PLL3VCO x 1/2) x 1/2	(PLL3VCO x 1/2) x 1/8
0010	(PLL3VCO x 1/2) x 1/4	(PLL3VCO x 1/2) x 1/16
0100	(PLL3VCO x 1/2) x 1/8	(PLL3VCO x 1/2) x 1/32
0110	(PLL3VCO x 1/2) x 1/16	(PLL3VCO x 1/2) x 1/64
1001	(PLL3VCO x 1/2) x 1/36	(PLL3VCO x 1/2) x 1/128
1100	(PLL3VCO x 1/2) x 1/64	(PLL3VCO x 1/2) x 1/256
Others	Setting prohibited	

Note 1. The frequency depends on PLL3VCO frequency. See 8.1.5.3 about PLL3VCO frequency specification.

8.2.12 PLL Enable Control Register (PLLECR)

PLLECR is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	PLL7ST	-	-	-	-	-	-	-	PLL7E
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PLL6ST	PLL5ST	PLL4ST	-	PLL3ST	-	PLL2ST	PLL1ST	PLL6E	PLL5E	PLL4E	-	PLL3E	-	PLL2E	PLL1E
Initial value:	1	1	1	0	1	0	1	1	1	1	1	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	PLL7ST	1	R	PLL circuit 7 status. Displays PLL circuit 7 status (on or off). 0: PLL circuit 7 is turned off. The main clock is supplied. 1: PLL circuit 7 is turned on. The output from PLL circuit 7 is supplied.
23 to 17	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
16	PLL7E	1	R/W	PLL circuit 7 enable. Turns PLL circuit 7 on or off. Actual status of PLL7 is shown in PLL7ST bit. 0: Turns off PLL circuit 7 1: Turns on PLL circuit 7
15	PLL6ST	1	R	PLL circuit 6 status. Displays PLL circuit 6 status (on or off). 0: PLL circuit 6 is turned off. The main clock is supplied. 1: PLL circuit 6 is turned on. The output from PLL circuit 6 is supplied.
14	PLL5ST	1	R	PLL circuit 5 status. Displays PLL circuit 5 status (on or off). 0: PLL circuit 5 is turned off. The main clock is supplied. 1: PLL circuit 5 is turned on. The output from PLL circuit 5 is supplied.
13	PLL4ST	1	R	PLL circuit 4 status. Displays PLL circuit 4 status (on or off). 0: PLL circuit 4 is turned off. The main clock is supplied. 1: PLL circuit 4 is turned on. The output from PLL circuit 4 is supplied.
12	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
11	PLL3ST	1	R	PLL circuit 3 status. Displays PLL circuit 3 status (on or off). 0: PLL circuit 3 is turned off. The main clock is supplied. 1: PLL circuit 3 is turned on. The output from PLL circuit 3 is supplied.
10	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	PLL2ST	1	R	PLL circuit 2 status. Displays PLL circuit 2 status (on or off). 0: PLL circuit 2 is turned off. The main clock is supplied. 1: PLL circuit 2 is turned on. The output from PLL circuit 2 is supplied.
8	PLL1ST	1	R	PLL circuit 1 status. Displays PLL circuit 1 status (on or off). 0: PLL circuit 1 is turned off. The main clock is supplied. 1: PLL circuit 1 is turned on. The output from PLL circuit 1 is supplied.
7	PLL6E	1	R/W	PLL circuit 6 enable. Turns PLL circuit 6 on or off. Actual status of PLL6 is shown in PLL6ST bit. 0: Turns off PLL circuit 6 1: Turns on PLL circuit 6
6	PLL5E	1	R/W	PLL circuit 5 enable. Turns PLL circuit 5 on or off. Actual status of PLL5 is shown in PLL5ST bit. 0: Turns off PLL circuit 5 1: Turns on PLL circuit 5
5	PLL4E	1	R/W	PLL circuit 4 enable. Turns PLL circuit 4 on or off. Actual status of PLL4 is shown in PLL4ST bit. 0: Turns off PLL circuit 4 1: Turns on PLL circuit 4
4	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
3	PLL3E	1	R/W	PLL circuit 3 enable. Turns PLL circuit 3 on or off. Actual status of PLL3 is shown in PLL3ST bit. 0: Turns off PLL circuit 3 1: Turns on PLL circuit 3
2	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	PLL2E	1	R/W	PLL circuit 2 enable. Turns PLL circuit 2 on or off. Actual status of PLL2 is shown in PLL2ST bit. 0: Turns off PLL circuit 2 1: Turns on PLL circuit 2
0	PLL1E	1	R/W	PLL circuit 1 enable. Turns PLL circuit 1 on or off. Actual status of PLL1 is shown in PLL1ST bit. 0: Turns off PLL circuit 1 1: Turns on PLL circuit 1

8.2.13 PLL1 Control Register 0 (PLL1CR0)

PLL1CR0 is a 32-bit readable register. This register specifies the integer multiplication ratio and SSCG mode of PLL circuit 1. Mode pin control for PLL parameter setting is applied for PLL1 because the parameter cannot be changed by software registers as described in 8.1.5.1 (PLL1 Multiplication Ratio).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	NI [7:0]								-	SSMODE [2:0]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SSFREQ [6:0]							MD14	SSDEPT [6:0]						
Initial value:	0	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	-	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
27 to 20	NI[7:0]	*(1)	R	PLL1 multiplication ratio control parameter. SSMODE[2:0] = 3'b000: ・ PLL1 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL1VCO = (PLL1 reference clock) x (PLL1 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b110, 3'b111: ・ PLL1 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL1VCO = (PLL1 reference clock) x (PLL1 multiplication ratio)
19	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
18 to 16	SSMODE [2:0]	*(1)	R	PLL1 mode and output frequency dither mode are shown in the value of SSMODE[2:0]. B'000: Integer multiplication PLL mode. Output frequency is fixed (0% dither). B'100: Fractional multiplication PLL mode. Output frequency is fixed (0% dither). B'110: Fractional multiplication PLL mode. Output frequency is dithered (Down spread). B'111: Fractional multiplication PLL mode. Output frequency is dithered (Center spread). Others: Setting prohibited.
15	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
14 to 8	SSFREQ [6:0]	*(1)	R	F_{mod} is always 20.833 KHz. The parameter is described in Figure 8.2.15.1.
7	MD14	-	R	The value of MD14

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	SSDEPT [6:0]	*(1)	R	PLL1 modulation depth parameter described in Figure 8.2.15.1. 1) SSMODE[2:0] = B'110 (Down spread) B'0000000: the modulation depth = 0 % B'0010100: the modulation depth = -1.0 % B'0101000: the modulation depth = -2.0 % B'0111100: the modulation depth = -3.0 % B'1010000: the modulation depth = -4.0 % B'1100100: the modulation depth = -5.0 % B'1111000: the modulation depth = -6.0 % Others: Setting prohibited 2) SSMODE[2:0] = B'111 (Center spread) B'0000000: the modulation depth = 0 % B'0010100: the modulation depth = ±0.5 % B'0101000: the modulation depth = ±1.0 % B'0111100: the modulation depth = ±1.5 % B'1010000: the modulation depth = ±2.0 % B'1100100: the modulation depth = ±2.5 % B'1111000: the modulation depth = ±3.0 % Others: Setting prohibited

Note 1. See Table 8.1.5.1 (PLL1 Initial Parameter Setting).

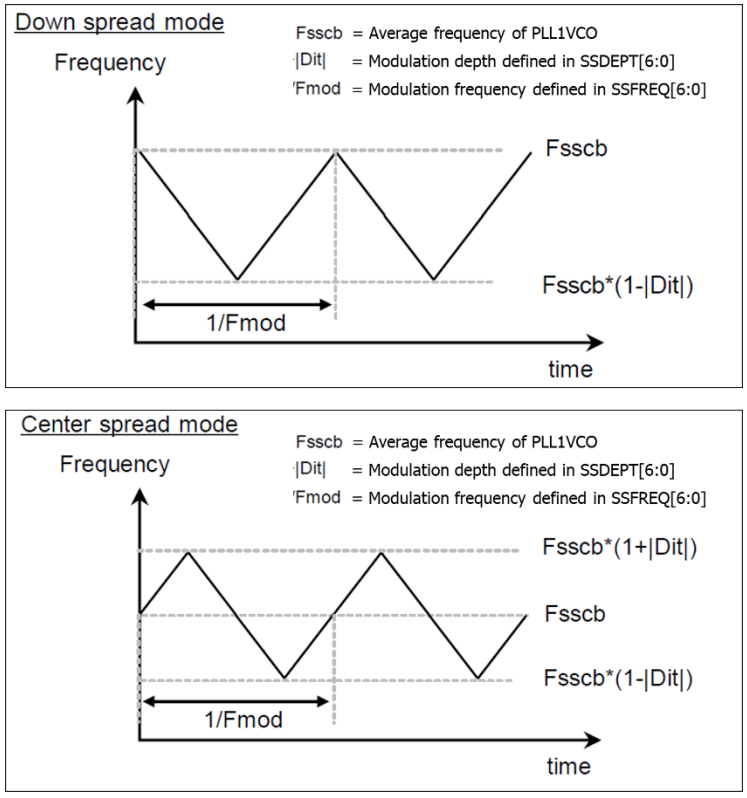

Figure 8.2.15.1 Image diagram of SSCG (Down spread and Center spread)

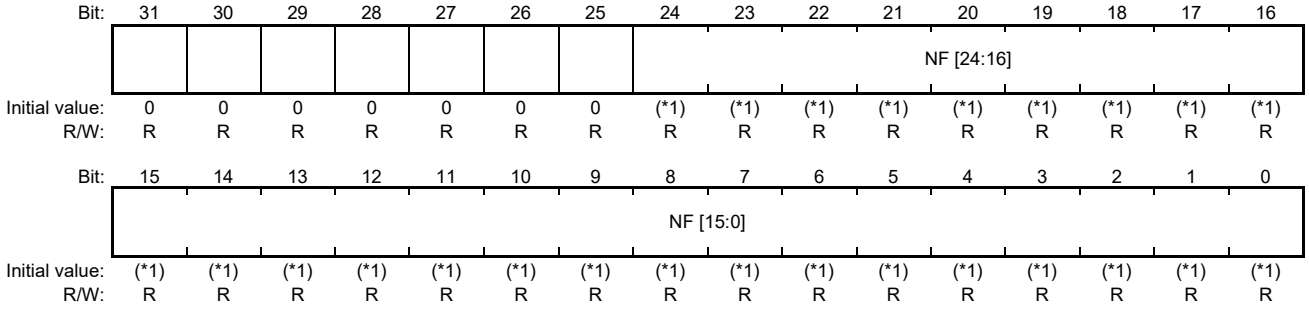
8.2.14 PLL1 Control Register 1 (PLL1CR1)

PLL1CR1 is a 32-bit readable register. This register specifies the fractional multiplication.



Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24 to 0	NF[24:0]	*(1)	R	PLL1 multiplication ratio control parameter. SSMODE[2:0] = 3'b000 ・ PLL1 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL1VCO = (PLL1 reference clock) x (PLL1 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b110, 3'b111 ・ PLL1 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL1VCO = (PLL1 reference clock) x (PLL1 multiplication ratio)

Note 1. See Table 8.1.5.1 (PLL1 Initial Parameter Setting).

8.2.15 PLL2 Control Register 0 (PLL2CR0)

PLL2CR0 is a 32-bit readable/writable register. This register specifies the integer multiplication ratio and SSCG mode of PLL circuit 2. The parameter setting of Center spread is prohibited because Cortex-A76 operation cannot be guaranteed. The PLL2 parameter can be changed by software registers (PLL2CR0, PLL2CR1) as shown in Sec.8.1.5.2 (PLL2 Multiplication Ratio).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24 to 0	NF[24:0]	*(1)	R/W	PLL2 multiplication ratio control parameter. One example of the parameter setting is shown in Table 8.1.5.2. SSMODE[2:0] = 3'b000 ・ PLL2 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL2VCO = (PLL2 reference clock) x (PLL2 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b110 ・ PLL2 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL2VCO = (PLL2 reference clock) x (PLL2 multiplication ratio)

Note 1. See Table 8.1.5.2 (PLL2 Initial Parameter Setting).

8.2.17 PLL3 Control Register 0 (PLL3CR0)

PLL3CR0 is a 32-bit readable/writable register. The parameter setting of SSCG mode is prohibited because DDR operation cannot be guaranteed. The PLL3 parameter can be changed by software registers (PLL3CR0, PLL3CR1) as shown in 8.1.5.3 (PLL3 Multiplication Ratio).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	KICK	0	R/W	KICK bit. Setting 1 to this register activates the PLL3CRn (n = 0,1) setting. - 1'b0: Does not activate the PLL3CRn (n = 0,1) settings. - 1'b1: Activate the PLL3CRn (n = 0,1) settings. This bit is automatically cleared to 0 when the PLL setting is completed after 1 is written to this bit.
30 to 28	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
27 to 20	NI[7:0]	*(1)	R/W	PLL3 multiplication ratio control parameter. ・ PLL3 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL3VCO = (PLL3 reference clock) x (PLL3 multiplication ratio)
19	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
18 to 16	SSMODE [2:0]	*(1)	R/W	As described in 8.1.5.3, DDR operation can be guaranteed during the integer and fractional multiplication PLL mode. SSMODE [2:0] — PLL mode and output frequency dither mode B'000 — Integer multiplication PLL mode. Output frequency is fixed (0% dither) B'100 — Fractional multiplication PLL mode. Output frequency is fixed (0% dither). Others — Setting prohibited.
15 to 8	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
7	MD14	-	R	The value of MD14
6 to 0	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. See Table 8.1.5.3a (PLL3 Initial Parameter Setting).

8.2.18 PLL3 Control Register 1 (PLL3CR1)

PLL3CR1 is a 32-bit readable/writable register. This register specifies the fractional multiplication.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
								NF [24:16]								
Initial value:	0	0	0	0	0	0	0	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

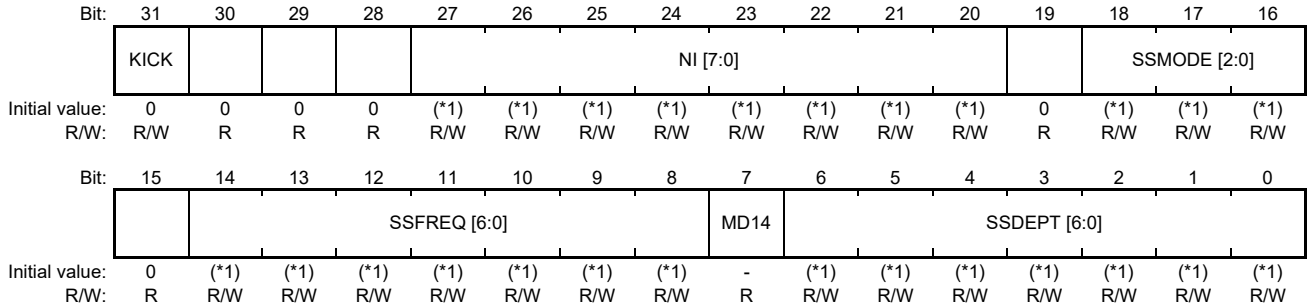
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NF [15:0]															
Initial value:	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)	(*1)
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24 to 0	NF[24:0]	*(1)	R/W	PLL3 multiplication ratio control parameter. Before SSMODE[2:0] is changed from 3'B100 (fractional multiplication mode) to 3'B000 (integer multiplication mode), write 25'H000 to NF[24:0]. Any other values except 25'H000 are prohibited for NF[24:0] in integer multiplication mode. SSMODE[2:0] = 3'b000 ・ PLL3 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL3VCO = (PLL3 reference clock) x (PLL3 multiplication ratio) SSMODE[2:0] = 3'b100 ・ PLL3 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL3VCO = (PLL3 reference clock) x (PLL3 multiplication ratio) SSMODE[2:0] = Others ・ Setting prohibited.

Note 1. See Table 8.1.5.3a (PLL3 Initial Parameter Setting). The value is always All 0.

8.2.19 PLL4 Control Register 0 (PLL4CR0)

PLL4CR0 is a 32-bit readable/writable register. This register specifies the integer multiplication ratio and SSCG mode of PLL circuit 2. The PLL4 parameter can be changed by software registers (PLL4CR0, PLL4CR1) as shown in 8.1.5.4 (PLL4 Multiplication Ratio).



Bit	Bit Name	Initial Value	R/W	Description
31	KICK	0	R/W	KICK bit. Setting 1 to this register activates the PLL4CRn (n = 0,1) setting. - 1'b0: Does not activate the PLL4CRn (n = 0,1) settings. - 1'b1: Activate the PLL4CRn (n = 0,1) settings. This bit is automatically cleared to 0 when the PLL setting is completed after 1 is written to this bit.
30 to 28	-	000	R	Reserved. These bits are always read as 0. The write value should always be 0.
27 to 20	NI[7:0]	*(1)	R/W	PLL4 multiplication ratio control parameter. One example of the parameter setting is shown in Table 8.1.5.4. SSMODE[2:0] = 3'b000 ・ PLL4 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL4VCO = (PLL4 reference clock) x (PLL4 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b110 ・ PLL4 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL4VCO = (PLL4 reference clock) x (PLL4 multiplication ratio)
19	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
18 to 16	SSMODE [2:0]	*(1)	R/W	SSMODE [2:0] / PLL mode and output frequency dither mode B'000 / Integer multiplication PLL mode. Output frequency is fixed (0% dither) B'100 / Fractional multiplication PLL mode. Output frequency is fixed (0% dither). B'110 / Fractional multiplication PLL mode. Output frequency is dithered (Down spread). Others / Setting prohibited.
15	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.

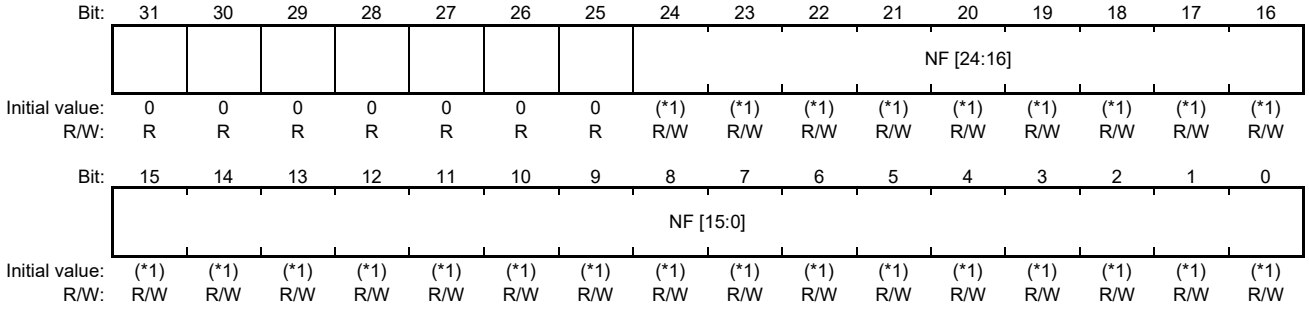
Note 1. See Table 8.1.5.4 (PLL4 Initial Parameter Setting).

8.2.20 PLL4 Control Register 1 (PLL4CR1)

PLL4CR1 is a 32-bit readable/writable register. This register specifies the fractional multiplication.



Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24 to 0	NF[24:0]	*(1)	R/W	PLL4 multiplication ratio control parameter. One example of the parameter setting is shown in Table 8.1.5.4. SSMODE[2:0] = 3'b000 ・ PLL4 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL4VCO = (PLL4 reference clock) x (PLL4 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b111 ・ PLL4 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL4VCO = (PLL4 reference clock) x (PLL4 multiplication ratio)

Note 1. See Table 8.1.5.4 (PLL4 Initial Parameter Setting).

8.2.21 PLL6 Control Register 0 (PLL6CR0)

PLL6CR0 is a 32-bit readable/writable register. This register specifies the integer multiplication ratio and SSCG mode of PLL circuit 6. The parameter setting of Center spread is prohibited because Cortex-R52 operation cannot be guaranteed. The PLL6 parameter can be changed by software registers (PLL6CR0, PLL6CR1) as shown in 8.1.5.6 (PLL6 Multiplication Ratio).

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24 to 0	NF[24:0]	*(1)	R/W	PLL6 multiplication ratio control parameter. One example of the parameter setting is shown in Table 8.1.5.6. SSMODE[2:0] = 3'b000 ・ PLL6 multiplication ratio = (NI[7:0] + 1) x 2 ・ PLL6VCO = (PLL6 reference clock) x (PLL6 multiplication ratio) SSMODE[2:0] = 3'b100, 3'b110 ・ PLL6 multiplication ratio = (NI[7:0] + 1) x 2 + NF[24:0] / 2^24 ・ PLL6VCO = (PLL6 reference clock) x (PLL6 multiplication ratio)

Note 1. See Table 8.1.5.6 (PLL6 Initial Parameter Setting).

8.2.23 PLLn Stop Control Register (PLLnSTPCR (n = 1,2,3,4,6,7))

- PLLnSTPCR is a 32-bit readable/writable register. This register specifies the stop condition of PLL circuit n when PLLECR.PLLnE is set to 1.

- If the power supply status meets the stop condition of PLL circuit specified by this register (all of the power domains specified by this register is power off), the CPG cancels the oscillation request to PLL circuit n even if the PLLECR.PLLnE is set to 1. PLL circuit oscillates when this register is set to the initial value, meaning that the oscillation request from the application part is always enabled.

8.2.25 RPC Clock Frequency Control Register (RPCCKCR)

RPCCKCR is a 32-bit readable/writable register. This register controls the RPC clock (RPCφ). This register should be set before RPC module is operated. Do not access RPC module during changing the clock frequency of RPCφ and RPCD2φ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CKSTP2	CKSTP	-	-	-	RPCFC [4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	(*1)	(*1)	1
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9	CKSTP2	0	R/W	RPCD2φ Clock 0: Supplies clock to RPC 1: Stops clock to RPC
8	CKSTP	0	R/W	RPCφ Clock Stop. 0: Supplies clock to RPC 1: Stops clock to RPC
7 to 5	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	RPCFC [4:0]	[4:3] = 10 [2:1] = *(1) [0] = 1	R/W	RPC clock (RPCφ, RPCD2φ) Frequency Division Ratio. When PLL5 is turned off, RPC clock can't be oscillated (please set CKSTP1 and CKSTP2 before turning off PLL5). **RPCFC[4:3]** RPCFC [4:3] / RPCSRCφ [MHz] 00 / (PLL5VCO) x 1/2 x 1/2 01 / (PLL5VCO) x 1/2 x 1/3 10 / (PLL5VCO) x 1/5 11 / (PLL5VCO) x 1/6 **RPCFC[2:0]** RPCϕ = RPCSRCϕ / (RPCFC [2:0] +1) RPCD2ϕ = RPCSRCϕ / { (RPCFC [2:0] +1) x 2 } The setting RPCFC [2:0]= 000 is prohibited. The setting RPCFC [0] = 0 is also prohibited, because duty = 50% is required. **Example** RPCFC [4:3][2:0] / RPCφ [MHz] / RPCD2φ [MHz] 10_000 / Prohibited 10_001 / PLL5VCO(3200MHz) x 1/5 x 1/2 = 320 (RPC max, initial value when PRCφ = 320MHz) / 160 10_010 / Prohibited 10_011 / PLL5VCO(3200MHz) x 1/5 x 1/4 = 160 (QSPI max, initial value when RPCφ = 160MHz) / 80 10_100 / Prohibited 10_101 / PLL5VCO(3200MHz) x 1/5 x 1/6 = 106.66 / 53.33 10_110 / Prohibited 10_111 / PLL5VCO(3200MHz) x 1/5 x 1/8 = 80 (Initial value when RPCφ = 80MHz or stopped) / 40 11_000 / Prohibited 11_001 / PLL5VCO(3200MHz) x 1/6 x 1/2 = 266.66 / 133.33 11_010 / Prohibited 11_011 / PLL5VCO(3200MHz) x 1/6 x 1/4 = 133.33 / 66.66 11_100 / Prohibited 11_101 / PLL5VCO(3200MHz) x 1/6 x 1/6 = 88.88 / 44.44 11_110 / Prohibited 11_111 / PLL5VCO(3200MHz) x 1/6 x 1/8 = 66.66 / 33.33

Note 1. Depend on MD4, MD3, MD2, and MD1 values
When (MD4, MD3, MD2, MD1) = (Don't care, 0, 1, 0), DIV[2:0] = 001, DIV[4:3] = 10.
When (MD4, MD3, MD2, MD1) = (Don't care, 0, 1, 1), DIV[2:0] = 011, DIV[4:3] = 10.
When (MD4, MD3, MD2, MD1) = (Others), DIV[2:0] = 111, DIV[4:3] = 10.

8.2.26 CAN-FD Clock Frequency Control Register (CANFDCKCR)

CANFDCKCR is a 32-bit readable/writable register. This register controls the CAN-FD clock (CANFDφ). This register should be set before CAN-FD module is operated. Do not access CAN-FD module during changing the clock frequency of CANFDφ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	0	R/W	Clock Stop. 0: Supplies clock to CAN-FD module 1: Stops clock to CAN-FD module
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	All 1	R/W	Division Ratio. These bits set the frequency division ratio of CAN-FD clock. CAN-FD clock source is divided by the division ratio of 1 / (setting + 1). DIV[5:0] should be set so that CANFDφ frequency doesn't exceed the max frequency shown in Sec. 8.1.4. CANFDφ frequency [MHz] = PLL5VCO x 1/2 x 1/2 x 1 / (setting + 1).

8.2.27 MSIOF Clock Frequency Control Register (MSOCKCR)

MSOCKCR is a 32-bit readable/writable register. This register controls the MSIOF clock (MSOφ). This register should be set before MSIOF module is operated. Do not access MSIOF module during changing the clock frequency of MSOφ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP (*1)	0	R/W	Clock Stop. 0: Supplies clock to MSIOF module 1: Stops clock to MSIOF module
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	All 1	R/W	Division Ratio. These bits set the frequency division ratio of MSIOF clock. MSIOF clock source is divided by the division ratio of 1 / (setting + 1). DIV[5:0] should be set so that MSOφ frequency doesn't exceed the max frequency shown in Sec. 8.1.4. MSOφ frequency [MHz] = PLL5VCO x 1/2 x 1/2 x 1 / (setting + 1).

Note 1:
When accessing any registers defined in 109.2 Register Description (for Clock-Synchronized Serial Interface with FIFO (MSIOF)), the MSIOF clock (MSOφ) shall not be stopped. Before accessing the registers, the bit value of CKSTP shall be checked. The value shall be 0 (Supplies clock to MSIOF module).

8.2.28 CSI Clock Frequency Control Register (CSICKCR)

CSICKCR is a 32-bit readable/writable register. This register controls the CSI clock (CSIφ). This register should be set before CSI module is operated. Do not access MIPI-CSI2 module during changing the clock frequency of CSIφ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	1	R/W	Clock Stop. 0: Supplies clock to CSI module 1: Stops clock to CSI module
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	6'b011111	R/W	Division Ratio. These bits set the frequency division ratio of CSI clock. CSI clock source is divided by the division ratio of 1 / (setting + 1). DIV[5:0] should be set so that CSIφ frequency doesn't exceed the max frequency shown in Sec. 8.1.4. CSIφ frequency [MHz] = PLL5VCO x 1/2 x 1/2 x 1 / (setting + 1).

8.2.29 DSI Clock Frequency Control Register (DSIEXTCKCR)

DSIEXTCKCR is a 32-bit readable/writable register. This register controls the DSI clock (DSIEXTφ). This register should be set before DSI module is operated. Do not access MIPI-DSI module during changing the clock frequency of DSIEXTφ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	1	R/W	Clock Stop. 0: Supplies clock to DSI module 1: Stops clock to DSI module
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	All 0	R/W	Division Ratio. These bits set the frequency division ratio of DSI clock. DSI clock source is divided by the division ratio of 1 / (setting + 1). DIV[5:0] should be set so that DSIEXTφ frequency doesn't exceed the max frequency shown in Sec. 8.1.4. DSIEXTφ frequency [MHz] = PLL5VCO x 1/2 x 1/2 x 1 / (setting + 1).

8.2.30 Power on Self Test Clock Frequency Control Register (POSTCKCR)

POSTCKCR is a 32-bit readable/writable register. This register controls the Power-On Self Test clock (POSTφ). POST frequency is 66.66 MHz, so the initial frequency is also 66.66MHz. Run-Time Test is done at 66.66MHz. POSTφ target is any others except Cortex-A76, 3D Graphics Engine, Vision IP.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	~MD25 (*1)	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	~MD25 (*1)	R/W	Clock Stop. 0: Supplies clock with POSTφ target modules. 1: Stops POSTφ.
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	6'b001011	R/W	Division Ratio. These bits set the frequency division ratio of clock. POST clock source is divided by the division ratio of 1 / (setting + 1). Initial value: PLL5VCO (3200MHz) x 1/2 x 1/2 x 1 / (setting + 1) = 66.66 MHz. "setting" is equal to 6'b001011.

Note 1."POST is skipped" operation, the POSTφ clock is stopped in the initial state.
"POST is skipped" operation, see 171.1.2.7 Debugger Usage Note.

8.2.31 Power on Self Test 2 Clock Frequency Control Register (POST2CKCR)

POST2CKCR is a 32-bit readable/writable register. This register controls the Power-On Self Test 2 clock (POST2φ), which is used for Cortex-A76 during POST executing.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	~MD25 (*1)	0	0	0	0	0	1	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	~MD25 (*1)	R/W	Clock Stop. 0: Supplies clock with POST2φ target modules. 1: Stops POST2φ.
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	6'b000101	R/W	Division Ratio. These bits set the frequency division ratio of clock. POST clock source is divided by the division ratio of 1 / (setting + 1). Initial value: PLL5VCO (3200MHz) x 1/2 x 1/2 x 1 / (setting + 1) = 133.33 MHz. "setting" is equal to 6'b000101.

Note 1."POST is skipped" operation, the POST2φ clock is stopped in the initial state.
"POST is skipped" operation, see 171.1.2.7 Debugger Usage Note.

8.2.32 Power on Self Test 3 Clock Frequency Control Register (POST3CKCR)

POST3CKCR is a 32-bit readable/writable register. This register controls the Power-On Self Test clock (POST3φ). POST frequency is 66.66 MHz, so the initial frequency is also 66.66MHz. Run-Time Test is done at 66.66MHz. POST3φ target is 3D Graphics Engine.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	~MD25 (*1)	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	~MD25 (*1)	R/W	Clock Stop. 0: Supplies clock with POST3φ target modules. 1: Stops POST3φ.
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	6'b001011	R/W	Division Ratio. These bits set the frequency division ratio of clock. POST3 clock source is divided by the division ratio of 1 / (setting + 1). Initial value: PLL5VCO (3200MHz) x 1/2 x 1/2 x 1 / (setting + 1) = 66.66 MHz. "setting" is equal to 6'b001011.

Note 1."POST is skipped" operation, the POST3φ clock is stopped in the initial state.
"POST is skipped" operation, see 171.1.2.7 Debugger Usage Note.

8.2.33 Power on Self Test 4 Clock Frequency Control Register (POST4CKCR)

POST4CKCR is a 32-bit readable/writable register. This register controls the Power-On Self Test clock (POST4φ). POST frequency is 66.66 MHz, so the initial frequency is also 66.66MHz. Run-Time Test is done at 66.66MHz. POST4φ target is Vision IP.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	DIV [5:0]					
Initial value:	0	0	0	0	0	0	0	~MD25 (*1)	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	~MD25 (*1)	R/W	Clock Stop. 0: Supplies clock with POST4φ target modules. 1: Stops POST4φ.
7 to 6	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
5 to 0	DIV [5:0]	6'b001011	R/W	Division Ratio. These bits set the frequency division ratio of clock. POST4 clock source is divided by the division ratio of 1 / (setting + 1). Initial value: PLL5VCO (3200MHz) x 1/2 x 1/2 x 1 / (setting + 1) = 66.66 MHz. "setting" is equal to 6'b001011.

Note 1."POST is skipped" operation, the POST4φ clock is stopped in the initial state.
"POST is skipped" operation, see 171.1.2.7 Debugger Usage Note.

8.2.34 Clock Source Select Control Register (CKSRCSELCR)

CKSRCSELCR is a 32-bit readable/writable register. The register selects the clock frequency select of SDSRCφ.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	SDSRC SEL		-	-	-	-	-	-	-	-	-	-			
Initial value:	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	-	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
30 to 29	SDSRCSEL [1:0]	All 0	R/W	SDSRCφ clock frequency select. The bit should be set before SD-IF0 module (SDHI) is operated. Do not access SDHI during changing the clock frequency of SD0Hφ, and SD0φ, or stopping these clocks. The bit setting is necessary when SD0CKCR register is set. 2'b00: 800.00 MHz (PLL5VCO (always 3200 MHz) x 1/2 x 1/2) 2'b01: 640.00 MHz (PLL5VCO (always 3200 MHz) x 1/5) 2'b10: 533.33 MHz (PLL5VCO (always 3200 MHz) x 1/6) 2'b11: Setting prohibited
28	-	0	R	Reserved. These bits are always read as 0. The write value should always be 0.
27 to 20	-	All 1	R	Reserved. This bit is always read as 1. The write value should always be 1.
19 to 16	-	All 1	R	Reserved. This bit is always read as 1. The write value should always be 1.
15 to 4	-	All 0	R	Reserved. This bit is always read as 0. The write value should always be 0.
3 to 0	-	All 0	R	Reserved. This bit is always read as 0. The write value should always be 0.

8.2.35 Domain 0 Write Access Control Register A n (D0WACRAn (n = 0 to 63))

D0WACRAn (n = 0 to 63) is a 32-bit readable/writable register. Only Domain 0 can access the register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D0WACRAn31	D0WACRAn30	D0WACRAn29	D0WACRAn28	D0WACRAn27	D0WACRAn26	D0WACRAn25	D0WACRAn24	D0WACRAn23	D0WACRAn22	D0WACRAn21	D0WACRAn20	D0WACRAn19	D0WACRAn18	D0WACRAn17	D0WACRAn16
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	-	-	-	-		-	-	-	-	-	-	-	-	-	-	INT EN	CHK EN
Initial value:	0	0	0	0		0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R		R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CHKRES	0	R	Check result. 0: Clock oscillates normally. 1: Detect unexpected clock oscillation. Even if INTEN is 0, this bit shows check result. This bit is cleared when XXXCKMECR.CLRRES is 1.
30 to 25	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
24	CLRMON	All 0	R	Reference for clear command signal - XXXCKMECR.CLRRES 0: Clear command signal is released. 1: Clear command signal is issued.
23 to 19	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
18	RSTMMON	0	R	Reset status for monitor clock domain of clock monitor module. 0: Reset signal is issued. 1: Reset signal is released.
17	RSTMSMP	0	R	Reset status for sampling clock domain of clock monitor module. 0: Reset signal is issued. 1: Reset signal is released.
16	ENMON	0	R	Operating status. 0: Clock monitor is stopped. 1: Clock monitor is operating.
15 to 2	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
1	INTEN	0	R/W	Interrupt mask bit. 0: Mask an interrupt. 1: Permit to issue an interrupt when clock monitor detects an error.
0	CHKEN	0	R/W	Enable for checking clock oscillation. 0: Stop clock monitor checking. 1: Run clock monitor checking.

8.2.40 XXX Clock Monitor Error Clear Register (XXXCKMECR)

XXXCKMECR is a 32-bit readable/writable register.

Bit:	31	30	29	28		27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12		11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLRRES
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
0	CLRRES	0	R/W	Reference for clear command signal - XXXCKMECR.CLRRES 0: Release clear signal. 1: Issue clear signal to clock monitor, when clock monitor accepts it. XXXCKMCSR.CHKRES and XXXCKMCNTE are cleared to all 0. After confirming that they are cleared, release this clear signal. Don't issue this clear signal while XXXCKMCSR.CHKEN or XXXCKMCSR.ENMON is 1.

8.2.41 XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

XXXCKMLCH is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CMPH[23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
23 to 0	CMPH[23:0]	All 0	R/W	The upper limit to judge as expected oscillation. This value is compared with XXXCKMCNT.MONCNT. If XXXCKMCNT.MONCNT is greater than or equal to CMPH, clock monitor judges it as an error. Don't modify this value while XXXCKMCSR.CHKEN or XXXCKMCSR.ENMON is 1.

8.2.42 XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

XXXCKMLCH is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CMPL[23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved. These bits are always read as unknown value. The write value should always be 0.
23 to 0	CMPL[23:0]	All 0	R/W	The lower limit to judge as expected oscillation. This value is compared with XXXCKMCNT.MONCNT. If XXXCKMCNT.MONCNT is less than CMPL, clock monitor judges it as an error. Don't modify this value while XXXCKMCSR.CHKEN or XXXCKMCSR.ENMON is 1.

8.2.43 XXX Clock Monitor Count Register (XXXCKMCNT)

XXXCKMCNT is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	UPDCNT[6:0]							MONCNT[23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MONCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

8.2.44 XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

XXXCKMCNTE is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VLD	UPDCNTE [6:0]							MONCNTE [23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MONCNTE [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VLD	All 0	R	Valid bit. 0: UPDCNTE & MONCNTE are showing invalid value. 1: UPDCNTE & MONCNTE are showing valid value.
30 to 24	UPDCNTE[6:0]	All 0	R	XXXCKMCNT.UPDCNT value when the first error occurred.
23 to 0	MONCNTE [23:0]	All 0	R	The counter value of clock monitor when the first error occurred. If monitor clock is stopped, there is a possibility that this register may show the value within the normal range.

8.2.45 YYY Clock Monitor Write Protect Register (YYYCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in 8.2.1.
YYY = TOP, MM, RT, RTCR52, PER, HSC.

8.2.46 ZZZ Clock Monitor Write Protect Control Register (ZZZCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in 8.2.2.
ZZZ = TOP, MM, RT, RTCR52, PER, HSC.

8.2.47 CPG All Clock Monitor Status Register (CPGACKMSR)

CPGACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor for clocks generated from PLL (Sec.8.5.2.1). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.48 TOP All Clock Monitor Status Register (TOPACKMSR)

TOPACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor in Slave Access Bus domain (Sec.8.5.2.2). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.49 MM All Clock Monitor Status Register (MMACKMSR)

MMACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor in Main Memory domain (Sec.8.5.2.3). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.50 RT All Clock Monitor Status Register (RTACKMSR)

RTACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor (ckmrt) in RT (Real Time) domain (Sec.8.5.2.4). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.51 RT (CR52) All Clock Monitor Status Register (RTCR52ACKMSR)

RTCR52ACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor (ckmcr52) in RT (Real Time) domain (Sec.8.5.2.4). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.52 PER All Clock Monitor Status Register (PERACKMSR)

PERACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor in Peripheral domain (Sec.8.5.2.5). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.53 HSC All Clock Monitor Status Register (HSCACKMSR)

HSCACKMSR is a 32-bit readable register.

The registers are applied for Clock Monitor in HSC (High speed Communication) domain (Sec.8.5.2.6). The monitor result of each clock monitor is stored on the corresponding bit.

0: Clock oscillates normally.
1: Clock doesn't oscillate normally (Unexpected clock oscillation).
—: Reserved. The bit is always read as 0. The write value should always be 0.

8.2.54 CPGMA0 Clock Stop Control Register (CPGMA0CKSTPCR)

CPGMA0CKSTPCR is a 32-bit readable register. The register is applied for stopping clocks generated from PLL1 when the corresponding modules are not operated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
24	ZXFLG	0	R	Check bit for ZXSTP bit. - 1'b0: Does not activate the ZXSTP setting. - 1'b1: Activates the ZXSTP setting.
23	S0VIOFLG	0	R	Check bit for S0VIOSTP bit. - 1'b0: Does not activate the S0VIOSTP setting. - 1'b1: Activates the S0VIOSTP setting.
22	S0VCFLG	0	R	Check bit for S0VCSTP bit. - 1'b0: Does not activate the S0VCSTP setting. - 1'b1: Activates the S0VCSTP setting.
21	SVVIPFLG	0	R	Check bit for SVVIPSTP bit. - 1'b0: Does not activate the SVVIPSTP setting. - 1'b1: Activates the SVVIPSTP setting.
20	SVIRFLG	0	R	Check bit for SVIRSTP bit. - 1'b0: Does not activate the SVIRSTP setting. - 1'b1: Activates the SVIRSTP setting.
19	IMPAFLG	0	R	Check bit for IMPASTP bit. - 1'b0: Does not activate the IMPASTP setting. - 1'b1: Activates the IMPASTP setting.
18	IMPBFLG	0	R	Check bit for IMPBSTP bit. - 1'b0: Does not activate the IMPBSTP setting. - 1'b1: Activates the IMPBSTP setting.
17	VIOFLG	0	R	Check bit for VIOSTP bit. - 1'b0: Does not activate the VIOSTP setting. - 1'b1: Activates the VIOSTP setting.
16	VCFLG	0	R	Check bit for VCSTP bit. - 1'b0: Does not activate the VCSTP setting. - 1'b1: Activates the VCSTP setting.
15 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	ZXSTP	0	R/W	Stop control bit for ZXφ. - 1'b0: Supplies ZXφ - 1'b1: Stops ZXφ.
7	S0VIOSTP	0	R/W	Stop control bit for S0_VIOφ. - 1'b0: Supplies S0_VIOφ. - 1'b1: Stops S0_VIOφ.
6	S0VCSTP	0	R/W	Stop control bit for S0_VCφ. - 1'b0: Supplies S0_VCφ. - 1'b1: Stops S0_VCφ.
5	SVVIPSTP	0	R/W	Stop control bit for SV_VIPφ. - 1'b0: Supplies SV_VIPφ. - 1'b1: Stops SV_VIPφ.
4	SVIRSTP	0	R/W	Stop control bit for SV_IRφ. - 1'b0: Supplies SV_IRφ. - 1'b1: Stops SV_IRφ.

3	IMPASTP	0	R/W	Stop control bit for IMPASRCφ - 1'b0: Supplies IMPASRCφ. - 1'b1: Stops IMPASRCφ.
2	IMPBSTP	0	R/W	Stop control bit for IMPBSRCφ - 1'b0: Supplies IMPBSRCφ. - 1'b1: Stops IMPBSRCφ.
1	VIOSTP	0	R/W	Stop control bit for VIOSRCφ. - 1'b0: Supplies VIOSRCφ. - 1'b1: Stops VIOSRCφ.
0	VCSTP	0	R/W	Stop control bit for VCSRCφ. - 1'b0: Supplies VCSRCφ. - 1'b1: Stops VCSRCφ.

8.2.55 ADGH Clock Frequency Control Register (ADGHCKCR)

ADGHCKCR is a 32-bit readable/writable register. This register controls the ADGH clock (ADGHφ). This register should be set before ADGH module is operated. Do not access the module during ADGH module is operated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CKSTP	-	-	-					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
8	CKSTP	0	R/W	Clock Stop. 0: Supplies clock to ADGH module 1: Stops clock to ADGH module
7 to 0	-	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

8.2.56 Write Access Protect Control/Status Register (CPGWPTCSR)

CPGWPTCSR is a 32-bit readable register.

The register is used for a function described in 8.1.2 (4) Bus Access Protection [Functional Safety]. If there are illegal write accesses for CPG and MSTPRST registers (*1), an error notification is reported to ECM (ECMERRxxxR00 Bit29). In addition, the error notification is cleared by using the register (See the description of Bit 0 (ERR)).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	EIE	ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description (Monitor Clock)
31 to 2	—	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
1	EIE	1	R/W	Error notification mask bit. 0: An error notification is masked. Even if there are illegal write accesses for CPG and MSTPRST registers, an error notification is not reported to ECM (ECMERRxxxR00 Bit29). 1: An error notification is enable. If there are illegal write accesses for CPG and MSTPRST registers, an error notification is reported to ECM (ECMERRxxxR00 Bit29).
0	ERR	0	R/W	Check result bit. When EIE (Bit 1) is equal to 1'b0, the bit value is always 1'b0. 0: An error notification is not reported because there are not any illegal write accesses for CPG and MSTPRST registers. 1: An error notification is reported because there are illegal write accesses for CPG and MSTPRST registers. When 1'b1 is written to the bit after the bit value is 1'b1 (the check result shows there are the illegal write accesses for CPG and MSTPRST registers), the error notification is cleared.

Note 1. Regarding MSTPRST registers, see 9.1.1 (5). In this section, it is described which registers are target of the write access protection function.

8.3 Operation

8.3.1 Changing Multiplication Ratio of PLL circuit

- PLL multiplication ratio and operation mode (integer mode, fractional mode, SSCG mode) can be changed by the PLL control register. The methods are described in the section below. Figure 8.3.1 shows the procedure for changing the multiplication ratio and operation mode.

- PLL parameter setting is executed by PLLnCR0, PLLnCR1 registers setting. The modules operation must be stopped before setting the PLL parameter setting because the PLL is automatically under standby mode when writing access to PLLnCR0, PLLnCR1. The clock source is changed from PLL to Main OSC when PLL is under standby mode. Therefore, the modules operation cannot be guaranteed when the Figure 8.3.1 procedure is not kept.

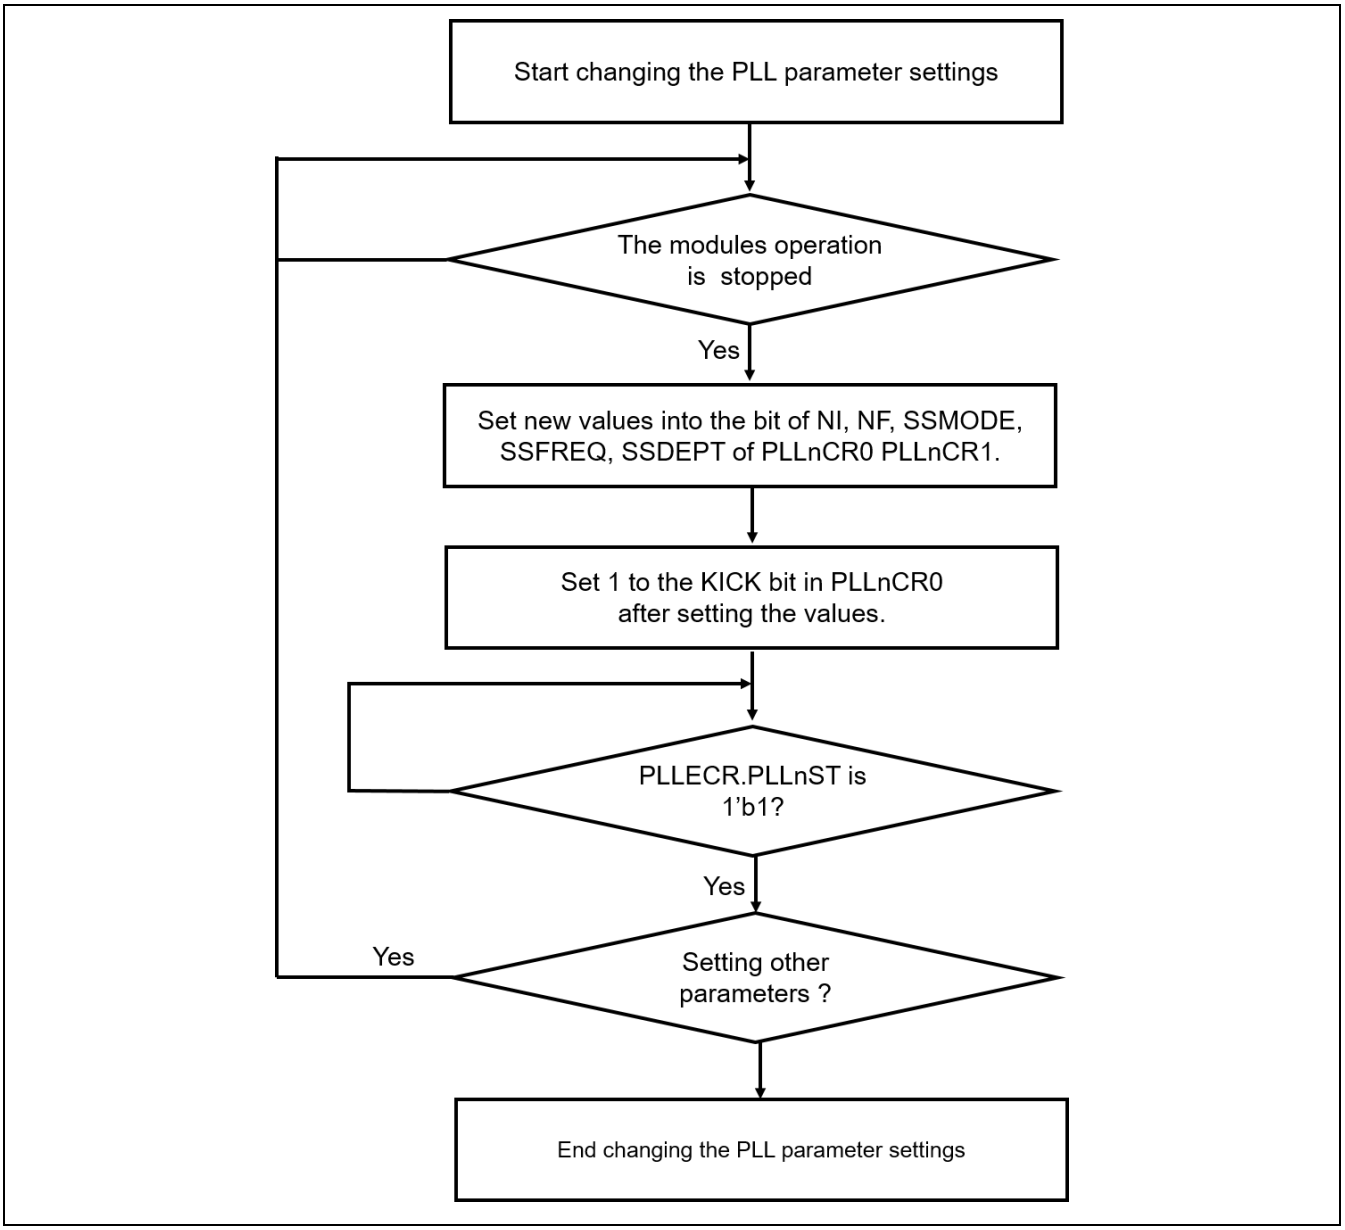

Figure 8.3.1 PLLn Parameter Setting Procedure

8.3.1.1 PLL Circuit 1

- PLL1 parameter setting is prohibited by software registers because the system operation cannot be guaranteed. Therefore, although there are control registers (PLL1CR0, PLL1CR1), the write access to the registers is prohibited (only the read access can be accepted).

- Initial parameter setting can be executed by MD pins (MD13, MD14, MD36, MD37). The detail information for the parameter setting is shown in Table 8.1.5.1.

8.3.1.2 PLL Circuit 2

- PLL2 parameter setting is executed by writing access to PLL2CR0, PLL2CR1. The initial PLL2 operation mode is the integer mode. The detail parameter information is shown in Table 8.1.5.2.

- Table 8.1.5.2 shows one example of the PLL2 parameter setting. When the parameter setting is necessary so that PLL2 can be operated with the fractional mode or the SSCG (Down spread) mode, see the Figure 8.3.1.

8.3.1.3 PLL Circuit 3

- PLL3 parameter setting is executed by writing access to PLL3CR0, PLL3CR1. The parameter setting is necessary as described in Sec. 8.1.5.3 because PLL3 can be operated only with the integer mode. When the multiplication of PLL3 is changed, see the Figure 8.3.1.

8.3.1.4 PLL Circuit 4

- PLL4 parameter setting is executed by writing access to PLL4CR0, PLL4CR1. The initial PLL4 operation mode is the integer mode. The detail parameter information is shown in Table 8.1.5.4.

- Table 8.1.5.4 shows one example of the PLL4 parameter setting. When the parameter setting is necessary so that PLL4 can be operated with the fractional mode or the SSCG (Down spread) mode, see the Figure 8.3.1.

8.3.1.5 PLL Circuit 5

- As shown in Sec.8.1.5.5, there are no control registers for PLL5 parameter setting. Table 8.1.5.5 shows the initial PLL5 parameter setting which depends on MD pins (MD13, MD14).

8.3.1.6 PLL Circuit 6

- PLL6 parameter setting is executed by writing access to PLL6CR0, PLL6CR1. The initial PLL6 operation mode is the integer mode. The detail parameter information is shown in Table 8.1.5.6.

- Table 8.1.5.6 shows one example of the PLL6 parameter setting. When the parameter setting is necessary so that PLL6 can be operated with the fractional mode or the SSCG (Down spread) mode, see the Figure 8.3.1.

8.3.1.7 PLL Circuit 7

- As shown in Sec.8.1.5.7, there are no control registers for PLL7 parameter setting. Table 8.1.5.7 shows the initial PLL7 parameter setting which depends on MD pins (MD13, MD14).

8.3.2 Changing Division Ratio of Cortex-A76, Cortex-R52, Debug Trace, 3DG Clock

Changing the frequency of ZC0φ, ZC1φ, ZC2φ, ZC3φ, ZR0φ, ZR1φ ,ZR2φ, ZSφ, ZTφ, ZTRφ, and ZGφ can be done by modifying each set of bits for setting the division ratio in FRQCRB and FRQCRC0 and FRQCRC1. After setting new ratio, write 1 to the KICK bit in FRQCRB to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRB, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRB and FRQCRC0 and FRQCRC1. When the KICK bit is read as 1, do not write 0 into the KICK bit.

8.3.3 Changing Division Ratio for DDR, DBSC clock

Changing the frequency of ZB3φ, ZB3D2φ, ZB3D4φ can be done by modifying ZB3FC bits for setting the division ratio in FRQCRD. After setting new ratio, write 1 to the KICK bit in FRQCRD to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRD, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRD. When the KICK bit is read as 1, do not write 0 into the KICK bit.

8.3.4 Changing Division Ratio for any other clocks

If “Variable” is filled on “Dividing ratio” column in Table 8.1.4a ~ Table 8.1.4g, the corresponding clock division ratio can be changed by the clock control register. See Sec.8.2 Register Description which corresponds with the target clock when the clock division ratio is changed.

8.4 Usage Notes

8.4.1 Write Protect Function for CPG registers

(1) Protected Registers

All registers in CPG (registers described in the section 8 CPG and section 9 Module Standby, Software Reset) except for CPGWPR can be protected from unexpected write operation when CPGWPCR.WPE = 1. When CPGWPCR.WPE = 1, CPG registers can't be written without using CPGWPR before the write access to the target register.

(2) How to Write to CPG Registers When CPGWPCR.WPE = 1

When CPGWPCR.WPE = 1, writing to CPGWPR is required before writing to the target register. The sample procedure is shown below (the case in which you want to write H'AAAA 5555 to the target register).

1. Write H'5555 AAAA (= inverted value of H'AAAA 5555) to CPGWPR
2. Write H'AAAA 5555 to the target register

Then, the target register is written by H'AAAA 5555.
When you skip the first step above, you can't write H'AAAA 5555 to the target register.

(3) How to Clear CPGWPCR.WPE

When CPGWPCR.WPE = 1, the bit can be cleared by the following procedure.

0. CPGWPCR.WPE is 1
1. Write H'5A5A FFFF to CPGWPR
2. Write H'A5A5 0000 to CPGWPCR
3. CPGWPCR.WPE becomes 0

When CPGWPCR.WPE = 0, the write protect function is disabled. Registers can be written directly without using CPGWPR.

8.4.2 Bus Access Protection for CPG registers

(1) Overview

R-Car V4M system allows to access CPG registers from multiple domains. To avoid the access confliction when there are multiple accesses for different domains, APB Bus is available to control the domain access by each 16 KB register address area as shown in Figure 8.4.1. The purpose is to enhance the security protect and safety protect of CPG register accesses.

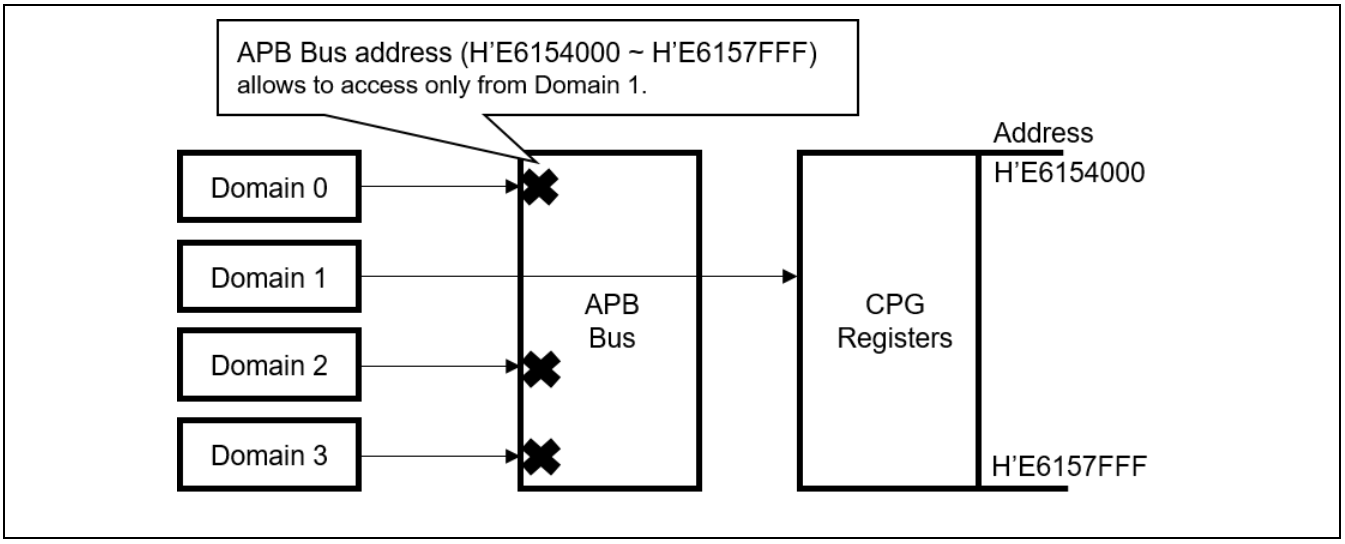

Figure 8.4.1 Bus Access Protection for CPG registers

CPG register address map is assigned from H'E6150000 to H'E615FFFF. The address map is separated into 4 groups which is accessed by each domain (Domain 0, Domain 1, Domain 2, Domain 3). The Physical address of CPG register body from 0x0000_0000 to 0x0000_3FFF.

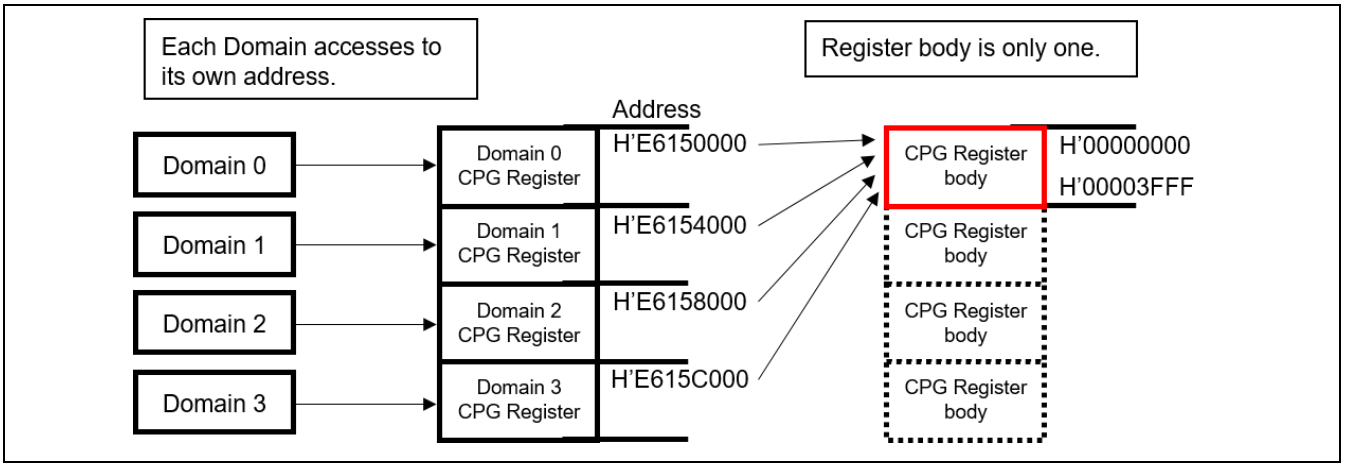

Figure 8.4.2 Address Map Structures

(2) Domain x Write Access Control Register (DxWACR) (x = 0, 1, 2, 3)

Each register in “CPG Register body” is protected by “Domain x Write Address Control Register (DxWACR (x = 0, 1, 2, 3)). For example of the case below (Figure 8.4.3), D2WACR.bit1 = 1, D{0, 1, 3}WACR.bit1 = 0. Only Domain 2 can write access to “Register 1”.

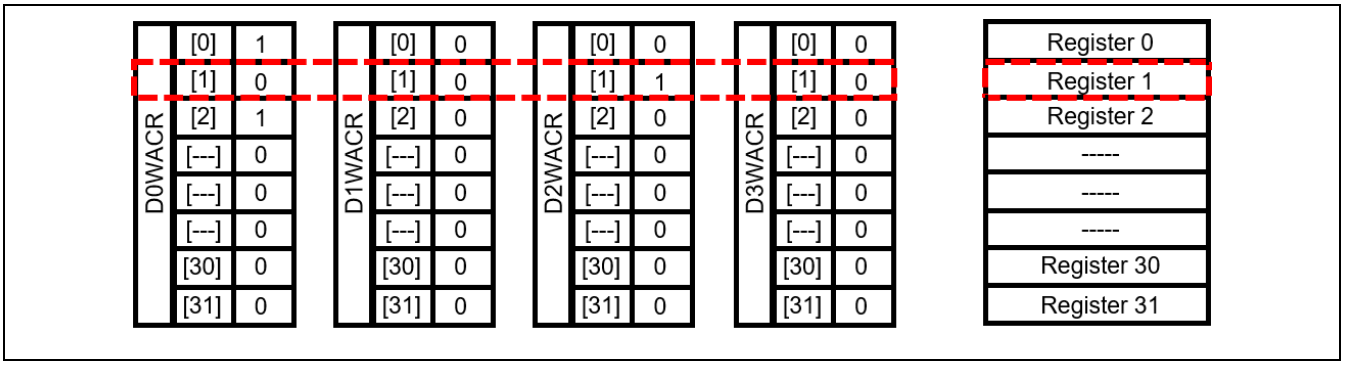

Figure 8.4.3 Usage of D0WACR, D1WACR, D2WACR, D3WACR

The register corresponds with D0WACRAn, D1WACRAn, D2WACRAn, D3WACRAn (n = 0 to 63) in Sec. 8.2.35, 8.2.36, 8.2.37, 8.2.38.

8.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

8.5.1 Overview

- CPG has Clock Monitor (a safety mechanism) in CPG itself to detect incorrect frequency of the clock generated from PLLn (n = 1, 2, 3, 4, 5, 6, 7). In addition, RCLK and CBFUSAφ is monitored by the Clock Monitor. It is described in 8.5.2.1.
- In each bus domain, the Clock Monitor is located to detect incorrect frequency of any clocks. It is described in 8.5.2.2 ~ 8.5.2.6.

8.5.2 Clock Monitor

Clock Monitor counts the rising edge of the monitor clock for N cycles of sampling clock (N value depends on the type of the monitor clock as shown in Table 8.5.2.1.1, Table 8.5.2.2.1, Table 8.5.2.3.1, Table 8.5.2.4.1a, Table 8.5.2.4.1b, Table 8.5.2.5.1, Table 8.5.2.6.1). When the counted value is out of upper/lower limit or monitor clock is stopped for a certain period, clock Monitor reports an error to ECM.

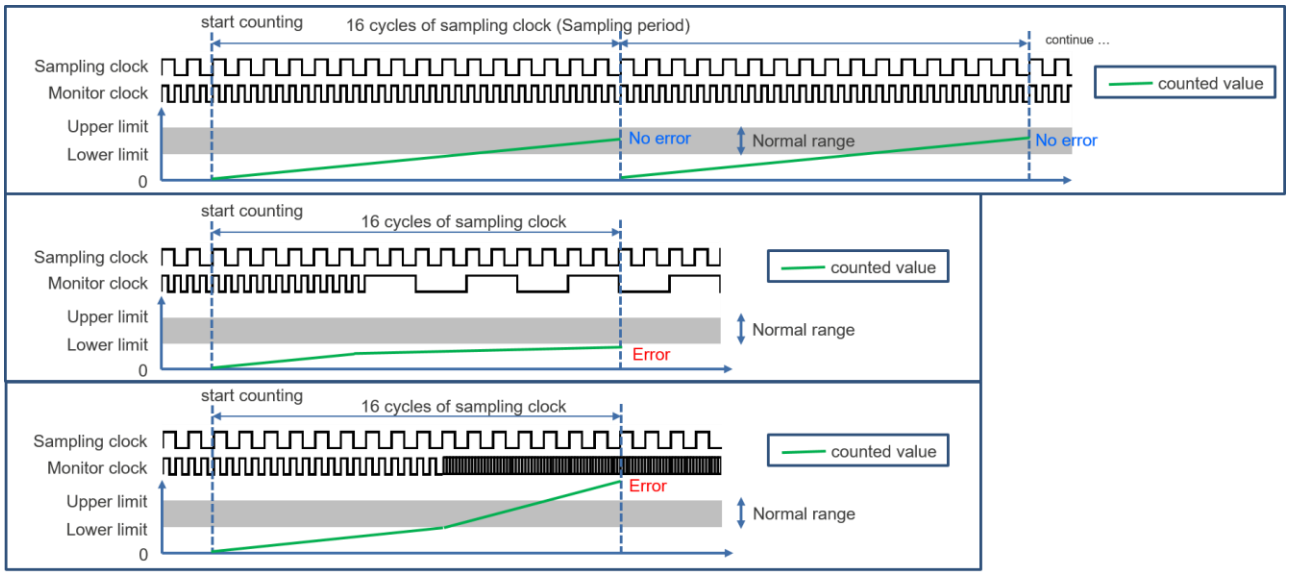

Figure 8.5.2.1 Clock monitor counter Timing Chart (Ex. 16 cycles (N=4) of sampling clock)

8.5.2.1 Clock Monitor for clocks generated from PLL

(1) Overview

Clock Monitor Counter exists in CPG module as shown in Figure 8.5.2.2. The clock monitor counter monitor whether the clock frequency for PLLnFBCK (n = 1, 2, 3, 4, 5, 6, 7), CBFUSAφ, RCLK is normal or not.

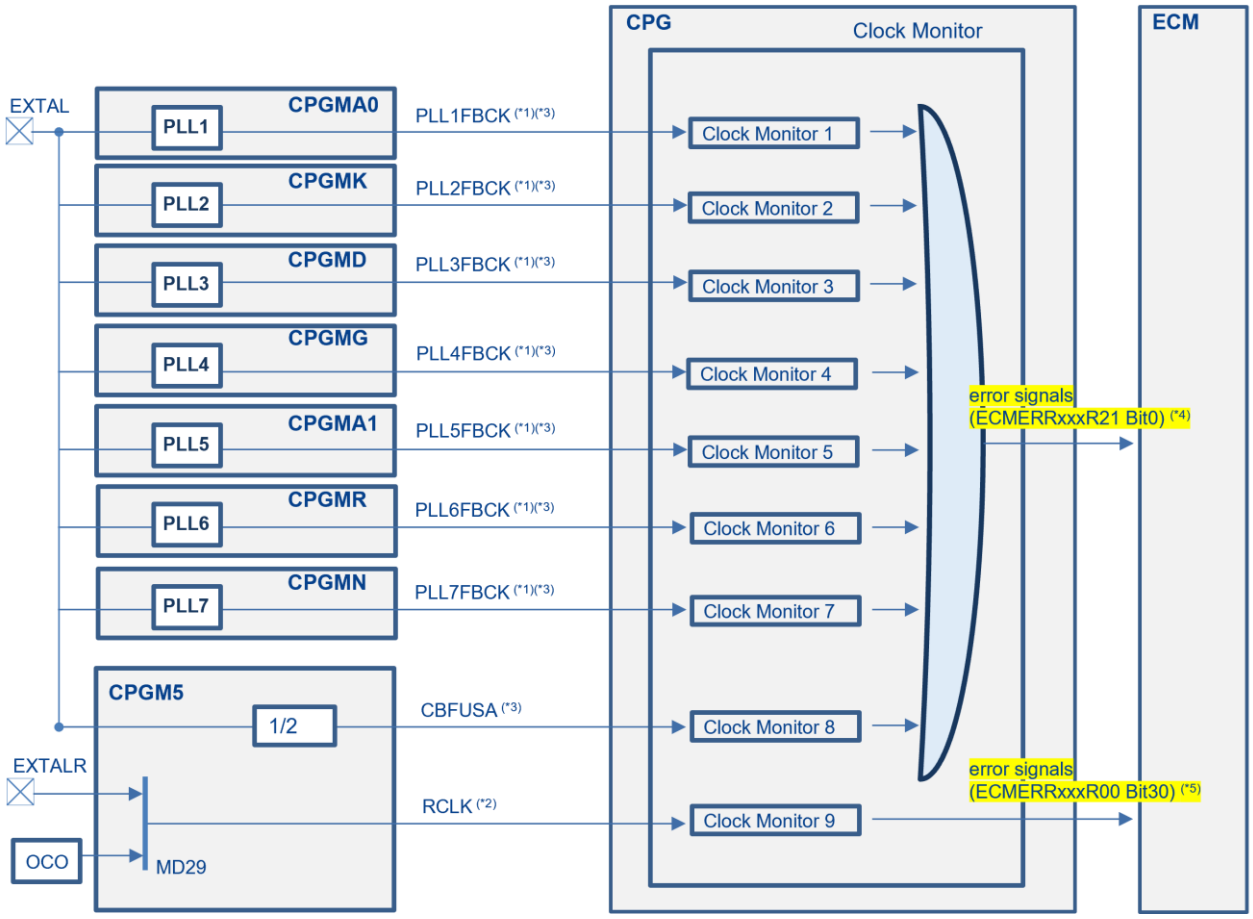

Figure 8.5.2.2 Block diagram of Clock Monitor Counter

Note *1: Frequency of Monitor clock (PLL1FBCK, PLL2FBCK, PLL3FBCK, PLL4FBCK, PLL5FBCK, PLL6FBCK, PLL7FBCK) is calculated as the following.

Monitor clock	Frequency [MHz]
PLL1FBCK	(PLL1VCO x 1/2) x 1/96
PLL2FBCK	(PLL2VCO x 1/4) x 1/12
PLL3FBCK	(PLL3VCO x 1/2) x 1/64
PLL4FBCK	(PLL4VCO x 1/2) x 1/12
PLL5FBCK	(PLL5VCO x 1/2) x 1/96
PLL6FBCK	(PLL6VCO x 1/2) x 1/12
PLL7FBCK	(PLL7VCO x 1/2) x 1/24

Note *2: In case that RCLK is monitored, the sampling clock is CBFUSAφ.
Note *3: In case of monitoring clocks except RCLK, the sampling clock is RCLK.
Note *4: When PLLnFBCK (n = 1, 2, 3, 4, 5, 6, 7) and CBFUSAφ are incorrect frequency, the error signal is reported to ECM.
Note *5: When RCLK is incorrect frequency, the error signal is reported to ECM.

(2) Register Configuration

See Table 8.1.6.1b.

(3) Register Description

XXX = PLL1FB, PLL2FB, PLL3FB, PLL4FB, PLL5FB, PLL6FB, PLL7FB, CBFUSA, RCLK.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) CPG All Clock Monitor Status Register (CPGACKMSR)

See 8.2.47.

(4) Operation

All registers in Clock Monitor except for CPGWPR can be protected from unexpected write operation when CPGWPCR.WPE = 1. When CPGWPCR.WPE = 1, CPG registers cannot be written without using CPGWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

[Initial Check]
1. Check if the reset for Clock Monitor is negated.
   I. Wait until XXXCKMCSR.RSTMSMP == 1 and XXXCKMCSR.RSTMMON == 1

[Run Clock Monitor]
1. Set limit count value (*1).
   I. Write value to XXXCKMLCH.CMPH & XXXCKMLCL.CMPL.

2. Run Clock Monitor.
   I. Set XXXCKMCSR.CHKEN = 1.
      Set also XXXCKMCSR.INTEN = 1 if you want to report error to MFIS.
   II. Wait until AAACKMSSR.CHKEN = 1 and AAACKMCSR.INTEN = 1

3. Check the status of Clock Monitor.
   I. Read check XXXCKMCSR.ENMON == 1.
   II. Read check XXXCKMCSR.CLRMON == 0.
   III. Wait until AAACKMCSR.ENMON == 1 and AAACKMCSR.CLRMON == 0.

4. Check the result (*2).
   I. Read out XXXCKMCSR.CHKRES status

Note *1: Modifying limit count value is not allowed while Clock Monitor is running.
Note *2: When INTEN=1 (MFIS notification function is enable), skipping the step 4 is allowed.

[Stop clock monitor & Clear error]
1. Stop clock monitor.
   I. Set XXXCKMCSR.CHKEN = 0.
   II. Wait until XXXCKMCSR.ENMON == 0.

2. Clear error
   I. Set XXXCKMECR.CLRRES = 1
   II. Wait until XXXCKMCSR.CHKRES == 0
   III. Set XXXCKMECR.CLRRES = 0

Note: Setting XXXCKMECR.CLRRES = 1 is not allowed while Clock Monitor is running.

[Error Injection – Clock Monitor Test]

1. Check if the reset for Clock Monitor is negated.
   I. Wait until XXXCKMCSR.RSTMSMP == 1 and XXXCKMCSR.RSTMMON == 1

2. Set limit count value.
   I. Write test value to XXXCKMLCH.CMPH & XXXCKMLCL.CMPL.
   (See 8A in the calculation example for the test settings.)
   II. Confirm that the setting has been written to those registers.

3. Run Clock Monitor.
   I. Set XXXCKMCSR.CHKEN = 1
   Set also XXXCKMCSR.INTEN = 1 if you want to report error to MFIS.

4. Check the status of Clock Monitor
   I. Read check XXXCKMCSR.ENMON == 1.
   II. Read check XXXCKMCSR.CLRMON == 0.

5. Check the result.
   I. Wait for the clock monitor to detect error. (Wait 26 cycles of SMPCK).
   II. Read out XXXCKMCSR.CHKRES status.
   III. Go back to the step i while the status is 0 up to 3 times.

   The test is passed when the status is 1 since the clock monitor detects the pseudo error.
   If the status read is 0 for the third check, quit all the tests and follow the fault control process.

6. Stop Clock Monitor
   I. Set XXXCKMCSR.CHKEN = 0
   II. Wait until XXXCKMCSR.ENMON == 0

7. Clear error
   I. Set XXXCKMECR.CLRRES = 1
   II. Wait until XXXCKMCSR.CHKRES == 0
   III. Set XXXCKMECR.CLRRES = 0

8. Go back to the step 2 unless all the tests have finished.

8A.
[Example of calculating MONCNT value]
fs = Frequency of sampling clock = 10MHz
fm = Frequency of monitor clock = 200MHz (N=4)

Expected MONCNT value = fm x (2^N / fs) = 200 x (2^N / 10) = 320

Table 8.5.2.1.1 N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
PLL1FB, PLL2FB, PLL3FB, PLL4FB, PLL5FB, PLL6FB, PLL7FB, CBFUSA	4
-	8
RCLK	16

To generate the pseudo error, the limit values are calculated as follows:

[For Upper Limit Test]
- The upper limit is set at half of the expected value.
- The lower limit is set at H’0000 0000.

[For Lower Limit Test]
- The lower limit is set at twice of the expected value.
- The upper limit is set at H’00FF FFFF.

8.5.2.2 Clock Monitor in Slave Access Bus domain

(1) Overview

A Clock Monitor Counter exists in Slave Access Bus domain as shown in Figure 8.5.2.3 to monitor whether the clock frequency is normal or not. One clock is monitored by one clock monitor counter inside Clock Monitor.

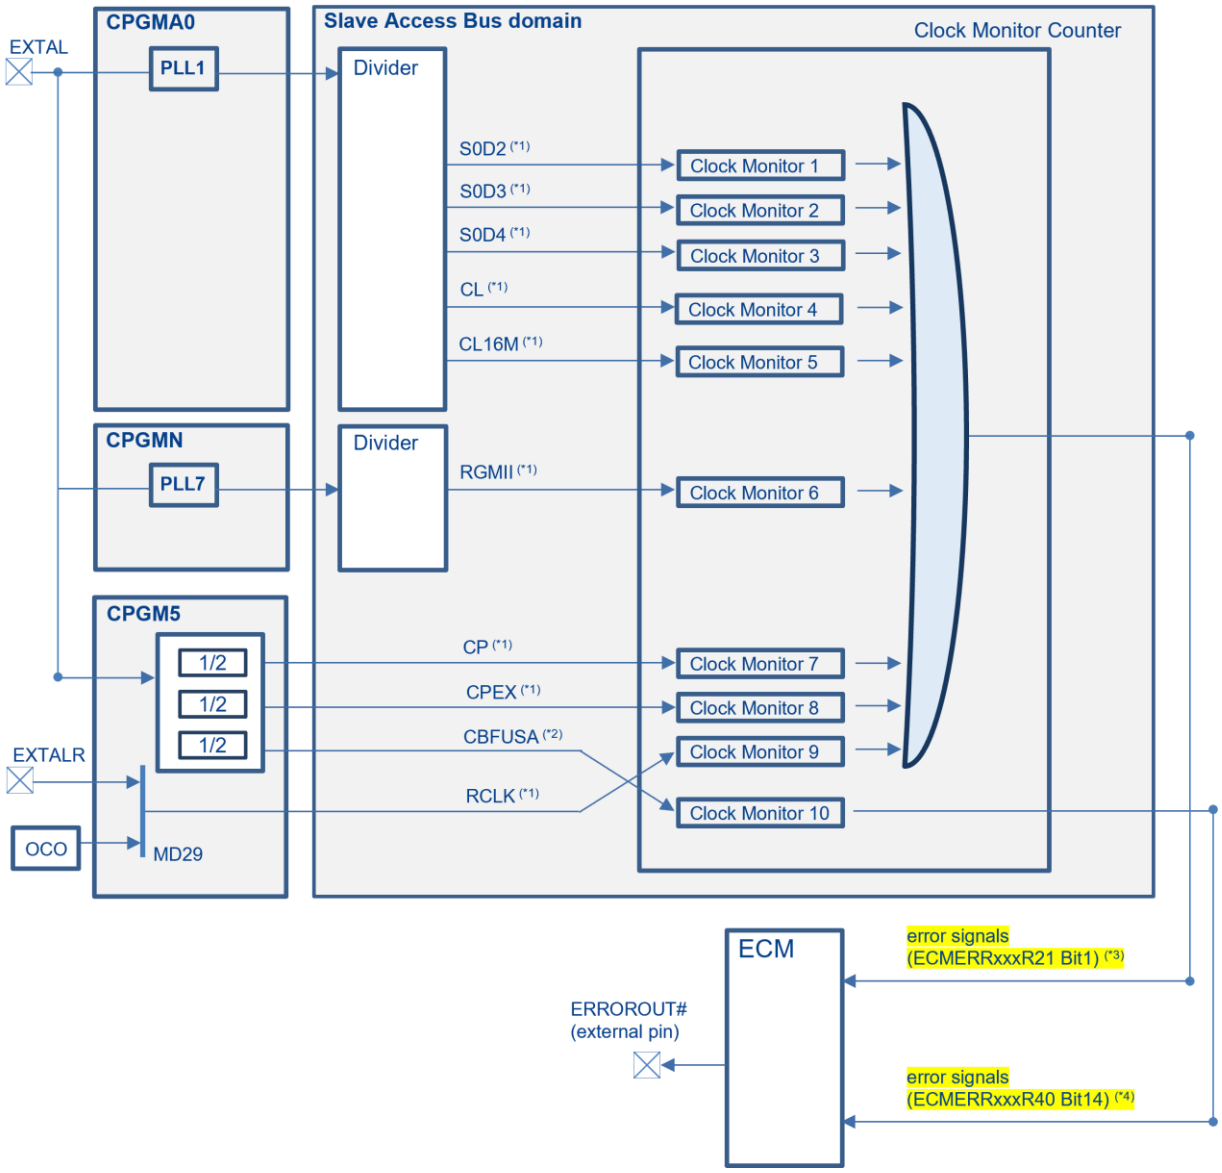

Figure 8.5.2.3 Block diagram of Clock Monitor Counter

Note *1 In case that CBFUSAφ is monitored, the sampling clock is RCLK. CBFUSAφ = EXTAL/2.
Note *2 In case of monitoring clocks except CBFUSAφ, the sampling clock is CBFUSAφ.
Note *3 Even if one of all clocks except CBFUSA has incorrect frequency, the error signal is reported to ECM.
Note *4 When CBFUSAφ is incorrect frequency, the error signal is reported to ECM via different notification path from any other clocks.

(2) Register Configuration

See Table 8.1.6.2.1.

(3) Register Description

XXX = S0D2, S0D3, S0D4, CL, CL16M, RGMII, CP, CPEX, CBFUSATOP, RCLKTOP.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) TOP Clock Monitor Write Protect Register (TOPCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.2 (3).

(h) TOP Clock Monitor Write Protect Control Register (TOPCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.2 (3).

(i) TOP All Clock Monitor Status Register (TOPACKMSR)

See 8.2.48.

(4) Operation

- All registers in Clock Monitor except TOPCKMWPR can be protected from unexpected write operation when TOPCKMWPCR.WPE = 1. When TOPCKMWPCR.WPE = 1, CPG registers cannot be written without using TOPCKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.2.1 about N cycles information of the sampling clock.

Table 8.5.2.2.1 N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D2, S0D3, S0D4, RGMII, CBFUSA	4
CL, CL16M, CP, CPEX	8
RCLK	16

8.5.2.3 Clock Monitor in Main Memory domain

(1) Overview

A Clock Monitor Counter exists in Main Memory domain as shown in Figure 8.5.2.4 to monitor whether the clock frequency is normal or not. One clock is monitored by one clock monitor counter inside Clock Monitor.

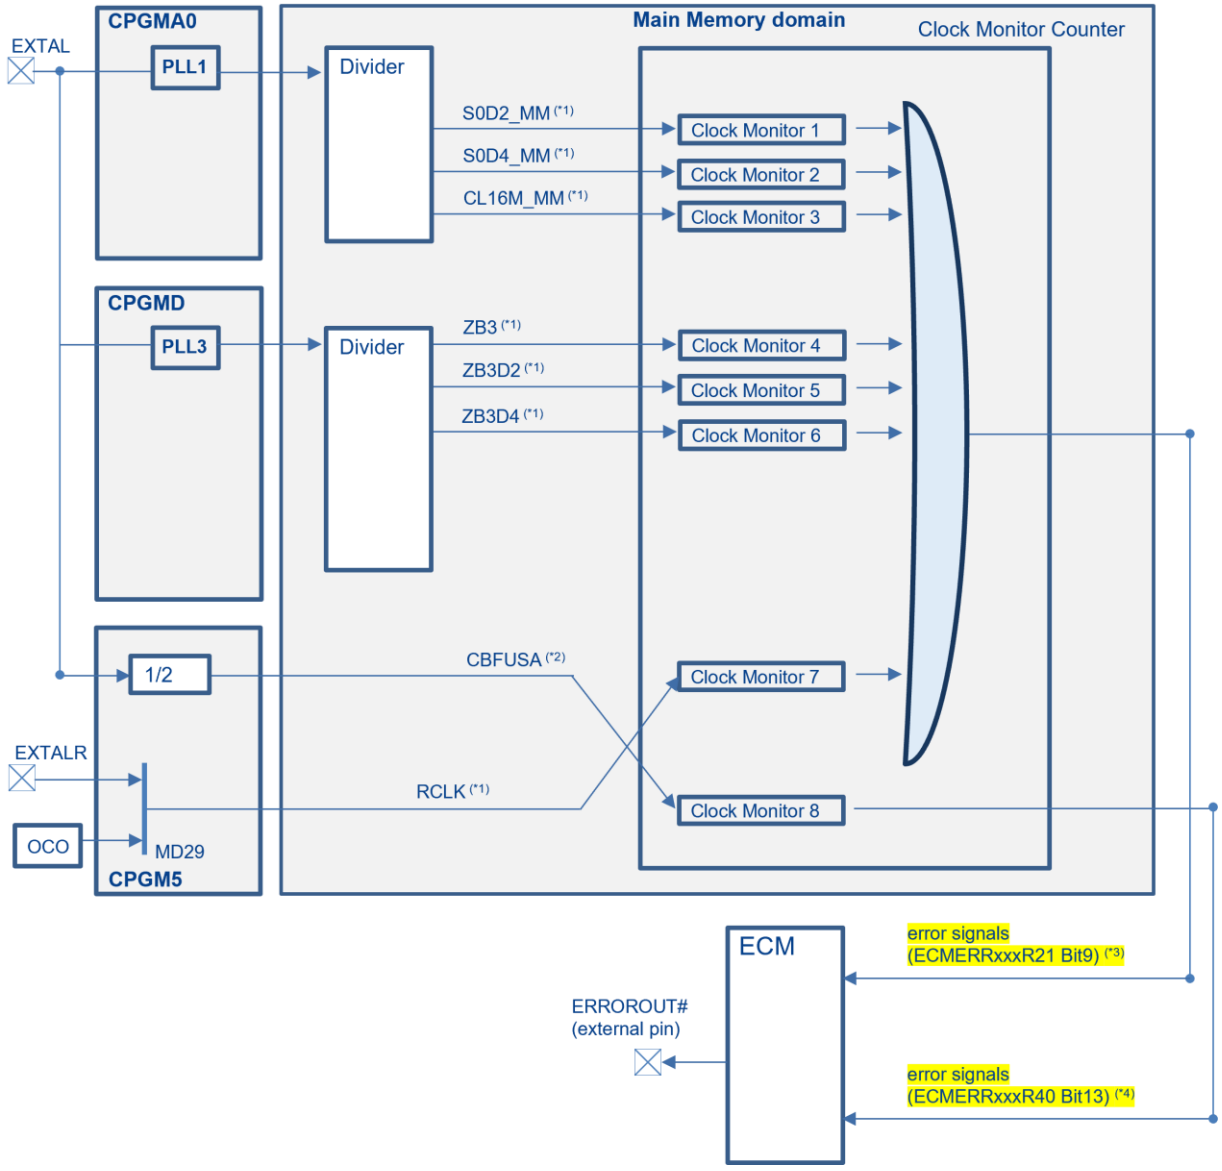

Figure 8.5.2.4 Block diagram of Clock Monitor Counter

Note *1 In case that CBFUSAφ is monitored, the sampling clock is RCLK. CBFUSAφ = EXTAL/2.
Note *2 In case of monitoring clocks except CBFUSAφ, the sampling clock is CBFUSAφ.
Note *3 Even if one of all clocks except CBFUSA has incorrect frequency, the error signal is reported to ECM.
Note *4 When CBFUSAφ is incorrect frequency, the error signal is reported to ECM via different notification path from any other clocks.

(2) Register Configuration

See Table 8.1.6.2.2.

(3) Register Description

XXX = S0D2MM, S0D4MM, CL16MMM, ZB3, ZB3D2, ZB3D4, CBFUSAMM, RCLKMM.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) MM Clock Monitor Write Protect Register (MMCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.3 (3).

(h) MM Clock Monitor Write Protect Control Register (MMCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.3 (3).

(i) MM All Clock Monitor Status Register (MMACKMSR)

See 8.2.49.

(4) Operation

- All registers in Clock Monitor except MMCKMWPR can be protected from unexpected write operation when MMCKMWPCR.WPE = 1. When MMCKMWPCR.WPE = 1, CPG registers cannot be written without using MMCKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.3.1 about N cycles information of the sampling clock.

Table 8.5.2.3.1 N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D2_MM, S0D4_MM, CBFUSA	4
CL16M_MM, ZB3, ZB3D2, ZB3D4	8
RCLK	16

8.5.2.4 Clock Monitor in RT (Real Time) domain

(1) Overview

Clock Monitor Counter exists in RT (Real Time) domain as shown in Figure 8.5.2.5 to monitor whether the clock frequency is normal or not. One clock is monitored by one clock monitor counter inside Clock Monitor. Clock Monitor (ckmcr52) monitors the clock which is provided for Cortex-R52 related modules. The clock for any other related modules is monitored by Clock Monitor (ckmrt).

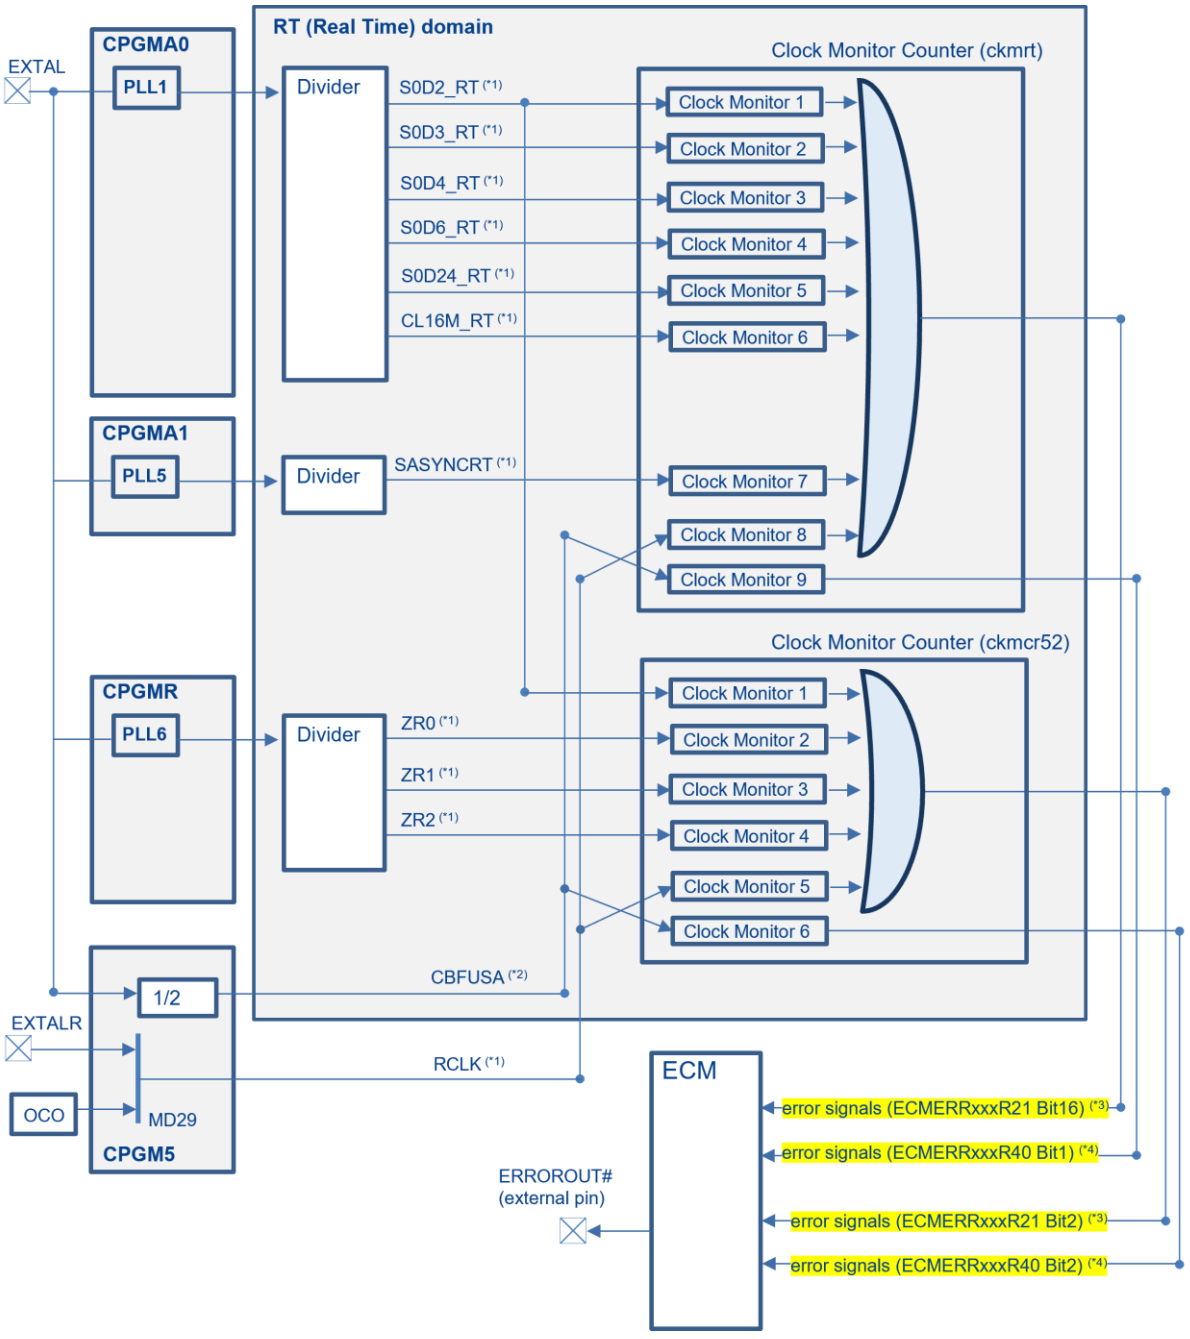

Figure 8.5.2.5 Block diagram of Clock Monitor Counter in RT (Real Time) domain

Note *1 In case that CBFUSAφ is monitored, the sampling clock is RCLK. CBFUSAφ = EXTAL/2.
In addition, S0D24_RTφ monitor is not mandatory because the clock is not used by any modules.
Note *2 In case of monitoring clocks except CBFUSAφ, the sampling clock is CBFUSAφ.
Note *3 Even if one of all clocks except CBFUSA has incorrect frequency, the error signal is reported to ECM.
Note *4 When CBFUSAφ is incorrect frequency, the error signal is reported to ECM via different notification path from any other clocks.

(2) Register Configuration

See Table 8.1.6.2.3a, 8.1.6.2.3b.

(3) Register Description

1. Clock Monitor Counter (ckmrt)

XXX = S0D2RT, S0D3RT, S0D4RT, S0D6RT, S0D24RT, CL16MRT, SASYNCRT, CBFUSART, RCLKRT.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) RT Clock Monitor Write Protect Register (RTCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.4 (3) 1.

(h) RT Clock Monitor Write Protect Control Register (RTCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.4 (3) 1.

(i) RT All Clock Monitor Status Register (RTACKMSR)

See 8.2.50.

2. Clock Monitor Counter (ckmcr52)

YYY = S0D2RTCR52, ZR0CR52, ZR1CR52, ZR2CR52, CBFUSARTCR52, RCLKRTCR52.

(j) YYY Clock Monitor Control / Status Register (YYYCKMCSR)

See 8.2.39.

(k) YYY Clock Monitor Error Clear Register (YYYCKMECR)

See 8.2.40.

(l) YYY Clock Monitor Limit Count H Register (YYYCKMLCH)

See 8.2.41.

(m) YYY Clock Monitor Limit Count L Register (YYYCKMLCL)

See 8.2.42.

(n) YYY Clock Monitor Count Register (YYYCKMCNT)

See 8.2.43.

(o) YYY Clock Monitor Count on Error Register (YYYCKMCNTE)

See 8.2.44.

(p) RTCR52 Clock Monitor Write Protect Register (RTCR52CKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (j), (k), (l), (m), (n), (o) registers in 8.5.2.4 (3) 2.

(q) RTCR52 Clock Monitor Write Protect Control Register (RTCR52CKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (j), (k), (l), (m), (n), (o) registers in 8.5.2.4 (3) 2.

(r) RTCR52 All Clock Monitor Status Register (RTCR52ACKMSR)

See 8.2.51.

(4) Operation

1. Clock Monitor Counter (ckmrt)

- All registers in Clock Monitor except RTCKMWPR can be protected from unexpected write operation when RTCKMWPCR.WPE = 1. When RTCKMWPCR.WPE = 1, CPG registers cannot be written without using RTCKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.4.1a about N cycles information of the sampling clock.

Table 8.5.2.4.1a N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D2_RT, S0D3_RT, S0D4_RT, S0D6_RT, CBFUSA	4
S0D24_RT, CL16M_RT, SASYNCRT	8
RCLK	16

2. Clock Monitor Counter (ckmcr52)

- All registers in Clock Monitor except RTCR52CKMWPR can be protected from unexpected write operation when RTCR52CKMWPCR.WPE = 1. When RTCR52CKMWPCR.WPE = 1, CPG registers cannot be written without using RTCR52CKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.4.1b about N cycles information of the sampling clock.

Table 8.5.2.4.1b N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D2_RT, CBFUSA	4
ZR0, ZR1, ZR2	8
RCLK	16

8.5.2.5 Clock Monitor in Peripheral domain

(1) Overview

A Clock Monitor Counter exists in Peripheral domain as shown in Figure 8.5.2.6 to monitor whether the clock frequency is normal or not. One clock is monitored by one clock monitor counter inside Clock Monitor.

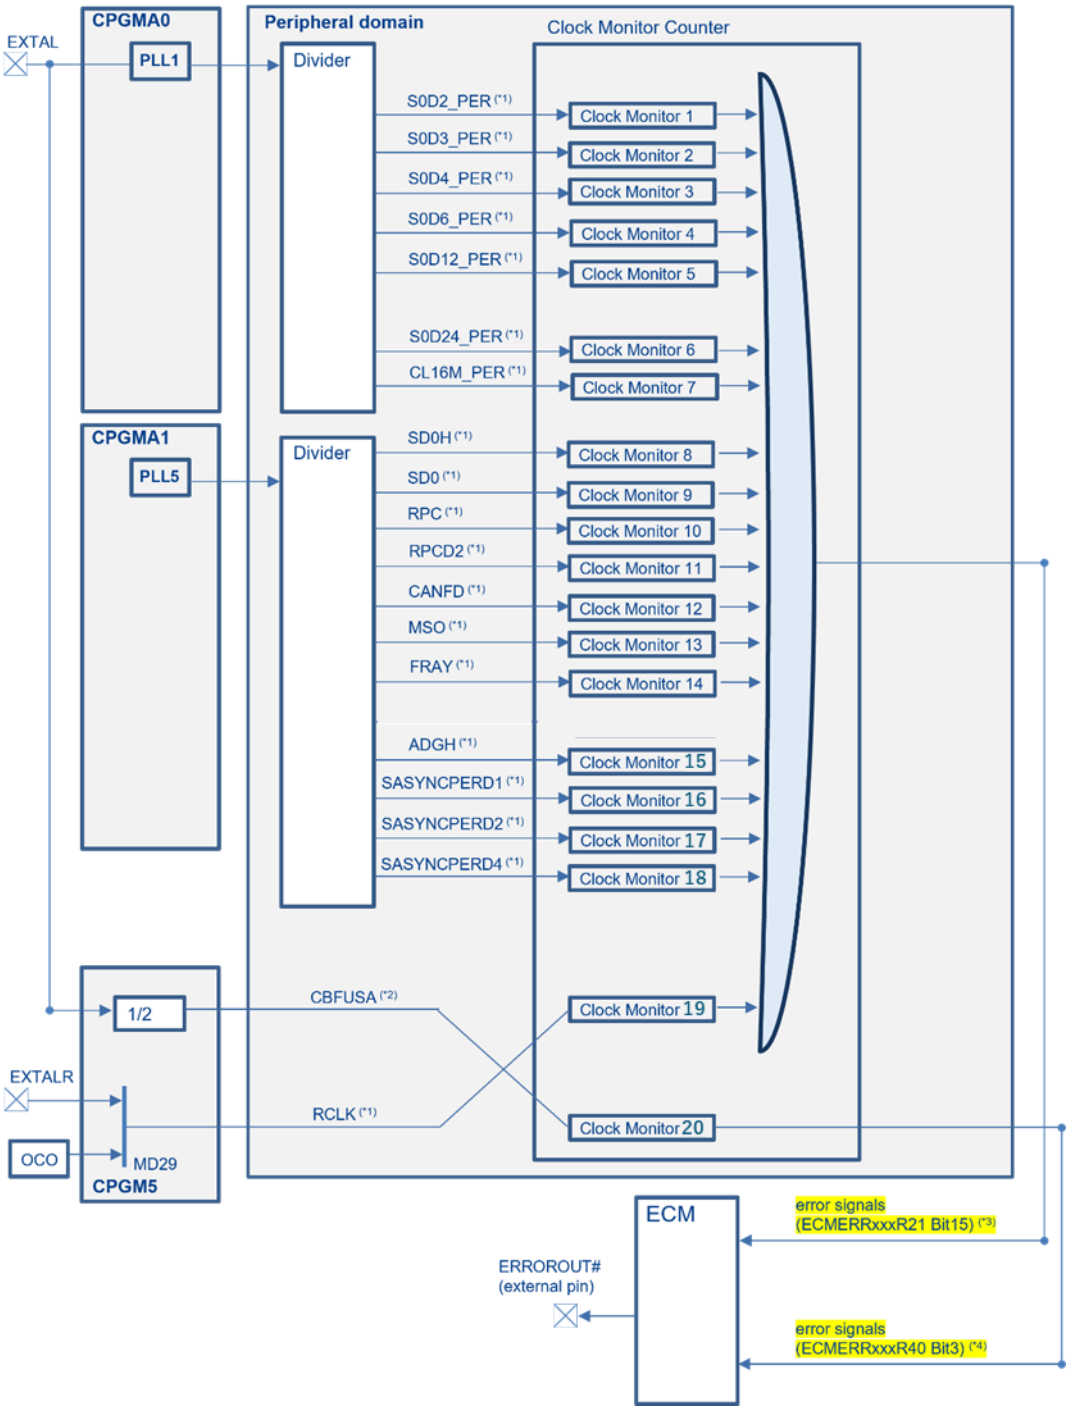

Figure 8.5.2.6 Block diagram of Clock Monitor Counter

Note *1 In case that CBFUSAφ is monitored, the sampling clock is RCLK. CBFUSAφ = EXTAL/2.
In addition, ADGHφ monitor is not mandatory because the clock is not used by any modules.
Note *2 In case of monitoring clocks except CBFUSAφ, the sampling clock is CBFUSAφ.
Note *3 Even if one of all clocks except CBFUSA has incorrect frequency, the error signal is reported to ECM.
Note *4 When CBFUSAφ is incorrect frequency, the error signal is reported to ECM via different notification path from any other clocks.

(2) Register Configuration

See Table 8.1.6.2.4.

(3) Register Description

XXX = S0D2PER, S0D3PER, S0D4PER, S0D6PER, S0D12PER, S0D24PER, CL16MPER, SD0H, SD0, RPC, RPCD2, CANFD, MSO, FRAY, ADGH, SASYNCPERD1, SASYNCPERD2, SASYNCPERD4, CBFUSAPER, RCLKPER.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) PER Clock Monitor Write Protect Register (PERCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.5 (3).

(h) PER Clock Monitor Write Protect Control Register (PERCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.5 (3).

(i) PER All Clock Monitor Status Register (PERACKMSR)

See 8.2.52.

(4) Operation

- All registers in Clock Monitor except PERCKMWPR can be protected from unexpected write operation when PERCKMWPCR.WPE = 1. When PERCKMWPCR.WPE = 1, CPG registers cannot be written without using PERCKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.5.1 about N cycles information of the sampling clock.

Table 8.5.2.5.1 N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D2_PER, S0D3_PER, S0D4_PER, S0D6_PER, SD0H, ADGH, SASYNCPERD1, SASYNCPERD2, CBFUSA	4
S0D12_PER, S0D24_PER, CL16M_PER, SD0, RPC, RPCD2, CANFD, MSO, FRAY, SASYNCPERD4	8
RCLK	16

8.5.2.6 Clock Monitor in HSC (High speed Communication) domain

(1) Overview

A Clock Monitor Counter exists in HSC (High speed Communication) domain as shown in Figure 8.5.2.7 to monitor whether the clock frequency is normal or not. One clock is monitored by one clock monitor counter inside Clock Monitor.

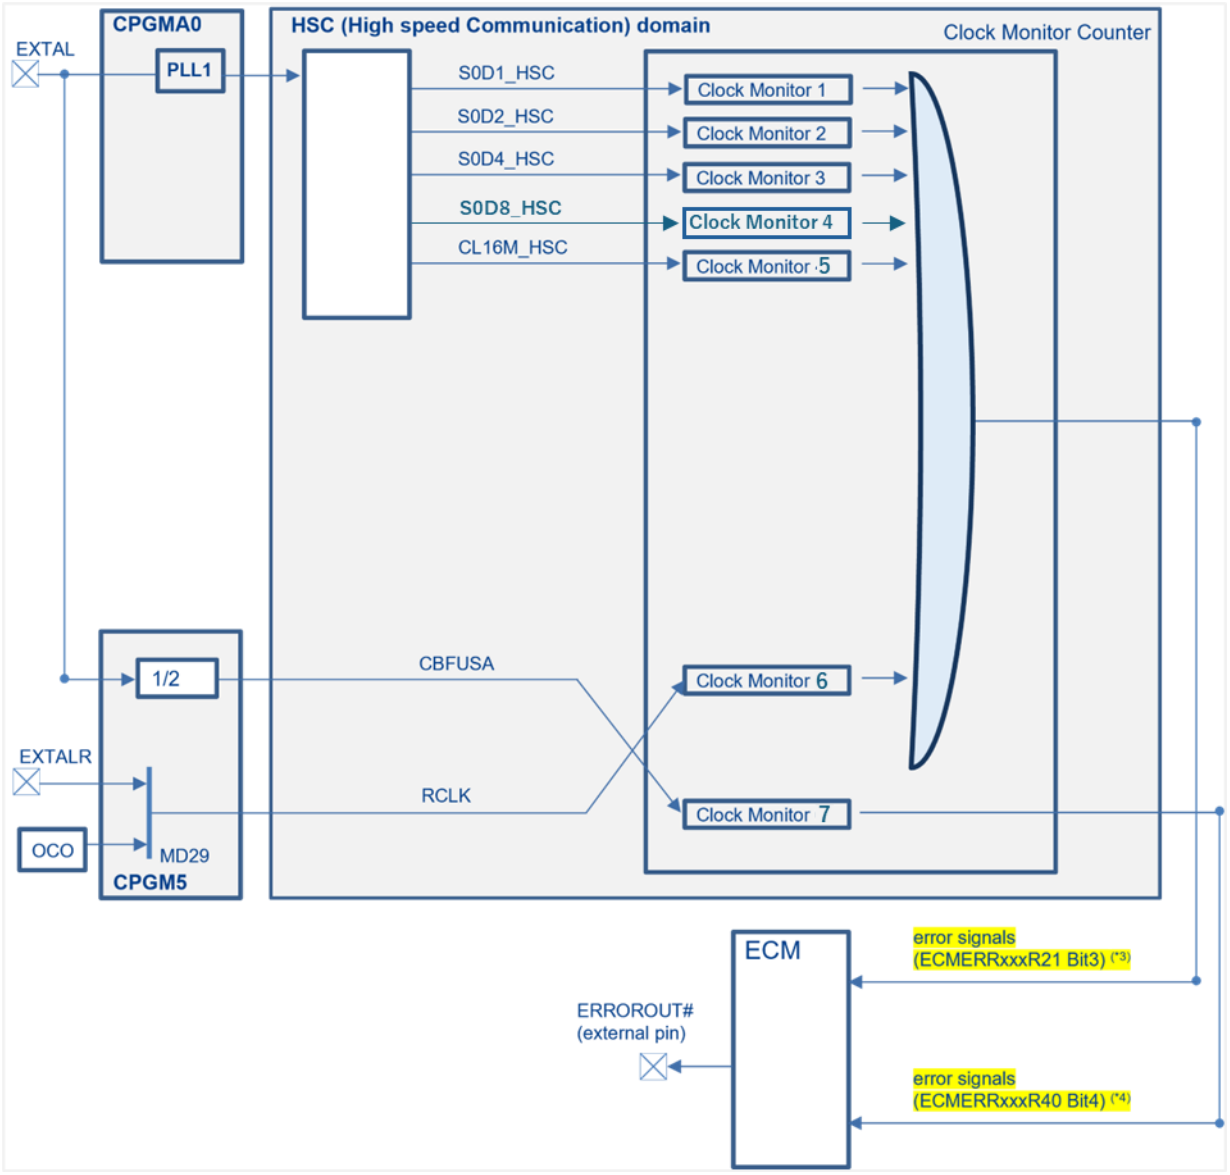

Figure 8.5.2.7 Block diagram of Clock Monitor Counter

Note *1 In case that CBFUSAφ is monitored, the sampling clock is RCLK. CBFUSAφ = EXTAL/2.
Note *2 In case of monitoring clocks except CBFUSAφ, the sampling clock is CBFUSAφ.
Note *3 Even if one of all clocks except CBFUSA has incorrect frequency, the error signal is reported to ECM.
Note *4 When CBFUSAφ is incorrect frequency, the error signal is reported to ECM via different notification path from any other clocks.

(2) Register Configuration

See Table 8.1.6.2.5.

(3) Register Description

XXX = S0D1HSC, S0D2HSC S0D4HSC, CL16MHSC, CBFUSAHSC, RCLKHSC.

(a) XXX Clock Monitor Control / Status Register (XXXCKMCSR)

See 8.2.39.

(b) XXX Clock Monitor Error Clear Register (XXXCKMECR)

See 8.2.40.

(c) XXX Clock Monitor Limit Count H Register (XXXCKMLCH)

See 8.2.41.

(d) XXX Clock Monitor Limit Count L Register (XXXCKMLCL)

See 8.2.42.

(e) XXX Clock Monitor Count Register (XXXCKMCNT)

See 8.2.43.

(f) XXX Clock Monitor Count on Error Register (XXXCKMCNTE)

See 8.2.44.

(g) HSC Clock Monitor Write Protect Register (HSCCKMWPR)

The specification is same as CPG Write Protect Register (CPGWPR) specification in Sec.8.2.1. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.6 (3).

(h) HSC Clock Monitor Write Protect Control Register (HSCCKMWPCR)

The specification is same as CPG Write Protect Control Register (CPGWPCR) specification in Sec.8.2.2. The register is effective for (a), (b), (c), (d), (e), (f) registers in 8.5.2.6 (3).

(i) HSC All Clock Monitor Status Register (HSCACKMSR)

See 8.2.53.

(4) Operation

- All registers in Clock Monitor except HSCCKMWPR can be protected from unexpected write operation when HSCCKMWPCR.WPE = 1. When HSCCKMWPCR.WPE = 1, CPG registers cannot be written without using HSCCKMWPR before the write access to the target register. In detail, see the Sec. 8.4.1. The write access usage is same as it.

- The other operation procedure is same as that of 8.5.2.1 (4).

- See Table 8.5.2.6.1 about N cycles information of the sampling clock.

Table 8.5.2.6.1 N value for Monitor clock during calculating MONCNT value

Monitor clock	N value
S0D1_HSC, S0D2_HSC, S0D4_HSC, S0D8_HSC, CBFUSA	4
CL16M_HSC	8
RCLK	16

8.5.3 Safety Access Protection

(1) Overview

CPG provides a safety access protection mechanism to guarantee “Freedom From Interference (FFI)” when accessing the registers belonging to the CPG module. Several masters (e.g. Cortex-R52, Cortex-A76) take control of different portions and modules of the chip. The access protection mechanism shall enable sharing and splitting the functionality among cores.

The access protection mechanism for the control registers belonging to CPG module shall be aligned with the Region ID concept. In detail, see Sec.8.4.2. CPG has critical system control functions such as the clock enable, the clock distribution, the module reset. Therefore, the strong access restrictions are necessary for CPG.

(2) Register Description

As shown in Sec. 8.4.2 (2), the register corresponds with D0WACRAn, D1WACRAn, D2WACRAn, D3WACRAn (n = 0 to 63) in Sec. 8.2.35, 8.2.36, 8.2.37, 8.2.38.

(3) Operation

See Sec. 8.4.2 (1) and 8.4.2 (2).

9. Module Standby, Software Reset

9.1 Overview

The CPG functions related to module control are explained in this section. Under software control, the CPG is capable of turning the supply of clock signals to individual modules on or off and of resetting individual modules.

9.1.1 Features

(1) Module Standby

Clock supply to specified modules is stopped by setting the module stop control register bits. Two registers for one module, and supply of the clock signal to a module is stopped when all these registers bits are set to 'stop'. The register specification is described in 9.2.3, 9.2.4.
- Module Stop Control Register (MSTPCRn (n = 0 to 29))
- Module Stop Status Register (MSTPSRn (n = 0 to 29))

(2) Software Reset

Initialize the specified module by setting the software reset register bit. The register specification is described in 9.2.1, 9.2.2.
- Software Reset Control Register (SRCRn (n = 0 to 29))
- Software Reset Clearing Register (SRSTCLRn (n = 0 to 29))

(3) Reset Status Monitor [Functional Safety]

Reset status monitor is a safety mechanism that confirms if an intended reset is asserted and an unintended reset is asserted. The related register specification is described in Section 8.2.10, 8.2.11, 8.2.12, 8.2.13.
- Functional Safety Reset Check Register A (FSRCHKRAn (n = 0 to 29))
- Functional Safety Reset Check Register B (FSRCHKRBn (n = 0 to 29))
- Functional Safety Reset Check Set Register (FSRCHKSETRn (n = 0 to 29))
- Functional Safety Reset Check Clear Register (FSRCHKCLRRn (n = 0 to 29))

(4) Force Reset

Software Reset, which is shown in Section 9.1.1 (2), is asserted after the request/acknowledge handshake between CPG and the target modules is completed to guarantee the system operation in the chip. On the other hand, when writing 0 to the corresponding bit of RAHSRn (Request/Acknowledge Handshake Select Register), CPG is forced to assert the software reset to the target modules without completing the handshake. The related register specification is described in 9.2.5.
- Request/Acknowledge Handshake Select Register (RAHSRn (n = 0 to 29))

(5) Bus Access Protection [Functional Safety]

Register access protection is applied for registers of Module Standby, Software Reset, Forced Reset. The detail specification is described in 9.4.2. In addition, the function is a safety mechanism to guarantee "Freedom From Interference (FFI)". In detail, see 9.5.3. The register specification is described in 9.2.6.
- Domain x Write Access Control Register of MSTPCRn (DxWACR_MSTPCRn (x = 0 to 3))
- Domain x Write Access Control Register of SRCRn (DxWACR_SRCRn (x = 0 to 3))
- Domain x Write Access Control Register of SRSTCLRn (DxWACR_SRSTCLRn (x = 0 to 3))
- Domain x Write Access Control Register of RAHSRn (DxWACR_RAHSRn (x = 0 to 3))

9.1.2 Block Diagram

A block diagram of CPG is shown in Figure 9.1.1.

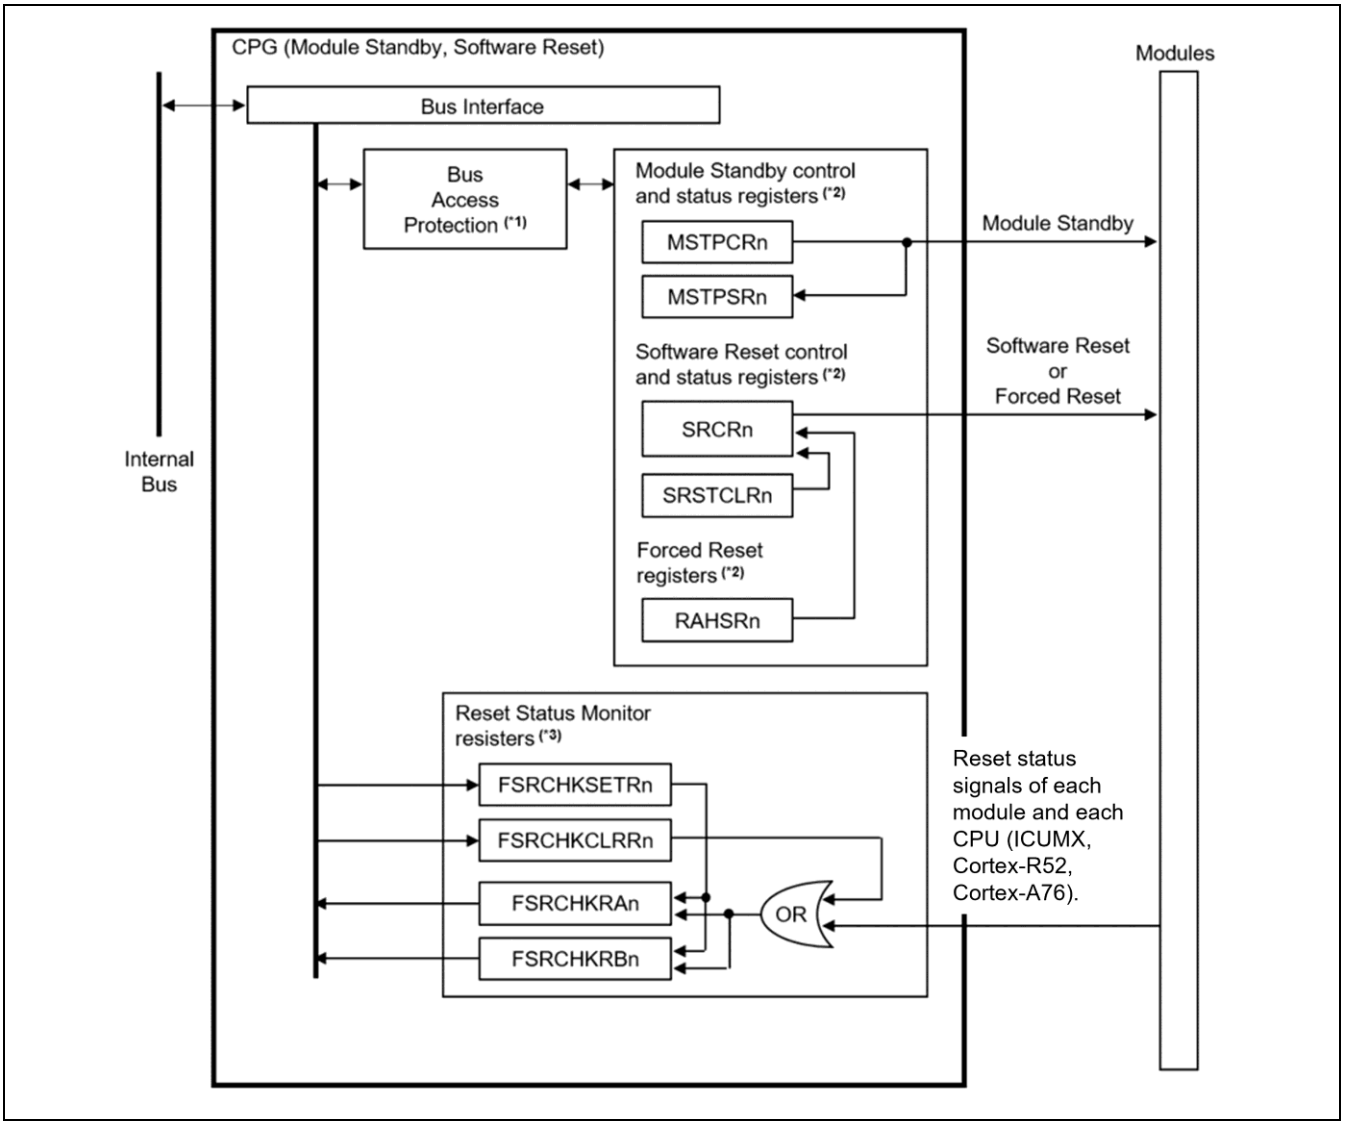

Figure 9.1.1 Block Diagram of Module Standby, Software Reset

Note *1: See 9.4.2, 9.5.3 about the detailed description.
Note *2: See 9.2.1, 9.2.2, 9.2.3, 9.2.4, 9.2.5 about the register specification.
Note *3: See 8.2.3, 8.2.4, 8.2.5, 8.2.6 about the register specification.

9.1.3 External Pins

There is no input/output pin related with this function.

9.1.4 Register Configuration

- The base-address of Module Standby, Software Reset is H'E615 0000
- CPG has Bus Access Protection registers (DxWACRA) as shown in Section 9.1.1 (5). See Section 9.4.2 in detail.

Table 9.1.4.1 Register Configuration

Register Name (Abbreviation)	R/W	Address	Initial value	Access Size	Corresponding DxWACRA (x = 0, 1, 2, 3)
SRCR0	R/W	H'E615 2C00	H'0000 0000	32	DxWACR_SRCR0
SRCR1	R/W	H'E615 2C04	H'0000 0000	32	DxWACR_SRCR1
SRCR2	R/W	H'E615 2C08	H'0000 0000	32	DxWACR_SRCR2
SRCR3	R/W	H'E615 2C0C	H'0000 0000	32	DxWACR_SRCR3
SRCR4	R/W	H'E615 2C10	H'0000 0000	32	DxWACR_SRCR4

Note 1. There are no protect registers (DxWACRA (x = 0, 1, 2, 3)) for Read Only register.
Note 2 DxWACRA (x = 0, 1, 2, 3) registers can be accessed only by Domain 0.

9.2 Register Description

Legend for Register Description
Initial value : Register value after a reset
– : Undefined value
R/W : Readable/writable. The written value can be read.
R : Read-only.
W : Write-only. The read value is undefined.

9.2.1 Software Reset Register (SRCRn (n = 0 to 29)

Each SRCRn is a 32-bit readable/writable register. Each bit is assigned to a module in the chip. Writing 1 to the bit resets the corresponding module. Writing 1 to a given bit of the software reset clearing register (SRSTCLRn (n = 0 to 29)) clears the corresponding bit of SRCRn and releases the reset. SRCRn and SRSTCLRn does not need read-modify-write sequence. Write 1 to only target module bit of SRCRn or SRSTCLRn. It takes maximum 1 cycle by RCLK to complete software reset after setting 1 to target bit of SRCRn. When release software reset, it is necessary to wait more than 1 cycle by RCLK before setting 1 to target bit of SRSTCLRn. If applying a software reset to a module connected to the AXI, wait the completion of any data transfer.

Register protection function is covered by a function shown in 9.1.1 (5).

9.2.1.1 Software Reset Register 0 (SRCR0)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.2 Software Reset Register 1 (SRCR1)

See the following excel file, in which the bit assignment and the bit description are summarized.

9.2.1.18 Software Reset Register 17 (SRCR17)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.19 Software Reset Register 18 (SRCR18)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.20 Software Reset Register 19 (SRCR19)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.21 Software Reset Register 20 (SRCR20)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.22 Software Reset Register 21 (SRCR21)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.23 Software Reset Register 22 (SRCR22)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.24 Software Reset Register 23 (SRCR23)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.25 Software Reset Register 24 (SRCR24)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.26 Software Reset Register 25 (SRCR25)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.27 Software Reset Register 26 (SRCR26)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.28 Software Reset Register 27 (SRCR27)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.29 Software Reset Register 28 (SRCR28)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.1.30 Software Reset Register 29 (SRCR29)

See the following excel file, in which the bit assignment and the bit description are summarized.

R-CarV4M_UM_009_SRCRn_FSRCHKRAn_FSRCHKRBn_r1p10.xlsx

9.2.2 Software Reset Clearing Register (SRSTCLRn (n = 0 to 29))

Each SRSTCLRn is a 32-bit writable register. Each bit is assigned to a module in this chip. Writing 1 to the bit clears the corresponding bit of SRCRn and releases the reset. Write 0 to the reserved bits.

Bit assignment of SRSTCLRn is same with one of SRCRn.

Register protection function is covered by a function shown in Section 9.1.1 (5).

9.2.3 Module Stop Control Register (MSTPCRn (n = 0 to 29))

MSTPCRn is 32-bit readable/writable registers which control supply of the clock signal to the modules assigned to the corresponding bits. Module stop signals can be controlled by setting the MSTPCRn (n = 0 to 29).

0: Enables supply of the clock signal to the corresponding module.
1: Stops supply of the clock signal to the corresponding module.

Register protection function is covered by a function shown in Section 9.1.1 (5).

9.2.3.1 Module Stop Control Register 0 (MSTPCR0)

31 to 28	-	All 0	R	Reserved. These bits are always read as an initial value. System operation cannot be guaranteed when the different value from the initial value is written to these bits.
27	ssi	1	R/W	SSI
26	ssiu	1	R/W	SSIU
25 to 0	-	All 0	R	Reserved. These bits are always read as an initial value. System operation cannot be guaranteed when the different value from the initial value is written to these bits.

9.2.4 Module Stop Status Register (MSTPSRn (n = 0 to 29))

MSTPSRn is a 32-bit readable register that indicates whether the on-chip modules are in the module standby state. Setting a bit in this register to 1 stops supply of the clock signal to the corresponding module and the setting a bit to 0 enables clock supply to the corresponding module. The bit assignment and the initial value are same as that of MSTPCRn (n = 0 to 29).

0: Supply of the clock signal to the corresponding module is enabled.
1: Supply of the clock signal to the corresponding module is stopped.

9.2.5 Request/Acknowledge Handshake Select Register (RAHSRn (n = 0 to 29)

RAHSRn is a 32-bit readable/writable register. The bit assignment of RAHSRn is same as that of SRCRn (the initial value of RAHSRn is different from that of SRCRn). The usage method is described in Section 9.3 (4).

Register protection function is covered by a function shown in Section 9.1.1 (5).

9.2.6 Domain x Write Access Control Register for yyy (DxWACR_yyy (x = 0 to 3))

DxWACR_yyy is a 32-bit readable/writable register. The register specification is described in Section 9.4.2. The register is applied for the registers below.

- MSTPCRn (n = 0 to 29)
- SRCRn (n = 0 to 29)
- SRSTCLRn (n = 0 to 29)
- RAHSRn (n = 0 to 29))

9.3 Operation

(1) Module Standby

The following is procedure for Module Stop (turn off clock).

1. Set to 1 at the target module bit of MSTPCRn by read-modify-write.
2. Check the bit that the target module of MSTPSRn is 1.

The following is procedure for clear Module Stop (turn on clock).

1. Set to 0 at the target module bit of MSTPCRn by read-modify-write.
2. Check the bit that the target module of MSTPSRn is 0.

(2) Software Reset

There are three types ((A), (B), (C)) of Software Reset flows as the following:

A) See Figure 9.3.1 (a), 9.3.1 (b), which is applied to issue the Software reset for Master modules in Power Shutoff domain (IMP domain, VIO (Video IO) domain, VC (Video Codec) domain, VIP (Vision IP Processor), GSX (Graphics) domain). See 18. AXI-Bus about which modules corresponds with the Master modules.

B) See Figure 9.3.2, which is applied to issue the Software Reset for Master modules in Always Power On domain (RT (Real Time) domain, Peripheral domain, HSC (High Speed Communication) domain, Main Memory domain, Slave Access Bus domain). See 18. AXI-Bus about which modules corresponds with the Master modules.

C) See Figure 9.3.3, which is applied to issue the Software Reset for Slave modules. These flows are effective to avoid the system hang-up. See 18. AXI-Bus about which modules corresponds with the Slave modules.

(3) Reset Status Monitor

See Section 9.5.2 (3).

(4) Force Reset

The following is procedure for Force Reset. When the function is used, the Software Reset is asserted without any handshakes between CPG and target modules. It should be noted that the software reset is forced to be asserted without guaranteeing the system operation in the chip.

1. Writing 0 to the corresponding target module bit of RAHSRn.
2. Writing 1 to the corresponding target module bit of SRCRn.
3. Software reset is asserted to the target module without request/acknowledge handshake between CPG and the module.
4. The corresponding bit of SRCRn can be cleared by writing 1 to the corresponding bit of SRSTCLRn.

(5) Bus Access Protection

See Section 9.4.2.

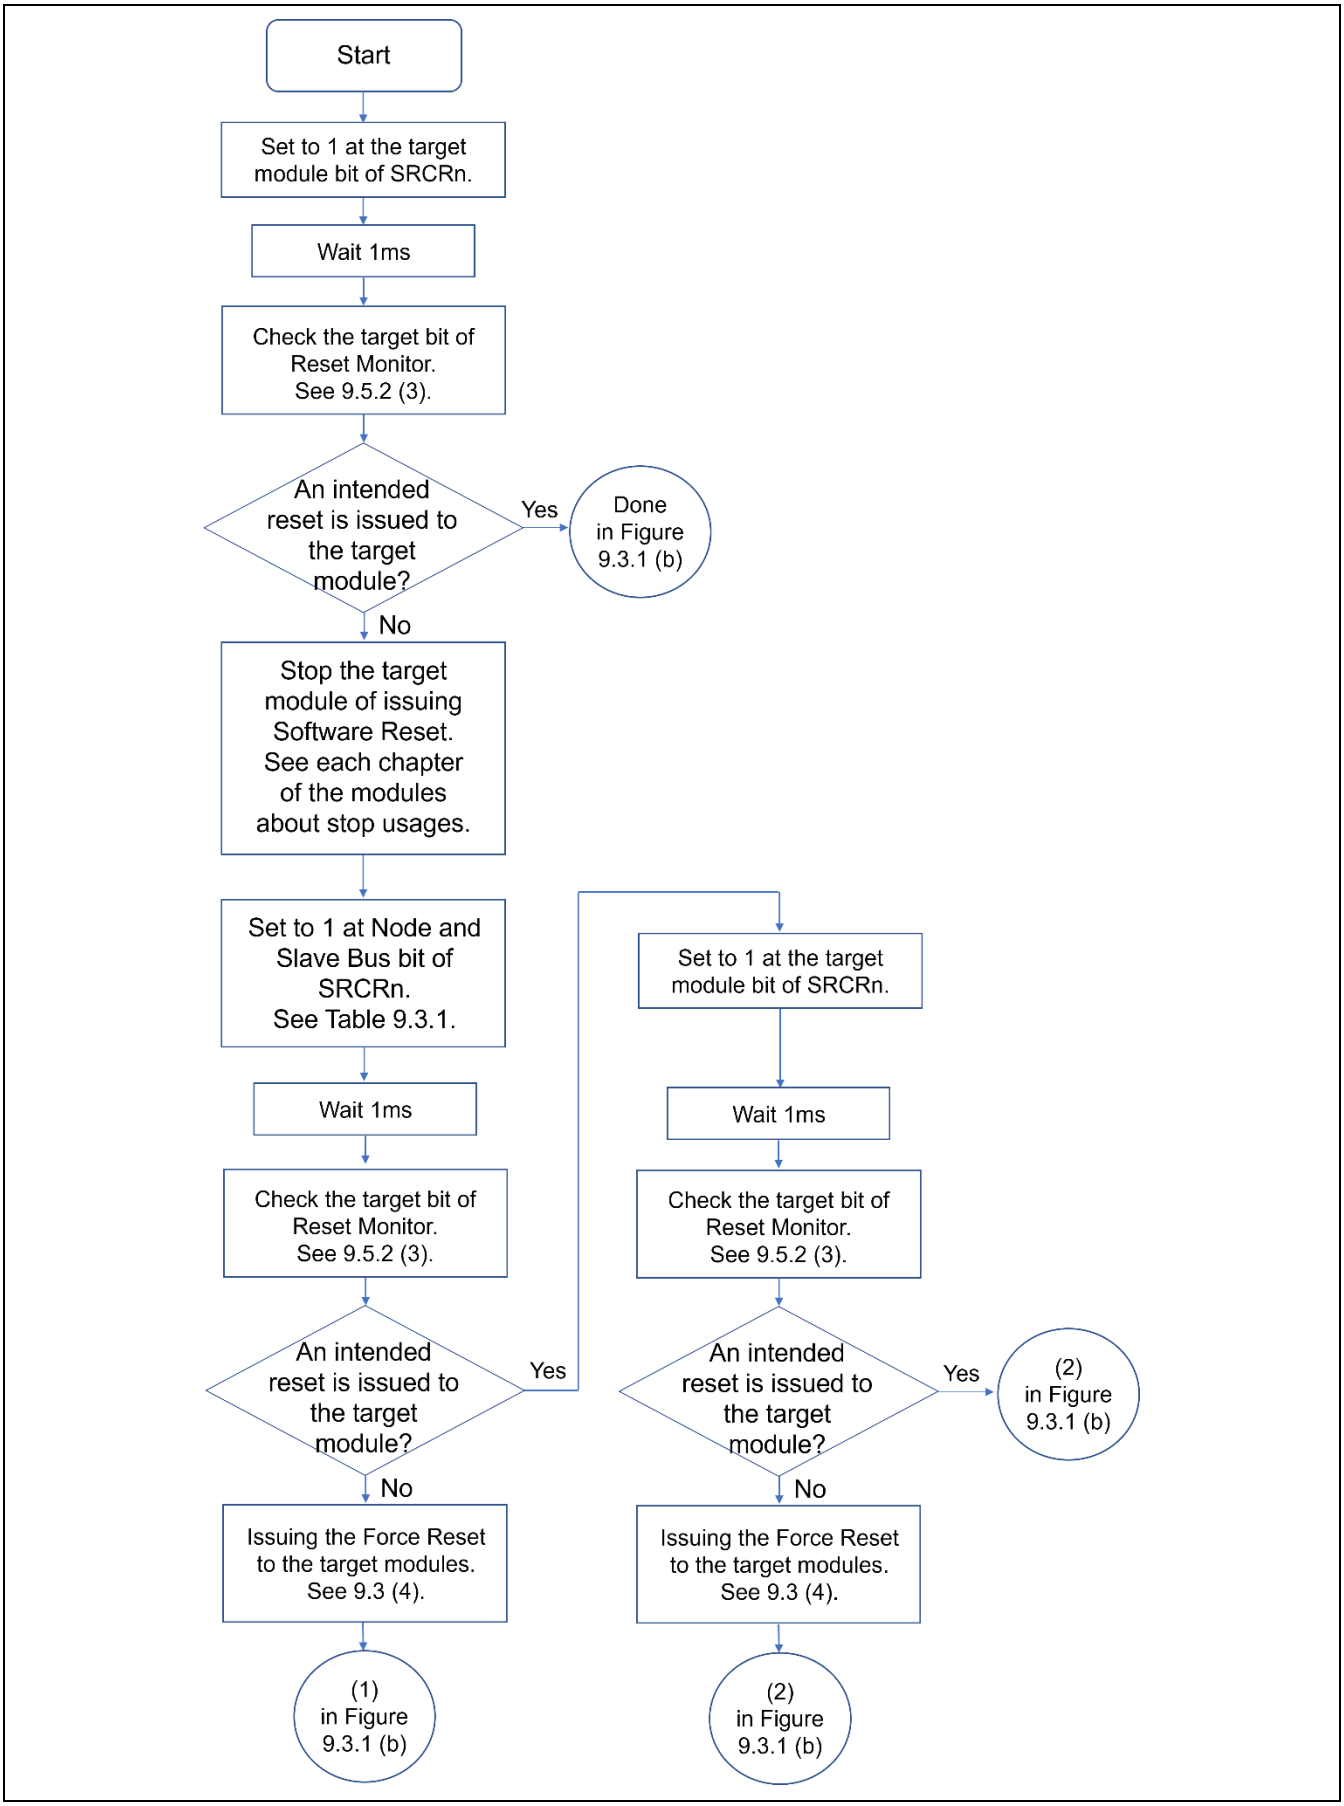

Figure 9.3.1 (a) Software Reset flow (A)

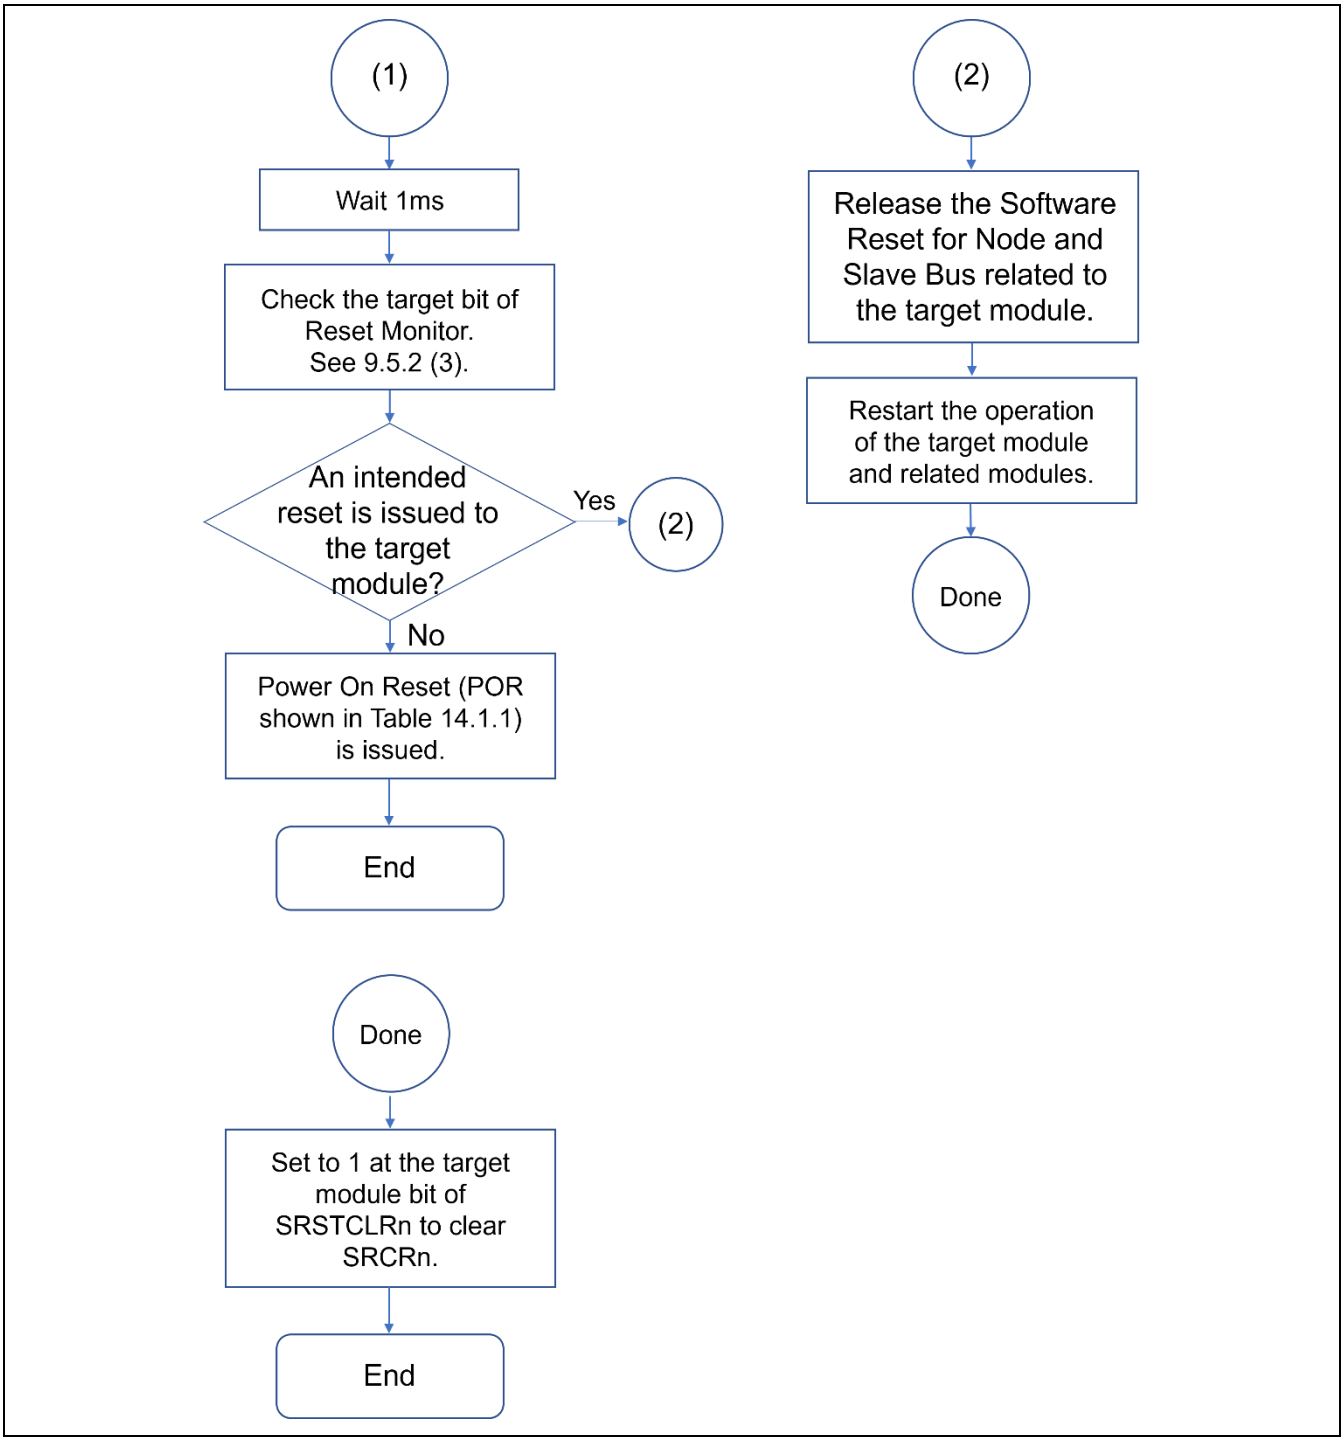

Figure 9.3.1 (b) Software Reset flow (A) (Continuation from Figure 9.3.1 (a))

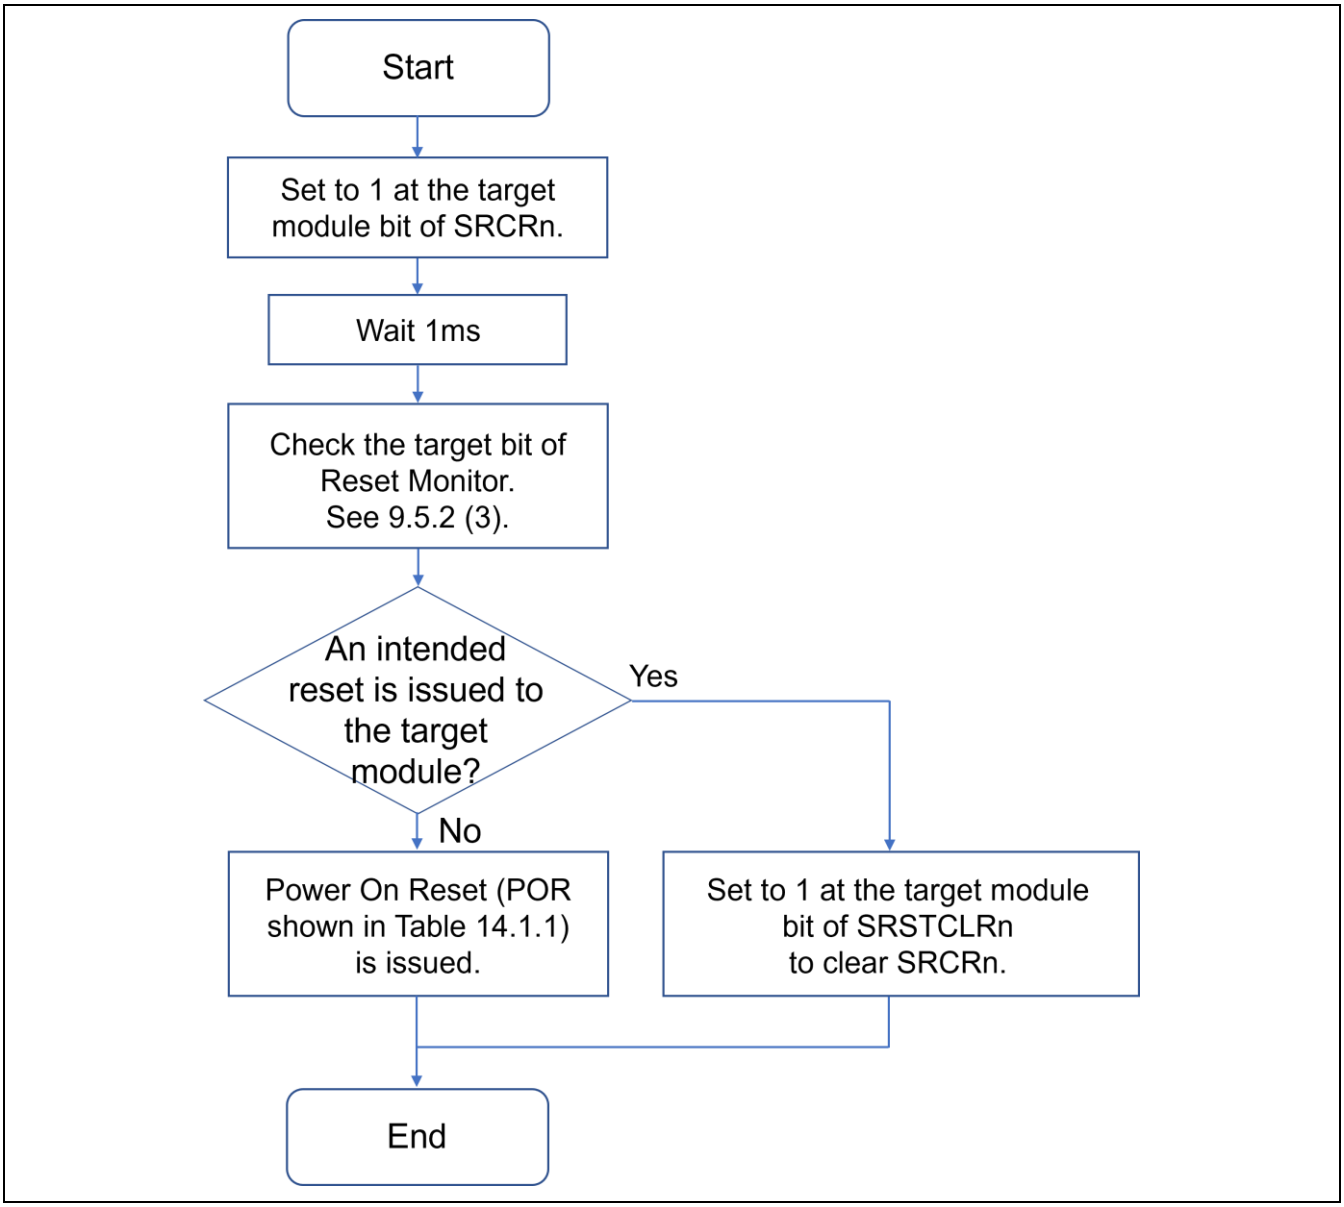

Figure 9.3.2 Software Reset flow (B)

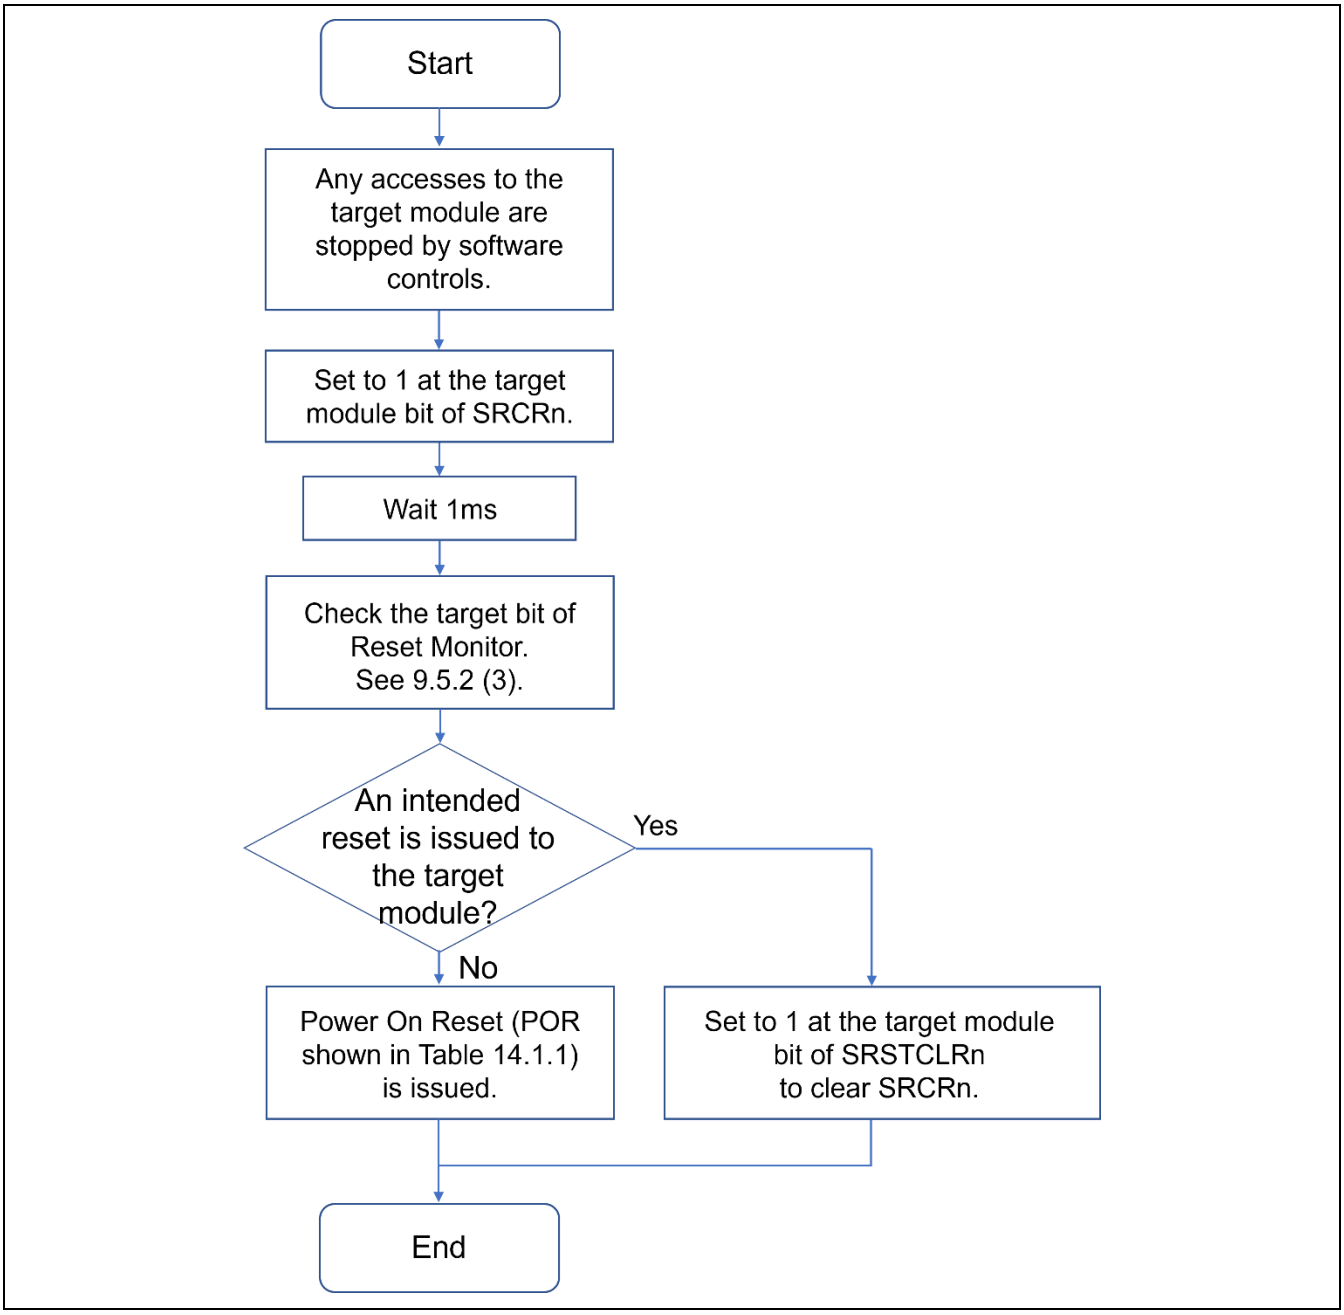

Figure 9.3.3 Software Reset flow (C)

Table 9.3.1 Target Node and Slave Bus for issuing and releasing Software Reset in Software Reset flow (A)

Register Name	Bit No.	Bit Name	Target Node and Slave Bus
SRCR1	Bit 13	SRT13	AXI Bus module in IMP domain.
SRCR1	Bit 12	SRT12	Bus register of AXI Bus module in IMP domain.
SRCR2	Bit 31	SRT31	AXI Slave Bus module in Main Memory domain.
SRCR2	Bit 30	SRT30	Bus register of AXI Bus module in Peripheral domain.
SRCR2	Bit 29	SRT29	AXI Bus module in Peripheral domain.
SRCR2	Bit 28	SRT28	Bus register of AXI Slave Bus module in Slave Access bus domain.
SRCR2	Bit 27	SRT27	AXI Slave Bus module in Slave Access bus domain.
SRCR2	Bit 25	SRT25	AXI Bus module for Cortex-R52 in RT (Real Time) domain.
SRCR2	Bit 24	SRT24	Bus register of AXI Bus module for Cortex-R52 in RT (Real Time) domain.
SRCR2	Bit 23	SRT23	Bus register of AXI Bus module for RT-DMAC in RT (Real Time) domain.
SRCR2	Bit 22	SRT22	AXI Bus module for RT-DMAC in RT (Real Time) domain.
SRCR2	Bit 21	SRT21	Bus register of AXI Bus module in RT (Real Time) domain.
SRCR2	Bit 20	SRT20	AXI Bus module in RT (Real Time) domain.
SRCR2	Bit 19	SRT19	AXI Bus module for GSX (Graphics) domain.
SRCR2	Bit 18	SRT18	Bus register of AXI Bus module for GSX (Graphics) domain.
SRCR2	Bit 8	SRT8	APB Bus module for MSIOF in Peripheral domain.
SRCR2	Bit 7	SRT7	Bus register of APB Bus module for MSIOF in Peripheral domain.
SRCR2	Bit 6	SRT6	Bus register of APB Bus module operated with SASYNCPERD1/2/4φ in Peripheral domain.
SRCR2	Bit 5	SRT5	APB Bus module operated with SASYNCPERD1/2/4φ in Peripheral domain.
SRCR2	Bit 4	SRT4	APB Bus module in RT (Real Time) domain.
SRCR2	Bit 3	SRT3	Bus register of APB Bus module in RT (Real Time) domain.
SRCR3	Bit 0	SRT0	Bus register of AXI Slave Bus module in Main Memory domain.
SRCR3	Bit 1	SRT1	AXI Slave Bus module (North part) in Slave Access bus domain.
SRCR3	Bit 2	SRT2	Bus register of AXI Slave Bus module (North part) in Slave Access bus domain.
SRCR3	Bit 3	SRT3	Bus register of AXI Bus module in Peripheral domain.
SRCR3	Bit 4	SRT4	AXI Bus module in Peripheral domain.
SRCR3	Bit 7	SRT7	Bus module (from CSD STM to PCI).
SRCR3	Bit 8	SRT8	Bus register of Bus module (from CSD STM to PCI).
SRCR3	Bit 11	SRT11	Bus register of AXI Bus module in VC (Video Codec) domain.
SRCR3	Bit 12	SRT12	AXI Bus module in VC (Video Codec) domain.
SRCR3	Bit 16	SRT16	Bus register of AXI Bus module in VIO (Video IO) domain.
SRCR3	Bit 17	SRT17	AXI Bus module in VIO (Video IO) domain.
SRCR3	Bit 18	SRT18	Bus register of AXI Bus module in VIO (Video IO) domain.
SRCR3	Bit 22	SRT22	Bus register of AXI Bus module in VIP (Vision IP Processor) domain.
SRCR3	Bit 23	SRT23	AXI Bus module in VIP (Vision IP Processor) domain.
SRCR11	Bit 8	SRT8	AXI Bus module in VIO (Video IO) domain.
SRCR15	Bit 1	SRT1	Bus register of AXI Bus module in HSC (High Speed Communication) domain.
SRCR15	Bit 2	SRT2	AXI Bus module in HSC (High Speed Communication) domain.
SRCR15	Bit 22	SRT22	APB Bus module in VIO (Video IO) domain.
SRCR15	Bit 23	SRT23	Bus register of APB Bus module in VIO (Video IO) domain.

9.4 Usage Notes

9.4.1 Write Protect Function for Module Standby and Software Reset registers

Write Protect Function specification is same as that of CPG registers. The detail specification is described in Section 8.4.1.

Example)
When writing a value of "H'0000 00FF" to MSTPCR0 register, the following is procedure
- Write "H'FFFF FF00" (inverted value of "H'0000 00FF") to H'E615 0000.
- After that, write "H'0000 00FF to MSTPCR0 ("H'E615 2D00").

9.4.2 Bus Access Protect for Module Standby and Software Reset registers

(1) Overview

Overview is same as that of MSTPRST registers. The detail specification is described in Section 8.4.2 (1).

(2) Domain x Write Access Control Register (DxWACR_YYY) (x = 0, 1, 2, 3)

Each bit of MSTPCRn, SRCRn, SRSTCLRn, RAHSRn (n = 0 to 29) is protected by DxWACR_MSTPCRn, DxWACR_SRCRn, DxWACR_SRSTCLRn, DxWACR_RAHSRn (x = 0, 1, 2, 3), respectively. DxWACR_YYY can be accessed only by Domain 0.

Figure 9.4.1 shows one example of usage of DxWACR_YYY registers. In this case, only Domain 2 can write a value to MSTPCR0.bit1.

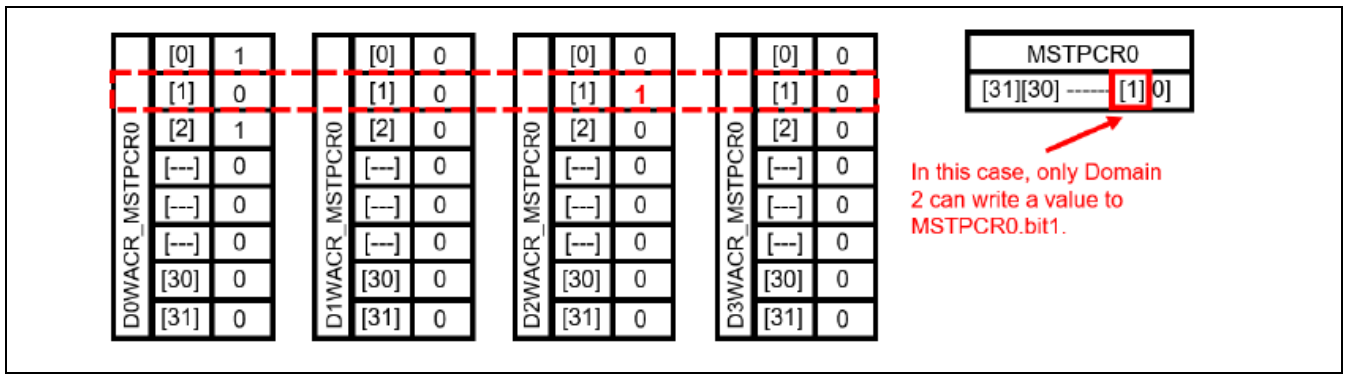

Figure 9.4.1 Usage of D0WACR_YYY, D1WACR_YYY, D2WACR_YYY, D3WACR_YYY

(3) Check method of illegal write accesses

If there are illegal write accesses for the MSTPRST registers, an error notification is reported to ECM (ECMERRxxxR00 Bit29). In addition, the error notification is cleared by using CPGWPTCSR (Write Access Protect Control/Status Register). In detail, see 8.2.61, in which the register usage is described.

9.4.3 Force Reset

When target modules and the connecting bus are under deadlock due to any failures, the modules cannot be initialized by the normal Software Reset (the corresponding bit of RAHSRn is 0). In case of it, the Force Reset function is effective. If

there are not any failures for the modules, the Software Reset (shown in 9.3 (2)) must be used to guarantee the system operation in a chip.

9.5 Safety Mechanisms

9.5.1 Overview

- CPG (Module Standby, Software Reset) module supports Reset Status Monitor function. Reset Status Monitor is a safety mechanism which confirms that an intended reset is issued and which defects that an unintended reset occurs.

- The access rights for changing independent register bits in CPG (Module Standby, Software Reset) shall be configurable for each Domain 0, 1, 2, 3. The detail specification is described in 9.5.3.

9.5.2 Reset Status Monitor

(1) Overview

CPG (Module Standby, Software Reset function) can issue reset signals to each module, and it can issue reset signals to each CPU (Cortex-A76 and Cortex-R52). The software on the chip can issue software reset signals to each module and each CPU.
Reset status monitor checks that an intended reset is issued and detects that an unintented reset occurs by using the software registers of FSRCHKSETRn, FSRCHKCLRRn, FSRCHKRAn, FSRCHKRBn (n = 0 to 27).

(2) Register Description

As shown in Section 9.1.1 (3), the register corresponds with the following one. The detail specification is described in Section 8.2.7, 8.2.8, 8.2.9, 8.2.10.
- Functional Safety Reset Check Register A (FSRCHKRAn (n = 0 to 29))
- Functional Safety Reset Check Register B (FSRCHKRBn (n = 0 to 29))
- Functional Safety Reset Check Set Register (FSRCHKSETRn (n = 0 to 29))
- Functional Safety Reset Check Clear Register (FSRCHKCLRRn (n = 0 to 29))

(3) Operation

In order to check that an intended reset is issued and defect that an unintended reset occurs, the registers are used as shown in the block diagram (Figure 9.1.1). The following is a procedure for using the Reset Status Monitor.

1. Each bit of FSRCHKRAn and FSRCHKRBn can be cleared by writing 1 to the corresponding bit of FSRCHKCLRRn before using the Reset Status Monitor function. It takes 1 cycle of RCLK clock to reflect the write value to FSRCHKCLRRn

2. When writing 1 to the designated bit of FSRCHKSETRn (n = 0 to 29), the corresponding bits of both FSRCHKRAn and FSRCHKRBn are set to 1.

3. The registers of FSRCHKRAn and FSRCHKRBn can be used to check whether an intended reset is issued or not.

4. Each bit can be cleared by writing 1 to the corresponding bit of FSRCHKCLRRn.

9.5.3 Safety Access Protection

(1) Overview

CPG (Module Standby, Software Reset) provides a safety access protection mechanism to guarantee “Freedom From Interference (FFI)” when accessing the registers belonging to the modules. Several masters (Cortex-A76, Cortex-R52) take control of different portions and modules of the chip. The access protection mechanism shall enable sharing and splitting the functionality among cores.

The access protection mechanism for the control registers belonging to CPG (Module Standby, Software Reset) module shall be aligned with the Region ID concept. In detail, see Section 9.4.2. The module has critical system control functions (Module Standby, Software Reset). Therefore, the strong access restrictions are necessary for the module.

(2) Register Description

As shown in Section 9.4.2 (2), the register corresponds with D0WACRAn_YYY, D1WACRAn_YYY, D2WACRAn_YYY, D3WACRAn_YYY (n = 0 to 63) in Section 9.2.6.

(3) Operation

See Section 9.4.2 (1) and 9.4.2 (2).

10. Advanced Power Management Unit

10.1 Overview

The Advanced Power Management Unit (APMU) is a module to control power supply and clock supply to the AP-System Core and Realtime Core. It also provides the reset vector base address for AP-System Core and Realtime Core.

10.1.1 Features

This module includes the following functions and features:

- Controls power supply to each CPU core and L3 cache area in AP-System core.
- Supports following power modes of Arm® Cortex®-A76 CPU cores defined by Arm.
  - On
  - Emulated off
  - Off
- The following power modes of Cortex-A76 CPU cores are not supported.
  - Debug recovery
  - Core dynamic retention
- Supports following power modes of Cortex-A76 CPU cluster defined by Arm.
  - On
  - Functional retention
  - Memory retention
  - Off
  - L3 cache partial powerdown
- The following power mode of Cortex-A76 CPU cluster is not supported.
  - Debug recovery
- Not support boot mode of AP-System Core.
- Controls power supply to each core of Cortex®-R52.
- Supports following power modes of Cortex-R52 defined by Arm.
  - RUN
  - SHUTDOWN
  - Debug over powerdown
- This module has boot address registers for Cortex-A76 and Cortex-R52.
- This module is implemented as DCLS.

Cortex-A76 CPU core power mode defined by Arm is described in the Cortex-A76 Technical Reference Manual (TRM) (Reference [1]). Cortex-A76 CPU cluster power mode defined by Arm is described in the DynamIQ Shared Unit (DSU) TRM (Reference [2]). Cortex-R52 power mode defined by Arm is described in the Cortex-R52 TRM (Reference [4]). The P-channel interface is used to communicate between APMU and Cortex-A76 CPU cores, clusters or Cortex-R52 when APMU controls the power mode for Cortex-A76 CPU cores, clusters or Cortex-R52. The P-channel interface specification is defined by Arm and it is described in the Reference [3].

10.1.2 Block Diagram

Figure 10.1 shows block diagram of APMU.

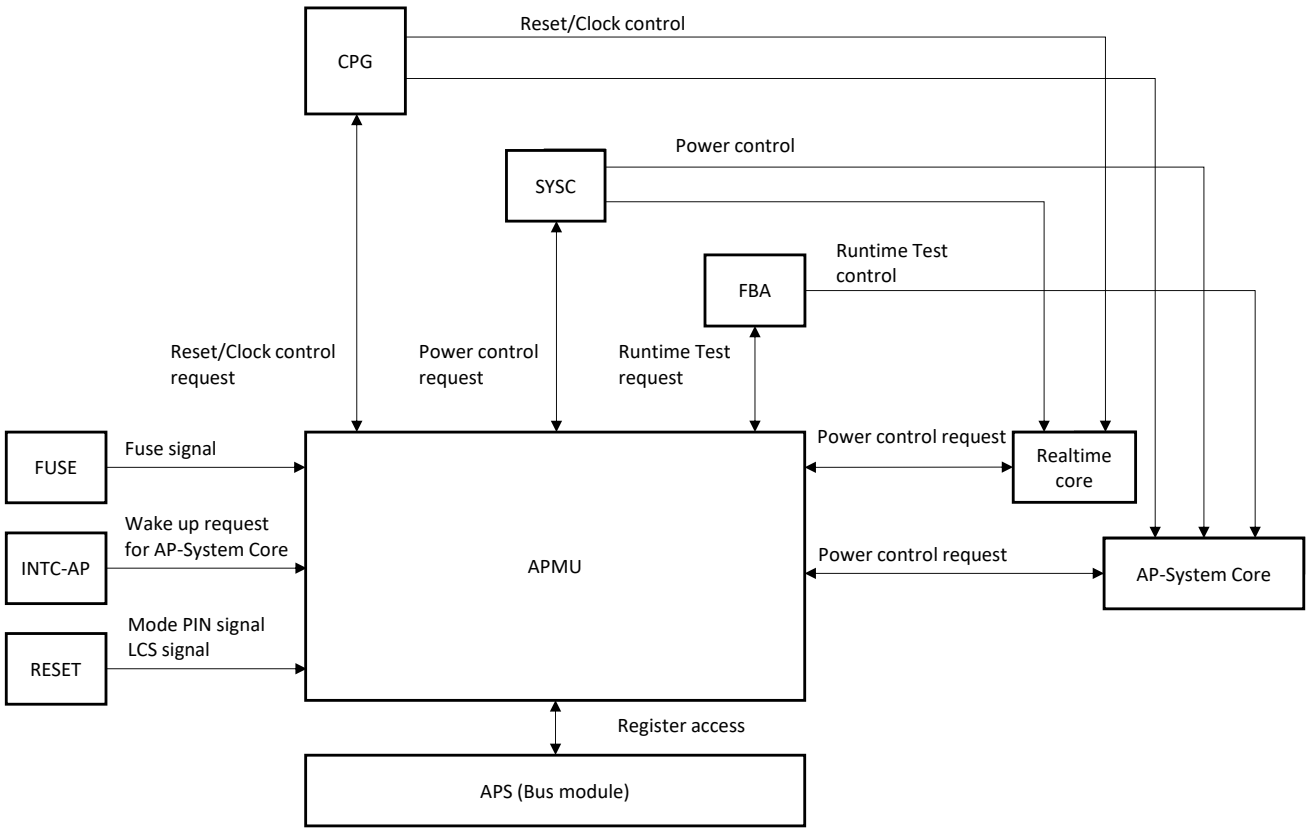

Figure 10.1 Block Diagram of APMU

10.1.3 External Pins

There are no external pins related to this function.

10.1.4 Register Configuration

Refer to the EXCEL file (R-CarV4M_UM_010_APMU_r1p00.xlsx).

Parameters Table

Parameters	Range	Description
n	0-3	APMU register domain number
r	0-2	Realtime Core number
i	0	Subsystem number for AP-system core
x	0	Cluster number for AP-system core. Labeled Cluster0. Register names expanded according to ”Register Groups Offset Table”. Corresponding to “Module ID” of “CORTEXA76CLUSTER” register groups offset.
z	0-3	Core number for AP-system core. Labeled Core0-Core3 Register names expanded according to ”Register Groups Offset Table”. Corresponding to “Module ID” of “CORTEXA76CORE” register groups offset.

The following shows an example of Register Groups Offset Table.

Register groups offset name	Module ID (=ID*1)	Base Address (=BaseAdd*1)	Register name (=RegName*1)	Symbol name (=Symbol *1)

Sample	#XX	H'YY	Rel0	_REL0

*1. These are the names listed in the following Register Configuration Table.

e.g. If following example are described in the Register Configuration Table and Module ID is #XX, that means as below.

Sample[ID,BaseAdd] = H'YY

Sample[ID,RegName] = Rel0

Sample[ID,Symbol] = _REL0

10.1.5 Connected Module

Connected modules with the APMU are described in Table 10.1.

Table 10.1 Connected Module

Module name	Connected module name	Function of connected module
APMU	AP-System Core	APMU controls Cortex-A76 power status.
	Realtime Core	APMU controls Cortex-R52 reset status.
	CPG	APMU and CPG control Cortex-A76 reset status and Cortex-R52 reset status.
	SYSC	APMU and SYSC control Cortex-A76 power status and Cortex-R52 power status.
	INTC-AP	APMU gets request to wake up Cortex-A76 CPU core from interrupt controller.
	FUSE	FUSE defines the configurations of Cortex-A76 and Cortex-R52. APMU refers to their information.
	FBA	APMU and FBA control Runtime Test operation of Cortex-A76 CPU cores and clusters.

10.1.6 Reference

[1] Arm® Cortex®-A76 Core Technical Reference Manual, Revision: r4p1
[2] Arm® DynamIQ™ Shared Unit Technical Reference Manual, Revision: r4p1

10.2 Register Description

Refer to the EXCEL file (R-CarV4M_UM_010_APMU_r1p00.xlsx).

[Explanation of abbreviation of register]

Initial value: Value of the register after power-on reset

—: Undefined value

R/W: The bit or field is readable and writable.

R/WC0: The bit or field is readable and writable. Writing 0 to the bit initializes the bit. Writing 1 to the bit is ignored.

R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit. Writing 0 to the bit is ignored.

R: The bit or field is readable only. When writing to the register, write 0 to it.

W: The bit or field is writable. Note that values read from write-only bits are not guaranteed.

10.3 Operation

10.3.1 Power Mode

APMU controls power domains for Cortex-A76 CPU cores, clusters and cluster common parts. Each logic has their own power domain. Table 10.2 shows each power domain name and its description. Those power domains have hierarchical structure. Figure 10.2 shows power domain structure. Any power domain must be powered on whenever its upper power domain is powered on.

In chapter 5 and 10, A2 represents A2E0D0. A1 represents A1E0D0C0, A1E0D0C1, A1E0D0C2 and A1E0D0C3.

Table 10.2 Power Domain of AP-System Core

Power Domain	Description	Power Domain	Description
A1E0D0C0	Cortex-A76 CPU core 0	A2E0D0	Cortex-A76 CPU cluster 0
A1E0D0C1	Cortex-A76 CPU core 1		
A1E0D0C2	Cortex-A76 CPU core 2		
A1E0D0C3	Cortex-A76 CPU core 3		

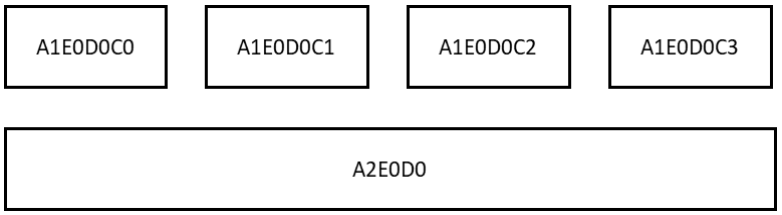

Figure 10.2 Power domain of AP-System Core

10.3.1.1 Cortex-A76 CPU core power mode

Each Cortex-A76 CPU core has following power modes.

- ON mode

This power mode is the same as On mode defined in Cortex-A76 TRM (Reference [1]). Cortex-A76 CPU core is powered on. When Cortex-A76 CPU core is in this power mode, Cortex-A76 CPU cluster including this core must be in ON mode.

- OFF mode

  This power mode is the same as Off mode defined in Cortex-A76 TRM (Reference [1]). Cortex-A76 CPU core is powered off.

- OFF_EMU mode

  This power mode is the same as Off (emulated) mode defined in Cortex-A76 TRM (Reference [1]). A warm reset of Cortex-A76 CPU core is asserted. So, Cortex-A76 CPU core debug domain is not initialized. And, Cortex-A76 CPU core is not powered off. When Cortex-A76 CPU core is in this power mode, Cortex-A76 CPU cluster including this core must be in ON mode.

- Pseudo OFF mode

  Cortex-A76 CPU core is Off mode defined in Cortex-A76 TRM (Reference [1]). However, Cortex-A76 CPU core is still powered on. This power mode is used for Runtime Test.

10.3.1.2 Cortex-A76 CPU cluster power mode

Each Cortex-A76 CPU cluster has following power modes.

- ON mode

  This power mode is same as On mode defined in DSU TRM (Reference [2]). Cortex-A76 CPU cluster is powered on.

- OFF mode

  This power mode is same as Off mode defined in DSU TRM (Reference [2]). Cortex-A76 CPU cluster is powered off. When Cortex-A76 CPU cluster is in this power mode, all Cortex-A76 CPU cores which belong to this cluster must be in OFF mode.

- FUNC_RET mode

  This power mode is same as Functional retention mode defined in DSU TRM (Reference [2]). Cortex-A76 CPU cluster is powered on. All reset signals are not asserted. All RAM modules are in resume standby mode.

- MEM_RET mode

  This power mode is the same as Memory retention mode defined in DSU TRM (Reference [2]), but Cortex-A76 CPU cluster is powered on. All reset signals are asserted. All RAM modules are in resume standby mode. When Cortex-A76 CPU cluster is in this power mode, all Cortex-A76 CPU cores which belong to this cluster must be in OFF mode.

- L3 cache partial powerdown mode

  This power mode is same as L3 cache partial powerdown mode defined in DSU TRM (Reference [2]), but RAM modules are not powered off. RAM modules go to resume standby mode.

- Pseudo OFF mode

  Cortex-A76 CPU cluster is Off mode defined in DSU TRM (Reference [2]). However, Cortex-A76 CPU cluster is still powered on. When Cortex-A76 CPU cluster is in this power mode, Cortex-A76 CPU cores which belong to this cluster must be in OFF mode or Pseudo OFF mode. This power mode is used for Runtime Test.

10.3.1.3 Cluster common part Power mode

Each Cluster common part has following power modes.

- ON mode

  Cluster common part is powered on.

- OFF mode

  Cluster common part is powered off. When Cluster common part is in this mode, all Cortex-A76 CPU clusters which belong to this Cluster common part must be in OFF mode.

10.3.2 Power control

10.3.2.1 Wake up sequence of AP-System Core

Figure 10.3 shows power on sequence of Cortex-A76 CPU core. After Cortex-A76 CPU core is booted, WUP_REQ bit of PWRCTRLCz is cleared to 0. When the power status needs to be confirmed, the status can be confirmed by WUP_REQ bit of PWRCTRLCz.

Figure 10.4 shows power on sequence of Cortex-A76 CPU core by wakeup request from INTC-AP. After Cortex-A76 CPU core is booted, H'0000 000D is set to FSMSTSRCz. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCz. If unexpected values are read, it means the power mode transition sequence is not completed. Until the expected value is read, polling operation is necessary.

The additional procedure written in the Usage Notes shall be applied. Refer to 10.4.3.

While C4 power is off, AP-System Core cannot wake up. Please turn on C4 power before wakeup AP-System Core. For more detail, please refer to 11. System Controller.

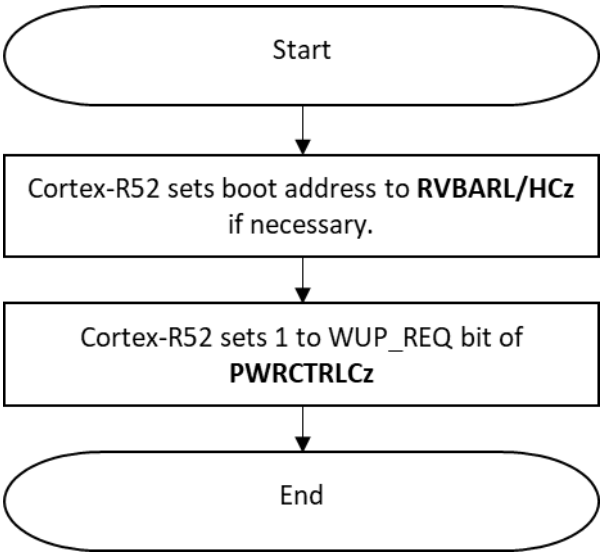

Figure 10.3 Power on sequence of Cortex-A76 CPU core

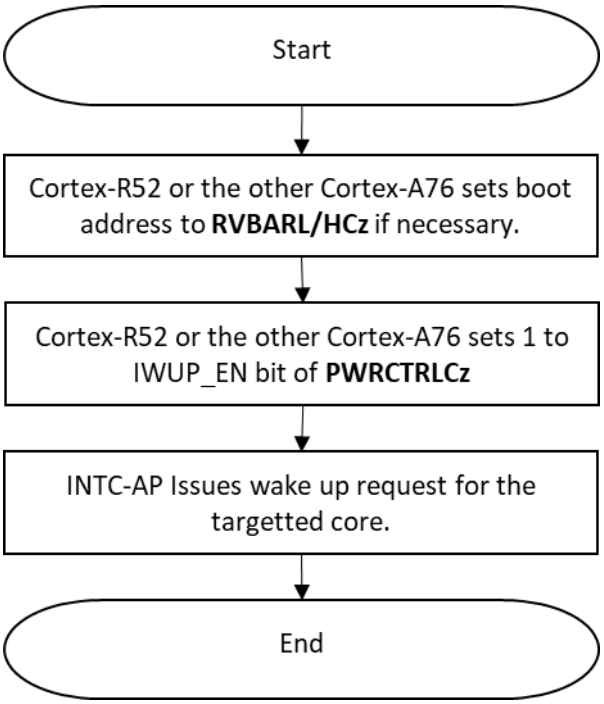

Figure 10.4 Power on sequence of Cortex-A76 CPU core by wakeup request from INTC-AP

10.3.2.2 Power off sequence of AP-System Core

Figure 10.5 shows Cortex-A76 CPU core power off sequence. After Cortex-A76 CPU core is powered off, H'0000 0000 is set to FSMSTSRCz. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCz. Refer to Reference [1] for the registers written in Bold Italics and details about Power off of Cortex-A76 CPU core.

When Cortex-A76 CPU Core is in debug mode, setting 0 to DBGEN_PPDN bit of SAFECTRLCz is necessary to power off Cortex-A76 CPU core before starting Figure 10.5 sequence. When Cortex-A76 CPU core is in debug mode and DBGEN_PPDN bit of SAFECTRLCz is 1, even if Figure 10.5 sequence is done, Cortex-A76 CPU core is not powered off. Cortex-A76 CPU core goes to OFF_EMU mode. After that, H'0000 001C is set to FSMSTSRCz. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCz. In Cortex-A76 TRM (Reference [1]), there is a power mode transition from OFF_EMU mode to OFF mode. However, APMU does not support that po wer mode transition.

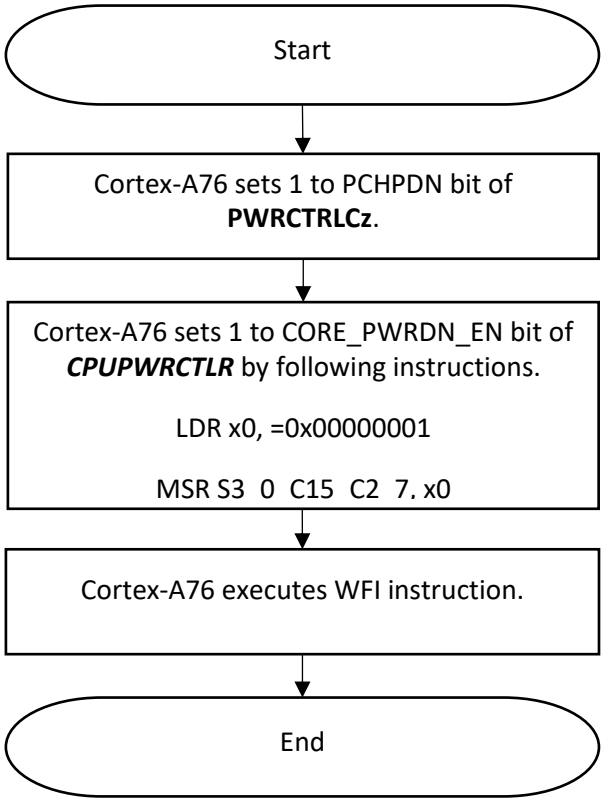

Figure 10.5 Power off sequence of Cortex-A76 CPU core

Figure 10.6 shows power off sequence of Cortex-A76 CPU core and cluster. After Cortex-A76 CPU core is powered off, H'0000 0000 is set to FSMSTSRCz. After Cortex-A76 CPU cluster is powered off, H'0000 0000 is set to FSMSTSRCLx. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCz and FSMSTSRCLx. Refer to Reference [1] and Reference [2] for the registers written in Bold Italics and details about Power off of Cortex-A76 CPU core and cluster.

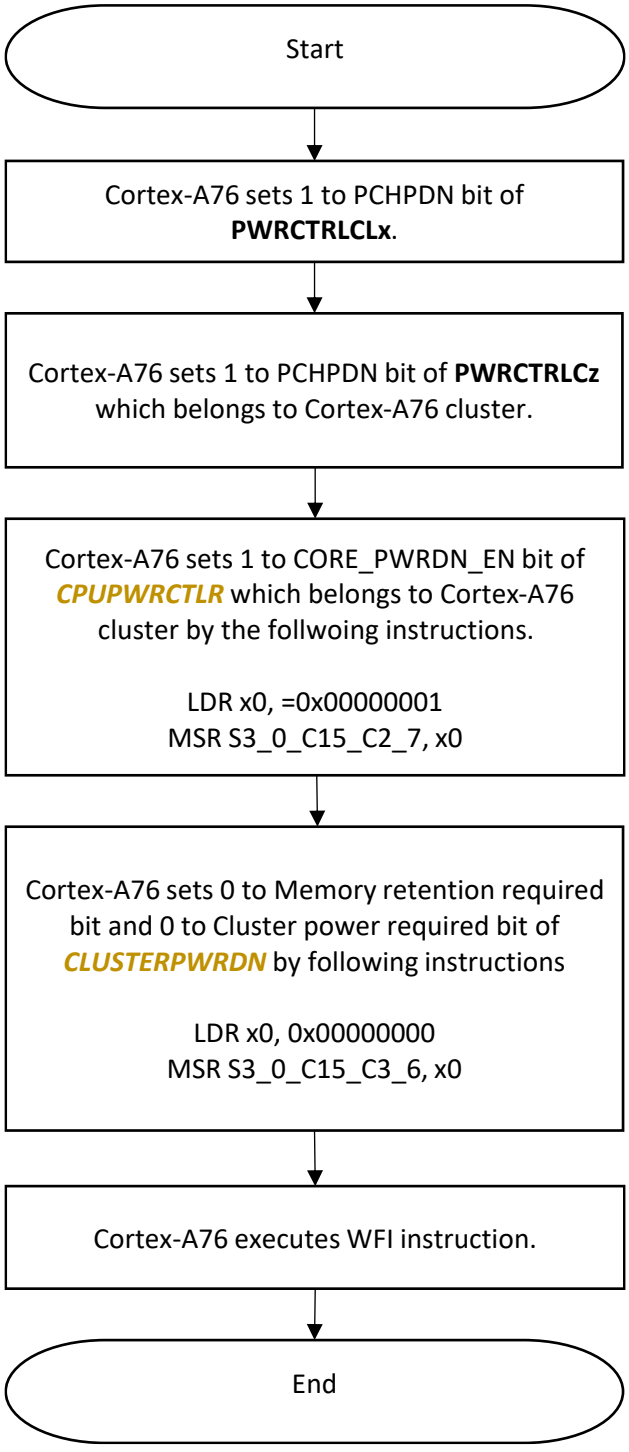

Figure 10.6 Power off sequence of Cortex-A76 CPU core and cluster

For the above each case, if unexpected values are read from FSMSTSRCz or FSMSTSRCLx, it means the power mode transition sequence is not completed. Until the expected value is read, polling operation is necessary.

The additional procedure written in the Usage Notes shall be applied. Refer to 10.4.3.

10.3.2.3 Power mode transition sequence to go to FUNC_RET/MEM_RET mode

Figure 10.7 shows power mode transition sequence to go to FUNC_RET mode. About enabling Generic Counter, refer to Section 5. After power mode transition is completed, H'0000 0021 is set to FSMSTSRCLx. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCLx. Refer to Reference [2] for the registers written in Bold Italics and details about FUNC_RET.

Figure 10.8 shows power mode transition sequence to go to MEM_RET mode. After power mode transition is completed, H'0000 0031 is set to FSMSTSRCLx. When the power status needs to be confirmed, the status can be confirmed by FSMSTSRCLx. Refer to Reference [2] for the registers written in Bold Italics and details about MEM_RET.

For the above each case, if unexpected values are read from FSMSTSRCLx, it means the power mode transition sequence is not completed. Until the expected value is read, polling operation is necessary.

The IWUP_EN bit of PWRCTRLCz needs to be set to one when Cortex-A76 CPU core is powered up again by wakeup request from INTC-AP. The PCHWUPEN bit of PWRCTRLCLx needs to be set to one when Cortex-A76 CPU core is powered up again by wakeup request from Cortex-A76 CPU cluster. The PCHWUPEN bit of PWRCTRLCz needs to be set to one when Cortex-A76 CPU core is powered up again by wakeup request from Cortex-A76 CPU core.

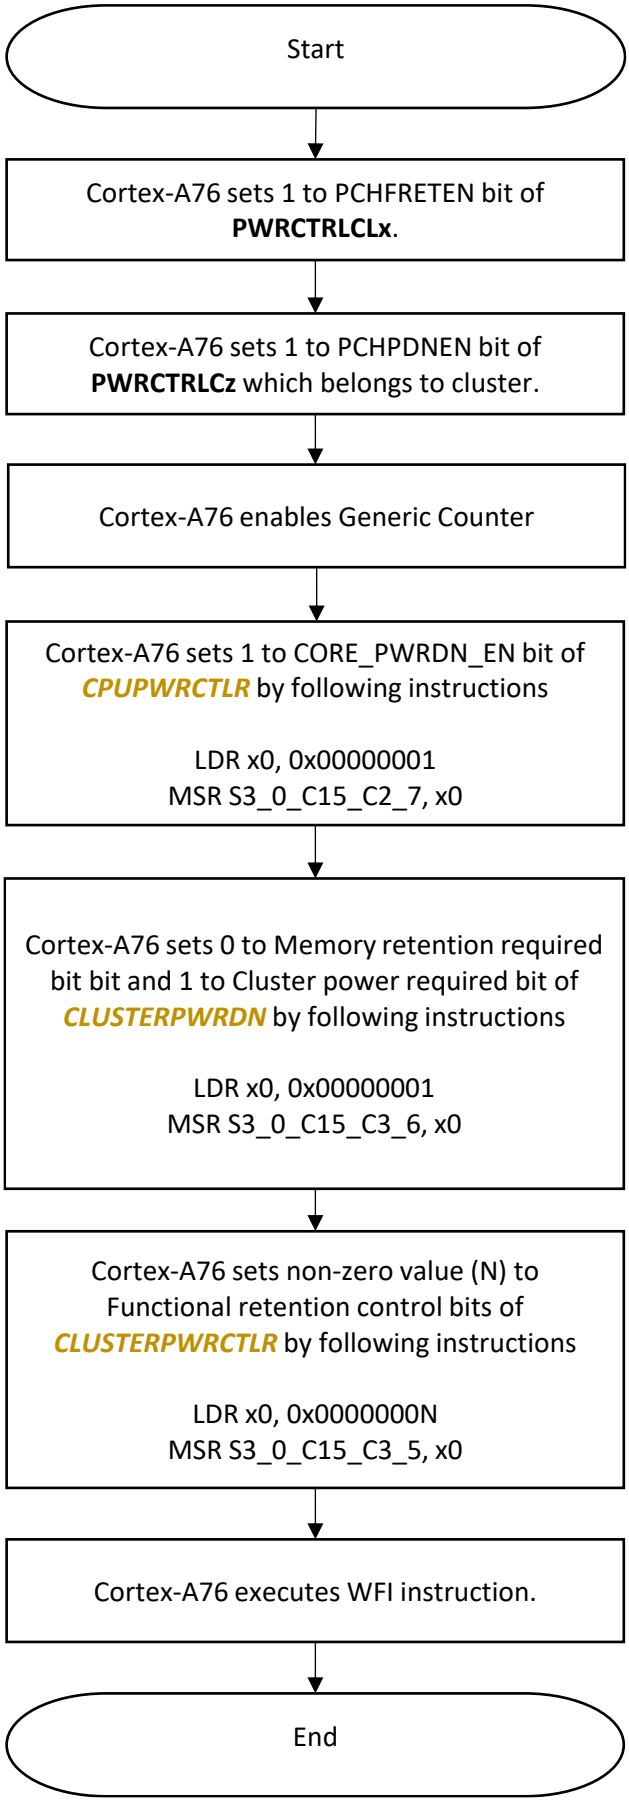

Figure 10.7 Power mode transition sequence to FUNC_RET mode

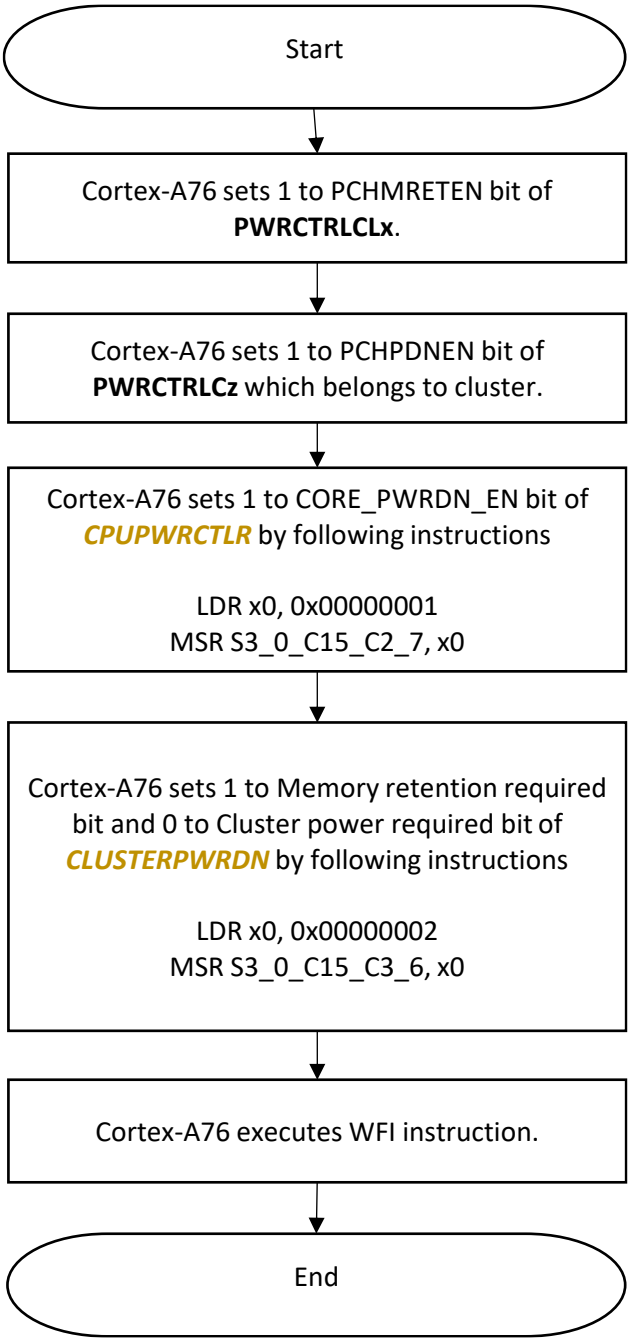

Figure 10.8 Power mode transition sequence to MEM_RET mode

10.3.2.4 L3 cache partial power off sequence

L3 cache partial power off mode is supported. The operating cache capacity can be selected from: all, 3/4, 1/2, 1/4, and none. However, each cache capacity size can be selected only when current cache capacity size is specific size. For example, cache capacity none can be selected only when current cache size is 1/4. Figure 10.9 shows L3 cache partial power control sequence. Refer to Reference [2] for the registers written in Bold Italics and details about L3 cache partial power off.

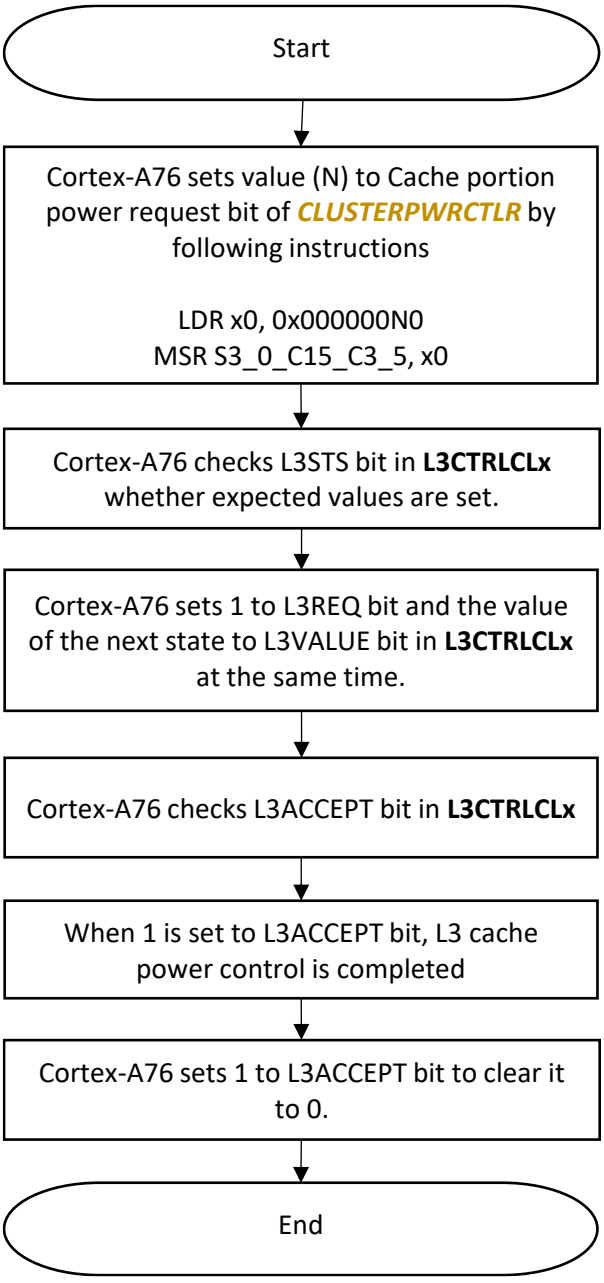

Figure 10.9 L3 cache partial power control sequence

10.3.2.5 Power operation for Cortex-R52

Cortex-R52 supports the following five power modes.

- Core Standby mode (A3CR* domain power is off)
- Normal Operation mode

- Sleep mode (clock stop)
- Core powerdown mode (A3CR* domain power is off)
- Debug over Core powerdown mode

Core Standby mode is a power mode before Cortex-R52 CPU core is booted. Cortex-R52 CPU core 0 is in Core Standby mode only in ICUMX boot. Other Cortex-R52 CPU cores are in Core Standby mode before they are woken up. Each Cortex-R52 CPU core is under reset and there is no operation in Core Standby mode. The Cortex-R52 CPU core leaves Core Standby mode when Cortex-R52 CPU core is woken up by ICUMX, AP-System Core or other Cortex-R52 CPU cores. The Cortex-R52 CPU core is woken up when 0 is set to CR52RST bit in CR52RSTCTRLx. After leaving Core Standby mode, it is impossible to go back to this mode. The boot address can be set by using CR52BARPr or CR52BARr before each core is woken up as needed.

Cortex-R52 CPU cores enters Sleep mode when Cortex-R52 CPU core executes WFI instruction. Clock to Cortex-R52 CPU core is stopped to save the power consumption until Cortex-R52 CPU core receives a wake-up request.

In Core powerdown mode, CPU core power domain (A3CR* power domain) is powered-off. Core powerdown mode has less power than Sleep mode. Debug over Core powerdown mode is for debug Core powerdown mode.

(1) Core powerdown mode flow

Figure 10.10 shows core powerdown flow. If core denies the powerdown, PDENY interrupt is occur and core does not transition powerdown. Refer to Reference [4] for details about core powerdown.

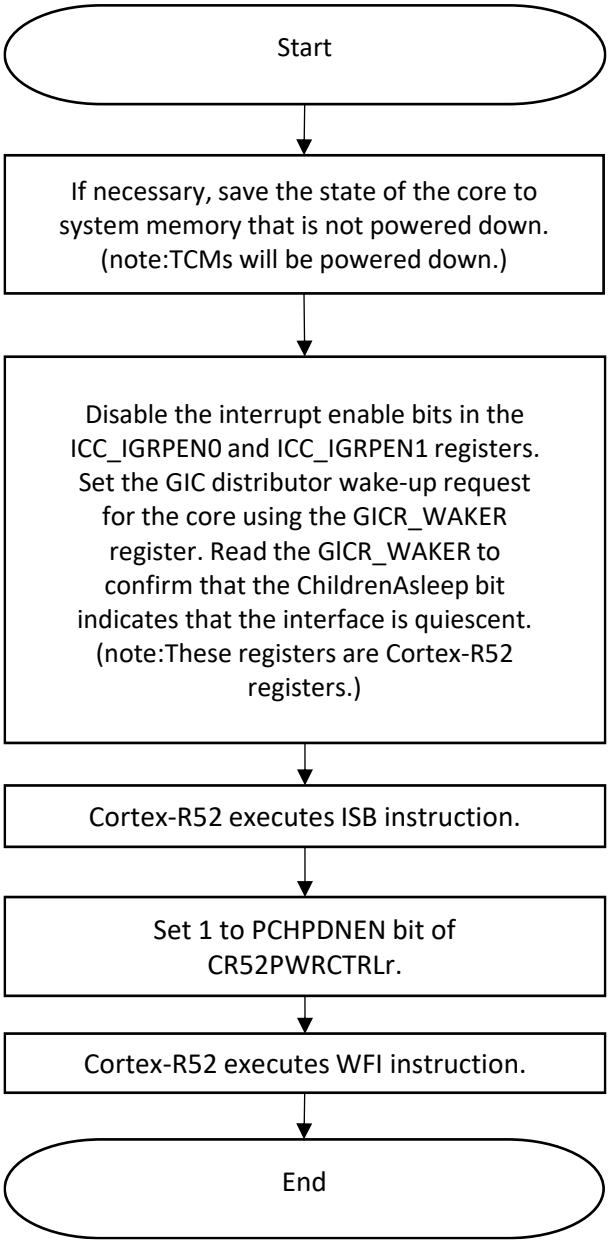

Figure 10.10 Power mode transition sequence to Core powerdown mode

(2) Core powerup mode flow

If PCHWUPEN bit of CR52PWRCTRLr is 1 and wake-up request for the core using the GICR_WAKER comes, Cortex-R52 core will be powered up.

Or, if WUP_REQ bit of CR52PWRCTRLr is set 1, Cortex-R52 core will be powered up.

(3) Debug over Core powerdown mode flow

When Cortex-R52 is debug mode, even if you execute power down sequence, the core power does not turn off. Some debug information in core power domain is kept.

10.3.3 Boot address setting

V4M contains three Cortex-R52 CPU cores, core 0, 1, and 2 (See 6.1.1). Boot address of Cortex-R52 CPU core0 is defined by Mode PIN setting and it is described in CR52BAR0 and CR52BARP0. Table 10.3 shows Boot address and initial value of CR52BAR0 and CR52BARP0 bit field. In addition, for the Secure Boot, the special initial values are set to CR52BAR0 and CR52BARP0, regardless of the Mode PIN setting. It is also described in Table 10.3. About the detail of CR52BAR0 and CR52BARP0, please refer to section 10.2.

Table 10.3 Initial values of BAREN, BTMD[1:0] and Boot address

Mode pin setting				**Initial value**		
MD4	**MD3**	**MD2**	**MD1**	**BAREN**	**BTMD[1:0]**	**Boot address**
0	0	0	0	0	00	H'00 0000 0000
0	0	0	1	1	01	H'00 0800 0000
0	0	1	0	1	10	H'00 EB10 0000

Secure Boot						
-	-	-	-	1	10	H'00 EB10 0000

Boot address of Cortex-A76 CPU core is defined by Mode PIN setting and it is described in RVBARLC0, RVBARHC0, RVBARPLC0 and RVBARPHC0. Table 10.4 shows Boot address of Cortex-A76 CPU core. In addition, for the Secure Boot, the special initial values are set to RVBARLC0 and RVBARLPLC0, regardless of the Mode PIN setting. It is also described in Table 10.4. About the detail of RVBARLC0 and RVBARPLC0, please refer to section 10.2.

Table 10.4 Boot Address of Cortex-A76 CPU core for Each Mode Pin Setting

Mode pin setting

10.3.4 Interrupt function

APMUhas interrupt request signals. It is asserted when a denied state transition has occurred, which is controlled by PDENYINTRCLx and PDENYINTRCz. A denied state transition is detailed in the Reference [3].

To issue interrupt request from APMU, it needs to set 1 to any bits of PDENYINTRCLx or PDENYINTRCz. When a denied state transition has occurred, the corresponding bit of PDENYSTSRCLx or PDENYSTSRCz by APMU is set to 1. At that time, if the corresponding bit of PDENYINTRCLx or PDENYINTRCz is 1, the corresponding bit of INTSTSR is set to 1 and interrupt request signal by APMU is issued.

After interrupt request is issued from APMU, which FSM issuing interrupt request is identified by reading INTSTSR. After interrupt operations are finished, each bit of PDENYSTSRCLx or PDENYSTSRCz must be cleared to 0. By this operation, a corresponding bit of INTSTSR is cleared by APMU. And interrupt request signal is also negated.

10.3.5 Reset operation

10.3.5.1 Forced reset procedure

Forced reset asserting to Cortex-A76 CPU core and cluster is done by FRSTR register. If forced reset operation is done, the data inside Cortex-A76 CPU core and cluster is disappeared. So, this function is used for recovery when any fault is found in Cortex-A76 CPU core or cluster. In addition to, FSMLOCKR for each core and cluster is reset. And any value is set to each FSMSTSR for each core and cluster.

When forced reset of Cortex-A76 CPU core is asserted, it is necessary to assert reset signal of Cortex-A76 CPU cluster including target cores at the same time. In other words, forced reset can be done only for each cluster. Forced reset for only core cannot be done. For example, when forced reset asserting for Cortex-A76 CPU core 0 is done, setting 1 to FRSTRC0, FRSTRC1, FRSTRC2, FRSTRC3 and FRSTRCL0 bit in FRSTR is necessary.

10.3.5.2 Reset operation for Cortex-R52

When Cortex-R52 set 1 to RR bit of Hypervisor Reset Management Register, and Cortex-R52 executes WFI instruction, the warm reset of Cortex-R52 is asserted. After that, the warm reset is negated automatically, and Cortex-R52 starts the boot sequence. About the detail of Hypervisor Reset Management Register and warm reset, please refer to Arm Cortex-R52 Processor Technical Reference Manual.

Please refer to “10.3.2.5 Power operation for Cortex-R52” for reset and power operation.

10.3.6 Access protection

10.3.6.1 Bus access protection specification (common specification)

APB Bus is available to control Domain access by each 4KB (0x1000) register address area. Figure 10.11 shows an example. The basic idea and detail of this function is written in Section 18.

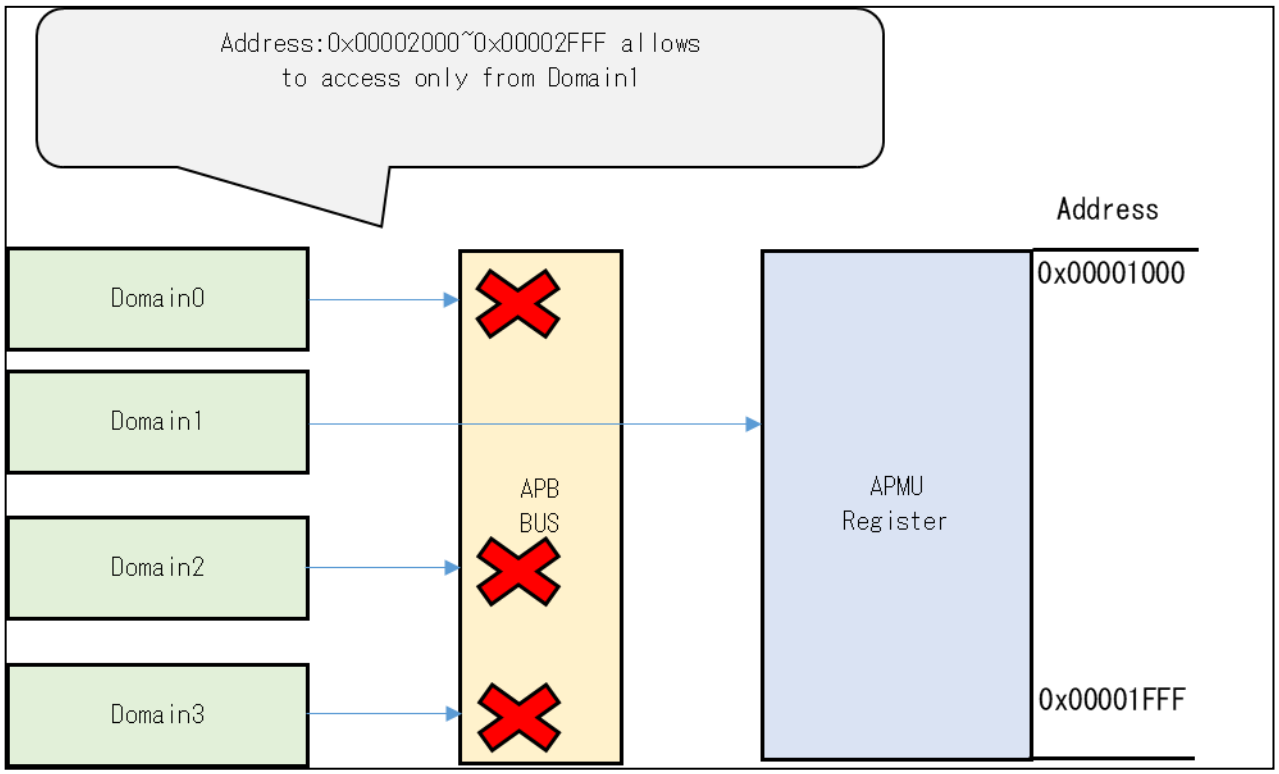

Figure 10.11 Bus access protection

10.3.6.2 APMU access protection specification

(1) Address and register entity (common specification)

Each domain has an address area exclusively, but Register entity is only one.

- Domain

  All registers in APMU are accessed through the Domain. There are 4 Domains for APMU.

- Access Group

  Each register in APMU belongs to specific access group. User can assign access groups to each Domain by configuration registers. User can assign 2 or more access groups to 1 Domain. User can assign 1 access group to 2 or more Domains.

Multiple registers belonging to the different group can have different access privileges. However, max is 4 types of access privileges for APMU registers because there are only 4 Domains for APMU. Figure 10.12 shows an example.

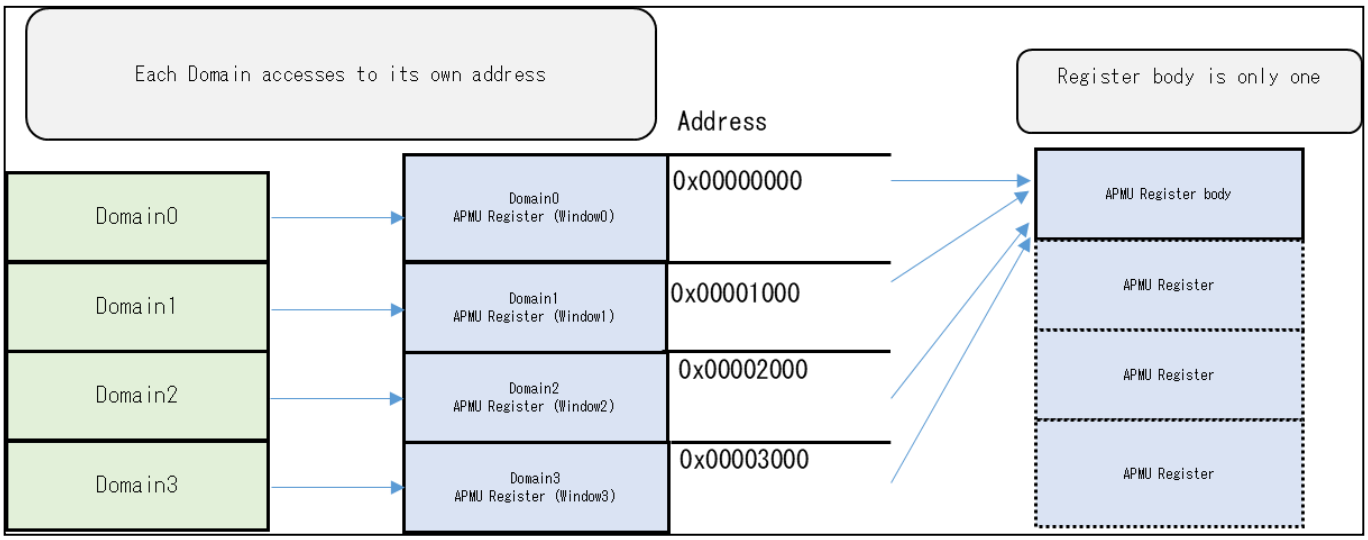

Figure 10.12 APMU register structure

(2) Domain check logic (common specification)

Domain check logic checks from which Domain access and restrict the other Domain to access registers.

APMU has registers, “Domain n Access Enable Register (n = 0-3)”, and it enables Domain control. The detail is written in the following, please refer to 10.3.6.2(3).

[Initial value]

Initial value of Domain 0 access enable register is all 1 (Access enable). Initial value of Domain n access enable register (n = 1-3) is all 0 (Access disable). Domain 0 only can Read/Write enable. Domain 1-3 can Read only (Write disable).

Figure 10.13 shows Domain check logic’s structure.

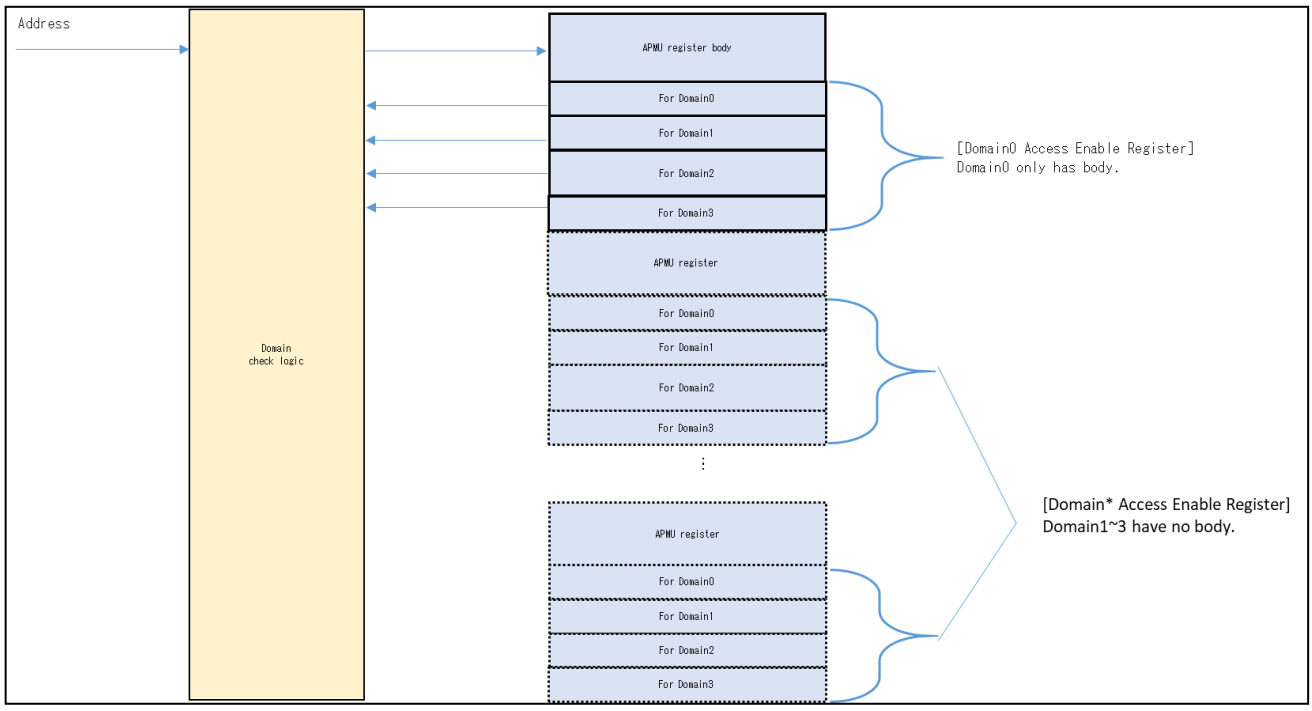

Figure 10.13 Domain check logic

(3) Domain n Access Enable Register (n = 0-3) (APMU specific)

APMU has Registers “Domain n Access Enable Register (n = 0-3)”. They control access privilege of each Domain. Detail of Domain n Access Enable Register and applicable register is described in section 10.2.

Applicable registers of Domain protection are:

- admin registers

  APMU’s general control registers;

- Cortex-R52 registers

  Cortex-R52 reset control registers and CR52BAR;

- Cortex-A76 CPU cluster x registers (x = 0)

  Cortex-A76 CPU cluster x power and reset control registers (x = 0) and RVBAR;

Each register is categorized in the following four groups. The summary of all registers and their groups is described in Table 10.5, Table 10.6, Table 10.7 and Table 10.8.

- Group0

  They are expected to be used for security operation. For example, Reset Vector Base Address Register for secure mode.

- Group1

  They are expected to be used for safety operations. For example, Runtime Test configuration of Cortex-A76 CPU clusters.

- Group2

  They are expected to be used for normal power and reset control. For example, power ON/OFF operation.

- Group3

  Reserved. Not used

For example, in the case of the following, only Domain 0 can access Group0 of Cortex-A76 CPU cluster 0's registers. The other Domains cannot access Group0 of Cortex-A76 CPU cluster 0's registers.

D0ACCENR.CL0GRP0 = 1 (Access Enable)

D1ACCENR.CL0GRP0 = 0 (Access Disable)

D2ACCENR.CL0GRP0 = 0 (Access Disable)

D3ACCENR.CL0GRP0 = 0 (Access Disable)

The Domain x Access Enable Register can be written by only Domain 0, regardless of the setting value. Domain 1, 2 and 3 cannot be written. And reading registers is possible by Domain 0, 1, 2 and 3.

Reset Vector Base Address Register Protected Low for Core z	RVBARPLCz	Group0
Reset Vector Base Address Register Protected High for Core z	RVBARPHCz	Group0

z = 0 - 3

(4) Write protect logic (APMU specific)

All registers in APMU except for WPCR and WPR can be protected from unexpected write operation by setting one to WPE bit of WPCR register. When one is set to WPE bit of WPCR register, writing inverted values to WPR is necessary before write access.

The sample procedure is shown in following. In this case, user wants to write H'AAAA 5555 to the target register.

1. Write H'5555 AAAA (= inverted value of H'AAAA 5555) to WPR
2. Write H'AAAA 5555 to the target register

   If the first step is skipped, H'AAAA 5555 is not written to the target register.

10.4 Usage Notes

10.4.1 Reset operation when AP-System core is in DEBUG mode

When AP-System Core is in DEBUG mode and forced reset function needs to be used, setting zero to FRSTCTRL[30] is necessary.

The above operations must be done during Boot sequence.

10.4.2 Enable Access protect function

When access protect function is enabled, setting one to RTGRP3 and CL0GRP3 of each D[n]ACCENR (n=0-3) is necessary.

Setting Group3 affects nothing because there are no registers belonging to Group3.

10.4.3 Additional procedure for power on/off control of AP-System Core

When you power-on/off the AP-System Core, you must apply an additional procedure described in this section: either Procedure-1 or Procedure-2.

Refer to 10.3.2.1 for the operation of power-on sequence and 10.3.2.2 for the operation of power-off sequence.

(1) Procedure-1

Setting 0 to FRSTCTRL[29] is necessary. This operation must be done before the first Cortex-A76 CPU core is booted.

(2) Procedure-2

Do not power-off Cortex-A76 CPU core alone. Cortex-A76 CPU cluster [x] and all CPU cores which belongs to the cluster [x] are necessary to powered-off at a time in the following manner. Where, [x] is cluster number 0.

Power-off sequence

When you power-off Cortex-A76 CPU cluster [x], the following procedure is necessary in the power-off sequence.

1. Clean L1 caches of all CPU cores in the cluster [x] and L3 cache of the cluster [x]. (*1)
2. Power-off threecores in the Cortex-A76 CPU cluster [x]. (*2)
3. Power-off the last core in the Cortex-A76 CPU cluster [x] and the cluster [x] itself.

Notes

*1: Refer to the following document for the example of cache clean.
Example 11-3, section 11.5, ARM Cortex-A Series Programmer's Guide for ARMv8-A version 1.0
(https://developer.arm.com/documentation/den0024/a)

*2: If any of cores in the cluster [x] will never be used, you do not need to power-on that core from the beginning. If you need to use the unpowered core later, power-off the already booted core and its cluster, then power-on all necessary cores in the cluster [x].

10.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

10.5.1 Block diagram for functional safety

APMU is implemented as DCLS. Figure 10.14 shows APMU DCLS structure. All sub-modules in APMU are duplicated. One is used as master core and the other is used as checker core. Each core executes same operation and execution result from each core is always compared. If the compare logic detects difference, it judges APMU has failure and it asserts error notification signal. This error notification signal has error injection function. It is controlled by DCLSEIJTR.

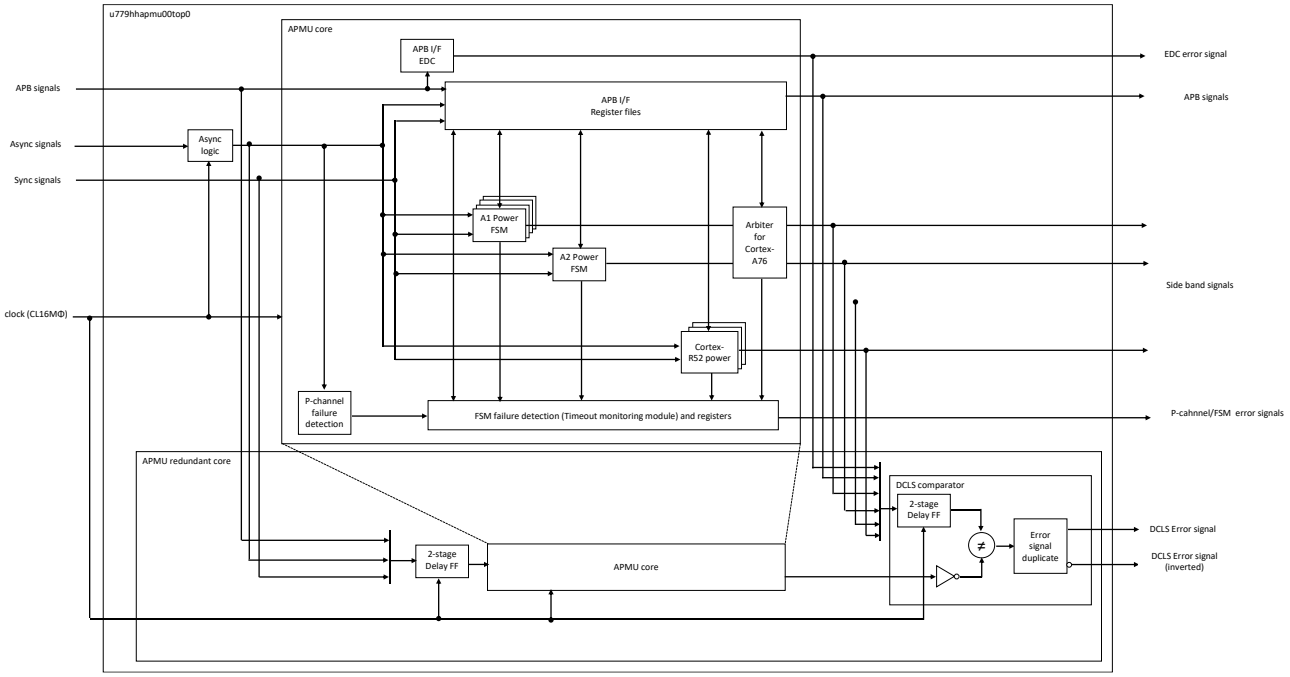

Figure 10.14 APMU DCLS structure

10.5.2 Safety Mechanism for Cortex-R52 (DCLS)

(1) Overview

The dual core lock step (DCLS) architecture is implemented in Cortex-R52. And its comparator is controlled by CR52CMPENr register.

(2) Related Registers

Table 10.9 Register configuration of Safety Mechanism for Cortex-R52 (DCLS)

Register Name	Abbreviation
Cortex-R52 Comparator Enable Register r	CR52CMPEN[r] (r=0-2)

(3) Hardware Description

For more detail about Cortex-R52, please refer to section 6.

10.5.3 Safety Mechanism for AP-System Core

(1) Overview

AP-System Core does not support DCLS mode.

(2) Related Registers

There is no content in this section.

(3) Hardware Description

There is no content in this section.

10.5.4 Safety Mechanism for P-channel interface

(1) Overview

P-channel interface is used to communicate between APMU and Cortex-A76/R52 CPU core and cluster. And Safety Mechanism for this interface is implemented to APMU and Cortex-A76/R52 CPU core and cluster. The block diagram is shown in Figure 10.15.

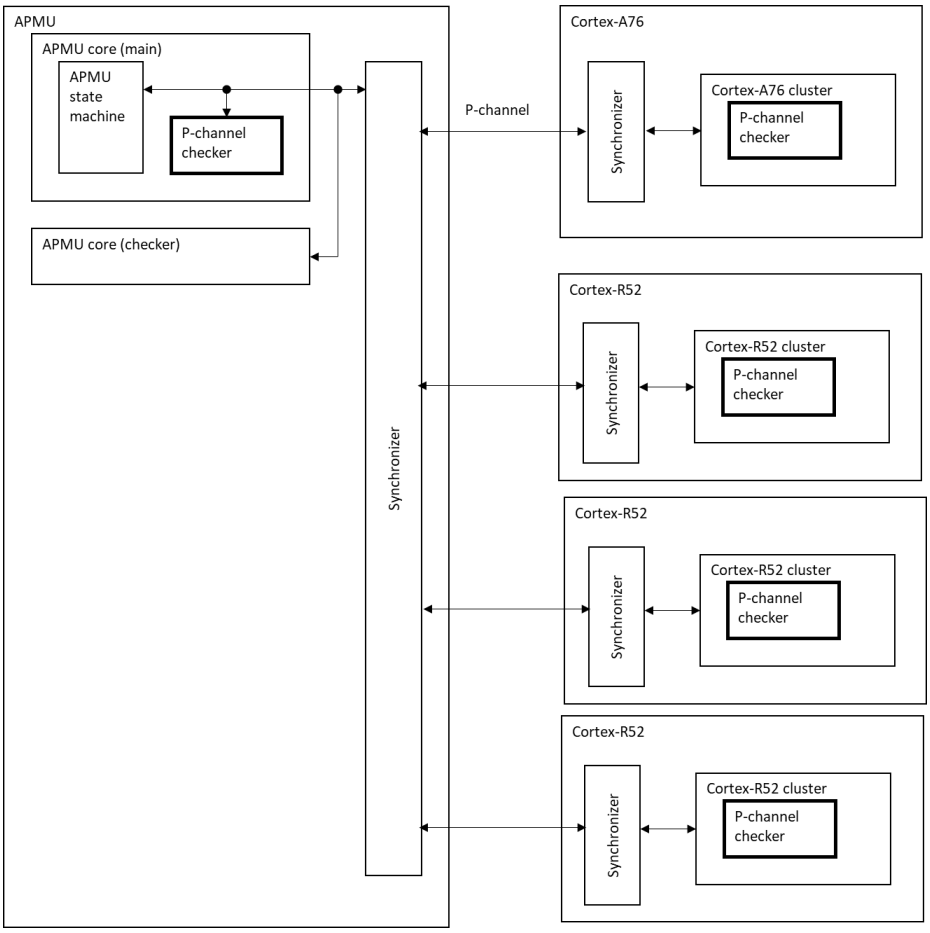

Figure 10.15 Safety Mechanism for P-channel between APMU and Cortex-A76/R52

(2) Related Registers

Table 10.10 Related Registers of Safety Mechanism for P-channel Interface

Register Name	Abbreviation
Error Status Register	ERRSTSR
FSM Lock Register for Cortex-R52 [r]	FSMLOCKRCR52[r] (r=0-2)
FSM Lock Register for Cluster [x]	FSMLOCKRCL[x] (x=0)
FSM Lock Register for Core [z]	FSMLOCKRC[z] (z=0-3)

(3) Hardware Description

a) Safety Mechanism in APMU side

This Safety Mechanism can detect three types of errors. First is P-channel protocol error, second is P-channel corruption error and third is FSM deadlock error. The error detection flag is stored to FSM Lock Register for each FSM. When error detection flag is set, one is set to each bit of ERRSTSR, and APMU notifies error detecting to ECM.

P-channel protocol error

P-channel signal from Cortex-A76/R52 CPU core and cluster to APMU is duplicated. And they are compared by this mechanism. This function can be activated after Cortex-A76/R52 CPU core is booted. At that time, before enabling this function, PRTCL_ERR bit must be cleared to 0.

This mechanism is enabled by setting one to PRTCL_EN bit of FSMLOCKRCLx, FSMLOCKRCz or FSMLOCKRCR52r. If this mechanism detects failing, one is set to PRTCL_ERR bit of FSMLOCKRCLx, FSMLOCKRCz or FSMLOCKRCR52r.

P-channel corruption error

A Toggle order of P-channel signals is defined by Arm. About the detail, refer to the Reference [3]. This mechanism detects failing of this order by monitoring a set of P-channel signal.

This mechanism is enabled by setting one to CRPT_EN bit of FSMLOCKRCLx, FSMLOCKRCz or FSMLOCKRCR52r. If this mechanism detects failing, one is set to CRPT_ERR bit of FSMLOCKRCLx, FSMLOCKRCz or FSMLOCKRCR52r.

FSM deadlock error

APMU has FSMs for each power domain and Cortex-R52. And each FSM is monitored by a timeout monitoring module. The timeout monitoring module counts transition time from one power mode to other power modes. If the transition time is more than configured time, this mechanism judges FSM is in deadlock.

This mechanism is enabled by setting one to LOCK_EN bit of each FSMLOCKR. Transition time is configured by CNT_VALUE field of FSMLOCKR. A timeout monitoring module counts transition time by 1/16 frequency clock of APMU clock. If this mechanism detects failing, one is set to LOCK_ERR bit of FSMLOCKR.

Error notification signal and handling

APMU outputs four error notification signals. A corresponding signal is asserted when one is set to any bits of ERRSTSR. The correspondence of error notification signals and bits of ERRSTSR is described in Table 10.11.

If error notification signal is captured by ECM, ECM issues interrupt signal to Cortex-R52. If Cortex-R52 receives interrupt signal to notify APMU failing, Cortex-R52 must read ERRSTSR to identify which FSM detects failure. After that Cortex-R52 reads FSMLOCKR of failing FSM to identify which type of error is detected. After Cortex-R52 finishes error operation, Cortex-R52 clears error flag bit of each FSMLOCKR to zero. By this operation, the corresponding bit of ERRSTSR is cleared by APMU. And error notification signal is also negated by APMU.

Table 10.11 Error notification signal of Safety Mechanism for P-channel interface

Error notification signal	**Bit name of ERRSTSR.**
Cortex-R52 CPU core 0 reset control error	CR52_ERR0
Cortex-R52 CPU core 1 reset control error	CR52_ERR1
Cortex-R52 CPU core 2 reset control error	CR52_ERR2
Cortex-A76 CPU cluster 0 power control error	A2C0_ERR, A1C0_ERR, A1C1_ERR, A1C2_ERR, A1C3_ERR

Error injection function

The above three types of errors have error injection function. If one is set to PRTCL_EIJT, CRPT_EIJT or LOCK_EIJT bit by SW, one is set to corresponding error status bits and corresponding error signals are asserted. To negate error notification signal, CPU must clear all error injection bits to zero. After that CPU must clear all error status bits to zero.

b) Safety Mechanism in Cortex-A76/R52 CPU core and cluster side

This Safety Mechanism can find two types of errors. First is parity error and second is P-channel signal protocol error. If either one error is detected, Cortex-A76/R52 CPU core notifies error detection to ECM.

Parity error for P-channel signal

A parity bit is added to P-channel signal from APMU to Cortex-A76/R52 CPU core and cluster. The parity checking logic is implemented in Cortex-A76/R52 CPU core and cluster. It detects parity error.

P-channel protocol error

Toggle ordering of P-channel signals is defined by Arm. About the detail, refer to the Reference [3]. This mechanism detects failing of this ordering.

10.5.5 Safety Mechanism for APB bus interface

(1) Overview

APMU has EDC checker and generator for APB bus interface.

(2) Related Registers

Table 10.12 Related Registers of Safety Mechanism for APB bus Interface

Register Name	Abbreviation
PADDR Check Status Register	PADDCHKSTSR
PWDATA Check Status Register	PWDATACHKSTSR

(3) Hardware Description

For more detail, please refer to Section 15.

10.5.6 Safety Mechanism between Generic Counter and CPUs

(1) Overview

Safety mechanism is implemented between Generic Counter and Cortex-A76 CPU core and Cortex-R52 CPU core. It is controlled by GCNTERRENCR52r and GCNTERRENCLx.

(2) Related Registers

Table 10.13 Related Registers of Safety Mechanism between Generic Counter and CPUs

Register Name	Abbreviation
GCNT Error Enable Register for Cortex-R52 [r]	GCNTERRENCR52[r] (r=0-2)
GCNT Error Enable Register for Cluster [x]	GCNTERRENCL[x] (x=0)

(3) Hardware Description

For more detail about Safety mechanism between Generic Counter and Cortex-R52, please refer to section 6. For more detail about Safety mechanism between Generic Counter and Cortex-A76 CPU core, please refer to section 5.

11. System Controller (SYSC)

11.1 Overview

11.1.1 Features

Power Control

SYSC works as a power control for any power domains including.

AP-system core

SYSC controls Power-ON and Power-OFF of the Cortex-A76 CPU core at APMU's request. APMU's request can be masked by register settings.

Realtime core

SYSC controls Power-ON and Power-OFF of the Realtime core at APMU's request. APMU's request can be masked by register settings.

GPU

SYSC controls Power-ON and Power-OFF of the Cortex-A76 CPU core at 3DGE's request. 3DGEs request can be masked by register settings.

Other

SYSC controls Power-ON and Power-OFF of other modules by power domain registers.

Function

SYSC controls Power-ON and Power-OFF of power domains, and checks the power state status thereof. SYSC has pseudo Power-OFF function.

SYSC and CPG interact since CPG controls clock and reset. When the power state control is completed or violation occurs, the interrupt function for CPUs activates. SYSC controls isolation cells.

Multi Request Power flow support

Multiple power control requests able accepted.

This module is sequentially processed by power control requests.

FuSa

SYSC has the following functions for FuSa.

- Write access protection
- Isolation Error Detection
- HW Redundancy
- SYSC is POST (Power On Self Test) target

Policy

SYSC controls Power Switch and Isolation cells for all power domains.

Basically, we can detect the failure of SYSC function by the following mechanism.

Failure of Power Switch control function.:

If Power Switch is unintentionally Power-OFF, we can detect the failure by using register access, reset feedback etc because the modules in the power domain cannot operate correctly.

Failure of Isolation control function:

If isolation is unintentionally active, we can detect the failure by using register access and reset feedback etc. because the signal is masked by isolation cell.

If isolation cell is failure during Power-OFF, we can detect it by isolation error detection function (SM).

Functional Safety function

Create error notification to error correction module when occur error.

HW redundancy
Can be error notification when occur violation operation, therefore hardware redundancy of register and FSM in sysc logic. Error correction have 16 violation. And can be mask of error notification.

SYSC is POST (Power ON Self Test) target

Power control when period of POST mode. All power ON of power domains before POST mode. Power and isolation control when period of POST mode by SWC.

Write access protection
Write access protection function for register. For common registers, write access protection is possible for each register. For power control registers, write access protection is possible for each power domains. If occur write access violation, error notification and store of address.

Isolation Error detection
SYSC have error notification of isolation cells.Isolation Function to detect cell failure. It is possible to check in which power domains an error occurred. Error mask function implemented for each error cause.

11.1.2 Power Domain Structure

When one of those power domains is Power-OFF state, all power domains which are written left the domain does not change Power-OFF state. For example, when A2E0D0 is Power-OFF state, A1E0D0C0 and A1E0D0C1 power requests are processed after waiting for A2E0D0 Power-ON state.

Table 11.1 Power Domain Structure

Power Domain	Description	Power Domain	Description	Power Domain	Description
A1E0D0C0	Cortex-A76 CPU core0 *1	**A2E0D0**	Cortex-A76 CPU cluster *1	**C4**	
A1E0D0C1	Cortex-A76 CPU core1 *1

Note: "-" is Reserved.

11.1.4 Register Configuration

Table 11.3 lists the SYSC registers.

Base-address of SYSC H'E618 0000

SYSC has Write Access Protection function. The register can only access from permitted protection domains.

There are 4 protection domains (Domain0/1/2/3) by address. Access the same register from each protection domain.

Protection domains select uses 15 and 14 bits. Therefore, for base addresses other than 0, use the following calculation formula.

SYSC register area By address

H'E618 0000 + H’4000 * Protection Domain No.

Do not write to addresses other than those listed below, otherwise normal operation cannot be guaranteed. Values read from other addresses are undefined.

Access size are all 32bits.

[Legend]

Initial value: Register value after a reset

- : Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be the initial value.

-/WB: Write-only. The read value is undefined.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

Table 11.3 List of Registers

n: Power Domain Register Number(PDR) , refer to List of PDR and Power domain (Table 11.2).
The register value when the power domain does not exist is unknown.
Example: Offset Address of PDRSR01 is H’1040, PDRSR48 is H’1C00

Register name	Abbreviation	R/W	Offset Address	Initial Value
SYSC Status Register	SYSCSR	R	H'0000	H'0000 0003

Note
*1:The initial value cannot be confirmed.

Table 11.4 Register Diagram

	address		offset address
Domain0	E618_0000h	Common Registers	0000h
		PowerDomainRegisters	1000h
		Reserved area	2000h
		Write access control Registers(only Domain0)	3000h
Domain1	E618_4000h	mirroring from all Domains	
Domain2	E618_8000h		
Domain3	E618_C000h		
	E618_FFFFh		

This Domain is different from Power Domain.
Bus module can protect access by address region (min 4kB unit) each regionID.
ex.) only Cortex-R52 can access to Domain0. Other masters cannot access to Domain0.

Write access protection registers in SYSC can protect write access each regisiter or each Power domain registers.

11.2 Register Description

(include Safety Mechanism related register description)

Explanation of abbreviation of register

Initial value: Value of the register after power-on reset

-：Undefined value

R/W：The bit or field is readable and writable.

R/WC0：The bit or field is readable and writable. Writing 0 to the bit initializes the bit. Writing 1 to the bit is ignored.

R/WC1：The bit or field is readable and writable. Writing 1 to the bit initializes the bit. Writing 0 to the bit is ignored.

R：The bit or field is readable only. When writing to the register, write 0 to it.

-/WB：the bit or field is writable. Note that values read from write-only bits are not guaranteed.

11.2.1 SYSC Status Register (SYSCSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BUSY[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	*1	*1	Reserved *2
1 to 0	BUSY[1:0]	*1	*1	Indicates whether the SYSC is processing Power-ON or Power-OFF sequence. 00: Processing Power-ON or OFF sequence 11: Not processing Power-ON or OFF sequence

Note

*1: Refer to bit assignment table above.

*2: In Reserved, read value is always initial value and write value must be initial value.

Common Registers

SYSC has Common Registers to control all power domains.

11.2.2 Power-ON Status Register0 (SYSCPONSR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	PDR[31]	PDR[30]	PDR[29]	PDR[28]	PDR[27]	PDR[26]	PDR[25]	PDR[24]	PDR[23]	PDR[22]	PDR[21]	PDR[20]	PDR[19]	PDR[18]	PDR[17]	PDR[16]
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	PDR[15]	PDR[14]	PDR[13]	PDR[12]	PDR[11]	PDR[10]	PDR[9]	PDR[8]	PDR[7]	PDR[6]	PDR[5]	PDR[4]	PDR[3]	PDR[2]	PDR[1]	PDR[0]
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PDR[31:0]	*1	*1	Power-ON status for PDR00-31 power domains. 0: non-Power-ON state 1: Power-ON state The read value of reserved PDR bit is 0.

Note
*1: Refer to bit assignment table above.

11.2.3 Power-ON Status Register1 (SYSCPONSR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	PDR[63]	PDR[62]	PDR[61]	PDR[60]	PDR[59]	PDR[58]	PDR[57]	PDR[56]	PDR[55]	PDR[54]	PDR[53]	PDR[52]	PDR[51]	PDR[50]	PDR[49]	PDR[48]
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	PDR[47]	PDR[46]	PDR[45]	PDR[44]	PDR[43]	PDR[42]	PDR[41]	PDR[40]	PDR[39]	PDR[38]	PDR[37]	PDR[36]	PDR[35]	PDR[34]	PDR[33]	PDR[32]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PDR[63:32]	*1	*1	Mask complete interrupt request to INTC for PDR32-63 power domains. 0: Not mask complete interrupt request 1: Masks complete interrupt request If PDR[n] is reserved power domain, write value must be initial value.

Note
*1: Refer to bit assignment table above.

11.2.12 Extended Function Control Register (SYSCEFCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	ADE	ADM	AD-	-	-	-	-	-	-	-	-
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/WC1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	*1	*1	Reserved *2
10	ADE	*1	*1	All request Done interrupt Enable 0: Disable 1: Enable
9	ADM	*1	*1	All request Done interrupt Mask 0: not mask All request Done interrupt. 1: Mask All request Done interrupt.
8	AD	*1	*1	All request Done interrupt status/clear 0: Non-detected All request Done interrupt 1: Detected All request Done interrupt (when SYSCRSR0, 1, 2, 3 are all 0, this bit is set to 1) When write 1, this bit is cleared to 0. If ADE bit is 0, this bit is not set.
7 to 0	-	*1	*1	Reserved *2

Note
*1: Refer to bit assignment table above.

*2: In Reserved, read value is always initial value.

Power Domain Registers

SYSC has Power Domain Registers for each Power Domain.

11.2.13 Power Domain Status Register n (PDRSRn) (n=00-63)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	ON_STATE	-	-	-	OFF_STAT	-	-	-	ON	-	-	-	OFF
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	-	*1	*1	Reserved *2
12	ON_STATE	*1	*1	Indicates status of Power-ON sequence. 0:Not processing Power-ON sequence 1:Processing Power ON sequence
11 to 9	-	*1	*1	Reserved *2
8	OFF_STATE	*1	*1	Indicates status of Power-OFF sequence. 0: Not processing Power-OFF sequence 1: Processing Power OFF sequence
7 to 5	-	*1	*1	Reserved *2
4	ON	*1	*1	Indicates Power-ON state. 0:Not Power-ON state 1:Power-ON state
3 to 1	-	*1	*1	Reserved *2
0	OFF	*1	*1	Indicates Power-OFF state. 0:Not Power-OFF state 1:Power-OFF state

Note
*1: Refer to bit assignment table above.
*2: In Reserved, read value is always initial value.

11.2.14 Power Domain power-ON Control Register n (PDRONCRn) (n=00-63)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PWR ON
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	*1	*1	Reserved *2
0	PWRON	*1	*1	Power-ON request. If write 1, activate Power-ON request. If the target power domain is already Power-ON, the request is ignored. it is ignored to write 0 to this register

Note
*1: Refer to bit assignment table above.
*2: In Reserved, write value must be 0.

11.2.15 Power Domain power-OFF Control Register n (PDROFFCRn) (n=00-63)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PWR OFF
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	*1	*1	Reserved *2
0	PWROFF	*1	*1	Power-OFF request. If write 1, activate Power-OFF request. If the target power domain is already Power-OFF, the request is ignored. it is ignored to write 0 to this register

Note
*1: Refer to bit assignment table above.
*2: In Reserved, write value must be 0.

11.2.16 Power Domain power-ON/OFF Error Status Register n (PDRESRn) (n=00-63)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ERR
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	*1	*1	Reserved *2
0	ERR	*1	*1	Power Domain power-ON/OFF Error Status 0: Either a preceding power OFF or power ON request was accepted. 1: Either a preceding power OFF or power ON request was not accepted.

Note

*1: Refer to bit assignment table above.

*2: In Reserved, read value is already 0.

Write access protection Registers

11.2.17 Protect Control/Status Register (SYSCPTCSR)

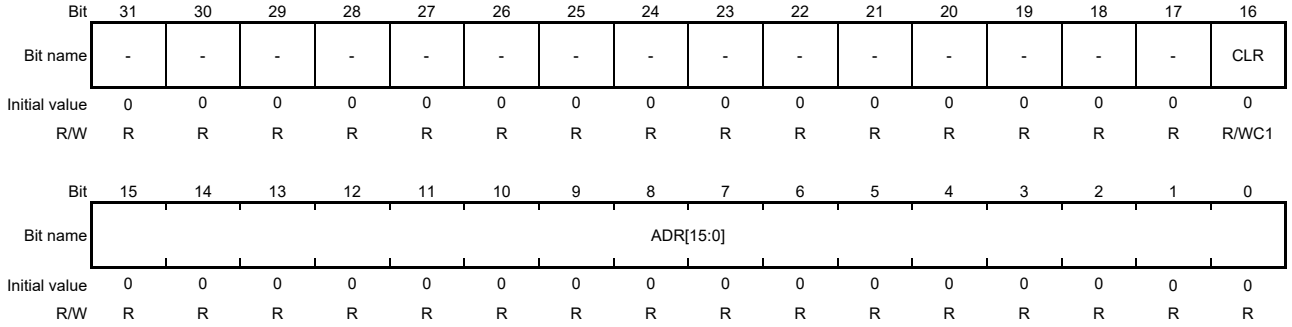
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	EIEI	EIE	ERR
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	*1	*1	Reserved *2
2	EIEI	*1	*1	Write access protection Error Interrupt request Enable for INTC. 0: Disable error interrupt request for INTC 1: Enable error interrupt request for INTC
1	EIE	*1	*1	Write access protection Error Interrupt request Enable for ECM (FuSa). 0: Disable error interrupt request for ECM 1: Enable error interrupt request for ECM
0	ERR	*1	*1	Indicates Write access protection Error status. 0: Not detected Write access protection error. 1: Detected Write access protection error. If write 1, this bit is cleared to 0. If write 0, it is ignored.

Note
*1: Refer to bit assignment table above.
*2: In Reserved, read value is always initial value and write value must be initial value.

11.2.18 Protect Error Address Register (SYSCPTERADR)



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit name	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLR
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

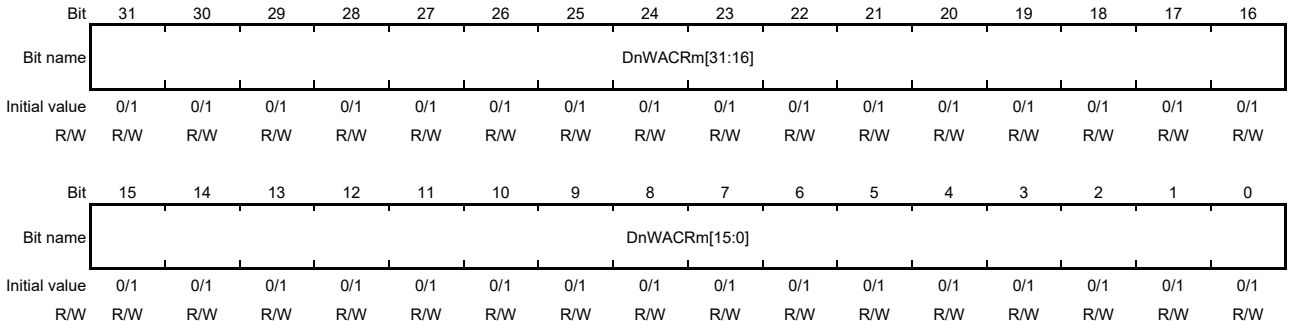
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit name	ADR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	*1	*1	Reserved *2
16	CLR	*1	*1	Write access protection error address clear Before it clear, must clear to SYSCPTCSR.ERR . If write 1, ADR is cleared to 0 and the next error address can be hold. Read value is always 0.
15 to 0	ADR[15:0]	*1	*1	First Write access protection error address. Indicates first Write access protection error address if Write access protection error occurs. It is cleared by CLR bit.

Note
*1: Refer to bit assignment table above.
*2: In Reserved bits, read value is always initial value and write value must be initial value.

11.2.19 Domain n Write Access Control Register m (SYSCDnWACRm) (n=0/1/2/3) (m=0/1/2/3)

This register can be written by only Domain0 address. (H'E618_0000− H'E618_3FFC)



Initial value

n=0: H'FFFF_FFFF

n=1,2,3: H'0000_0000

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DnWACRm[31:0]	*1	*1	Domain[n] Write access control for Common Registers. For protected address assignment, refer to Table 11.6. 0 : Prohibit write access. 1 : Permit write access. n: Domain No n=0/1/2/3 m: Register No m=0/1/2/3

Note

*1: Refer to bit assignment table above.

Table 11.6 Write access protected address assignment for Common Registers

11.3 Operation

11.3.1 Power Domain Structure

refer to Table 11.1 Power Domain Structure

11.3.2 Initial State of Power Domains

Since all power domains are power OFF start.

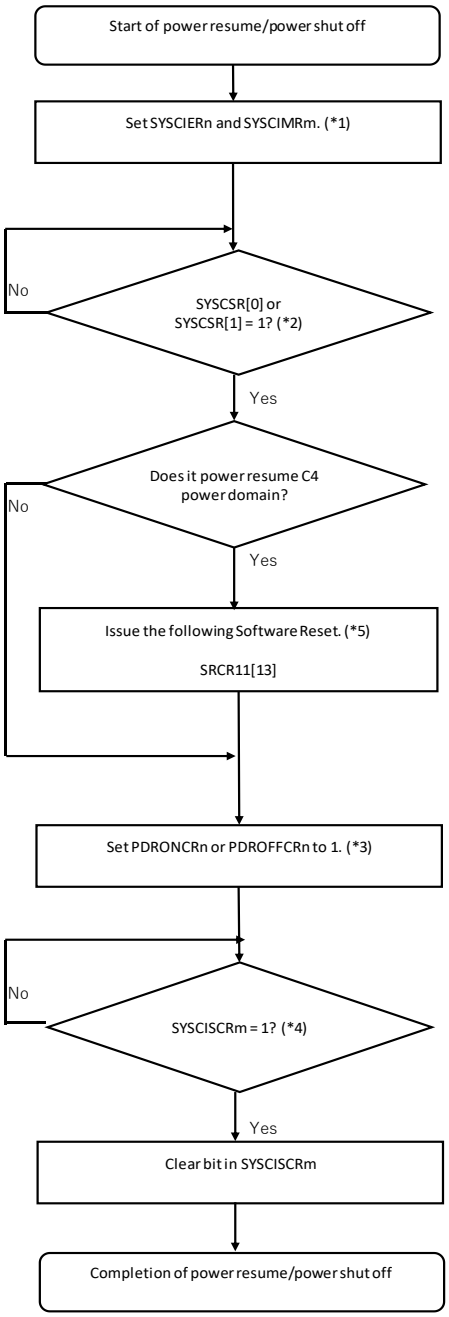
11.3.3 Power Control of Arm CPUs

The Cortex-A76 CPU cores and Realtime cores (Cortex-R52) can be powered off by executing the WFI instruction. Similarly, power of Arm CPUs can be resumed either by controlling the APMU (Advanced Power Management Unit) registers or by an IRQ or FIQ interrupt.

For detail of power control by APMU registers, see section 10, Advanced Power Management Unit for Cortex-A76 CPU Core (APMU).

11.3.4 Power Control of Non Arm CPU Modules

Power control on modules other than the Arm CPUs can be performed by SYSC registers. Following figure describes power control reference flowchart.



*1 Set interrupt enable register.
For domain 1->32: SYSCIER0, SYSCIMR0
For domain 33->63: SYSCIER1, SYSCIMR1

*2 Check following register, to confirm power resume or shutoff is ready to start.
For power resume : SYSCSR[1]
For power shut off : SYSCSR[0]

*3 For power resume: PDRONCRn
For power shut off: PDROFFCRn
(Refer to section 11.1.2 Power domain structure for supported power domain.)

*4 Wait for the completion of power sequence, by interrupt or register polling
For domain 1->32: SYSCISCR0
For domain 33->63: SYSCISCR1

*5 Assert and release the reset before C4 power domain resume.
(Refer to section 9.3(2)(B) for Software Reset operation.
Refer to sections 9.2.1 and 9.2.2 for reset registers.)

Figure Power Resume/Shutoff Flowchart for non Arm CPU domain by SYSC Registers

11.4 Usage Notes

It takes several hundreds of microseconds to Power-ON and Power-OFF power domain.

Because actual time required for Power-ON and Power-OFF depends on the status of on-board power line, Power-ON and Power-OFF time is not guaranteed by electrical specification.

To perform BUS control, the power supply is required to be ON.

refer to the following for the table.

chapter 18 AXI-Bus

Before Power-OFF one (or more) of the below power domains, set all modules to the Module Standby state for which belong to the power domain.

Refer to Figure 11.5a.

A3VIP2,0/A3ISP0

Refer to Figure 11.5b.

A3VC/C4/ A2IMP01

Just before Power-OFF for below power domains, clear to Module Standby of modules in these power domains.

Refer to Figure 11.5c.

A2DMA/A2PSC/A2CV3-0/A2CN0/A1DSP1-0

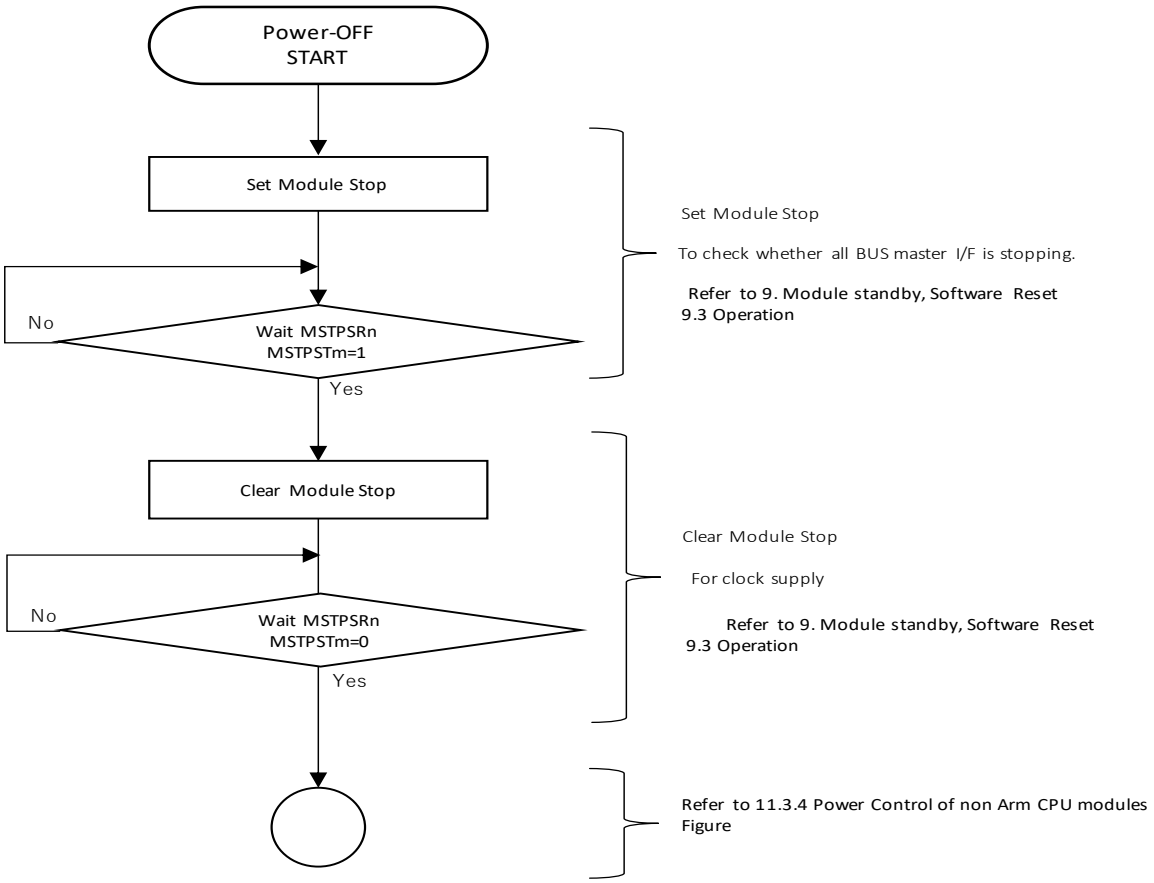


Figure 11.5a Set and clear module standby

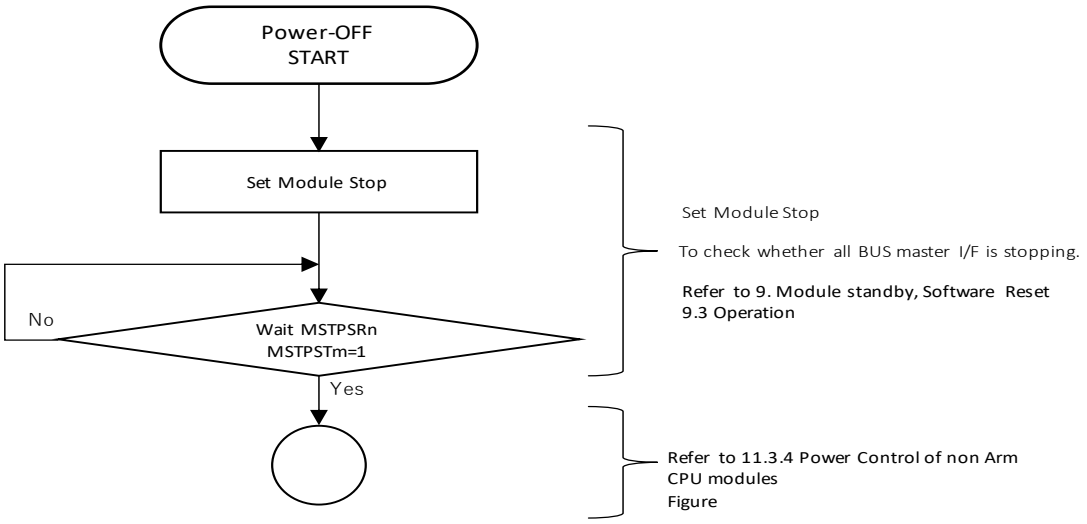

Figure 11.5b Set Module Standby

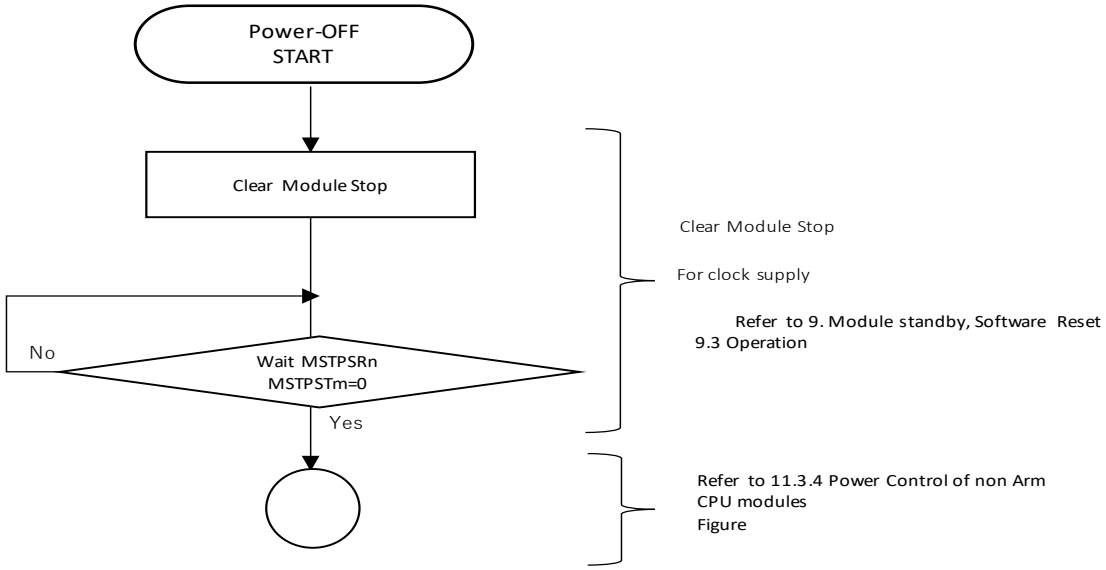

Figure 11.5c Clear module standby

11.5 Safety Mechanisms

11.5.1 Safety Mechanism 1

a) Overview

SYSC has the following functions for FuSa.

- Write access protection
- Isolation Error Detection
- HW Redundancy
- SYSC is POST (Power On Self Test) target

Policy

SYSC controls Power Switch and Isolation cells for all power domains.

Basically, we can detect the failure of SYSC function by the following mechanism..

Failure of Power Switch control function.:

If Power Switch is unintentionally Power-OFF, we can detect the failure by using register access, reset feedback etc because the modules in the power domain cannot operate correctly.

Failure of Isolation control function:

If isolation is unintentionally active, we can detect the failure by using register access and reset feedback etc. because the signal is masked by isolation cell.

If isolation cell is failure during Power-OFF, we can detect it by isolation error detection function (SM).

Functional Safety function

Create error notification to error correction module when occur error.

HW redundancy
Can be error notification when occur violation operation, therefore hardware redundancy of register and FSM in sysc logic. Error correction have 16 violation. And can be mask of error notification.

SYSC is POST (Power ON Self Test) target

Power control when period of POST mode. All power ON of power domains before POST mode. Power and isolation control when period of POST mode by SWC.

Write access protection
Write access protection function for register. For common registers, write access protection is possible for each register. For power control registers, write access protection is possible for each power domains. If occur write access violation, error notification and store of address.

Isolation Error detection

SYSC have error notification of isolation cells. Isolation Function to detect cell failure. It is possible to check in which power domains an error occurred. Error mask function implemented for each error cause.
If target power domain was pseudo power-OFF power domain, this function not work.

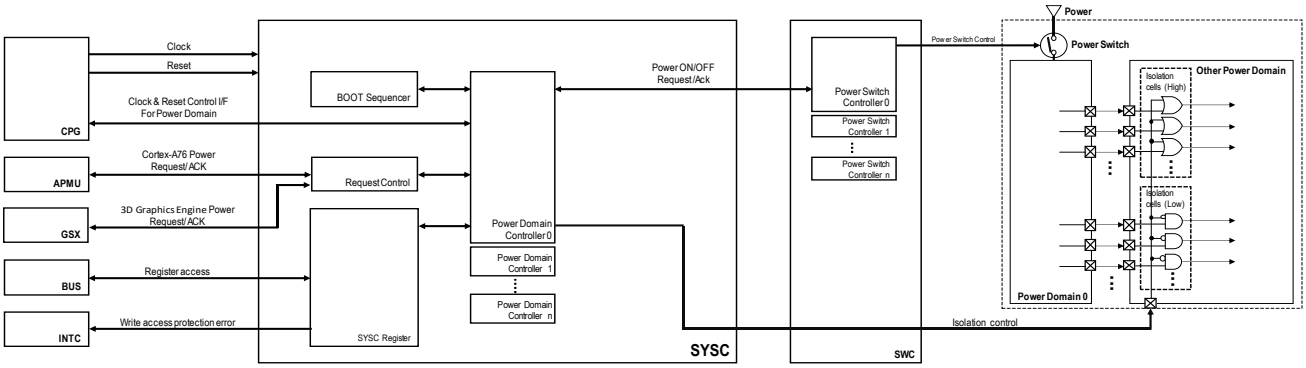
c) Hardware Description

Connected to the internal peripheral bus (the APB bus), SYSC operates in coordination with CPG, RESET module, and APMU; it contains a module that controls the objects of power shutoff.



12. Adaptive Voltage Scaling (AVS) [for specific customers only]

12.1 Overview

Adaptive voltage scaling (AVS) mitigates power variation by adjusting VDD voltage.

12.1.1 Features

- AVS allows lower voltage operation without operating frequency degradation if there is a room to speed. Up to 3 adjustable voltage setting called as AVS code is offered. AVS can be employed only VDD voltage. (refer to 12.3.1)
- Register-AVS
  Adjust VDD voltage by register values corresponding to AVS code after boot (refer to 12.3.2)

  AVS code is not available via AVS pins which are described in 004_R-CarV4M_Pin_Multiplex_r1p10.xlsx
  VOLCOND register shows AVS code.

12.1.2 Block Diagram

A block diagram of the Adaptive Voltage Scaling (AVS) module is shown in Figure 12.1.

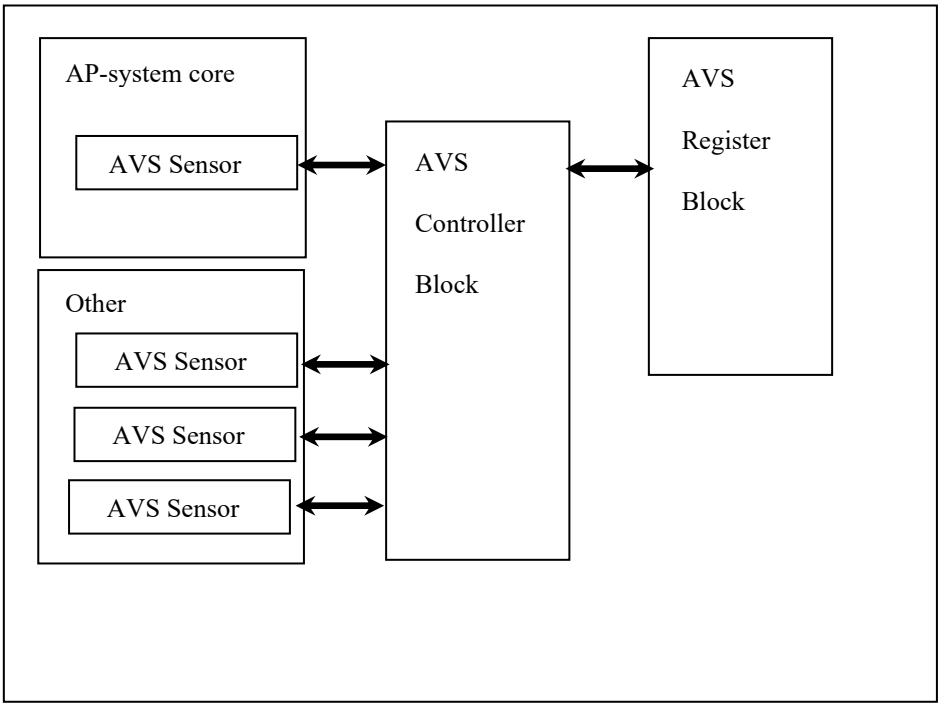


Figure 12.1 Block Diagram of Adaptive Voltage Scaling (AVS)

Table 12.1 Block Diagram Description Table

Name	Description
AVS Sensor*	Sensor for checking module process variation.
AVS Controller	Module that controls information on each sensor.
AVS Register	A group of registers that instructs the sensor and stores acquired information.

12.1.3 External Pins

(1) Connection diagram

As shown in Figure 12.2, the PMIC output voltage terminal is connected to the VDD terminal, it is possible to it is possible to change the PMIC voltage via I2C after activating the PMIC at a specified voltage.

AVS code is not available via AVS pins which are described in 004_R-CarV4M_Pin_Multiplex_r1p10.xlsx VOLCOND register shows AVS code.

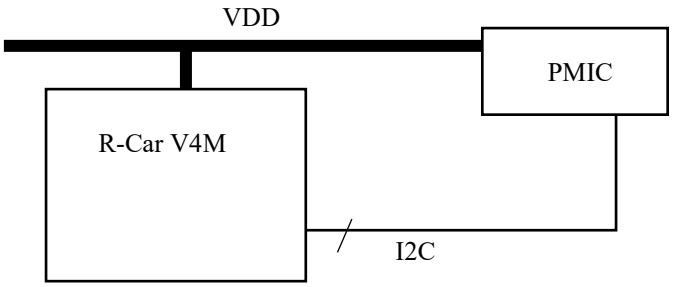

Figure 12.2 Connection Diagram of Adaptive Voltage Scaling (AVS)

For how to change the VDD voltage after startup.

Name	Description
PMIC	Power management IC which has the output voltage switching function.

12.1.4 Register Configuration

Table 12.2 is a list of registers.

For the access address of this register, add the Offset Address of Table 12.2 Register Configuration to "BASE ADDRESS" below.

BASE ADDRESS = 0xE60A 0000

[Legend for register description]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. Writing is prohibit.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
__/W:	Write-only. The read value is undefined.

Table 12.2 List of Registers of the Adaptive Voltage Scaling (AVS)

Register Name	Mnemonic	R/W	Offset Address	Initial value	Size	R-Car V4M
Adaptive Dynamic Voltage ADJust Parameter (non-AVS)	ADVADJP	R	0x080	0x0000 0000	32	√
Adaptive Dynamic Voltage ADJust Parameter (AVS)	ADVADJP	R	0x080	0x0000 0XXX	32	√

Note: Please do not access other than the above address.

(include Safety Mechanism related registers)

12.1.5 Connected Module

Table 12.3 is a list of the modules that are connected to this module.

Table 12.3 Connected Modules

Module Name	Connected Module Name	Connected Module Function
AVS	AP-system core	System CPU core
	CNN	Convolution neural network engine
	FUSE	For ADVADJP

12.2 Register Description

[Legend for register description]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. Writing is prohibit.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
__/W:	Write-only. The read value is undefined.

12.2.1 Adaptive Dynamic Voltage ADJust Parameter (ADVADJP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VOLCOND[8:0]								
Initial value:	0	0	0	0	0	0	0	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved (AVS) These bits are always read as 0. Writing is prohibited.
8 to 0	VOLCOND[8:0]	*	R	AVS code Initial values are derived from Fuse.

Note *: Table 12.4 VOLCOND[8:0] shows the initial value of this register.

12.2.2 VOLCOND[8:0]

The Table 12.4 is a list of AVS code.
Refer to “Power supply employing AVS”, which describes the voltage value corresponding to each AVS code.

Table 12.4 VOLCOND[8:0] Table

	VOLCOND								
	[8]	**[7]**	**[6]**	[5]	[4]	[3]	[2]	[1]	[0]
Non-AVS	0	0	0	0	0	0	0	0	0
AVS0	0	0	0	0	0	0	0	0	1
AVS1	0	0	0	0	0	0	0	1	0
AVS2	0	0	0	0	0	0	1	0	0

Notes: Other values should be handled as Non-AVS.
x: undefined (internal code)

(include Safety Mechanism related register description)

12.3 Operation

12.3.1 AVS code

(non-AVS product) The register of ADVADJP are always 0.

AVS code, which cannot be changed, is determined by shipment test and written as Fuse values.

12.3.2 Register-AVS

The voltage of VDD can be adjusted manually by using register values of AVS code after boot. That should be completed before AP-system core and CNN is started running.

13.Thermal Sensor/Chip Internal Voltage Monitor/Core Voltage Monitor (THS/CIVM/CVM)

13.1 Overview

This LSI provides a thermal sensor module that measures the temperature (Tj) inside the LSI. The thermal sensor module also includes a chip internal voltage monitoring module that measures voltage supply inside the LSI.

13.1.1 Features

13.1.1.1 THS Features

(1) Each of the thermal sensors measures temperature Tj

(2) R-Car V4M provides two thermal sensor modules (THS1/CIVM1, THS2/CIVM2)

(3) This module generates errors when the detected temperature Tj within the LSI rises above or falls below a specified temperature

Table 13.1 Placed Point of THS

THS	Placed point	Rationale of location
THS1	around Cortex-R52	CPU Core 0 is candidate of hotspot because usually it is used as primary core in cluster
THS2	around Cortex-A76	CPU Core 0 is candidate of hotspot because usually it is used as primary core in cluster.

13.1.1.2 CIVM Features

(1) Each of the chip internal voltage monitors in the thermal sensor module measures voltage supply inside the LSI

(2) R-Car V4M monitors VDD voltage supply

Table 13.2 Monitoring Point of CIVM

CIVM	Monitoring Point	Monitor Voltage	Power shut-off control
CIVM1	VDD around Cortex-R52	VDD	None (always on)
CIVM2	VDD around Cortex-A76	VDD	None (always on)

13.1.1.3 CVM Features

(1) This module detects the lower or upper value of VDD's voltage and notifies the state thereof by using the VTHREF0 and VTHSENSE0 pins or by reading the CVM_VMOUT_BK register

(2) R-Car V4M provides two CVM modules (TSC1/CVM1, TSC2/CVM2)

TSC : Thermal Sensor Controller

Table 13.3 Monitoring Point of CVM

CVM	Monitoring Point	Monitor Voltage	Power shut-off control
CVM1	VDD around Cortex-R52	VDD	None (always on)
CVM2	VDD around Cortex-A76	VDD	None (always on)

13.1.2 Block Diagram

Figure 13.1 shows a block diagram of the thermal sensor modules. Each thermal sensor module consists of a thermal sensor (THS), a chip internal voltage monitor (CIVM), a core voltage monitor (CVM) and a thermal sensor controller (TSC). THS measures Tj temperature, and CIVM measures a voltage. CVM detects the lower or upper value of VDD's voltage. TSC controls THS, CIVM and CVM.

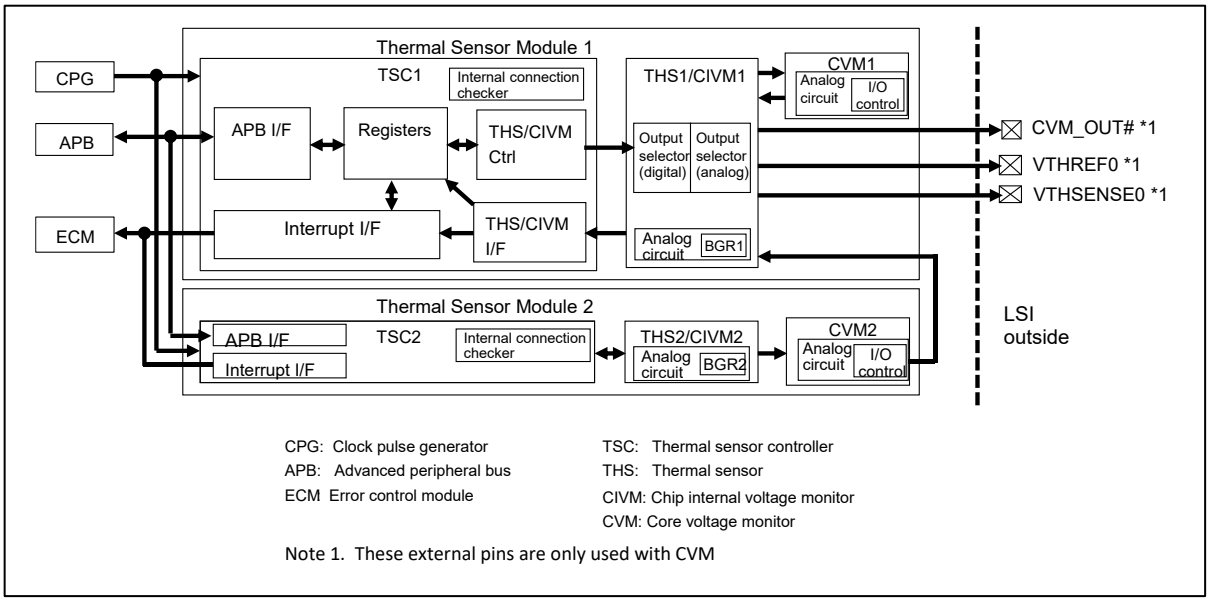

Figure 13.1 Block Diagram of Thermal Sensor Modules

13.1.3 External Pins

Table 13.4 is a list of external pins. These external pins are only used with CVM. For the processing of these pins, refer to Usage Note. The external pins detail are as follows：

-Digital Pin 1 pin, Core Supply Voltage Failure Detection.

-Analog Pin 2 pin, Overvoltage, Undervoltage, Illegal, Notification

-No state retention

Table 13.4 Pin Configuration

Pin Name	I/O	Function
VTHSENSE0	Analog I/O	VDD undervoltage indicator
VTHREF0	Analog I/O	VDD overvoltage indicator
CVM_OUT#	Digital output	VDD anomaly(undervoltage or overvoltage) indicator

For noise reduction, connect the capacitor on the VTHREF0/VTHSENSE0 pins on the board as shown in Figure 13.2. Connect C1 and C2 to VSS (GND) at one point. However, if there are no noise concerns or if noise reduction is considered in other ways, these capacitances are not mandatory. If the routing to the connection destination of VTHREF0 and VTHSENSE0 runs in parallel wiring (like differential wiring) C1 and C2 are not always necessary.

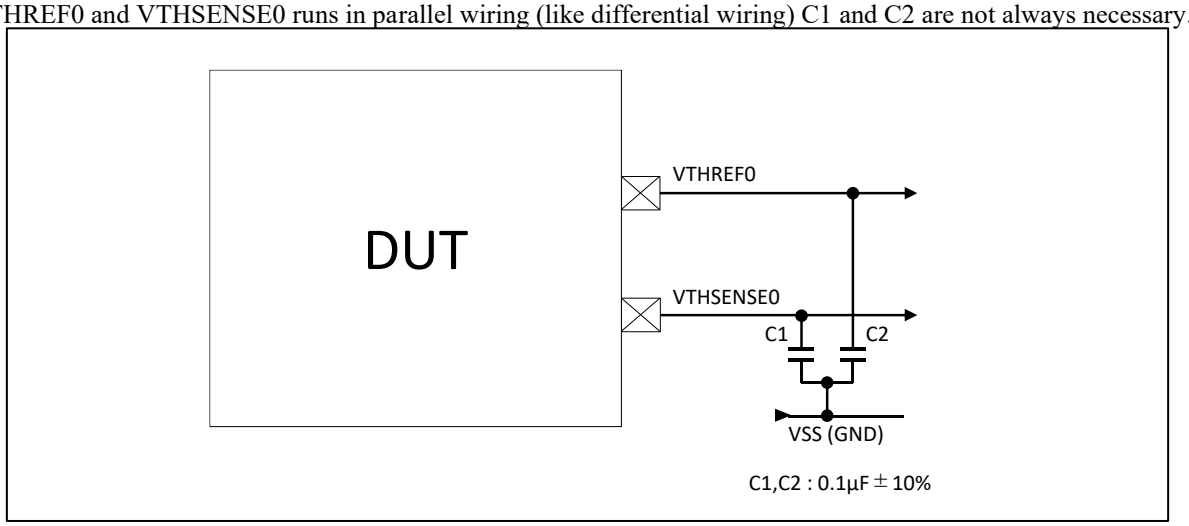

Figure 13.2 Connect capacitors to Analog Pin

13.1.4 Register configuration

Please refer to R-CarV4M_UM_013_THS_CIVM_CVM_r1p10.xlsx.

13.1.5 Connected Module

Table 13.5 is a list of the modules that are connected to this module.

Table 13.5 Connected Modules

Module Name	Connected Module Name	Connected Module Function
THS/CIVM	APB	Controls register accesses
	CPG	Outputs clocks
	ECM	Error Control module
	Module standby	Stops clocks
	Software reset	Execute software reset

13.2 Register description

Please refer to R-CarV4M_UM_013_THS_CIVM_CVM_r1p10.xlsx.

13.3 Operation

13.3.1 Thermal Sensor/Chip Internal Voltage Monitor Operation Mode

Figure 13.3 shows the state transition diagram of Finite State Machine. To change the operating mode, set the register according to Table 13.6 How to Set Each Mode Entry. Switching the operating mode in a procedure not described in this table is prohibited.

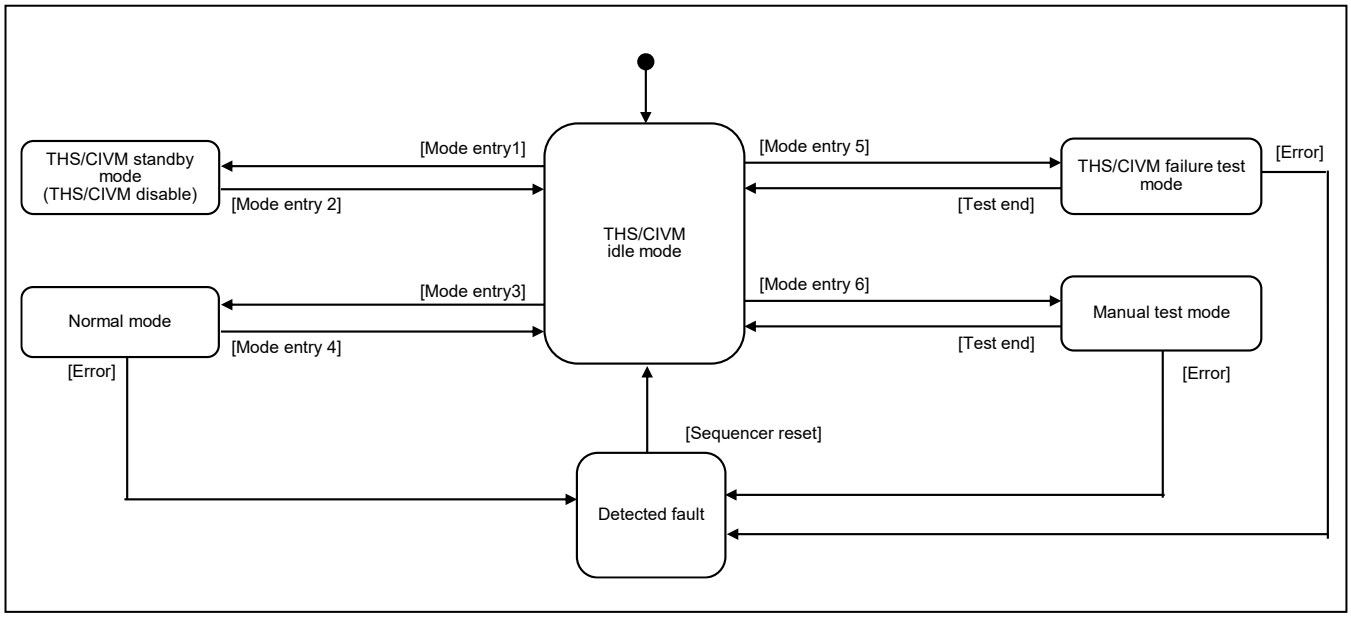

Figure 13.3 THS/CIVM control FSM State Transition

Table 13.6 How to Set Each Mode Entry

Register	Mode Entry 1	Mode Entry 2	Mode Entry 3	Mode Entry 4	Mode Entry 5	Mode Entry 6
TH_EN_B	0 -> 1	1 -> 0	0	0	0	0
THSST	0	0	0 -> 1	1 -> 0	0	0
CIVMTST	0	0	0	0	0 -> 1	0
MANTST	0	0	0	0	0	0 -> 1
CTRSEL	0	0	0	0	0	0

13.3.2 THS Idle Mode

The initial state after the reset is THS idle mode. This mode must be maintained for at least 100 [us] until the BGR stabilizes after power-on.

13.3.3 Normal Mode

Normal mode of thermal sensor module outputs the digital codes of temperature and voltage which are measured by thermal sensor module at a constant period. The measured digital code can be monitored with the TEMP_CODE and VOLT_CODE registers.

13.3.3.1 THS/CIVM operation

The THS operation uses an A/D converter to obtain the sensing voltage from the thermal sensor. The CIVM operation uses the same A/D converter to get the chip internal voltage. Repeat THS operation, CIVM operation, or both during Normal mode.THS operation and CIVM operation are enabled by register configuration. If both operations are enabled, the acquisition time is increased because the A/D converter is used alternately.

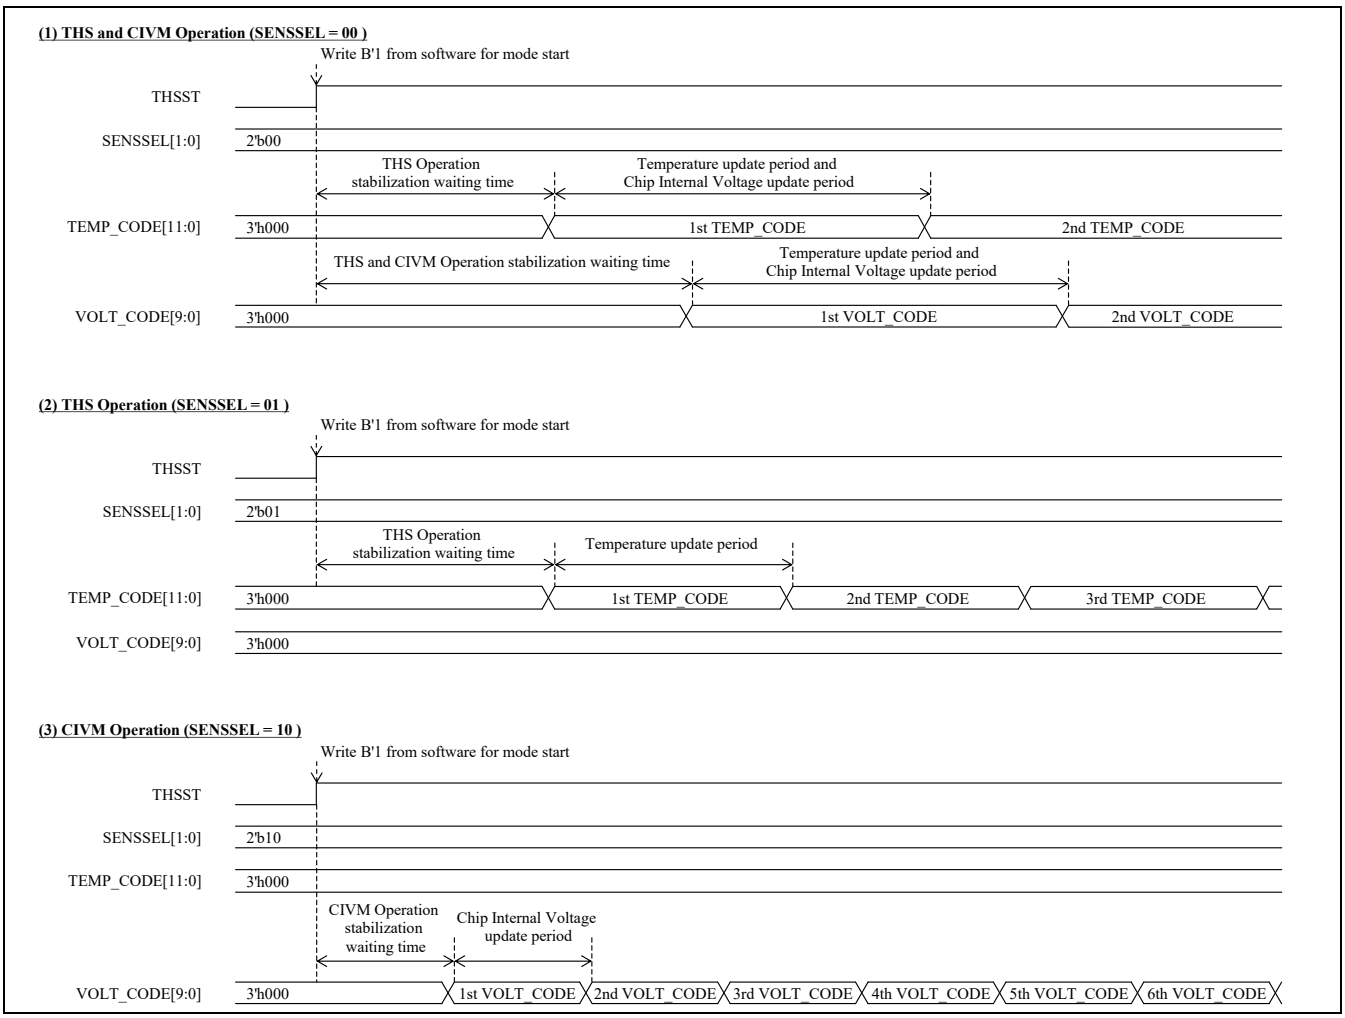

Figure 13.4 THS/CIVM operation timing chart

13.3.3.2 Temperature change detection

Temperature change can be detected during Normal mode. When the measured value crosses the set temperature threshold, an error is notified to the external module. After starting normal mode, you should check that the first measurement value is within the threshold temperature range.
The block diagrams of temperature error are shown in Figure 13.5. The temperature threshold for thermal sensor module has three (Thermal Sensor ch1, Thermal Sensor ch2 and Thermal Sensor ch3). The temperature change errors for TSC1 and TSC2 can detect to exceed (TEMP1, TEMP2 and TEMP3) or to fall below (TEMPD1, TEMPD2 and TEMPD3), and the error signal of its module is set to 1 by is detected each of TEMP or TEMPD.

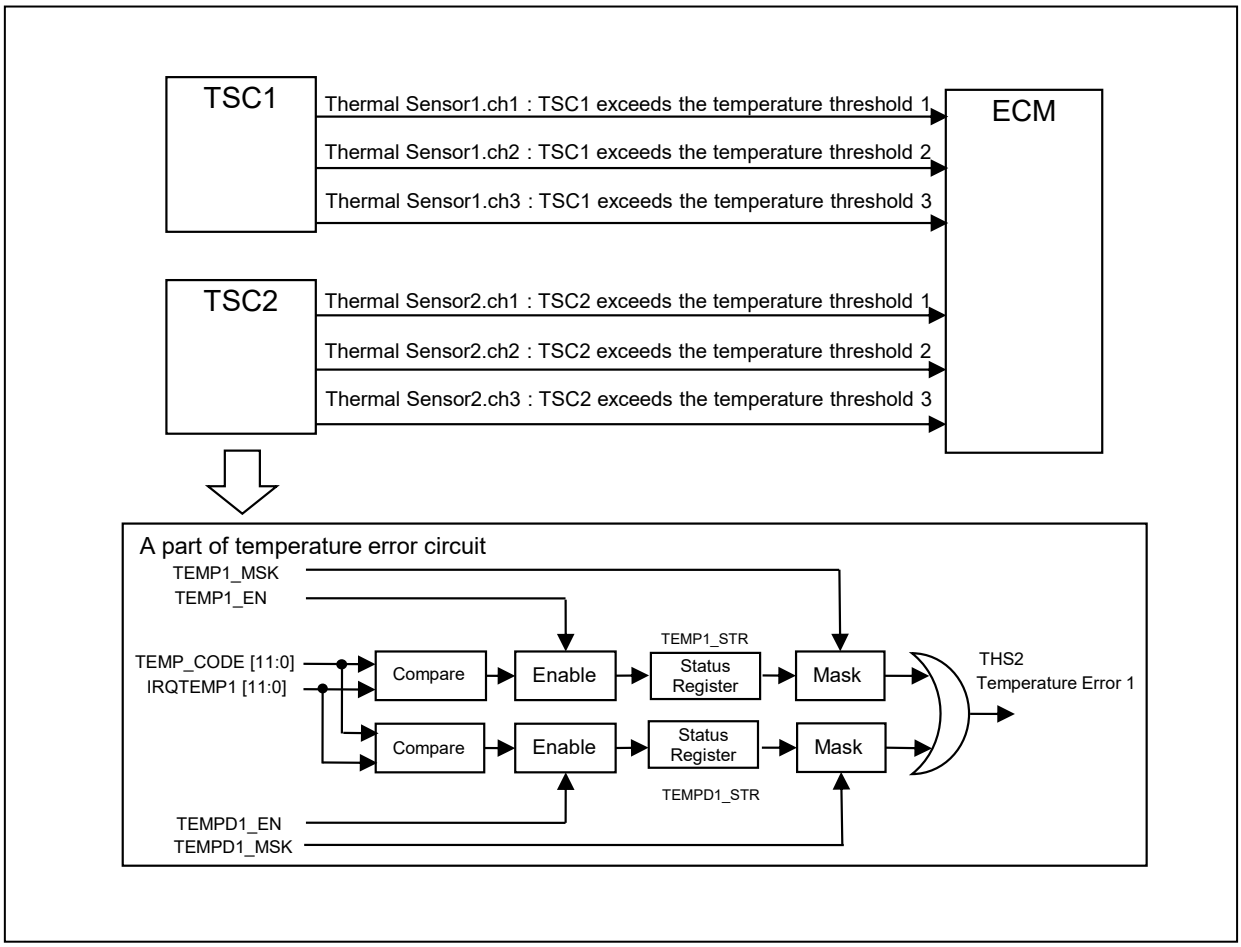

Figure 13.5 Block Diagram of Temperature Error

13.3.3.3 Setting of Normal Mode

Figure 13.6 and Figure 13.7 show a flowchart of the normal mode setting.

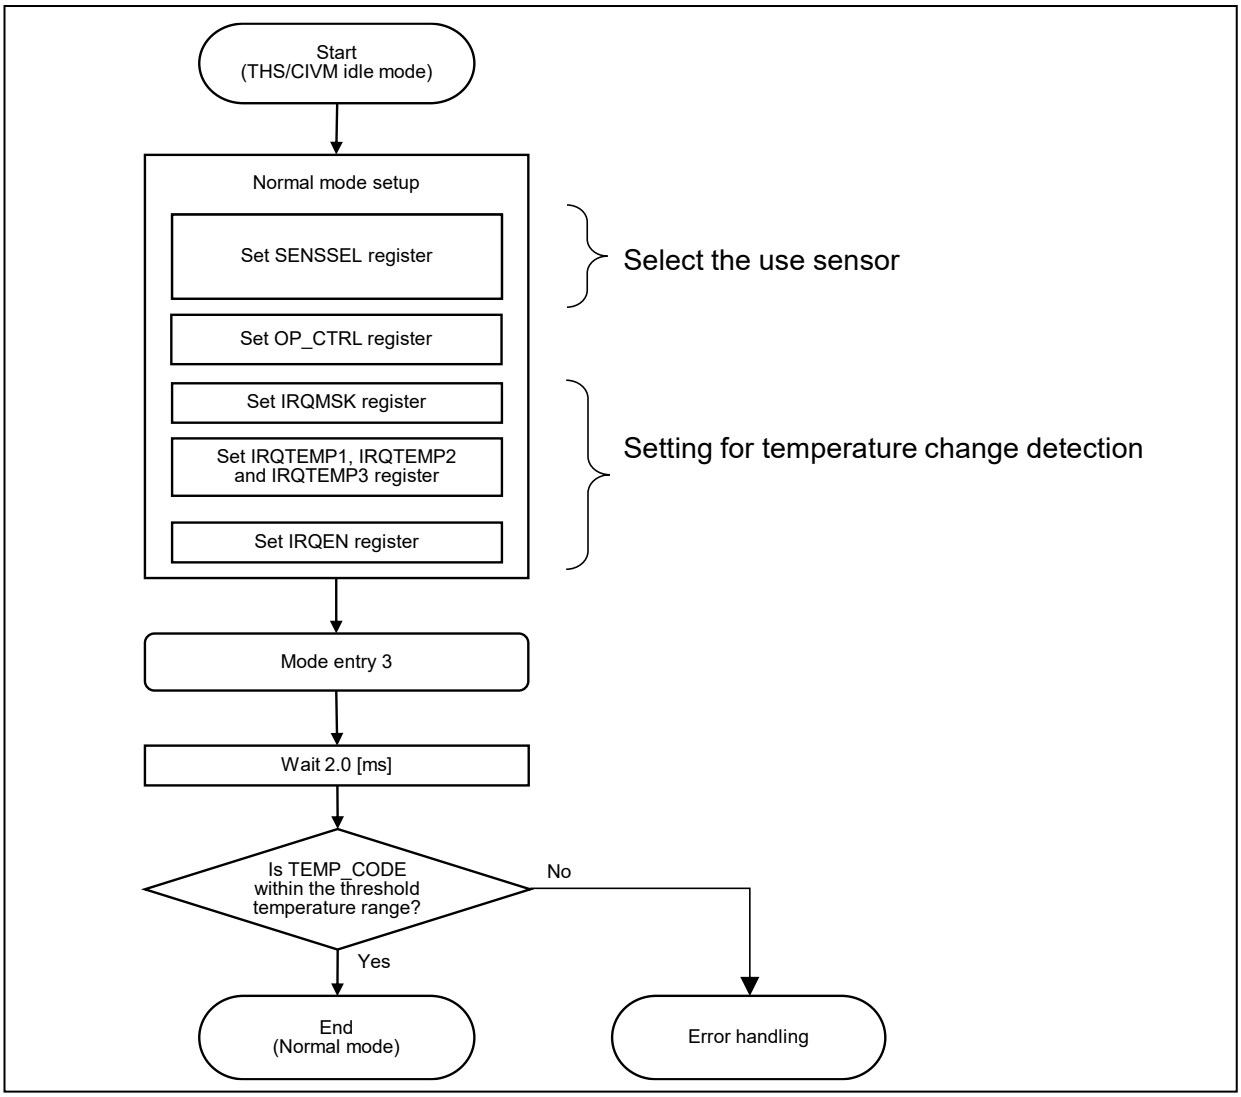

Figure 13.6 Normal mode start setting

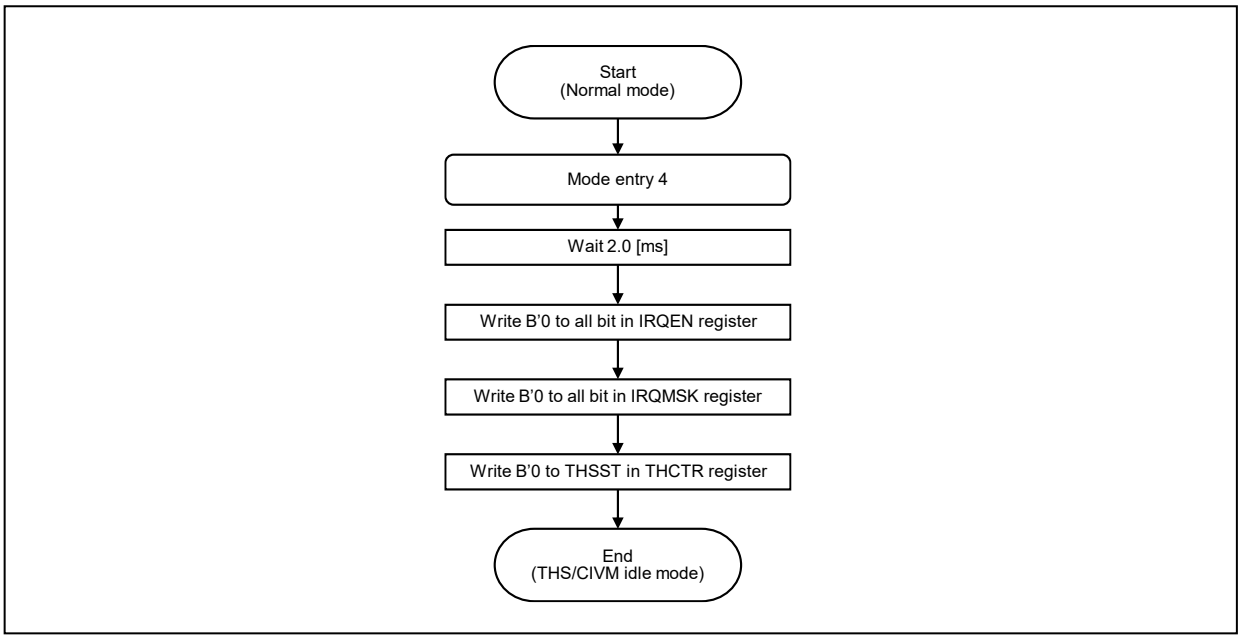

Figure 13.7 Normal mode stop setting

13.3.3.4 The conversion formula for Thermal Sensor

The temperature conversion formula is shown below.

When TEMP_CODE <THCODE2[11:0]

$$\text{Temperature}[°\text{C}]\{\text{dec}\} = \frac{167\{\text{dec}\}\times(\text{PTAT3}[11:0]-\text{PTAT2}[11:0])(\text{THCODE3}[11:0]-\text{TEMP_CODE}[11:0])}{(\text{PTAT3}[11:0]-\text{PTAT1}[11:0])(\text{THCODE3}[11:0]-\text{THCODE2}[11:0])} - 41\{dec\}$$

When TEMP_CODE ≥THCODE2[11:0]

$$\text{Temperature}[°\text{C}]\{\text{dec}\} = \frac{167\{\text{dec}\}\times(\text{PTAT1}[11:0]-\text{PTAT2}[11:0])(\text{THCODE1}[11:0]-\text{TEMP_CODE}[11:0])}{(\text{PTAT1}[11:0]-\text{PTAT3}[11:0])(\text{THCODE2}[11:0]-\text{THCODE1}[11:0])} + 126\{dec\}$$

{dec} is decimal value. The other terms are hex value.

The values of the terms PTAT1, PTAT2, PTAT3, THCODE1, THCODE2, and THCODE3 contained in the above conversion formula are stored in registers. The correspondence between terms and registers is shown in the table below.

Formula term	Register bit name
PTAT1	PTAT_PF_U_SR1
PTAT2	PTAT_PF_R_SR1
PTAT3	PTAT_PF_L_SR1
THCODE1	THCODE_U_SR1
THCODE2	THCODE_R_SR1
THCODE3	THCODE_L_SR1

13.3.3.5 The conversion formula for Chip Internal Voltage monitor

The chip internal voltage conversion formula is shown below.

$$\text{Voltage[mV]}\{\text{dec}\} = 1.39\{\text{dec}\} \times \text{VOLT_CODE[9:0]} - 131\{\text{dec}\}$$

{dec} is decimal value. The other terms are hex value.

13.3.3.6 The conversion formula for temperature error setting of temperature

IRQTEMP1 to 3[11:0] calculate by using below.

First, calculate Tj_T. It is

$$\text{Tj_T}\{\text{dec}\} = \frac{(\text{PTAT2[11:0]} - \text{PTAT3[11:0]}) \times 167\{\text{dec}\}}{(\text{PTAT1[11:0]} - \text{PTAT3[11:0]})} - 41\{\text{dec}\} \approx 20 \text{ to } 60\ [°\text{C}]\{\text{dec}\}$$

Note : 20 to 60 [°C]{dec} is an indication of the range of Tj_T.

Next, calculate IRQTEMP1 to 3[11:0].

If setting temperature, STEMP, is less than or equal to Tj_T,

$$\text{IRQTEMP1 to 3[11:0]} = \text{THCODE3[11:0]} - \frac{(\text{STEMP} + 41\{\text{dec}\})(\text{PTAT3[11:0]} - \text{PTAT1[11:0]})(\text{THCODE3[11:0]} - \text{THCODE2[11:0]})}{167\{\text{dec}\} \times (\text{PTAT3[11:0]} - \text{PTAT2[11:0]})}.$$

If setting temperature, STEMP, is more than Tj_T,

$$\text{IRQTEMP1 to 3[11:0]} = \text{THCODE1[11:0]} - \frac{(\text{STEMP} - 126\{\text{dec}\})(\text{PTAT1[11:0]} - \text{PTAT3[11:0]})(\text{THCODE2[11:0]} - \text{THCODE1[11:0]})}{167\{\text{dec}\} \times (\text{PTAT1[11:0]} - \text{PTAT2[11:0]})}.$$

STEMP : temperature error setting of temperature [°C]{dec}

{dec} is decimal value. The other terms are hex value.

The values of the terms PTAT1, PTAT2, PTAT3, THCODE1, THCODE2, and THCODE3 contained in the above conversion formula are stored in registers. See section 13.3.3.4 for the correspondence between terms and registers.

13.3.4 THS/CIVM Standby Mode

Figure 13.8 shows a flowchart of the THS/CIVM standby mode setting. This mode disables THS/CIVM.

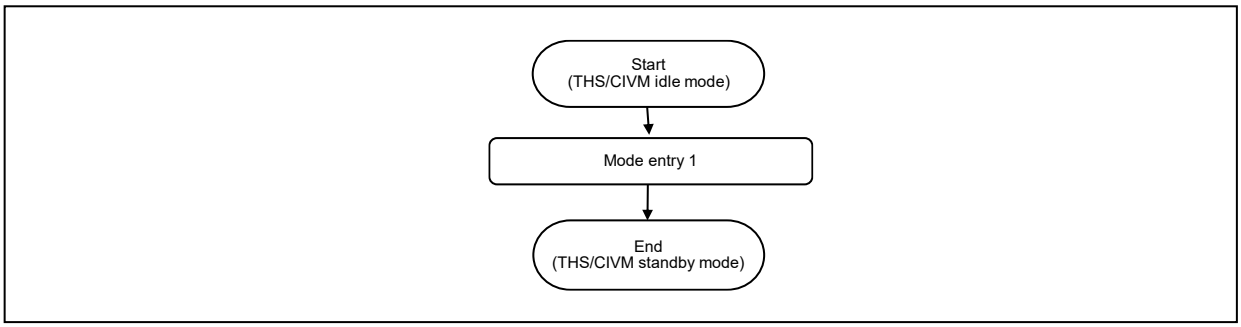

Figure 13.8 standby mode setting

Figure 13.9 shows a flowchart of idle setting from THS/CIVM standby mode. In case of transition from THS / CIVM standby mode to idle mode, wait for 100 [us] or more and then move to the next mode (normal mode, etc.).

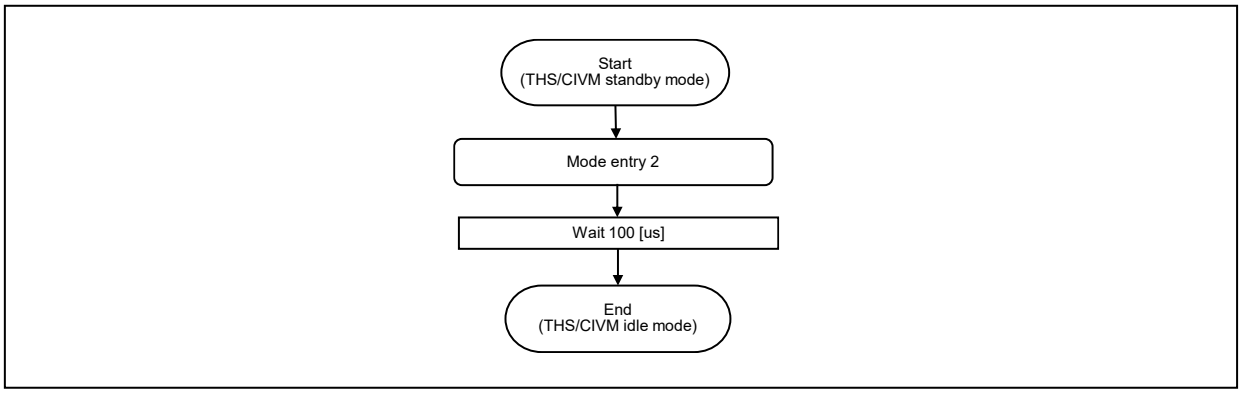

Figure 13.9 Setting from standby mode to idle mode

13.3.5 Thermal Sensor Module Standby Mode

This module supports Module Standby Mode. Module Standby Mode of TSC1 and TSC2 are controlled together. FSM must be set to THS/CVM idle mode or THS/CVM standby mode before the module can be set to Module Standby Mode. In the restart method, clear Module Standby register, execute a software reset. Refer to “Module Standby, Software Reset” section for the detail of setting method.

13.3.6 Software Reset

This module supports software reset. Software reset of TSC1 and TSC2 are controlled together. Refer to “Module Standby, Software Reset” section for the detail of setting method. FSM must be set to THS/CVM idle mode or THS/CVM standby mode before software reset. Several registers are not cleared by software reset.

13.4 Usage Notes

(1) When TH_EN_B of THCTR register set from 1 to 0, control register after 100 [us]. During this time, the software will have to wait.

(2) Leave external LSI pins (VTHSENSE0 and VTHREF0) open.

(3) Use digital code (TEMP register and VOLT register) when measuring Tj and chip internal voltage.

(4) When Tj exceeds 125[°C], correct operation and device characteristics of this module are not guaranteed.

(5) It is reducted spike noise that is shorter than the following period in each feature.

THS Features : 1000[us]

CIVM Features : 500[us]

CVM Features (analog output) : 7000[us]

CVM Features (digital output) : Filter is implemented to reduce spike noise. See 200.6.6 section.

13.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

13.5.1 THS/CIVM Characteristics Check

13.5.1.1 THS characteristic failure determination

This test determines the failure of the BGR reference(VREF) voltage for each THS and the failure of the A/D conversion value of the proportional to absolute temperature(PTAT) voltage relative to VREF.

Figure 13.10 shows a block diagram for characteristic failure determination. Each THS uses a resistor-divider to generate voltages equivalent to 126[°C] and -41[°C] from the BGR circuit's reference voltage, which can be A/D converted. In addition, the InV[B1] output of THS1 is supplied to THS2, and A/D conversion can be performed based on the VREF of each THS. Using these paths, the voltages equivalent to 126[°C] and -41[°C] generated by THS1 can be A/D converted at each THS, and the result can be used to detect BGR reference voltage failures.

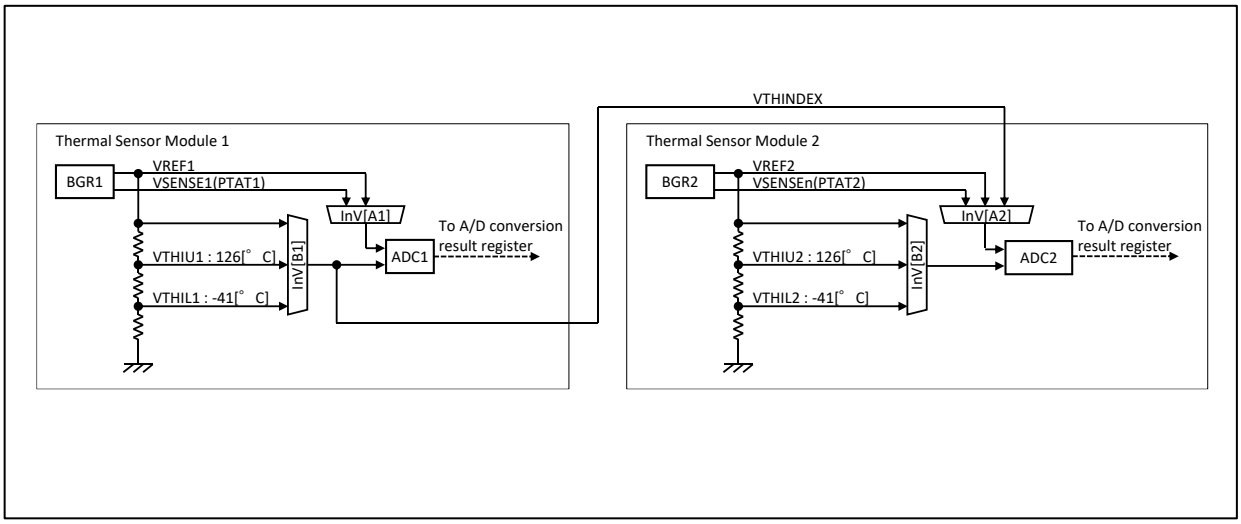

Figure 13.10 Block diagram for characteristic failure determination

The flowchart of the A/D conversion control necessary for BGR reference voltage failure determination is shown in Figure 13.11 and Figure 13.12. Figure 13.11 is a flowchart for A/D conversion with reference to the VREF voltage of THS1.

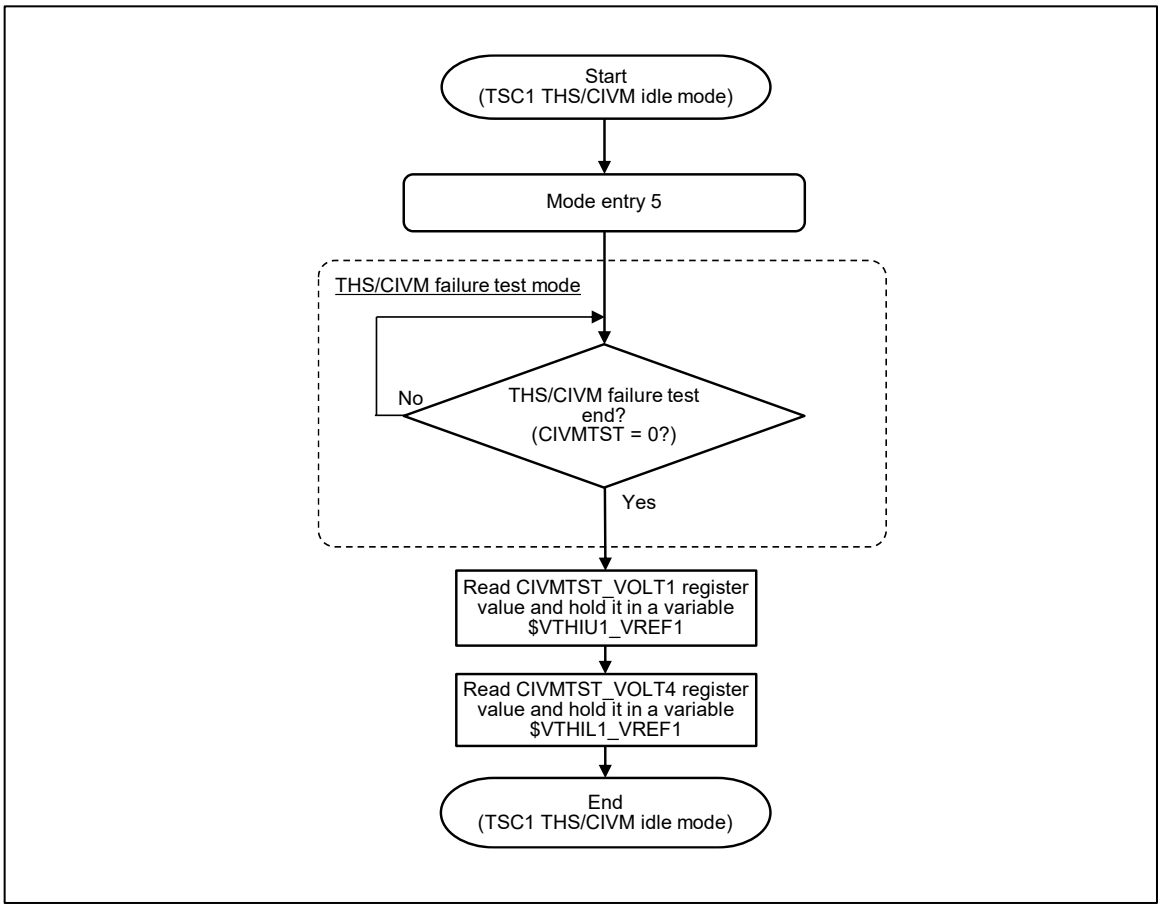

Figure 13.11 A/D conversion flowchart for VREF voltage test(1/2)

Figure 13.12 is a flowchart for A/D conversion with reference to the VREF voltage of each THS. All THS must work together for this A/D conversion. In order to fix the output of the InV[B1] of THS1, it is necessary to control by a different register setting than the FSM. During this time, do not allow the FSM of THS1 to transition to anything other than THS/CIVM idle mode. Each THS other than THS1 uses Manual mode to A/D conversion of the supplied test voltage.

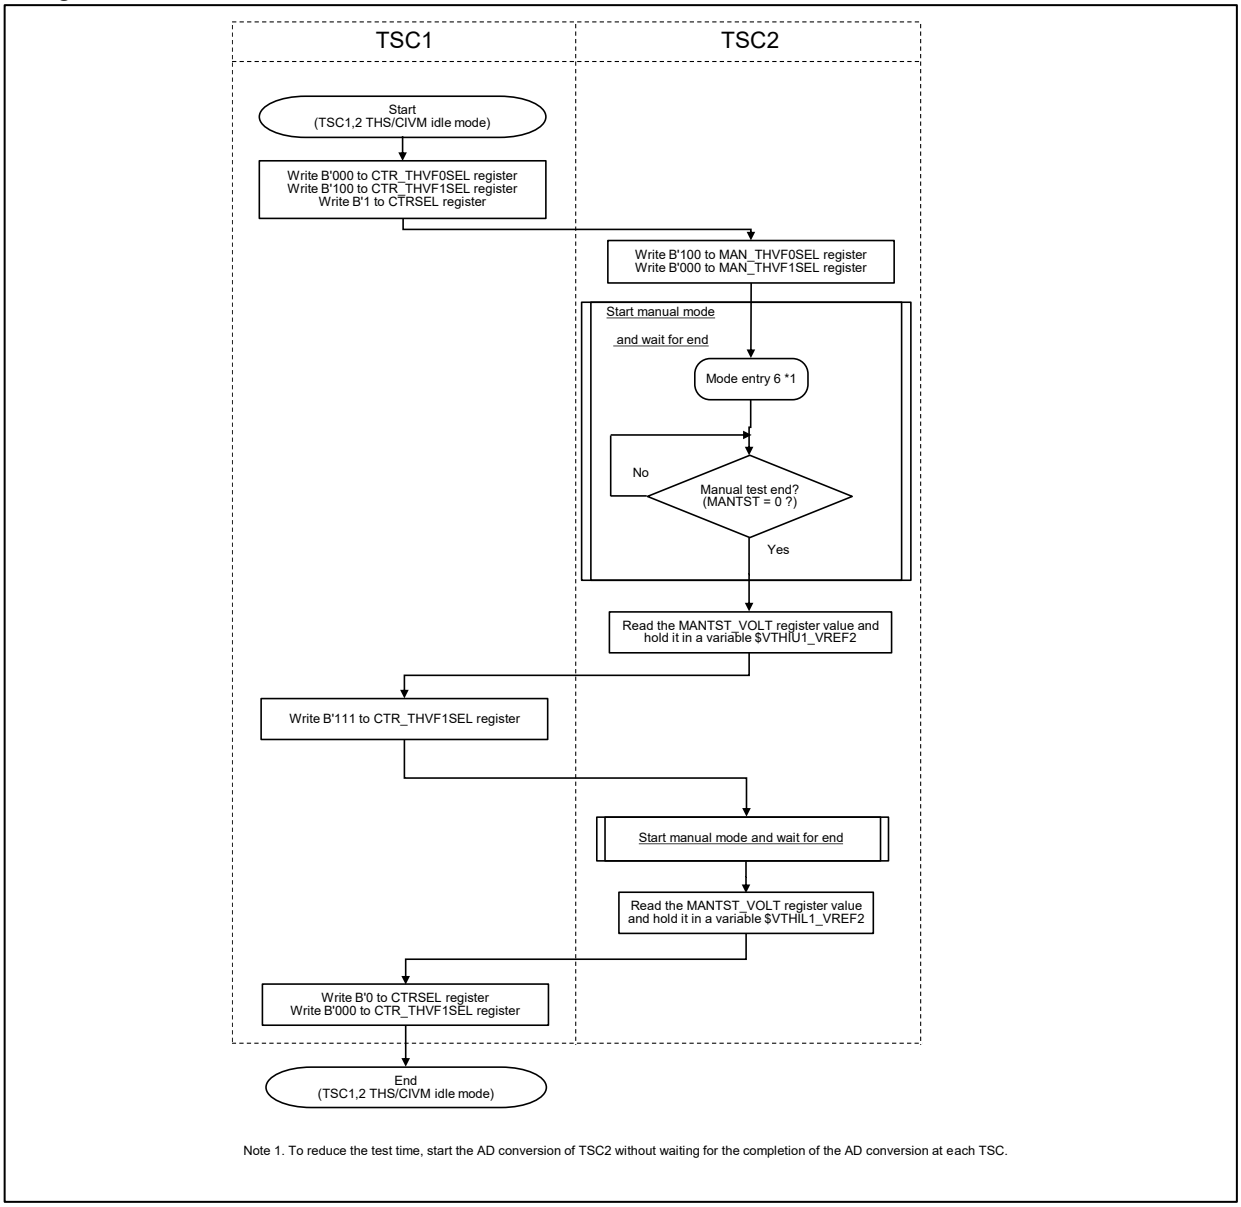

Figure 13.12 A/D conversion flowchart for VREF voltage test(2/2)

The determination formula is shown below. Under normal conditions, the following formula holds.

$$2800\{dec\} \leq \$VTHIU1_VREF1 \leq 3500\{dec\}$$

$$2800\{dec\} \leq \$VTHIU1_VREF2 \leq 3500\{dec\}$$

That is each value of $VTHIU1_VREF1, $VTHIU1_VREF2 is all in the range 2800{dec} to 3500{dec}.

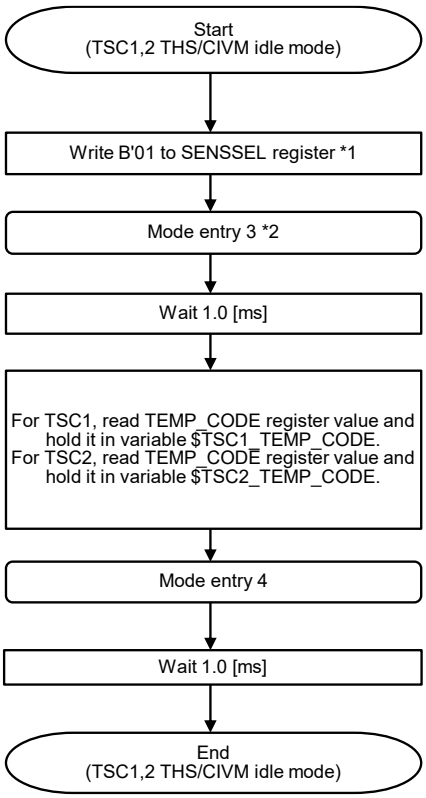
$$1700\{dec\} \leq \$VTHIL1_VREF1 \leq 2200\{dec\}$$

$$1700\{dec\} \leq \$VTHIL1_VREF2 \leq 2200\{dec\}$$

That is each value of $VTHIL1_VREF1, $VTHIL1_VREF2 is all in the range 1700{dec} to 2200{dec}.

{dec} is decimal value.

Figure 13.13 shows a flowchart of the PTAT voltage failure determination. To determine the failure of the A/D conversion value of the PTAT voltage, the TEMP_CODE acquired by each THS is used.



Note 1. Please make it THS-only operation to shorten the update period of the TEMP_CODE

Note 2. To reduce the test time, start the AD conversion of TSC1,2 without waiting for the completion of the AD conversion at each TSC.

Figure 13.13 PTAT voltage failure determination flowchart

The determination formula is shown below.

Calculate the difference between $TSC1_TEMP_CODE and other TEMP_CODE.

$$\mathrm{DIF_TEMP_CODE2} = \$\mathrm{TSC2_TEMP_CODE} - \$\mathrm{TSC1_TEMP_CODE}$$

Under normal conditions, the following formula holds.

$$-325\{\mathrm{dec}\} \leq \mathrm{DIF_TEMP_CODE2} \leq 325\{\mathrm{dec}\}$$

{dec} is decimal value.

13.5.2 Fault Detection During Operation

Figure 13.14 shows a block diagram of thermal sensor module error. In addition to the temperature change detection shown in section 13.3.3.2, the thermal sensor controller notifies the external module of an error if fault is detected during operation. The detailed errors are as follows：

- ERR_ACKTOV : Digital code acquisition timeout (9.6[ms] or more)

- ERR_THCNTOV : Digital code counter overflow

- ERR_THCODE : Obtained illegal digital code (all 0 or all 1)

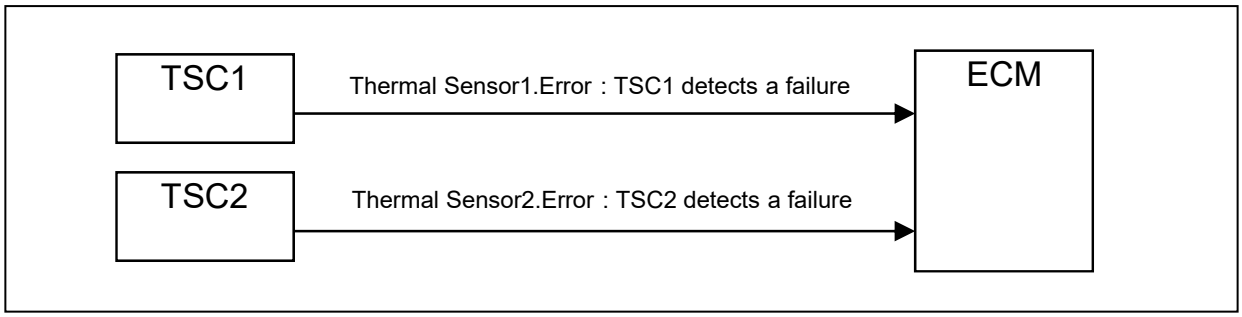


Figure 13.14 Block diagram of thermal sensor module error

13.5.3 Error Injection

Error injection function is implemented for errors output from TSC to ECM. Figure 13.15 shows a block diagram of the error injection function for temperature change detection. Figure 13.16 shows the error injection flowchart for temperature change detection(13.3.3.2 section).

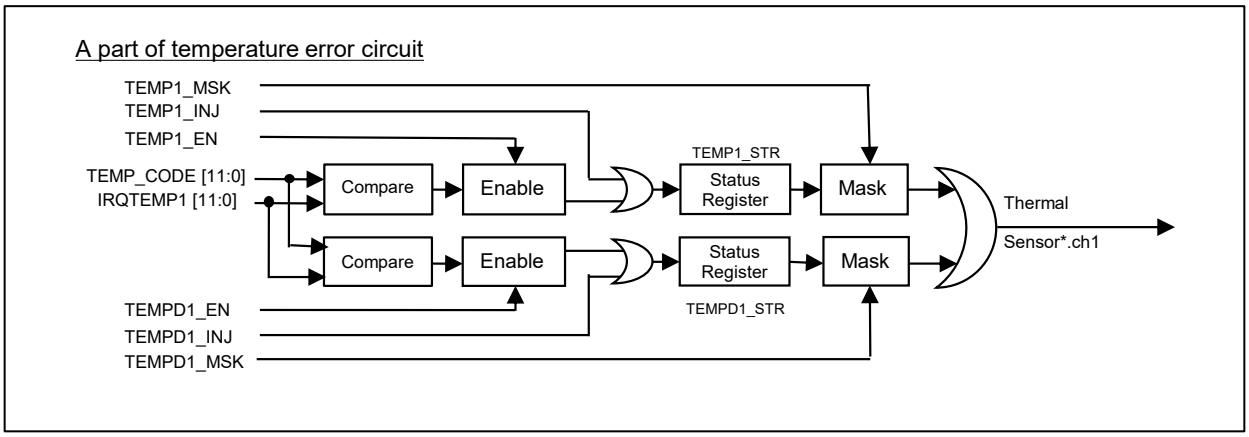

Figure 13.15 Temperature change detection error injection block diagram

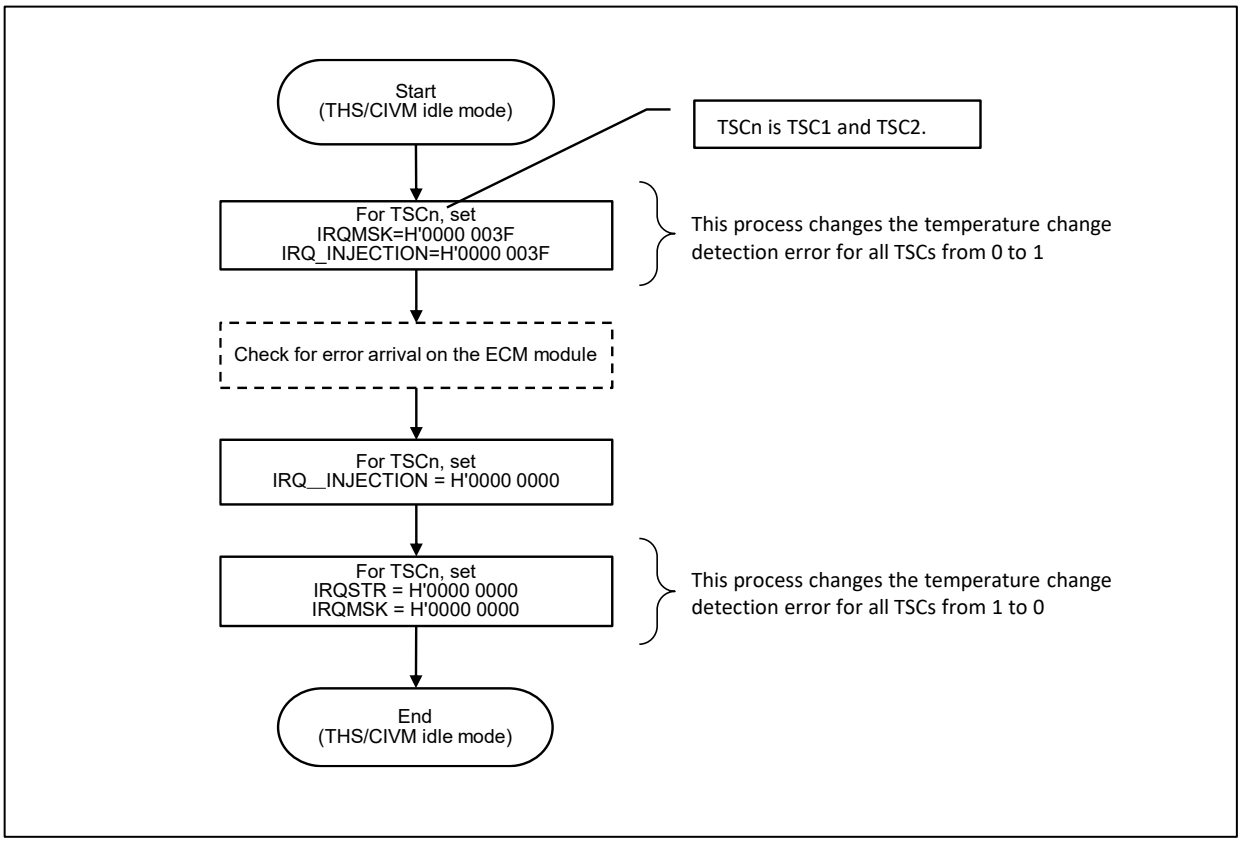

Figure 13.16 Temperature change detection error injection flowchart

Figure 13.17 shows a block diagram of the error injection function for failure detection error. Figure 13.18 shows error injection flowchart for failure detection error (13.5.2 section).

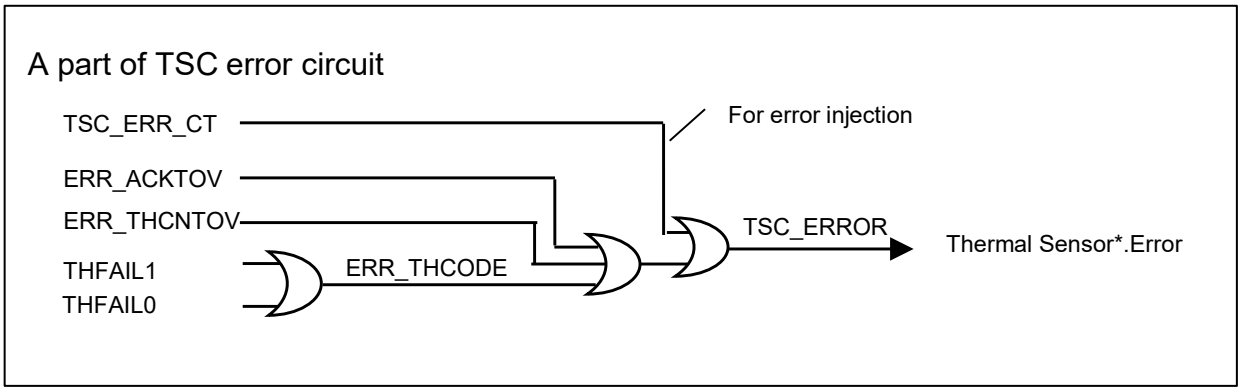

Figure 13.17 Failure detection error injection block diagram

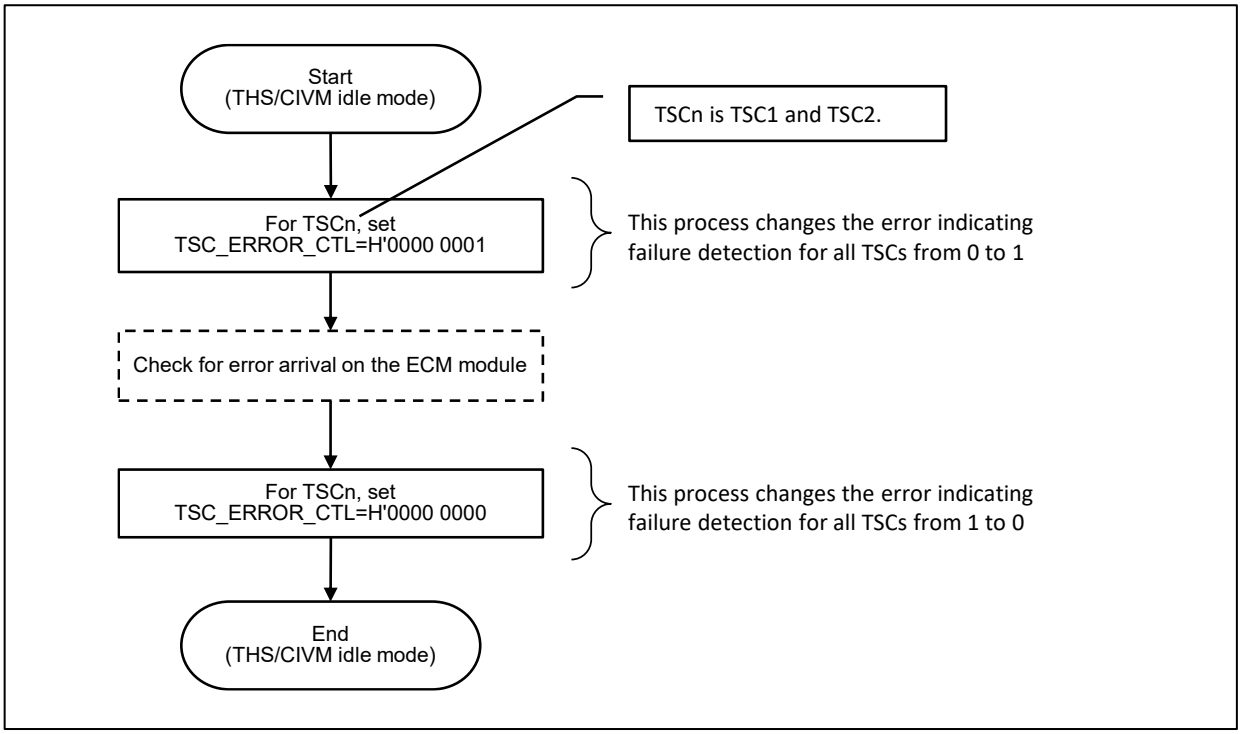

Figure 13.18 Failure detection error injection flowchart

13.5.4 Core Voltage Monitor

Figure 13.19 and Figure 13.20 depicts the block diagram of CVMs implemented in R-Car V4M. R-Car V4M has two CVMs monitoring distant positions on the same net. Each CVM compares the potential of the monitoring point with its own Bandgap Reference, and it asserts error signals in case it is beyond the preprogrammed threshold (overvoltage) or it is below another preprogrammed threshold (undervoltage). The threshold configuration is copied to and latched in the VDDQ18 domain so that the VDD anomaly does not destroy the configuration. The threshold configuration can be changed from the time Power on Reset is released until the VM_LOCK register is set to 1. Setting VM_LOCK to 1 completely retains the threshold configuration latched to the VDDQ18 domain and cannot be changed until Power on Reset.

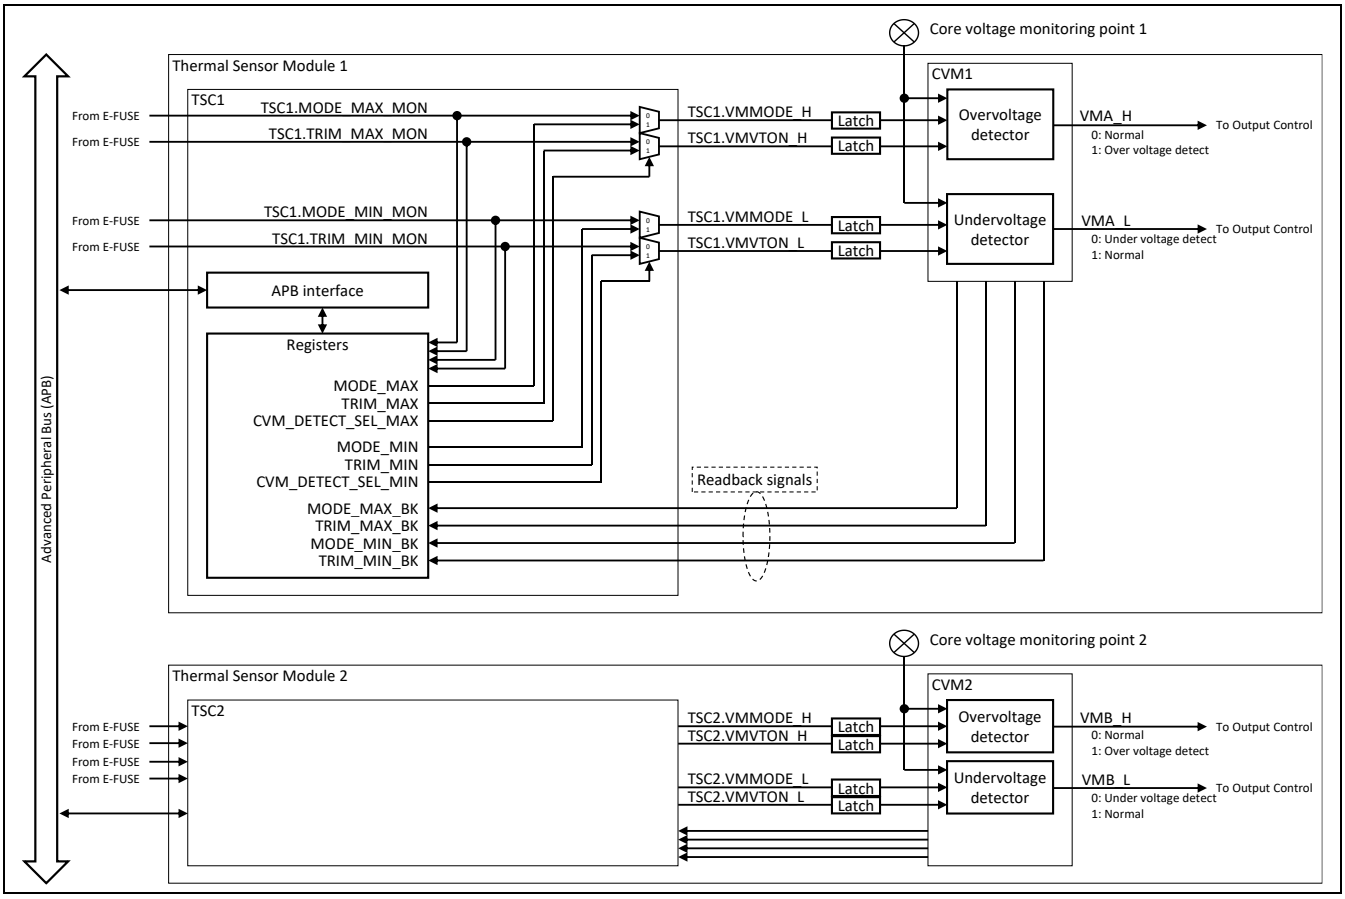

Figure 13.19 Voltage Detector part of CVM Block Diagram

The two CVMs shall be consolidated to deliver the error states.

Undervoltage and Overvoltage is respectively sent out to VTHREF0 pin and VTHSENSE0 pin. Core Supply Voltage Failure Detection is sent to CVM_OUT# pin. Table 13.7 shows the truth table of the external terminal output for CVM. The initial state (after Power on Reset release) is VMCHPL bits are all 0 (all CVMs are disable state), and CVM_OUT# output Low. Insert Low Pass Filter between Out Put Buffer and Digital External Pin.

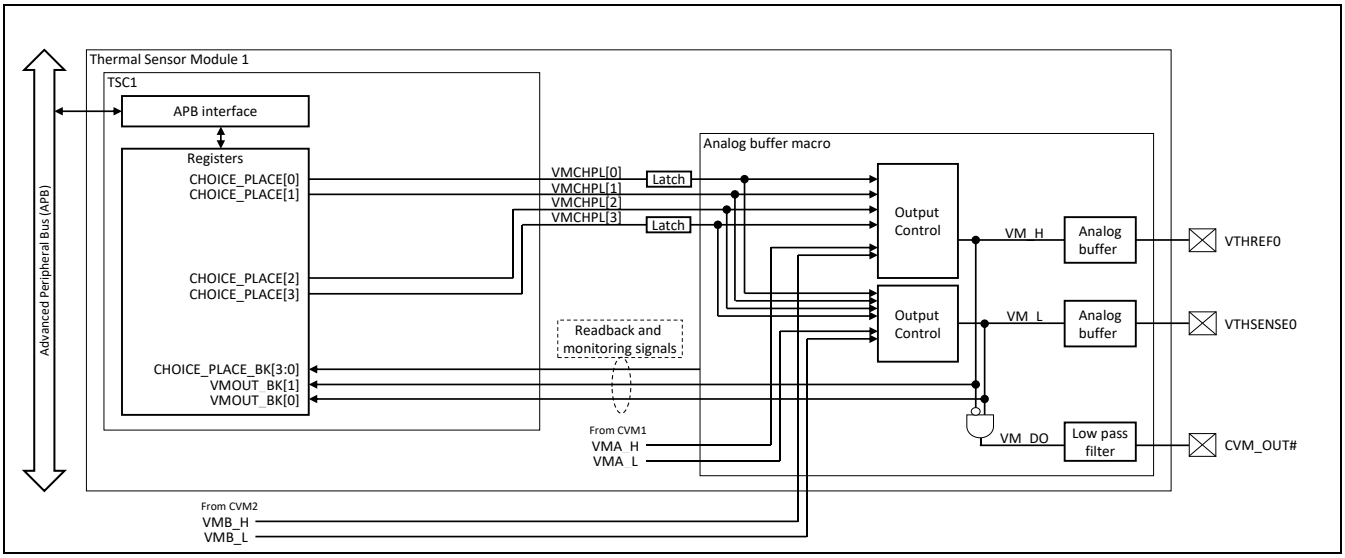

Figure 13.20 Output Control part of CVM Block Diagram

Table 13.7 CVM external pins output truth table

Input		Output			State
VM_L	VM_H	VM_DO (CVM_OUT#[V])	VTHSENSE0[V]	VTHREF0[V]	
0	0	0 (≈0)	≈0	≈0.8	Undervoltage
0	1	0 (≈0)	≈0	≈1.24	Illegal
1	0	1 (≈1.8)	≈0.8	≈0.8	Normal voltage
1	1	0 (≈0)	≈0.8	≈0	Overvoltage

13.5.4.1 CVM failure detection test & CVM initial sequence

CVM failure detection test is shown Figure 13.21. Figure 13.22 to Figure 13.26 and Figure 13.28 show the predefined process of Figure 13.21. This test checks CVM function. In this test, the output of the external pins (CVM_OUT#, VTHSENSE0, VTHREF0) changes because the CVM is intentionally set to normal, illegal, undervoltage, and overvoltage states. Do not use external pins until the CVM configuration is complete.

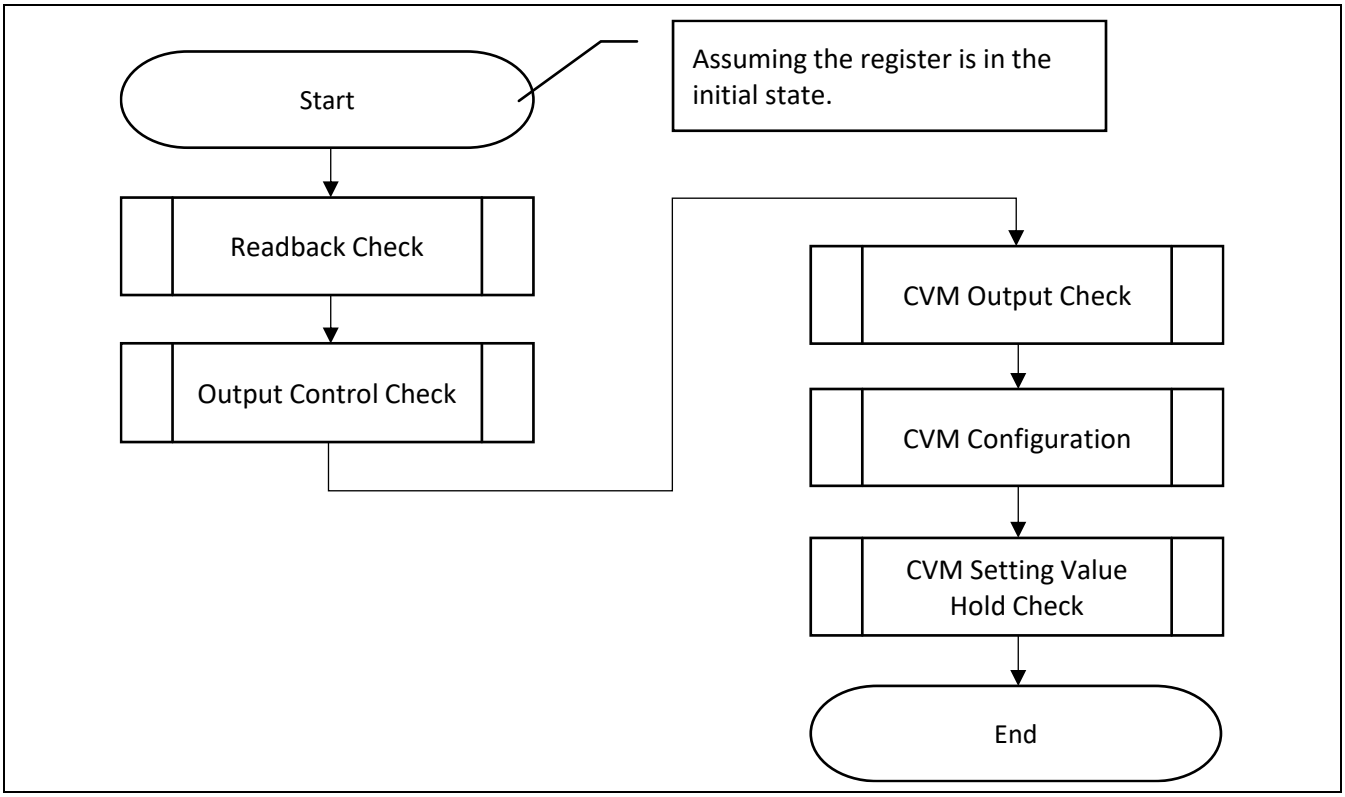

Figure 13.21 CVM failure detection test

Readback Check is shown Figure 13.22. This test uses the CVM Detection Voltage Manual Setting Register to comprehensively switch between the overvoltage and undervoltage thresholds to ensure that the settings and Readback values all match.

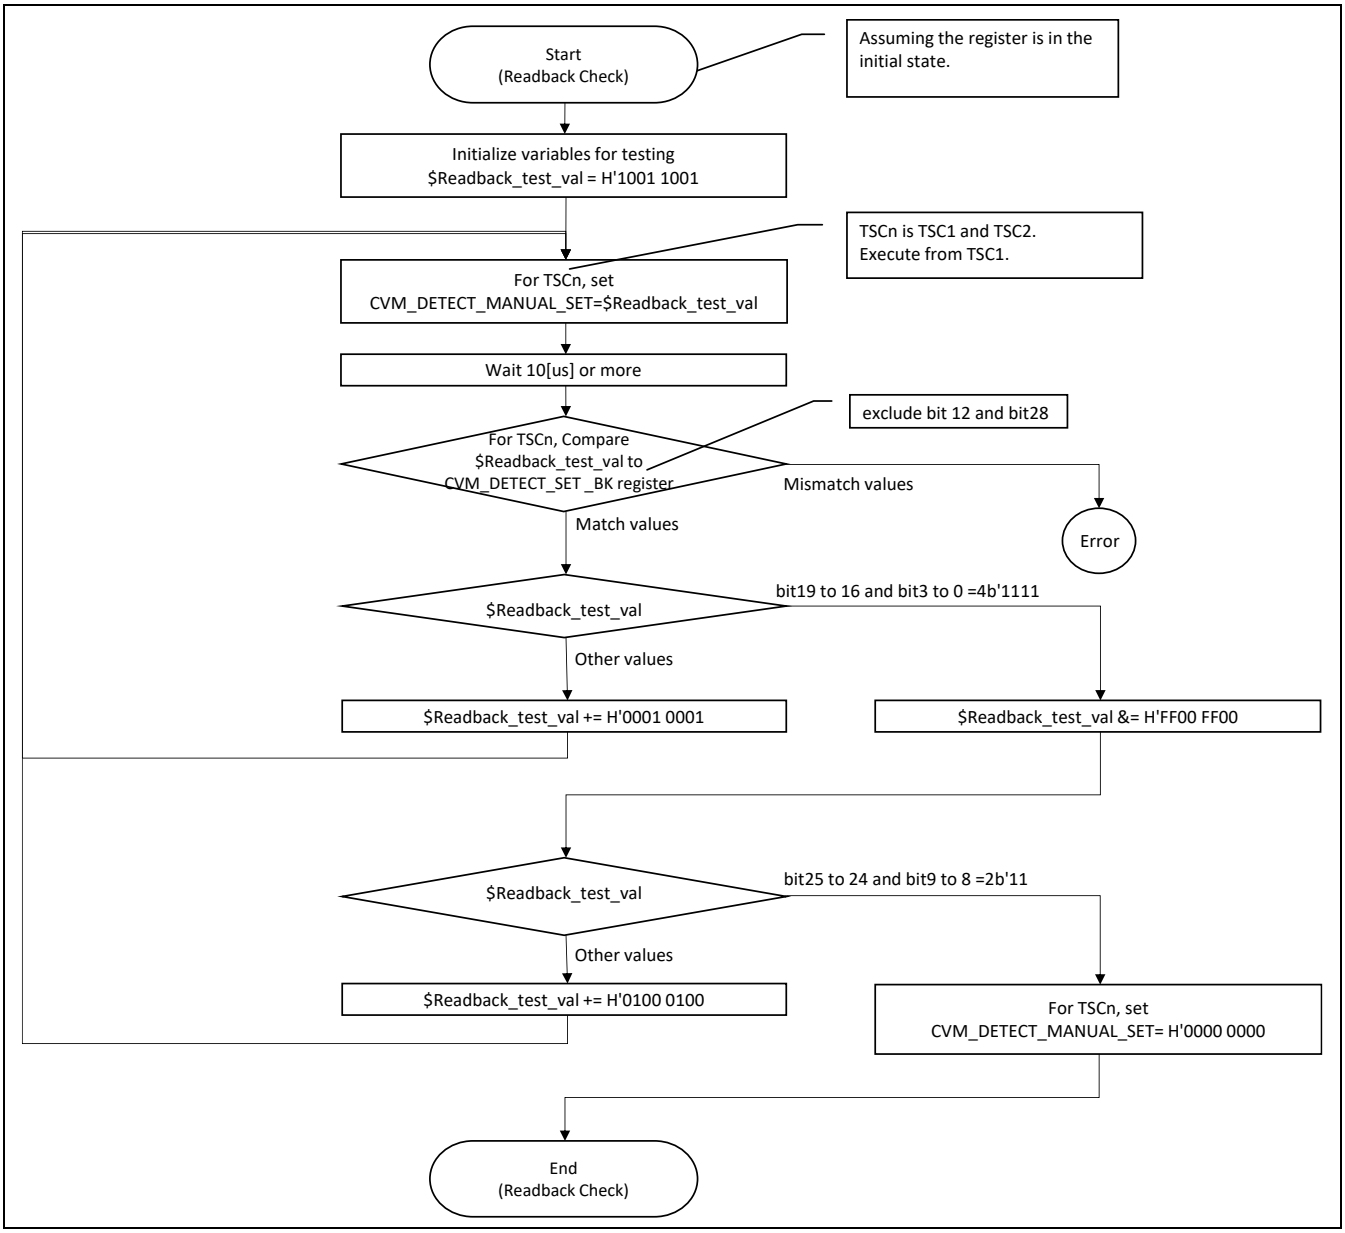

Figure 13.22 Predefined process “Readback Check”

The Output Control Check is shown Figure 13.23. This test changes the threshold voltage settings for each CVM to detect Overvoltage or Undervoltage, and verifies that only the CVM results selected by CHOICE_PLACE bits is combined (VM_H and VM_L) output. Table 13.10 shows the combination table used in this test.

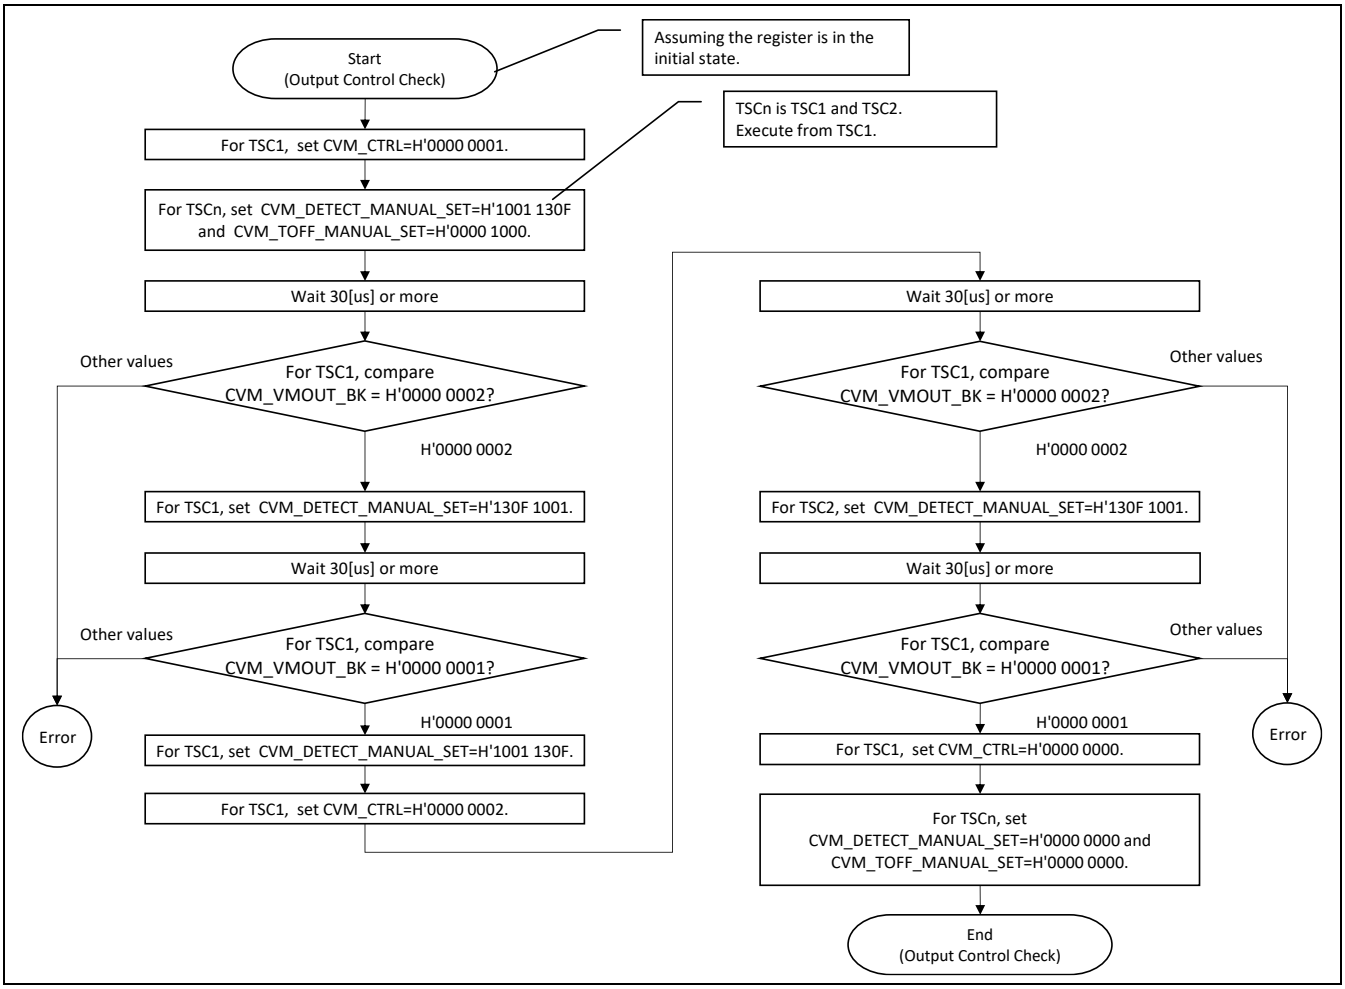

Figure 13.23 Predefined process "Output Control Check"

Table 13.10 Output Control Check combination table

Input								Output	
VMCHPL				VMA_L	VMB_L	VMA_H	VMB_H	VM_L	VM_H
[0]	[1]	[2]	[3]						
1	0	0	0	0	1	1	0	0	1
				1	1	0	0	1	0
0	1	0	0	1	0	0	1	0	1
				1	1	0	0	1	0

CVM Output Check is shown Figure 13.24. This test sets CVM to an overvoltage, undervoltage, illegal, and normal state to check the external pin outputs for each state. Table 13.11 shows the combination table used in this test.

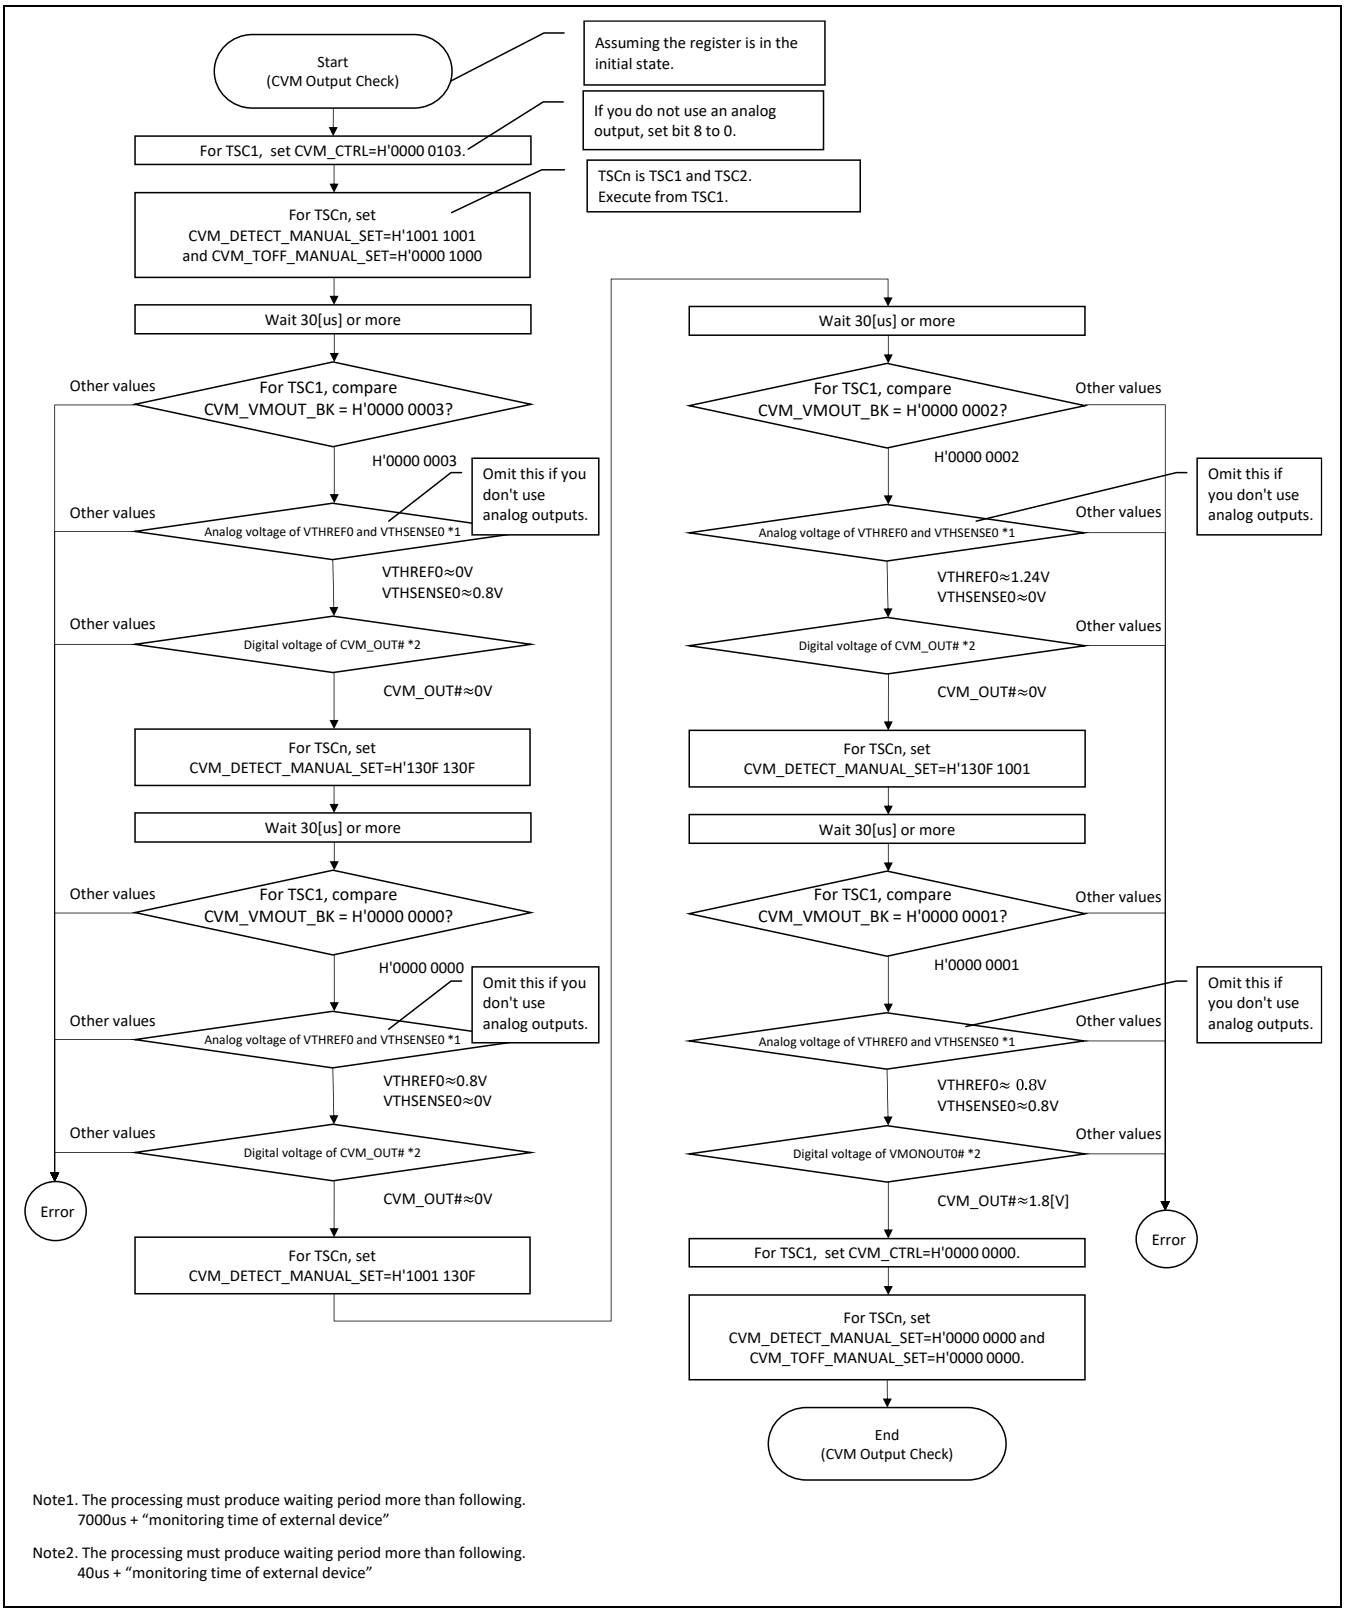

Figure 13.24 Predefined process "CVM Output Check"

Table 13.11 CVM Output Check combination table

Input						Output				
VMCHPL				VMA_L, VMB_L	VMA_H, VMB_H	VM_L	VM_H	CVM_OUT# [V]	VTHSENSE0[V]	VTHREF0[V]
[0]	[1]	[2]	[3]							
1	1	0	0	1	1	1	1	≈0	≈0.8	≈0
				0	0	0	0	≈0	≈0	≈0.8
				0	1	0	1	≈0	≈0	≈1.24
				1	0	1	0	≈1.8	≈0.8	≈0.8

CVM Configuration is shown Figure 13.25. CVM configuration sets overvoltage and undervoltage thresholds using CVM trimming values read from E-fuse. If necessary, set analog output settings and digital output LPF settings. Figure 13.26 shows a block diagram of the optional CVM function selection register. After these settings, make sure that all settings and Readback values match and that the CVM is in a normal state, and set the VM_LOCK to hold the settings.

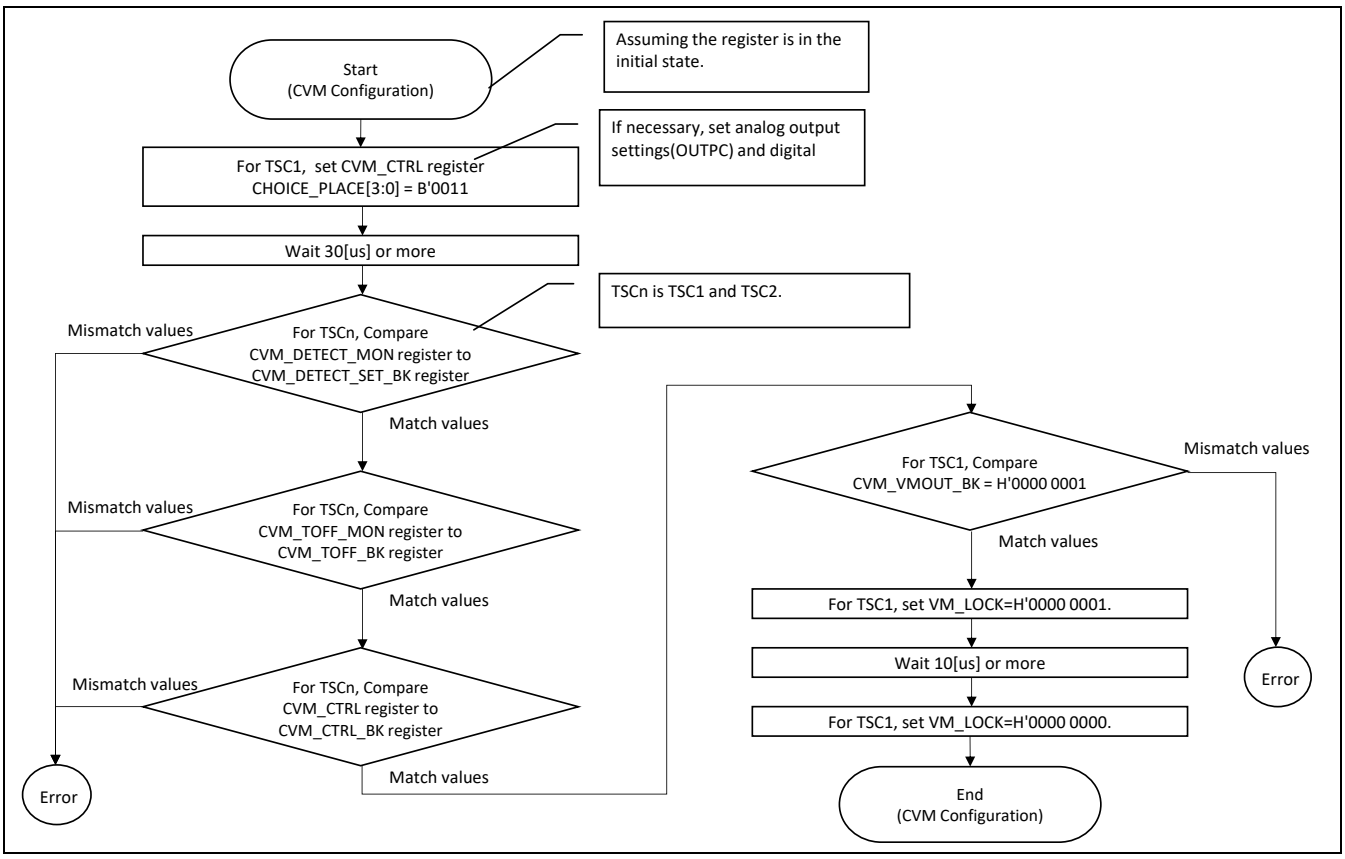

Figure 13.25 Predefined process "CVM Configuration"

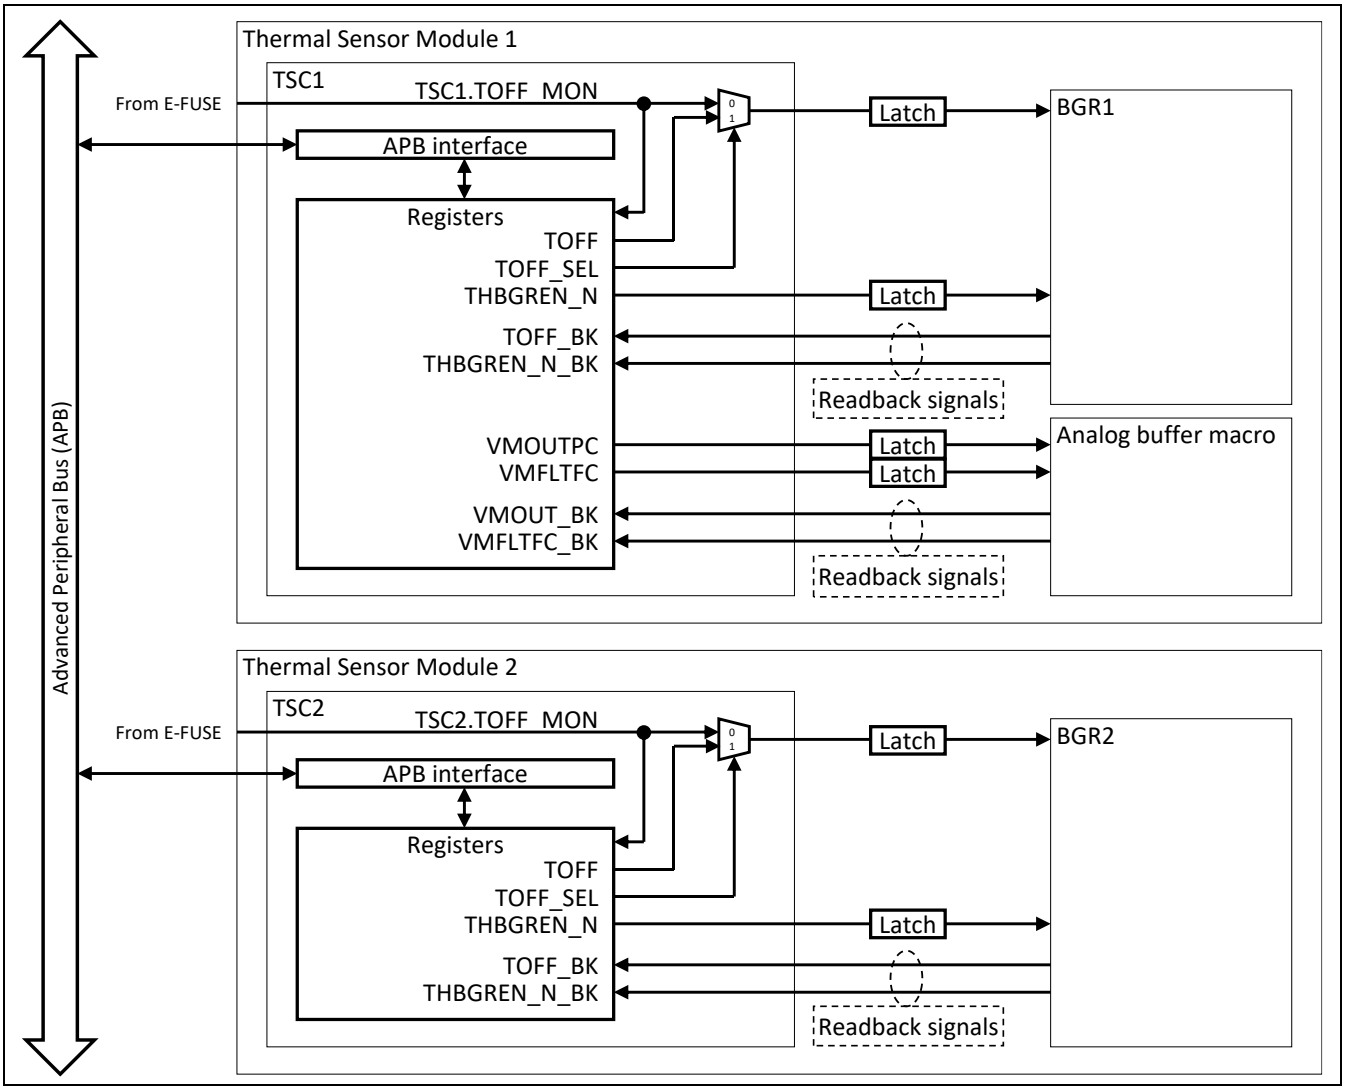

Figure 13.26 Optional CVM function selection register

CVM Setting Value Hold Check is shown Figure 13.27. This test verifies that the settings held by the VM_LOCK feature do not change.

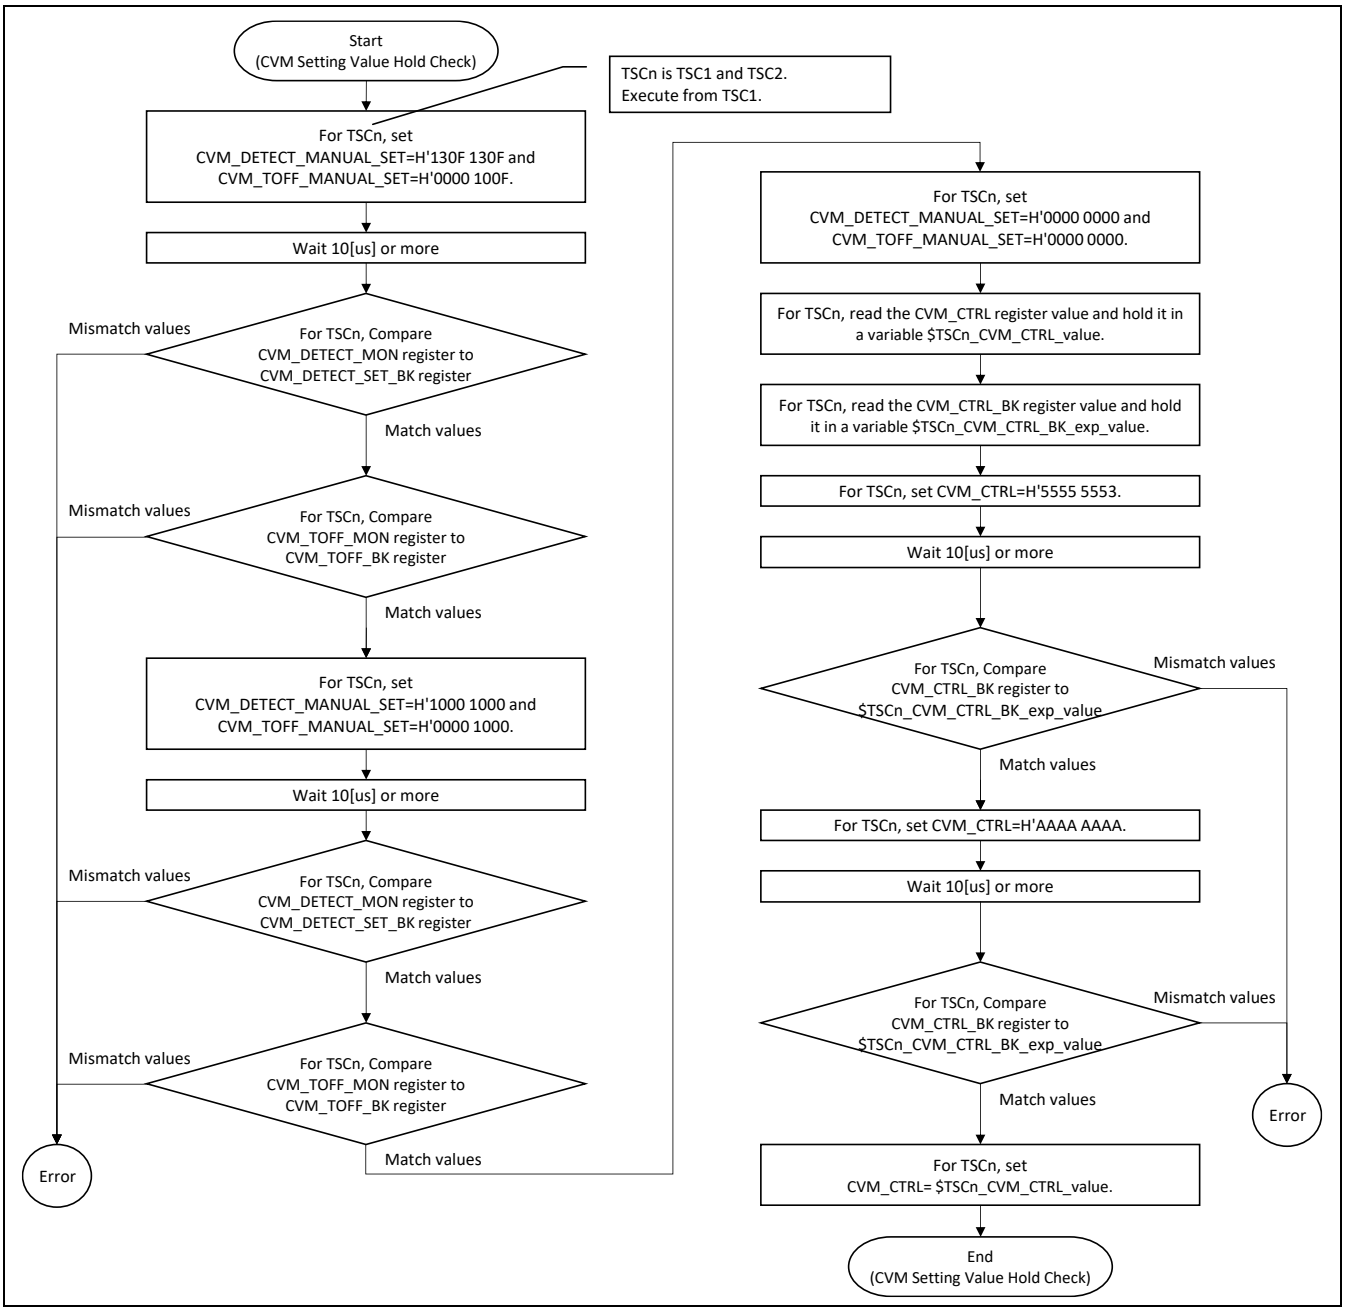

Figure 13.27 Predefined process "CVM Setting Value Hold Check"

13.5.5 Operation example

Figure 13.28 shows an operation example.

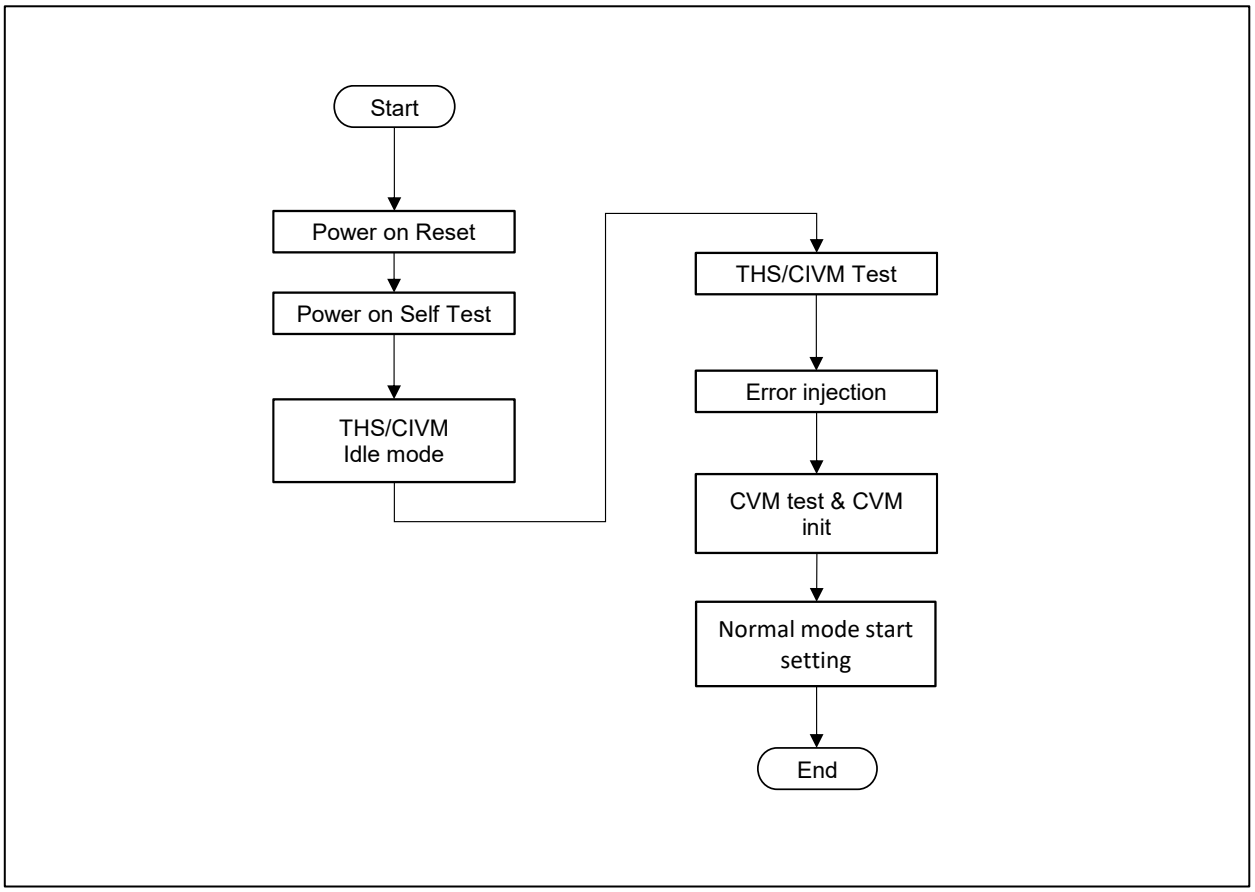

Figure 13.28 operation example

14. Reset (RST)

14.1 Overview

The reset (RST) consists of the bus interface block and registers related to reset control of Power On Reset (POR) and Software Power On Reset (SWPOR). Timing of the bus interface block is based on CL16Mφ.

14.1.1 Features

(1) Mode Monitor Register

The Mode Pin values can be monitored by Mode Monitor Register 0 and 1 (MODEMR0 and MODEMR1). The detail register specification is described in Sec.14.2.1 and 14.2.2.

(2) Reset Control Function

Table 14.1.1 shows the reset categories and reset sources in a chip.

Table 14.1.1 Reset Categories and Reset Sources

Category	Source
Power On Reset (POR)	External reset pin (PRESET#) is available for initialization of a whole chip. The sequence for turning on the power is described in Sec.14.3.1.
Software Power On Reset (SWPOR) (*1)	A reset can be issued to a whole chip by software register (SRESCR0.SPRES=1). The register specification is described in Sec.14.2.6.
	WDT resets can be issued to a whole chip by the RWDT and System WDT modules. The specification of these modules is described in Sec.154.1 and 154.3, respectively.

Notes:
(1) Some registers of Reset (RST) are not initialized by SWPOR. See Table 14.1.4 about the reset target modules.

(3) Boot Address Registers for ICUMXB

Reset (RST) controls the boot address for ICUMXB as shown in Sec.14.2.11 (ICUMXBAR). The boot address register for Cortex-A76 and Cortex-R52 is controlled by APMU.

(4) PRESETOUT# [Functional Safety]

The safety mechanism is supported by PRESETOUT#. It can be judged by monitoring PRESETOUT# whether Reset (RST) module has any failures. When the boot sequence is succeeded without any failures, PRESETOUT# value is changed from LOW to HIGH.

(5) Bus Access Protection [Functional Safety]

Register access protection is applied for registers of Reset (RST). The detail specification is described in Sec.14.4.1. In addition, the function is a safety mechanism to guarantee “Freedom From Interference (FFI)”. In detail, see Sec.14.5.3. The register specification is described in Sec.14.2.14.

14.1.2 Block Diagram

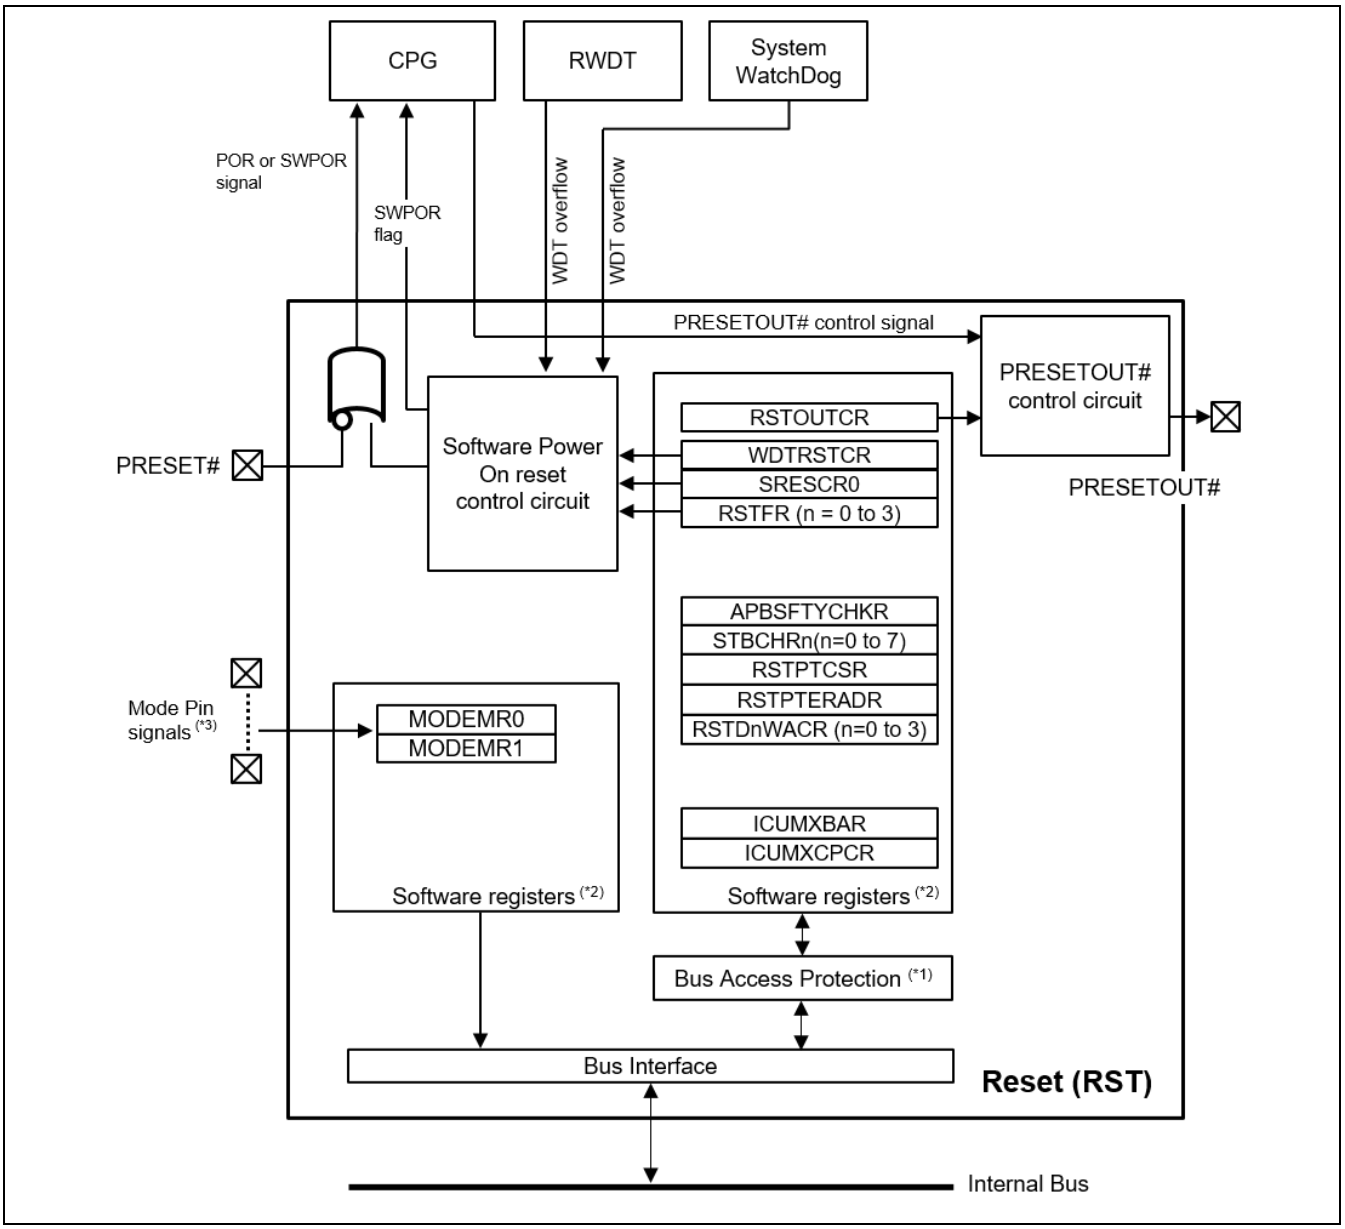

Figure 14.1.1 Block Diagram of RESET (RST)

Notes:

(1) Except MODEMR0 and MODEMR1, all registers are protected by Bus Access Protect shown in Sec.14.4.1.

(2) Reset (RST) has software registers. The details specification is described in Sec.14.2.

(3) When PRESET# is negated, the levels on Mode Pin are latched by RESET (RST). The latched signals are provided for target modules. In addition, the signals are sent to MODEMR0 and MODEMR1. The values can be monitored by the registers. See Sec.3.2 about the Mode Pin specification.

14.1.3 External Pins

The following table lists the pins connected to the RESET (RST).

Table 14.1.2 External Pins for RST

Name	I/O	Function
PRESET#	Input	Power-on-reset The low-level input on this pin places the LSI in the power-on-reset state.
PRESETOUT#	Input	Reset output (*6)
MD0	Input	Mode 0. Free Run Mode / Step Up mode Selection (*6)
MD1	Input	Mode 1. Boot Device select (*1)
MD2	Input	Mode 2. Boot Device select (*1)
MD3	Input	Mode 3. Boot Device select (*1)
MD4	Input	Mode 4. Boot Device select (*1)
MD5	Input	Mode 5. Reserved
MD6	Input	Mode 6. Master Boot Processor select(*3)
MD7	Input	Mode 7. Master Boot Processor select(*3)
MD8	Input	Mode 8. Reserved
MD9	Input	Mode 9. EXTAL/XTAL select (*5).
MD10	Input	Mode 10. Debug Mode select(*2)
MD11	Input	Mode 11. Debug Mode select(*2)
MD13	Input	Mode 13. PLL multiplication ratio setting (*5).
MD14	Input	Mode 14. PLL multiplication ratio setting (*5).
MD16	Input	Mode 16. Reserved.
MD17	Input	Mode 17. DDR clock frequency setting. (*7)
MD18	Input	Mode 18. SSCG enable / disable for PLL1(*4)
MD19	Input	Mode 19. DDR clock frequency setting. (*7)
MD20	Input	Mode 20. Debug Mode select(*2)
MD21	Input	Mode 21. Debug Mode select(*2)
MD22	Input	Mode 22. DDR Mode select (*7)
MD23	Input	Mode 23. POST target select (*8)
MD24	Input	Mode 24. Reserved.
MD25	Input	Mode 25. Field BIST enable / disable control (*8)
MD27	Input	Mode 27. DDR Mode select. (*7)
MD29	Input	Mode 29. RCLK reference clock select (*5).
MD31	Input	Mode 31. SCIF Download Mode select (*1)
MD32	Input	Mode 32. SCIF Download Mode select (*1)
MD33	Input	Mode 33. Reserved
MD35	Input	Mode 35. Reserved
MD36	Input	Mode 36. SSCG enable / disable for PLL1(*4)
MD37	Input	Mode 37. SSCG enable / disable for PLL1(*4)
MDT0	Input	MDT0. Debug Mode select(*2)

Notes

1) See 31 Boot (Table 31.1 Mode Pin Configuration (1))
2) See 170 Debug and Trace (Table JTAG selection table).
3) See 31 Boot (Table 31.2 Mode Pin Configuration (2))
4) See 8. CPG (8.1.5.1 PLL1 Initial Multiplication Ratio).
5) See 8. CPG (8.1.5 Clock Operating Modes).
6) See 8. CPG (8.1.5.9 Step-up Mode).
7) See 8. CPG (8.1.5.3 PLL3 Multiplication ratio)
8) See Table 171.2.

14.1.4 Register Configuration

Register address space of Reset module is separated by 4 domains. The base address of each domain is as bellow. The detail specification is described in Sec.14.4.1.

Domain number	Base address
0	H'E616 0000
1	H'E616 4000
2	H'E616 8000
3	H'E616 C000

Table 14.1.3 RESET (RST) Registers Details

Register Name	Mnemonic	R/W	Offset Address	Initial value	Size	Corresponding DnWACR (n = 0, 1, 2, 3)
Mode Monitor Register 0	MODEMR0	R	H'0000	H'---- ----	32	(*2)
Mode Monitor Register 1	MODEMR1	R	H'0004	H'-000 000-	32	(*2)
Watchdog Timer Reset Control Register	WDTRSTCR	R/W	H'0010	H'0000 8003	32	RSTDnWACR [4]
PRESETOUT# Control Register	RSTOUTCR	R/W	H'0014	H'0000 0001	32	RSTDnWACR [5]
Soft Power On Reset Control Register 0	SRESCR0	R/W	H'0018	H'0000 0000	32	RSTDnWACR [6]
Reset Flag Register 0	RSTFR0	R/W	H'0020	H'0000 0000	32	RSTDnWACR [8]
Reset Flag Register 1	RSTFR1	R/W	H'0024	H'0000 0000	32	RSTDnWACR [9]
Reset Flag Register 2	RSTFR2	R/W	H'0028	H'0000 0000	32	RSTDnWACR [10]
Reset Flag Register 3	RSTFR3	R/W	H'002C	H'0000 0000	32	RSTDnWACR [11]
Standby Flag Register 0	STBCHR0	R/W	H'0030	H'0000 0000	32	RSTDnWACR [12]
Standby Flag Register 1	STBCHR1	R/W	H'0034	H'0000 0000	32	RSTDnWACR [13]
Standby Flag Register 2	STBCHR2	R/W	H'0038	H'0000 0000	32	RSTDnWACR [14]
Standby Flag Register 3	STBCHR3	R/W	H'003C	H'0000 0000	32	RSTDnWACR [15]
Standby Flag Register 4	STBCHR4	R/W	H'0040	H'0000 0000	32	RSTDnWACR [16]
Standby Flag Register 5	STBCHR5	R/W	H'0044	H'0000 0000	32	RSTDnWACR [17]
Standby Flag Register 6	STBCHR6	R/W	H'0048	H'0000 0000	32	RSTDnWACR [18]
Standby Flag Register 7	STBCHR7	R/W	H'004C	H'0000 0000	32	RSTDnWACR [19]
APB bus Safety Check Register	APBSFTYCHKR	R/W	H'0050	H'0000 0000	32	RSTDnWACR [20]
ICUMXB Boot Address Register	ICUMXBAR	R/W	H'0054	H'0000 00--	32	RSTDnWACR [21]
ICUMXB CPinit Control Register	ICUMXCPCR	R/W	H'0058	H'0000 000-	32	RSTDnWACR [22]
Protect Control/Status Register	RSTPTCSR	R/W	H'0068	H'0000 0002	32	RSTDnWACR [26]
Protect Error Address Register	RSTPTERADR	R	H'006C	H'0000 0000	32	RSTDnWACR [27]
Domain 0 Write Access Control Register	RSTD0WACR	R/W	H'3800	H'FFFF FFFF	32	(*1)
Domain 1 Write Access Control Register	RSTD1WACR	R/W	H'3A00	H'0000 0000	32	(*1)
Domain 2 Write Access Control Register	RSTD2WACR	R/W	H'3C00	H'0000 0000	32	(*1)
Domain 3 Write Access Control Register	RSTD3WACR	R/W	H'3E00	H'0000 0000	32	(*1)

Note 1: The register can be accessed by Domain 0.

Note 2: There are no protect registers for Read Only register.

Table 14.1.4 Initialization condition of RST Register

Register Name	Mnemonic	Initialization condition
Mode Monitor Register 0	MODEMR0	PRESET# only
Mode Monitor Register 1	MODEMR1	PRESET# only
Watchdog Timer Reset Control Register	WDTRSTCR	PRESET# only
PRESETOUT# Control Register	RSTOUTCR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Soft Power On Reset Control Register 0	SRESCR0	PRESET# only
Reset Flag Register 0	RSTFR0	PRESET# only
Reset Flag Register 1	RSTFR1	PRESET# only
Reset Flag Register 2	RSTFR2	PRESET# only
Reset Flag Register 3	RSTFR3	PRESET# only
Standby Flag Register 0	STBCHR0	PRESET# only
Standby Flag Register 1	STBCHR1	PRESET# only
Standby Flag Register 2	STBCHR2	PRESET# only
Standby Flag Register 3	STBCHR3	PRESET# only
Standby Flag Register 4	STBCHR4	PRESET# only
Standby Flag Register 5	STBCHR5	PRESET# only
Standby Flag Register 6	STBCHR6	PRESET# only
Standby Flag Register 7	STBCHR7	PRESET# only
APB bus Safety Check Register	APBSFTYCHKR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
ICUMXB Boot Address Register	ICUMXBAR	Depend on WDTRSTCR.RESBAR2S PRESET# only or PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
ICUMXB CPinit Control Register	ICUMXCPCR	Depend on WDTRSTCR.RESBAR2S PRESET# only or PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Protect Control/Status Register	RSTPTCSR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Protect Error Address Register	RSTPTERADR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Domain 0 Write Access Control Register	D0WACR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Domain 1 Write Access Control Register	D1WACR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Domain 2 Write Access Control Register	D2WACR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)
Domain 3 Write Access Control Register	D3WACR	PRESET#, Soft Power On Reset(WDT reset or SRESCR0.SPRES=1)

14.1.5 Connected modules

Table 14.1.5 Connected modules

Module name	Connected module name	Function of connected module
RST	CPG	Reset control
	RWDT	Mask RWDT reset request
	System WatchDog	Mask System WatchDog reset request
	ICUMXB	Reset and Boot address control

14.2 Register Description

Legend for Register Description

Initial value	: Register value after a reset
–	: Undefined value
R/W	: Readable/writable. The written value can be read.
R	: Read-only.
W	: Write-only. The read value is undefined.
R/WC1	: Readable/writable. Writing 1 inializes the bit. Writing 0 is ignored.

14.2.1 Mode Monitor Register 0 (MODEMR0)

MODEMR0 is a 32-bit read-only register, which can be accessed only in longwords.
This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MD31	—	MD29	—	MD27	—	MD25	MD24	MD23	MD22	MD21	MD20	MD19	MD18	MD17	MD16
Initial value:	—	0	—	0	—	0	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MD14	MD13	—	MD11	MD10	MD9	MD8	MD7	MD6	MD5	MD4	MD3	MD2	MD1	MD0
Initial value:	0	—	—	0	—	—	—	—	—	—	*1	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1 : Initial value of MD5 bit is 1'b0 when LCS = SE.

Bit	Bit Name	Initial Value	R/W	Description
31	MD31	Depend on mode setting	R	The value of MD31
30	—	0	R	Reserved. When read, returns 0.
29	MD29	Depend on mode setting	R	The value of MD29
28	—	0	R	Reserved. When read, returns 0.
27	MD27	Depend on mode setting	R	The value of MD27
26	—	0	R	Reserved. When read, returns 0.
25	MD25	Depend on mode setting	R	The value of MD25
24	MD24	Depend on mode setting	R	The value of MD24
23	MD23	Depend on mode setting	R	The value of MD23
22	MD22	Depend on mode setting	R	The value of MD22
21	MD21	Depend on mode setting	R	The value of MD21
20	MD20	Depend on mode setting	R	The value of MD20
19	MD19	Depend on mode setting	R	The value of MD19
18	MD18	Depend on mode setting	R	The value of MD18
17	MD17	Depend on mode setting	R	The value of MD17
16	MD16	Depend on mode setting	R	The value of MD16
15	—	0	R	Reserved. When read, returns 0.
14	MD14	Depend on mode setting	R	The value of MD14
13	MD13	Depend on mode setting	R	The value of MD13
12	—	0	R	Reserved. When read, returns 0.
11	MD11	Depend on mode setting	R	The value of MD11
10	MD10	Depend on mode setting	R	The value of MD10
9	MD9	Depend on mode setting	R	The value of MD9
8	MD8	Depend on mode setting	R	The value of MD8
7	MD7	Depend on mode setting	R	The value of MD7
6	MD6	Depend on mode setting	R	The value of MD6
5	MD5	Depend on mode setting *1	R	The value of MD5
4	MD4	Depend on mode setting	R	The value of MD4
3	MD3	Depend on mode setting	R	The value of MD3
2	MD2	Depend on mode setting	R	The value of MD2
1	MD1	Depend on mode setting	R	The value of MD1
0	MD0	Depend on mode setting	R	The value of MD0

14.2.2 Mode Monitor Register 1 (MODEMR1)

MODEMR1 is a 32-bit read-only register, which can be accessed only in longwords.
This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	MDT0	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	—	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	MD37	MD36	MD35	—	MD33	MD32
Initial value:	0	0	0	0	0	0	0	0	0	0	—	—	—	0	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved. When read, returns 0.
28	MDT0	Depend on mode setting	R	The value of MDT0
27 to 6	—	All 0	R	Reserved. When read, returns 0.
5	MD37	Depend on mode setting	R	The value of MD37
4	MD36	Depend on mode setting	R	The value of MD36
3	MD35	Depend on mode setting	R	The value of MD35
2	—	All 0	R	Reserved. When read, returns 0.
1	MD33	Depend on mode setting	R	The value of MD33
0	MD32	Depend on mode setting	R	The value of MD32

14.2.3 Watchdog Timer Reset Control Register (WDTRSTCR)

WDTRSTCR is a 32-bit readable/writable register, which can be accessed only in longwords. This register specifies whether the watchdog timer overflow should be masked or not as a reset trigger. The upper word of the write value should always be the code value H'A55A. If the code value is read, it is always read as 0.

This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'A55A)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RESBAR2S	—	—	—	—	—	—	—	—	—	—	—	—	—	SWDT_RSTMSK	RWDT_RSTMSK
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Code value (H'A55A) When read, returns 0.
15	RESBAR2S	1	R/W	Select BAR2 registers reset condition 0: ICUMXBAR and ICUMXCPCR are initialized only by PRESET#. 1: ICUMXBAR and ICUMXCPCR are initialized by PRESET#, WDT reset, and Soft Power On Reset (SRESCR0.SPRES=1).
14 to 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1	SWDT_RSTMSK	1	R/W	System WatchDog Reset Mask This bit is used to mask the detection of System WatchDog overflow. 0: Reset request 1: Not reset request
0	RWDT_RSTMSK	1	R/W	RWDT Reset Mask This bit is used to mask the detection of RWDT overflow. 0: Reset request 1: Not reset request

Note:

1. If a conflict between "WDTRSTCR.RWDT_RSTMSK (from 0 to 1)" and "SPOR asserting" occurs, it cannot be guaranteed that the value of RSTFRn.RCRWDT bit is certain. After the WDTRSTCR.RWDT_RSTMSK is changed from 0 to 1, the value of RWTCSRA.WOVF in RWDT (Sec. 154.1) should be checked instead of the value of RSTFRn.RCRWDT.

2. If a conflict between "WDTRSTCR.SWDT_RSTMSK (from 0 to 1)" and "SPOR asserting" occurs, it cannot be guaranteed that the value of RSTFRn.RCSWDT bit is certain. After the WDTRSTCR.SWDT_RSTMSK is changed from 0 to 1, the value of SWTCSRA.WOVF in SWDT (Sec. 154.1) should be checked instead of the value of RSTFRn.RCSWDT.

14.2.4 PRESETOUT# Control Register (RSTOUTCR)

RSTOUTCR is a 32-bit readable/writable register, which can be accessed only in longwords. This register controls the output level of external LSI pin RESETOUT# by software.

This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RES OUT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	RESOUT	1	R/W	PRESETOUT# control by software This bit is used to specify the output level of PRESETOUT#. 0: PRESETOUT# is asserted 1: PRESETOUT# is negated

14.2.5 Soft Power On Reset Control Register 0 (SRESCR0)

SRESCR0 is a 32bit readable/writeable register, which can be accessed only in longwords. The upper word of the write value should always be the code value H' 5AA5. If the code value is read, it is always read as 0.

This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'5AA5)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPRES	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Code value (H'5AA5) When read, returns 0.
15	SPRES	0	R/W	Soft Power On Reset Soft Power On Reset is asserted. This bit is initialized on Power On Reset. 0 : Ignored 1 : Soft Power On Reset is asserted. Note: Soft Power On Reset is asserted when 1 is written to this bit. When Power On Reset process is completed, this bit gets cleared (The range of initialization is same with Soft Power On Reset by WDT)
14 to 0	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.

14.2.6 Reset Flag Register n (RSTFRn) (n=0 to 3)

RSTFRn is a 32bit readable/writeable register, which can be accessed only in longwords. Write access is performed only to clear the flag bits. This register sets the reset flags when Soft Power On Reset (Power On Reset other than PRESET#) is detected. By reading this register at the time of reboot etc., it is known that which kind of reset was detected.

This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RCPRES	RCSWDT	RCRWDT	RPF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

0	RPF	0	R/W	Soft Power On Reset detection bit 0 : Soft Power On Reset is not detected. 1 : Soft Power On Reset is detected.

Note:
See “Note” in 14.2.4 Watchdog Timer Reset Control Register (WDTRSTCR).

14.2.7 Standby Flag Register n (STBCHRn) (n=0 to 7)

STBCHRn are 32-bit readable/writable registers, which can be accessed only in longwords. These registers are defined purely for software purpose. Setting these registers doesn't influence the LSI operation. As these bits are initialized only by PRESET#, the programmer can use this register at their convenience.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

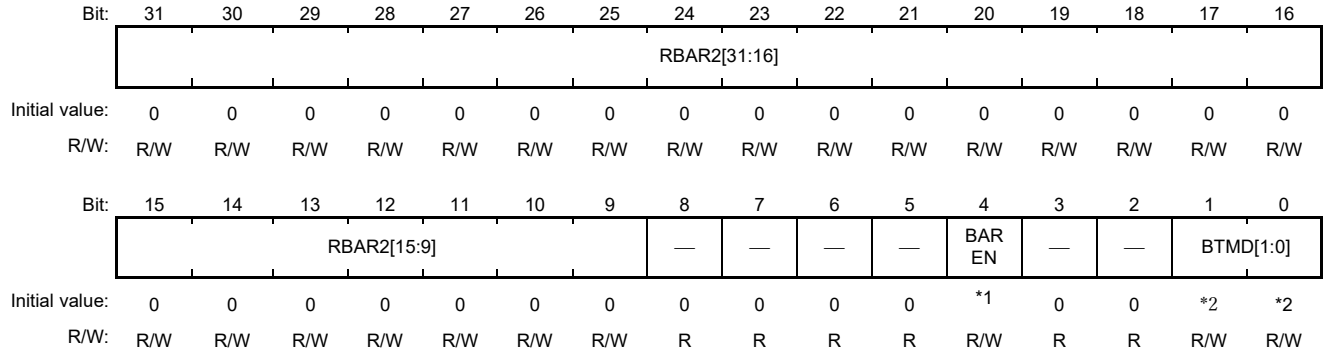
This register is functional safety use only. Keep initial value.

14.2.9 ICUMXB Boot Address Register (ICUMXBAR)

ICUMXBAR is a 32-bit readable/writable register, which can be accessed only in longwords.
This register is initialized by PRESET# when WDTRSTCR.RESBAR2S=0. This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1) when WDTRSTCR.RESBAR2S=1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 9	RBAR2[31:9]	All 0	R/W	ICUMXB Boot Address2 When the ICUMXB accesses to the range of physical address from 0x0000 0000 to 0x0000 01FF, the address bit in [31:9] is replaced by RBAR2[31:9].
8 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN *3	*1	R/W	BAREN bit 0: RBAR2 is not valid. 1: RBAR2 is valid.
3 to 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1 to 0	BTMD[1:0]	*2	R/W	Specifies the Boot area of ICUMXB During Hardware Power On Reset the initial value of these bits depends upon MD4, MD3, MD2 and MD1 pin setting. 00: RBAR2[31:9] is assigned to Boot address. 01: Prohibited. 10: Boots from BootROM. 11: Prohibited.

Note *1 When MD4!=0 or MD3!=0 or MD2!=0 or MD1!=0, initial value is 1. When others, initial value is 0.

Note *2 Initial value depends upon MD4, MD3, MD2 and MD1 pin setting. Refer to the Table 14.2.1.

Note *3 Do not rewrite BAREN=1 simultaneously with RBAR2 and BTMD. After completing the setting of RBAR2 and BTMD with BAREN=0, set only BAREN=1.
For example: Change RBAR2[31:9] from A to B, and BTMD[1:0]=00
Step 1: Write RBAR2[31: 9]=B, BAREN=0, BTMD[1:0]=00
Step 2: Write RBAR2[31: 9]=B, BAREN=1, BTMD[1:0]=00

Table 14.2.1 Initial values of BAREN, BTMD[1:0], and boot address

Mode pin setting				Initial values			Note
MD4	MD3	MD2	MD1	BAREN	BTMD[1:0]	Boot address

1	1	1	1	1	10	H'00 EB10 4000	

14.2.10 ICUMXB CPinit Control Register (ICUMXCPCR)

ICUMXCPCR is a 32-bit readable/writable register, which can be accessed only in longwords. This register is initialized by PRESET# when WDTRSTCR.RESBAR2S=0.

This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1) when WDTRSTCR.RESBAR2S=1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICUMX CPINIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Note *1 : When MD7=1 and MD6=0, initial value is 1, in other case initial value is 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	ICUMXCPINIT	*1	R/W	0: Reset to ICUMXB is asserted. ICUMXB is not booted. 1: Reset to ICUMXB is de-asserted. ICUMXB is booted.

Note *1 : When MD7=1 and MD6=0, initial value is 1, in other case initial value is 0.

Operation of ICUMXB boot by Cortex-R52 is below.

Step1: Cortex-R52 boot.
Step2: Setting ICUMXBAR
Step3: Dummy read to ICUMXBAR.
Step4: Changing ICUMXCPINIT value from 0 to 1. To Change the value from 1 to 0 is prohibited.

ICUMXBAR and ICUMXCPINIT register values are not used in Secure LCS.
Secure (SE) LCS is one of Life Cycle states, which is defined by secure engine at booting.

14.2.11 Protect Control/Status Register (RSTPTCSR)

RSTPTCSR is a 32-bit readable/writable register, which can be accessed only in longwords.
This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EIE	ERR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EIE	1	R/W	Enable error interrupt request of write access protection 0: Disable error interrupt request 1: Enable error interrupt request When EIE=1 and ERR=1, issue error interrupt request to ECM.
0	ERR	0	R/WC1	Display the status of error detection on secure access protection 0: Not detect error. 1: Detect error of write access protection to protected regsiters which are specified RSTDnWPTCSR. Write 1 to this bit to clear this flag bit.

14.2.12 Protect Error Address Register (RSTPTERADR)

RSTPTERADR is a 32-bit read-only register, which can be accessed only in longwords.
This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 1	ADDR[15:1]	All 0	R	Offset address[15:1] of the first illegal write access to the protected registers. When write access is occurred to the potected registers in RESET module, the address offset value is set to these bits automatically. The set address is one of the first illegal access.
0	ADDR[0]	0	R/WC1	Offset address[0] of the first illegal write access to the protected registers. When write access is occurred to the potected registers in RESET module, the address offset value is set to these bits automatically. The set address is one of the first illegal access. When write 1 to the bit, ADDR[15:0] Is cleared.

14.2.13 Domain n Write Access Control Register (RSTDnWACR) (n=0 to 3)

RSTDnWACR is a 32-bit readable/writable register, which can be accessed only in longwords. This register is specified write access premission of each regsiters from the domain n.
This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR0.SPRES=1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
27	RSTPTERADR	1	R/W	Write permission to RSTPTERADR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
26	RSTPTCSR	1	R/W	Write permission to RSTPTCSR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
25 to 23	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
22	ICUMXCPCR	1	R/W	Write permission to ICUMXCPCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
21	ICUMXBAR	1	R/W	Write permission to ICUMXBAR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
20	APBSFTYCHKR	1	R/W	Write permission to APBSFTYCHKR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
19	STBCHR7	1	R/W	Write permission to STBCHR7 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
18	STBCHR6	1	R/W	Write permission to STBCHR6 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
17	STBCHR5	1	R/W	Write permission to STBCHR5 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
16	STBCHR4	1	R/W	Write permission to STBCHR4 register from domain n. 0 : Prohibit write access. 1 : Permit write access.

Bit	Bit Name	Initial Value	R/W	Description
15	STBCHR3	1	R/W	Write permission to STBCHR3 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
14	STBCHR2	1	R/W	Write permission to STBCHR2 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
13	STBCHR1	1	R/W	Write permission to STBCHR1 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
12	STBCHR0	1	R/W	Write permission to STBCHR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
11	RSTFR3	1	R/W	Write permission to RSTFR3 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
10	RSTFR2	1	R/W	Write permission to RSTFR2 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
9	RSTFR1	1	R/W	Write permission to RSTFR1 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
8	RSTFR0	1	R/W	Write permission to RSTFR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
7	—	1	R	Reserved These bits are always read as 1. The write value should always be 1.
6	SRESCR0	1	R/W	Write permission to SRESCR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
5	RSTOUTCR	1	R/W	Write permission to RSTOUTCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
4	WDTRSTCR	1	R/W	Write permission to WDTRSTCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
3 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

[RSTDnWACR (n=1 to 3)]

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	RSTPTERADR	0	R/W	Write permission to RSTPTERADR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
26	RSTPTCSR	0	R/W	Write permission to RSTPTCSR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
25 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	ICUMXCPCR	0	R/W	Write permission to ICUMXCPCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
21	ICUMXBAR	0	R/W	Write permission to ICUMXBAR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
20	APBSFTYCHKR	0	R/W	Write permission to APBSFTYCHKR register from domain n. 0 : Prohibit write access. 1 : Permit write access.

Bit	Bit Name	Initial Value	R/W	Description
19	STBCHR7	0	R/W	Write permission to STBCHR7 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
18	STBCHR6	0	R/W	Write permission to STBCHR6 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
17	STBCHR5	0	R/W	Write permission to STBCHR5 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
16	STBCHR4	0	R/W	Write permission to STBCHR4 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
15	STBCHR3	0	R/W	Write permission to STBCHR3 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
14	STBCHR2	0	R/W	Write permission to STBCHR2 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
13	STBCHR1	0	R/W	Write permission to STBCHR1 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
12	STBCHR0	0	R/W	Write permission to STBCHR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
11	RSTFR3	0	R/W	Write permission to RSTFR3 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
10	RSTFR2	0	R/W	Write permission to RSTFR2 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
9	RSTFR1	0	R/W	Write permission to RSTFR1 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
8	RSTFR0	0	R/W	Write permission to RSTFR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
7	—	0	R/W	Reserved. Register writes are retained and readable, but do not affect the hardware operation.
6	SRESCR0	0	R/W	Write permission to SRESCR0 register from domain n. 0 : Prohibit write access. 1 : Permit write access.
5	RSTOUTCR	0	R/W	Write permission to RSTOUTCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
4	WDTRSTCR	0	R/W	Write permission to WDTRSTCR register from domain n. 0 : Prohibit write access. 1 : Permit write access.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

14.3 Operation

14.3.1 Power-On Reset by PRESET# Pin

- For the power-on oscillation settling time (tOSC), see Section 200, Electrical Characteristics. After the state on the PRESET# pin input is changed from a low level to high level, the internal reset state continues until the flash ROM reset time (longer than 50 µs), the flash ROM holding time (longer than 5 µs) and the reset holding time
- Figure 14.3.1 shows a sequence for turning on the power. When the power is turned on, ensure that a low level is input to the PRESET# pin. A low level input is also needed on the TRST# pin.

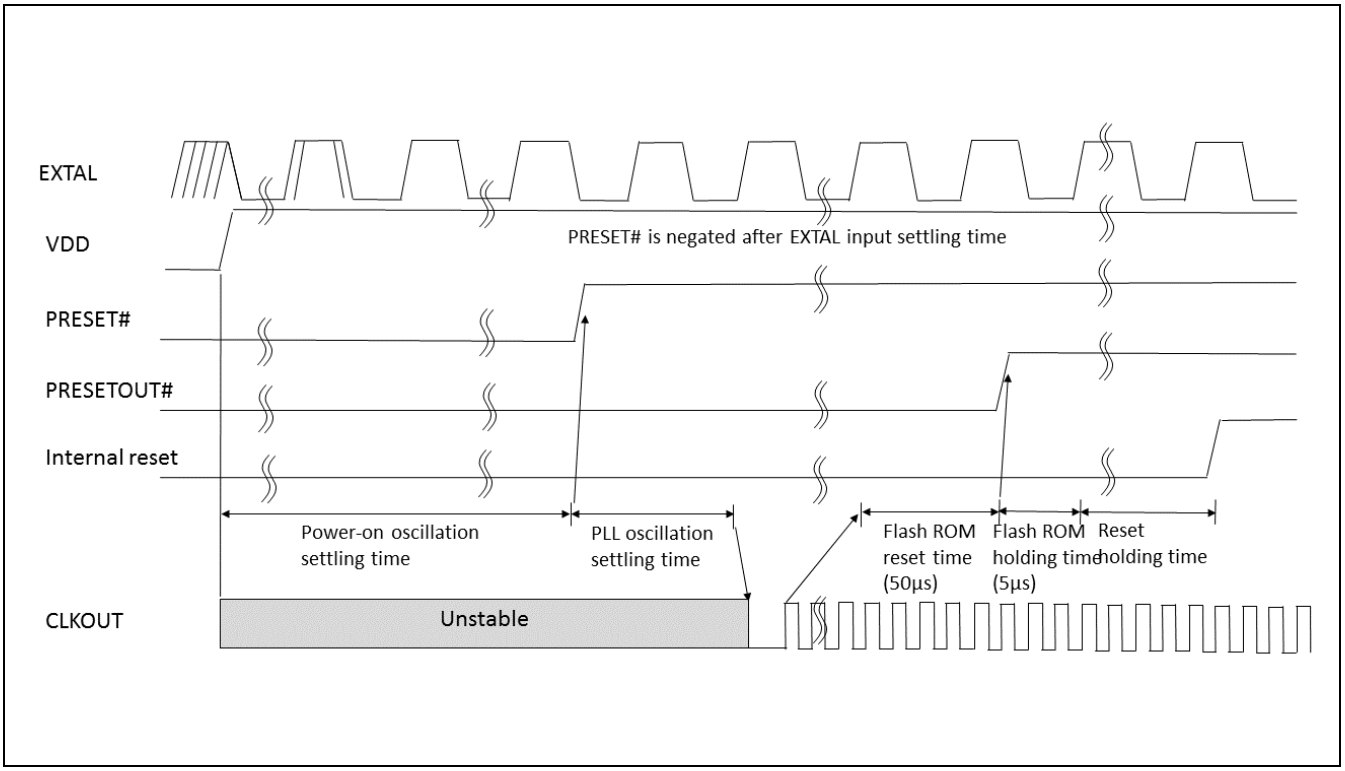

Figure 14.3.1 Free-Running Mode

14.3.2 WDT reset

WDT resets can be issued by the RWDT and System WDT modules.
WDTRSTCR controls the permission or prohibition of WDT resets.
The reset (RST) module is not initialized by a WDT reset.

14.4 Usage Notes

14.4.1 Bus Access Protection for Reset (RST) registers

(1) Overview

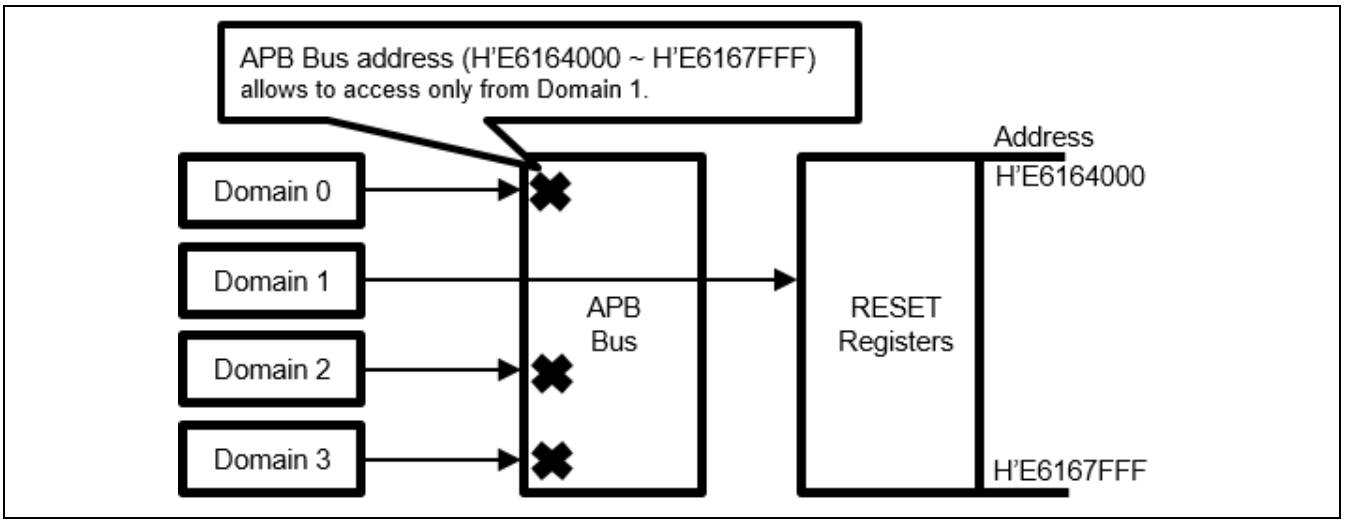

Figure 14.4.1 Bus Access Protection for Reset (RST) registers

Reset (RST) register address map is assigned from H'E6160000 to H'E616FFFF. The address map is separated into 4 groups which is accessed by each domain (Domain 0, Domain 1, Domain 2, Domain 3). The Physical address of Reset (RST) register body from 0x0000_0000 to 0x0000_3FFF.

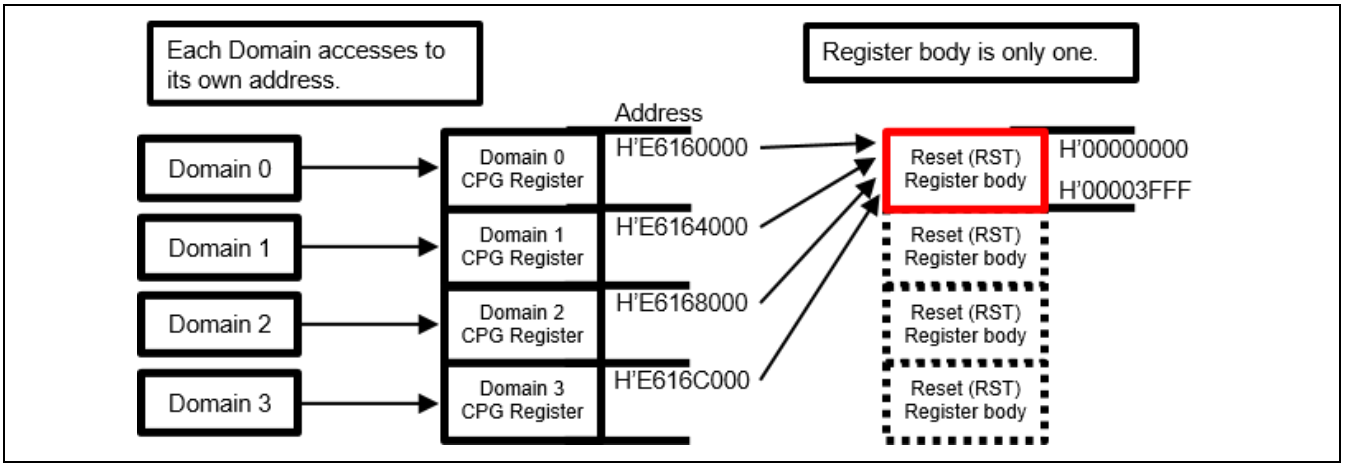

Figure 14.4.2 Address Map Structures

(2) Domain n Write Access Control Register (RSTDnWACR) (n = 0, 1, 2, 3)

Each register in “Reset (RST) Register body” is protected by “Domain n Write Address Control Register (RSTDnWACR (n = 0, 1, 2, 3)). For example of the case below (Figure 14.4.3), D2WACR.bit15 = 1, D{0, 1, 3}WACR.bit15 = 0. Only Domain 2 can write access to “STBCHR3”.

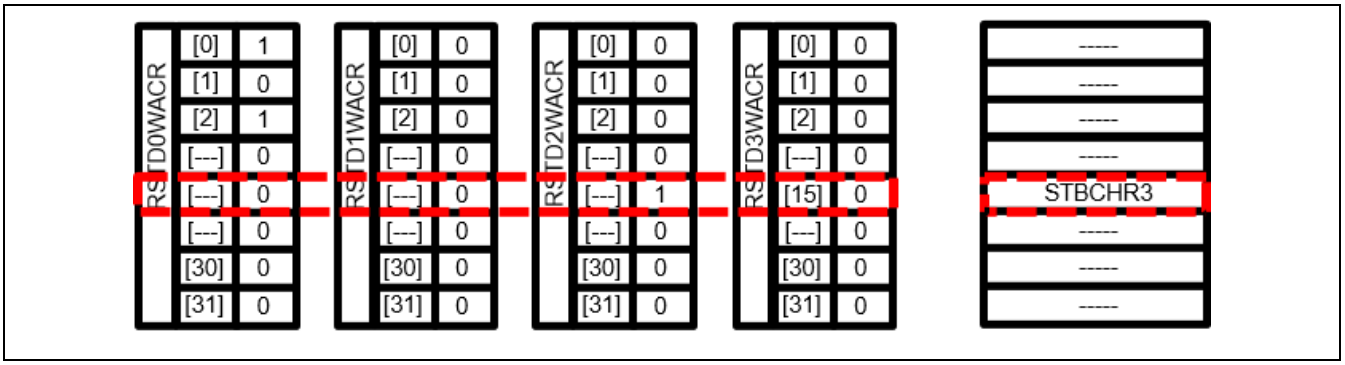

Figure 14.4.3 Usage of RSTDnWACR (n = 0, 1, 2, 3)

The register corresponds with RSTD0WACR, RSTD1WACR, RSTD2WACR, RSTD3WACR in Sec.14.2.14.

(3) Check method of illegal write accesses

If there are illegal write accesses for the Reset (RST) registers, an error notification is reported to ECM (ECMERRxxxR00 Bit31). In addition, the error notification is cleared by using RSTPTCSR (Protect Control/Status Register). In detail, see 14.2.12, in which the register usage is described.

14.5 Safety Mechanisms

14.5.1 Overview

- The safety mechanism is supported by PRESETOUT#. It can be judged by monitoring PRESETOUT# whether Reset (RST) module has any failures.
- The access rights for changing independent registers in Reset (RST) shall be configurable for each Domain 0, 1, 2, 3. See 14.5.3 in detail.

14.5.2 PRESETOUT#

The safety mechanism is supported by PRESETOUT#. It can be judged by monitoring PRESETOUT# whether Reset (RST) module has any failures. When the boot sequence is succeeded without any failures, PRESETOUT# value is changed from LOW to HIGH. In addition, it can be judged that the Power on Self Test is succeeded.

14.5.3 Bus Access Protect

Reset (RST) provides a safety access protection mechanism to guarantee “Freedom From Interference (FFI)” when accessing the registers belonging to the Reset (RST) module. Several masters (e.g. Cortex-R52, Cortex-A76) take control of different portions and modules of the chip. The access protection mechanism shall enable sharing and splitting the functionality among cores.

The access protection mechanism for the control registers belonging to Reset (RST) module shall be aligned with the Region ID concept. In detail, see Sec.14.4.1. Reset (RST) has critical system control functions such as Reset Control Function. Therefore, the strong access restrictions are necessary for Reset (RST).

15. Interrupt Controller (INTC)

15.1 Overview

This module handles system and realtime domain interrupt events.

This module handles system domain interrupt events. This module is integrated Arm GIC-600 (r1p6) which is compliant with Arm GICv3.

15.1.1 Features

- There is one INTC-Monitor for one interrupt signal of the safety-related module
- INTC-Monitors use a dedicated clock from the Timer clock generator.
- Clock frequency of the Timer Clock generator can be configured by the Counter control register. The Counter control register and its access error status registers can be accessed in secure mode. (Non-secure access is prohibited.)
- When non-secure access to the secure registers are occurred, the access error signal is output.
  - The error's factor is kept in register
- All INTC-Monitors have each control registers and status bits.
- Each control registers and status bits of INTC-Monitors can be accessed in non-secure mode.
- INTC-Monitor can monitor the following two items.
  - Whether the interrupt signal is asserted within the expected time
  - Whether the interrupt signal is de-asserted within the expected time
- When the expected time is exceeded, the error signal is output.
  - The error's factor is kept in status register
  - The error signals are output from status registers respectively
- INTC-AP handles system domain interrupt events.
  - Interrupt controller for AP-System core
  - 32 programmable priority levels
  - Arm-IRQ interrupt generation
  - INTC-AP handles peripheral interrupt
  - GIC600 (r1p6) implemented
- Handles the external NMI/IRQ as a common module
- Edge-triggered by rising edge, falling edge or both edges
- Level-sensitive to the high or low values

- Provides IRQ signal de-bouncing, noise reduction and chattering

15.1.2 Block Diagram

Figure 15.1 show block diagram of connection between INTC and related modules. INTC module consists of synchronization, selector and INTC-Monitor parts.

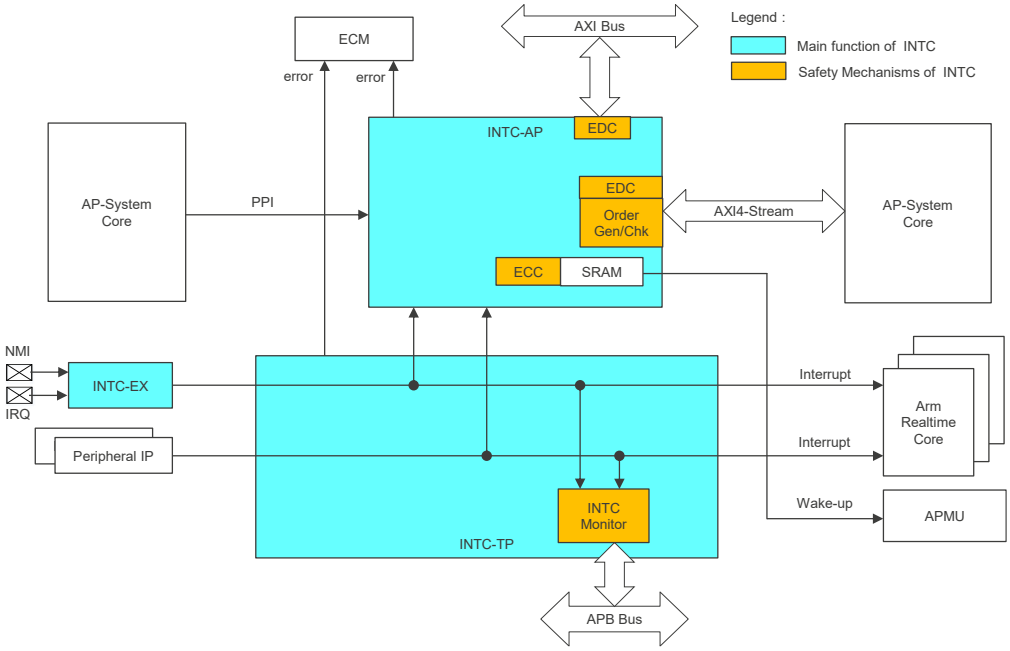

Figure 15.1 Block diagram of connection between INTC and related modules

15.1.3 External Pins

Table 15.1 shows the INTC-EX pin configuration.

Table 15.1 Pin Configuration

Name	Function	I/O	Description
IRQ[d] (d=0-5)	External interrupt input pins	Input	Input of IRQ[d] interrupt request signals from externaldevice. All IRQ signals are always active.
NMI	External non maskable interrupt input pins	Input	Input of NMI interrupt request signal from external device.

15.1.4 Conntected Module

Table 15.2, Table 15.3 and Table 15.4 shows the connected modules to INTC. As for the feature of the connected modules, refer to the chapter of each module.

Table 15.2 Connected Modules of INTC-AP

Module Name	Connected Module Name	Connected Module Function
INTC-AP	AP system core	Application CPU core block
	APMU	Send a request to wake up the Application CPU core to APMU.
	AXI-BUS	AXI-Bus, APB-Bus
	INTC-TP	Collect interrupts from each IPs, INTC-EX
	CPG	Clock Supply
	RST	Module Reset
	ECM	Error Interrupt Controller

Table 15.3 Connected Modules of INTC-TP

Module Name	Connected Module Name	Connected Module Function
INTC-TP	IPs	Interrupt collection from IPs
	Realtime core	Realtime CPU core
	INTC-AP	Interrput controller for Application CPU core
	INTC-EX	Provide interrupts from external device
	AXI-BUS	APB-Bus
	CPG	Clock Supply
	RST	Module Reset
	ECM	Error Interrupt Controller

Table 15.4 Connected Modules of INTC-EX

Module Name	Connected Module Name	Connected Module Function

Refer to 015_R-CarV4M_INTC_Interrupts_Mapping_r1p00.xlsx

as interrupt table.

15.4 Usage Notes

15.4.1 INTC-AP Register Configuration and Function Description

INTC-AP is based on Arm Generic Interrupt Controller. For more information, see Arm Generic Interrupt Controller Architecture Specification and section 5, AP-System Core.

960 SPI interrupts are integrated into Interrupt ID [959:32]. Also 256 LPIs (Locality-specific Peripheral Interrupts) are supported.

The INTC-AP supports 4 CPU cores which are mapped as shown below.

Table 15.5 Port mapping for INTC-AP

CPU0 interface	AP-System core (Cortex-A76) CPU core 0
CPU1 interface	AP-System core (Cortex-A76) CPU core 1
CPU2 interface	AP-System core (Cortex-A76) CPU core 2
CPU3 interface	AP-System core (Cortex-A76) CPU core 3

CPU5 interface	—
CPU6 interface	—
CPU7 interface	—

Table 15.6 shows the base address of GIC600.

Table 15.6 GIC600 Base address

Functions	Base Address
GIDC/GICDA : Distributor Registers	H'F100_0000
GICD message-based interrupts (GICA) : Distributor registers (GICA) for message-based SPIs	H'F101_0000
GICT : trace and debug functions Registers	H'F102_0000
GICP : Performance Monitoring Unit functions Registers	H'F103_0000
GITS : ITS control register	H'F104_0000
GITS translate : ITS translation register	H'F105_0000
GICR (LPI) : Redistributor registers for control and physical LPIs	H'F106_0000 + CPUn x H'2_0000
GICR (SGI) : Redistributor registers for SGIs and PPIs	H'F107_0000 + CPUn x H'2_0000

For more information of these registers, see Arm Cortex-A76 Technical Reference Manual and Arm GIC-600 (r1p6) Generic Interrupt Controller Technical Reference Manual.

15.4.2 Interrupts Mapping

Refer to 015_R-CarV4M_INTC_Interrupts_Mapping_r1p00.xlsx

as interrupt table.

Note: SGI is Software Generated Interrupt, PPI is Private Peripheral Interrupt and SPI is Shared Peripheral Interrupt. All SPI interrupts should be level-sensitive configuration. If you want more detail information, refer to Arm Cortex-A76 Technical Reference Manual and Arm GIC-600 (r1p6) Generic Interrupt Controller Technical Reference Manual.

15.4.3 NMI Mask Lock Feature

NMI can be masked by setting NMI Mask Lock Set Register. If you set the lock code to NMI lock code register and set the same lock code to NMI lock set register, then NMI cannot be masked by software (locked NMI mask). If you want to unlock NMI mask, you need to set DBGEN bit of NMI debug control register and set the unlock code to the NMI debug code register.

15.4.4 Procedure of NMI Mask Lock

- Lock feature

1. Write the lock code to NMI lock code register
   ex) Write32 (INTC-EX_BASE + H'0A04), H'00A CCE55
2. Write the lock code to NMI mask lock set register
   ex) Write32 (INTC-EX_BASE + H'0A00), H'00AC CE55
3. Write access to NMI lock code register and NMI mask lock set register
   — Check whether these registers cannot be updated

- Unlock feature

1. Set enable bit to NMI debug control register
   ex) Write32 (INTC-EX_BASE + H'0A08), H'0000 0001
2. Write unlock code to NMI debug code register
   ex) Write32 (INTC-EX_BASE + H'0A0C), H'558C CAFF
3. Write access to NMI lock code register and NMI mask lock register
   — Check whether these registers can be updated

15.4.5 Instructions for using INTC-AP

For reducing power consumption, software reset for INTC-AP is asserted and module stop for INTC-AP is enabled at after reset released.
Before wake-up AP System Cores, we must negate software reset for INTC-AP and disable module stop for INTC-AP.

This is the procedure of negating software reset and disabling module stop.
For details on these registers, refer to section 8.2 Register Description, in section 8, "Clock Pulse Generator (CPG)" and section 9.2 Register Description, in section 9, "Module Standby, Software Reset".

1. Negate software reset for INTC-AP.

(1) Write H'7FFF_FFFF to the CPG write protect register (CPGWPR).

(2) Write H'8000_0000 to the Software Reset Clearing Register 5 (SRSTCLR5).

(3) Write H'FFF7_FFFF to the CPG write protect register (CPGWPR).

(4) Write H'0008_0000 to the Software Reset Clearing Register 11 (SRSTCLR11).

2. Disable module stop for INTC-AP.

(1) Write H'7FFF_FFFF to the CPG write protect register (CPGWPR).

(2) Write H'8000_0000 to the Module Stop Control Register 5 (MSTPCR5).

15.4.6 Restriction of interrupt control in CPU power off

When a CPU core power off like as changing low power mode, all the interrupts for the CPU core target of power off must be deasserted.
This restriction is also described in Arm GIC-600 (r1p6) Generic Interrupt Controller Technical Reference Manual, chapter 3.6.2 “Processor core power management”.

15.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

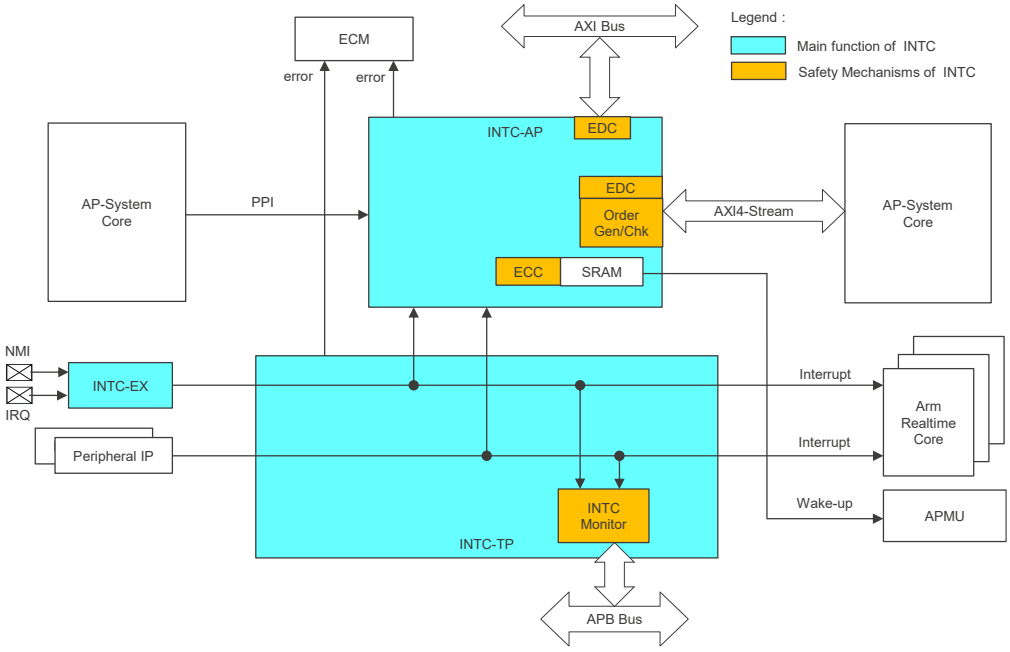

Figure 15.2 Block diagram of Safety Mechanisms

15.5.1 Block diagram for functional safety

Peripheral's interrupt is implemented by interrupt monitoring

EDC protection for AXI, AXI4-stream and APB BUS channel

15.5.2 Safety Mechanism

- Interrupt monitoring
- EDC protection in BUS channel

15.5.3 Interrupt monitoring (INTC Monitor)

Interrupt monitoring (INTC Monitor) is the following two types of check functions for interrupt signal.

— Assert period check (from assert to de-assert):
This mechanism detects an error if an interrupt signal is not cleared by the interrupt handler within a specified time period. Assert period check is effective only for level-sensitive interrupt.

— De-assert period check (from de-assert to assert):
This mechanism detects an error if an interrupt signal is not asserted by the module within the specified time period.

When de-assert period check is activated for the interrupt, assert period check is also activated.

When disabling interrupts in INTC-AP and/or the Realtime core, ensure that the corresponding interrupt signals are de-asserted by configuring the appropriate registers in each peripheral and/or INTC-EX.

16. Multifunctional Interface (MFIS)

16.1 Overview

The multifunctional interface (MFIS) provides an interface between the AP System Core domain and the Realtime Core domain. The MFIS supports the issuing of interrupts for the AP System Core domain and the Realtime Core domain by each core.

16.1.1 Features

- By writing to specific bits of the internal registers of the MFIS from the AP System Core domain, interrupts can be sent to the Realtime Core domain. Similarly, interrupts can also be sent from the Realtime Core domain to another core domain.
- Different software-controlled interrupts are provided to each CPU and enabling high-speed data transfer using interrupts.
- The resource shared with each CPU cores can be realized by use of the lock register.
- Access Protection of Security supported
- PRR Product Register inside (individual address)

Indices

Index	Description
i	Throughout this section, the individual number of AP System cores are identified by the index “i”. And “i” means the number for sender/receiver communication between AP system Core and Realtime core.
k	Throughout this section, the individual number of Realtime cores are identified by the index “k”. And “k” means the number for sender/receiver of communication between AP system Core and Realtime core.
m	Throughout this section, “m” means the number for sender of communication between Realtime cores.
n	Throughout this section, “n” means the number for receiver of communication between Realtime cores.
j	Throughout this section, “j” means the number of MFIS lock register.

16.1.2 Block Diagram

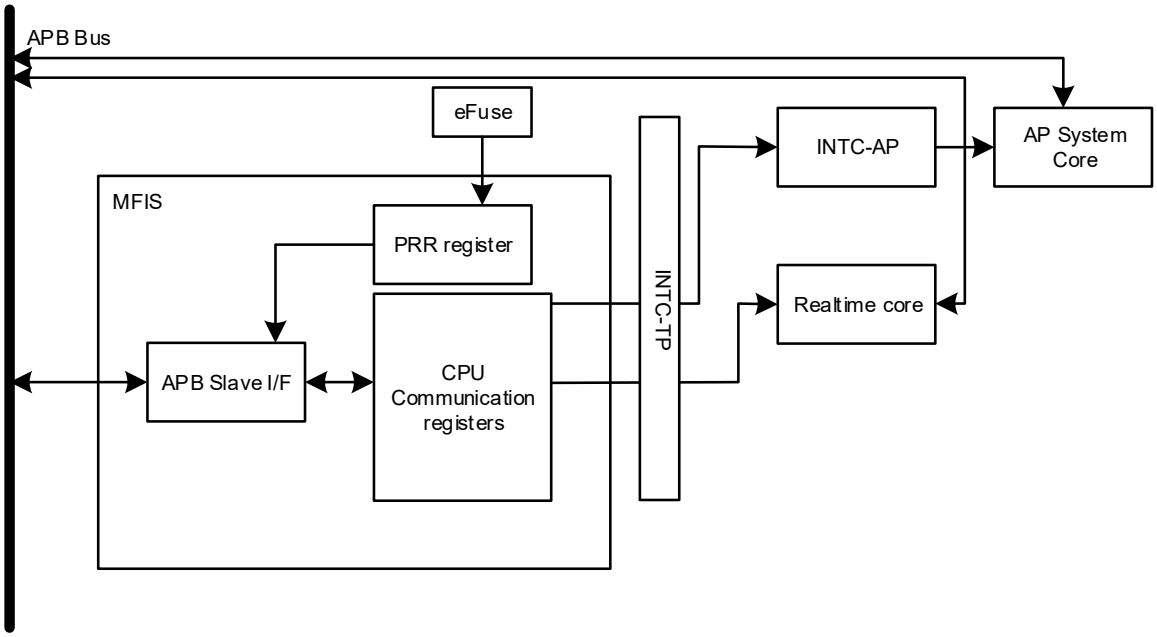

Figure 16.1 MFIS Block Diagram

16.1.3 External Pins

There are no external pins in this module.

16.1.4 Connected Module

Table 16.1 shows the connected modules to MFIS. As for the feature of the connected modules, refer to the chapter of each module.

Table 16.1 Connected Modules

Module Name	Connected Module Name	Connected Module Function
MFIS	AP System Core	AP System Core
	Realtime Core	Realtime Core
	AXI-BUS	APB-Bus
	CPG	Clock Supply
	RST	Module Reset
	INTC	Interrupt handling

16.1.5 Register configuration

Refer to R-CarV4M_UM_016_MFIS_r1p10.xlsx

16.2 Register description

Refer to R-CarV4M_UM_016_MFIS_r1p10.xlsx

16.3 Operation

16.3.1 Mutex Control

To implement exclusive access to resources shared among the AP System Core, Realtime Core, MFIS lock registers (MFISLCKRj [j=0-63]) can be used to apply mutex control. An example of the procedure for mutex control for the two CPUs by using the lock registers is given below.

1. For example, if the CPU0 is to use resource A, the CPU reads MFISLCKR0 (here we assume that MFISLCKR0 is used for resource A).
2. The CPU0 reads the LCK bit in MFISLCKR0 to confirm that its current value is 0. This causes setting of the LCK bit in MFISLCKR0 to 1.
3. The CPU0 proceeds to use resource A. As long as resource A is in use by the CPU0, the CPU1 reads MFISLCKR0 before attempting to start using resource A. The value 1 read from the LCK bit (indicating that resource A is in use) indicates that resource A is not available to the CPU1.
4. When the CPU0 is finished with resource A, it sets the LCK bit in MFISLCKR0 to 0 (indicating that resource A is not currently in use).

16.4 Usage Notes

No description on this section.

16.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

16.5.1 Hardware Redundancy for MFIS

(1) Overview

Hardware redundancy is applied to the MFIS in order to detect fault of functional logic.

(2) Hardware Description

Figure 16.2 shows a block diagram of MFIS protection for functional safety. Not only the body of MFIS logic but also the control registers are checked by lock-step operation. When an error related to the functional safety is detected, this error is reported through the external system.

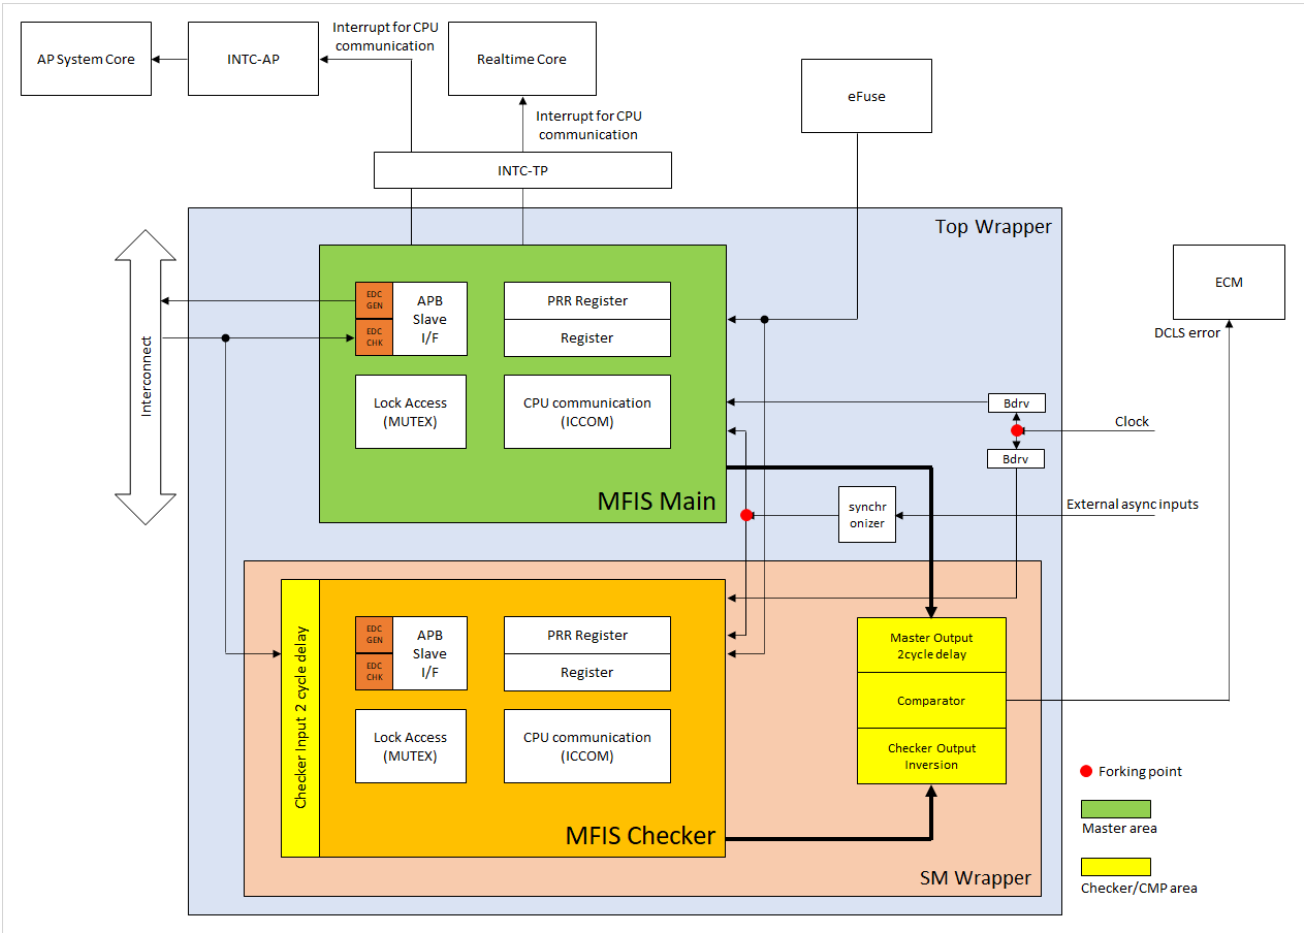

Figure 16.2 Block diagram of MFIS protection for Functional Safety

16.5.2 Region ID Protection for MFIS

(1) Overview

A Region ID Protection (RGID) provides “Freedom From Interfere (FFI)”.
This safety mechanism checks a consistency of master and slave. A Region ID protection is a function of safety mechanism that prevents unexpected access.
For details, refer to section 18, AXI-Bus.

(2) Hardware Description

MFIS is provided Region ID Protection each 4KB block can set its own Region ID.
To apply Region ID Protection, refer to section 18.5.9, Region ID protection, in section 18, AXI-Bus.
Table 16.2 shows register assignment for each Region ID block in MFIS and related register in AXI-Bus.

Before access to registers in MFIS, apply Region ID Protection set as below.

1. Set Region ID Protection setting for each MFIS region by RGIDR_MODID register.
   RGIDR_MODID[15:0] bits can set protection access from the master set Region 15 to 0.
   Ex: To set read permission only a master Region ID = 1 to Address area of “MFIS - Region 1”,
   write 32’h0000 0002 to RGIDR_MODID[RGIDR_MFI01] register.
2. Set Region ID for each master by RGIDM_MODID register.
   RGIDM_MODID[3:0] bits can set Region ID of the master.
   Ex: To set Realtime core [k] Region ID = 1, write 32’h0000 0001 to RGIDM_MODID[RGIDM_CR52SS[k]] register.

Table 16.2 Register assignment for each Region ID block

Category	Target Register	Register Address	Function	Comment in Address Map	Related Register in AXI-Bus

17. Error Control Module (ECM)

17.1 Overview

The ECM is to collect all hardware errors and notify to the system and decide the reaction of the specified error.

17.1.1 Features

Error Control Module (ECM) has the following feature

- Collect all hardware errors and notify to the system
- Decide the reaction of the specified error.
  - Assert interrupt internal or external
  - RAM error count is implemented
- External error control logic is implemented
  - Control error assert/negate timing
  - Initial condition of external error signal is active
- Support generating error interrupt by software
- Dynamic error notification mode supported
- 4x additional error notification signal supported
- APB bus is implemented for register access
- 43x Error Control Registers are implemented in ECM.
- Up to 2048 error can be handled.

17.1.2 Block Diagram

Figure 17.1 shows a block diagram of the ECM.

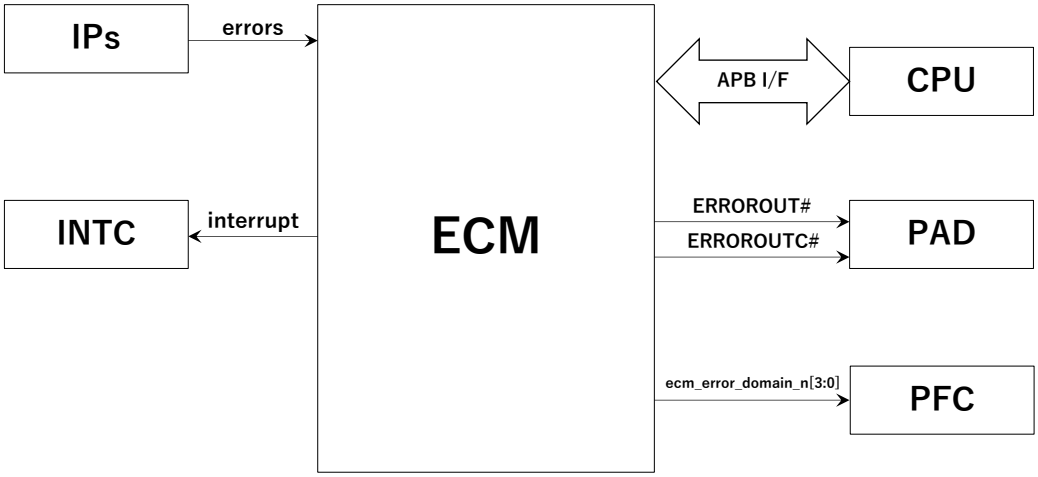

Figure 17.1 ECM Block Diagram

17.1.3 External Pins

Table 17.1 shows the pin configuration of ECM.

Table 17.1 Pin Configuration

Name	Function	I/O	Description
ERROROUT#	ERROR OUT pin	output	Error notification for external system.
ERROROUTC#	ERROR OUT control	output	Error notification for external system, PFC.

17.1.4 Connected Module

Table 17.2 shows the connected modules to ECM. As for the feature of the connected modules, refer to the chapter of each module.

Table 17.2 Connected Modules

Module Name	Connected Module Name	Connected Module Function
ECM	IPs	Error collection from IPs
	AXI-BUS	APB-Bus
	CPG	Clock Supply
	RST	Module Reset
	PFC	Pin Function
	INTC	Interrupt handling

17.1.5 Register configuration

17.2 Register description

Note: Don't access (write) the registers described as “reserved” in register description.

(Refer to R-CarV4M_UM_017_ECM_r0p81.xlsx)

This attachment file shows bit assignment of ECMERRxxxR[n].

(Refer to 017_R-CarV4M_ECM_Map_table_V4M_for_D_r1p00.xlsx)

Note:
In R-Car V4M, there is some errors that is “Initial Value” column is “1” but “ECMERRxxxRn meanings of this error [R-Car V4M]” is Reserved. Therse errors are removed from R-Car V4H but keeping the initial value of ECMERRCTLR[n]=1 in R-Car V4M.
So these errors aren’t asserted in R-Car V4M and it’s no problem to change the ECMERRCTLR[n]=0.

17.3 Operation

No description on this section.

17.4 Usage Notes

No description on this section.

17.5 Safety Mechanisms

17.5.1 Error Management System

(1) Overview

The ECM module supports error management in order to notify either the system interrupt controller (INTC) or the external systems of hardware errors, such as RAM ECC errors.

(2) Hardware Description

(a) Error Checking function

The enable bit of ECMERRCTLR is set, the corresponding error can be reported to ECM and the status of the corresponding error is set in ECMERRSTSR. The reporting target which is notified of the error status can be selected from the INTC and the external pin by the corresponding bit of ECMERRTGTR.
Figure 17.2 shows the block diagram of error checking function.

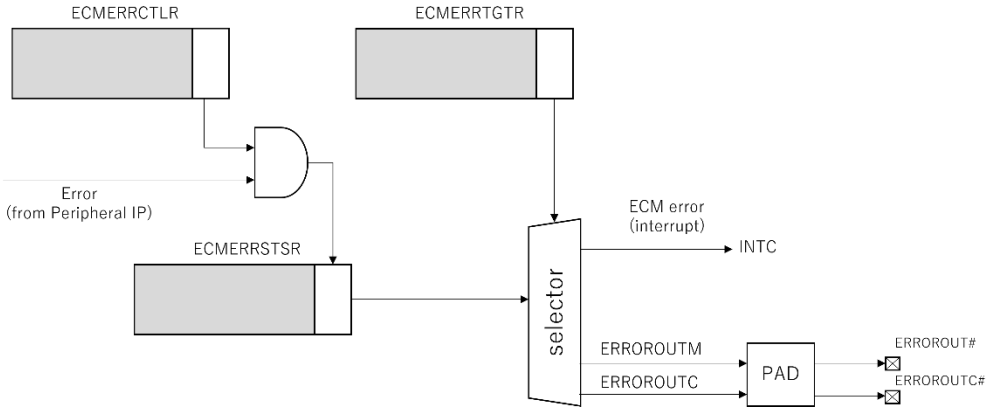

Figure 17.2 ECM Block Diagram of Error Checking function

1. Set 1'b0 to a corresponding error bit in ECMERRTGTR[n] register.
   When this bit is set 1'b1, error detection target is set to INTC.

2. Set 1'b1 to a corresponding error bit in ECMERRCTLR[n] register to be enable error detection.
   Not to set this bit before setting for ECMERRTGTR[n] register isn't completed.

(b) Pseudo Error Insertion

For the sake of software development of error notification to the external systems, the ECM module is equipped with the pseudo error generation logic. If you want to generate a hardware error and notify either the system interrupt controller (INTC) or the external pin of the error by using this function, you have to set both the safety error insertion control register (SAFCTLR) and safety set error insertion enable register (SAFSTERRENR).

Before generating pseudo error notification, the following procedure is required. At first, set "1" to SAFCTLR.DBGEN and select the target error registers by setting SAFCTLR.REGSEL [5:0]. After setting "1" to the target bit of SAFSTERRENR, the corresponding error is generated. If the corresponding bit of SAFCLERRENR is set to "1", then clear the status of this error notification. By checking the value of the corresponding bit of "SAFSTSR", it can be checked whether error notification is generated.

(c) Write Protection

In order not to update the functional registers by mistake, the write access protection function need to introduce.

If the target address is the same as the value of the target address field, then update target register and clear the internal access flag. If not, internal access flag is only cleared. Once the write access fail, the target address needs to be set in ECMWACNTR register again. When “WPD” bit in ECMWPCNTR register is set, the write access can be done without any permission.

Figure 17.3 shows the general flow of the write access of the target registers.

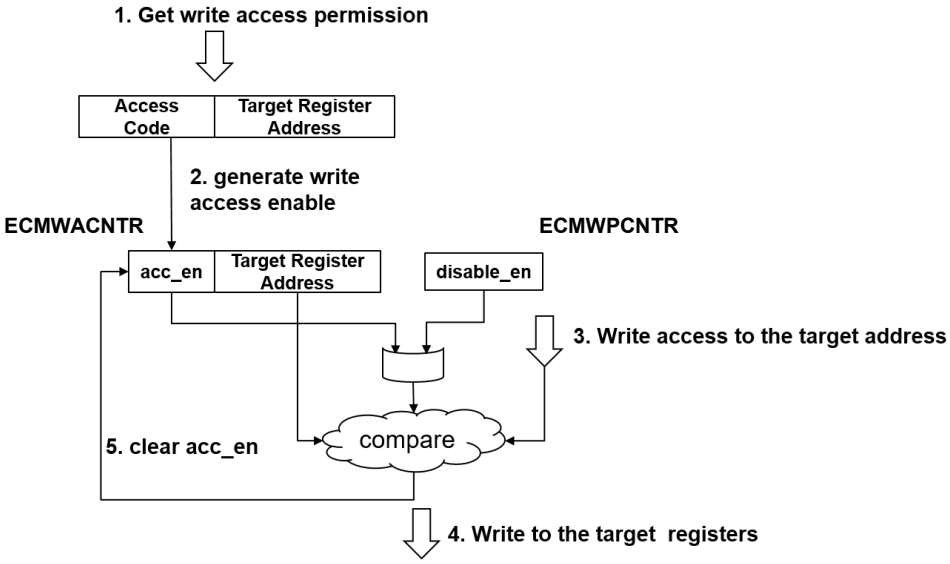

Figure 17.3 Data flow of write access of the target registers

(d) Error Count function

In case that the internal RAM is protected by ECC, the number of the 1-bit or multi-bit errors can be count-up. When the number of the errors exceed the maximum number of errors, then ECM issues the interrupt related to this error. The maximum number of errors can be controlled by software.

Below is detailed information about the error count function.

- When the bit for ECMERRCTLR[n] corresponding to an ECM error is set to 1, enabling ECM error detection, the error count for ECMERRCNTR[m], which is subject to the ECM error, becomes active.

- When an ECC 1-bit Error is detected in the RAM of the module subject to the ECM error, CECN_1bit is incremented. Clearing the cause of the error at the source will result in an increment upon the next error occurrence. (※1)

- An error notification is sent to ECM when the count value reaches the same as the MECN_1bit setting value.

- When an ECC multi-bit Error is detected, CECN_mbit is incremented. Clearing the cause of the error at the source will result in an increment upon the next error occurrence. (※1)

- An error notification is sent to ECM when the count value reaches the same as the MECN_mbit setting value.

- For ECM errors, errors are separated into ECC 1-bit Error and ECC multi-bit Error, with each error assigned its respective counter.

- For ECM errors where ECC 1-bit Error and ECC multi-bit Error are not separated, it indicates that an error notification is sent when the error count reaches MECN_1bit (1-bit Error) or MECN_mbit (multi-bit Error).

- The behavior regarding the ECM error counter is the same regardless of the ECM error.

About the list of the target modules which is controlled by each ECM Error Count Registers, refer to "V4MECMERRCNTR_UM" sheet in the attachment file, "017_R-CarV4M_ECM_Map_table_V4M_for_D_r1p00.xlsx".

※1: To continuously count the error counter, the operation flow of error occurrence,
count-up → error cause clearing → error occurrence count-up
is required.
Errors occurring before the clearing of the error cause cannot be detected, hence there are limitations such as not observing cases of frequent occurrences in a short time.

[Additional Notes on Error Counter]

- When the combination of MECN_1bit and CECN_1bit as well as MECN_mbit and CECN_mbit reach the same value, the count value is reset to 0x1.

- These counters are cleared to 0 and the counting operation continues when a 1 is written to the corresponding bit in ECMERRSTSR[n] to clear the error.

- After the counter value reaches the 5-bit length full b'11111', the counting operation returns to 0x1, and counting does not continue after reaching full.

(e) Port Safe State Function

To keep safe operating state (Port Safe State) in case of failure, and then stop it, Port Safe State operate to receive fault information from ECM and make Pin for each domain.

In details, refer to section 7.3.9, Port Safe State Function, in section 7, Pin Function (PFC/GPIO).

(f) Control External Error Request

To ensure that external system controller receive this error request, need to be controlled the assert/de-assert timing of the external error request.

Once the external error signal is asserted, then kick the internal timer of the external request holding. When the enable bit of the ECMEXTRQHLDCNTR register is set, the external error signal cannot be de-asserted until the internal timer is overflowed.

On the other hand, once the external error signal is de-asserted, then kick the internal timer of the external request masking. When the enable bit of the ECMEXTRQMSKCNTR register is set, the external error signal cannot be asserted until the internal timer is overflowed. Figure 17.4 shows the block diagram of the external error request control feature.

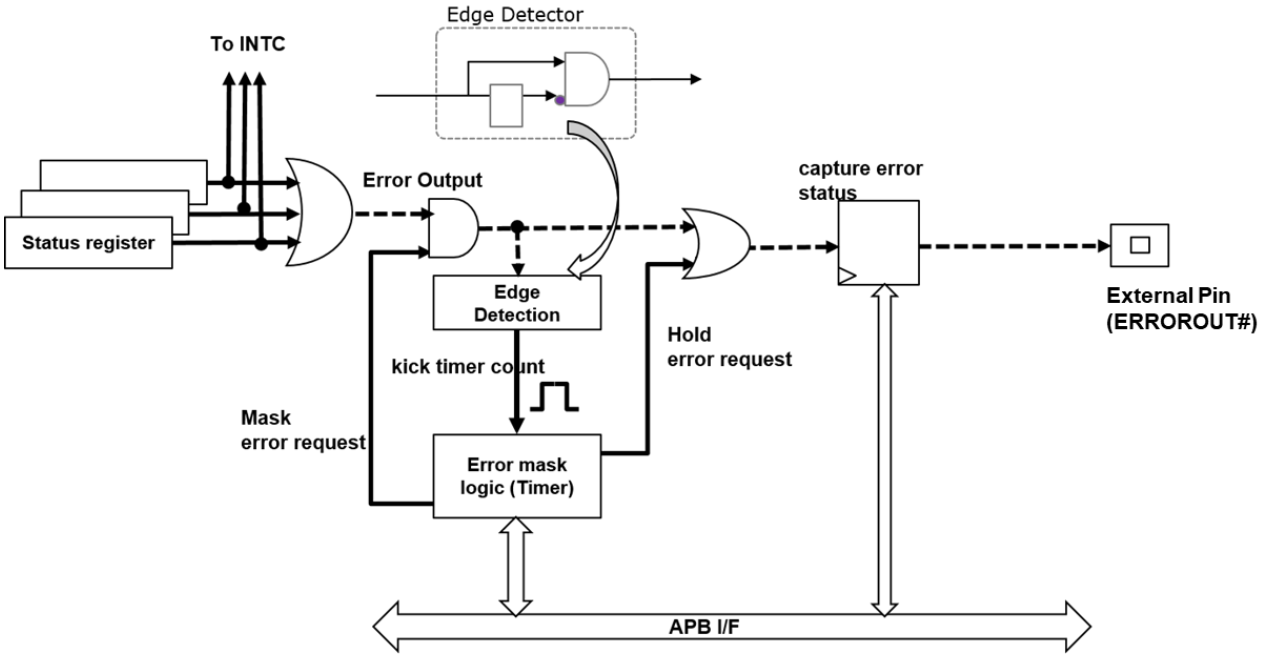

Figure 17.4 Block Diagram of the external error request control

18. AXI-Bus

18.1 Overview

AXI-bus is the On-Chip interconnect bus based on the AMBA® Advanced extensible Interface (AXI) Protocol Specification. AXI-bus has the hierarchical structure and there are the following domains.

- Peripheral domain AXI
- HSC (High speed Communication) domain AXI
- RT (Real Time) domain AXI
- VIO (Video IO) domain AXI
- VC (Video Codec) domain AXI
- VIP (Vision IP Processor) domain AXI
- CPU domain AXI
- GSX (Graphics) domain AXI
- IMP domain AXI
- Main Memory domain AXI
- Slave Access Bus

Features

- Bus protocol: AXI3 with QoS Control
- Source clock: S0D2_{domain}φ, S0D3_{domain}φ, SVD1_{domain}φ, VIOBUSD1φ, VCBUSD1φ, MSOφ, SASYNCPERD2φ, SASYNCRTφ, CL16Mφ
- Bus width: 32bits/64bits/128bits/256bits/512bits
- Quality-of-Service (QoS)
- Provide flexible SDRAM address mapping. Linear mapping allocates a continuous address space to every single memory controller. Split mapping provides an interleaved address space to four memory controller at 4KB granularity.
- Decompression of lossless compressed image
- Virtualization and Security Support
  - Access protection based on Region ID setting for FFI (Freedom From Interference).
  - Access protection based on secure attribute.
  - Provide Bus Domain Protection.
- Low Power function with dynamic module stop function

18.1.1 Block diagram

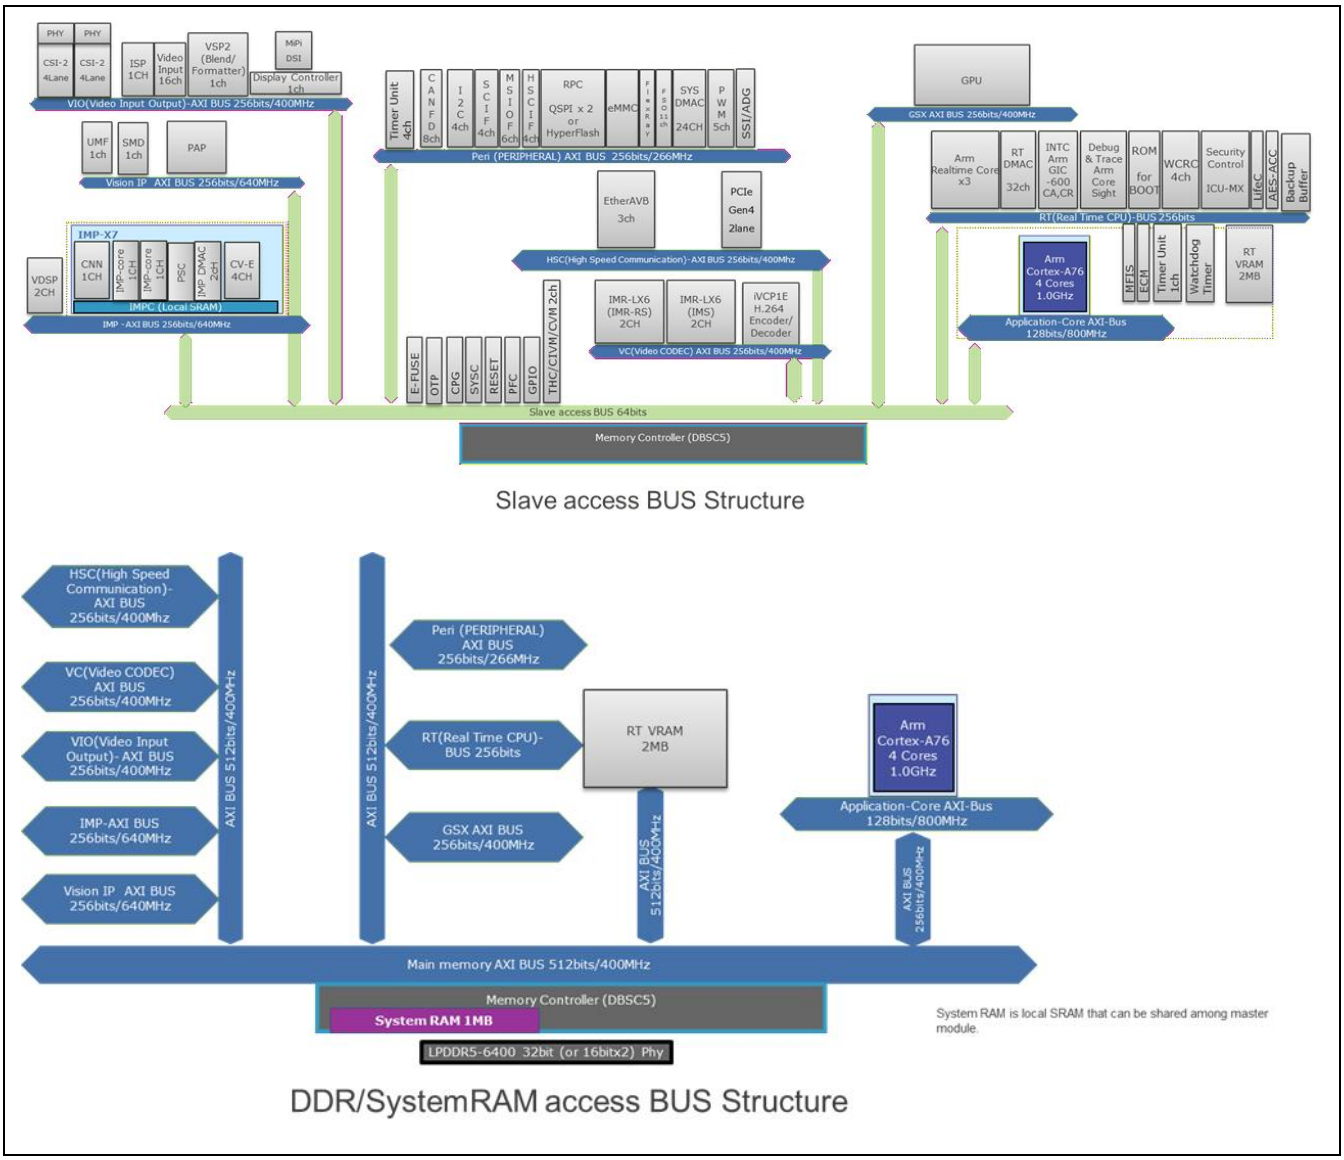

Figure 18.1 Block diagram of AXI-Bus

18.1.2 Register configuration

Please refer to R-CarV4M_UM_018_AXI-bus_r1p10.xlsx.

18.2 Register description

Please refer to R-CarV4M_UM_018_AXI-bus_r1p10.xlsx.

18.3 Operation

18.3.1 DRAM Split/Linear Address mapping

Section 18.3.1 is reserved on R-CarV4M.

18.3.2 QoS arbitration

AXI-bus has the QoS arbitration to guarantee latency and bandwidth. A concept of the time shared control which is being called time division slot allocation is introduced. The arbitration can be controlled by assigning bandwidth of each IP to time slot.

18.3.3 Memory Protection

Main Memory domain AXI-bus has memory protected area function. This function for DRAM as shown in Figure 18.2 is that DRAM area can be divided into 64 areas respectively and each area can be set access privilege to 2 secure groups. This function for System RAM as shown in Figure 18.3 is that System RAM area can be divided into 16 areas respectively and each area can be set access privilege to 2 secure groups.

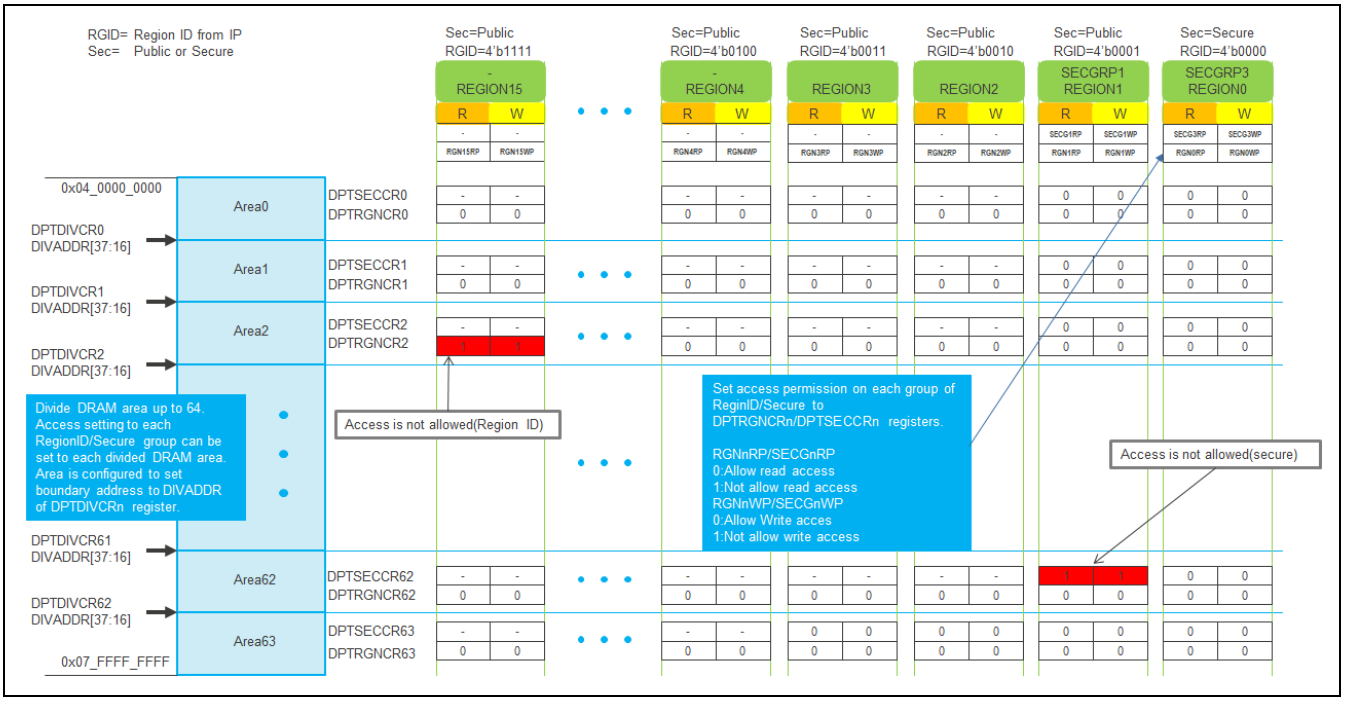

Figure 18.2 DDR Memory Protected Area Function Concept

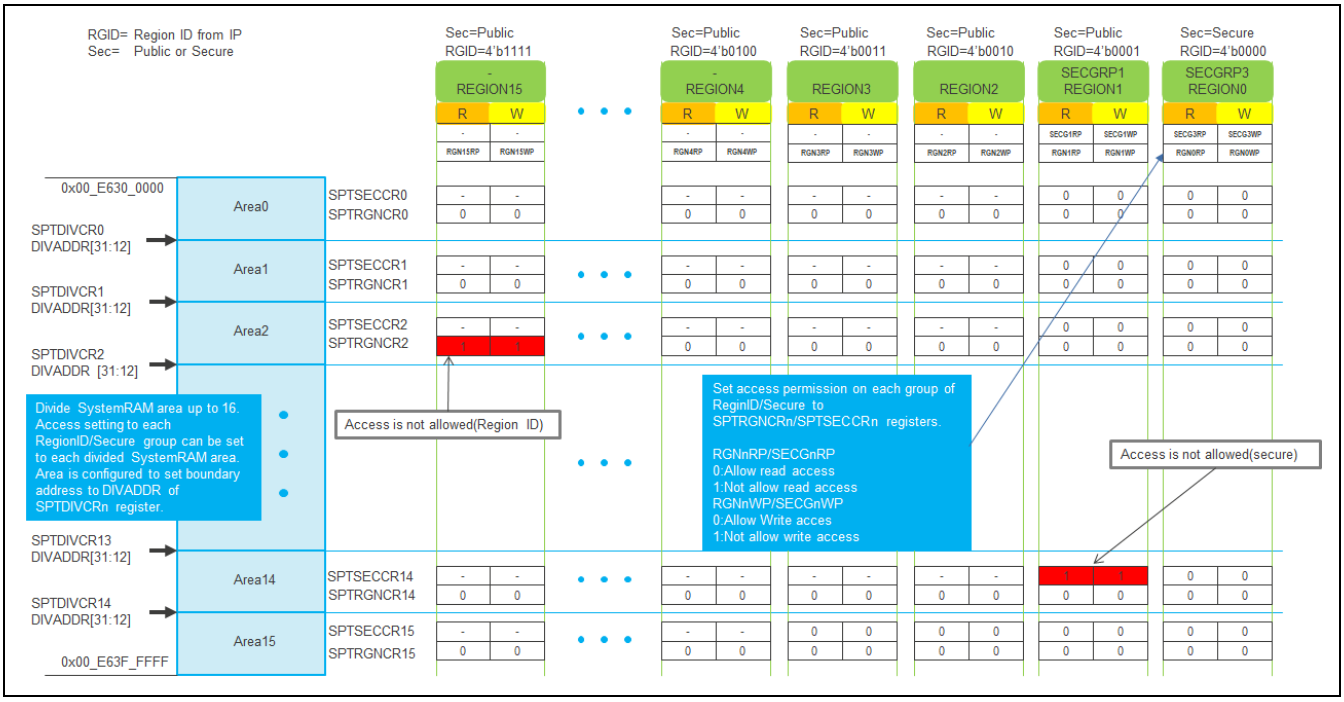

Figure 18.3 System RAM Memory Protected Area Function Concept

18.4 Usage Notes

18.4.1 Access Protection for Secure/Safety Region

A Region ID Protection (RGID) provides “Freedom From Interfere (FFI)”.
By using RGID, a user can specify flexible access protection up to 16 region in a system.
For register setting flow, please refer section 18.5.9(3).

18.4.2 Bus Domain Protection

A Bus Domain Protection (BDP) provides register or bit unit access protection corporate with slave module.
Combination with RGID, a user can specify access policy of each bit level. As example, a master A can access to bit 15 of slave A register while a master B cannot access to bit 15 of it.

18.4.3 QoS System

AXI-bus has the QoS arbitration to guarantee latency and bandwidth. A concept of the time shared control which is being called time division slot allocation is introduced. The arbitration can be controlled by assigning bandwidth of each IP to time slot.

18.4.4 Limitation for access to FCPRC

When you use data compression by FCPRC, AXI_FCPRC register shall be set to 1 before all masters start to access to System RAM and DRAM.

18.4.5 Source ID

AXI-bus has Source ID (SRC_ID) to identify master of the bus transaction.
SRC_ID has 256 IDs and they are linked each master interface.
Please refer Table 18-1 in section 18.5.9(2) for SRC_ID list.

18.5 Safety Mechanism for AXI-bus

There are safety mechanisms inside AXI-Bus system.

- AXI-bus ECM (Error Collection Module)
- Destination ID Checker
- Illegal Response Detection.
- Protocol Check
- Register Slice Order check
- Redundant Integration for protocol conversion
- Bus Protocol EDC
- Default slave and dummy slave error notification
- Region ID protection
- Bus Domain Protection
- EDC protection for QoS SRAM

This section describes each of safety mechanism and register description.

Notice: All AXI-Bus safety mechanism is always enable.

Overview of Safety Mechanism of AXI-bus

Please refer to 018_R-CarV4M_AXI-bus_overview_structure_of_SM_r0p30.pdf.

18.5.1 AXI-bus ECM (Error Collection Module)

(1) Overview

The AXI-bus ECM module manages all AXI-bus error on each domain of this SoC.
This module collects all AXI-bus errors and reflects them to status register. One error signal notification is connected to ECM module or INTC module. ICISTP errors and SEC errors are connected to INTC module. Other errors are connected to ECM module. This manages interrupt enable/disable for all AXI-bus errors (routing error/illegal response/timeout counter/protocol check/dummy slave/order check/Burst ID check/Redundant integration/Region ID protection). This also manages error injection function for all AXI-bus safety mechanisms.

(2) Error Notification from AXI-bus ECM to ECM

There is one error signal connection from AXI-bus ECM to ECM.

AXI-Bus ECM Domain	Corresponding ECM Error Status Register
TOP0 (Slave Access Bus)	Bit 6 of ECMERRSTSR7
TOP1 (Slave Access Bus)	Bit 23 of ECMERRSTSR39

TOP2 (Slave Access Bus)	Bit 19 of ECMERRSTSR39
TOP3 (Slave Access Bus)	Bit 24 of ECMERRSTSR39
RT0	Bit 7 of ECMERRSTSR7
RT1	Bit 17 of ECMERRSTSR39
RT2	Bit 16 of ECMERRSTSR39
RT3	Bit 18 of ECMERRSTSR39
PER00	Bit 9 of ECMERRSTSR7
PER01	Bit 20 of ECMERRSTSR39
PER02	Bit 21 of ECMERRSTSR39
PER03	Bit 22 of ECMERRSTSR39
HSC	Bit 8 of ECMERRSTSR7
IMP	Bit 11 of ECMERRSTSR7
VIO0	Bit 27 of ECMERRSTSR39
VIO1	Bit 3 of ECMERRSTSR7
VIO2	Bit 28 of ECMERRSTSR39
VC0	Bit 4 of ECMERRSTSR7
VIP0	Bit 2 of ECMERRSTSR7
3DG (GSX domain AXI)	Bit 5 of ECMERRSTSR7
MM	Bit 10 of ECMERRSTSR7

There is one error signal connection from AXI-bus ECM to INTC.

About assignment, please refer attached “R-Car V4M series User's Manual [015_R-CarV4M_INTC_Interrupts_Mapping_r1p00.xlsx]“ as interrupt table.

AXI-Bus ECM Domain	Corresponding INT ID in SPI_Assignment sheet.
TOP0	0x026F
TOP1	0x0280
TOP2	0x0277
TOP3	0x0278
PER00	0x026C
PER01	0x027D

PER02	0x027E
PER03	0x027F
HSC	0x026D
RT0	0x026E
RT1	0x0275
RT2	0x0274
RT3	0x0276
IMP	0x026A
VIO0	0x027B
VIO1	0x0272
VIO2	0x027C
VC0	0x0271
VIP0	0x0273
3DG (GSX domain AXI)	0x0270
MM	0x026B

(3) Operation

For bit assignment of AXI-bus ECM, please refer 018_AXI-Bus_ECM_assignment_r1p10.xlsx.

1. Status (ST) register

When error occurs, corresponding bit is asserted. Reserved bit doesn't guarantee read value of status register. When corresponding bit of INTEN register is set 1, error notification is informed from AXI-bus ECM to ECM or INTC. To clear the status, please write 1 to corresponding bit.

2. Interrupt Enable (INTEN) register

When a bit is set 1 and corresponding error occurs, error notification is informed form AXI-bus ECM to ECM or INTC. Reserved bit shall be set 1'b0.

3. DUMMY register

When a bit is set 1, dummy error notification is informed from AXI-bus ECM to ECM or INTC.

18.5.2 Destination ID Checker.

(1) Overview

This safety mechanism checks consistency between destination ID of transaction and ID of slave module. When data is sent to a slave module from the master, the slave module will check whether the ID of the transaction is addressed to itself or not.

(2) Hardware Description

Every AXI master I/F of each bus module, it generates DSTID (Destination ID) that specifies destination of slave I/F of each module. When a transaction reaches slave I/F of each bus module, a routing check function compares DSTID of transaction and that of defined value of each slave. If it is not matched, it is recognized as routing error.

For APB slave I/F, two stage routing check is applied. First stage of routing check is completed before AXI to APB conversion logic. Then DSTID is re-generated at the entrance of APB I/F (different logic of APB decode logic), then it is transferred with transaction. When a transaction is reached to APB slave I/F, a routing check function checks consistency under same manner of AXI slave case.

This also covers a transaction between a master and slave that cannot be covered by Region ID protection.

When an AXI-bus ECM module receives an error notification signal from each Destination ID Checker, it issues an error notification to ECM.

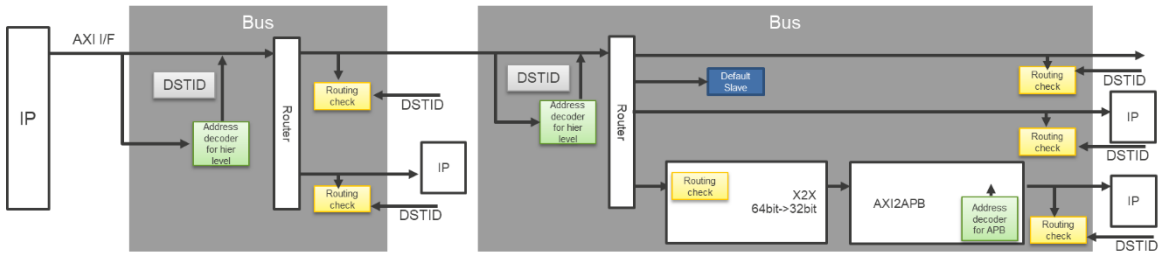

Figure 18.4 Routing Check function

18.5.3 Illegal Response Check

(1) Overview

This safety mechanism uses Outstanding Counter and Transaction ID (TID) table of FIXED ERROR function. The Outstanding Counter can be used for illegal response error as explained in section 18.5.1. The safety mechanism uses illegal response error to detect the fault when response exceeds requests. The Transaction ID table can be used for illegal response of in-order transaction.

(2) Hardware Description

There are four types of detection, Request Timeout, Over Outstanding Requests, Wrong Response Detection, and Wrong Order Detection for in-order transaction in the FIXED ERROR function.

The Request Timeout is a function that performs to count cycles of latency from transaction requests to transaction acceptance. When it exceeds certain period, it is recognized as wrong operation of bus-controller.

The Over Outstanding Requests is a function that performs counting number of accepted requests. When it exceeds defined number (supported outstanding requests for each master module), it is recognized as wrong operation of bus-controller.

The Wrong Response Detection is a function that performs checking SRCID of response transaction. A SRCID is a unique value of each master module. When a transaction is accepted, AXI-bus puts this SRCID on transaction. When it reaches slave module, AXI-bus record SRCID value and put it on response packet. When a response transaction is back to master module, this function checks consistency of SRCID value of master module and SRCID value on response transaction. When it is mismatch, it is recognized as wrong operation of bus-controller.

The Wrong Order Detection for in-order transaction is a function that performs transaction order check among in-order requests. When a transaction is accepted, AXI-bus puts unique Transaction ID (TID) on transaction and record them in transaction table (FIFO) with AXI ID (Same AXI ID is recognized as in-order transaction.). This function expects TID order in transaction table among in-order transaction (same AXI ID entry). When a response transaction back to master module, this function checks TID value and AXI ID. When an order of TID is incorrect among same AXI-ID transaction, it is recognized as wrong operation of bus-controller.

When the AXI-bus ECM module receives an error notification signal from each FIXED ERROR function, it issues an error notification to ECM.

FIXED ERROR:

Figure 18.5 shows the structure of Outstanding Counter and Request Timeout Counter function. This function is consisted of several counters.

- Outstanding counter
- Timer

Outstanding Counters watches how many requests are not completed.
Request num increment logic and response num decrement logic are the logic controller for Outstanding Counter.
When a module issues a request to bus module, then request num increment logic increases the value of Outstanding Counter. When a bus module receives a response, then response num decrement logic decreases the value of Outstanding Counter. When an Outstanding Counter is exceeded outstanding setting at bus controller, it is recognized as wrong operation of bus controller “2) request number violation”.

When an Outstanding Counter is less than 0, this function recognizes it to receive illegal response from slave module as “3) response number violation”. For check targets of FIXED ERROR, see Bit description table of FIXST registers.

A timer of request timeout exceeds cycles that is specified by FDT_X*1 setting then this function recognize it as “1) Request timeout error”
*1: X is a target module name listed as shown in Register description (section 18.2).

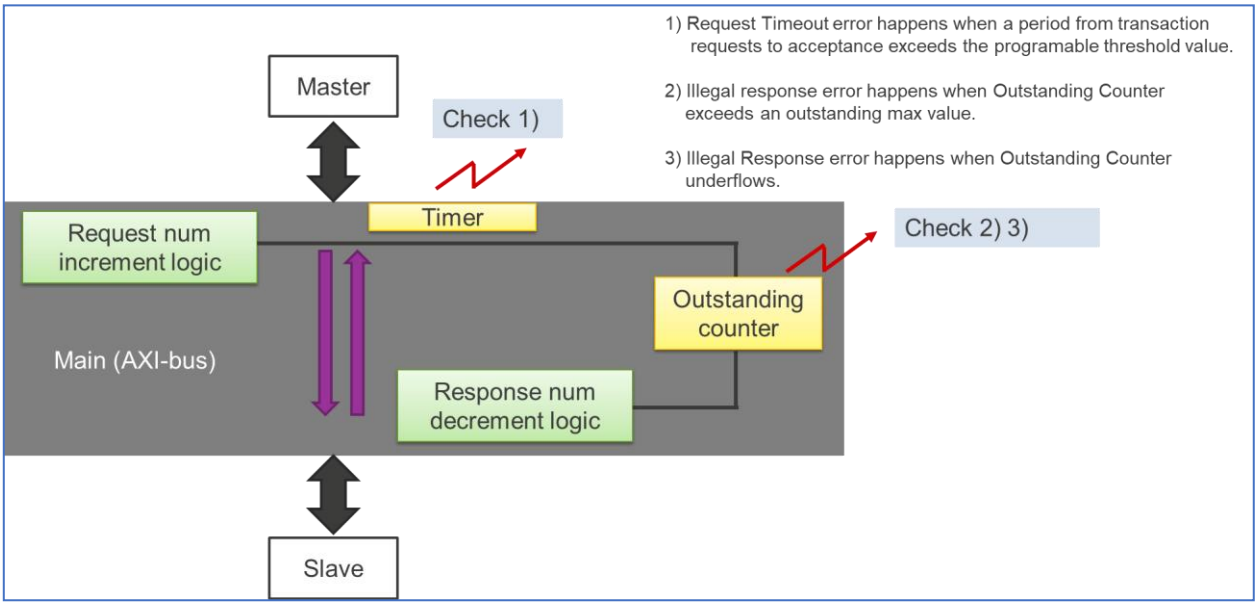

Figure 18.5 Overview of Outstanding Counter function and Request Timeout function.

TID check:

Figure 18.6 shows the structure of TID function.

This function is consisted of Transaction table (FIFO) and timer.

Transaction table records AXI ID, Slave ID (SlvID) and TID. TID is unique transaction ID to recognize order of in-order transaction. An entry of this table is managed by FIFO algorithm. Entry number 0 is always the oldest transaction. A timeout counter of this function only counts cycles from a transaction becomes the oldest. When the oldest transaction is updated, then this counter is initialized. When value of this timeout counter exceeds cycles that is specified by FDT_X*1 setting, then this function recognize it as “transaction timeout error”.
*1: X is a target module name listed as shown in Register description (section 18.2).

When in-order transaction back from slave, this function checks whether in-order transaction (same AXI ID) keeps the order based on TID value. When it is not matched, it is recognized as illegal response of in-order transaction.

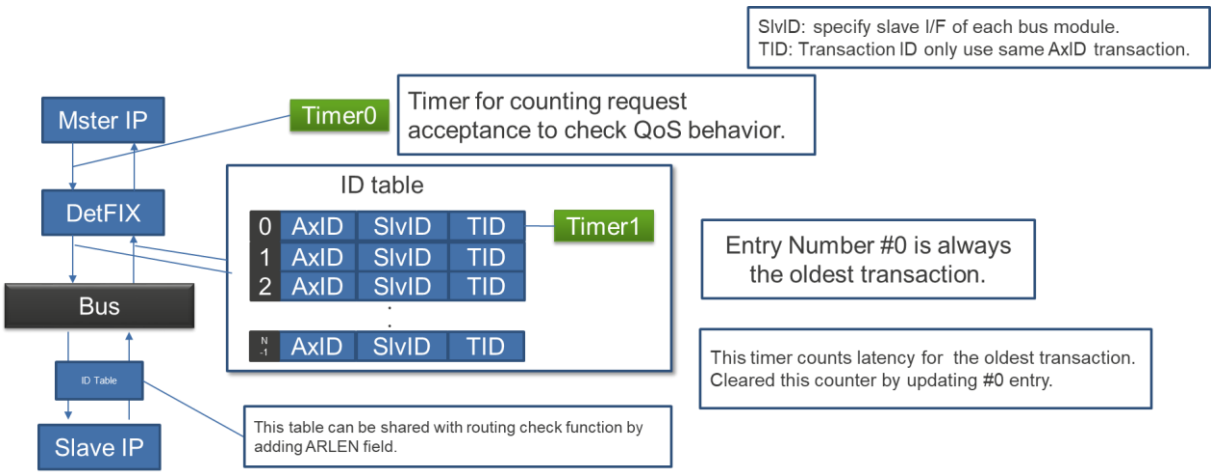

Figure 18.6 FIXED ERROR function

When the AXI-bus ECM module receives an error notification signal from FIXED ERROR function, it issues an error notification to ECM.

18.5.4 Protocol Check

(1) Overview

This safety mechanism uses Wchk/Rchk function and LEN/SIZE check function. The Wchk/Rchk uses data consistency check can be used BurstID function. The safety mechanism detects wrong data transfer. The LEN/SIZE check checks consistency among AR/AW channel and actual R/W behavior. The safety mechanism detects a potential of hang-up transaction at the entrance of bus module.

(2) Hardware Description

The Wchk/Rchk function check the number of R and W channel order in burst transaction. It puts number of burst transaction (BurstID) on transaction in descending order and check them:
The order of Burst ID (Whether they are in descending order)
The value of RLAST/WLAST (RLAST/WLAST=1 only when the BurstID =0)

When the order of BurstID or the timing of RLAST/WLAST is incorrect, then it is recognized as protocol error by malfunction of bus module.

The LEN/SIZE check function checks consistency of LEN/SIZE value which specifies transaction length and bit width of one cycle transaction and actual data transaction (R or W channel) behavior. When a request (AR/AW channel) is

received this function records LEN/SIZE value of transaction, then it checks actual burst length of data channel and transaction size based on LEN/SIZE value. If it is not matched, this safety mechanism recognized it as protocol error.

When the AXI-bus ECM module receives an error notification signal from Protocol Checker, it issues error notification to ECM.

18.5.5 Register Slice Order check

(1) Overview

Register Slice Order check for AXI-bus is a safety mechanism that detects incorrect order of transaction, transaction insertion, repetition, and lost due to wrong operation of buffer management of Register Slice.

(2) Hardware Description

Register Slice Order check function checks the order inside Register Slice. When a transaction is received both master and slave side, it puts the order number in ascending order. When a transaction is output, then it checks the order number whether it is in ascending order. If this is not matched, it is recognized as wrong operation (Insertion/Lost/Repetition/Resequencing/of Register Slice in AXI-bus.

When the AXI-bus ECM receives error notification signal from each Register Slice Order check function, it issues an error notification to ECM.

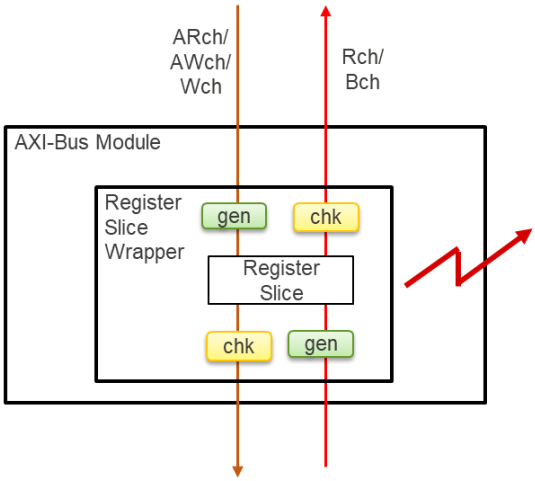

Figure 18.7 Register Slice Order check function for AXI-bus

18.5.6 Redundant Integration

(1) Overview

Hardware redundancy is applied to the following AXI-bus elements in order to detect fault functional logic.

- X2X (bit width conversion)
- X2P (Protocol conversion logic from AXI to APB)
- uTLB
- Main Memory Interconnect
- Node, Trunk Bus module

Hardware redundancy implementation is different in each AXI domain bus.

AXI domain bus	Implementation of redundancy
Peripheral	Redundancy with 2 delay FFs
HSC	Redundancy with 2 delay FFs
RT	Redundancy with 2 delay FFs
VIO	Redundancy without 2 delay FFs
VC	Redundancy without 2 delay FFs
VIP	Redundancy without 2 delay FFs
CPU	Redundancy with 2 delay FFs
GSX	No redundancy
IMP	Redundancy without 2 delay FFs
Main Memory	Redundancy with 2 delay FFs
Slave Access Bus	Redundancy with 2 delay FFs

(2) Hardware Description

Figure 18.8 to Figure 18.9 shows the block diagram of AXI-bus protection for functional safety.

A redundant integration for X2X/X2P/uTLB supports all signals redundancy while main memory interconnects supports transaction signals except for DATA (Read/Write Data). For Read/Write data, EDC code for Read/Write data is redundant. Then by checking consistency of EDC and data at master and checker logic, it can detects wrong operation inside main memory interconnect.

Figure 18.8 shows redundancy with 2 delay FF. Master core has 2 delay FF at output ports and checker core has 2 delay FF at input ports. VIO/VC/VIP/IMP AXI bus domain doesn’t have these 2 delay FF. And, GSX AXI bus domain doesn’t have redundancy protection.

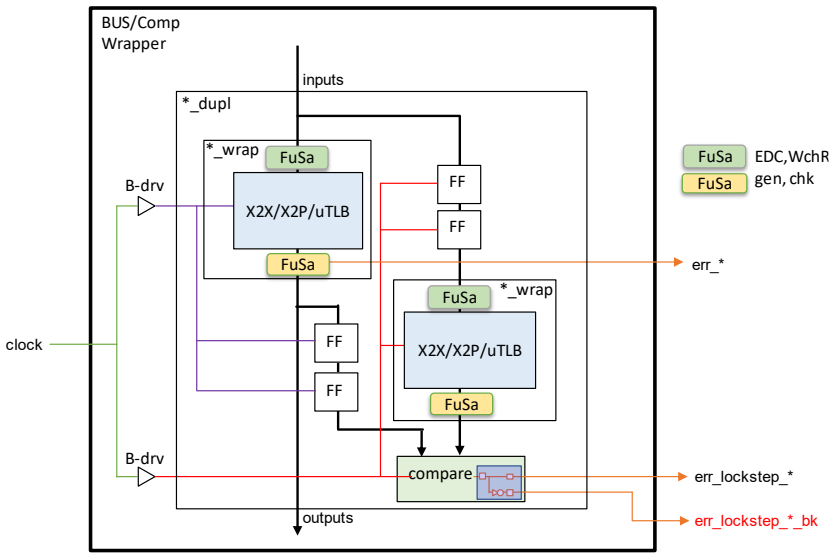

Figure 18.8 A structure of redundant integration of X2X/X2P/uTLB.

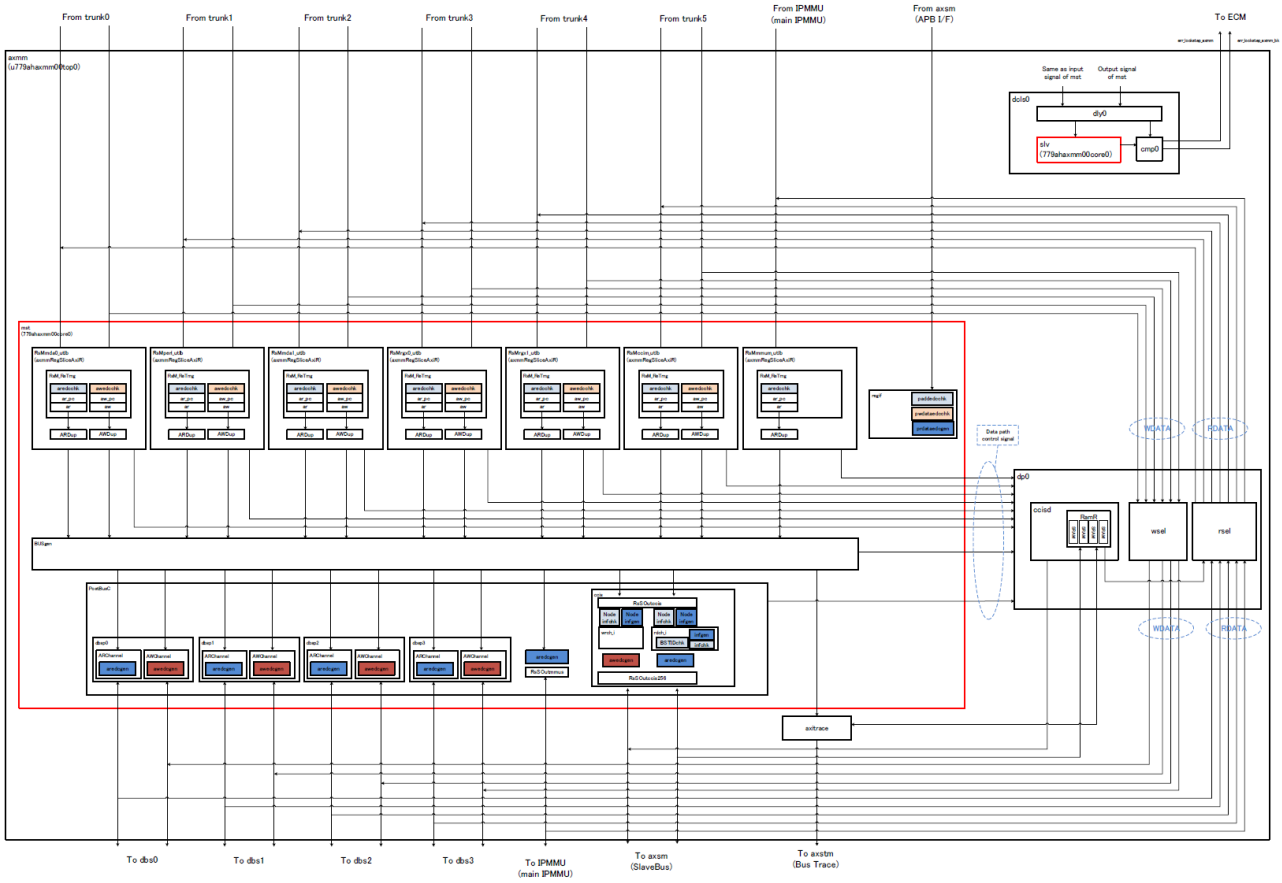

Figure 18.9 A redundant integration of Main Memory Interconnect.

18.5.7 Bus Protocol EDC

(1) Overview

EDC protection is applied to all transactions on AXI-bus in order to detect the wrong data transfer caused by data/command (including address) corruption or wrong operation of bus-controller.

(2) Hardware Description

An error detection code (EDC) is a function for detecting bus transaction errors by comparing check bits. The check bits are a compressed code generated from target bus transaction signals such as address, transaction size, and read/write data. Figure 18.10 shows an image of an EDC generator and EDC checker. The check bits are generated in the EDC generator on a master module side and transferred with the bus transaction signal to a target slave module. When the slave module receives both the bus transaction signal and check bits, the EDC checker compares the received check bits and the check bits generated in the EDC checker. If they do not match, it can be determined that a transaction error has occurred due to corruption of the signal. Error signal from each EDC checker is input to AXI-bus ECM module. AXI-bus ECM module issues an interrupt to ECM when receive error signal from any EDC checker. T

Figure 18.10, Figure 18.11 shows integration path.

Transaction Data in Figure 18.11 represents a set that includes the data, address, and command line.

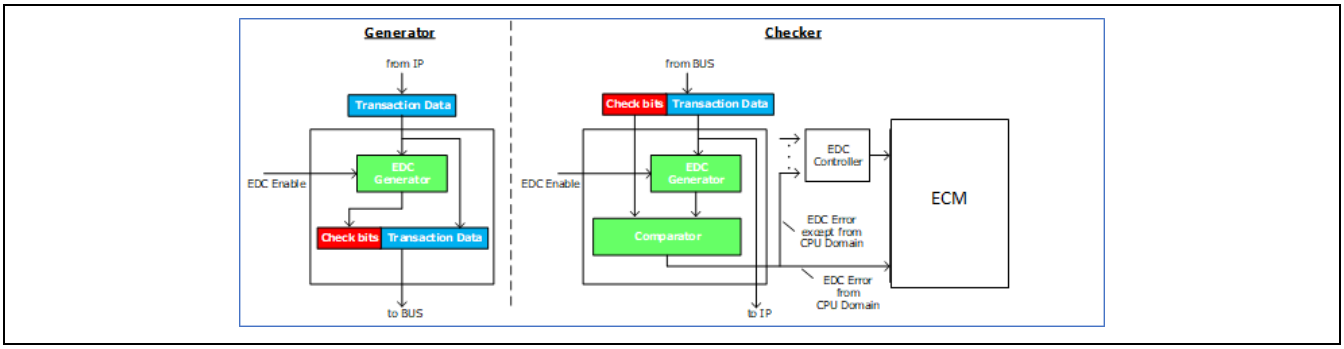

Figure 18.10 A structure of EDC

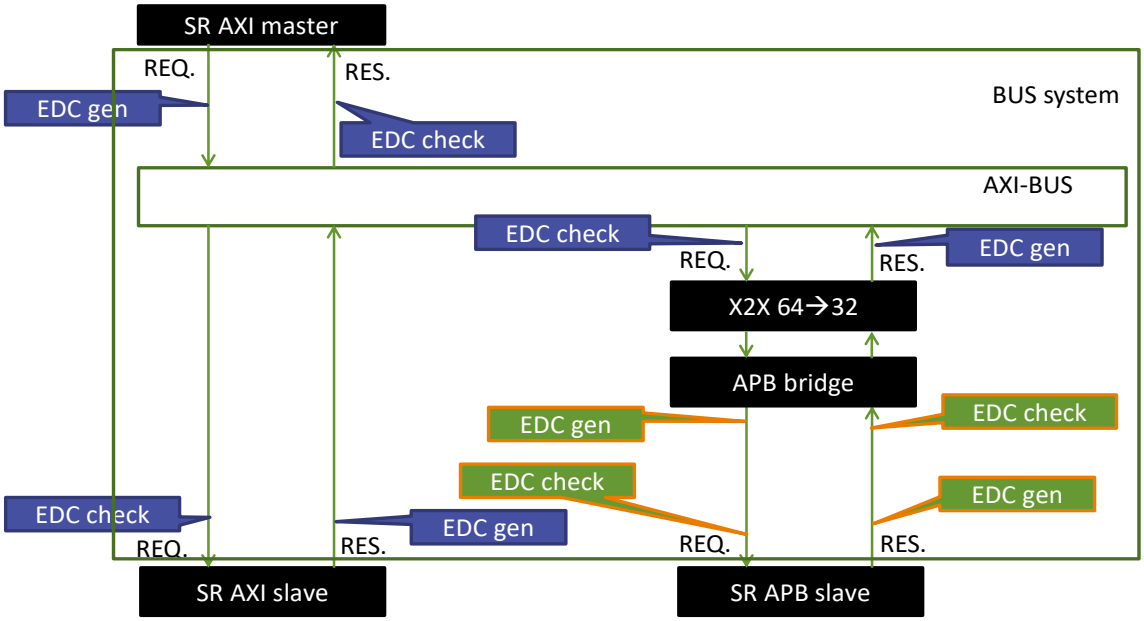

Figure 18.11 A structure of EDC on AXI-Bus

18.5.8 Dummy slave

(1) Overview

A dummy slave is a function in order to avoid AXI bus hang-up when a target slave module is in module standby (clock is suspended) by accepting a transaction and inserting error response to master module instead of slave module. This function also notifies an error to AXI-bus ECM when it inserts error response as safety mechanism for transaction lost and delay.

(2) Hardware Description

A dummy slave is a function that returns error response to master module (origin of AXI transaction) when it detects a transaction arrival during a module standby for target slave is asserted. Error signal from each dummy slave is input to AXI-bus ECM module. An error status is captured in the ICISTPSTX registers in AXI-bus ECM module. AXI-bus ECM module issues an interrupt to INTC when receive error signal from any dummy slave where ICISTPINTENX are set.

18.5.9 Region ID protection

(1) Overview

This safety mechanism checks a consistency of master and slave A Region ID protection is a function of safety mechanism that prevents unexpected access.

(2) Hardware Description

A Region ID (RGID) protection is a function that blocks illegal access from un-expected master to slave module. Figure 18.12 shows a concept of RGID protection. Figure 18.13 shows a structure of RGID protection. The total number of RGID is 16. A value of RGID value is transferred with AXI transaction as USER extension signals. When it is reached to AXI Slave I/F, this function checks RGID value on a transaction and that on acceptable RGID value defined on AXI Slave I/F. A transaction is issued to slave module when it is matched. An error response is issued to master module when it is not matched. Error signal from each RGID protection is input to AXI-bus ECM module. AXI-bus ECM module issues an interrupt to ECM when receive error signal from any RGID protection.

Each of slave I/F, multi RGID values can be set as acceptable RGID for Read and Write channel independently. This provides “Read only”, “Read and Write”, “Access Prohibited” configuration for each RGID value.

Region ID Master Setting Register is a register that set a RGID value for each Master I/F. Region ID Read (Write) Enable Register is a register that set acceptable RGID value for each Slave I/F.

For SYS-DMAC, RT-DMAC, this function also provides independent RGID value for one AXI Master I/F. It output possible RGID value for internal function of those IPs such as “each DMAC channel”. There are internal registers for RGID value setting inside those IPs and each those IPs compared a value from possible RGID and setting value. When it is matched, setting value can be used. With this function, each DMAC channel can be used with different access protection policy.

For a specific module listed below this function also provides Region ID Read/Write Enable Register dividing one slave address space into several area. A granularity of this divided area, see chapter 2, Area Map.

Target List: CPG/RESET/APMU/PFC/GPIO/PCIe/SYS-DMAC/RT-DMAC/Generic Counter/APSREG/AXCC/DBSC/SYSC
For a SYSRAM/DDR area, this function provides area configuration mechanism that define target area of one Region ID Read/Write Enable setting. The total number of configuration area is 64 for SYSRAM and DDR area. Figure XX shows a function of SYSRAM and DDR area configuration.

If they do not match, it can be determined that an access error has occurred due to RGID value mismatch. Error signal from each RGID protection is input to AXI-bus ECM module. AXI-bus ECM module issues an interrupt to ECM when receive error signal from any RGID protection.

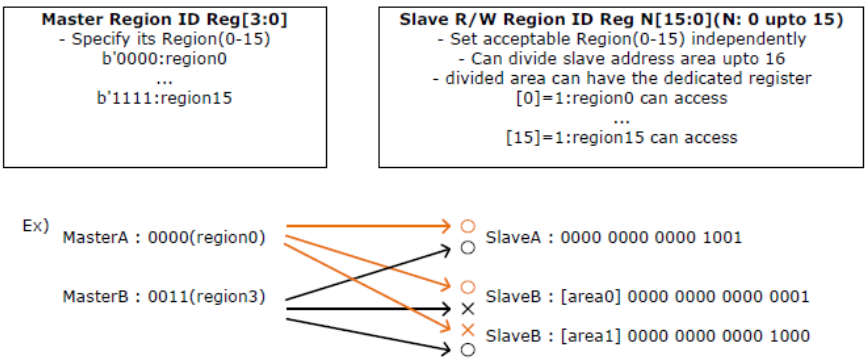

Figure 18.12 A mechanism of Region ID Protection

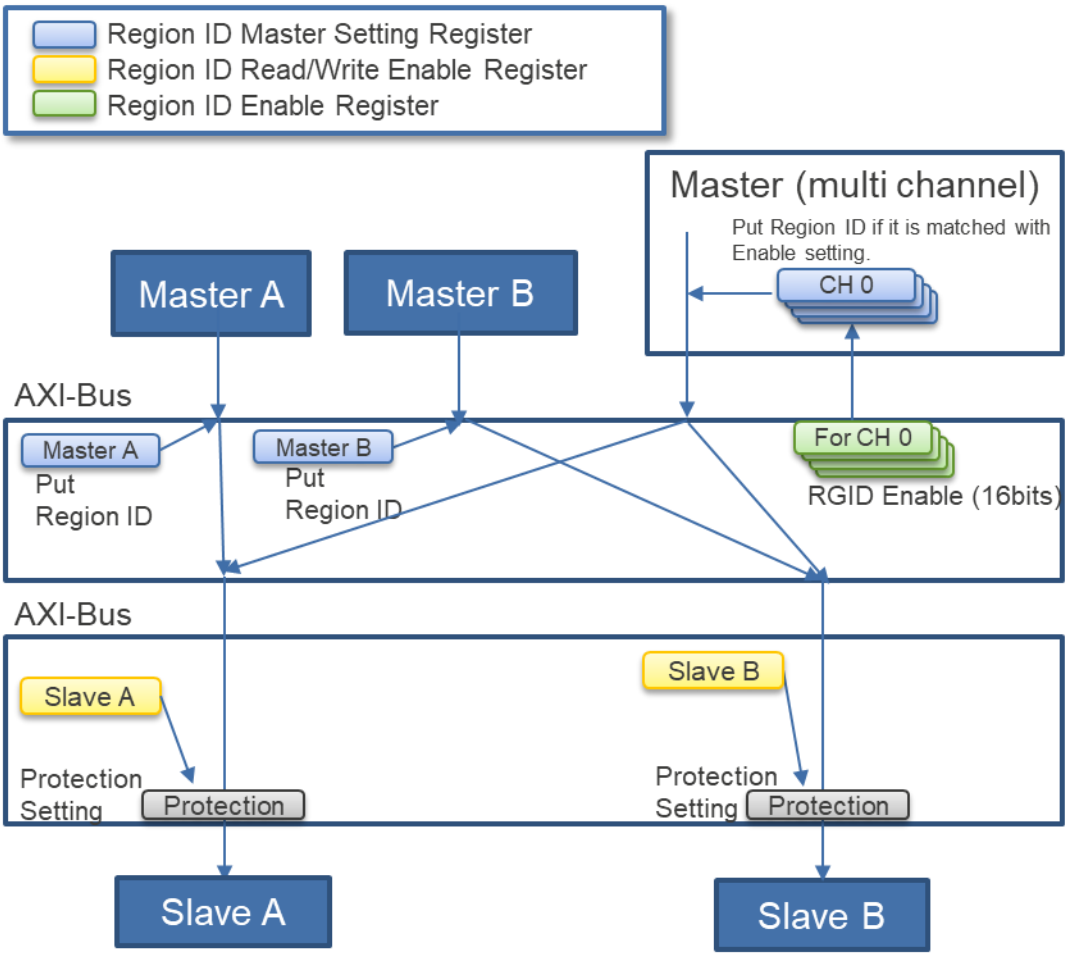

Figure 18.13 Region ID protection structure

When Region ID protection error occurs, SRC_ID to identify error master is stored into SAFID register.
Table 18-1 shows list of SRC_ID.

Table 18-1 SRC_ID list

SrcID	Function
H'01-H'02	ICUMX
H'03-H'05	Realtime Core

H'ED	PAP
H'F0-H'FE	Power On Self Test and Runtime Test

Others	Renesas internal use only

(3) Operation

0. Initial Condition

All Region ID Master Setting Register (RGIDM_<Master>) is set as 0 (Region ID 0).
All Region ID Read Enable Register (RGIDR_<Slave>) and Regin ID Write Enable Register (RGIDW_<Slave>) allows only Region ID 0.
All Secure Group Setting Register (SEC_<Slave>) allows public access.
Secure Attribute Register for Real-time core (SECATTR_CR52_0) is set as 1 (secure).

1. Set SECATTR registers

Please set secure attribute for Realtime Core (0: public, 1: secure).
This register is secure attribute for Realtime Core access to AXI-bus.
ARPROT[1]/AWPROT[1] of AXI signal for Realtime Core access are overwritten by this register.
ARPROT[1]/AWPROT[1] are used for Secure Protection by SEC register.
If access protection using secure attribution of transaction (configurate by SEC registers) and Realtime Core is used as non-secure IP, SECATTR register shall be changed to 0.

2. Set RGIDR and RGIDW registers

Please set allowed Region ID for the slave by RGIDR registers, RGIDW registers.
Bit width of these registers is 16bits and each bit correspond to each Region ID (bit n corresponds to Region ID n).
0 means “not allowed” and 1 means “allowed”.
For RT-VRAM, please set “allowed” for all Region ID.

3. Set SEC registers

Please set SEC registers for the slave that allows only secure access (e.g. ICUMX access).
Initial value allows both of public access and secure access.
For slave that needs to protect by secure, please set H’0 to the bit.

4. Set Region ID Enable for RT-VRAM

In RT-VRAM, there are registers of Region ID Enable.
Please refer section 36.

5. Set RGIDM registers

Please set Region ID number (from 0 to 15) to each IP’s RGIDM register.

6. Set RGIDMEN registers

Registers of Region ID Master Setting for Sys-DMAC and RT-DMAC are in them.
DMAC Region ID is set in area map of each DMAC channel.
But, the area is protected by RGIDR and RGIDW registers of each DMAC channel.
To prevent security hole, AXI-Bus provides allowed Region ID to DMAC by RGIDMEN registers.
RGIDMEN registers are protected by RGIDR and RGIDW registers of AXI-bus registers.
Bit width of RGIDMEN is 16bits and each bit correspond to each Region ID (bit n corresponds to Region ID n).
0 means “not allowed” and 1 means “allowed”.

7. Set Region ID Master Setting for Sys-DMAC and RT-DMAC

For detail, please refer section 30.5.2.
These registers are protected by RGIDW and RGIDR registers of each DMAC channel, not RGIDMEN registers.
If set value is not allowed by RGIDMEN registers, register set is ignored.

8. Set Region ID Master Setting for AP-System Core

Registers of Region ID Master Setting for AP-System core are in it.
AP-System Core doesn’t need setting of RGIDMEN registers.
Please refer section 5.

18.5.10 Bus Domain Protection

Bus Domain Protection is a function that provides independent Region Read/Write Enable function for one slave I/F by splitting address space. A target slave is listed below.

CPG/RESET/APMU/PFC/GPIO/PCIe/SYS-DMAC/RT-DMAC/Generic Counter/APSREG/AXCC/DBSC/SYSC/SYSRAM/DDR space

For some module on the list, it provides bit level access protection corporate with Bus Domain Protection. Figure 18.14 shows a structure of example.

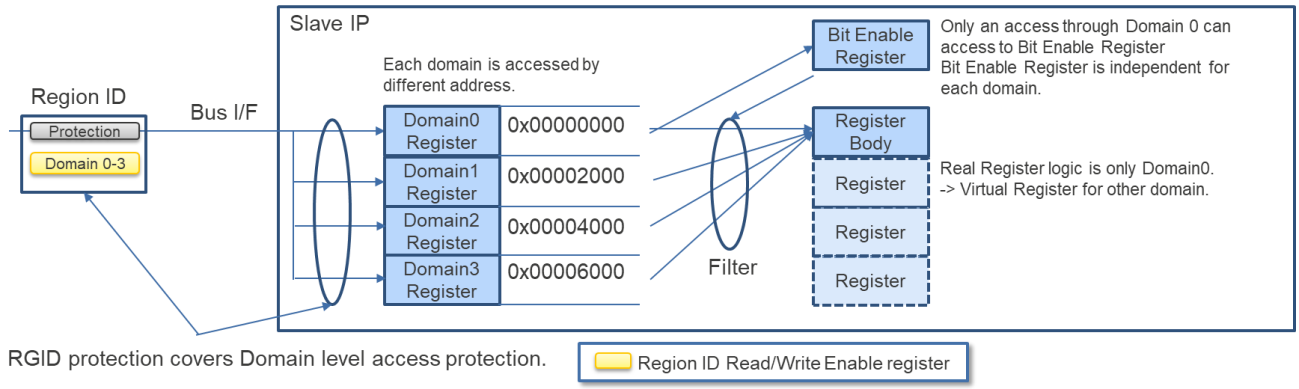

Figure 18.14 Overview of Bus Domain Protection

For SYSRAM and DDR space, area size of each domain is configurable by register setting. Figure 18.15 shows a structure of configuration of area size. A total number of configured areas is 64.

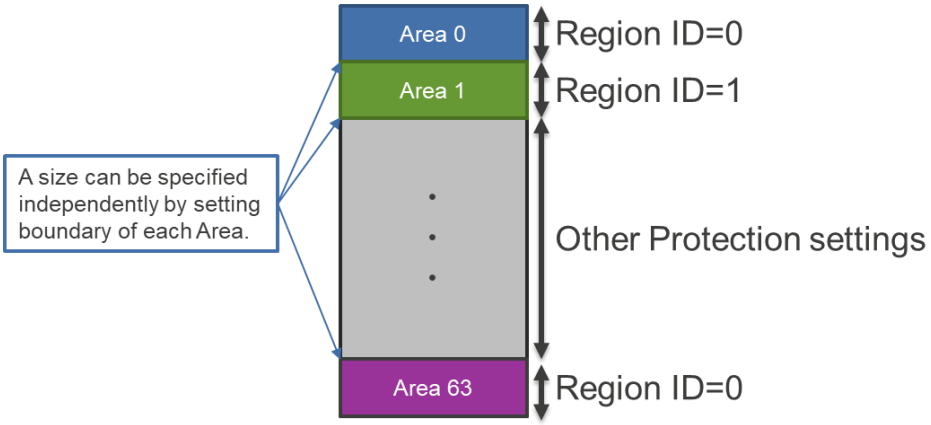

Figure 18.15 SYSRAM and DDR area configuration

18.5.11 EDC protection for QoS SRAM

(1) Overview

This safety mechanism checks register data in QoS SRAM by EDC. This QoS SRAM is in MM hierarchy.

(2) Hardware Description

Registers of protection target by this safety mechanism are QOSBW_FIX_QOS_BANK[n][k] and QOSBW_BE_QOS_BANK[n][k].

These registers are 64bits and EDC is generated from 64bits data to 8bits.

EDC is checked when SRAM is read from AXI-bus or QoS controller.

This error is notified to AXI-bus ECM module without register configuration.

An error status is captured in bit 13 of EDCSTMM0 register in AXI-bus ECM module.

(3) Operation

These registers shall be set by 64bits access to prevent wrong EDC error notification because 8bits EDC is generated from 64bit data.

19. IPMMU

19.1 Overview

The IPMMU is a Memory Management Unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.

- IPMMU cache and main IPMMU have 16 contexts that can be selected by the uTLBs
- Each context refers to two individual page tables, which can be set two base addresses by register setting
- IPMMU cache and main IPMMU context have a 1:1 relation
- All used contexts in main IPMMU as well as IPMMU cache need to be configured accordingly

19.1.1 Features

IPMMU includes the following main features.

- MMU architecture compatible with Armv8 VMSAv8-64 and VMSAv8-32 including the Large Physical Address Extension (LPAE), the Security Extensions and the Multiprocessing Extensions. IPMMU supports sixteen sets of TLBs and these can be managed independently.
- PMB (Privileged space Mapping Buffer) address translation functionality compatible with SH-4A. IPMMU supports sixteen domains. Four types of tables (16MB, 64MB, 128MB and 512MB) can be set.
- Caching recently used page table entries in translation look-aside buffer (TLB)
- Performance monitoring for Armv8 VMSAv8-64 and VMSAv8-32 LPAE
- DVM messages are not supported.
- Supported memory translation granule size is 4KB or 64KB. (16KB is not supported)
- 8-bit ASID size is only supported for 1st-starge and 2nd-stage address translation. (not support 16-bit size).

For more information about Armv8 VMSA, see Arm Architecture Reference Manual Armv8, for Armv8-A architecture profile.

In VMSAv8-64, supported memory translation granule size is 4KB and 64KB. 16KB granule size is not supported in IPMMU. In VMSAv8-32, 40bit IPA can be handled by IPMMU.

19.1.2 Block Diagram

Figure 19.1 shows the IPMMU block diagram. When a master (a processing unit or an interconnect) issues a transaction, a micro-TLB connected to the master sends a virtual address to the IPMMU cache which is connected to the same bus domain. If the virtual address is not cached in the IPMMU cache, the IPMMU performs a page table walk to the main IPMMU which is located at the main memory bus domain through an interconnect and returns a physical address to the micro-TLB.

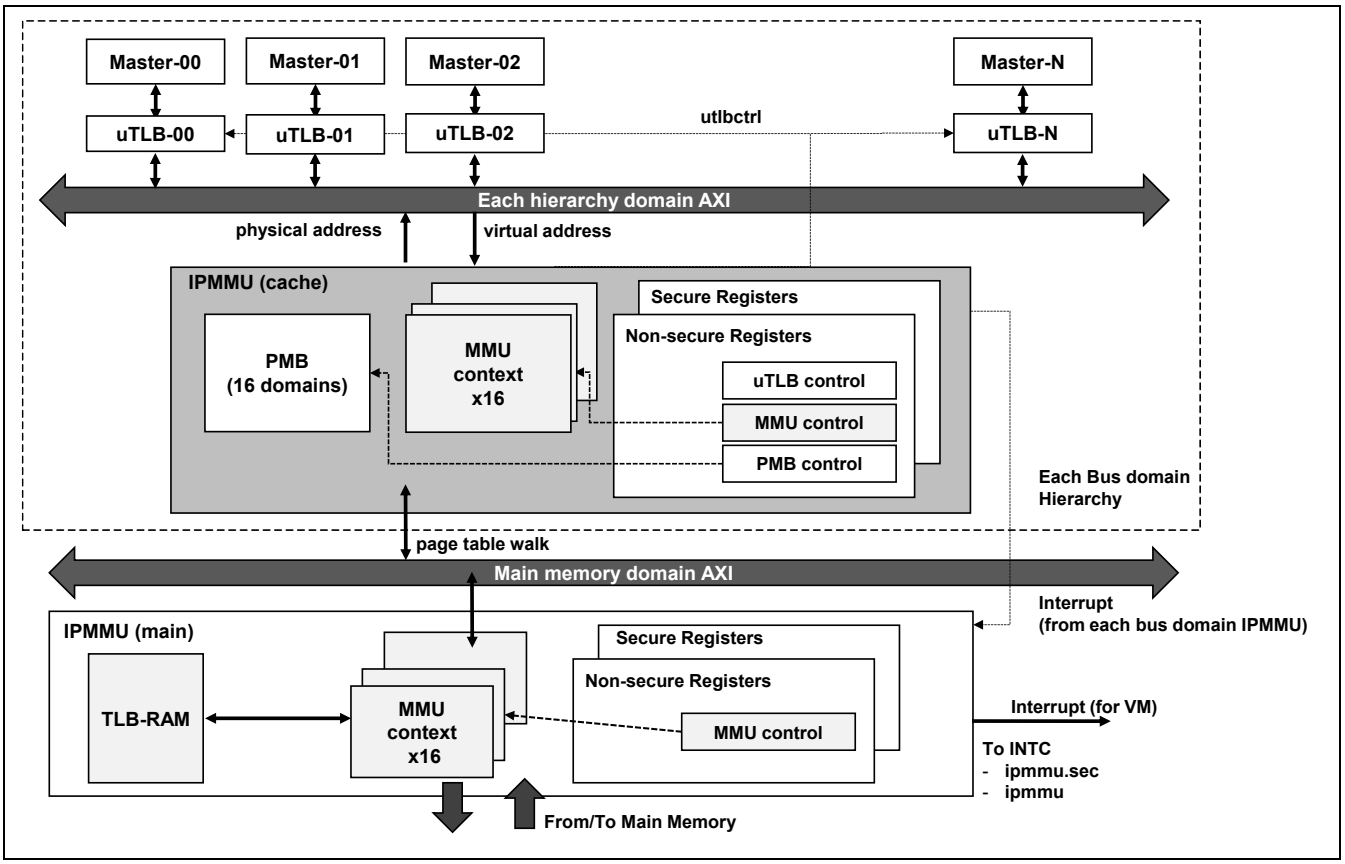

Figure 19.1 IPMMU System Integration

19.1.3 External Pins

There are no external pins in this module.

19.1.4 Connected Module

Table 19.1 shows the connected modules to IPMMU. As for the feature of the connected modules, refer to the chapter of each modules.

Table 19.1 Connected Modules

Module Name	Connected Module Name	Connected Module Function
IPMMU	AXI-BUS	Bus
	SYSC	Clock Supply
	RST	Module Reset
	INTC	Interrupt handling
	ECM	Error Interrupt Controller

19.1.5 Register configuration

Refer to R-CarV4M_UM_019_IPMMU_r0p81.xlsx and R-CarV4M_UM_019_IPMMU_long_descripter_r0p70.xlsx.

Table 19.2 IPMMU Base Address and Power Domain

MMU	Power Domain	Base Address
IPMMU-VI0	C4	H'EEE8 0000
IPMMU-VI1	C4	H'EEEC 0000
IPMMU-VC	C4	H'EEDC 0000
IPMMU-IR	C4	H'EED8 0000
IPMMU-HC	C4	H'EED4 0000
IPMMU-RT0	Always-On	H'EE48 0000
IPMMU-RT1	Always-On	H'EE4C 0000
IPMMU-DS0	Always-On	H'EED0 0000
IPMMU-VIP0	C4	H'EEF0 0000
IPMMU-3DG	C4	H'EEE0 0000
IPMMU-MM	Always-On	H'EEFC 0000

19.2 Register description

Refer to R-CarV4M_UM_019_IPMMU_r0p81.xlsx and R-CarV4M_UM_019_IPMMU_long_descripter_r0p70.xlsx.

19.3 Operation

19.3.1 Address Translation Sequence in micro-TLBs

Each micro-TLB has independent entries and can translate from a virtual address to a physical address without sending translation requests to the IPMMU if the virtual address is cached in the micro-TLB.

When a translation error occurred in address translation, the micro-TLB blocks subsequent transactions until a valid page entry is registered. Set IMUCTRn.FLUSH = 1 after the entry registration.

Figure 19.2 shows the micro-TLB address translation sequence.

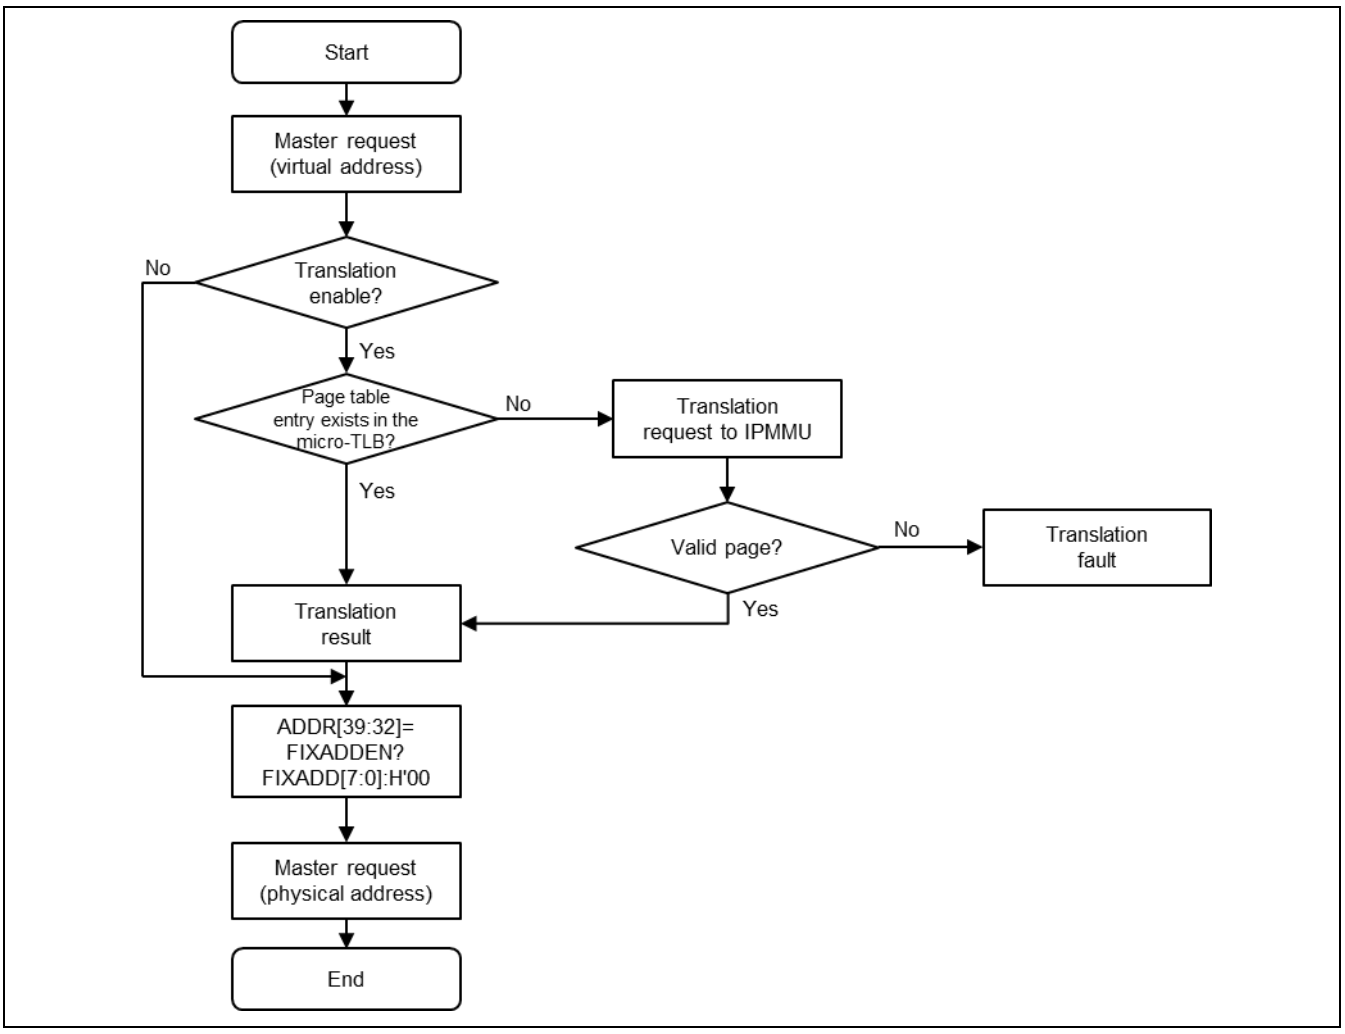

Figure 19.2 micro-TLB Address Translation Sequence

19.3.2 Address Translation Sequence in the IPMMU

(1) MMU Address Translation

The IPMMU has independent sixteen contexts that can select non-secure contexts or secure contexts with a page table for each context. It supports two page table formats, the Short-descriptor format and the Long-descriptor format. When the IPMMU receives an address translation request from a micro-TLB, the IPMMU starts address translation sequence based on the page table specified by IMUCTRn.TTSEL. In case that the micro-TLB is enabled and MMU is selected in IMUCTRn.TTSEL, then the corresponding IMCTRn.MMUEN also need to be set. In case that IMCTRn.MMUEN is disabled, the corresponding micro-TLB must not be enabled.

Figure 19.3 shows the MMU address translation sequence.

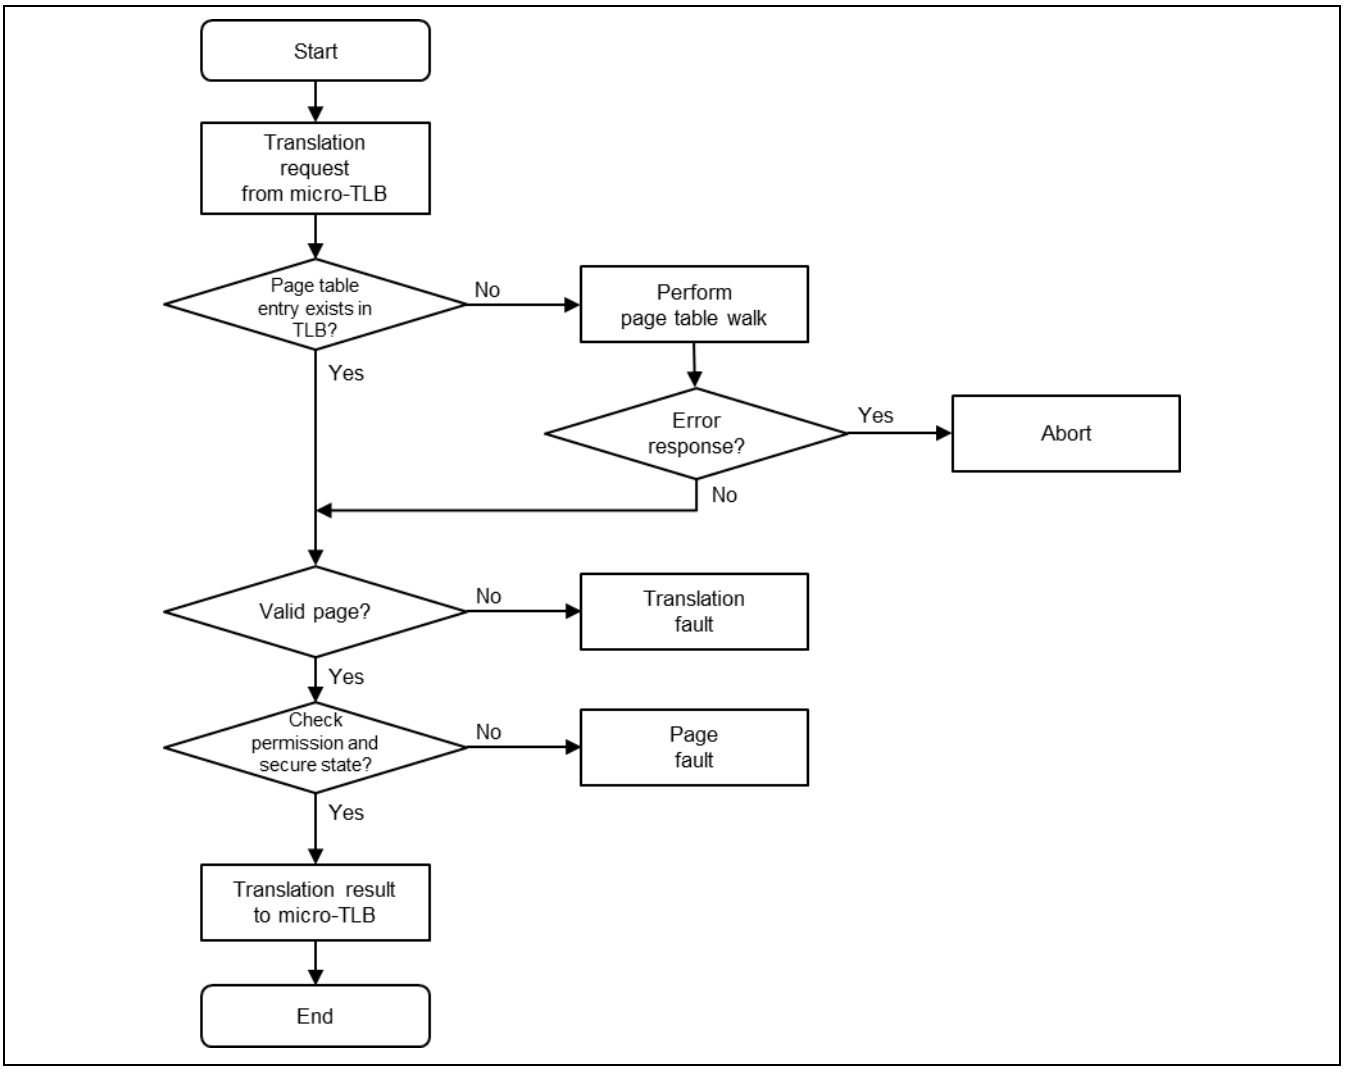

Figure 19.3 MMU Address Translation Sequence

(2) PMB Address Translation

PMB address translation is performed in two ways. When PMB address translation is chosen in IMUCTRn.TTSEL, all virtual addresses are translated by PMB. In case that the micro-TLB is enabled and PMB is selected in IMUCTRn.TTSEL, then the corresponding IMPCTR.PMBEN also need to be set. In case that IMPCTR.PMBEN is disabled, the corresponding micro-TLB must not be enabled.

Figure 19.4 shows the PMB translation flow.

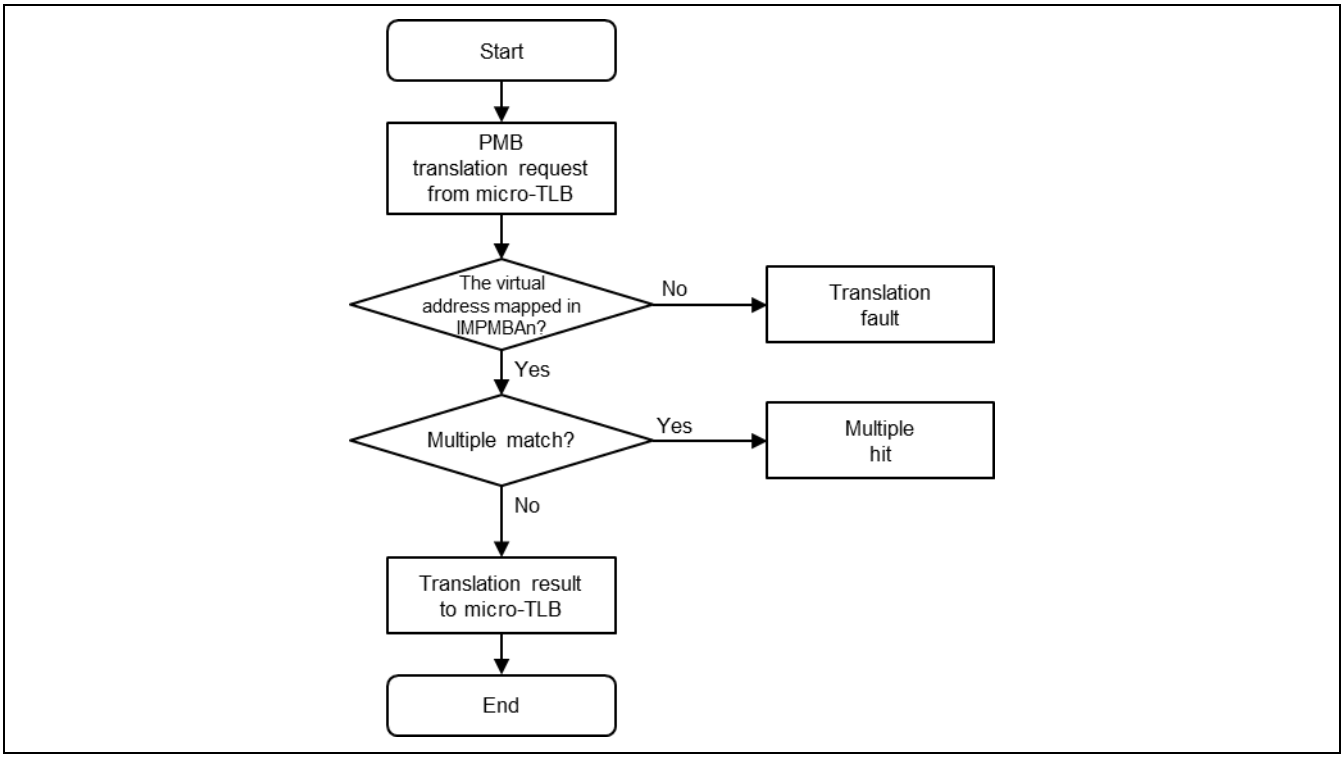

Figure 19.4 PMB Translation Flow

19.3.3 Address Space

(1) Short-descriptor

In the short-descriptor format, 32-bit virtual address space is translated to 32-bit physical address space managed by TTBR0/1.

Note: “TTBR0” is register bit of IMTTLBR0[n].TTBR[31:12].
“TTBR1” is register bit of IMTTLBR1[n].TTBR[31:12].
“TTBCR” is IMTTBCR[n] register.
n = 0 to 15 (IPMMU context)

Figure 19.5 shows the Short-descriptor address space.

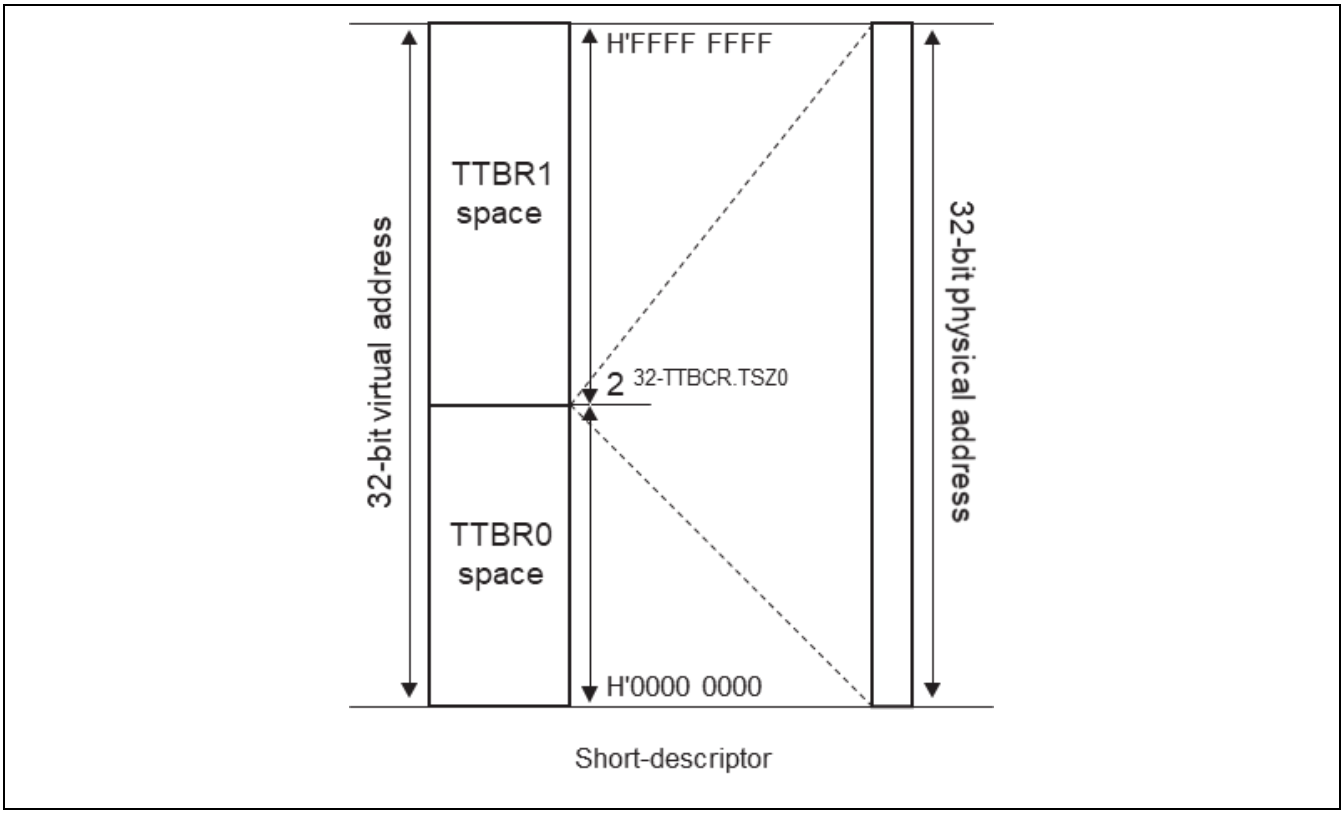

Figure 19.5 Short-descriptor Address Space

(2) Long-descriptor

In the long-descriptor format, 32-bit and 40-bit virtual address space is translated to 40-bit physical address space managed by TTBR0/1. The IPMMU supports the Secure PL1 and PL0 stage 1 translation and the Non-secure PL1 and PL0 stage 1 translation.

Figure 19.6 and Figure 19.7 shows the Long-descriptor address space for VMSAv8-32 and VMSAv8-64.

Note: "TTBR0" is register bit of IMTTUBR0[n].TTBR[39:32] and IMTTLBR0[n].TTBR[31:12].
"TTBR1" is register bit of IMTTUBR1[n].TTBR[39:32] and IMTTLBR1[n].TTBR[31:12].
"TTBCR" is IMTTBCR[n] register.
n = 0 to 15 (IPMMU context)

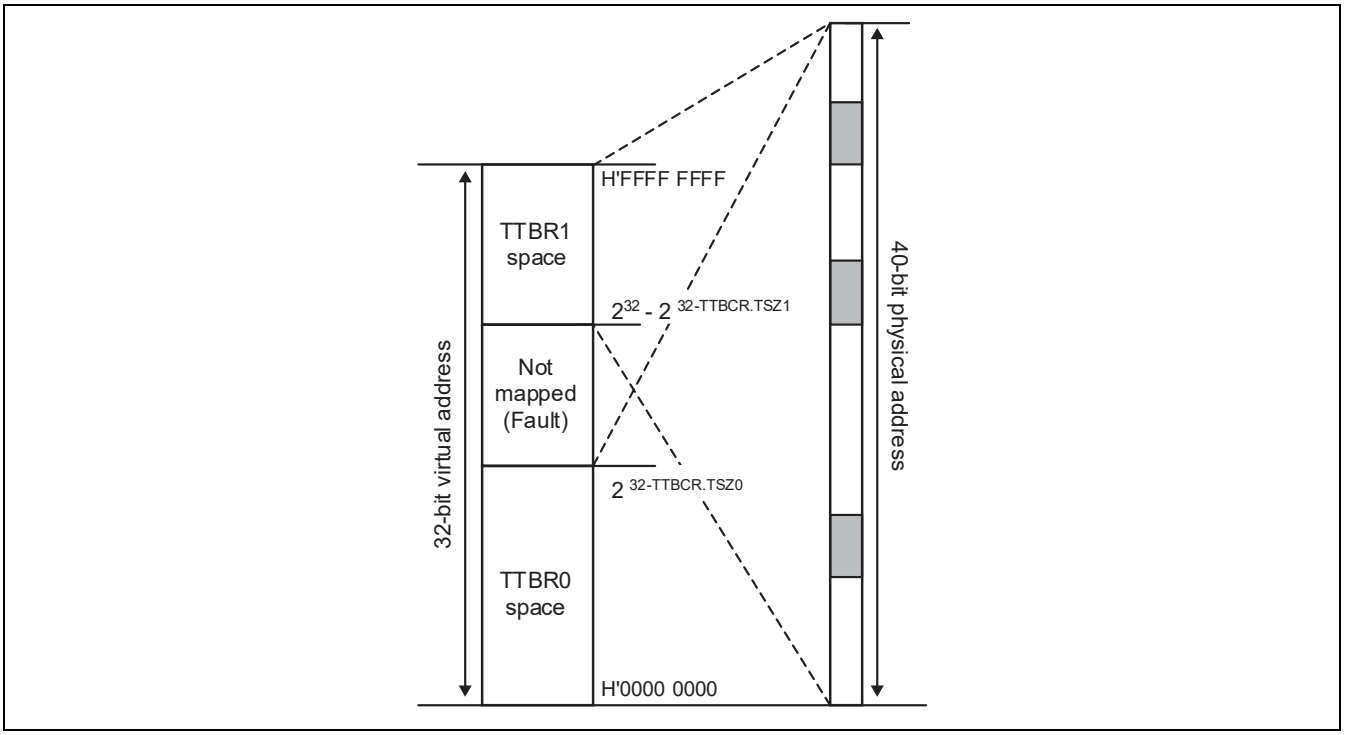

Figure 19.6 Long-descriptor Address Space (VMSAv8-32)

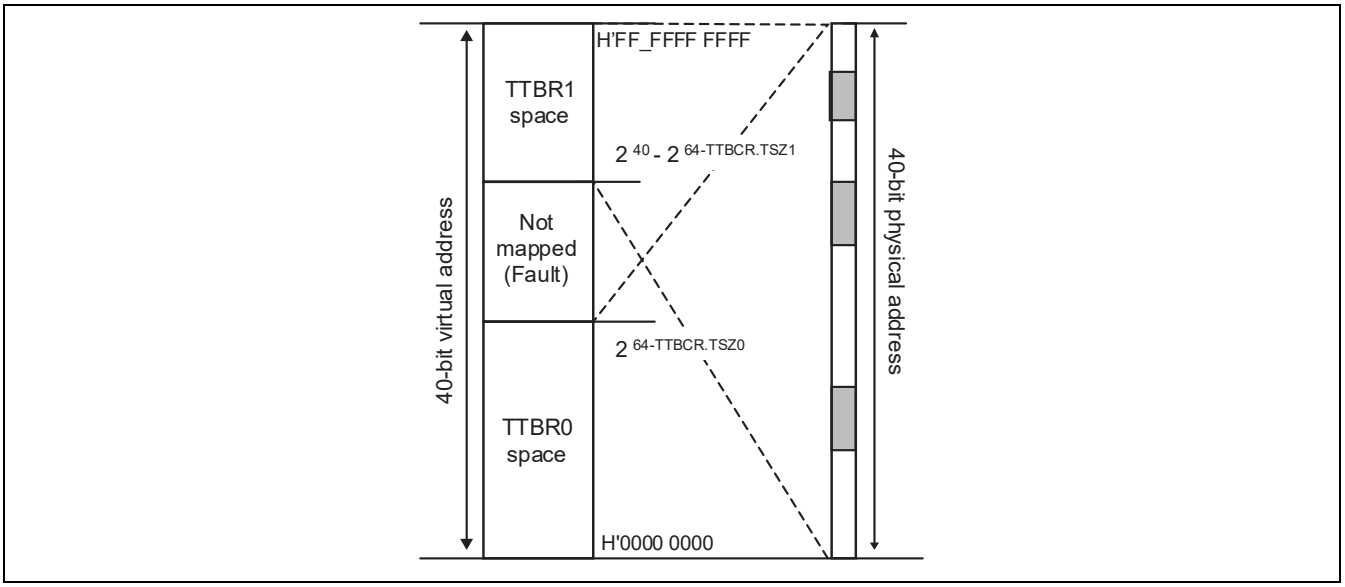

Figure 19.7 Long-descriptor Address Space (VMSAv8-64)

(3) PMB

The IPMMU supports the PMB address translation system. Figure 19.8 shows the PMB address space.

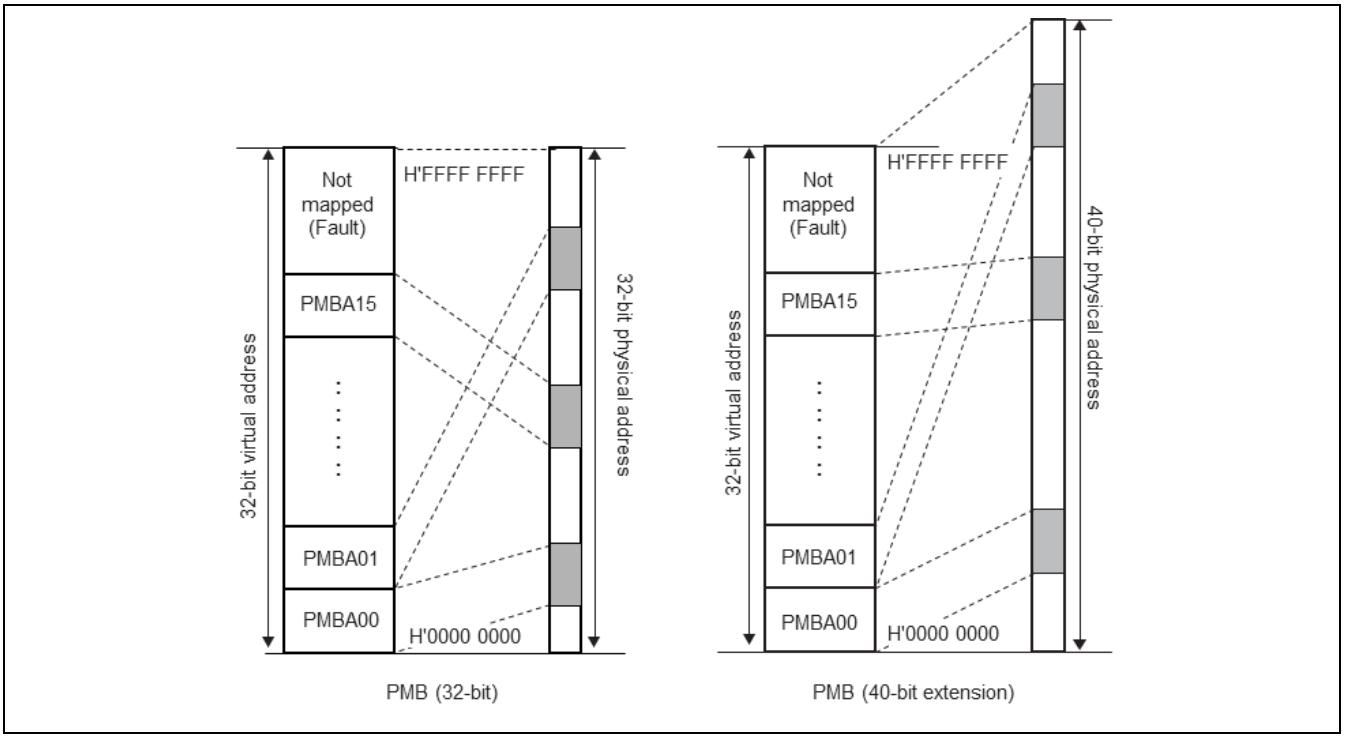

Figure 19.8 PMB Address Space

(4) Stage 2 Translation

The IPMMU supports stage 2 translation. At the stage 1, 32-bit address space is translated to 32-bit or 40-bit intermediate physical address (IPA) space. At the stage 2, 32-bit or 40-bit IPA space is translated to 40-bit physical address space. In order to enable the stage 2 translation, set 1 to IMCTRn.TREN and set its stage 2 page table to IMCTRn.RTSEL. In default, IPMMU use stage 1 translation table format even if performing stage 2 translation. In case of using stage 2 translation table format in stage 2 translation, set 1 to IMSAUXCTLR.S2PTE. In some hypervisor system, only address translation from IPA to PA is supported by stage 2 translation. By setting 1 to IMTTBCRn.BYPEN, IPMMU doesn't perform stage 1 address translation and start stage 2 address translation.*

Figure 19.9 shows the stage 2 translation address space.

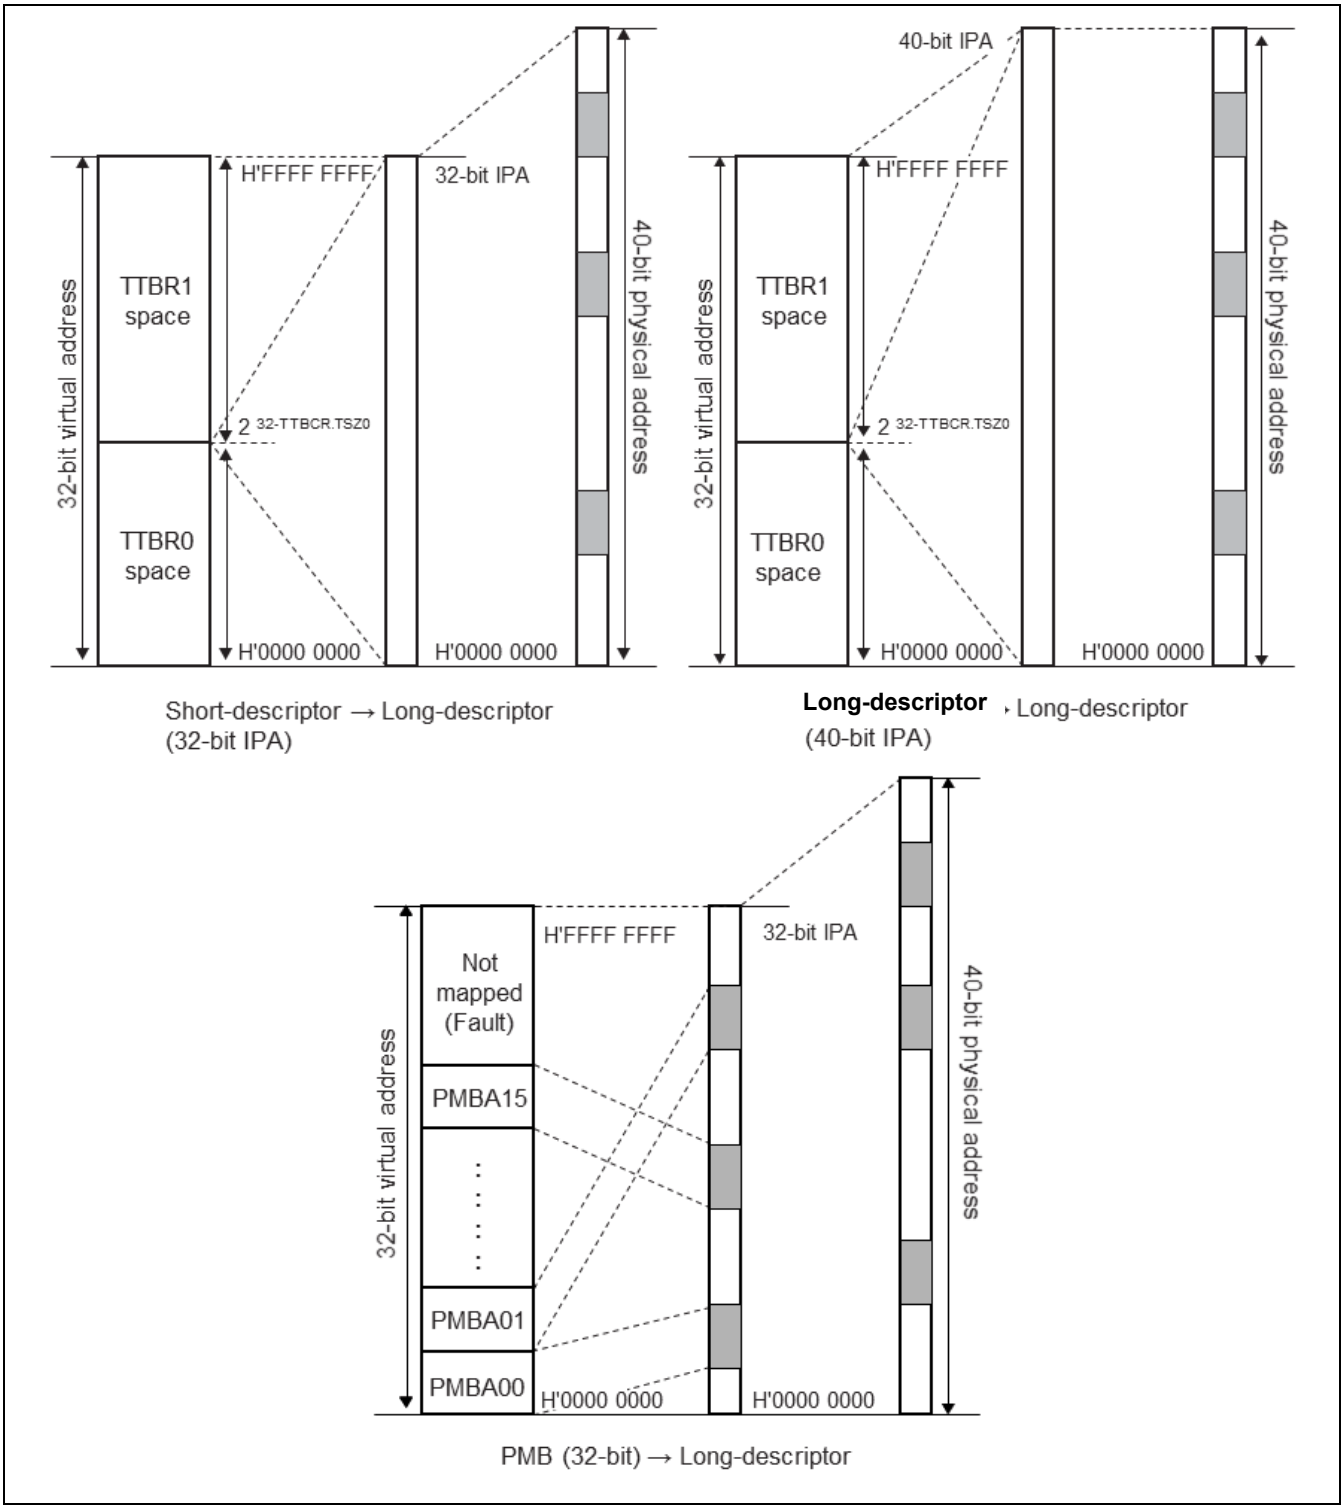

Figure 19.9 Stage 2 Translation Address Space

19.3.4 Initialization Sequence

This section describes the initialization sequence of the IPMMU.

(1) Module Stop

The IPMMU doesn't support module stop control. The IPMMU can be used whenever a master requires address translation through the IPMMU. When a master doesn't require address translation, the corresponding IMUCTRn MMUEN must be disabled.

(2) micro-TLB

Before a master access, the corresponding micro-TLB registers which includes the translation mode and ASIDs must be configured.

Figure 19.10 and Figure 19.11 shows the example of the procedure for using MMU and PMB function.

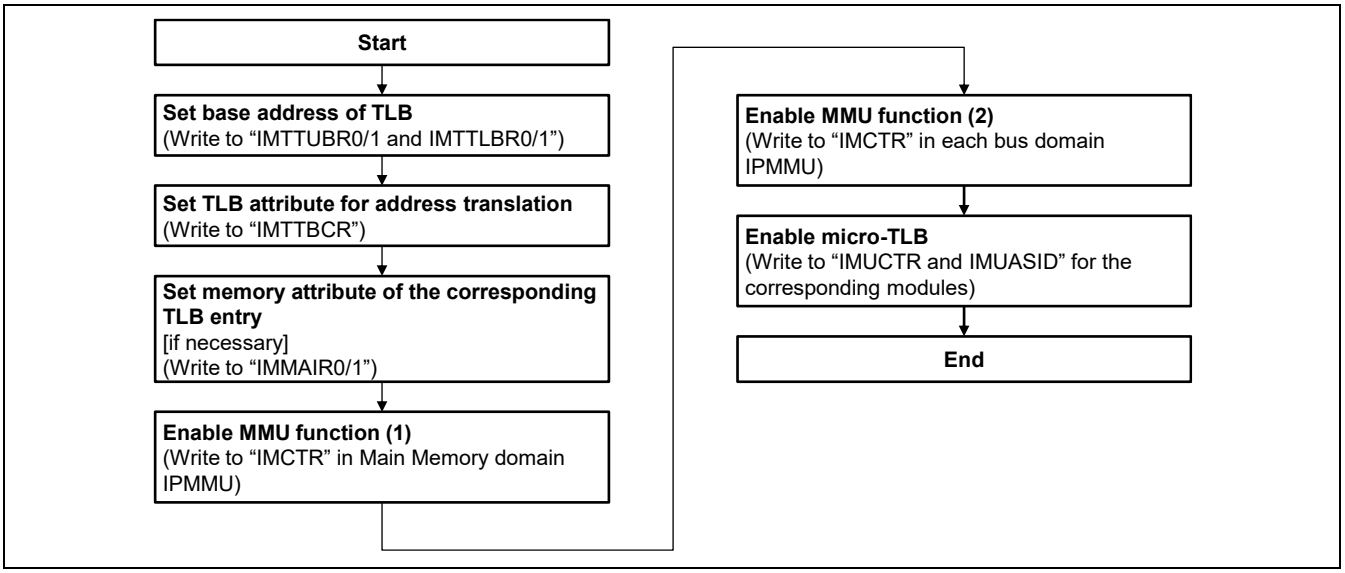

Figure 19.10 initialization sequence for using MMU function

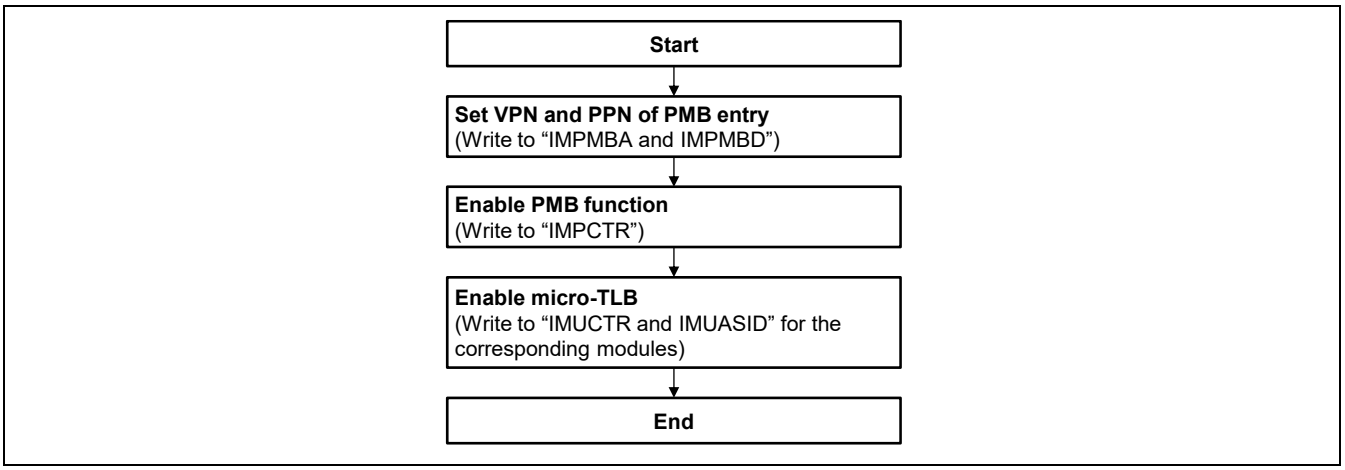

Figure 19.11 initialization sequence for using PMB function

19.3.5 TLB Maintenance

Some TLB maintenances between an IPMMU and the connected micro-TLBs are performed automatically by hardware. In case that the flush operation is performed via IMCTRn (IMCTRn FLUSH=1), all the micro-TLB which is related to the same MMU tables are applied the TLB flush and clear the all TLB entry in micro-TLB.

Table 19.3 TLB Maintenance

Category	Software operation	TLB maintenance in IPMMU	TLB maintenance in micro-TLB
MMU Page Table	First entry registration	Not required	Not required
	Entry update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
	Entry release	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
ASID	ASID update	Automatically invalidated	Automatically invalidated
MMU registers	MMU register values update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
PMB	PMB entry registration	Not required	Not required
	PMB entry update	Not required	Invalidate the target micro-TLB
	PMB entry release	Not required	Invalidate the target micro-TLB

IPMMU-main cannot issue the flush operation to each IPMMU-cache and micro-TLB. In case of replacing the MMU table, the flush operation of both IPMMU-main and IPMMU-cache via IMCTRn(IMCTRn.FLUSH=1) is required. TLB invalidation is instantaneous so software doesn't need to check IMUCTRn.FLUSH or IMCTRn.FLUSH whether TLB invalidation is completed. Figure 19.12 shows the example of the procedure for updating TLB entry

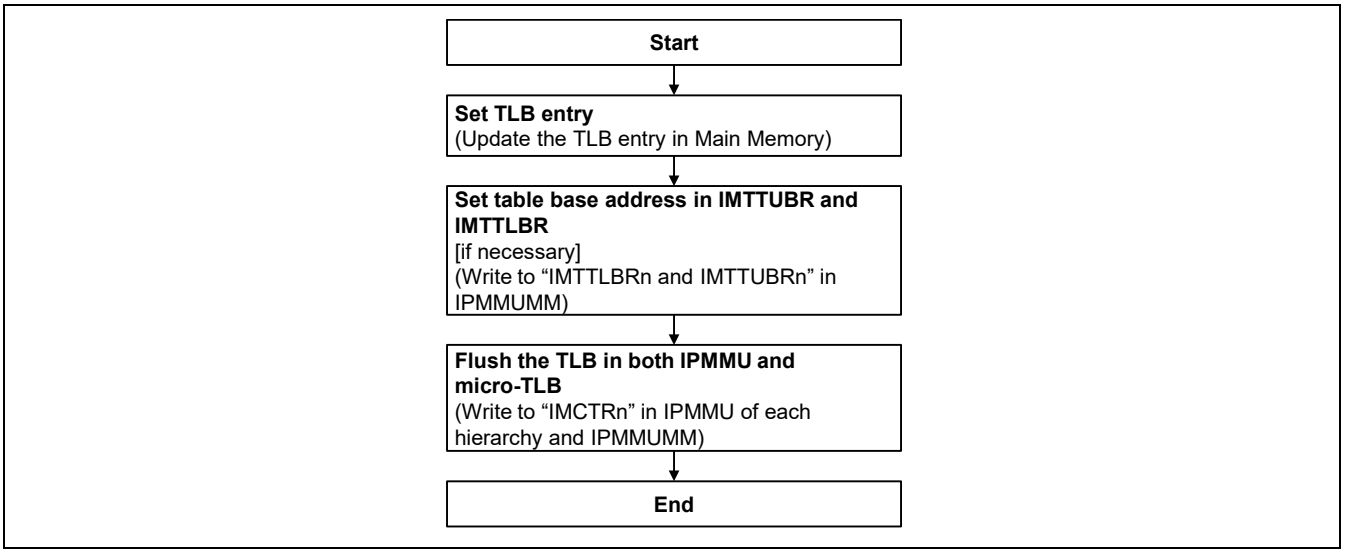

Figure 19.12 update sequence of TLB entry

19.3.6 Security Support

The IPMMU supports the security function based on Armv8 and additional extensions.

(1) Banked Registers

The IPMMU has two copies of a register at the same address. They are banked with secure and non-secure. A Non-secure access can read and write only non-secure registers and a secure access can read and write secure registers. A secure access can also read and write non-secure registers through the alias address space to non-secure registers (from H'4000 to H'7FFC).

(2) Address Translation

When a Secure/Accelerator master sends a translation request to an IPMMU through a micro-TLB, Secure MMU registers are referred to perform its page table walk. The Secure page table walk can read secure page table entries (NS = 0). In the case of a Non-secure translation request, Non-secure MMU registers are referred and the access to secure page table entries is ignored.

(3) Secure Master

Realtime Core can be secure master. And ICUMX is also secure master*. These modules use secure page table and Secure MMU registers.

Note: * ICUMX can be select the operation mode by the software. So it depends on the software whether the secure TLB and registers are used.

Note:** In case that secure master uses the address translation feature by IPMMU, use long descriptor format only is supported.

19.3.7 OS-ID support

IPMMU-HC, IPMMU-3DG and IPMMU-IR support the OS-ID which is used for specifying the operating system. In order to use this feature, the micro-TLB which corresponds to the OS-ID needs to be used. Table 19.4 and Table 19.5 show the micro-TLB assignment for each OS-ID.

Table 19.4 micro-TLB assignment for OS-ID support

OS-ID	Micro-TLB assignment
ID 0	uTLB0, uTLB8, uTLB16, uTLB24, uTLB32, uTLB40, uTLB48 and uTLB56
ID 1	uTLB1, uTLB9, uTLB17, uTLB25, uTLB33, uTLB41, uTLB49 and uTLB57
ID 2	uTLB2, uTLB10, uTLB18, uTLB26, uTLB34, uTLB42, uTLB50 and uTLB58
ID 3	uTLB3, uTLB11, uTLB19, uTLB27, uTLB35, uTLB43, uTLB51 and uTLB59
ID 4	uTLB4, uTLB12, uTLB20, uTLB28, uTLB36, uTLB44, uTLB52 and uTLB60
ID 5	uTLB5, uTLB13, uTLB21, uTLB29, uTLB37, uTLB45, uTLB53 and uTLB61
ID 6	uTLB6, uTLB14, uTLB22, uTLB30, uTLB38, uTLB46, uTLB54 and uTLB62
ID 7	uTLB7, uTLB15, uTLB23, uTLB31, uTLB39, uTLB47, uTLB55 and uTLB63

PCIe ch0/ch1 in IPMMU-HC have 16 OS-ID, the assignment is as below.

Table 19.5 micro-TLB assignment for 16 OS-ID support

OS-ID	Micro-TLB assignment
ID 0	uTLB0, uTLB16, uTLB32 and uTLB48
ID 1	uTLB1, uTLB17, uTLB33 and uTLB49
ID 2	uTLB2, uTLB18, uTLB34 and uTLB50
ID 3	uTLB3, uTLB19, uTLB35 and uTLB51
ID 4	uTLB4, uTLB20, uTLB36 and uTLB52
ID 5	uTLB5, uTLB21, uTLB37 and uTLB53
ID 6	uTLB6, uTLB22, uTLB38 and uTLB54
ID 7	uTLB7, uTLB23, uTLB39 and uTLB55
ID 8	uTLB8, uTLB24, uTLB40 and uTLB56
ID 9	uTLB9, uTLB25, uTLB41 and uTLB57
ID 10	uTLB10, uTLB26, uTLB42 and uTLB58
ID 11	uTLB11, uTLB27, uTLB43 and uTLB59
ID 12	uTLB12, uTLB28, uTLB44 and uTLB60
ID 13	uTLB13, uTLB29, uTLB45 and uTLB61
ID 14	uTLB14, uTLB30, uTLB46 and uTLB62
ID 15	uTLB15, uTLB31, uTLB47 and uTLB63

19.3.8 Error Handling

(1) IPMMU Interrupt Requests

Table 19.6 shows the error events which can cause interrupts. They are all errors which IPMMU supports.
To enable interrupt in MMU address translation, set IMCTRn.INTEN in IPMMU(main) before starting address translation. These errors are set in IMSTRn registers in IPMMU(main).
To enable interrupt in PMB address translation, set IMPCTRn.INTEN in each IPMMU(cache) before starting address translation. The errors are set in IMPSTR register in IPMMU(cache).

Table 19.6 IPMMU Error Events

Category	Error	Description
Long-descriptor Short-descriptor**	Translation Fault	A virtual address was not mapped in the region defined by TTBR0 and TTBR1.*
		A descriptor was neither Table nor Block format
	Page Fault	AP (access permissions) / AF (access flag) bit mismatch occurred.
		NS bit mismatch occurred. Non-secure master read a Secure page table entry.
	Abort	The IPMMU got an error response from an Interconnect during a page table walk.
	Multiple Hit (MHIT)	Multiple TLB hits occurred.
PMB***	Translation Fault	A virtual address was not mapped in IMPMBAn.
	Multiple Hit (MHIT)	Multiple PMB hits occurred.

Note: * This factor is only for long-descriptor.
** All of IPMMU error events in MMU translation are detected in IMSTRn registers in IPMMU(main).
*** Interrupts from IPMMU(cache) are caused only PMB address translation.

(2) Error Handling Flow

When the micro-TLB cannot translate its virtual address because of some IPMMU errors, the micro-TLB stops to issue the following transactions. When the IPMMU detects an error, IMCTRn.FLUSH must be set after the IMSTRn register is cleared and page table entries are updated. After the TLB invalidation, the micro-TLB resumes to issue transactions. And when the IPMMU detects an error by PMB address translation, IMUCTRn.FLUSH must be set after the IMPSTRn register is cleared and PMB translation tables are updated.

Figure 19.13 shows the error handling flow in MMU address translation.

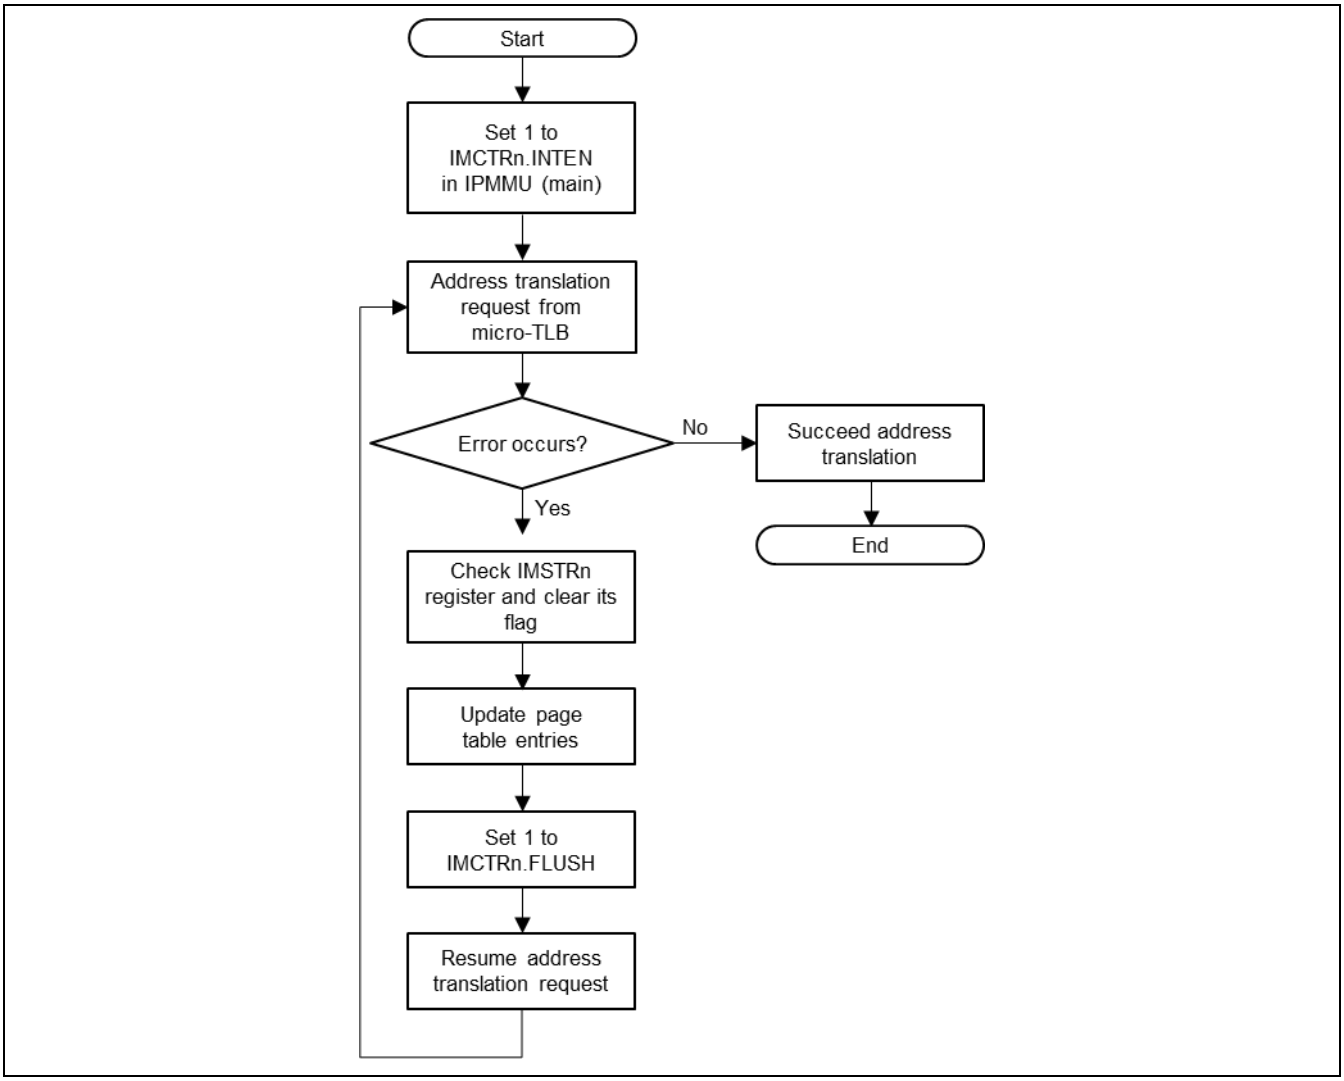

Figure 19.13 Error Handling Flow in MMU address translation

Figure 19.14 shows the error handling flow in PMB address translation.

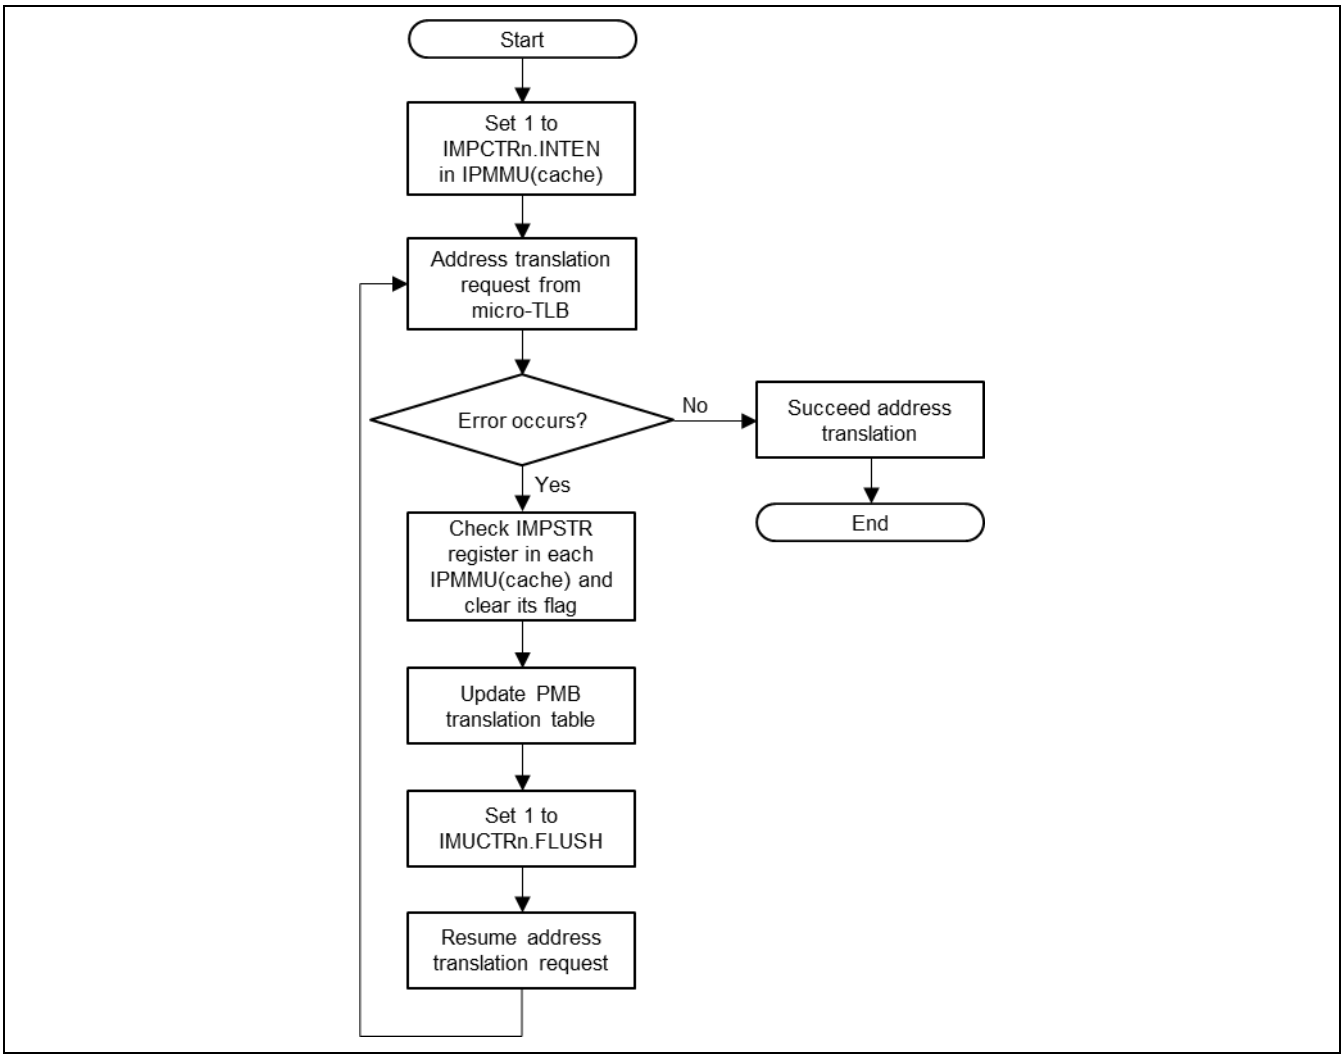

Figure 19.14 Error Handling Flow in PMB address translation

19.3.9 Performance monitor

In order to check the number of the page hit or miss, performance monitor is helpful for this purpose. When you use performance monitor, set the IMPFMCTR.MD[1:0] bits. After that set 1 to IMPFMCTR.EN bit. After you set 1 to IMPFMCTR.EN, IMPFMTOTAL, IMPFMHIT, IMPFML3MISS and IMPFML2MISS registers start counting.

Table 19.7 and Table 19.8 shows detail of performance monitor.

Note: n = 0 to 15 (IPMMU context)

Table 19.7 Description of performance monitor in IPMMU cache

Register name	IMPFMCTR.MD[1:0]	description of monitor
IMPFMTOTAL	2'b00	The total number of translation requests
	2'b11	The total number of translation requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
	2'b01/10	Reserved
IMPFMHIT	2'b00	The total number of TLB hit requests
	2'b11	The total number of TLB hit requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
	2'b01/10	Reserved
IMPFMMISS	2'b00	The total number of miss requests
	2'b11	The total number of miss requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
	2'b01/10	Reserved

Table 19.8 Description of performance monitor in main IPMMU

Register name	IMPFMCTR.MD[1:0]	description of monitor
IMPFMTOTAL	2'b00	The total number of translation requests of all 40-bit MMUs
	2'b01	The total number of translation requests of all 32-bit MMUs
	2'b10	Reserved
	2'b11	The total number of translation requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
IMPFMHIT	2'b00	The total number of TLB hit requests (= 40-bit L3 TLB hit)
	2'b01	The total number of TLB hit requests (= 32-bit TLB hit)
	2'b10	Reserved
	2'b11	The total number of TLB hit requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
IMPFML3MISS	2'b00	The total number of 40-bit L3 TLB miss requests (= 40-bit L2 TLB hit)
	2'b01 / 2'b10	Reserved
	2'b11	The total number of 40-bit L3 TLB miss requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)
IMPFML2MISS	2'b00	The total number of 40-bit L2 TLB miss requests not including 40-bit L1 miss (= Page Table Walk)
	2'b01	The total number of TLB miss requests (= Page Table Walk)
	2'b10	Reserved
	2'b11	The total number of TLB miss requests only in MMU[n] (specified by the IMPFMCTR.SEL[3:0] bits)

19.3.10 micro-TLB Assignment

The assignment of micro-TLB. Refer to the following sections.

Table 19.9 micro-TLB Assignment

	Master Module

19.4 Usage Notes

19.4.1 IPMMU Naming

Table 19.10 shows the correspondence between each IPMMU and each bus domain.

Table 19.10 IPMMU naming

IPMMU	Bus Domain
IPMMU-VI0	VIO (Video IO) domain AXI
IPMMU-VI1	VIO (Video IO) domain AXI
IPMMU-VC	VC (Video Codec) domain AXI
IPMMU-IR	IMP domain AXI
IPMMU-RT0	RT (Real Time) domain AXI
IPMMU-RT1	RT (Real Time) domain AXI
IPMMU-DS0	Peripheral domain AXI
IPMMU-HC	HC (High Communication) domain AXI
IPMMU-3DG	3DG (3D-Graphics) domain AXI
IPMMU-VIP0	VIP (Vision IP) domain AXI
IPMMU-MM	Main Memory domain AXI

19.4.2 Restrictions for IPMMU

(1) Page size and Section size usage in VMSAv8-32

IPMMU cannot handle both 4KB page and 64KB page at the same MMU context in VMSAv8-32. In case of using the 64KB page, IMTTBCRn.PGSZ=1 is required. Also 1MB section and 16MB super-section cannot be handled. In case of using 16MB section, IMTTBCRn.SCSZ=1 is required.

(2) 4KB page usage in VMSAv8-64

Four level translation is not supported in IPMMU. In case of using 4KB page granule, we should set "0x1" to "SL" field. (start from 1st level) and use concatenated translation table. Architecturally, this table optimization is supported in stage 2 translation, but IPMMU supports this mode in stage 1 translation as well in order to reduce the number of page table walk. In table lookup, MSB of input address (IA[39]) is used for the page table entry selection for upper or lower table.

(3) Error Handling in VMSAv8-64

Architecturally, Address Size Fault is described in VMSAv8-64. But this fault is not handled in IPMMU. On the other hand, the NS bit in a Non-secure translation table descriptor need to be set in IPMMU although it is ignored in VMSAv8-64. In order to avoid “Secure Access Fault”, set “NS bit” in a Non-secure translation table descriptor.

(4) Start Level for Page Table Walk

Start Level for page table walk need to be set under below condition. Refer to Table 19.11.

Table 19.11 Start Level for Page Table Walk

IMCTRn.VA64 = 1 IMTTBCRn.PGSZ = 0 (use 4KB page granule)		
Look Up	Stage-1 Translation	Stage-2 Translation
Level 0	No support	No Support
Level 1	base address[39:x]: Input Address[y:30] if IMTTBCRn.SL[1:0] = 2’b01 x = (37 – TSZn (n = 0, 1)) [24* <= TSZn <= 33]	base address[39:x]: Input Address[y:30] if IMTTBCRn.SL[1:0] = 2’b01 x = (37 – TSZn (n = 0, 1)) [24* <= TSZn <= 33]

	y = x+26 Other values go to Level 2	y = x+26 Other values go to Level 2
Level 2	base address [39:x], Input Address[y:21] if IMTTBCRn.SL[1:0] = 2'b00 x = (46 – TSZn (n = 0, 1)) [30 <= TSZn <= 39] y = x +17 Other values x = (46 -TSZn (n = 0,1)) [34 <= TSZn <= 39] y = x + 17	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1:0] = 2'b00 x = (46 – TSZn (n = 0,1)) [30 <= TSZn <= 39] y = x+17 Other values No support
IMCTRn.VA64 = 1 IMTTBCRn.PGSZ = 1 (use 64KB page granule)		
Level 1	No Support	No Support
Level 2	base address [39:x], Input Address[y:29] if IMTTBCRn.SL[1:0] = 2'b01 x = (38 – TSZn (n = 0, 1)) [24 <= TSZn <= 34] y = x + 25 Other values go to Level 3	base address [39:x], Input Address[y:29] if IMTTBCRn.SL[1:0] = 2'b01 x = (38 – TSZn (n = 0, 1)) [24 <= TSZn <= 34] y = x + 25 Other values go to Level 3
Level 3	base address [39:x], Input Address [y:16] if IMTTBCRn.SL[1:0] = 2'b00 x = (51 – TSZn (n = 0, 1)) [31 <= TSZn <= 39] y= x + 12 Other values x = (51 – TSZn (n = 0, 1)) [35 <= TSZn <= 39] y= x + 12	base address [39:x], Input Address [y:16] if IMTTBCRn.SL[1:0] = 2'b00 x = (51 – TSZn (n = 0, 1)) [31 <= TSZn <= 39] y= x + 12 Other values x = (51 – TSZn (n = 0, 1)) [35 <= TSZn <= 39] y= x + 12
IMCTRn.VA64 = 0		
Level 1	base address[39:x]: Input Address[y:30] if IMTTBCRn.SL[1] = 1'b1 x = (5 – TSZn (n = 0, 1)) [0 <= TSZn <= 1] y = x + 26 Other values go to Level 2	base address[39:x]: Input Address[y:30] if IMTTBCRn.SL[1] = 1'b1 x = (5 – TSZ0) [-2 <= TSZ0 <= 1] y = x + 26 Other values x = (5 – TSZ0) [-8 <= TSZ0 <= -3] y = x + 26
Level 2	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1] = 1'b0 x = (14 – TSZn (n = 0, 1)) [2 <= TSZn <= 7] y = x+17 Other values No support	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1] = 1'b0 x = (14 – TSZ0) [-2 <= TSZ0 <= 7] y = x+17 Other values No support

Note.* not support level 0 page table walk. Refer to 19.4.2(2) 4KB page usage in VMSAv8-64.

(5) Virtual address space range

Virtual address space range cannot be configured less than or equal 128MB. In case of supporting this address range, set virtual address space range to 256MB by setting TSZ0/TSZ1 and unnecessary area is not mapped by MMU.

(6) Disabling the Address Translation By IPMMU

Even if a master IP is disabling the address translation by IPMMU, IMUCTRn.TTSEL[3:0] needs to be set unused MMU context number. It means that only fifteen MMU context can be used for the address translation by IPMMU in this case.

(7) Restriction for PMB

In order to perform address translation by IPMMU normally, it is limited not to use PMB mode in secure mode. Use PMB mode only in non-secure mode.

(8) Restriction for DMAC address range

SYS-DMAC and RT-DMAC usage is restricted to 32bit virtual address range when IPMMU (uTLB) is used.
These restrictions are also described in the following registers. Please refer to section 30.2.

RDMFIXSAR, RDMFIXDAR, RDMFIXDPBASE, SDMFIXSAR, SDMFIXDAR, SDMFIXDPBASE

19.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

19.5.1 EDC for IP Memory Management Unit (IPMMU)

(a) Overview

EDC protection is applied to internal TLB RAM in IPMMU for main memory domain (IPMMU-MM).

TLB RAM is protected by SED-DED (single error detection, double error detection) EDC. Comparison logic for both EDC generator and EDC checker are implemented in IPMMU-MM as DCLS comparison error. Even if single error is detected, it doesn't correct the original data and doesn't update the data to main-IPMMU core. Also, error notification signal of the EDC error is asserted and notify this error to ECM. Both EDC generator and EDC checker are implemented in IPMMU-MM for each RAM macro.

TLB RAM support split-RAM structure in order to detect address bit failure.

(b) Hardware Description

Figure 19.15 shows a block diagram of the IPMMU protection for functional safety. Internal RAM is protected by EDC checking. TLB RAM is only provided in the MM domain.

When an error is detected, IPMMU issues error signal to ECM and records error information to the IMRAM0ERRSTR0/1 or IMRAM1ERRSTR0/1.

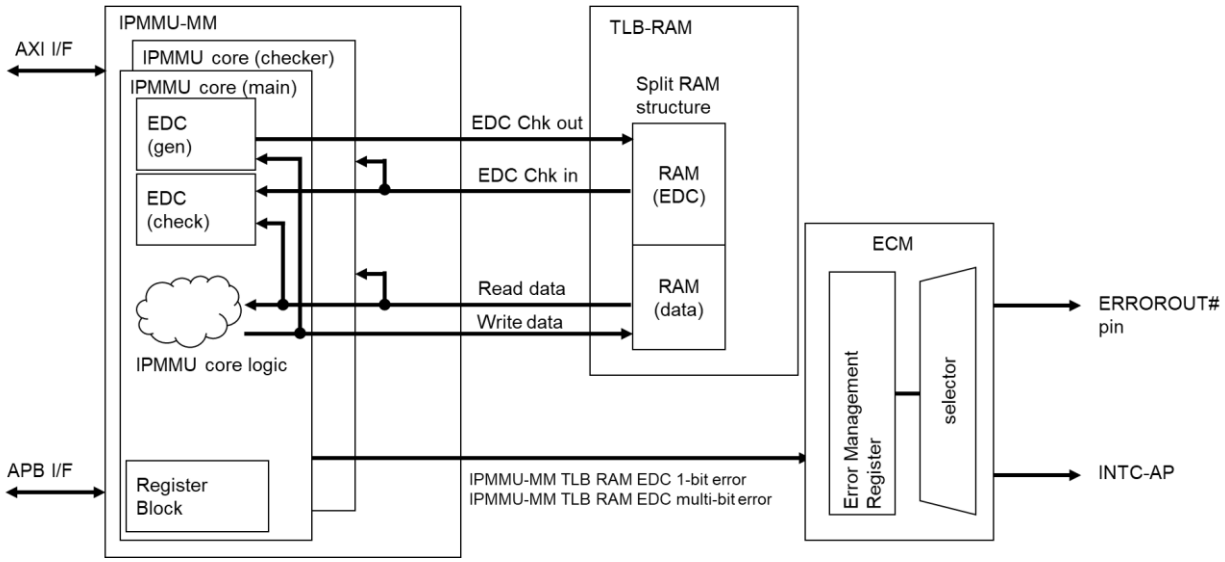

Figure 19.15 Block diagram of the IPMMU protection for Functional Safety

(c) Related Registers

Table 19.12 shows the each IPMMU base address. This table also shows which R-Car products have which IPMMUs. Basically, the IPMMU has one-to-one connections with each of the bus modules.

Table 19.12 IPMMU Base Address

MMU	Base Address
IPMMU-MM	H'EEFC 0000

Table 19.13 Register Configuration

Register Name	Abbreviation	R/W	Address Offset	Initial Value	Reset	Access Size
MMU RAM0 Error Control Register 0	IMRAM0ERRCTR0	R/W	H'0 05C0	H'0000 0000	Initialized	32

About register description of these registers, refer to R-CarV4M_UM_019_IPMMU_r0p81.xlsx and R-CarV4M_UM_019_IPMMU_long_descripter_r0p70.xlsx.

(d) Operation and Error Assignment of ECM

When an error is detected, the error notified to ECM module that is reported to INTC or the external systems through ERROROUT# pin. For details, see “Section 17, Error Control Module (ECM)”.

[Initial Setting]
Set the corresponding bits of the ECMERRCTLRn register 1’b1 to be enable error detection.
And set corresponding bits of the ECMERRTGTRn register 1’b1 to inform INTC (Interrupt Controller) the error or set 1’b0 to inform the external device of the error via the ERROROUT# pin.

ECMERRCTLRn	ECMERRTGTRn	Error Type
ECMERRCTLR21[22] = 1’b1	ECMERRTGTR21[22]	IPMMU-MM TLB RAM EDC 1-bit error
ECMERRCTLR21[21] = 1’b1	ECMERRTGTR21[21]	IPMMU-MM TLB RAM EDC multi-bit error

19.5.2 BUS EDC Protection for IPMMU

(a) Overview

EDC protection is applied to AXI-bus and APB-bus in IPMMU for main memory domain (IPMMU-MM) and IPMMU for each hierarchy domain (IPMMU-Cache).

(b) Hardware Description

Figure 19.16 and Figure 19.17 show a block diagram of the AXI-bus and APB-bus in IPMMU protection for functional safety. AXI-bus and APB-bus in IPMMU are protected by EDC checking. And these EDC modules are protected by DCLS comparison structure.
EDC for AXI-bus and APB-bus in IPMMU are implemented in both slave side and master side of IPMMU-MM.
EDC for AXI-bus and APB-bus in IPMMU are implemented in both slave side and master side of IPMMU-Cache.

And these errors have the function of error injection.

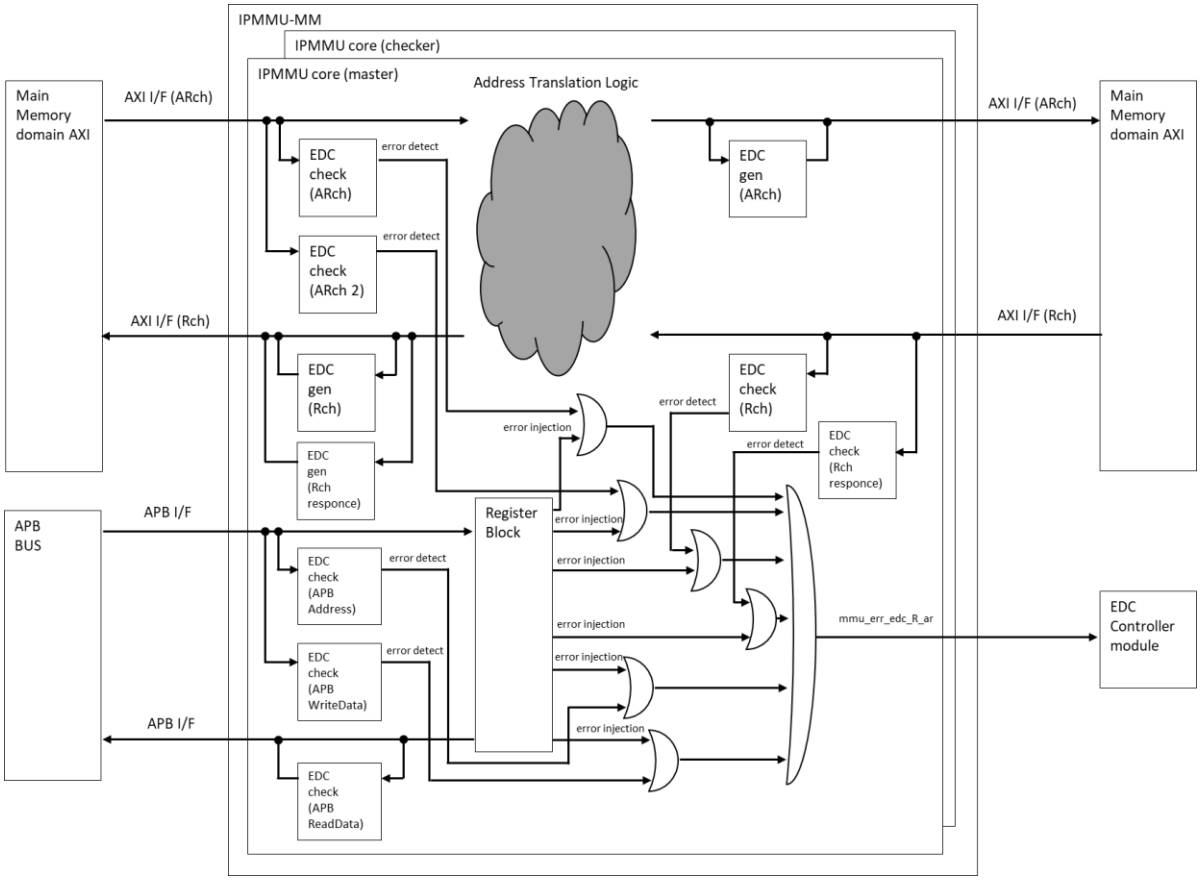

Figure 19.16 Block diagram of EDC protection of IPMMU-MM

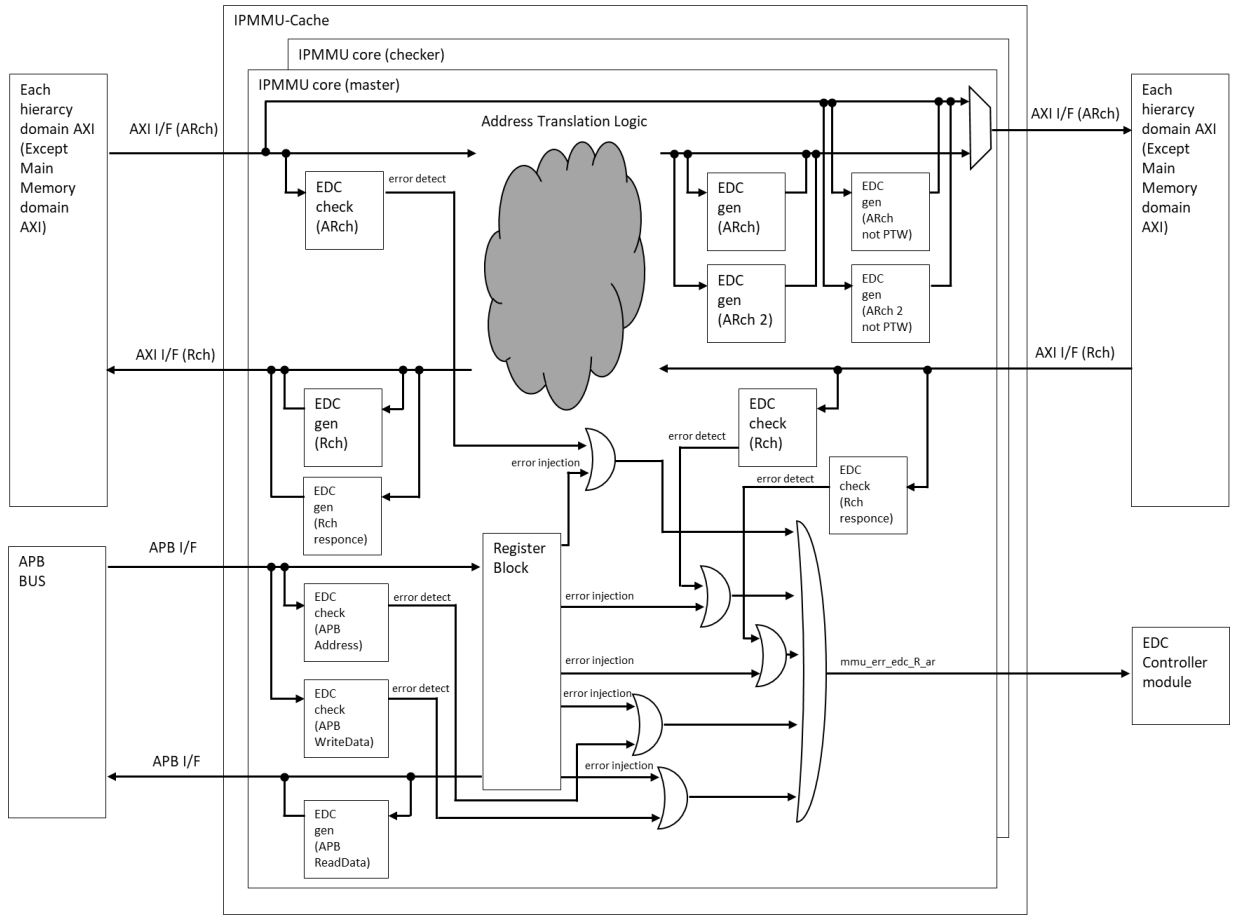

Figure 19.17 Block diagram of EDC protection of IPMMU-Cache

ISERRINJR	√	√

About register description of these registers, refer to R-CarV4M_UM_019_IPMMU_r0p81.xlsx and R-CarV4M_UM_019_IPMMU_long_descripter_r0p70.xlsx.

19.5.3 Hardware Redundancy for IPMMU

(a) Overview

Hardware redundancy is applied to the following IPMMUs in order to detect fault of functional logic.

— IPMMU-RT0 and IPMMU-RT1 in RT domain
— IPMMU-DS0 in PER0 domain
— IPMMU-MM in MM domain
— IPMMU-HC in HSC domain
— IPMMU-3DG in 3DG domain
— IPMMU-IR in IR domain
— IPMMU-VC in VC domain
— IPMMU-VI0 and IPMMU-VI1 in VIO domain
— IPMMU-VIP0 in VIP domain

(b) Hardware Description

Figure 19.18 shows the block diagram of IPMMU protection for functional safety. Not only the body of MMU logic but also the control registers are checked by lock-step operation. When an error related to the functional safety is detected, this error is reported through ECM and then to either INTC or the external system. Even if an error is detected, address translation operation can continue.

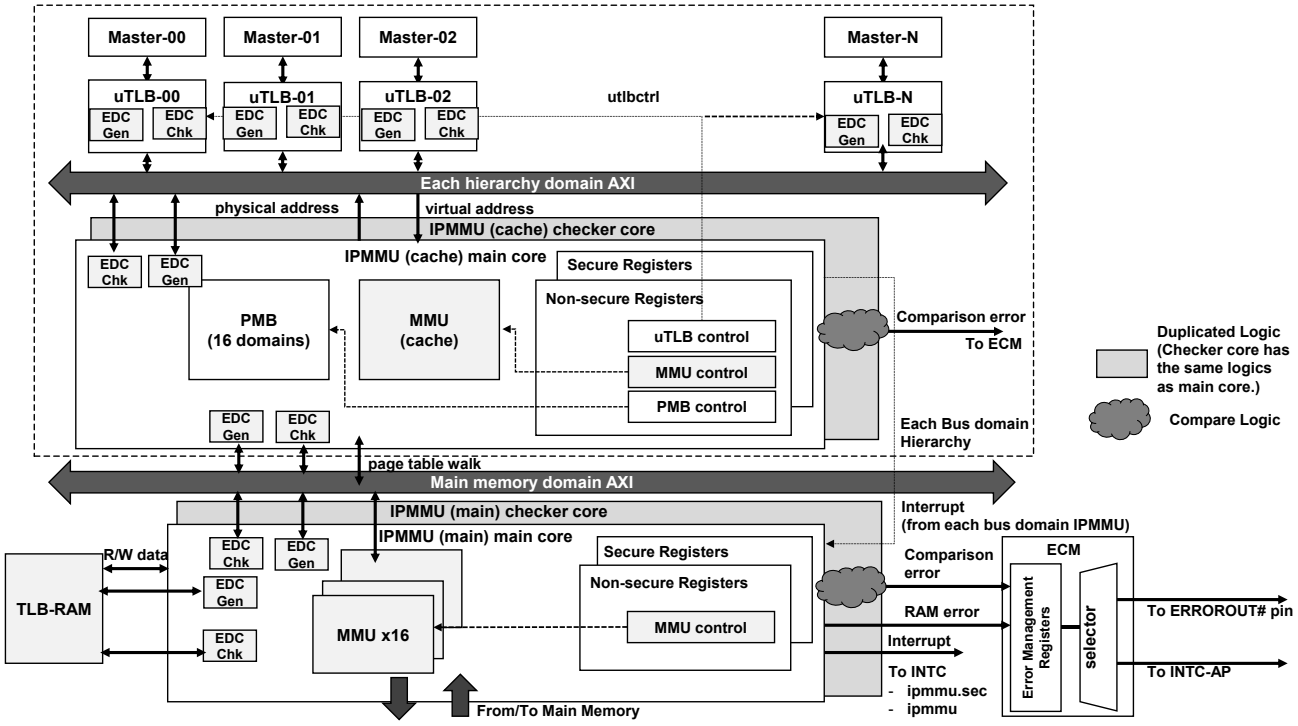

Figure 19.18 Block diagram of Hardware Redundancy for IPMMU

(c) Related Registers

Error by lock-step operation has the function of error injection.
This function could be controlled by a bit of MMU System Error Injection Register (ISERRINJR.ERRINJ_COMPFAIL). Refer MMU System Error Injection Register (ISERRINJR) in details.

(d) Operation and Error Assignment of ECM

When an error is detected, the error notified to ECM module that is reported to INTC (Interrupt Controller) or the external systems through ERROROUT# pin. For details, see “Section 17, Error Control Module (ECM)”.

[Initial Setting]
Set the corresponding bits of the ECMERRCTLRn register 1'b1 to be enable error detection.
And set corresponding bits of the ECMERRTGTRn register 1'b1 to inform INTC (Interrupt Controller) the error or set 1'b0 to inform the external device of the error via the ERROROUT# pin.

ECMERRCTLRn	ECMERRTGTRn	Error Type
ECMERRCTLR20[4] = 1'b1	ECMERRTGTR20[4]	IPMMU-DS0 checker core comparison error
ECMERRCTLR20[3] = 1'b1	ECMERRTGTR20[3]	IPMMU-MM checker core comparison error
ECMERRCTLR20[2] = 1'b1	ECMERRTGTR20[2]	IPMMU-RT0 checker core comparison error
ECMERRCTLR20[1] = 1'b1	ECMERRTGTR20[1]	IPMMU-IR checker core comparison error
ECMERRCTLR21[31] = 1'b1	ECMERRTGTR21[31]	IPMMU-HC checker core comparison error
ECMERRCTLR21[29] = 1'b1	ECMERRTGTR21[29]	IPMMU-3DG checker core comparison error
ECMERRCTLR21[28] = 1'b1	ECMERRTGTR21[28]	IPMMU-RT1 checker core comparison error
ECMERRCTLR21[27] = 1'b1	ECMERRTGTR21[27]	IPMMU-VC checker core comparison error
ECMERRCTLR21[26] = 1'b1	ECMERRTGTR21[26]	IPMMU-VI0 checker core comparison error
ECMERRCTLR21[25] = 1'b1	ECMERRTGTR21[25]	IPMMU-VI1 checker core comparison error
ECMERRCTLR21[24] = 1'b1	ECMERRTGTR21[24]	IPMMU-VIP0 checker core comparison error

19.5.4 Region-ID setting for page table walk request

(a) Overview

Each IPMMU cache can control Region-ID in the request of page table walk.

(b) Hardware Description

・Table number is set for each micro-TLB by IMUCTR register and IMCTR register.
・Region ID is not related to the Context-ID (MMU-ID) which is used for page table walk from IPMMU. (IPMMU doesn't check the Region ID from each IP)
・The memory area which TLB is located need to be given an access permission based on Region-ID as Figure 19.19.

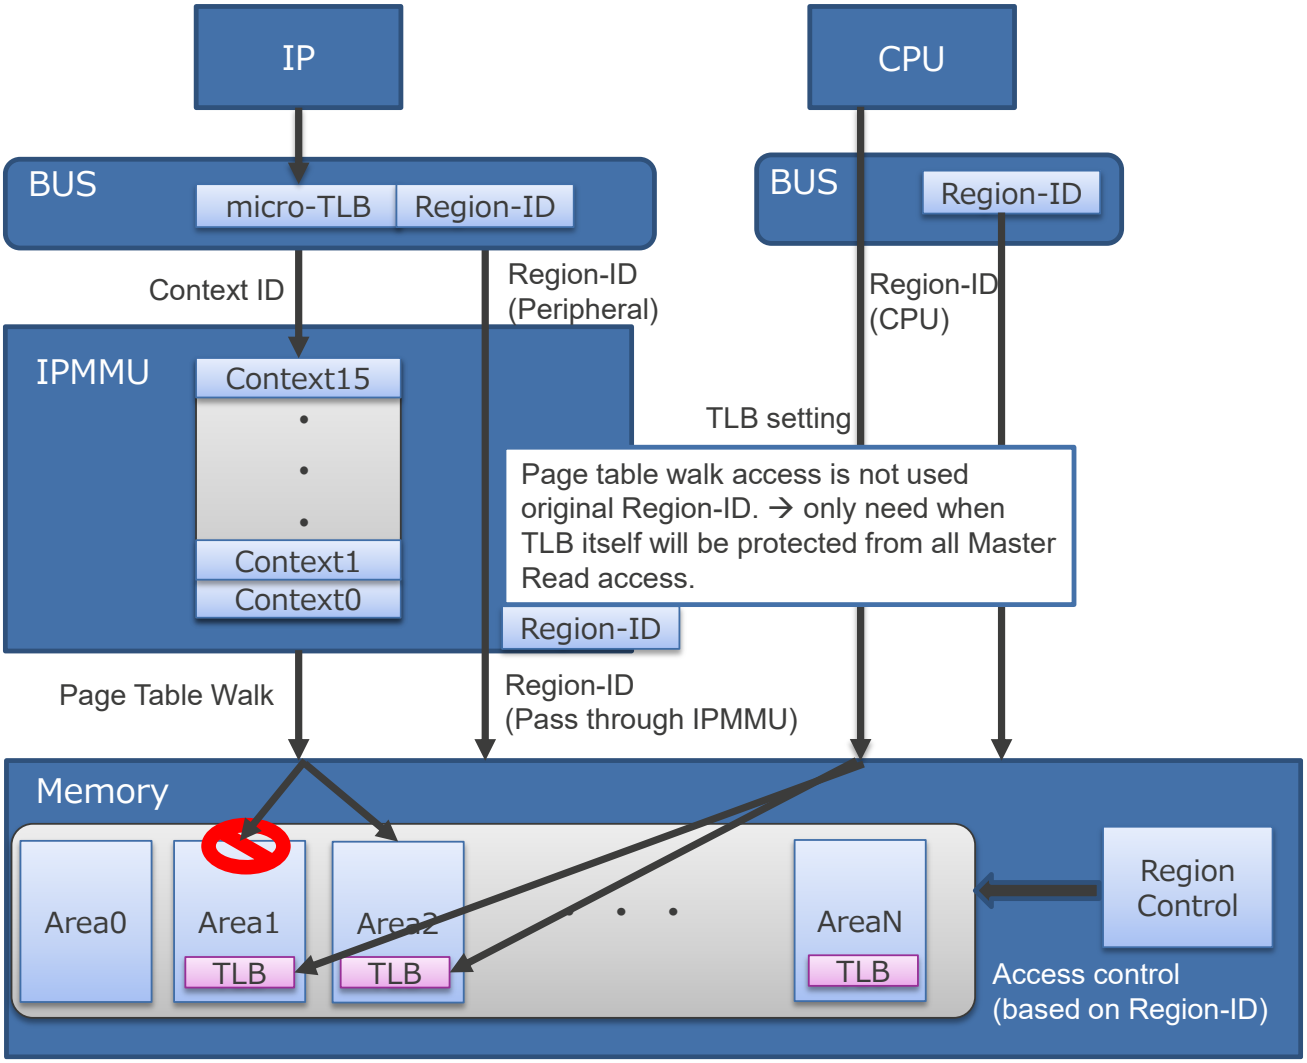

Figure 19.19 Region-ID protection for page table walk request

For example, Region-ID(CPU) is set to Area1 and Area2, but Region-ID (Peripheral) is set to Area2 only. In this case, TLB located in Area2 can be accessed by page table walk from Peripheral IP. But TLB located in Area1 cannot be accessed because access permission is not set.

(c) Related Registers

Region-ID in the request of page table walk can be set below registers in each IPMMU cache.

- MMU Region ID Register (IMRGID)
- MMU Region ID Enable Register (IMRGIDEN)
- MMU Secure Group Register (IMSECGRP)

In detail, refer to the register description.

30. Direct Memory Access Controller

This LSI includes a direct memory access controller for system (SYS-DMAC). The SYS-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

This LSI also includes a direct memory access controller in Real Time domain (RT-DMAC). The RT-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices.

30.1 Overview

30.1.1 Features

- Up to 32 DCLS channels are available due to 2 RT-DMAC instances.
- Up to 24 DCLS channels are available due to 2 SYS-DMAC instances.

- 1-T byte physical address space.
- Transfer data length: Byte, word (2 bytes), longword (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes.
- Maximum number of transfer times: 16,777,215.
- Address mode: Dual address mode.
- Transfer requests:
- Requests from on-chip peripheral modules or auto requests can be selected.
  - CRC can issue on-chip transfer requests to RT-DMAC.
  - I2C0~3, HSCIF0~3, SCIF0/1/3/4, TPU, MSIOF0~5, CANFD, SSI can issue on-chip transfer requests to SYS-DMAC.
- Selectable bus modes:
  - Normal speed mode or slow speed mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:
  - The DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor, at the end of the data transfer, in response to an MMU error, and in response to an address error.
- Descriptor function:
  - Up to 4096 sets of the settings for the source address register in external memory, destination address register, and transfer count register are available for use in setting up consecutive DMA transfers.
  - An infinite repeat mode is also available.
  - Event handling for descriptor suspension and execution for RT-DMAC.
- BUS I/F rate control
- FuSa:
  - All Channel FuSa DCLS supports (Core redundancy and comparison)
  - Bus protection and Memory protection (Security region assignment)
  - AXI and APB Bus EDC protection and Memory protection (Safety region assignment)

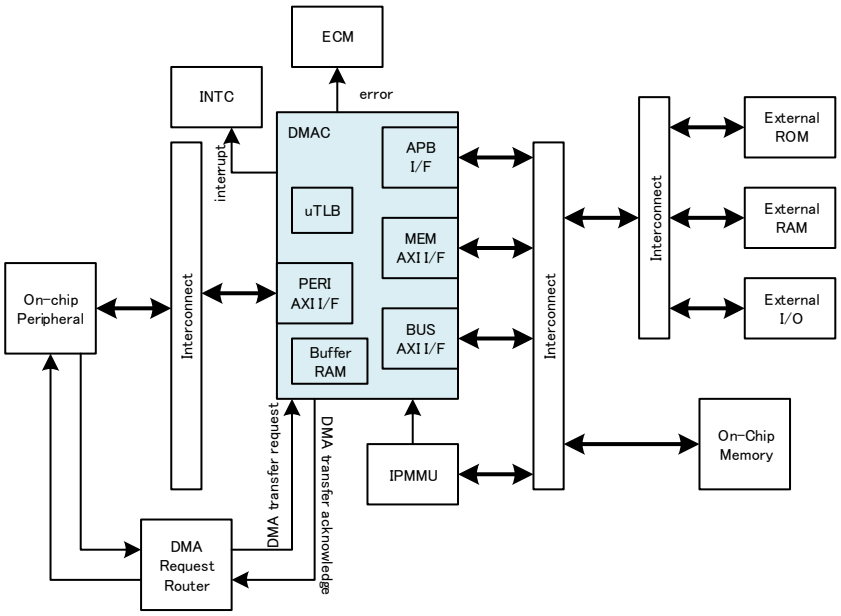

Figure 30.1 Block Diagram of the DMAC

30.1.2 Register configuration

Refer to R-CarV4M_UM_030_DMAC_r1p10.xlsx

30.2 Register Description

Refer to R-CarV4M_UM_030_DMAC_r1p10.xlsx

Table 30.1 SAR/DAR Address Restriction

Resource Selection	Address Mode	Restriction
Auto request	Incremental	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Incremental	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

30.3 Operation

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel in the DMRS.

30.3.1 DMA Transfer Requests

The transfer from/to SDRAM will use MEM I/F, and the transfer from/to peripheral will use PERI I/F, and other transfer source/destination will use BUS I/F

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the RT-DMAC to automatically generate a transfer request signal internally. When the DE bit in CHCR and the DME bit in DMOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in CHCR is 0.

(2) On-Chip Peripheral Module Request Mode

This mode is in case of CHCR.RS=1000.

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the peripheral is set as the transfer request, the transfer destination must be the peripheral transmit data register. Likewise, when receive data full transfer request of the peripheral is set as the transfer request, the transfer source must be the peripheral receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 30.2 DMA Transfer Requests

DMAC	Instance	DMA Request	Direction	DMARS	Note
RT-DMAC (0ch t0 31ch)	wcrc0	wcrc0_tsip0_res	Peri->DMAC	0x10

30.3.2 Channel Priority

When the RT-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMOR.

(a) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH14 > CH15.
CH0 > CH1 > ... > CH6> CH7.(SYS-DMAC 2 only)

(b) Round-Robin Mode

In round-robin mode each time data of one transfer unit (byte, word, longword, 8-byte or 16-byte unit) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH14 > CH15 immediately after reset.

30.3.3 Slow Speed Mode

DMAC has 2 kinds of Rate control (Slow Speed mode) function.

(a) SLM Bit in CHCRB

In the slow speed mode, DMA transfer is operated once in multiple clock cycle specified by SLM bit in CHCRB described at DMA channel control register B for RT-DMAC [m] in Channel[n](RDMCHCRB_[m]_[n])(m=0-1)(n=0-15), for SYS-DMAC 1 in Channel[n](SDMCHCRB_1_[n])(n=0-15) and for SYS-DMAC 2 in Channel[n](SDMCHCRB_2_[n])(n=0-7) in section 30.2 Register Description. It is possible whether DMA transfer is operated in slow speed mode or not for each DMA channel respectively. When some transfer channel in slow speed mode is kept waiting, it is possible for the other transfer channel in slow speed mode to operate DMA transfer during the waiting time.

(b) CNT Bit in RATE_RD and RATE_WR

In the rate access control mode, the performance of DMA transfer will decrease depending on value of the rate access counter which is set up by CNT bits in RATE_RD register or RATE_WR register. When to be enable rate access bit which is set up to 1 by EN bit in RATE_RD register or RATE_WR register, the rate access counter starts to count. Whenever value of CNT bits matches with value of counter register, then enable control bit will be toggled after 3 clock cycles.

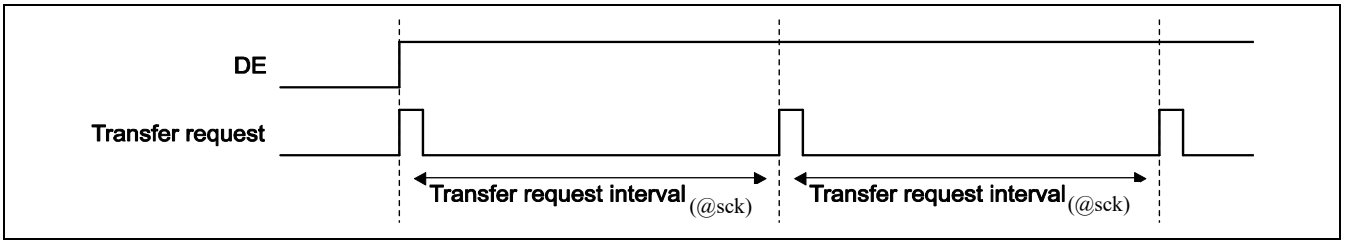

Figure 30.2 Slow Speed Mode

Table 30.4 Operation specification of Slow Speed Mode

	Operation for Slow mode	Support interface	Setting possible range (Transfer request interval)
SLB in CHCRB	Read and Write	Memory, Bus and Peripheral	0000: Normal mode 1000: 256 clock cycles 1001: 512 clock cycles 1010: 1024 clock cycles : 1111: 32768 clock cycles
RATE_RD	Read	Bus	3-255: valid setting (CNT + 1) * 2 + 3 (clock cycle)
RATE_WR	Write		

30.3.4 Descriptor

Descriptor is enabled by setting B'01, B'10 or B'11 to DPM[1:0] bit in CHCR. When TCR decrease to 0, and DMA transfer is stopped, Descriptor load next configuration from Descriptor and set to the register of the channel. Maximum number of steps is 256 when single channel is operated. Descriptor maximum step can extend to 4096 for external memory.

Set below in order to use Descriptor.

- Set base address of Descriptor which configurations of DMA transfer are written to DPBASE.
- Set 1 to DRST bit in CHCRB in order to reset Descriptor.
- Set the number of steps to DCNT bit in CHCRB. For the maximum step can be 4096, the DCNT bit in DPCR is used to set the upper bits for the number of steps. For example, if using 256 as the number of steps, 0xFF need to set to DCNT in CHCRB. If using 4096 as the number of steps, not only 0xFF need to set to DCNT in CHCRB, but also 0xF need to set to DCNT in DPCR.

Descriptor is shared by all DMA channels. Therefore, it is necessary to eliminate crossover of address spaces which are used by each DMA channel. And, arrange each step of Descriptor in 16-byte boundary.

There are two different methods to start Descriptor.

- Set configuration of first DMA transfer to SAR, DAR, TCR register and configurations of following DMA transfer to Descriptor, then set 0 to DPB bit in CHCR in order to start Descriptor. In this case, first DMA transfer is operated according to the configuration of SAR, DAR, TCR register and configuration of following DMA transfer is loaded when preceding DMA transfer ended. Then configurations of next DMA transfer are loaded from Descriptor and

second DMA transfer start. But if Descriptor is operated as repeat mode, configuration of SAR, DAR, TCR register are not loaded and Descriptor repeatedly load configuration from the head of Descriptor.

- Write configurations of DMA transfer to Descriptor, then write 1 to DPB bit in CHCR in order to start Descriptor. In this case, DMA transfer start from head of descriptor.

There are three different operating mode of Descriptor. Operating mode is specified by DPM[1:0] bit in CHCR register.

Details of each operating mode are described below.

(1) Setting Updating Flow By Descriptor

The setting updating flow by Descriptor can be specified by the RPT bit of CHCR.

If the setting updating flow by Descriptor is completed, the DPTR bit of CHCRB is incremented 1. When DPTR value equals to DCNT value, DPTR value returns to 0. DPTR also can be extends to 4096 by using DPTR bits in DPCR.

This flow is automatically processed with hardware.

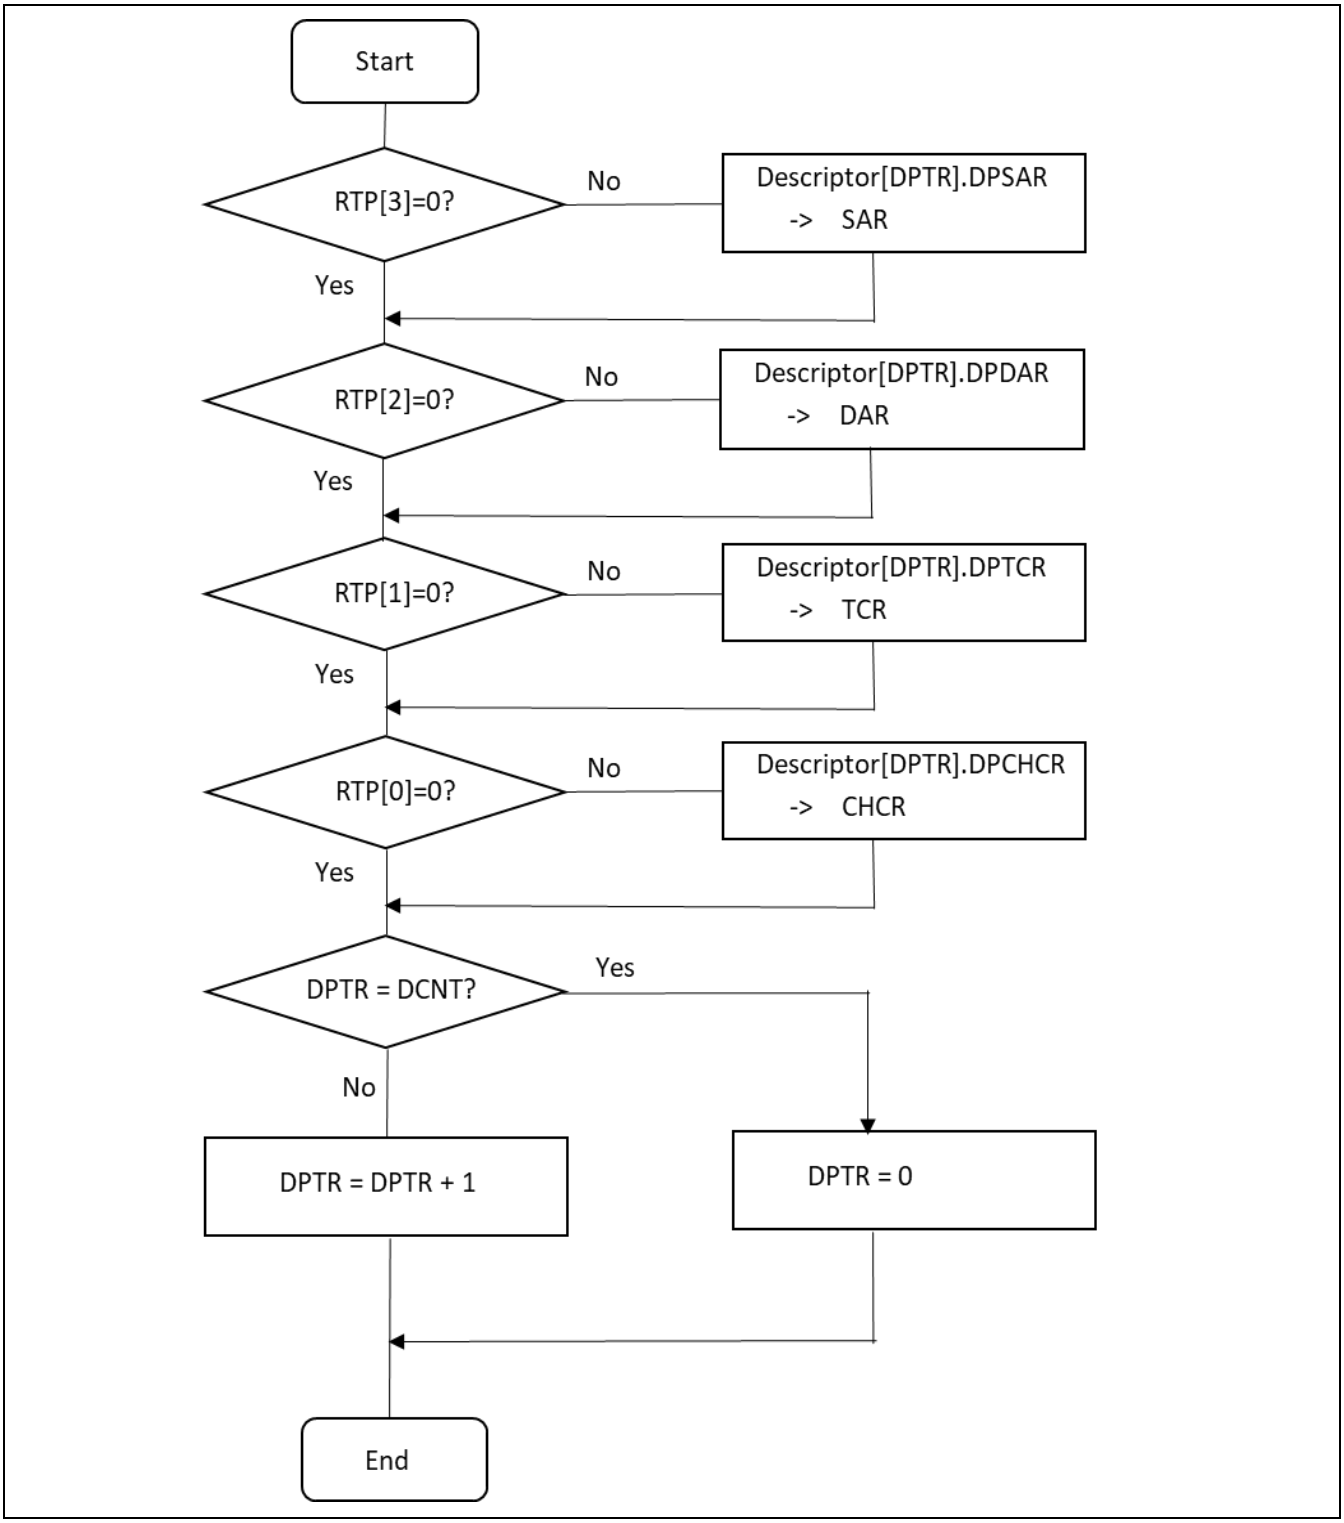

Figure 30.3 Setting Updating Flow by Descriptor

(2) Descriptor Operational Mode 1

The descriptor operational mode 1 (descriptor normal operation mode) sets 1 to TE bit of CHCR after the descriptor number-of-step transmission set as DCNT of a CHCRB register, and a DMA transfer ends. To select this operational mode, set B'01 to DPM of CHCR. Continuously transferring by a descriptor can be performed by setting to this operational mode.

When DSIE is set as 1, a DSE interrupt occurs for every termination of one step of descriptor. If the next DSE interrupt occurs without performing DSE interrupt processing, the following descriptor will not be read but a DMA transfer will stop. If a DSE bit is cleared, only interruption generated first will be cleared and the following descriptor will be read.

These are examples when the number of steps of Descriptor is set as four steps.

When the Descriptor operational mode 1 and TE/DSE is enabled, the example of transfer operation is shown in Figure 30.4.

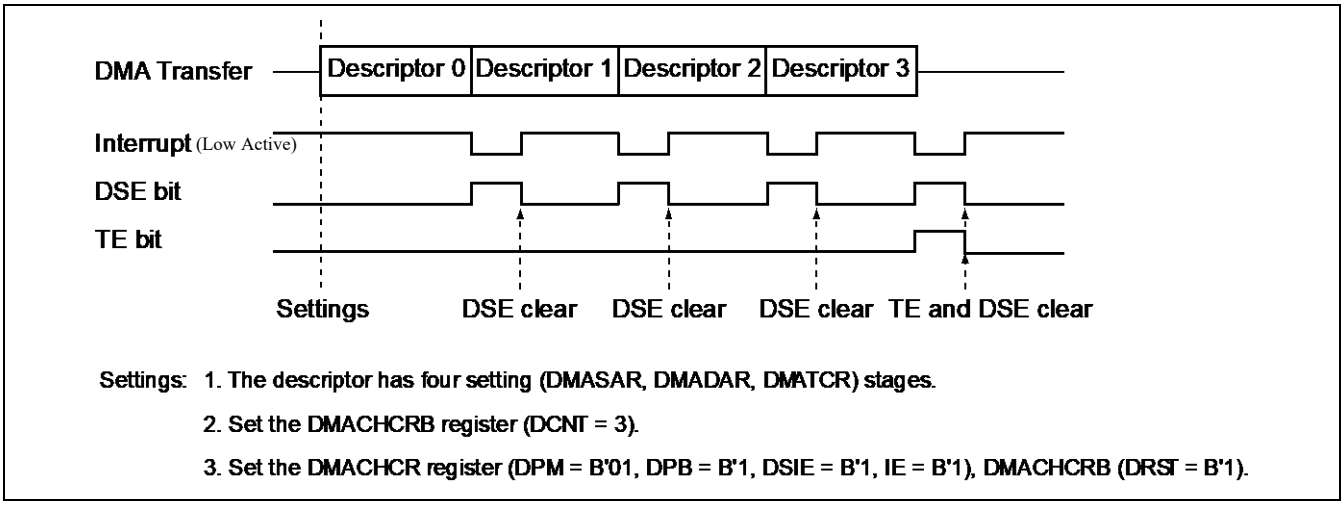

Figure 30.4 Descriptor Operational Mode 1 (Example 1)

When the Descriptor operational mode 1 and TE/DSE is enabled, if DSE interruption handling is delayed, the example of transfer operation is shown in Figure 30.5.

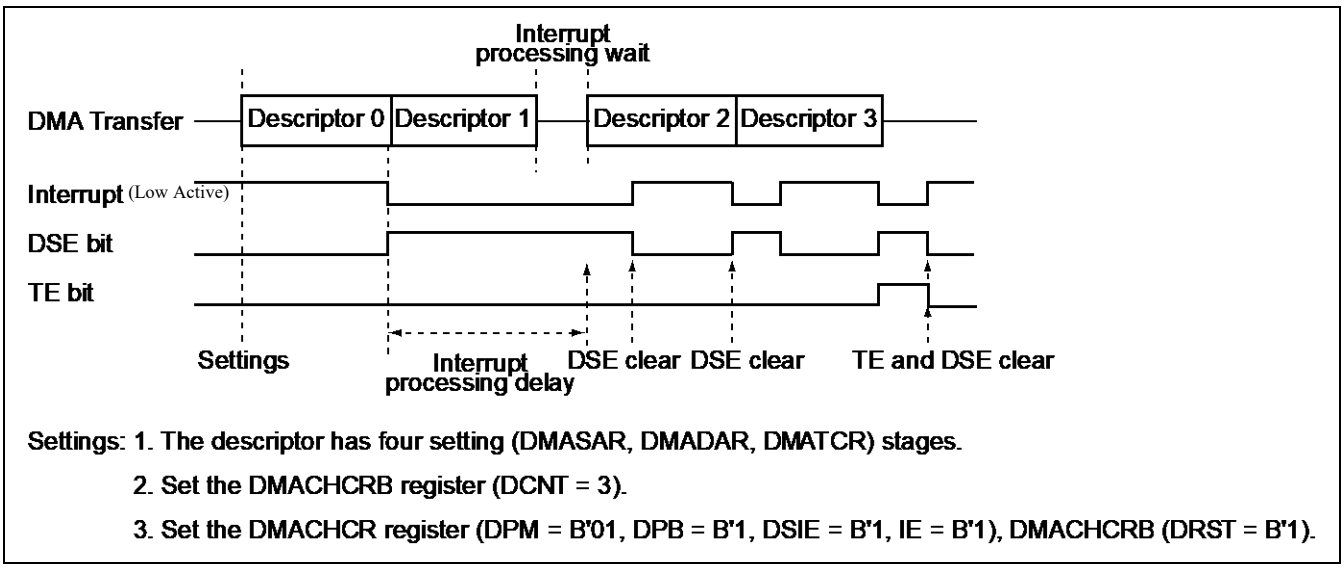

Figure 30.5 Descriptor Operational Mode 1 (Example 2)

When the Descriptor operational mode 1 and TE is enabled, the example of transfer operation is shown in Figure 30.6.

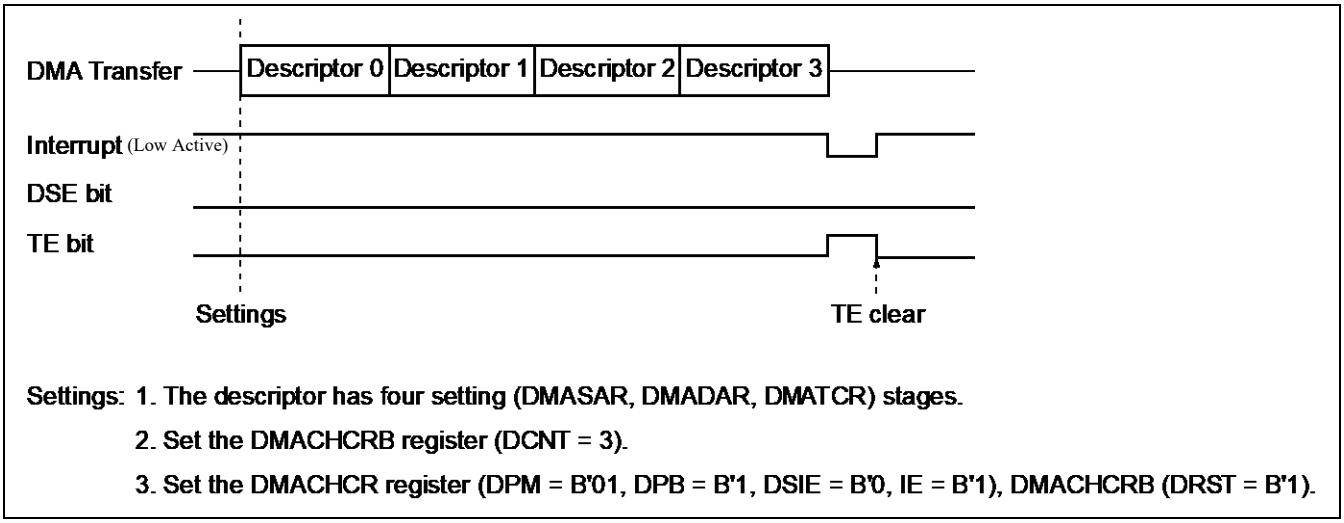

Figure 30.6 Descriptor Operational Mode 1 (Example 3)

(3) Descriptor Operational Mode 2

The descriptor operational mode 2 (repeat mode) sets 1 to TE bit of CHCR after the descriptor number-of-step transmission set as DCNT of CHCRB and repeats a DMA transfer again from the head of a descriptor. To select this operational mode, set B'10 to DPM of CHCR. Continuously transferring by a descriptor can be performed by setting to this operational mode.

When DSIE is set as one, a DSE interrupt occurs for every termination of one step of descriptor. If the next DSE interrupt occurs without performing DSE interrupt processing, the following descriptor will not be read but a DMA transfer will stop. If a DSE bit is cleared, only interruption generated first will be cleared and the following descriptor will be read.

When DSIE is set as 0, 1 is set to TE bit of CHCR after all the descriptor number-of-step transmission, and TE interrupt occurs. If the next TE interrupt occurs without performing TE interrupt processing, the following descriptor will not be read but a DMA transfer will stop. If TE bit is cleared, only interruption generated first will be cleared and the following descriptor will be read.

Change into the descriptor operational mode 1 in TE interrupt processing to end the descriptor operational mode 2.

By changing into the descriptor operational mode 1, a DMA transfer is completed to the following TE interruption occurrence time.

These are examples when the number of steps of Descriptor is set as four steps.

When the Descriptor operational mode 2 and TE/DSE is enabled, the example of transfer operation is shown in Figure 30.7.

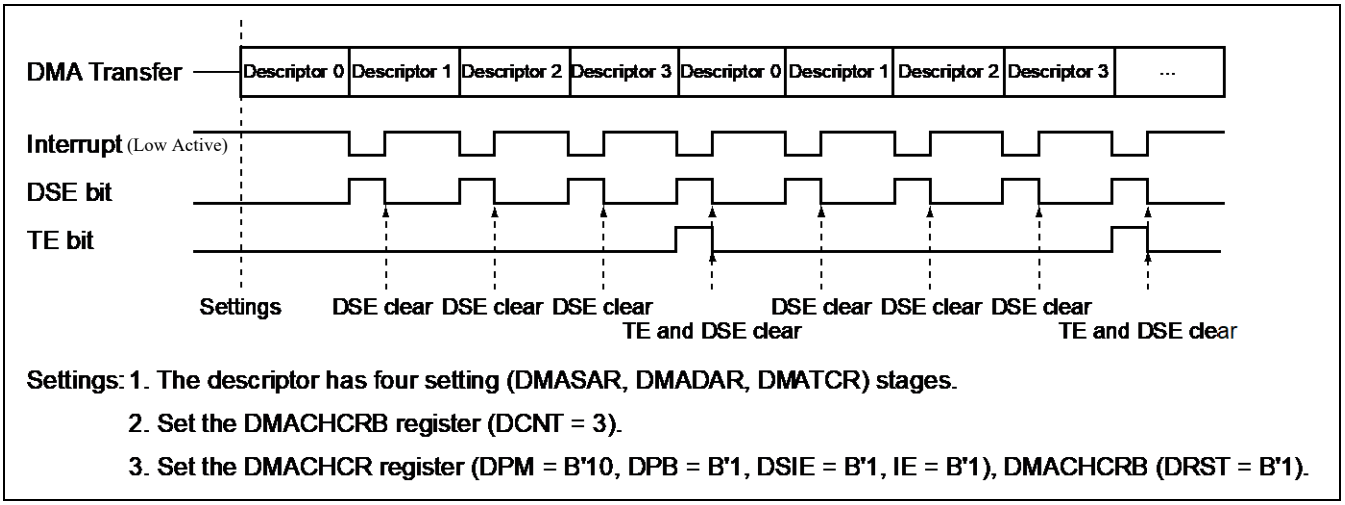

Figure 30.7 Descriptor Operational Mode 2 (Example 1)

When the Descriptor operational mode 2 and TE/DSE is enabled, if DSE interruption handling is delayed, the example of transfer operation is shown in Figure 30.8.

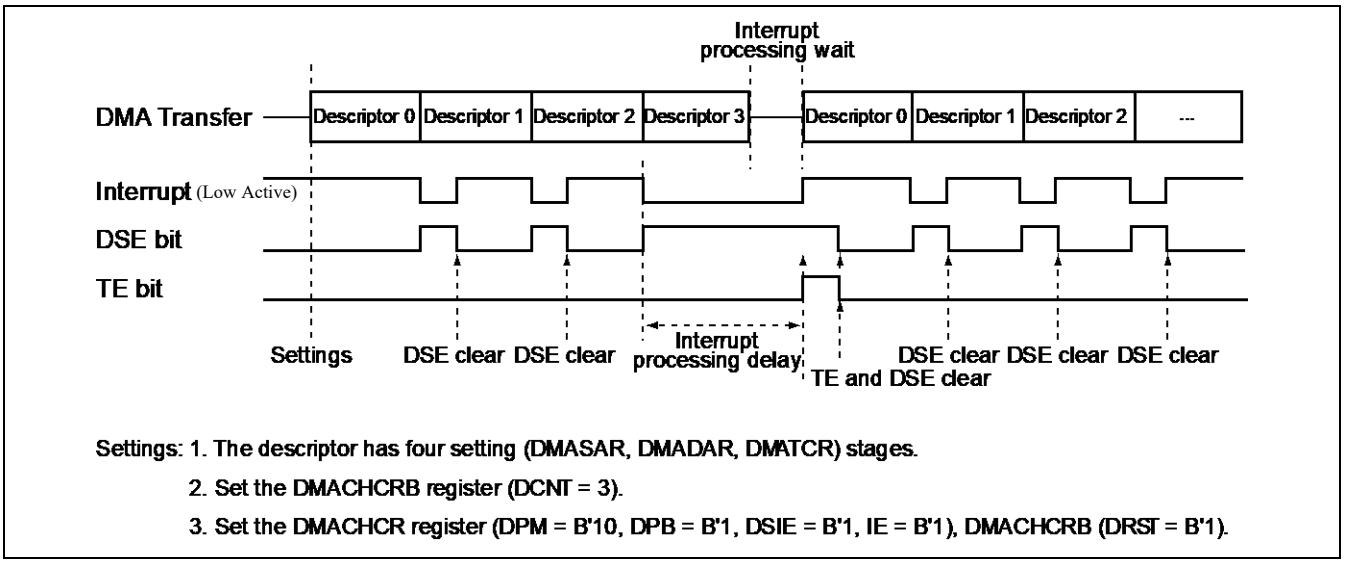

Figure 30.8 Descriptor Operational Mode 2 (Example 2)

When the Descriptor operational mode 2 and TE is enabled, the example of transfer operation is shown in Figure 30.9.

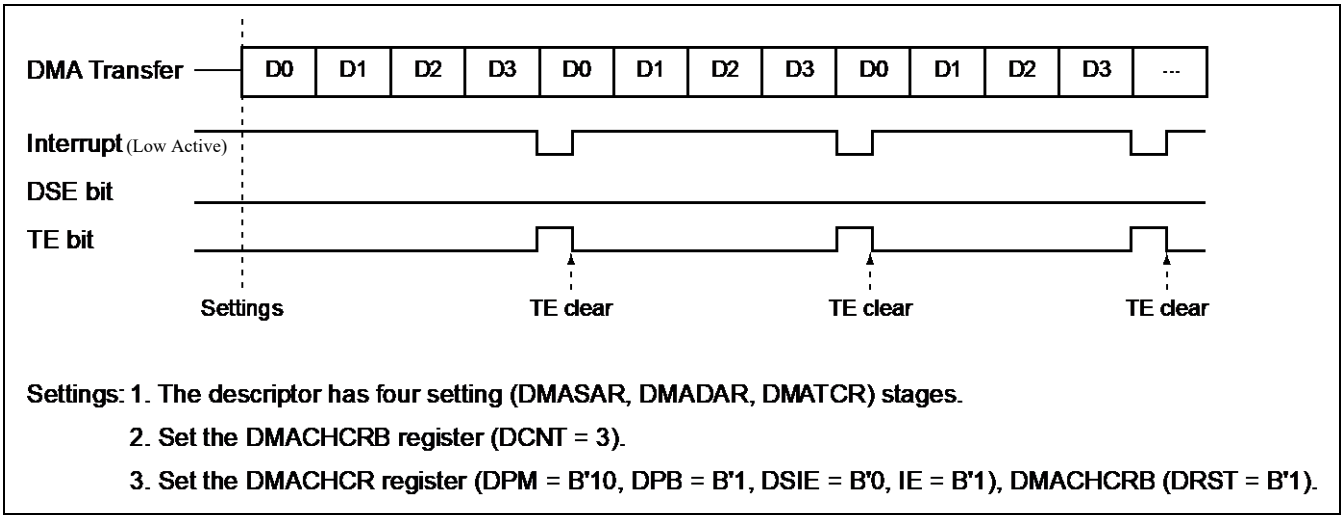

Figure 30.9 Descriptor Operational Mode 2 (Example 3)

When the Descriptor operational mode 2 and TE is enabled, if TE interruption handling is delayed, the example of transfer operation is shown in Figure 30.10.

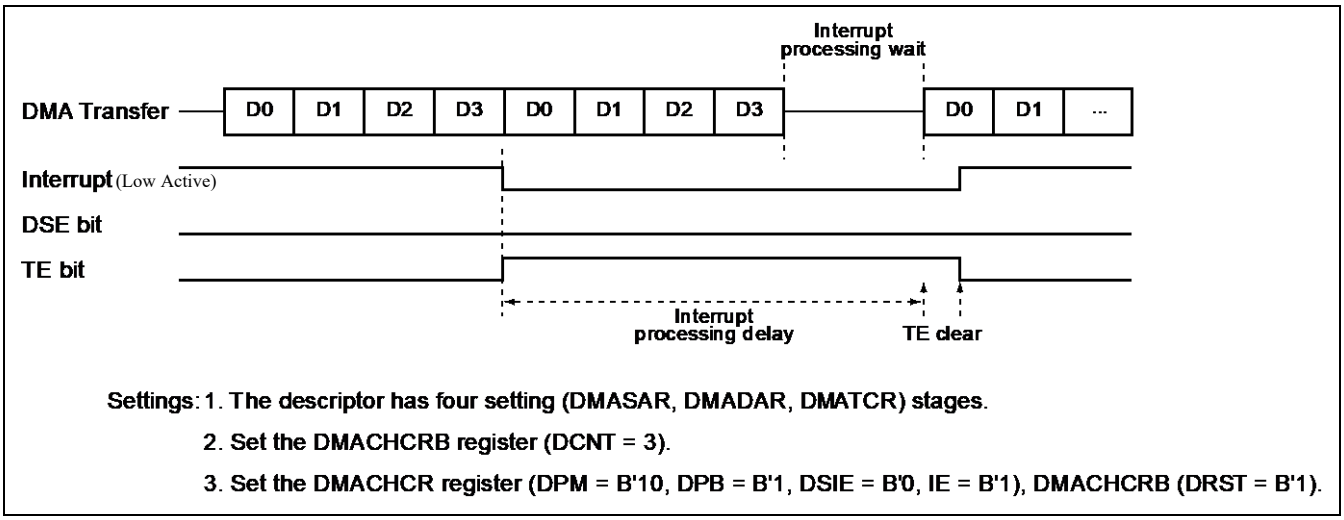

Figure 30.10 Descriptor Operational Mode 2 (Example 4)

(4) Descriptor Operational Mode 3

Change to infinite repeat mode and a descriptor read-out interrupt mode is possible for the descriptor operational mode 3 by the setting existence of DSIE and IE bit.

Descriptor infinite repeat mode performs the DMA transfer repeatedly set as the descriptor after completing transmission of the number of steps set as DCNT of CHCRB until it stops a DMA transfer repeatedly from the head of a descriptor again.

A DSE interrupt generates a descriptor read-out interrupt mode after reading the descriptor set as the DIPT register of DPCR. A descriptor can be started from a continuation by setting up to the following number of sections in DSE interrupt processing and clearing DSE. Similarly, it repeats from the head of a descriptor again after termination to the number of sections set as DCNT of CHCRB.

After a DMA transfer is completed during DSE interrupt processing, a DMA transfer is stopped without reading the following descriptor. When DSE interruption is cleared, the following descriptor is read, and transmission is resumed.

To select descriptor infinite repeat mode of the descriptor operational mode 3, set B'11 to the DPM bits and 0 to the DSIE and IE bits of CHCR register.

This operational mode is repeated from the head of a descriptor after the descriptor number-of-step transmission set as DCNT of CHCRB.

Perform a DMA transfer interruption process to stop this operational mode.

When performing the descriptor read-out interrupt mode of the descriptor operational mode 3, the number of sections of the descriptor which set the descriptor CHCR range to the DCNT register of CHCRB and was set as the DIPT bit of a DPCR register is set up. Set B'11 to the DPM bit of a CHCR register, set 1 to a DSIE bit, and start a DMA transfer.

A descriptor can be continuously started by a DSE interrupt occurring, setting up the following descriptor in interrupt treatment, and clearing interruption.

A descriptor number of sections is an example at the time of setting it as four steps.

When the Descriptor operational mode 3 and the example of infinite repeat mode transfer operation, the example of transfer operation is shown in Figure 30.11.

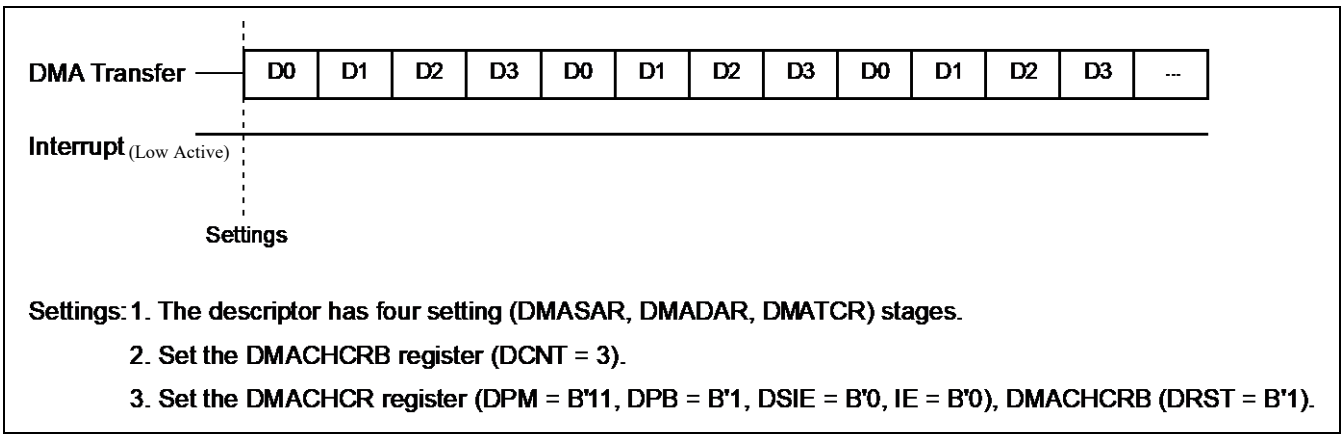

Figure 30.11 Descriptor Operational Mode 3 (Infinite Repeat)

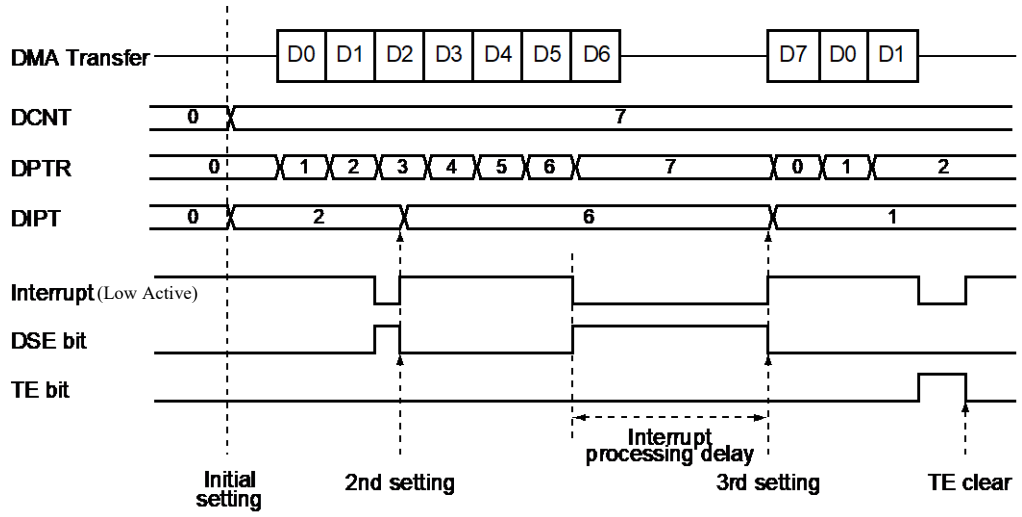
When the descriptor operational mode 3 and the example of descriptor read-out interrupt mode, the example of transfer operation is shown in Figure 30.12.



Initial setting:
1. Set the DMACHCRB register (DCNT = 7).
2. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
3. Set the DMADPCR register (DIPT = 2).
4. Set the DMACHCR register (DPM = B'11, DPB = B'1, DSIE = B'1, IE = B'0), DMACHCRB (DRST = B'1)

2nd setting:
1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT = 6).
(3 stages + 4 stages -1) mod 8 = 6
3. Clear DSE.

3rd setting: (Transfer end)
1. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT =1).
(3 stages + 4 stages + 3 stages -1) mod 8 = 1
3. Clear the DSE bit and set the DMACHCR register (DPM = B'11, DPB = B'0, DSIE = B'0, IE = B'1).

Figure 30.12 Descriptor Operational Mode 3 (Descriptor Read-Out Interrupt Mode)

(5) The Double Buffer Using of Descriptor

To use Descriptor for double buffering, set the number of Descriptor steps as two steps, and write each configuration of buffer in a descriptor. Then start it as the descriptor operational mode 2. Interruption uses only DSE interruption.

To end the use of double buffering, disable the descriptor operational mode. It stops after completing the transmission under execution.

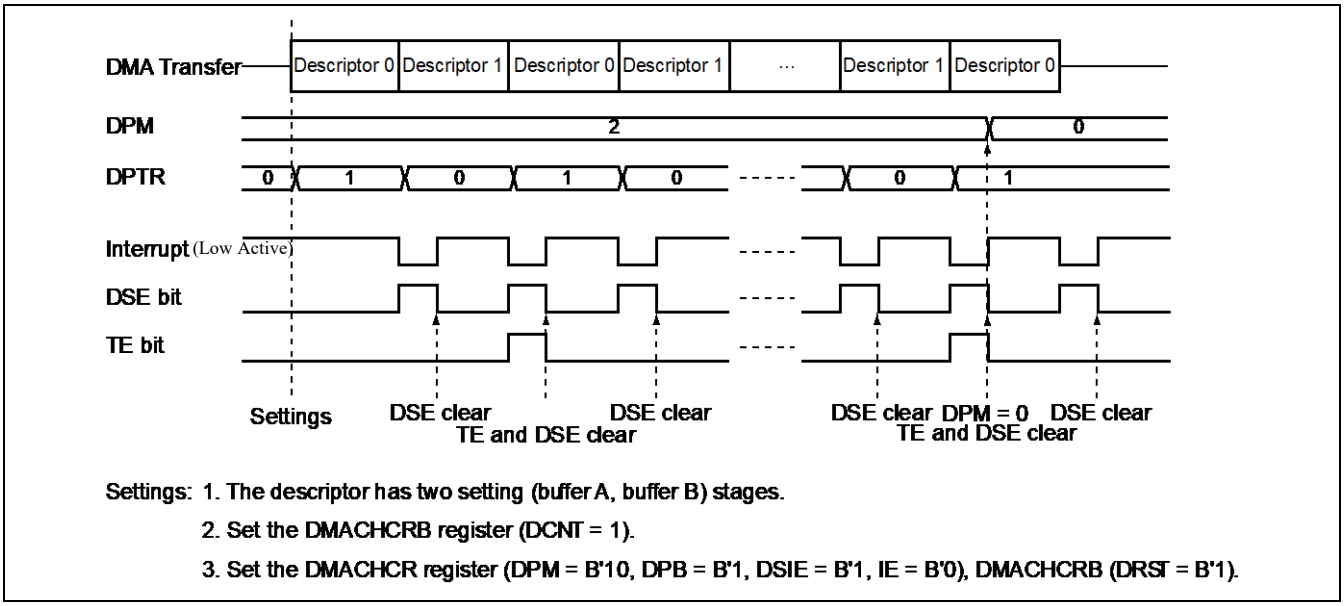


Figure 30.13 The Double Buffer by a Descriptor

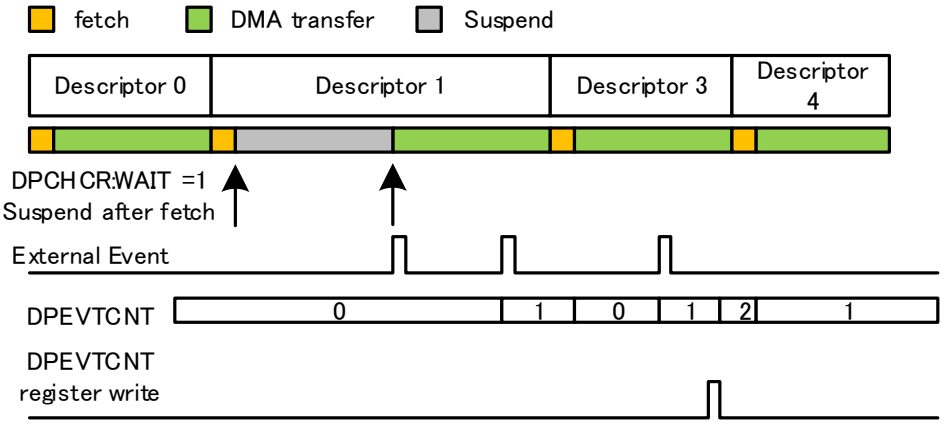
(6) Descriptor Suspend and Resume

To adapt the peripheral data collection speed, a descriptor processing suspend and resume scheme is introduced in to S4. Descriptor processing in every channel can suspend after its DPCHCR fetched into DMAC and the WAIT bit in DPCHCR is set to 1, and the suspending descriptor processing can resume by the selected external event trigger edge or by register DPEVTCNT write.



Notice: if user uses DPCHCR updating, RPT[0] in CHCR must be set.

The write access (regardless of value) of DPEVTCNT will trigger a pseudo-event.

The DPEVTCNT records how many external events or pseudo-events happen, if events come, the DPEVTCNT register bit EVTCNT will increment. If the DPEVTCN.EVTCNT is 0x7F and new event comes, overflow happens and the DPEVTCNT register bit OV set, DMISTA register bit OV [15:0] will set too corresponding bit that behalf current channel. The interrupt of AE will assert as well. When overflow happens, the event cannot resume the suspending descriptor processing any more until overflow is reset and new event come.

When descriptor processing is suspending, if the DPEVTCNT.EVTCNT is not 0 and not overflow, the descriptor processing will resume. If the DPEVTCNT.EVTCNT is 0, the suspending keeps until new event comes. If the DPEVTCNT.OV is 1, the suspending keeps until OV is reset by DPEVTCR.RST or CHCLR.CLR set.

When descriptor processing is suspending, the WAIT status can be checked by reading CHCR register bit WAIT.

and if the descriptor processing resumes, the DPEVTCNT will decrement.

Typical operation that wait event:

1. Prepare descriptors in the external memory, mark 1 to the WAIT bit of DPCHCR in corresponding descriptor which want to be suspend.
2. Configure DMAC channel that will use the above descriptors, set DPEVTCR register bit EXEN be 1 to enable external event input and set DPEVTCR register bit EVTID [4:0] for current channel to select which external event to use.
3. Start descriptor processing. DMAC will stop after it fetched the descriptor and found that DPCHCR.WAIT is set.
4. The descriptor processing suspends and is waiting event comes
5. The selected external event comes, and DMAC detect the rising edge of this event, DPEVTCNT.EVTCNT increments.
6. Suspending descriptor processing resumes and start its DMA transfer, DPEVTCNT.EVTCNT decrements.

The step 5 above can also be replaced by “write DPEVTCNT, DPEVTCNT.EVTCNT increments”

Typical operation that event outstanding:

1. Prepare descriptors in the external memory, mark 1 to the WAIT bit of DPCHCR in corresponding descriptor which want to be suspend.
2. Configure DMAC channel that will use the above descriptors, set DPEVTCR register bit EXEN be 1 to enable external event input and set DPEVTCR register bit EVTID [4:0] for current channel to select which external event to use.
3. Start descriptor processing. DMAC will stop after it fetched the descriptor and found that DPCHCR.WAIT is set.
4. Before descriptor processing suspends, the selected events come multiple times and DPEVTCNT.EVTCNT increment by each rising edge of the event.
5. The descriptor processing suspends and resumes immediately, DPEVTCNT.EVTCNT decrements.

The step 4 above can also be replaced by “write DPEVTCNT multiple times, DPEVTCNT.EVTCNT increments”

Typical operation that event overflow:

1. Prepare descriptors in the external memory, mark 1 to the WAIT bit of DPCHCR in corresponding descriptor which want to be suspend.
2. Configure DMAC channel that will use the above descriptors, set DPEVTCR register bit EXEN be 1 to enable external event input and set DPEVTCR register bit EVTID [4:0] for current channel to select which external event to use.
3. Start descriptor processing. DMAC will stop after it fetched the descriptor and found that DPCHCR.WAIT is set.

4. Before descriptor processing suspends, the selected events come too many times and DPEVTCNT.EVTCNT increment and finally overflow. DPEVTCNT.OV bit set and AE interrupt assert.

5. The descriptor processing suspends.

6. ECM detects the interrupt and interrupt processing master checks DMISTA.OV[15:0] to find OV in which channel happens.

7. Interrupt processing master set DPEVTCR.RST in corresponding channel to reset DPEVTCNT register, or just set CHCLR.CLR to reset the channel itself.

8. New event comes and resume the suspending descriptor processing.

30.3.5 Transmission Flow

Write transfer condition setup in DMA source address register (SAR), DMA destination address register (DAR), DMA transfer count register (TCR), DMA Channel control register (CHCR), DMA operation register (DMOR) and a DMA extended resource selector (DMRS), and DMAC transmits data in following order.

- A transfer request occurs and confirm whether to be a transfer permission state for (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). In the case of the auto request mode, start transmission automatically.
- Check whether updating by Descriptor is required.
  When DPB of CHCR is set to 1 or Descriptor is enabled, if TCR is set to 0, updating by Descriptor is operated at the state where transmission is completed.
  About updating by Descriptor, refer to a section 30.3.4, Descriptor.
- Check whether the address translation by IPMMU is required.
  When DE of CHCR is enabled, if updating of transfer setting by Descriptor is operated and address exceeds the effective size of address translation, address translation by IPMMU is operated.
- If transfer request is generated, one transfer unit (specified by TS [3:0]) will be transmitted. TCR will be decremented 1 at every termination of DMA transfer.
- When transmission of the number of times having been specified is finished (the value of TCR is set to 0), transmission is ended normally. At this time if IE bit of CHCR is set 1, TE interruption will be generated to CPU. When Descriptor is enabled, processing changes with each Descriptor operational modes. For details, see section 30.3.4, Descriptor.
- Transmission is terminated when the address error occurs in DMA transfer. In addition, transmission is terminated even if DE bit of CHCR or the DME bit of DMOR is set to 0.

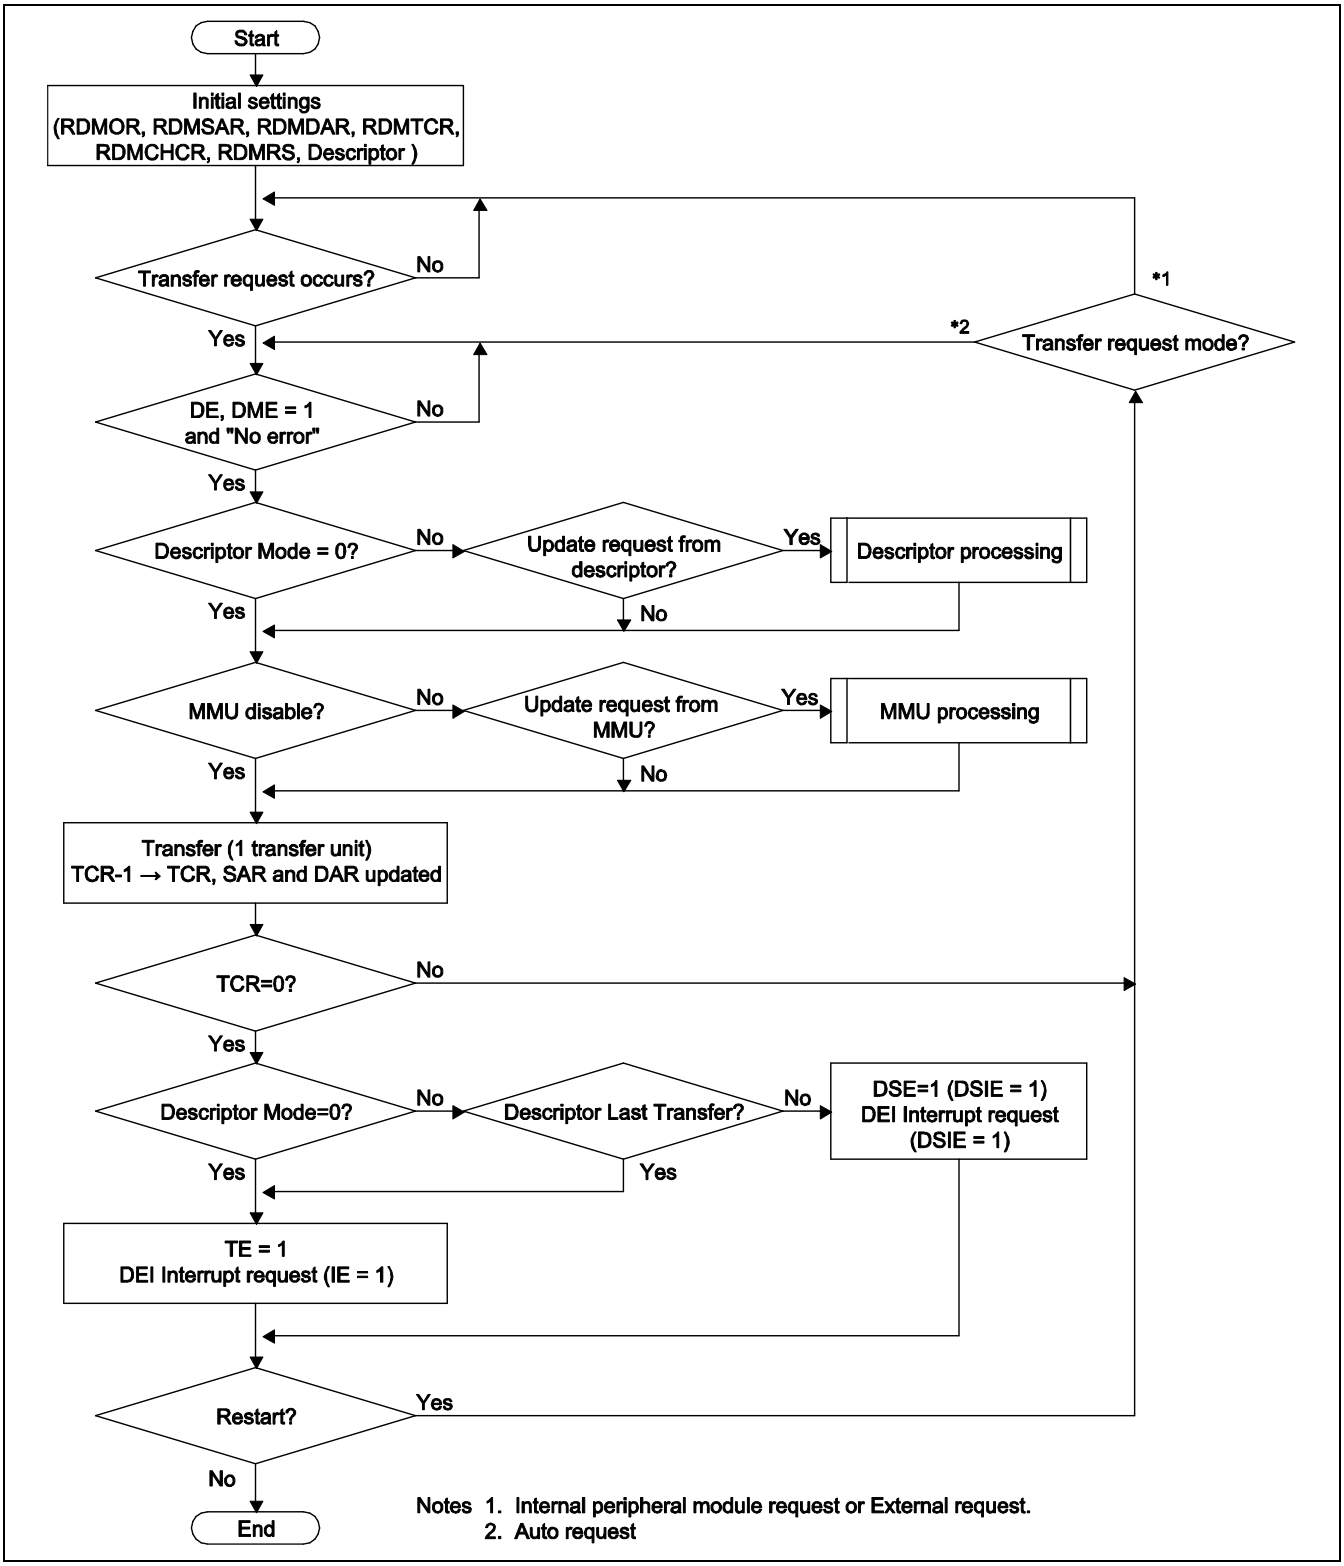


Figure 30.14 Transmission Flow

30.3.6 Total Size Transmission

Total size transmission can be set to TSR by byte size regardless of DMA transfer size (CHCR.TS). Thereby, arbitrary sizes can be transmitted with big DMA transfer size.

In order to use this function, use the address for Total size transmission of SAR, DAR, TSR, TSRB and CHCR (Refer to section 30.2 Register Description for the register for Total size transmission).

Total size is set in the TCR (TSR) of Descriptor and 1 is set in CHCRB.DTS at the time of Total size transmission use.

30.3.7 DREQ Outstanding and DMA Outstanding

To adapt the peripheral w/ high throughput and extract the maximum performance of RT-DMAC, DREQ outstanding and DMA outstanding option feature can be used in such case.

30.3.7.1 DREQ Outstanding

Normally, DMAC channel receives a DREQ (DMA transfer REQuest) from peripheral, then start DMA transfer. And after DMA transfer finish, DACK (DMA transfer ACKnowledge) will send back to the peripheral. So the peripheral must wait DACK and then assert new DREQ.

User can set CHCRB register bit DREQOSEN of current channel to enable DREQ outstanding feature.

In DREQ outstanding enable mode, current DMAC channel receives DREQ from peripheral, and store it to built-in DREQ outstanding buffer, then return the DACK immediately to the peripheral, and if the peripheral has the capability to send the next DREQ, DMAC will store it again and return the DACK, and so on until the peripheral has no capability to send new DREQs. The DREQ outstanding buffer has 8bit depth and can store up to 255 DREQ, but it supposes that no peripheral has capability to send such many DREQ, so no overflow flag for DREQ outstanding buffer.

Typical operation flow:

1. When configure DMAC channel, set CHCRB register bit DREQOSEN to enable DREQ outstanding feature. (don't set this register when in DMA transfer. The action will not be guaranteed)
2. Start DMA transfer. The DREQ and DACK handshake will automatically proceed.
3. Current DREQ outstanding status (the number of current DREQ outstanding) can be checked by reading DREQOS register.
4. After all DMA transfer finish such like TE bit set, the peripheral can also check the current DREQ outstanding status if there are DREQ remains or not. If the peripheral concerns that the remaining DREQ outstanding will affect the next DMA transfer, it can be cleared by clearing CHCRB.DREQOSEN and setting CHCRB.DREQOSEN again, or just by setting CHCLR.CLR to reset the channel itself.

30.3.7.2 DMA Outstanding

Normally, DMA outstanding capability of each channel is determined by the maximum space that each channel can use in buffer RAM. Buffer RAM's space(total 8KB) divides equally to 16 and correspond to each channel. So each channel can use maximum 512Bytes. And each channel can run maximum 256Byte for every burst transfer, so the outstanding of each channel is 2.

To improve the performance for DMA transfer, DMAC adds a partial outstanding improve method to get better performance.

Register BUFCR.MBU and BUFCR.ULB is used to set maximum burst size and maximum space usage. So in normal, MBU is max 256 and ULB is max 512.

User can set BUFMODE register bit BUFMODE to enable DMA Partial outstanding feature.

In Partial Outstanding mode, Channel 8~15 maximum space is decreased and the saving space is assigned to Channel 0~3.

Normal

CH	Max Burst	Max Space	Outstanding
CH0~15	256B	512B	2

Partial Outstanding

CH	Max Burst	Max Space	Outstanding
CH0~3	256B	1024B	4
CH4~7	256B	512B	2
CH8~15	128B	256B	2

To set Max space for 1024B, the BUFCR.ULB extend to 11bit and change its initial value to 1024. And adds guard logic to prevent wrong setting in BUFCR.ULB and BUFCR.MBU.

Typical operation flow:

1. When configure DMAC, set BUFMODE register bit BUFMODE to enable DMA Partial outstanding feature. (don't set this register when in DMA transfer. The action will not be guaranteed)

2. Start DMA transfer. The DMA outstanding will be partial outstanding.

User can use CH0~3 for heavy traffic.

30.4 Usage Notes

Pay attentions to the following notes when the DMAC is used.

30.4.1 Module Stop

While the DMAC is in operation, the DMAC should not be stopped by the module stop register (Refer to section "9.2.3 Module stop control register") setting. When the DMAC is stopped, transfer contents cannot be guaranteed.

30.4.2 Address Error

When a DMA address error is generated, set the register of the error-ridden channel again and then start a transfer.

30.4.3 DMA Transfer Interruption

When make the DMA transfer interrupted, the interruption disable should be set and set the DE bit in DMA channel control register (CHCR) as the DMA transfer disable. If the TE is generated during the DMA transfer interruption, the TE should be initialized. The generation timing after the transfer interruption for an asynchronous assumed following three cases.

1. A case that after setting for the interruption disable, TE/DSE is changed to 1 before the CHCR initialization. The TE/DSE is initialized by the processing DMA transfer initialization.
2. A case that after setting for the interruption disable, the TE/DSE is changed to 1 by ignoring the transfer interruption. After the DMA transfer initialization and the DE bit become 0, check the TE/DSE bit. If the TE/DSE bit is 1, the DMA transfer initialization process should be performed.
3. A case that after setting for the interruption disable, the TE/DSE is not changed to 0 even though the transfer interruption is occurred. After the DMA transfer interruption, the TE/DSE is not generated because the transfer data is remained.

Note: In a case that the DMA transfer initialization is performed while the last transfer is executing, causes TE/DSE generation delay. So, the dummy read should be performed.

30.4.4 Descriptor Format

Descriptor format expands for 40-bit address support,

	40-bit mode	32-bit mode
0x00	DPSAR[31:0]	DPSAR[31:0]
0x04	DPSAR[39:32]	DPDAR[[31:0]
0x08	DPDAR[[31:0]	DPTCR[31:0]
0x0C	DPDAR[[39:32]	DPCHCR[31:0]
0x10	DPTCR[31:0]	DPSAR[31:0]
0x14	-	DPDAR[[31:0]
0x18	DPCHCR[31:0]	DPTCR[31:0]
0x1C	-	DPCHCR[31:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
23 to 16	DRS[7:0]	0	R/W	resource select for DMA request mode
11 to 10	DM[1:0]	0	R/W	Destination Address Mode
9 to 8	SM[1:0]	0	R/W	Source Address Mode
7 to 6	RS[3:2]	0	R/W	Resource Selection
5	WAIT	0	R/W	Descriptor execution wait 0: normal 1: wait If WAIT bit is set, execution of the entry is paused during OV==1 || EVENT_COUNT[6:0]== 0. If OV==0 && EVENT_COUNT!=0, this descriptor entry is executed and EVENT_COUNT is decremented.
4	-	0	R	Reserved. This bit is always read as 0. The write value should always be 0.
3 to 0	TS[3:0]	0	R/W	Transfer size

30.4.5 Restriction for DMAC address range

SYS-DMAC and RT-DMAC usage is restricted to 32bit virtual address range when IPMMU (uTLB) is used.
These restrictions are also described in the following registers. Please refer to section 30.2.

RDMFIXSAR, RDMFIXDAR, RDMFIXDPBASE, SDMFIXSAR, SDMFIXDAR, SDMFIXDPBASE

30.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

30.5.1 Secure Function

Security/Non-secure of each channel of RT-DMAC is controlled by DMSEC register. Refer description of DMA secure control register for each channel

In case a channel is in secure mode, when Non-secure CPU access to that channel, the access must be denied, then RT-DMAC do these actions:

(1) Issue error status and store into ERRDET register.
(2) Log error ID of the first access into ERRPID register.
(3) Log error address of the first access into ERRADR register.
(4) Active error signal to ECM module. (Refer module ECM manual)

30.5.2 Safety Protection

As AXI master, DMAC can use REGIONID register in each channel to decide which region the channel will access. And the region that permitted to use for each channel are determined by region ID enable input
REGION ID of each channel only can be set to the value that external 16bit Enable signal allowed. There is Enable signal(*) correspond to each channel.
Each bit of Enable signal determine that which ID (0~15) can be set, if the corresponding bit is zero, the corresponding ID cannot be set by software.
For example, Enable bit is 16'b0010_0001_0000_1000 for current channel , only 3, 8, 13 can be set to REGIONID register of current channel. Other values that written to REGIONID register will be ignored.(Register values are keep.)

As APB slave, DMAC depends on bus bridge to distinguish the correct safety access or not to each channel register. If bus bridge pass an APB access to DMAC, DMAC treat it as valid access and do it. Regarding to PUBLIC registers, it suppose that only secure master can access it.

Note: The Enable signal reflects the following register settings of the BUS function.
Region ID register

RGIDMEN_RTDM{0-1}_{0-15}
RGIDMEN_SYDM1_{0-15}, RGIDMEN_SYDM2_{0-7}

For detail, see the BUS chapter (18.5.9 Region ID protection)for a description of Region ID protection.

31. Boot

31.1 Overview

This product allows selection of a master boot processor through the MD7 and MD6 pins. When Cortex-R52 or ICUMX is selected as a master boot processor, setting the MD[4:1] pins enables on-chip ROM boot or XIP(eXecute In Place) mode boot.

31.1.1 Features

•Either Cortex-R52 or ICUMX can be selected as a master boot processor through the MD7 and MD6 pins.
Selection of a master boot processor is described in Table 31.2.

• The following boot devices are supported through MD pins.
Selection of a boot device is described in Table 31.1.

— HyperFlash (Max. 320Mbps per pin) Octal SPI Flash and Serial Flash
— eMMC (12.5MHz x8 bus widths)
— SCIF and HSCIF as serial downloader

• The boot sequence of HyperFlash, Octal SPI Flash, Serial Flash and eMMC.

Cortex-R52 or ICUMX master boot processor executes the instructions in on-chip ROM.

Data including Boot ROM parameters, address information and data size information of IPL* are transferred from the HyperFlash, Octal SPI Flash, Serial Flash and eMMC to RT-VRAM. Then the amount of data specified by data size information is transferred to RT-VRAM. After the transfer, the processor jumps to the address specified by address information of IPL.

•XIP(eXecute In Place) mode of Hyper Flash boot is supported if master boot processor is Cortex-R52.

•Error message output through SCIF port when no boot error or verification error occurs at secure boot.

• Secure boot is supported (option).

— Secure boot is supported if a master boot processor is ICUMX.
The boot image for each processor is authorized by ICUMX.
— Encrypted boot image is supported.
— Debugging is disabled at booting, and it can be enabled with secure debugging authentication.
ICUMX can only support one-time authentication by using the Challenge and Response integrity check.
— Boot status register setting is supported.
— XIP mode of Hyper Flash boot is restricted.

Note: * IPL: Initial Program Loader.

31.1.2 External Pins

31.1.2.1 MD pins

Boot device, master boot processor can be selected through MD pins.

Table 31.1 Mode Pin Configuration (1)

Name	Pin Name	I/O	Function
Mode pin	MD4 to MD1	Input	Select a boot device.

MD[4:1]	Description
B’0000	Reserved
B’0001	Reserved
B’0010	HyperFlash boot at 160MHz using DMA
B’0011	HyperFlash boot at 80MHz using DMA
B’0100	Serial Flash boot at single read 40MHz using DMA
B’0101	Reserved
B’0110	Serial Flash boot using DMA.*2
B’0111	Octal SPI Flash 160/80MHz using DMA.*2
B’1000	Reserved
B’1001	Reserved
B’1010	HyperFlash at 160MHz(320Mbps) using XIP mode
B’1011	HyperFlash at 80MHz using XIP mode
B’1100	Reserved
B’1101	eMMC boot at 12.5MHz x8 bus widths using DMA
B’1110	Reserved
B’1111	SCIF/HSCIF download mode*1

Notes:
*1 SCIF or HSCIF download mode can be selected through MD[32:31] pins when MD[4:1] pins equal to B’1111.
*2 After reset sequence, RPC makes transfer with READ command (40MHz single bit SDR and dummy cycle 0) until Boot parameters loaded. Frequency and transfer mode can be selected by CLKSELR setting. For CLKSELR, see chapter 31.3.3.1. Dummy cycle can be set by DMCYC at MD[4:1]==B'0110 and CLKSELR=B'0000010x. For DMCYC, see chapter 31.3.3.2.

31.1.3 Boot ROM

The capacity is 160 Kbytes. Cortex-R52 and ICUMX codes are included.

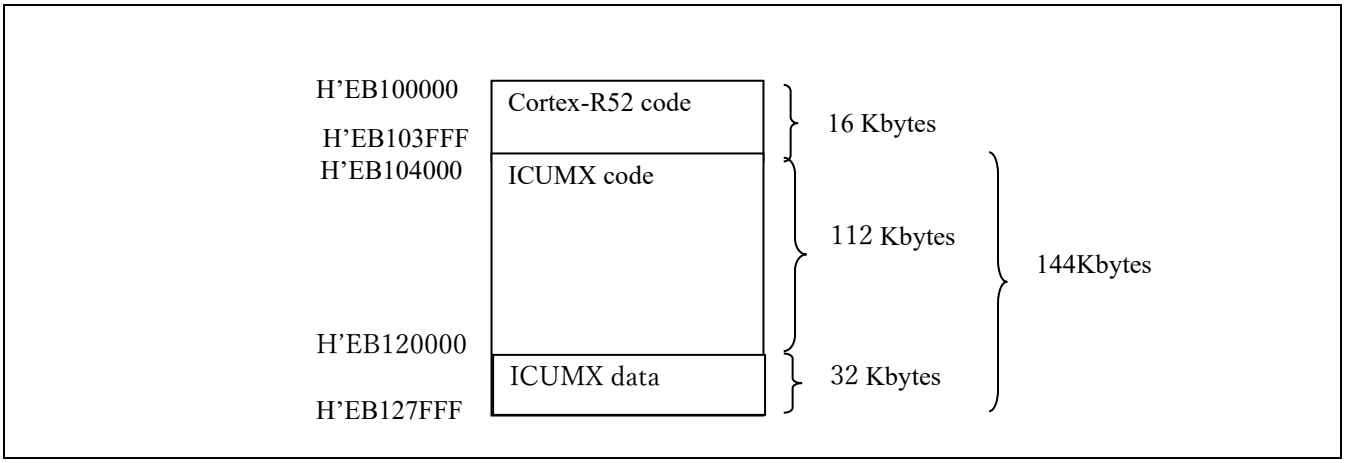

Figure 31.1 Boot ROM memory map

The ICUMX code area can only be read from ICUMX instruction fetch access.
For other accesses, the read value of the ICUMX code area is all '0'.

31.2 Register Description

No description on this section.

31.3 Operation

31.3.1 Boot Operation overview

The boot address of the master boot processor is controlled by RESET module. It depends on boot device selection through MD[4:1] pins.

If XIP mode boot is selected, the processor can directly fetch from the target device. If the boot device except for XIP mode is selected, the processor boots from on-chip Boot ROM and executes the boot sequence described “HyperFlash/Octal SPI Flash/Serial Flash using DMA Boot sequence” and “eMMC using DMA boot sequence” section. The header data are transferred from the target boot device to RT-VRAM. Then IPL is transferred to RT-VRAM. Then the processor jumps to the specified address.

If MD[4:1] reserved setting is selected, error message can be outputted via SCIF.

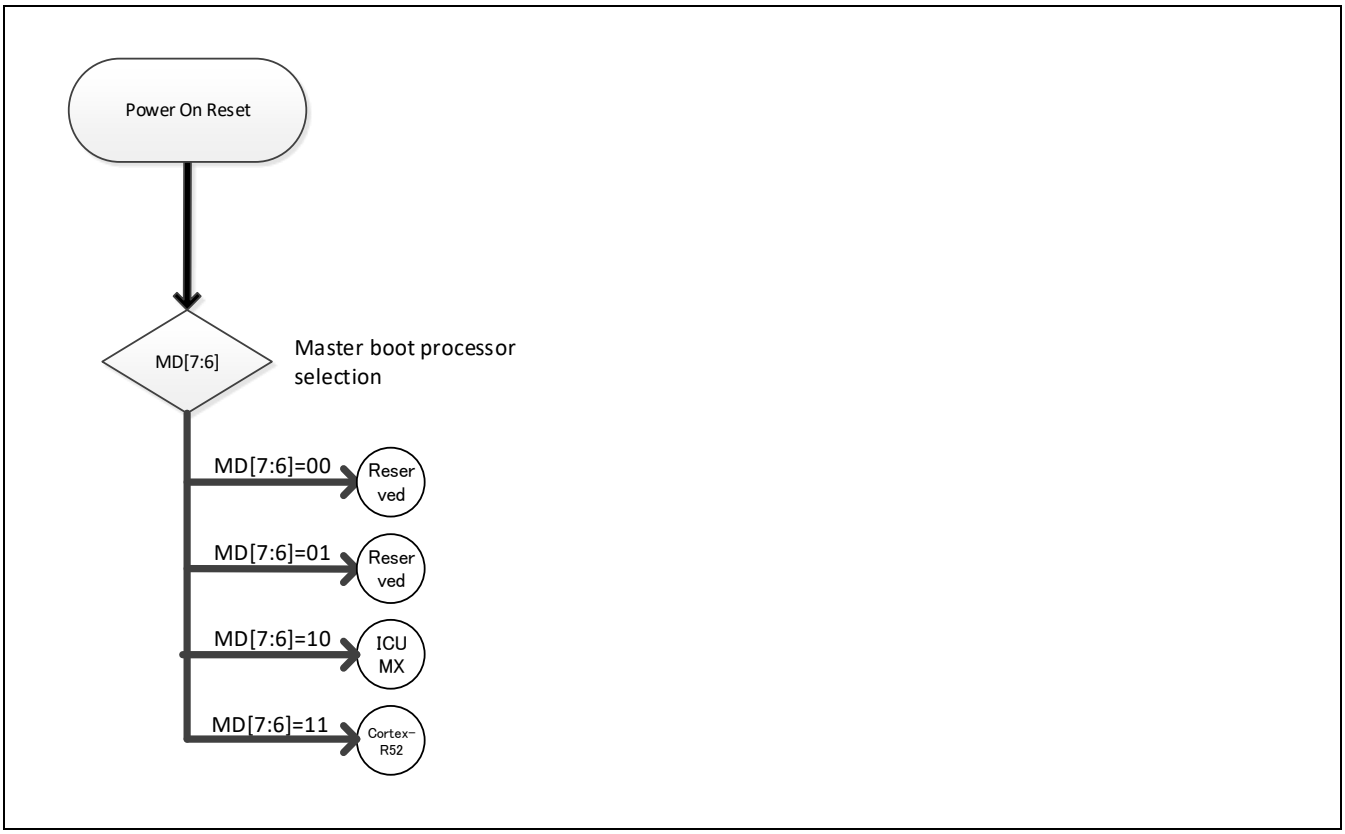

Figure 31.2 Master Boot processor selection

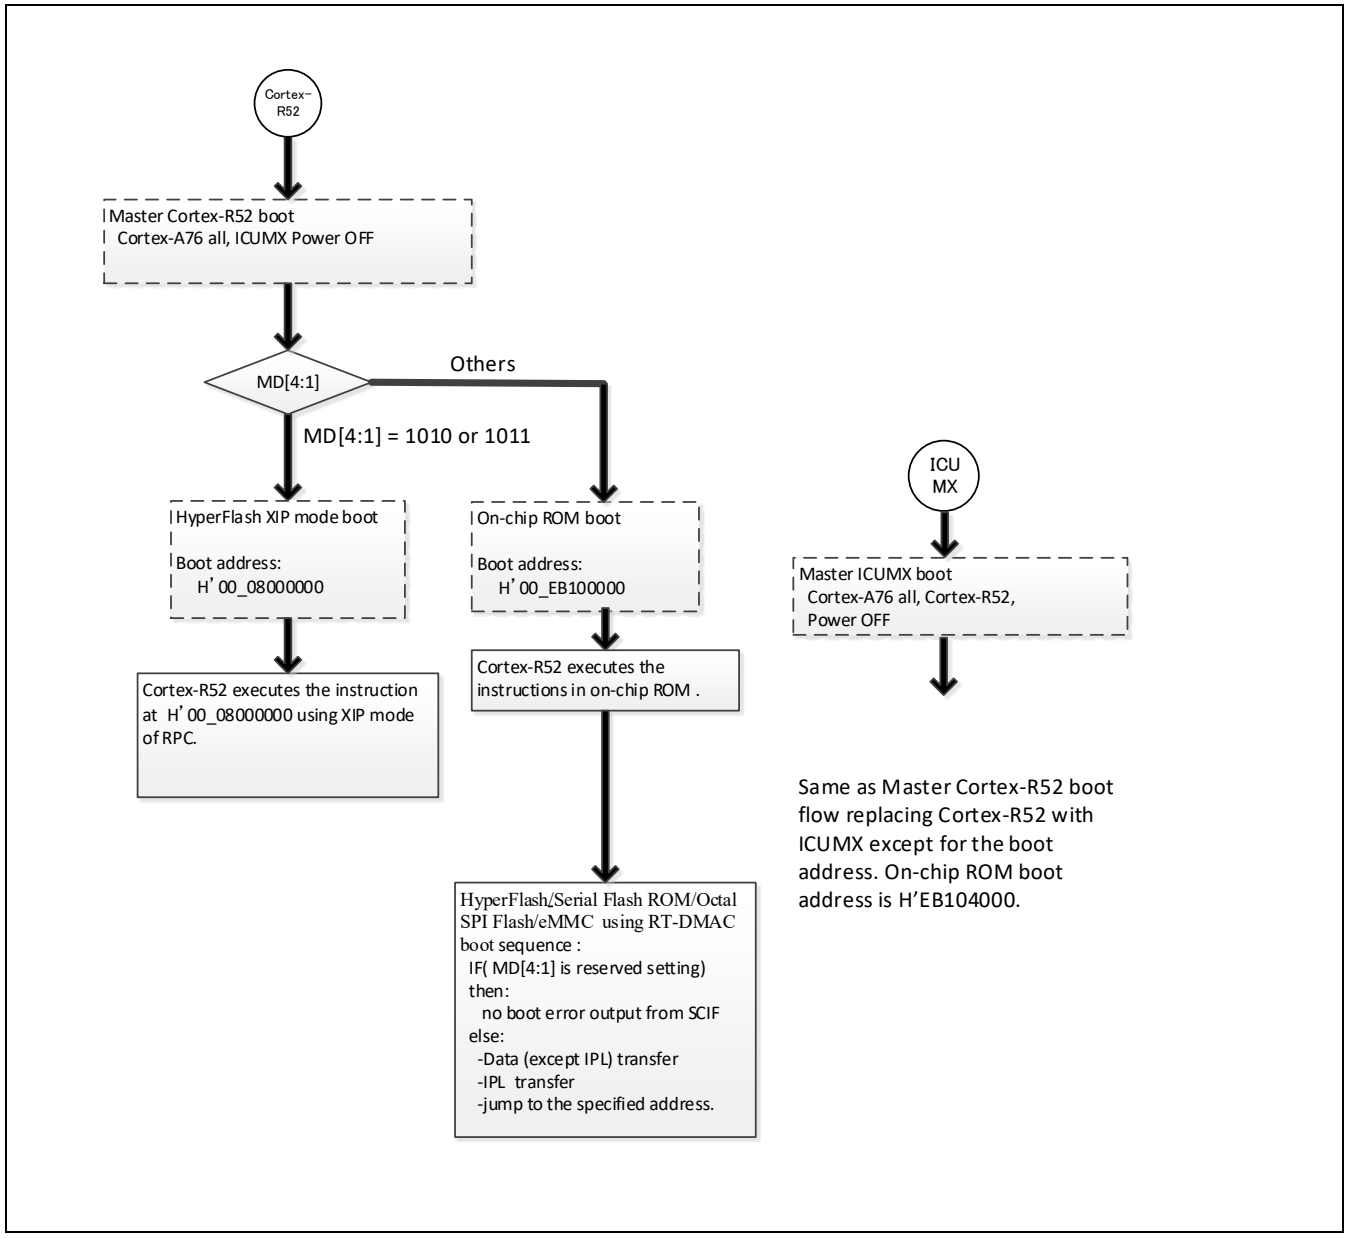

Figure 31.3 Cortex-R52, ICUMX boot operation overview

31.3.2 Boot Address control

Boot address is controlled by APMU module. If Cortex-R52 boot is selected through MD[7:6] pins, APMU.CR52BAR register function is used to specify the boot address. If ICUMX boot selected, RESET.ICUMXBAR register function is used to specify the boot address.

31.3.3 Boot parameters

31.3.3.1 Flash Clock parameters (External Flash ROM Address H'00000004)

Flash Clock parameters are 4bytes and it should be at on H'00000004 address of serial flash. It controls Octal SPI Flash clock frequency. The lower 8-bit value of this parameters is copied in BOOT status register bit15-8 in MFIS by Boot ROM program.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	-	Reserved
7 to 0	CLKSELR	-	-	QSPI Flash clock setting at MD[4:1]=B'0110 B'00000101: 80MHz Quad I/O B'00000100: 133MHz Quad I/O B'00000011: 80MHz Quad output read B'00000010: 133MHz Quad output read B'00000001: Reserved B'00000000: 80MHz Single fast read Others: 40MHz Single fast read Octal SPI Flash clock setting at MD[4:1]=B'0111 B'00000101: 160MHz Octal SPI for Macronix's products B'00000100: 80MHz Octal SPI for Macronix's products B'00000011: 160MHz Octal SPI for Micron's products B'00000010: 80MHz Octal SPI for Micron's products Others: Setting prohibited

31.3.3.2 Dummy Cycle Parameters (External Flash ROM Address H'00000008)

The 32bit value of this parameters is copied in DRDMCR[31:0] by Boot ROM program.

When the Quad I/O mode (MD[4:1]==B'0110 and CLKSELR=B'0000010x), these parameters are enabled. Also, if this value is 0xFFFFFFFF, DRDMCR.DMCYC is forcibly set 0x09 by Boot ROM program.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	27'b 0	-	Reserved The write value should always be 0.
4 to 0	DMCYC[4:0]	5'b 0	-	Number of Dummy Cycles Setting. (*1) B'00000: 1 cycle B'00001: 2 cycle B'00010: 3 cycle : B'10010: 19 cycle B'10011: 20 cycle

(*1) Ignore bit except for MD pin= B'0110 and Quad I/O mode.

31.3.4 HyperFlash/Octal SPI Flash/Serial Flash using DMA boot sequence

1. The master boot processor jumps to H'EB10 0000 (Cortex-R52) or H'EB10 4000 (ICUMX). The processor executes the instructions in Boot ROM and 30KB data(except IPL image) are transferred from HyperFlash, Octal SPI Flash, Serial Flash to RT-VRAM using RT-DMAC.

2. These data contain Flash Clock parameters, address information and data size information of IPL.

3. The amount of data specified by data size information is transferred to RT-VRAM. After the transfer, the master processor jumps to the address specified by address information of IPL.

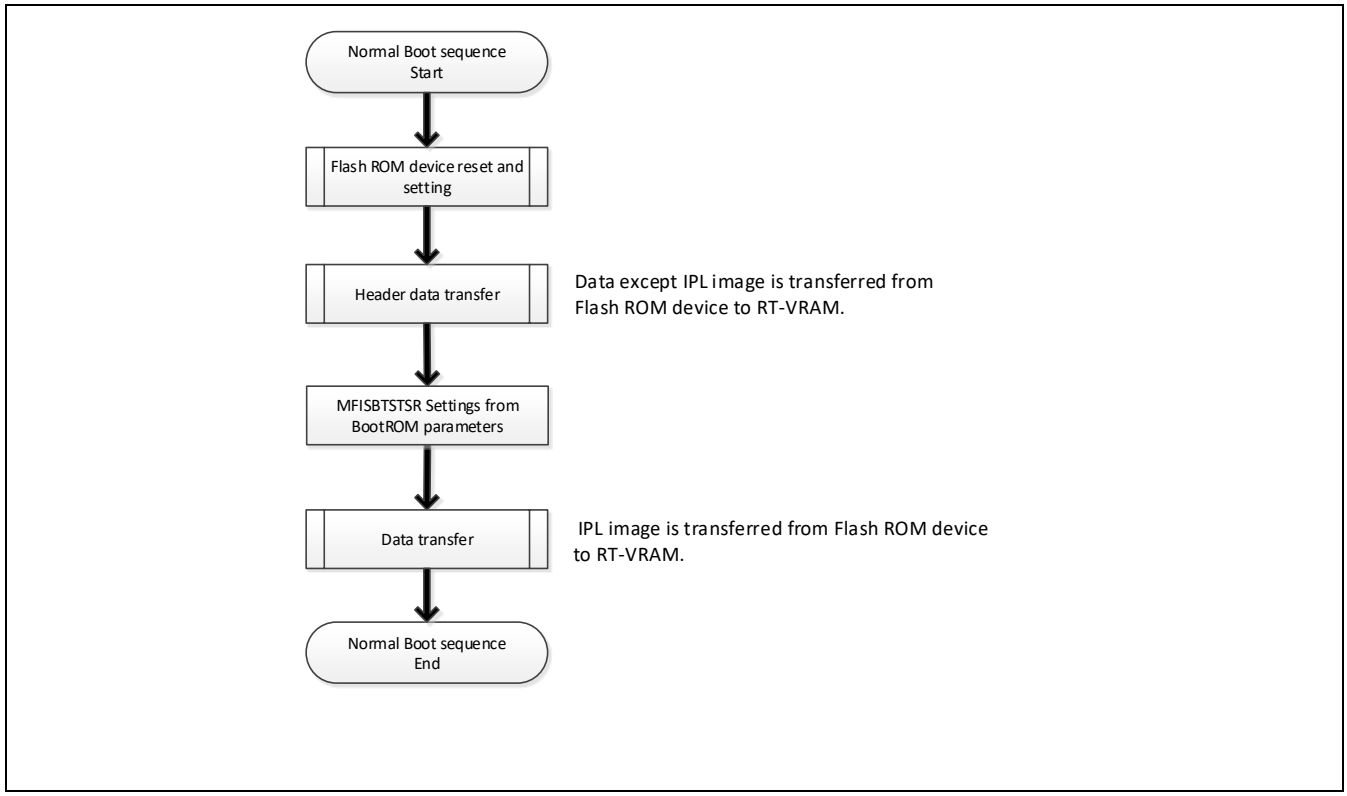

Figure 31.4 HyperFlash/Octal SPI Flash/Serial Flash using RT-DMAC boot sequence

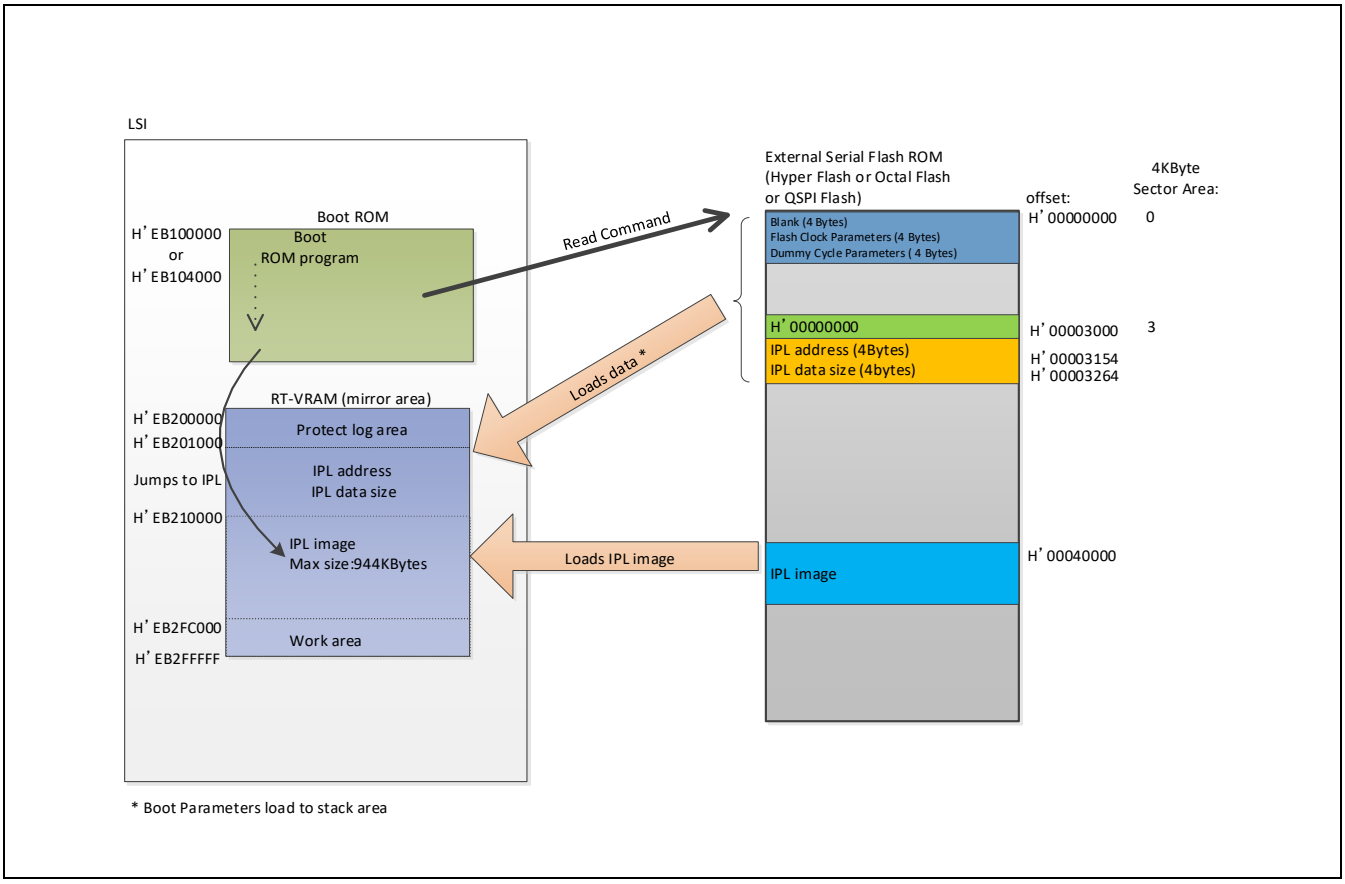

Figure 31.5 IPL transfer and Program image

31.3.5 eMMC using DMA boot sequence

1. [Cortex-R52 boot]
   The master boot processor jumps to H'EB10_0000. The processor executes the instructions in Boot ROM and 13.5KB data (except IPL image) are transferred from eMMC to RT-VRAM using MMC's DMA with 512-Byte transfer size.

   [ICUMX boot]
   The master boot processor jumps to H' EB10_4000. The processor executes the instructions in Boot ROM and 26.5KB data (except IPL image) are transferred from eMMC to RT-VRAM using MMC's DMA with 512-Byte transfer size.

2. These data contain address information and data size information of IPL.

3. The amount of data specified by data size information is transferred to RT-VRAM. After the transfer, the master processor jumps to the address specified by address information of IPL.

Note1: eMMC device must meet the following conditions.

- eMMC device that conforms to JEDEC eMMC standard 4.4 or higher
- eMMC device's IO voltage should be 1.8V.

Note2: eMMC device must meet the following conditions if master boot processor is Cortex-R52.

Set the EXT_CSD register byte179, PARTITION_CONFIG bit[6]= H'0(No boot acknowledge sent).
- Set the EXT_CSD register byte179, PARTITION_CONFIG bit[5:3]= H'1 (Boot Area partition1).
- Set the EXT_CSD register byte177, BOOT_BUS_CONDITIONS bit[4:3]= H'1(50MHz SDR).
- Set the EXT_CSD register byte177, BOOT_BUS_CONDITIONS bit[1:0]= H'2(x8 bus widths).

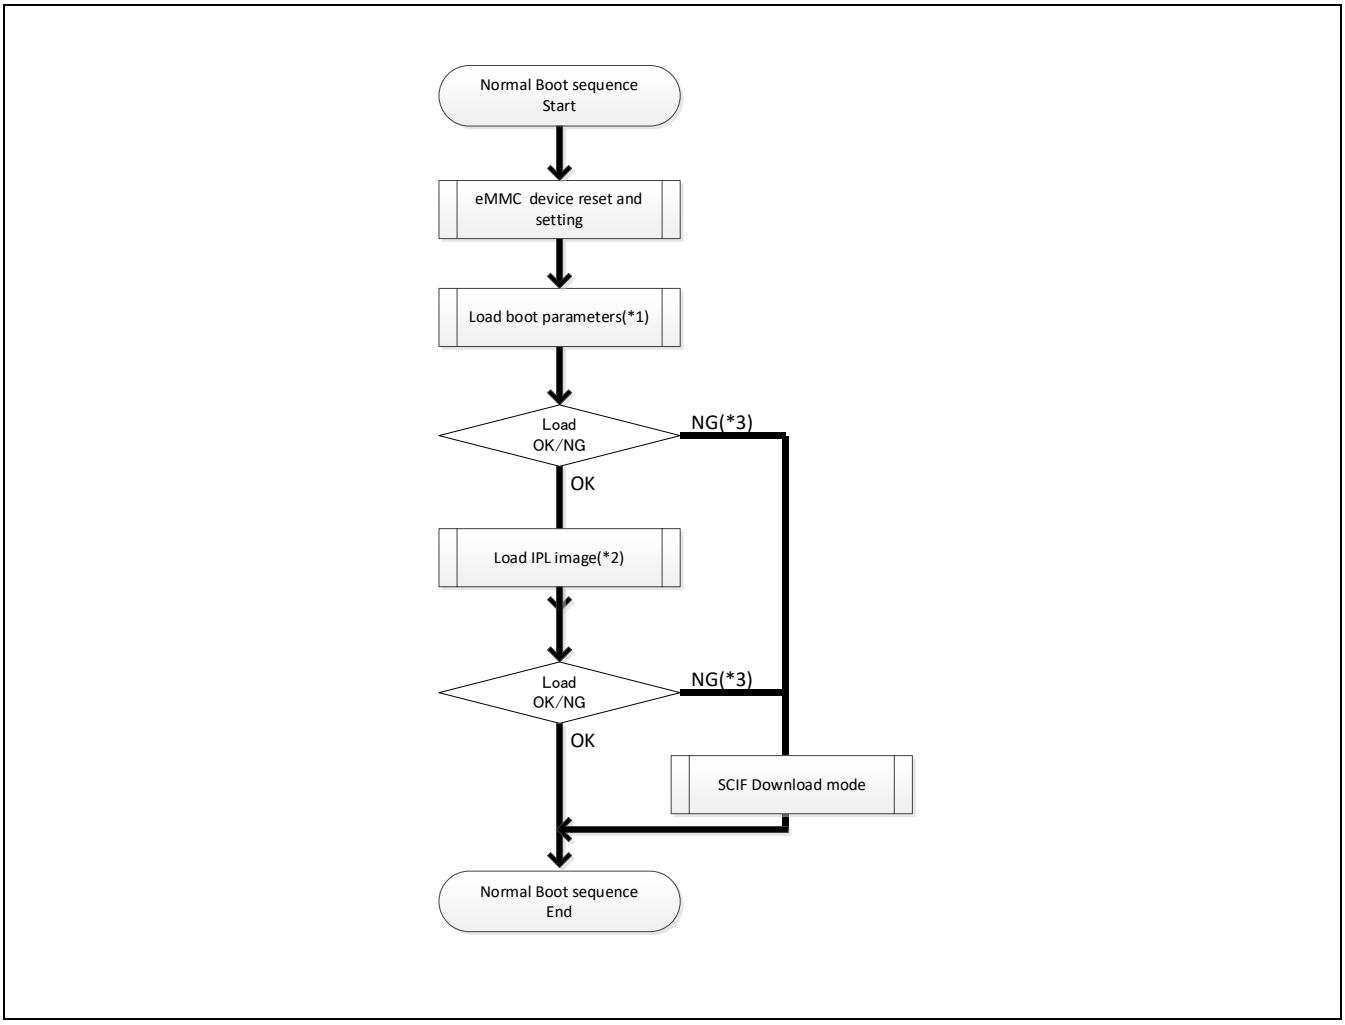

Figure 31.6 eMMC using DMA boot sequence

If master boot processor is Cortex-R52:

(*1) CMD0 is issued three times to transfer boot parameters, with argument + H'F0F0F0F0, + H'FFFFFFFA, + H'00000000.

(*2) As with (*1), CMD0 is also used during IPL image transfer.

(*3) In case of the error detection of SDHI module or IPL address range is invalid, judged to be NG.

If master boot processor is ICUMX:

(*1) Use the following command to initialize the device (IDLE state --> Transfer state).
CMD0 with argument + H'00000000,CMD1,CMD2,CMD3,CMD9,CMD7,CMD16,CMD8.
CMD6, CMD13 are used for changing frequency and bus width.
When loading boot parameters, CMD23,CMD18,and CMD13 are used .

(*2) CMD23,CMD18,and CMD13 are used.

(*3) In case of the error detection of SDHI module or IPL address range is invalid, judged to be NG.

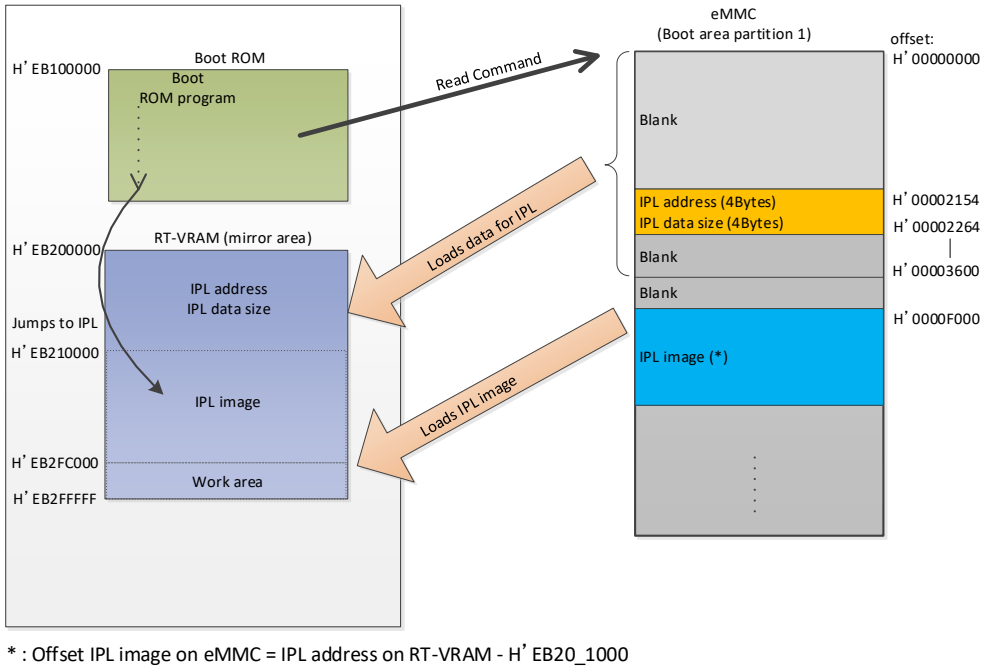

Figure 31.7 IPL transfer and Program image(eMMC, Cortex-R52 Boot)

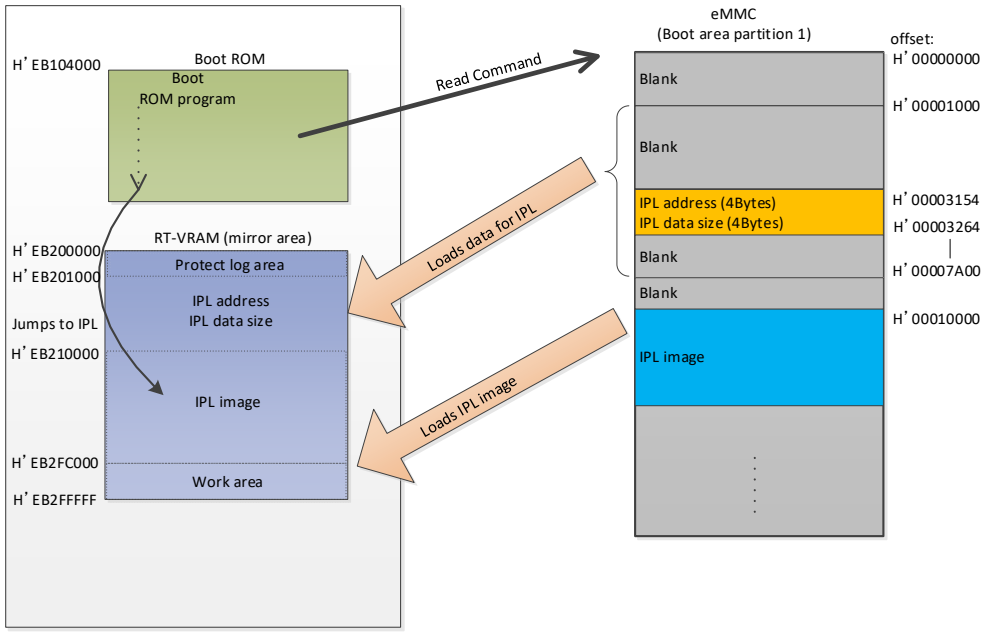

Figure 31.8 IPL transfer and Program image(eMMC, ICUMX Boot)

31.3.6 SCIF download mode

SCIF download mode uses SCIF0 serial ports. Data from Host PC is transferred to RT-VRAM. The transfer specification is below.

- Baud rate : 115200bps
- Data length : 8bit
- Parity : none
- Stop bit : 1bit
- Flow control : none
- Data format : Motorola S-record

The download sequence and data format are below.

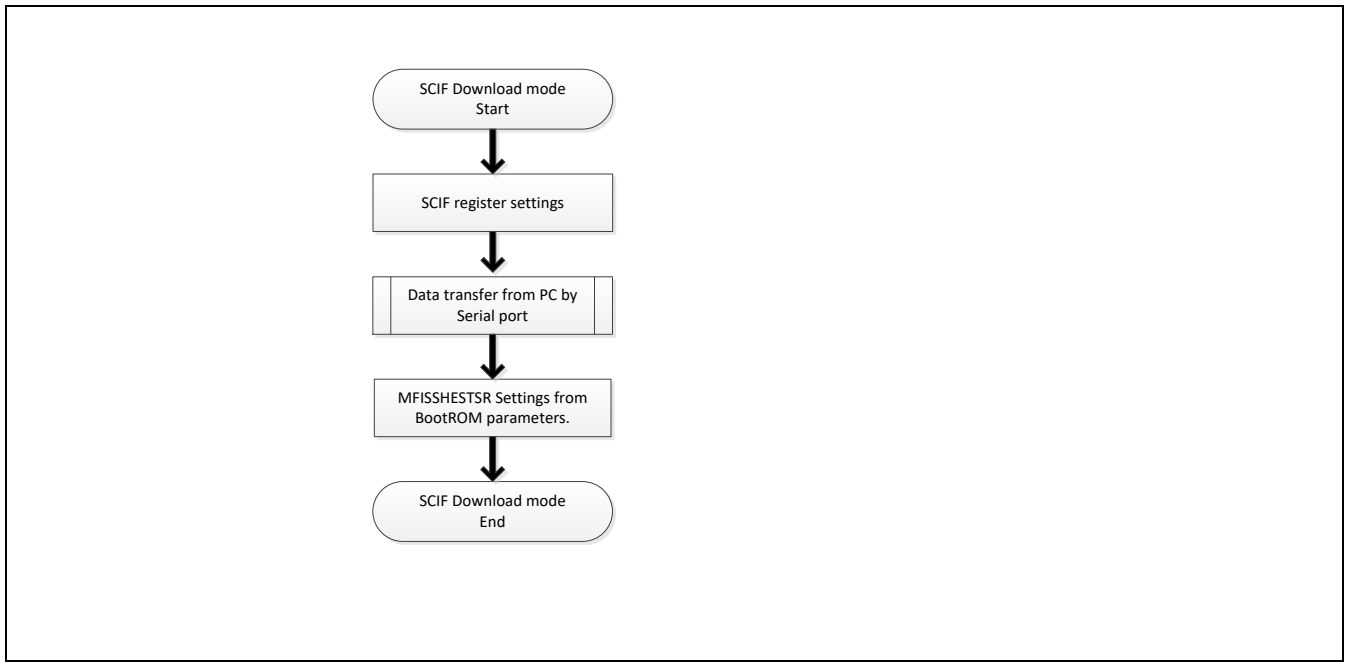

Figure 31.9 SCIF download mode sequence

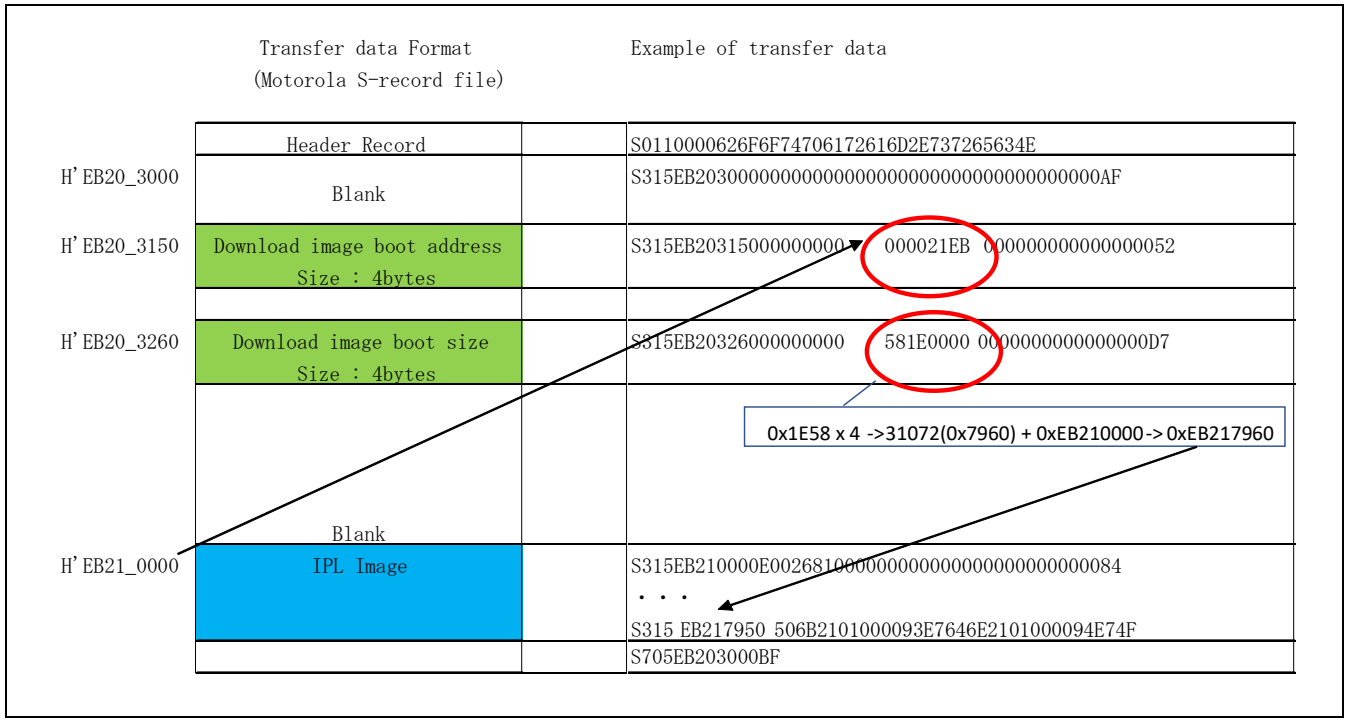

Figure 31.10 SCIF data format for transfer data

31.3.7 HSCIF download mode

HSCIF download mode uses HSCIF0 serial ports. Data from Host PC is transferred to RT-VRAM. The transfer data format is the same as SCIF download mode's.

The baud rate can be selected with MD[32:31] setting. Refer to Table 31.2.

31.3.8 Error message

The Boot ROM program outputs an error message via the serial port, if:

1. invalid (reserved) boot mode selected

2. failed verification of data in secure boot mode

3. invalid parameter(IPL address and size) input

31.4 Usage Note

31.4.1 IPL address and data size limitation

The IPL end address can be calculated by IPL address and data size. It should be lower than the address below.

- H'EB2F_BFFF

The IPL address requires 512-byte alignment.

31.4.2 Cleanup

Before jumping to the IPL, Boot ROM program cleans hardware registers used for loading the IPL and the master boot processor, as listed below.

Cortex-R52

- RT-DMAC registers are set to hardware initial value.
- Disable I-cache. Disable branch prediction setting.

ICUMX

- RT-DMAC registers are set to hardware initial value.
- FE level maskable interrupt (FEINT) and EI level maskable interrupt (EIINT) are always disabled.

Notes

- The PFC setting is not cleared after jumping to the IPL.
- The RPC module registers are not cleaned by Boot ROM program.
  For Serial Flash (MD[4:1]=B'0110) and Octal SPI Flash(MD[4:1]=B'0111) boot, RPC registers are configured by Boot ROM program. Refer to 31.4.6 for register settings after Boot ROM program execution.
- In the case of eMMC boot, initialize the SDHI interface registers.
- IRQ and FIQ are disabled.
- MPU of Cortex-R52 is not cleaned. Refer to chapter 6. Realtime Core for MPU setting.

31.4.3 Pull-up/down settings

Boot ROM program sets pull-up/down to QSPI pins. The below table shows pull-up/down settings in Serial Flash and Octal SPI Flash boot mode.

Table 31.8 Pull-up/down settings

MD[4:1]	Descriptions	QSPI0_IO2/QSPI0_IO3	QSPI1_SPCLK	QSPI1_MOSI_IO0/ QSPI1_MISO_IO1/ QSPI1_IO2/QSPI1_IO3
B'0100	Serial Flash 40MHz	Pull-up	Pull-down	Pull-up
B'0110	Serial Flash 40MHz to 80MHz (CLKSELR=0)	Pull-up	Pull-down	Pull-up
	Serial Flash 40MHz to Quad Output/IO (CLKSELR=2~5)	Pull-up(single) to No Pull-up/down (Quad)	Pull-down	Pull-up
	Serial Flash 40MHz (CLKSELR=others, except CLKSELR=1 (reserved))	Pull-up	Pull-down	Pull-up
B'0111	Octal SPI Flash 80/160MHz (CLKSELR=2~5)	Pull-up(single) to No Pull-up/down (octal)	Pull-down(single) to No Pull-up/down (octal)	Pull-up(single) to No Pull-up/down (octal)

31.4.4 Dual channel Serial Flash(Dual QSPI) boot

Boot ROM program supports booting from single channel serial flash and does NOT support booting from dual channel serial Flash. Dual channel serial Flash boot can be selected by setting the BSZ bits of CMNCR register in RPC to B'01 after IPL loading.

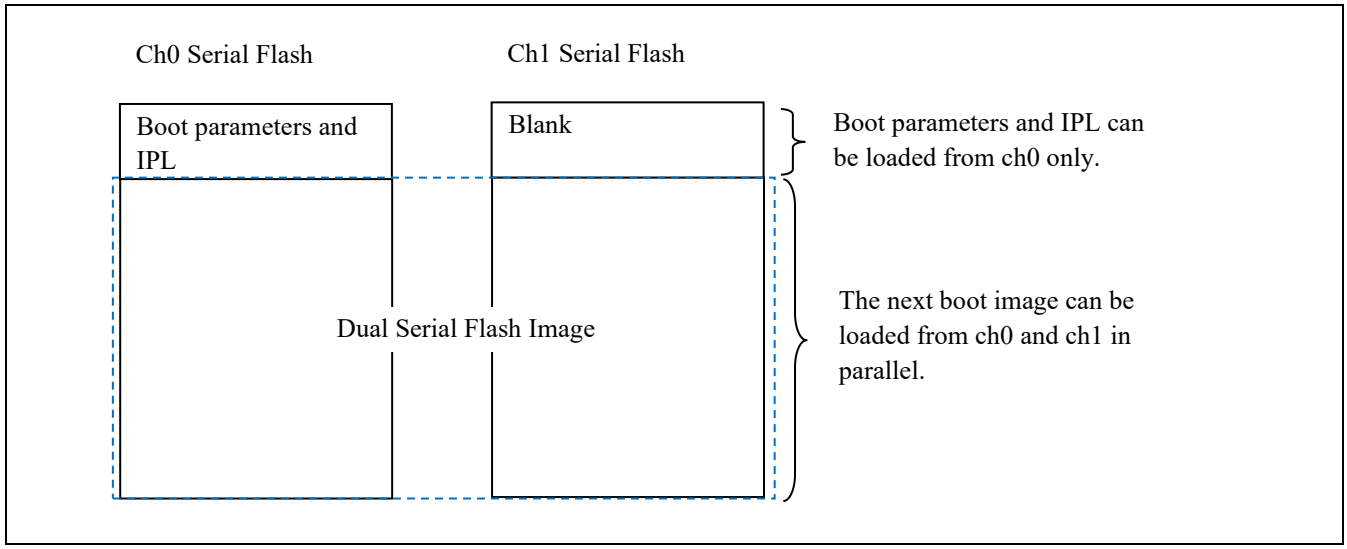

Figure 31.11 Flash image of dual channel Serial Flash booting

31.4.5 Serial Flash Reset commands

Serial Flash Reset commands are listed below.

Table 31.9 Serial Flash Reset commands

Command	Description
H'F0	RESET (selected by E-fuse setting)
H'66	RSTEN (selected by E-fuse setting)
H'99	RST (selected by E-fuse setting)

31.4.6 Register settings after on-chip ROM boot

31.4.6.1 Serial Flash boot (MD[4:1] = B'0110)

Table 31.10 shows the register settings after on-chip ROM boot in Serial Flash (MD[4:1]=B’0110).

Table 31.10 Register settings after on-chip ROM boot in Serial Flash boot (MD[4:1]=B’0110)

Boot Parameter	CLKSELR (*1)	B'00000000	B'000000010	B'000000011	B'000000100	B'00000101	Others (*6)

(*1) Refer to section 31.3.3.1.

(*2) Command-Address-Data

(*3) If reading 32MB or more in the IPL software, set the EAC[2:0] = 001.

(*4) Same as initial value, refer to Table 112.3.

31.5 Safety Mechanisms

No description on this section.

33. External Bus Controller for SDRAM (DBSC5)

33.1 Overview

The external bus controller (DBSC5) supports LPDDR4X/LPDDR5 SDRAM. DBSC5 contains AXI bus controller, cache, scheduler, device controller, and register controller. The AXI bus controller receives requests from an AXI bus and performs protocol conversion to suit the bus in DBSC5. The scheduler makes schedules for the requests stored in the cache block. The device controller converts requests that follow the internal bus protocol to command-level requests and reads from and writes to the SDRAM in response to commands. The register controller reads from and writes to the control registers that set the operations of DBSC5.

DBSC5 enables the maximum use of SDRAM bus bandwidth using the following functions:

(1) Multibank operation that improves the page hit rate.
(2) Preceding execution of the bank activate commands for subsequent requests

33.1.1 Definition of Terms and Symbols

The following terms and symbols are used throughout the DBSC5 specifications:

- In some cases, LPDDR4X/LPDDR5 SDRAM is abbreviated as SDRAM
- ceil(x) is the smallest integer which is greater than or equal to real number x.
- floor(x) is the greatest integer which is less than or equal to real number x.

33.1.2 Functions

Table 33.1 DBSC5 Functions.

Item	Function
Bank/Bank group mode	Supports 8 banks and no bank group for LPDDR4X Supports 4 banks and 4 bank groups (BG mode) for LPDDR5 Supports 16 banks and no bank group for LPDDR5
External bus width	16 bits x 2 channels x 1 instances
Preceding activate functions	Determines the content of subsequent requests in a request queue and performs preceding activate processing for the bank to be accessed during an empty command cycle upon page-miss.
Operating modes	Burst length:16 (fixed) Burst type: Sequential (fixed)
Power-down mode	Supports Idle power down mode, Self-refresh mode, Self-refresh-power down mode and Deep sleep mode. Combined use of the power-down mode and address translation function allows the SDRAM partial array self-refresh function to be effectively implemented.
Refreshes	Average interval and the minimum/maximum pulling-in count are set by the register.
ZQ calibration operation	Supports the automatic ZQ calibration function. The frequency of issuing ZQ calibration function can be specified through register settings in units of the auto-refresh count.
PHY interface	Supports DFI5.0.
Memory to be connected	LPDDR4X-SDRAM compliant with JEDEC JESD209-4C and JEDEC JESD209-4-1A. (One LPDDR4X-SDRAM can be connected to one channel. two 16bit channels within a pair must have same sizes. Support memory with sizes from 2Gbits to 16Gbits per 16bit channel per rank.) 2 ranks/channel support. (Two ranks must have same sizes.) LPDDR5-SDRAM compliant with JEDEC JESD209-5B (One LPDDR5-SDRAM can be connected to one channel. two 16bit channels within a pair must have same sizes. Support memory with sizes from 2Gbits to 32Gbits per 16bit channel per rank.) 2 ranks/channel support. (Two ranks must have same sizes.)
DBI (Data Bus Inversion)	Supports.
Cache	64KB x 1, one cache of which is shared by two 16bit channels.
Restriction	Unsupports the following LPDDR5 functions. • Data Copy Low Power Fucntion • Write X Operation Supports the memory bit rate. • 6400Mbps(max)@1rank / 5500Mbps(max)@2rank

33.1.3 Block Diagram

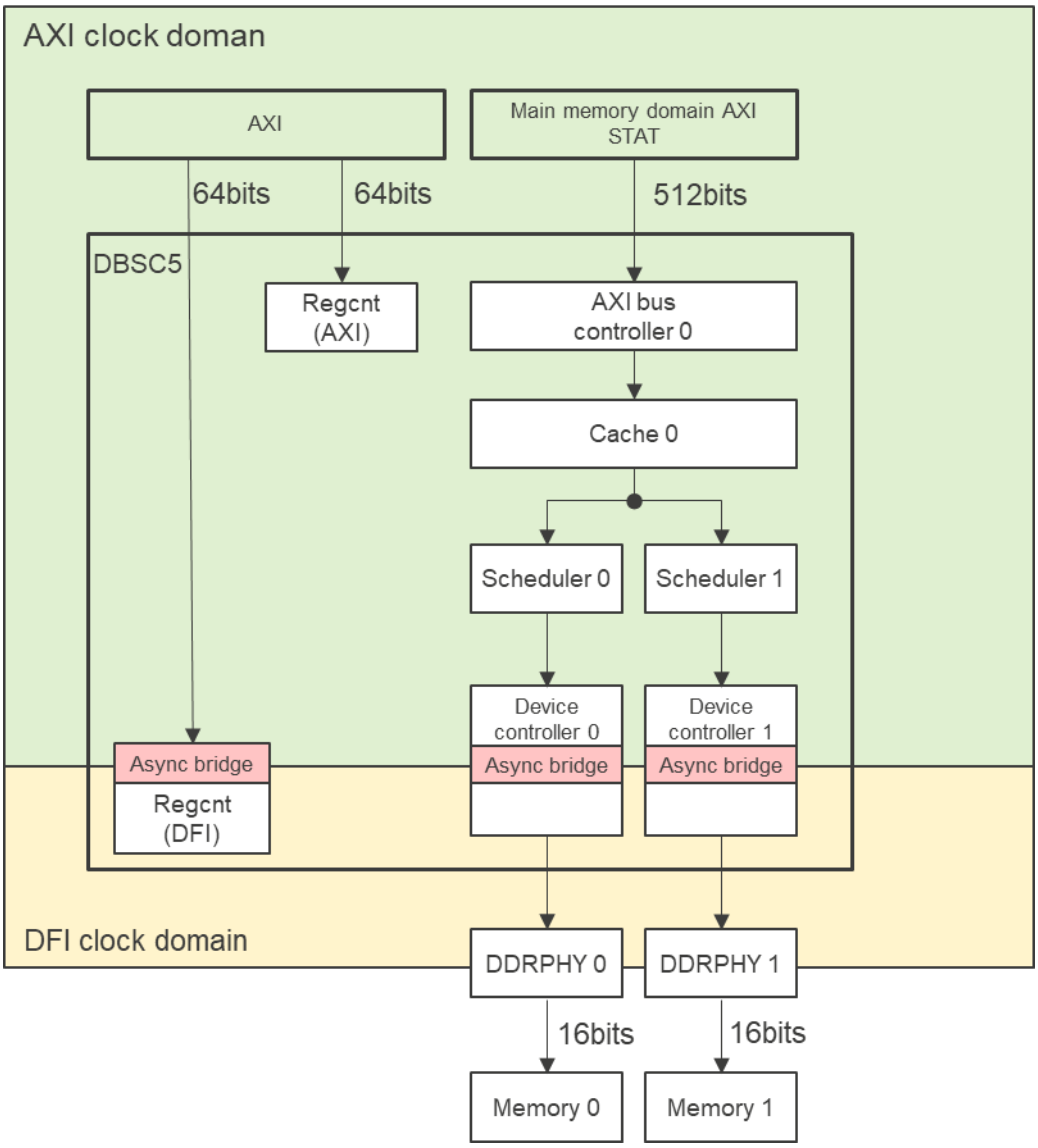

Figure 33.1 Block Diagram of DBSC5

33.1.4 Register Configuration

Refer to sheet “Register Configuration” of R-CarV4M_UM_033_DBSC5_r1p10.xlsx

Notes:

1. Access dbsc5 registers 32 bits at a time. Operations cannot be guaranteed if access is attempted other than 32 bits.
2. Do not access to any address other than listed above. Operations cannot be guaranteed if access is attempted to addresses other than listed above.
3. Writing to listed above register (except DB[0/1]SYSCNT0 and DB[0/1]SYSCNT0A) must be follow the following procedure.
   DB0SYSCNT0.REGLOCK <=0x1234
   DB0SYSCNT0A.REGLOCKA <= 0x1234
   If setting values other than the above are written, it can not be written to listed above register.
4. Register access is prohibited when clock is not supplied to dbsc5.
5. Register access to DDR memory/DDR-PHY is prohibited when clock is not supplied to DDR memory/DDR-PHY.
6. If a setting value or calculation formula is defined for additional document for application note, etc., those document contents will be given priority.

33.2 Register Description

Refer to sheet “Register Description” of R-CarV4M_UM_033_DBSC5_r1p10.xlsx

Table 33.2 Manual Command Issue Functions.

OPC	Code	Operation	Function of the CH Bits	Function of the RANK Bits	Function of the ARG Bits	LPDDR4X	LPDDR5
0000	Wait	Issue "Device Deselected".	Don't care.	Don't care	Don't care	√	√
0001	Reset	Control the dfi_reset_n signal.	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	0: Assertion 1: Negation	√	√
0010	Lock	Disable issuing a command other than manual commands.	Don't care.	Don't care.	0: Releasing from being disabled 1: Disabling	√	√
0100	PreA	Issue "Precharge All".	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	Don't set a value other than H'0010.	√	√
0101	Ref	Issue "Refresh".	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	Don't set a value other than H'0010.	√	√
0111	CAS	Issue "CAS".	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	B'10_0000_0000: CAS(WCK2CK FAST SYNC) B'11_1000_0000: CAS(WCK2CK SYNC OFF) B'10_1000_0000: CAS(WCK SUSPEND)	—	√
1000	PD	Issue "Power Down Entry/Exit".	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	0: Enter 1: Exit	√	√
1010	SR	Issue "Self-Refresh/Self-Refresh-Power-Down/Deep-Sleep-Mode Entry/Exit".	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	B'00: SR Enter B'01: SR/SRPD/DSM Exit B'10: SRPD Enter(LPDDR5 only) B'11: DSM Enter(LPDDR5 only)	√	√
1101	MPC	Issue MPC	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	B'0100_1111: ZQCal Start(LPDDR4X only) B'0101_0001: ZQCal Latch(LPDDR4X only) B'1000_0101: ZQCal Start(LPDDR5 only) B'1000_0110: ZQCal Latch(LPDDR5 only)	√	√
1110	MRW	Issue MRW.	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	Set the value of MA[7:0] in ARG[15:8] and of OP[7:0] in ARG[7:0].	√	√
1111	MRR	Issue MRR.	A particular physical channel is specified for the operation.	A particular rank is specified for the operation.	Set the value of MA[7:0] in ARG[15:8].	√	√

33.3 Operation

No description on this section.

33.4 Usage Notes

Before writing to DBSC register, it must be set to "0x00001234" for the following registers.
After writing to DBSC register, it must be set to a value other than "0x00001234" for the following registers.

DB0SYSCNT0A
DB0SYSCNT0

33.4.1 Activation Sequence

(1) Initialization Sequence

Refer to the following document.

R-Car Series, 4th Generation Initialization sequence of LPDDR4X/LPDDR5 interface.

(a) Overview

1. After stable power supply, reset release
2. Disable ECM
3. Disable DCLS error interrupt for memory channel 0 and 1.
4. DDRPHY register initialization
5. DDRPHY of PLL / DLL lock start
6. DDRPHY of PLL / DLL lock
7. DDRPHY training operation start
8. DDRPHY training Exit
9. DBSC register initialization
10. SDRAM register initialization
11. Auto-refresh operation start
12. Initialization Exit
13. Clear safety error interrupt signal for clk_dbsc domain
14. Enable DCLS error interrupt for memory channel 0 and 1.
15. Enable ECM

Note: Do not write DB[n]RFEN and DB[n]ACEN before 9.

(2) Self-Refresh Sequence

Refer to the following document.

R-Car Series, 4th Generation Initialization sequence of LPDDR4X/LPDDR5 interface.

(a) Overview

1. Disable DRAM access
2. Precharge all DRAM Banks
3. Issue Self-Refresh Entry Command
4. Disable Auto-Refresh

Use the following procedure to release self-refresh mode.

1. Enable Auto-Refresh
2. Issue Self-Refresh Exit Command
3. Enable DRAM access

(3) SDRAM Power-Supply Backup Mode

Refer to the following document.

R-Car Series, 4th Generation Initialization sequence of LPDDR4X/LPDDR5 interface.

(a) Overview

1. Disable DRAM access
2. Precharge all DRAM Banks
3. Issue Self-Refresh Entry Command
4. Disable Auto-Refresh
5. Set the M*BKUP signal to high level. Wait for at least 1us.
6. You can turn off the unnecessary power, other than the DDR-IO power.

(4) Recovery from SDRAM Power-Supply Backup Mode

Refer to the following document.

R-Car Series, 4th Generation Initialization sequence of LPDDR4X/LPDDR5 interface.

(a) Overview

1. After stable power supply, reset release
2. Disable ECM
3. Disable DCLS error interrupt for memory channel 0 and 1.
4. DDRPHY register initialization
5. DDRPHY of PLL / DLL lock start
6. DDRPHY of PLL / DLL lock
7. Set the M*BKUP signal to low level.
8. DDRPHY training operation start
9. DDRPHY training Exit
10. DBSC register initialization
11. SDRAM register initialization
12. Auto-refresh operation start
13. Recovery Exit
14. Clear safety error interrupt signal for clk_dbsc domain
15. Enable DCLS error interrupt for memory channel 0 and 1.
16. Enable ECM

Note: Do not write DB[n]RFEN and DB[n]ACEN before 10.

33.4.2 Dynamic Refresh Rate Control Sequence

Refresh period setting in STAT shall be constant, and the longest period in the operation shall be set.

(1) For Change from Longer Period to Shorter Period

1. QoS setting in STAT shall be changed for the shorter period.
2. Refresh period setting in DBSC shall be changed.
3. Enable new refresh period setting in DBSC.

(2) For Change from Shorter Period to Longer Period

1. Refresh period setting in DBSC shall be changed.
2. Enable new refresh period setting in DBSC.
3. QoS setting in STAT shall be changed for the longer period.

33.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

33.5.1 DCLS Mechanisms

(1) Overview

In case of DBSC, dbsc5rcarv4m_core (dbsc5rcarv4m_master) is a target of DCLS. This is an integration spec. of DCLS (Dual Core Lock Step) for DBSC. This module has two clock domain such as clk_axim and clk_dbsc. Since these clock domain are asynchronous, it's necessary to implement "comparator" as block diagram (Figure 33.2).

(2) Related Registers

Table 33.3 and Table 33.4 show the register configuration for DBSC module related to DCLS functional safety.

Table 33.3 Related Registers (ECM Register Mapping)

n = 0

Register Name	Abbreviation	Bit	Error content in ECM
Fusa Interrupt Indication Register 0 (for AXI domain)	DB[*n*]FSINTXXX00A	31	DCLS comparator error interrupt indication for AXI-domain (excluding SRAM related).
Fusa Interrupt Indication Register 0 (for AXI domain)	DB[*n*]FSINTXXX00A	30	DCLS comparator error interrupt indication for AXI-domain (SRAM related)
Fusa Interrupt Indication Register 1 (for DFI domain)	DB[*n*]FSINTXXX01D	31	DCLS comparator error interrupt indication for memory channel 1 (DDR1) in DFI clock domain
Fusa Interrupt Indication Register 1 (for DFI domain)	DB[*n*]FSINTXXX01D	15	DCLS comparator error interrupt indication for memory channel 0 (DDR0) in DFI clock domain

Table 33.4 Related Registers

(3) Hardware Description

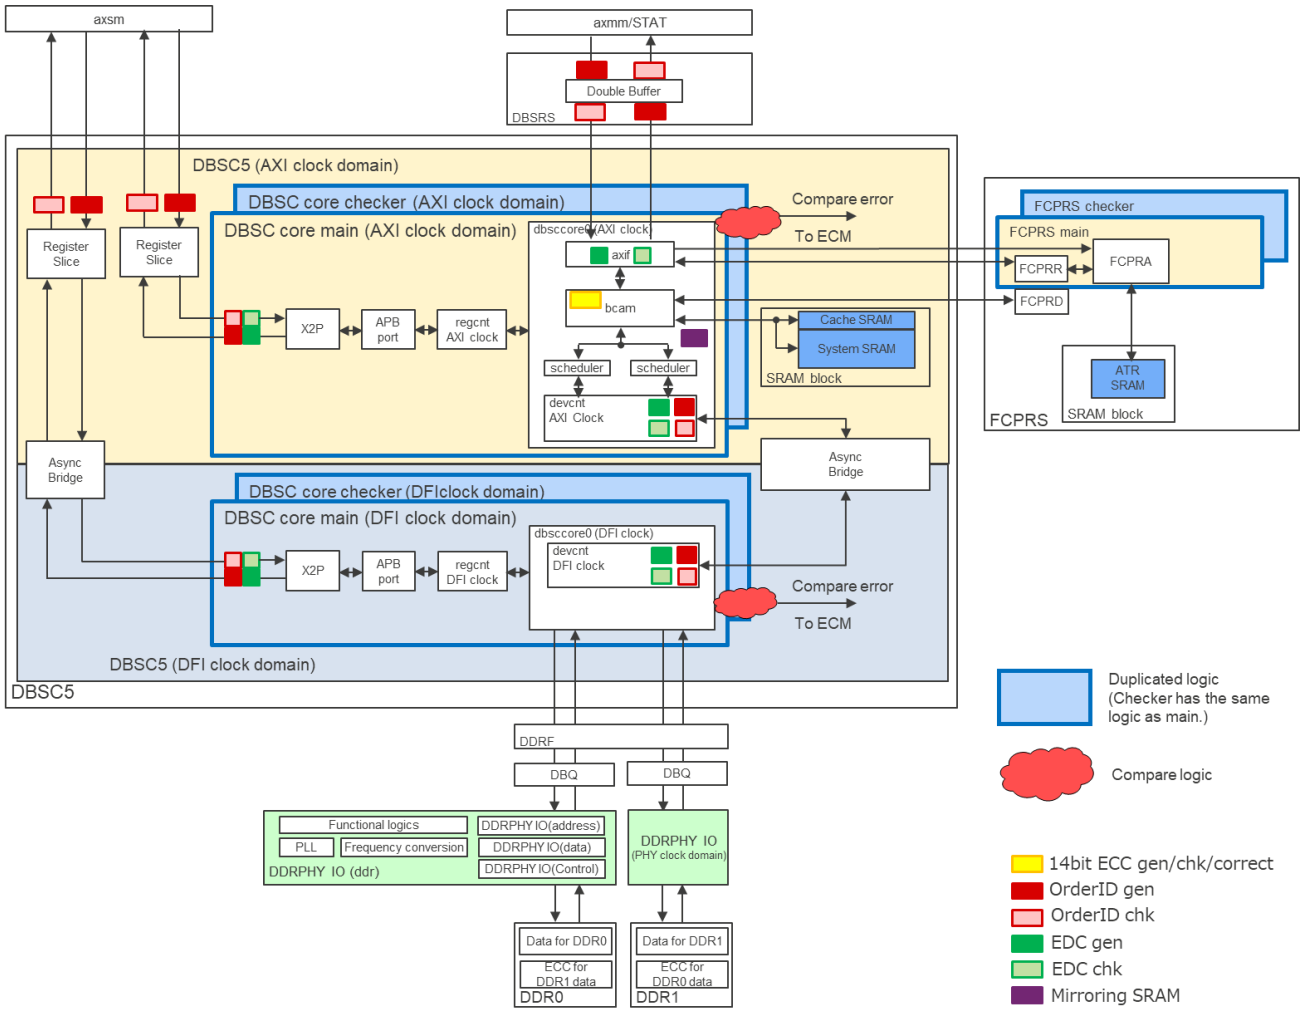

Figure 33.2 Block diagram of the DCLS protection

2 cycle delay: Two clock cycle delay for input signals of Checker Core and output signals from Master Core to Compare module is implemented.

Requirement of DCLS protection

- All logics except AXI64 access, SRAM and asynchronous bridge are duplicated.
- AXI64 is protected by EDC and other SMs, EDC chk/gen and other SMs are duplicated in DCLS core.
- Following SRAM and all of asynchronous bridge are located outside of DCLS core.
  - Data SRAM
  - 64bit/14bit ECC SRAM
- Compare outputs except following signals of DCLS core between DCLS master instance and DCLS checker instance.
  - AXI512 read data.
  - DFI write data.
  - Data SRAM write data.

- Data of asynchronous bridge.

- Compare logic is separated to some portions to avoid congestion.

- APB access converted from AXI64 is protected by DCLS.

33.5.2 ECC for DRAM and System RAM

(1) Overview

In DBSC, **ECC protection is applied to protect both SRAM and DRAM access**

(2) Related Registers

(3) Hardware Description

For ECC gen/ check implementation position in DBSC, refer below figure:

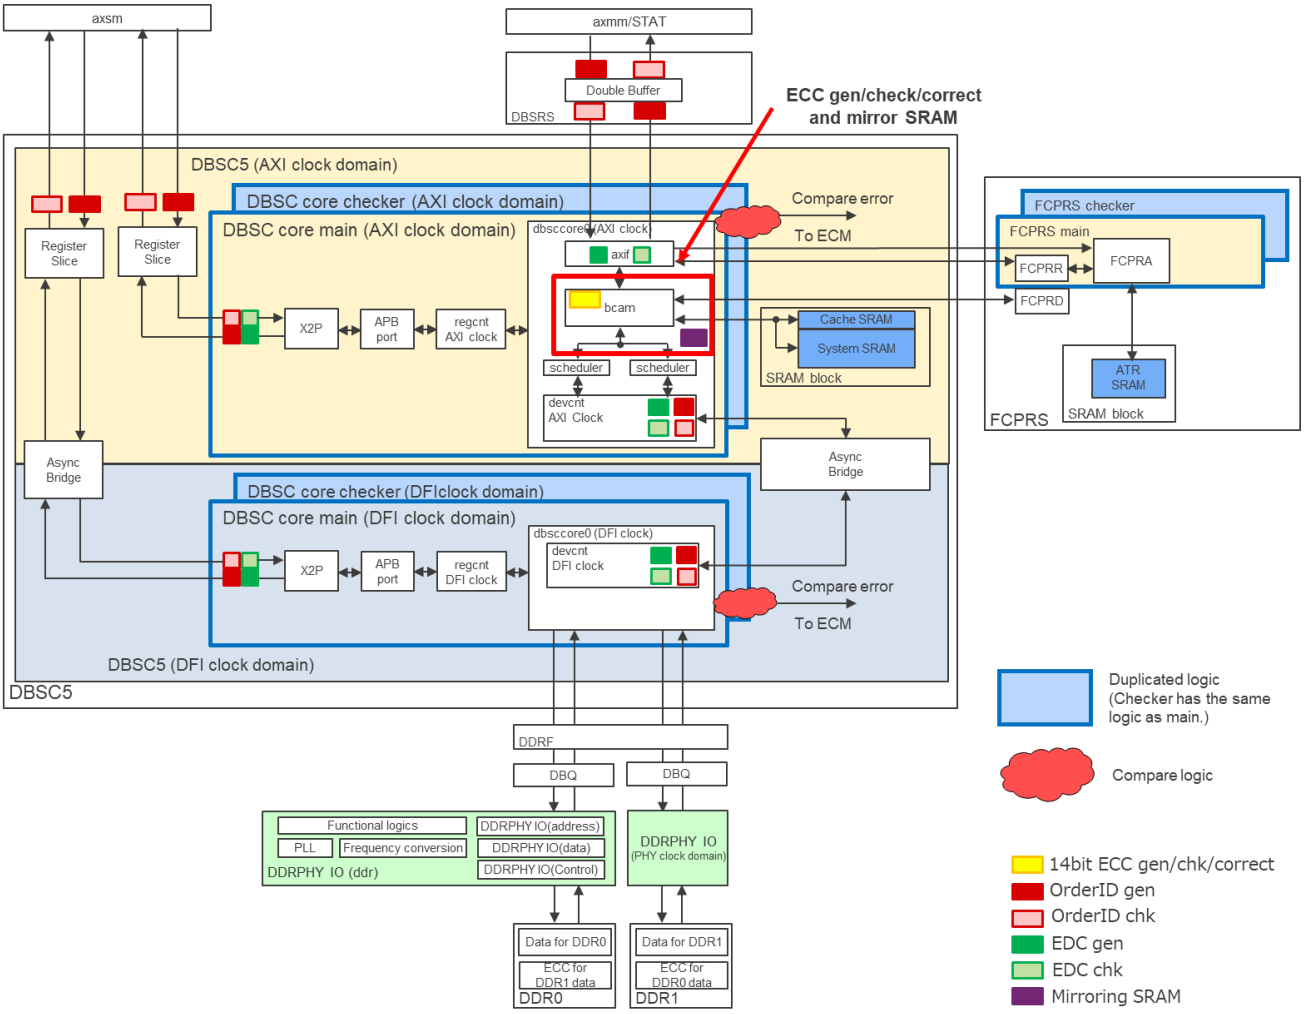

Figure 33.3 ECC protection position

Policy of 14bit ECC

DBSC use a single-error correction, double-error detection (SECDED). 14bit check bits has 2^14 = 16384 different possible syndromes, 1 syndrome indicates "no error", 64-bits data +14bit check bits = 78 syndromes indicate "1bit fault"(correction possible) , 16384-78-1 = 16305 syndromes indicate "multi bit fault" 16305/16384 = 99.52% of all multi bit faults are correctly identified. Select ECC (enable correction) mode or EDC (detection only) mode by register. If gen_din is all 0, gen_chkout is not all 0 so in DDR initialization, it can detect an error which all data and check bit are 0.

ECC decoder/encoder are placed into DCLS structure.

ECC protect for both SRAM and DDR.

ECC gen:

14bit check bits are generated from 64bit data in imb (internal master bus) write phase.

Some input data (din[3:2]) are inverted to avoid outputting all 0 check bit when input data are all 0.

ECC chk:

Check fault in 64bits data and 14bit check bits in imb read phase.

Use ECC mode (DB[N]FSCONFAXI[0] (errcrctdis) = 0). (errcrctdis bit can change to EDC mode (errcrctdis = 1)).

Use ECC gen because a check bit is recomputed from data.

ECC chk outputs 2 error signals (err_detect, err_multpl) to Error Injection chk.

Channel of Data & channel of ECC/EDC are different.

ECC protection is enabled by register setting. Default setting is disable

Policy of Error injection for ECC chk:
Inject before ECC chk because of high BER (Bit Error Rate). There are FFs which store wrong DATA/check bit pair. CPU writes 64bit data to a register in regcnt, and ECC gen generates 14bit check bits. 78bit DATA/check bit corruption register can select any bits (but no more than 2 bits) to be inverted. Read request to specific address reads the wrong DATA/check bit pair. Normal address and specific address paths are divided by specific address register ECC chk can detect the injected error. After that, it outputs err_detect and err_multpl to Error injection check. Address compare receives read address and compares with specific address. If the read address matches specific address, Address compare informs Error injection chk that this error is injected error.

Protection policy
16bit x 2ch DDR mode
All entries of SystemRAM are protected by 64bit/14bit ECC
Specied area of DRAM (set by register) is protected by 64bit/14bit ECC
Data of partial write to DRAM (data write is not full 64bit unit) is protected by data mirroring until ECC is regenerated.
When parital write access to SystemRAM (data write is not full 64bit unit) comes, ram_mw execute Read-Modify-Write.

ECC address generation

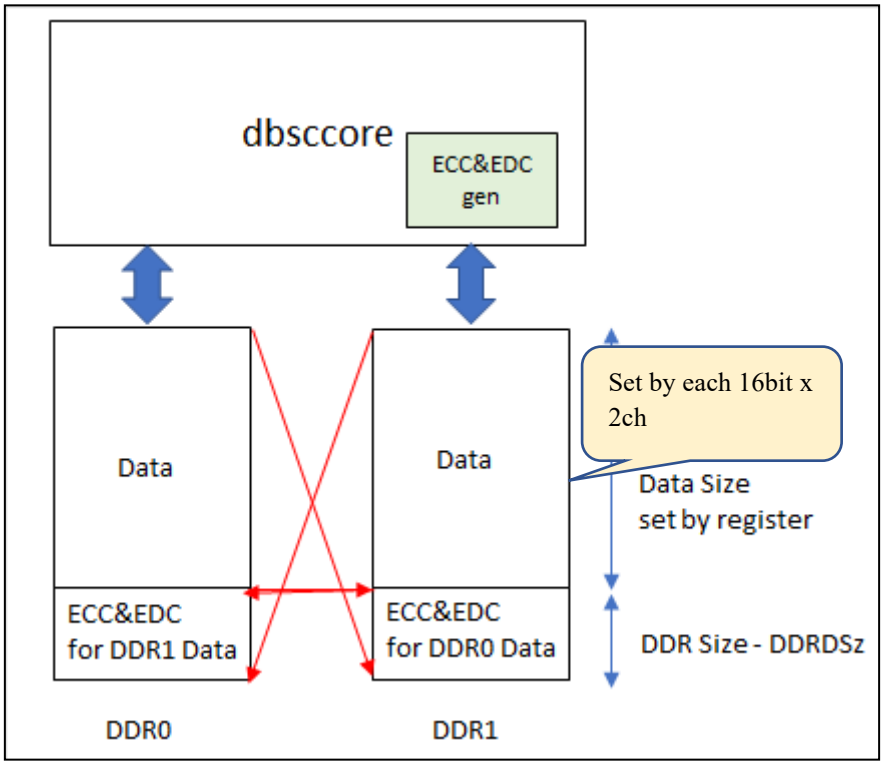

Figure 33.4 Image of DATA and ECC storage

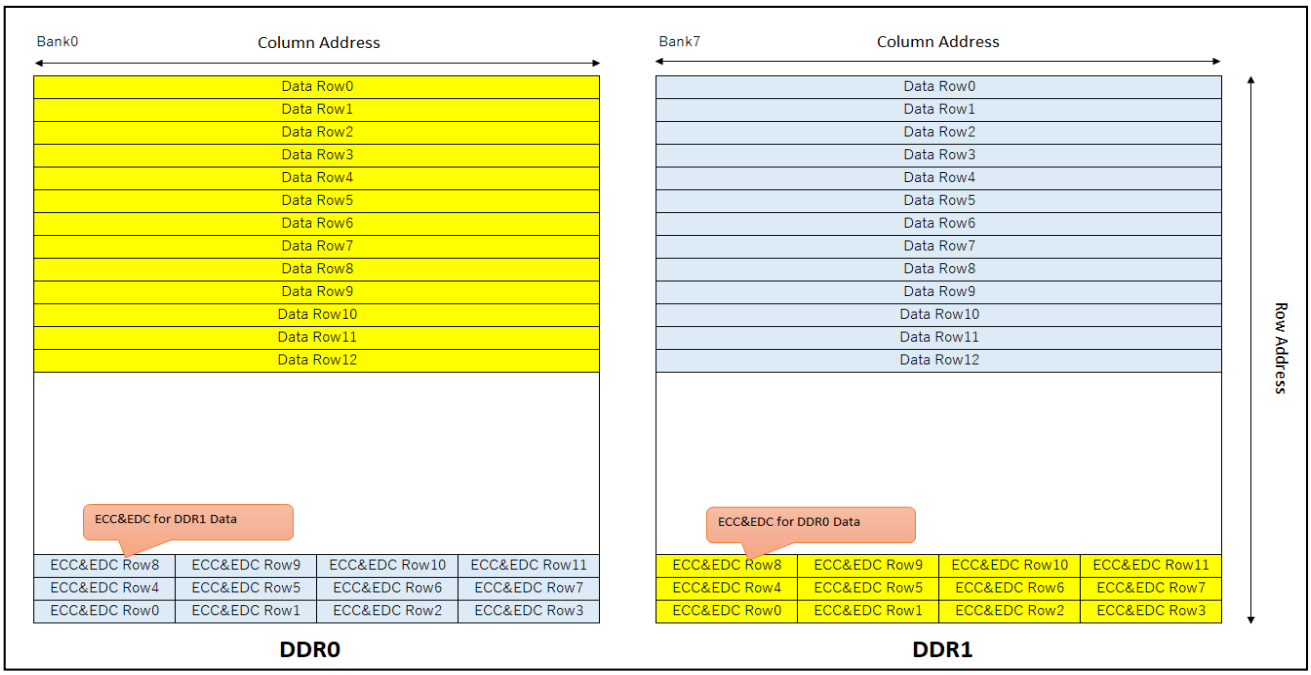

Figure 33.5 Image of ECC/EDC mapping

Bank of Data & bank of ECC are same.

Start row address of ECC is end of DDR row address.

In 1 row address, there are ECC for data of 4 row address.

Data size of target of ECC can bet set by register.

During ECC protection is disabled by register, can access to all DRAM area.

Cache data and ECC packet generated at AXI write phase are written together to DDR.

Refer to sheet "DRAM ADDRESS MAP" of 033_DRAM_address_map_r0p70.xlsx for DRAM address map(DATA/ECC).

33.5.3 EDC/OrderID protection for register access

(1) Overview

In DBSC, register access use EDC and OrderID to protect error in signals and prevent from data duplication or lost as below figure:

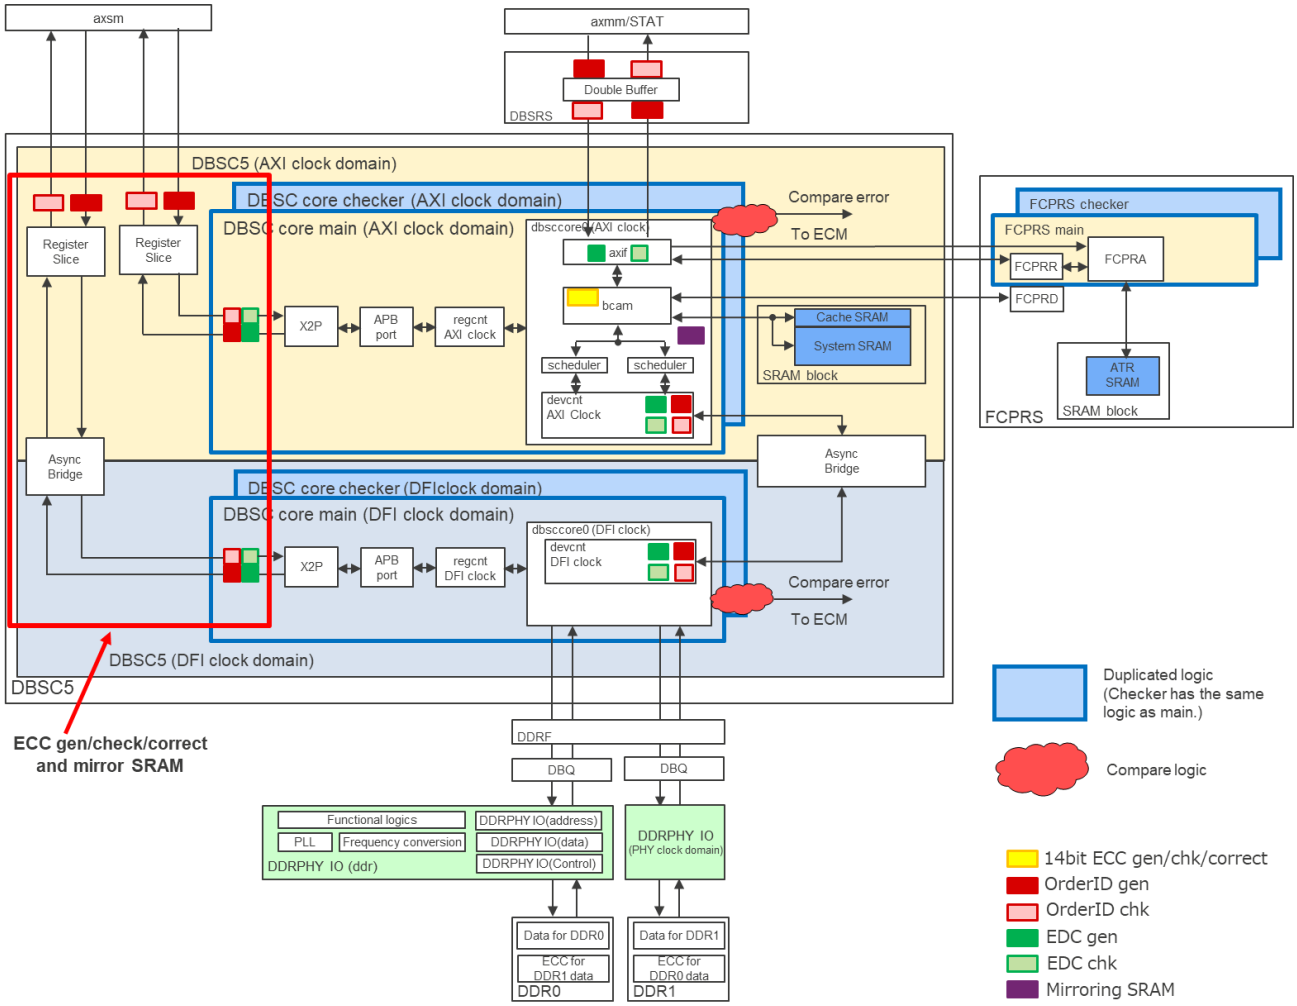

Figure 33.6 EDC/OrderID register access protection

(2) Related Registers

Table 33.7 Related Registers (ECM Register Mapping)

n = 0

Fusa Injection Mode Register 0 (for DFI domain)	DB[*n*]FSINJECT00D
Fusa Interrupt Counter Register 0 (for DFI domain)	DB[*n*]FSINTCNT00D

(3) Hardware Description

In AXI I/F between axsm and dbsc, it has EDC code on AxUSER and WUSER for EDC check and EDC code on RUSER for EDC generate. EDC check/gen are located into DCLS core

OrderID is used for register access to detect request packet lost and duplication. OrderID counter is increased when AR, AW or W ch packet is VALID & READY. Add OrderID counter value between axsm and Register slice to packet's attribute. When counter value of OrderID counter in DCLS core, and packet's attribute are different, it will report error.

OrderID is used for register access to detect response packet lost and duplication. OrderID counter is prepared on between DCLS port and AXI to APB Bridge in DCLS core, and on between axsm and Register slice. OrderID counter is increased when R or B ch packet is VALID & READY. OrderID counter value is added between DCLS port and AXI to APB Bridge to packet's attribute. Add 1 bit to MSB of packet's attribute for identification of clock domain. When counter value of OrderID counter between axsm and Register slice, and packet's attribute are different, it will report error.

There is error injection to inject an intentional error to each error flag to regcnt.

33.5.4 Protection between axmm & dbsc

(1) Overview

Interface between axmm and DBSC5 is protected by EDC gen/check and address check.

Double buffer of DBSRS module located between axmm and DBSC5 is protected by Order ID.

(2) Related Registers

Table 33.9 Related Registers

n = 0

Register Name	Abbreviation
Fusa Interrupt Indication Register 1 (for AXI domain)	DB[*n*]FSINTXXX01A
Fusa Interrupt Enable Register 1 (for AXI domain)	DB[*n*]FSINTENB01A

Fusa Monitor Nomem Error Address (LSB side) Register 0 (for AXI domain)	DB[*n*]FSMNDEA0LA
Fusa Monitor Nomem Error Address (MSB side) Register 0 (for AXI domain)	DB[*n*]FSMNDEA0HA

(3) Hardware Description

All EDC gen check for axmm and dbsc interface are located inside DCLS as below figure.

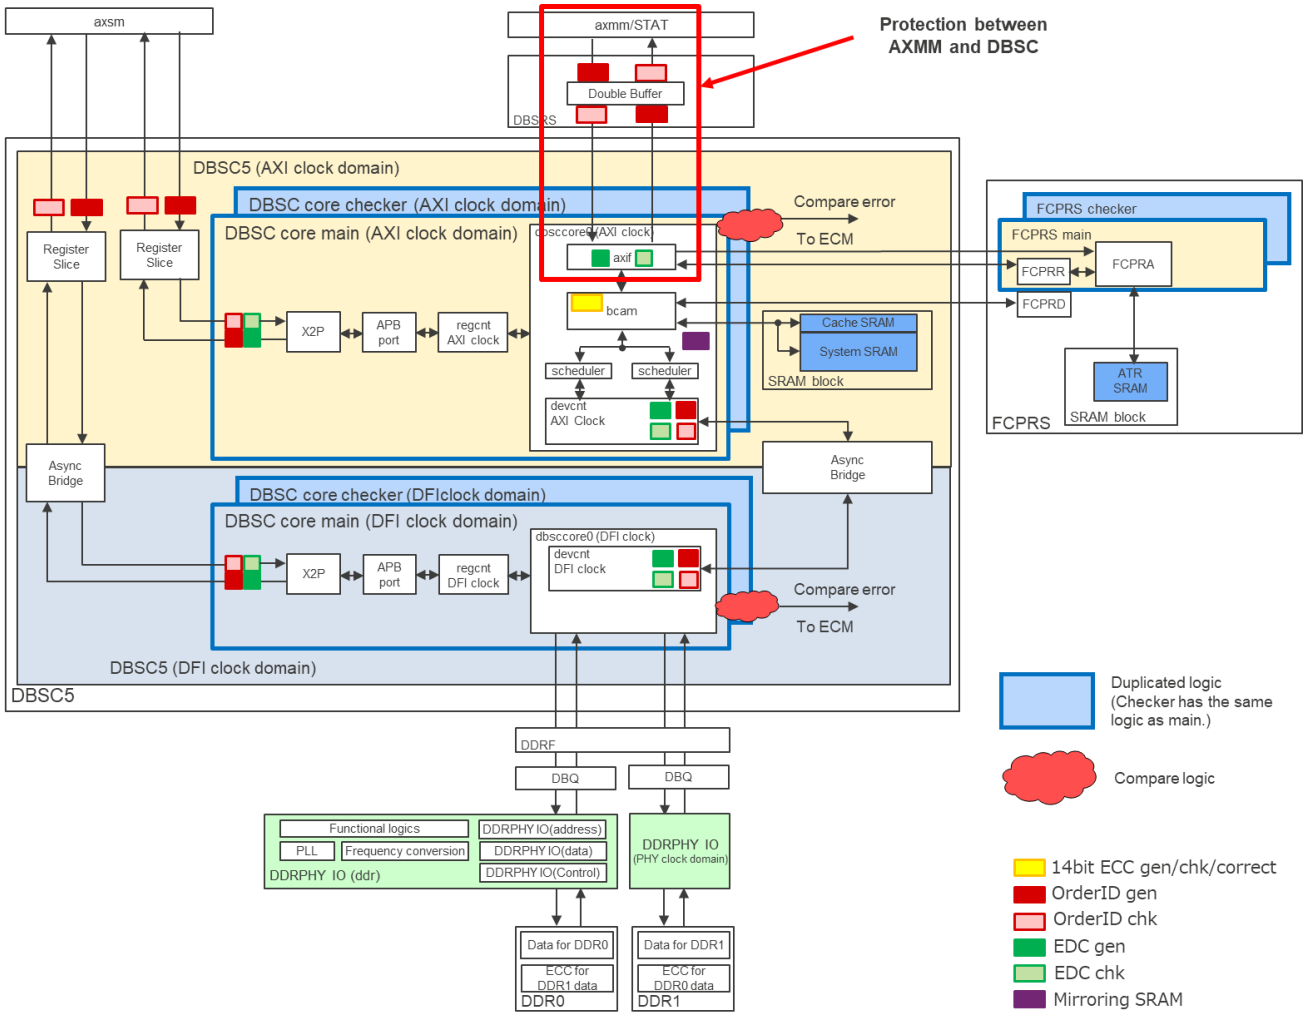

Figure 33.7 EDC protection between DBSC and AXMM

Operation:

EDC gen/check:

For request (address / write data), check EDC code generated by hierarchical bus in axiif module. For read response, EDC code is generated in axiif module, and added to AXI RUSER field. There is error injection to inject an intentional error flag to regcnt.

Address check:

Check whether the requested address is within valid space or not. If address is not in valid space, it will output error and set error status to register. Error address will be stored in register for first address error.

Burst ID gen/chk:

For read response, Burst ID is added to AXI RUSER field. For write data, check Burst ID to detect lost/interleave error in a burst.

Source ID is stored in a register for the first error.

There is error injection to inject an intentional error flag to regcnt.

33.5.5 Asynchronous protection

(1) Overview

Bus protocol of asynchronous bridge of DBSC are protected by EDC and OrderID. Other signals are protected by specific method such as inversion duplication, operation checks.

(2) Related Registers

Table 33.10 Related Registers

Fusa Interrupt Counter Register 1 (for DFI domain)	DB[*n*]FSINTCNT01D
Fusa Interrupt Counter Register 3 (for DFI domain)	DB[*n*]FSINTCNT03D

(3) Hardware Description

Below figure show position of EDC/OrderID for asynchronous bridge in DBS.

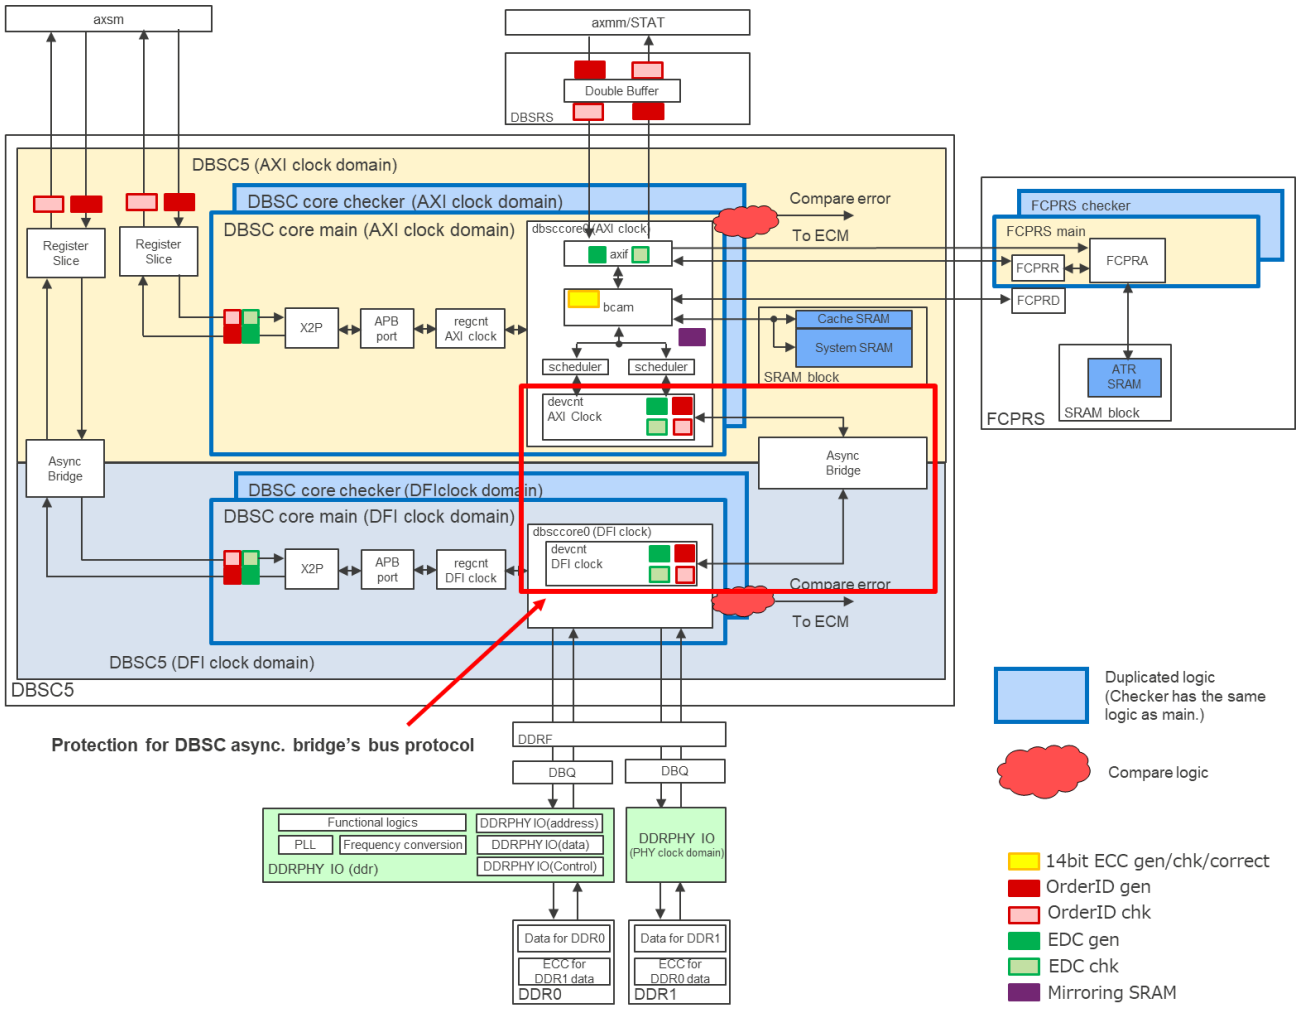

Figure 33.8 EDC/OrderID protection for DBSC's asynchronous bridge

For bus protcol:
EDC checker /generator is in DCLS core. All address and data are protected by EDC.
OrderID counter will detect packet lost and duplication. On before and after of asynchronous bridge, prepare OrderID counter. OrderID counter of before asynchronous bridge is increased when asynchronous bridge receives the packet. OrderID counter of after asynchronous bridge is increased when asynchronous bridge sends the packet. OrderID counter value of before asynchronous bridge is added to packet's attribute. When OrderID counter value of after asynchronous bridge and packet's attribute are different, report error. OrderID counter and checker are located into DCLS core.

For other sideband signals:

sy_ref_req & sy_wtraining protection

- When input request is high, but ack is low over 63 cycles, it will issue error. From request de-assertion, if ack is still high over 63 cycles, it will issue error. There is ack assertion but there is no request assertion before, it will issue error

Policy of devcnt status info to schcnt asynchronous path protection

- Protect by inversion duplication signal, and by OrderID

Policy of asdb_dv_empty path protection

- Protect by inversion duplication signal. The empty signal is asserted when the synced dv_empty asserted from 8 cycles or above. And, if empty signal generated from inversion signals and empty signal generated from normal signal are not equal during 16cycles, it will output error.

Policy of sy_dbscrm path protection

- Prepare status monitor register for sy_dbscrm (after async), user read the register and check read data by software. During accen=1, check sy_dbscrm is not change.

Policy of scxx_busy (busy signal of scheduler) path protection

- Signal duplication with inversion. Output signal is asserted when synced signal assert 8cycles or above. If signal generated from inversion signal is mismatch over 16 cycles with output signal, there will be error.

Policy of dvxx_rq_empty path protection

- Signal duplication with inversion. If generated signal from normal signal or inversion signal don't change during 64 cycles, and mismatch signal generated from normal signal and signal generated from inversion signals between 16cylcles and 32cycles ago, it will output error.

Policy of dvxx_stop_valid, dvxx_stop_rq_ack path protection

- Signal duplication with inversion and FSM, if async state from normal signal and async state from inversion signal is not matched after 31 cycles, it will output error.

Policy of dvxx_stop_cs, dvxx_stop_bg, dvxx_stop_ba, dvxx_stop_pb path protection

- Signal duplication with inversion.

Policy of other asynchronous path protection: No protection. Target signals type is as follows.

- Power down request from CPG
- Global monitor acknowledgement from CPU
- Performance monitor control from STAT

33.5.6 Self-test for Async, DBP, Hier-boundary

(1) Overview

In order to test data before DBSC initialization, ensure data is correct when data go through asynchronous bridges: It is in devcnt. There are 2 modules to protect data: POST gen (placed before asynchronous bridge) and POST check module (placed after asynchronous bridge). POST gen generates 2 packets in each clock cycle: n'hAAAA and n'h5555. POST check will checks that all bits are not tied to 0 or 1.

(2) Related Registers

Table 33.12 Related Registers

n = 0

Register Name	Abbreviation

Fusa Control Register 0 (for DFI domain)	DB[*n*]FSCTRLDBS0

(3) Hardware Description

Block diagram:

Structure of asynchronous bridge in devcnt: Protect data for ach, wch, rch at devcnt module.

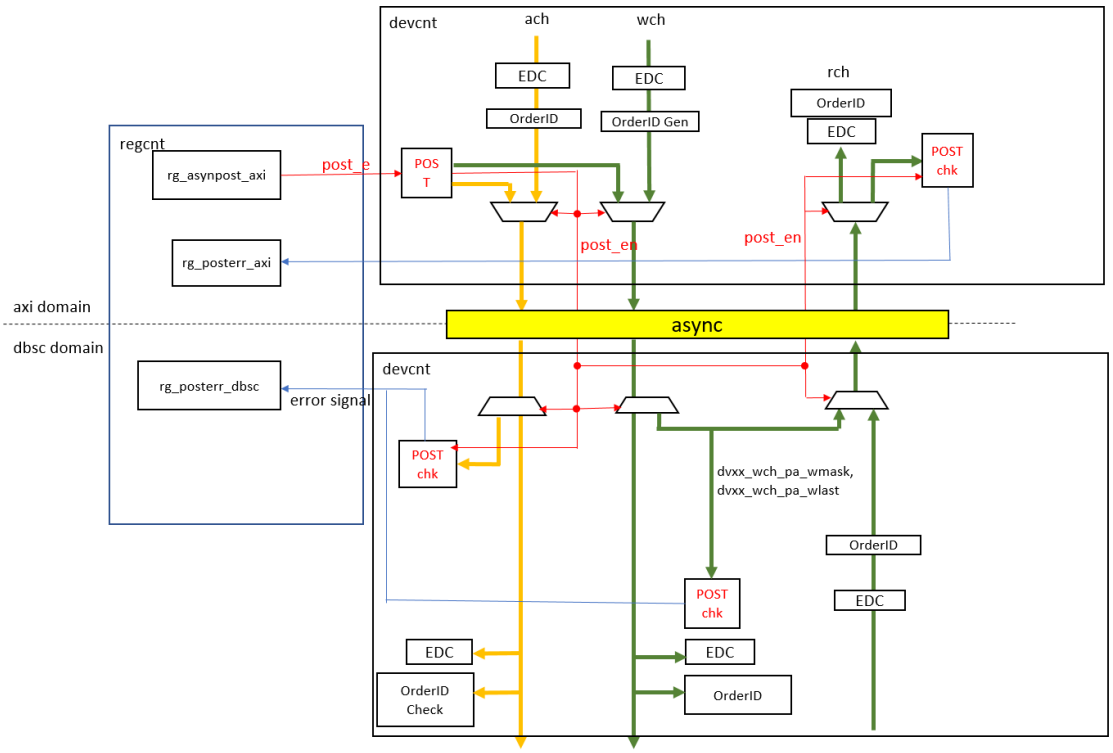

Figure 33.9 POST check for asynchronous bridge in devcnt

Operation:

Self-test is started by setting register (dbsc register). Timing of self-test sequence is 2 cycles continually. In self-test sequence, data between post_gen module and post_check module will be replaced by self-test data (n'hAAAA and n'h5555), data after post_check module will be mask zero during self-test sequence (Some DFI signals are needed to keep value: cke, cs, reset, wrdata_cs, rddata_cs, parity data, dll_rst_n).

Support error injection register: Inject an intentional error to each error flag by register

Self-test must be started before DBSC initialization to avoid pseudo error related to DFI protocol and another FUSA error (EDC, Parity Check). Please refer to below self-test sequence

1. Disable protection enable (EDC) and parity enable
2. Start Self-Test sequence
3. Confirm end of Self-Test sequence
4. Start DBSC initialization
5. Assert protection enable and parity enable

33.5.7 Parity check and generation for DDR-PHY register interface

(1) Overview

Generate parity (odd) for write data and register selection on DDR-PHY register interface in DBSC

Check parity (odd) for read data on DDR-PHY register interface and issue interrupt as fusa support in DBSC

(2) Related Registers

Table 33.13 Related Registers

n = 0

Register Name	Abbreviation
Fusa Interrupt Indication Register 1 (for DFI domain)	DB[*n*]FSINTXXX01D
Fusa Interrupt Enable Register 1 (for DFI domain)	DB[*n*]FSINTENB01D
Fusa Injection Mode Register 1 (for DFI domain)	DB[*n*]FSINJECT01D
Fusa Interrupt Counter Register 2 (for DFI domain)	DB[*n*]FSINTCNT02D
Fusa Interrupt Counter Register 4 (for DFI domain)	DB[*n*]FSINTCNT04D

(3) Hardware Description

Block diagram

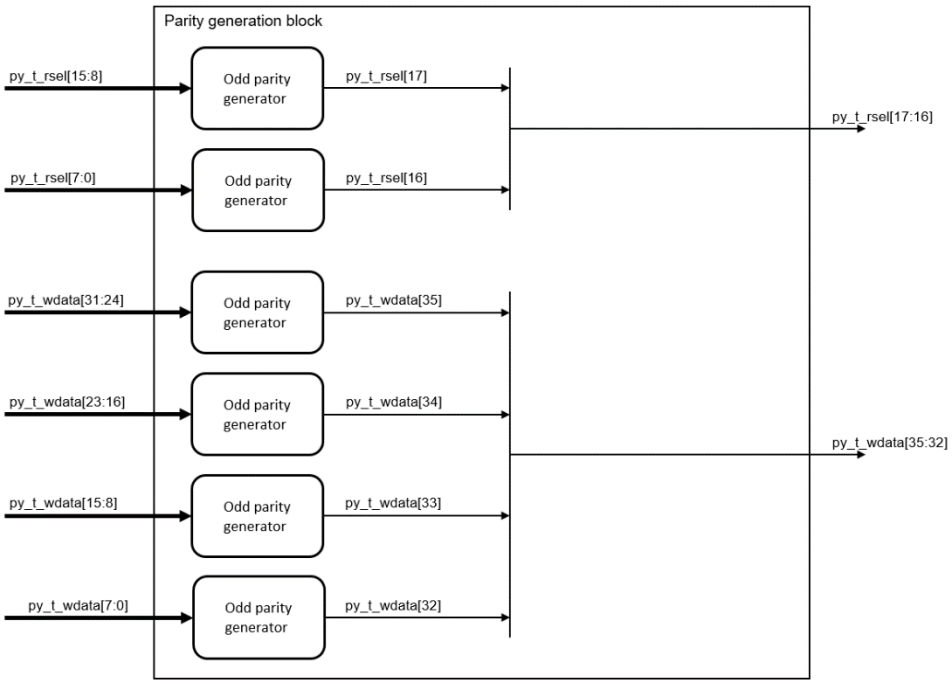

Figure 33.10 Parity generation block

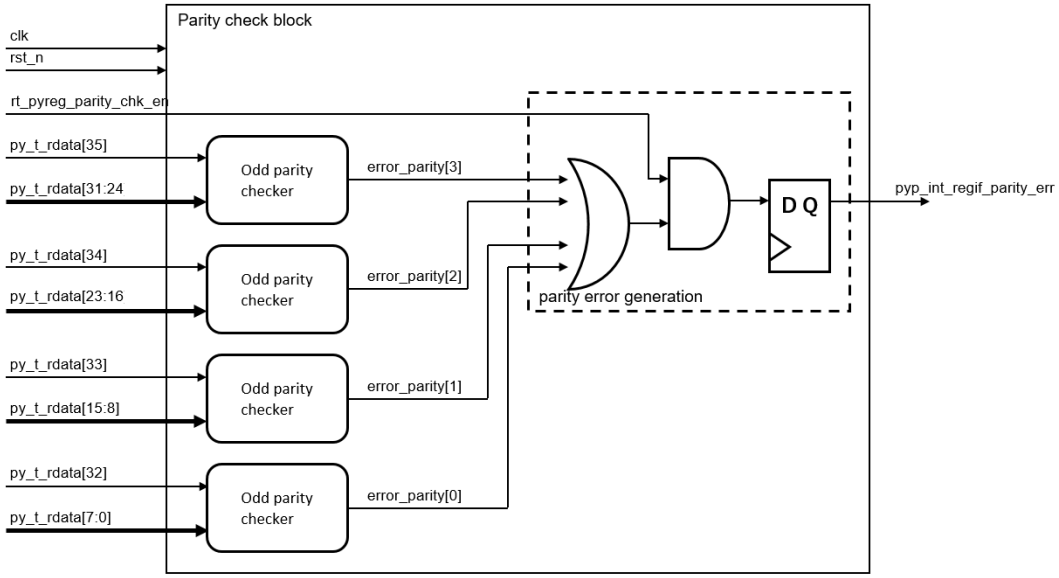

Figure 33.11 Parity check block

Operation

Parity check is started by setting register (dbsc register, active high) and run during DBSC operation. Parity generate module will generate parity (odd) for write data and register selection on DDR-PHY register interface in DBSC. Check module will check parity (odd) for read data on DDR-PHY register interface and issue interrupt as fusa support in DBSC.

Support error injection register: Inject an intentional error to each error flag by register.

Parity check must run after self-test to avoid pseudo error. Please refer to 10.5.6 for detail information.

34. System RAM

34.1 Overview

R-Car series 4th generation products incorporate System RAM.

34.1.1 Features

• Memory size: 1024KBytes.

• The data of System RAM is undefined on power-on reset and retained on other resets.

• System RAM takes charge of buffer between CPUs.

34.1.2 Block Diagram

System RAM is embedded in DBSC5.

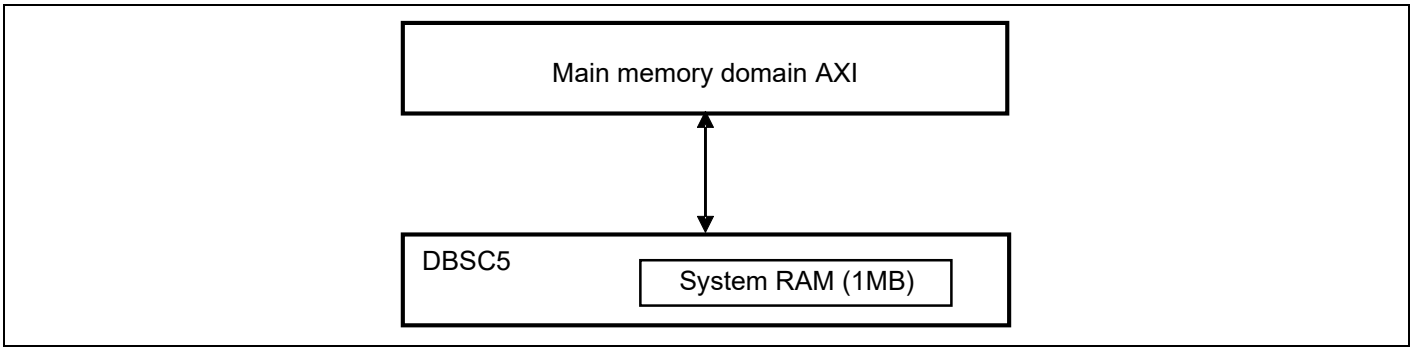

Figure 34.1 Block Diagram

34.1.3 Register Configuration

System RAM does not have the register.

34.2 Register Description

System RAM does not have the register.

34.3 Operation

No description on this section.

34.4 Usage Notes

Address of System RAM is shown in the table below.

Table 34.1 Address of System RAM

Address	Notice
H'E630 0000 to H'E63F FFFF	-

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

34.5 Safety Mechanisms

Refer to section 33.5 for safety mechanisms of System RAM.

36. RT-VRAM

RT-VRAM is 1M byte RAM in compatible mode and 28M byte cache in extended mode on Real Time domain. There is an instruction area of Cortex-R52 or ICUMX, and communication area.

36.1 Overview

36.1.1 Features

- Memory size: 1M bytes
- Number of modules: 2 modules (total 2M bytes)
- Memory initialization function: all memory value set to zero.
- Safety Region (up to 16 region) protect.
- Access protection for secure regions.
- Support exclusive access: 16 exclusive access monitors
- DCLS support.
- RAM EDC (single-bit, multi-bit) support.
- Cache size: Maximum 28M bytes (4/8/12/16/20/24/28MB selectable)
- Cache 4-WAY/8-WAY configurable
- 32-bit CRC protection per 256-byte boundary unit.
- DDR-RAM mapping configurable
- Data Scramble support

36.1.2 Block diagram

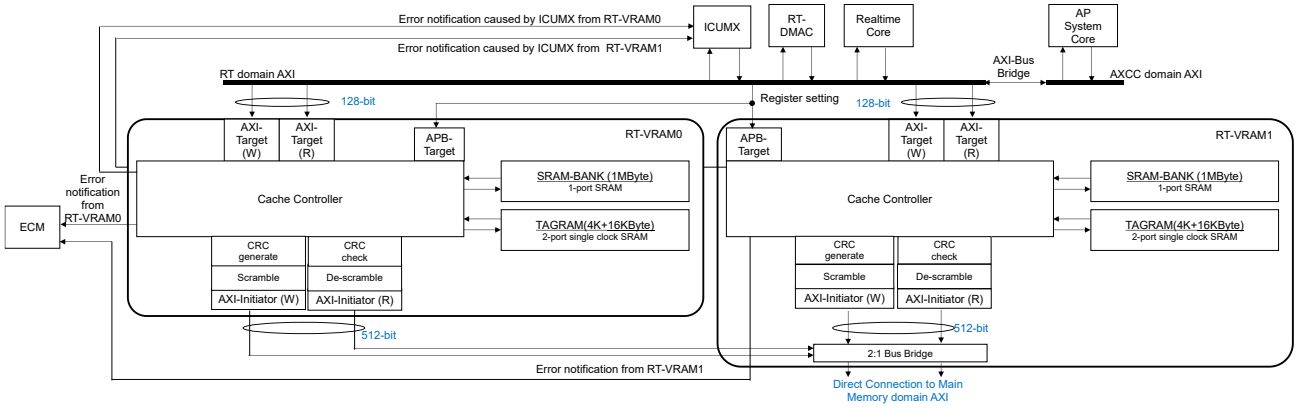

Figure 36.1 Block diagram

36.1.3 External Pins

The RT-VRAM does not have any external pins.

36.1.4 Connected Module

Table 36.1 shows the connected modules to RT-VRAM. As for the feature of the connected modules, refer to the chapter of each module.

Table 36.1 Connected Modules

Module Name	Connected Module Name	Connected Module Function
RT-VRAM	AXI-BUS	AXI-Bus, APB-Bus
	CPG	Clock Supply SRAM Initialization control
	RST	Module Reset
	ECM	Error Interrupt Controller
	ICUMX	Hardware security module

36.1.5 Register configuration

Refer to R-CarV4M_UM_036_RTVRAM_r0p81.xlsx.
Note: Register address spaces of FFE9_E000 to FFE9_FFFF and FFEC_E000 to FFEC_FFFF are reserved area.

36.2 Register description

Refer to R-CarV4M_UM_036_RTVRAM_r0p81.xlsx.

36.3 Operation

36.3.1 Address of RT-VRAM

Address of RT-VRAMs are below:

RT-VRAM0: 0xE000_0000 to 0xE1BF_FFFF (up to 28MB)

RT-VRAM1: 0xE200_0000 to 0xE3BF_FFFF (up to 28MB)

Note:

Address space is depending on RT-VRAM mode. Compatible mode supports 1MB from source address. For Extended mode these areas are extended up to 28MB area.

36.3.2 Compatible mode/Extended mode

(1) Compatible mode

Compatible mode can use 1MB of SRAM area (Default mode), All functions of conventional are available in this mode.

RT-VRAM doesn't issue any AXI transaction to DRAM.

Only in RT-VRAM0, 1MB of SRAM area (0xE000_0000 to 0xE00F_FFFF) are mirrored other area (0xEB20_0000 to 0xEB2F_FFFF).

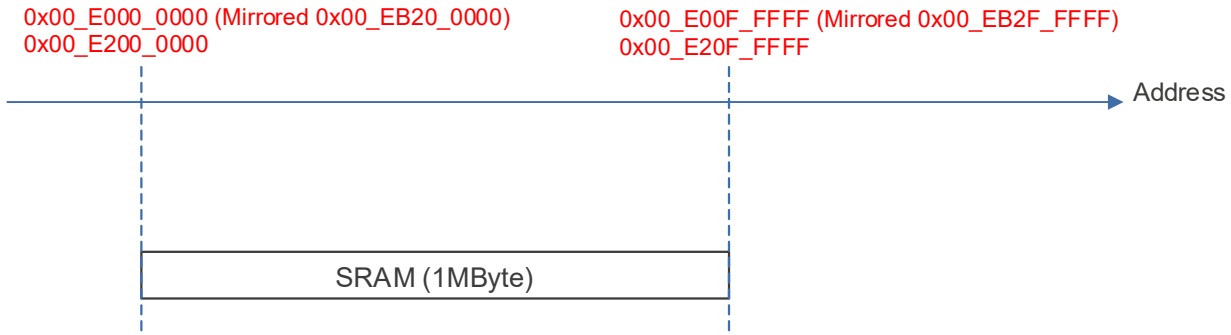

Figure 36.2 Address area of RT-VRAM in Compatible mode

(2) Extended mode

Buffer size is extended up to 28 MB (4/8/12/16/20/24/28MB selectable). It is a virtual buffer.

Actual data is allocated on DRAM, and it is protected by 32-bit CRC at 256-byte boundary unit.

The first 1MB area can mix SRAM and the virtual buffer, but this area doesn't support cache flush function. In details, please refer Section 36.3.4. *

RT-VRAM acts as a cache to access data on the virtual buffer.

The size of SRAM area is configurable. It depends on the size of the virtual buffer and the number of way of data cache. If IP access the out of the virtual buffer, RT-VRAM returns SLVERR to IP.

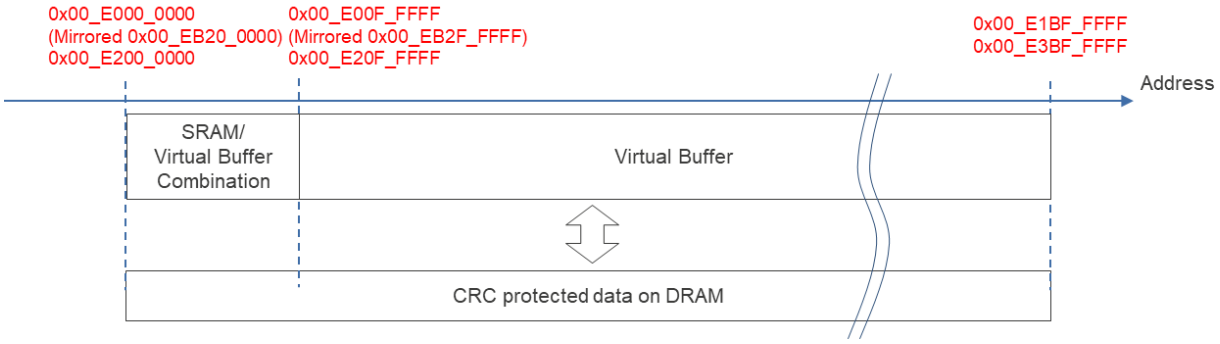

Figure 36.3 Address area of RT-VRAM in Extended mode

Cache in RT-VRAM has the following functions:

- Set Associative, 4 or 8-way configurable, 256 bytes line, 256 sets.
- Write policy: write back to DRAM when the line is modified and pushed out by replacement operation
- Replacement policy: Pseudo Least Recently Used (pLRU)
- There are 256 valid bits for each tag, and all bits become 0 when switching to extended mode. If the bit is 0, the cache uses the default value for tag instead of reading from TAGRAM. When the tag is updated, the corresponding bit is set to 1.
- Forcibly writes back of cache data to DRAM can be performed.

Note: * The size of SRAM area and Virtual buffer area in the first 1MB area in Extended Mode are decided as Figure 36.4. The size of the virtual buffer and the number of way of data cache are set by VBUF_CFG register.

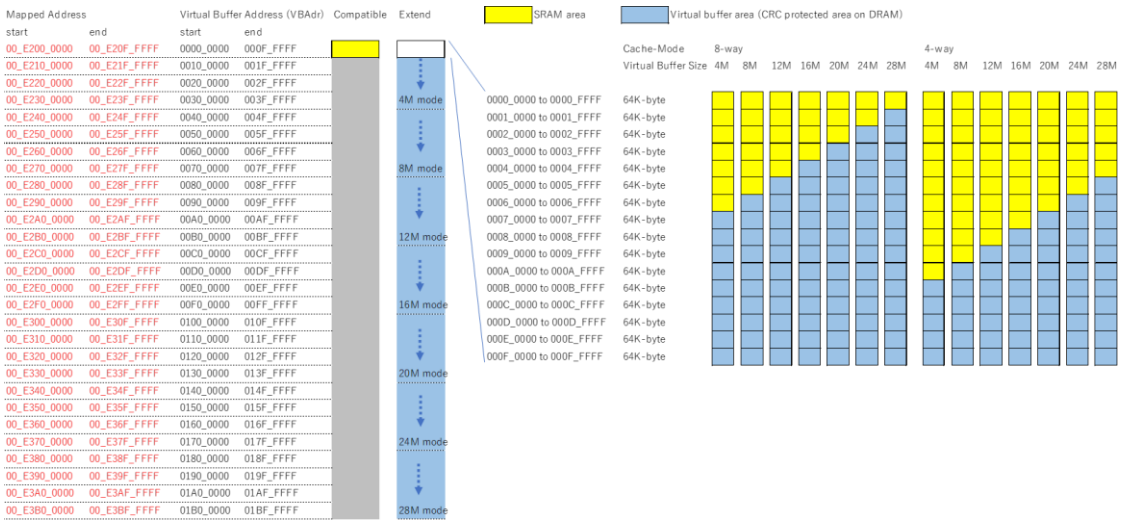

Figure 36.4 The size of SRAM area and Virtual buffer area in the first 1MB area in Extended Mode

36.3.3 Switching compatible mode to Extended Mode

(1) Procedure of switching Compatible Mode to Extended Mode

1. Wait memory initialization has completed (MEM_INIT.INIT)
2. Set VBUF_BADDRn register (Base address of each 4M-byte area of virtual buffer[39:16], n = 0 to 6)
3. Set VBUF_CFG register
4. Set 1'b1 to MODE bit in EXT_MODE register

(2) Restrictions in Extended Mode

Switch Compatible Mode to Extended Mode by setting to Extended Mode register EXT_MODE. It cannot switch back.

If the Extended Mode register is set to Extended Mode, all valid bits of TAG are set to 0 only.

The data continues to stay in SRAM-BANK and will be transferred to DRAM by write back processing of cache.

It is prohibited to set duplicated each 4MB area by BASE_ADDRn[23:0] bits in each VBUF_BADDRn register.

36.3.4 Cache Flush Function

RT-VRAM supports cache flush function.

The flush target area is one of 16 divided areas specified by access policy registers.

The target area is configured by register, and different areas can be flushed sequentially.

Note: it is prohibited to flush the area which contains first 1 MB (40'h00_E000_0000 to 40'h00_E00F_FFFF, 40'h00_E200_0000 to 40'h00_E20F_FFFF).

The flush operation is executed only when the access authority of the IP that issued the flush instruction matches the read permission of the area to be flushed.

If the execution is rejected by access policy, it is notified as PSVERR of the flush operation register access.

Cache data remains valid after flush operation.

Any IP cannot access to the flush target area during flush operation.

When an IP accesses, the access is rejected and notified as SLVERR.

The completion of the flush process is indicated by the status register.

Note that cache flush is available when extended mode (EXT_MODE.MODE = 1). If the register is set to perform the flush in compatible mode (EXT_MODE.MODE = 0), it is canceled and returns PSLVERR.

36.3.5 Software reset for RT-VRAM

RT-VRAM starts the initialization process of SRAM-BANK and TAGRAM both immediately after reset.

RT-VRAM has MEM_INIT register to execute the initialization process, but it is available only when Compatible Mode (EXT_MODE.MODE = 0). If the register is set to perform the initialization in the extended mode (EXT_MODE.MODE = 1), the initialization is canceled and return PSLVERR.

There is basically no use for MEM_INIT register because it breaks all processing that uses RT-VRAM. Above function is just for software compatibility.

RT-VRAM provide a reset sequence by software as RT-VRAM. To write 1 to INIT bit of MEM_INIT register, RT-VRAM can set all RAM data to zero.

INIT bit in Memory initialization Register (MEM_INIT) is set to "1" during initialization.

When initialization finished, INIT bit is cleared automatically.

By checking INIT bit, it is possible to check the initialization status via software.

After Power On Reset, if software wants to initialize memory manual, it shall follow the steps below:

1. Polling MEM_INIT register by READ until the read out value is 0x0000_0000.
2. READ MEM_INIT register to confirm the value is 0x0000_0000.
3. WRITE MEM_INIT register INIT(bit 0) by 1.
4. Polling MEM_INIT register by READ until the read out value is 0x0000_0000.
5. READ MEM_INIT register to confirm the value is 0x0000_0000.

Note: It is recommended that before running software reset, running flush operation to all using access protection of protect area defined by SECDIV[n] register to remain cache data to DDR memory.

36.3.6 Access protection for secure/safety regions

(1) Memory protection

RT-VRAM has memory protected area function. This function as shown Figure 36.5 is that RT-VRAM area can be divided into 16 areas and each area can be set access privilege to 2 secure groups and 16 safety groups.

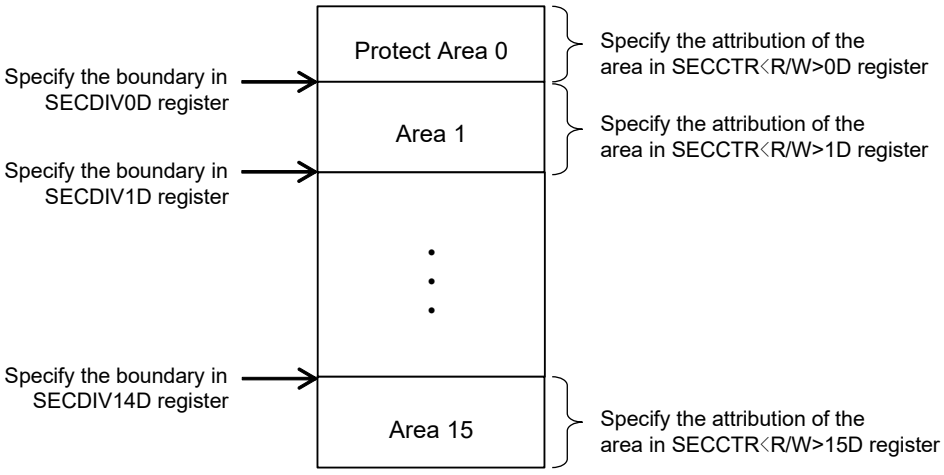

Figure 36.5 Memory Protected Area Function Concept

Table 36.2 Secure ID

Group	Group ID
Secure group	2'b00
Public group	2'b10

Table 36.3 Region ID

Group	Region ID	Group	Region ID
Region 0	4'b0000	Region 8	4'b1000
Region 1	4'b0001	Region 9	4'b1001
Region 2	4'b0010	Region 10	4'b1010
Region 3	4'b0011	Region 11	4'b1011
Region 4	4'b0100	Region 12	4'b1100
Region 5	4'b0101	Region 13	4'b1101
Region 6	4'b0110	Region 14	4'b1110
Region 7	4'b0111	Region 15	4'b1111

36.3.7 Exclusive access

RT-VRAM supports exclusive access from at most 16 masters. Exclusive marked block size is configurable up to 1 byte. For example, marked block size is 32 bytes, please write H'FFFFFFE0 to EX_ADR_MASKL register.

Exclusive access is performed in a pair of "Load-Exclusive" and "Store-Exclusive" of the identical address.

RT-VRAM always returns "EXOKAY" response to "Load-Exclusive".

If "Store-Exclusive" is success, RT-VRAM returns "EXOKAY" response and updates RAM.

If "Store-Exclusive" is fail (ex. by the interference of other processors), RT-VRAM returns "OKAY" response and don't update RAM.

Please refer to "Arm Architecture Reference Manual Armv8 (B2.2 Atomicity in the Arm architecture)" about details of exclusive access.

NOTE: Because Cortex-A76+AXCC changes ARch transaction ID and AWch transaction ID, so please don't use Store-Exclusive and Load-Exclusive instruction to access RT-VRAM from Cortex-A76. But Cortex-R52 has no this kind of issue. So Cortex-R52 can use Store-Exclusive and Load-Exclusive instruction to access RT-VRAM.

36.3.8 Data Scramble

RT-VRAM can set whether to scramble data in 4M bytes unit of virtual buffer.

A subset version of AES is used for encryption.

Apply two rounds processing.

A Key is 128 bits and it is set by secure register in RT-VRAM.

Block length is 256 bytes and the counter mode (CTR) is used for block cipher mode.

The Nonce is 64 bits and it is set by secure register in RT-VRAM.

Input of encryption is concatenated data of the Nonce (64-bit), start address of corresponding 256 bytes data in virtual buffer (32-bit) and incremental counter in units of 16 bites within the 256 bytes data (32-bit).

Only ICUMX can set the Key and Nonce only once after reset. After setting, no IP can access.

36.4 Usage Notes

36.4.1 Initialization waiting of RT-VRAM

If MEMINIT_ENABLE_SYSRAM_ALL is 1b on releasing hardware reset, software reset for RT-VRAM data (refer to 36.3.5) will run after releasing hardware reset. Initialization takes about 41.7us after releasing hardware reset when AXI clock is 400MHz.

While RT-VRAM running initialization, must not to access RT-VRAM. To read RT-VRAM will not finish until initialization ends, so it influences the performance.

36.4.2 Access protection regions configuration

It is prohibited that DIVADDR of SECDIV[n]D (n=1-14) register is set smaller than lower DIVADDR, access protection of Protect Area [n]. For example, it is prohibited that DIVADDR of SECDIV0D register is set H'20 and DIVADDR of SECDIV1D register is set H'10. It is not prohibited that DIVADDR of SECDIV0D register is set H'20 and DIVADDR of SECDIV1D register is set H'20 (not smaller but same value) and size of Area 1 will be 0 in this example.

When setting the SECDIV[n]D register, set it in order from the SECDIV0D register. Otherwise, the access protection settings do not take effect properly.

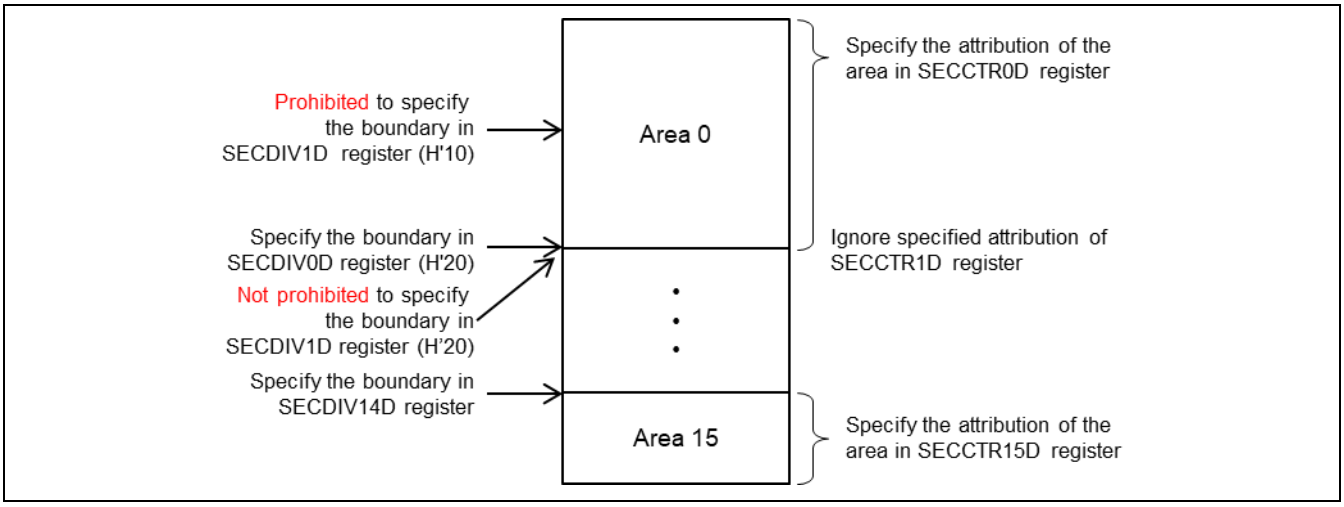

Figure 36.6 Access protection register configuration sample

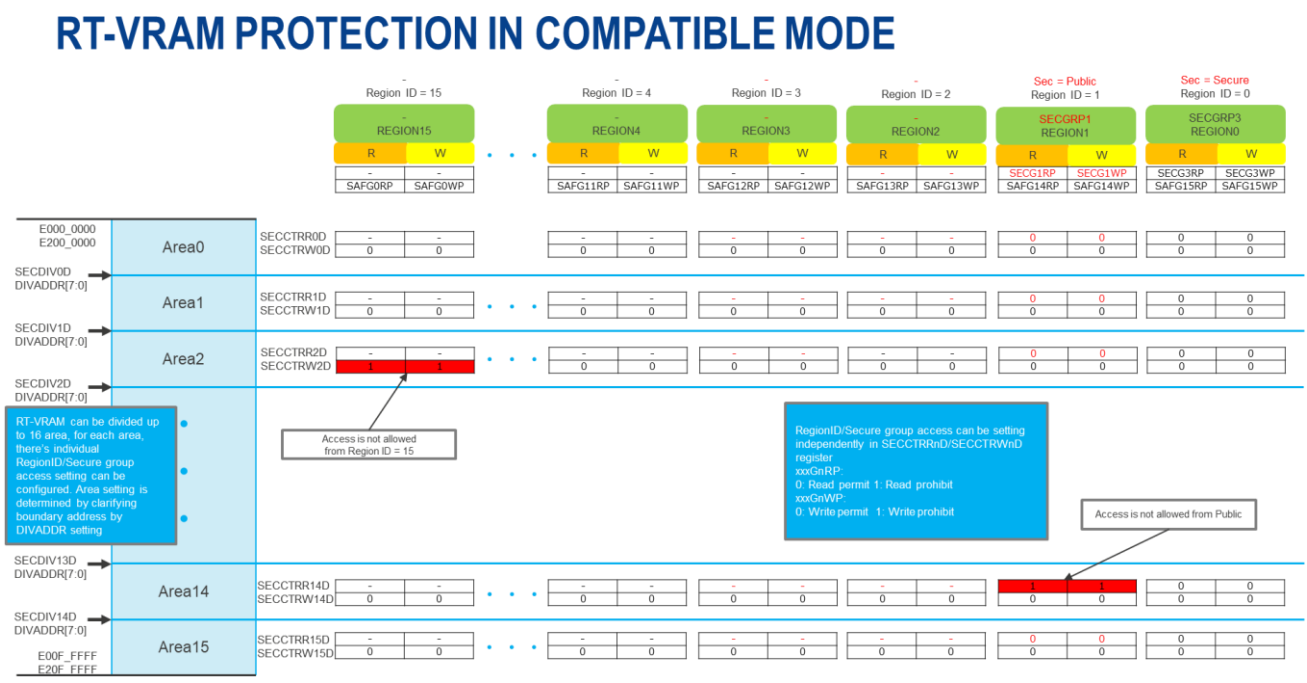

Figure 36.7 Access protection register configuration sample in Compatible Mode

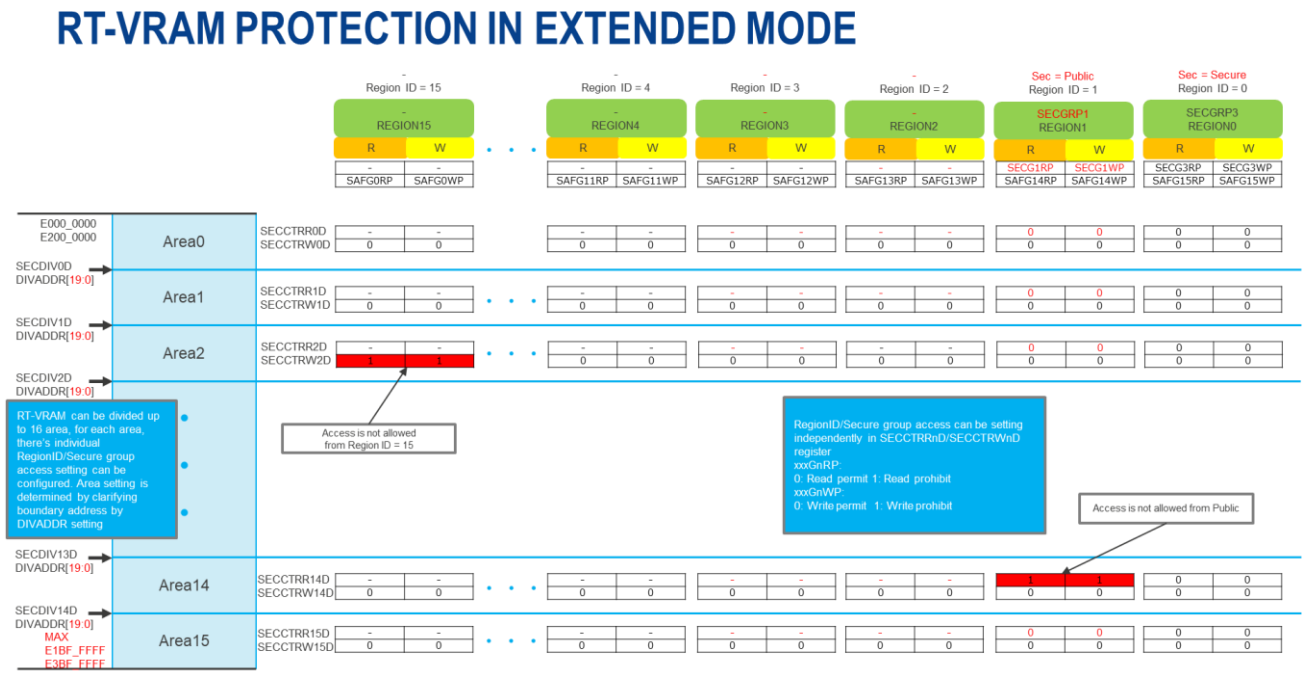

Figure 36.8 Access protection register configuration sample in Extended Mode

The figures above show a sample that how RT-VRAM protect the Memory area from Safety/Security access.

The total memory can be divided up to 16 area for safety/security access. The areas are determined by boundary address setting in SECDIV[n]D:DIVADDR registers. Each area has individual safety (i.e. RegionID) /security read/write access control setting register to permit/prohibit safety/security read/write access.

In SECCTRR[m]D/SECCTRW[m]D (m = 0 to 15)registers, safety/security group read/write access can be setting for each area. When the corresponding bit set to 0, it means the corresponding access is permitted. When the corresponding bit set to 1, it means the corresponding access is prohibited.

36.4.3 Timeout Detection for DRAM Access

RT-VRAM measures the period from the output of a transaction to the receipt of the corresponding response. If the period is longer than the value set in the register, RT-VRAM detects as a timeout error.

The error is transmitted to ECM module.

When multiple transactions are output to the main bus, RT-VRAM measures the duration of the oldest transaction.

When the measurement of the period of one transaction is completed, RT-VRAM switches to the measurement of the next oldest transaction. In that case, the start of the measurement period is not when the transaction is output but when the transaction to be measured is switched.

The threshold is set in units of 256 cycles at 400 MHz. The condition to timeout is as follow:

((counter to measure the period) >> 8) > (THRESHOLD)

The minimum period is 640 nsec and the maximum period is about 40 msec.

36.4.4 Restriction for Cache Function

RT-VRAM does not support cache coherency function with DDR memory.

36.4.5 Usage notes for Cache Flush function

Be sure to stop accessing virtual buffer area of RT-VRAM before executing Cache Flush.
Cache Flush starts by writing 1 to CACHE_FLUSH_[k].FLUSH. It returns to 0 when Cache Flush completes.
Accessing to virtual buffer area of RT-VRAM can be restarted after CACHE_FLUSH_[k].FLUSH has returned to 0.

36.4.6 Restriction of RT-VRAM access in Extended mode

In Extended mode, when a read occurs immediately after writing to the same address, RT-VRAM reads data that does not reflect the result of the previous write for the subsequent read.

The products of the value PRR.CUT = H’1, PRR.MASK = H’1, H’0 or PRR.CUT = H’0 are only target of this restriction.

Please contact us for details of restrictions on your using Ver.2.1 or earlier version.

To avoid this restriction, apply one of the following workarounds “a”, “b” or “c”.

a. Use RT-VRAM only in Compatible mode.

b. Configure the CPU memory attributes to “Device” for Cortex-A76 and Cortex-R52.

For the CPU memory attributes and related settings of Cortex-A76 and Cortex-R52, refer to the Arm Technical Reference Manuals (TRMs) [1] and [2].

[1] Arm Cortex-A76 Core Technical Reference Manual

[2] Arm Cortex-R52 Processor Technical Reference Manual

c. When reading data written to RT-VRAM, set read address starting from the beginning of the written data.

Please contact us for details of this workaround.

36.5 Safety Mechanisms

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

36.5.1 EDC for RT-VRAM

(a) Overview

EDC protection is applied to the SRAM for multi-bank internal memory. 8-bit error correction code is applied to each 64-bit data.

(b) Hardware Description

If the EDC error is detected on any bank of internal memory, RT-VRAM issues an interrupt and records error information to error status registers. An interrupt is issued to ICUMX or an error notification is issued to ECM, because RT-VRAM classifies ICUMX and other AXI master.

EDC_CFG register can control whether EDC error detection is enable or not.

RT-VRAM has error injection function to test the interrupt. While the corresponding bit of DUMMY_ERROR register is being set, RT-VRAM issues an interrupt. RT-VRAM doesn't update error information by error injection.

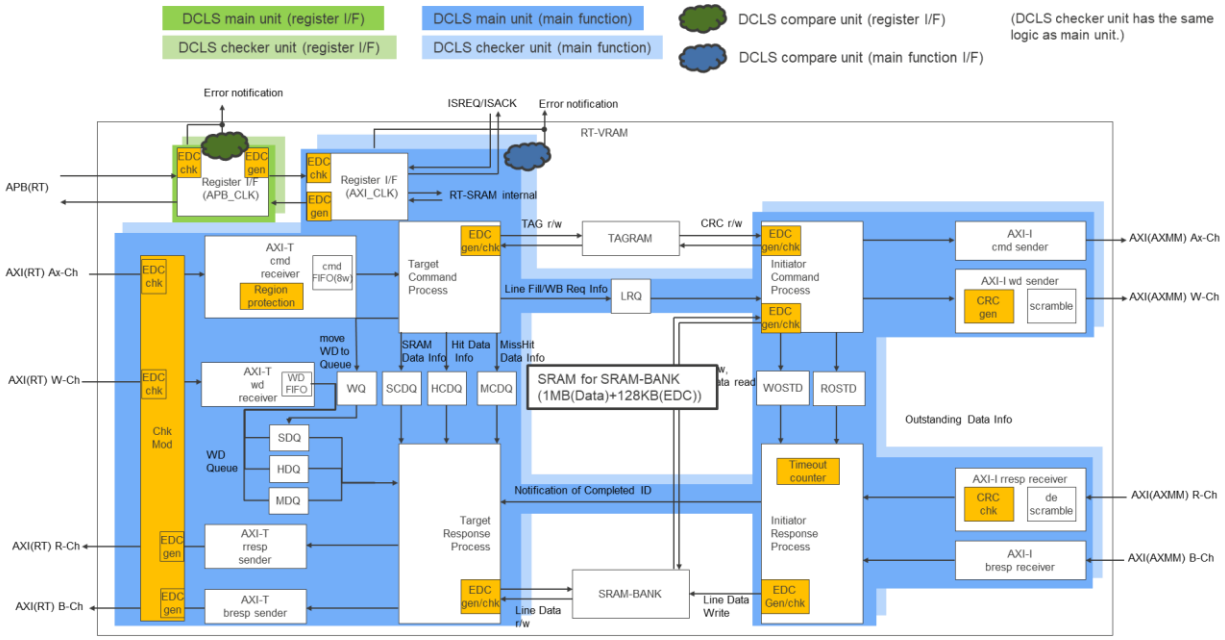

Figure 36.9 Protection for Internal memory

Table 36.4 Related Register

Register Name	Abbreviation
EDC error status Register	ERRBUSCAUSE

ERR_RTSRAM_DUPLEX	DCLS error notification to ECM
ERR_RTSRAM_SEC	Security error notification to ECM
ERR_RTSRAM_SAFE	Safety error notification to ECM
ERR_RTSRAM_EDC_RAM_DBIT	EDC error (DED) notification to ECM
ERR_RTSRAM_EDC_RAM	EDC error (SEC/SED) notification to ECM
ERR_RTSRAM_EDC_BUS	EDC error notification to ECM Note: This signal notifies to ECM not only EDC errors by other AXI master but also EDC errors of AXI Ax-Ch and AXI W-Ch caused by ICUMX.

36.5.2 EDC for RT-VRAM AXI interface

(a) Overview

EDC protection is applied to AXI interface of RT-VRAM. 8-bit error detection code is applied to each 64-bit data.

(b) Hardware Description

If the EDC error is detected on AXI interface of RT-VRAM, RT-VRAM issues an interrupt and records error information to error status registers. An interrupt is issued to ICUMX or an error notification is issued to ECM, because RT-VRAM classifies ICUMX and other AXI master.
RT-VRAM has error injection function to test the interrupt. While the corresponding bit of DUMMY_ERROR register is being set, RT-VRAM issues an interrupt. RT-VRAM doesn't update error information by error injection.
Note *: RT-VRAM can't classify whether EDC errors of AXI Ax-Ch and AXI W-Ch are detected by the request from ICUMX or other AXI master. But RT-VRAM can classify EDC errors of APB. So, an interrupt signal in Table 36.6 "ERR_RTSRAM_ICU_EDC_BUS" notifies to ICUMX only EDC error of APB caused by ICUMX. And an interrupt signal in Table 36.6 "ERR_RTSRAM_EDC_BUS" notifies to ECM not only EDC errors caused by other AXI master but also EDC errors of AXI Ax-Ch and AXI W-Ch caused by ICUMX.

36.5.3 Hardware Redundancy for RT-VRAM

(a) Overview

Hardware redundancy is applied to whole RT-VRAM except RAM bank.

(b) Hardware Description

RT-VRAM has Hardware Redundancy.

Figure 36.11 shows the block diagram of Hardware Redundancy of RT-VRAM. If the Redundancy error is detected, RT-VRAM issues an interrupt and records error information to error status registers. An error notification is issued to ECM.

RT-VRAM has error injection function to test the interrupt. While the corresponding bit of DUMMY_ERROR register is being set, RT-VRAM issues an interrupt. RT-VRAM doesn't update error information by error injection.

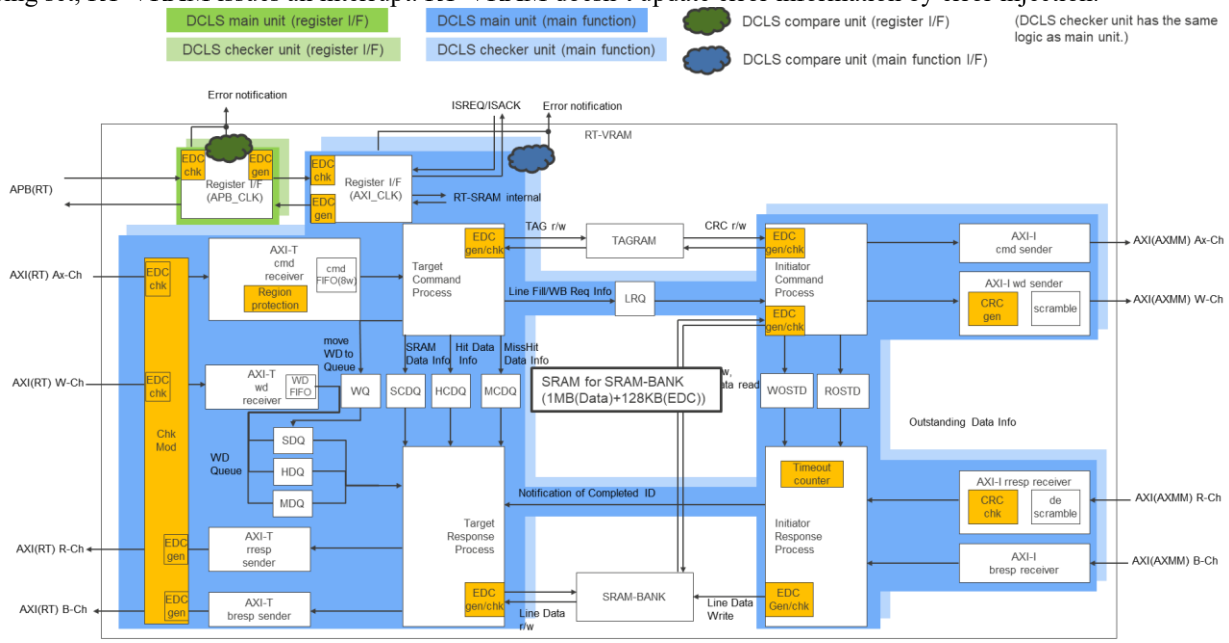

Figure 36.11 Block Diagram of Hardware Redundancy for RT-VRAM

Table 36.8 Description of interrupt signals

Interrupt signal	Description
ERR_RTSRAM_ICUDUPLEX	DCLS error notification to ICUMX

36.5.4 Access protection for secure/safety regions

(a) Overview

Area protection function is applied to RT-VRAM in order to detect the non-permitted access to the specified memory area that can be set by secure group and Region-ID which is defined by AXI-BUS module. Access control level can be defined for each area. It can be limited the modules which can access the area by access control level defined for each area.

(b) Hardware Description

(1) Memory protection

RT-VRAM has memory protected area function. This function as shown Figure 36.12 is that RT-VRAM area can be divided into 16 areas and each area can be set access privilege to 2 secure groups and 16 safety groups.

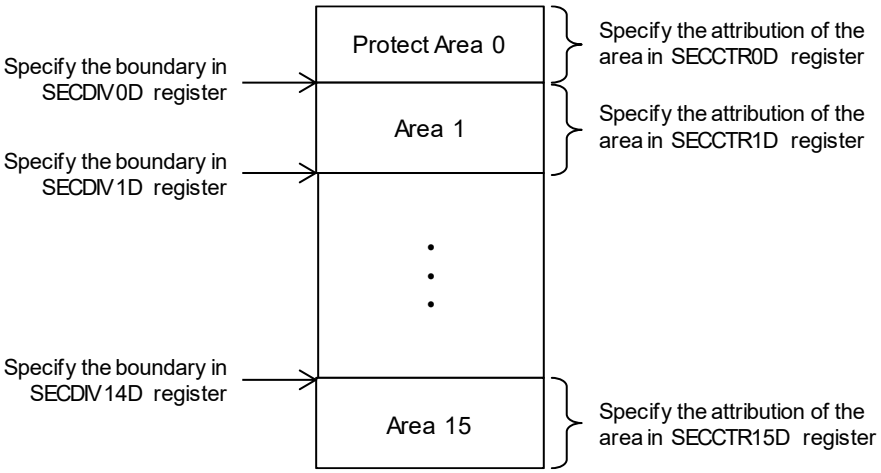

Figure 36.12 Memory Protected Area Function Concept

Table 36.9 Secure ID

Group	Group ID
Secure group	2'b00
Public group	2'b10

Table 36.10 Region ID

Group	Region ID	Group	Region ID
Region 0	4'b0000	Region 8	4'b1000
Region 1	4'b0001	Region 9	4'b1001
Region 2	4'b0010	Region 10	4'b1010
Region 3	4'b0011	Region 11	4'b1011

Region 5	4'b0101	Region 13	4'b1101
Region 6	4'b0110	Region 14	4'b1110
Region 7	4'b0111	Region 15	4'b1111

(2) Memory protect function

1) RT-VRAM Protect function

The RT-VRAM is divided into 16 areas and access settings for each area specific to the safety group are possible.
The areas can be specified by addresses within a 1Mbyte range from H'E200 0000 to H'E20F FFFF in compatible mode or 28Mbyte range from H'E200 0000 to H'E3BF FFFF in extended mode.
Separate access settings specific to the safety group reading and writing are possible.
Access to a protected area returns an error response. Writing to a protected area is ignored and reading from a protected area always returns 0.

a) Set limit to a register note and function.

Write protect function only by the specific safety group.

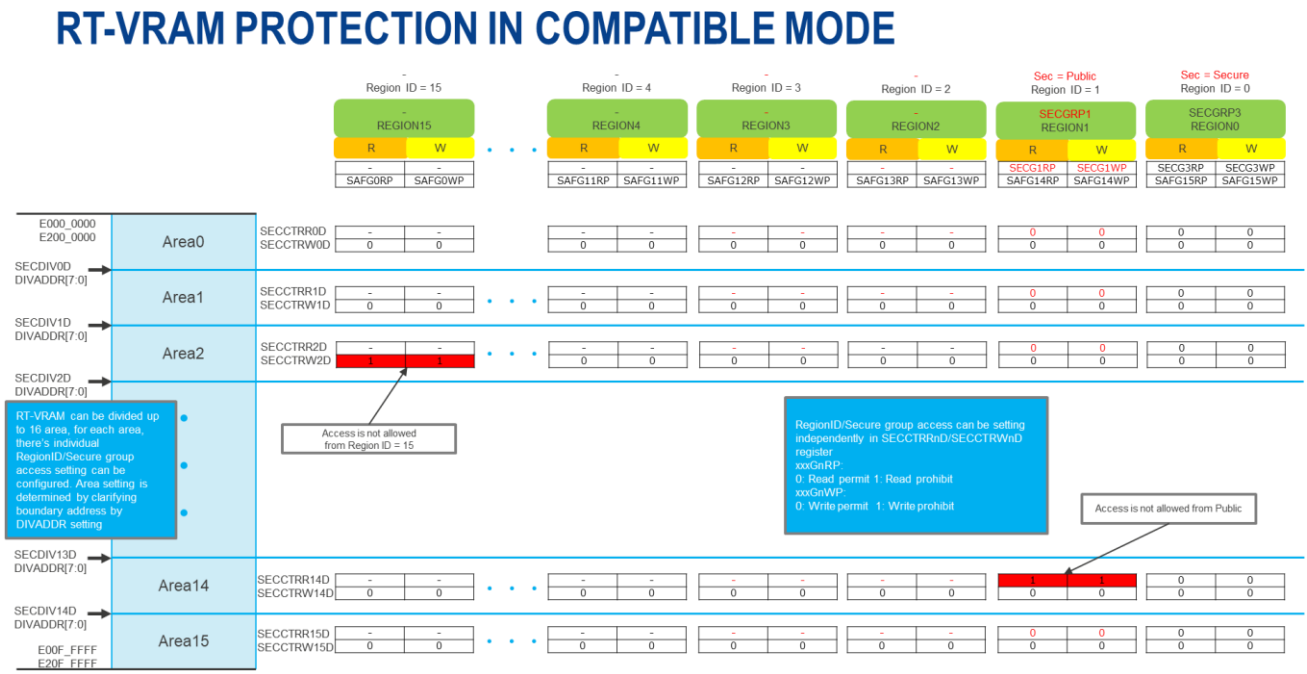

Figure 36.13 Access protection register configuration sample in Compatible Mode

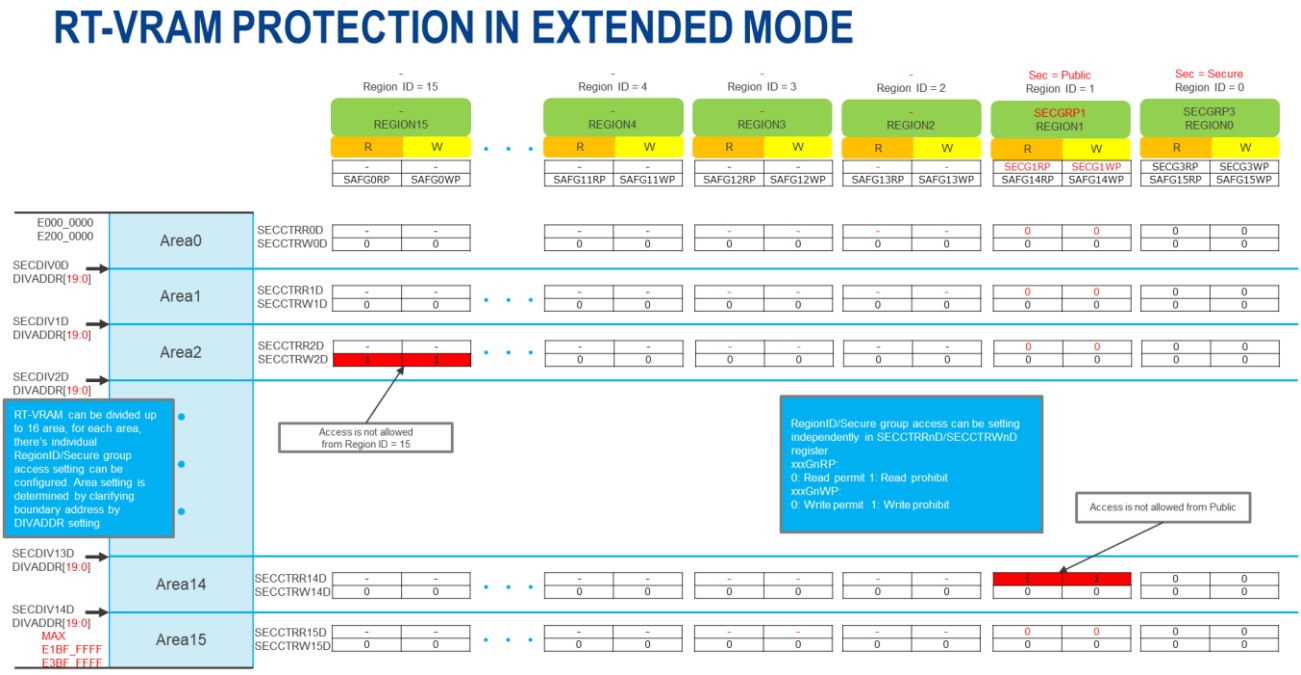

Figure 36.14 Access protection register configuration sample in Extended Mode

The figures above show a sample that how RT-VRAM protect the Memory area from Safety/Security access.

The total memory can be divided up to 16 area for safety/security access. The areas are determined by boundary address setting in SECDIV[n]D:DIVADDR registers. Each area has individual safety (i.e. RegionID) /security read/write access control setting register to permit/prohibit safety/security read/write access.

In SECCTRR[m]D/SECCTRW[m]D (m = 0 to 15)registers, safety/security group read/write access can be setting for each area. When the corresponding bit set to 0, it means the corresponding access is permitted. When the corresponding bit set to 1, it means the corresponding access is prohibited.

36.5.5 CRC for DDR on RT-VRAM

(a) Overview

In Extended mode, the buffer size of RT-VRAM is virtually extended up to 28M bytes. Actual buffer is allocated on DRAM, and the data in DRAM is protected by CRC (End-to-End protection).

RT-VRAM generates 32-bit CRC and stores in dedicated SRAM in RT-VRAM when writing 256 bytes data to DRAM. If RT-VRAM reads 256 bytes data from DRAM, it uses the corresponding CRC to check that the data is correct.

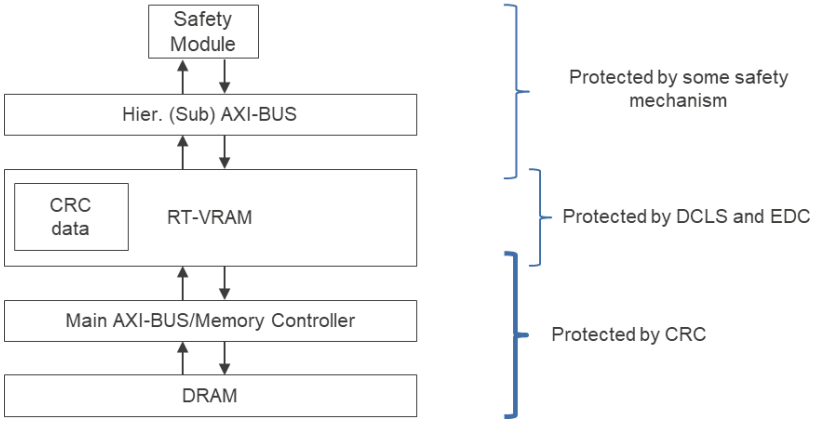

Figure 36.15 Overview of CRC protection for DRAM data

(b) Hardware Description

32-bit CRC is calculated every 256 bytes data. It is generated when 256 bytes data is stored to DRAM and checked when corresponding 256 bytes data is read from DRAM. The generated CRC is stored dedicated area of TAGRAM and SRAM-BANK. The maximum size of the protected area on DRAM is determined to 28M bytes by the size of CRC stored area on TAGRAM and SRAM-BANK. The CRC polynomial is H'04C1 1DB7, and initial value of reminder is H'FFFF FFFF.

CRC error detection function distinguishes whether it occurred in the transaction issued by ICUMX or not. And the function only notifies only CRC error due to non-ICUMX issued transactions. In other words, CRC error caused by ICUMX only updates the status.

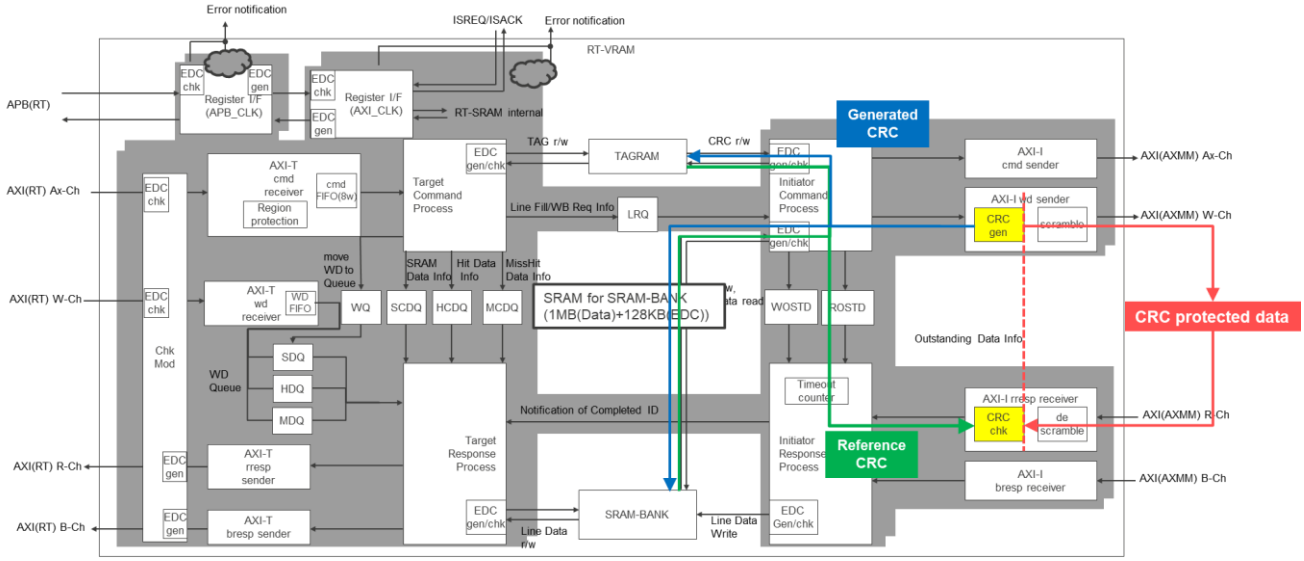

Figure 36.16 Block diagram of CRC for DDR in RT-VRAM

Table 36.12 Description of interrupt signals

Interrupt signal	Description
ERR_RTSRAM_EXT	CRC error notification to ECM

36.5.6 Timeout Counter in RT-VRAM

(a) Overview

Timeout Counter in RT-VRAM has counters for each transaction, and it can monitor all of transaction in parallel. The oldest counter is always compared with threshold, if the counter value exceeds the threshold, then timeout error will be notified to ECM.
When new request transaction is issued from RT-VRAM to DRAM, then counting starts. When request from DRAM is arrived, then counting stops. If one of request is not arrived within predefined period, then timeout error will be occurred. Thus, by setting expected the worst DRAM delay, the delay and loss between RT-VRAM and DRAM can be detectable.

Timeout counter error detection function distinguishes whether it occurred in the transaction issued by ICUMX or not. And the function only notifies only Timeout counter due to non-ICUMX issued transactions. In other words, Timeout counter caused by ICUMX only updates the status.

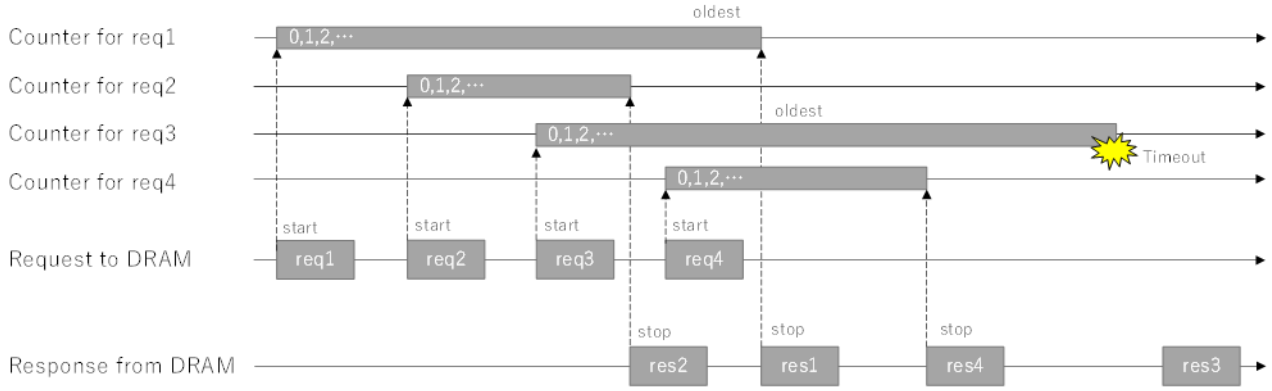

Figure 36.17 Timeout monitoring by timeout counter in RT-VRAM

(b) Hardware Description

Refer to section 36.4.3 Timeout Detection for DRAM Access.
Timeout Detection is supported fault injection function by FAULT_INJECTION register.

ERR_RTSRAM_TIMEOUT	Timeout error notification to ECM

37. Back-up Buffer (BKBUF)

The Back-up Buffer (BKBUF) is a module with space for storing 1024 bytes of data. Data stored in the Back-up Buffer are not deleted as long as the power is supplied to the given LSI chip. This section gives an overview and describes the usage of the Back-up Buffer.

37.1 Overview

37.1.1 Features

- The Back-up Buffer has a capacity of 1024 bytes.
  Address range to which the Back-up Buffer is mapped: H'EB18 0000 to H'EB18 03FC
- The power domain of the Back-up Buffer is the always-on domain of application domain*1, which is beyond control over shutting off the supply of power.
  The AXI bus for use by the Back-up Buffer is connected to the RT domain AXI*2.
- Power-on resets are applicable to the Back-up Buffer.
- The 1024 bytes of data storage in the Back-up Buffer are not initialized after a reset.
- The power-on self-test is not applicable to the Back-up Buffer.

Notes: 1. For details, refer to section 11.1.2, Power Domain Structure, in section 11, System Controller (SYSC).
2. For details, refer to section 18, AXI-bus.

37.1.2 Block Diagram

Figure 37.1 shows a block diagram of the Back-up Buffer.
The Data Storage is made from Flip Flop (F/F) not used SRAM, use the Back-up Buffer function in accordance with the electrical characteristics.

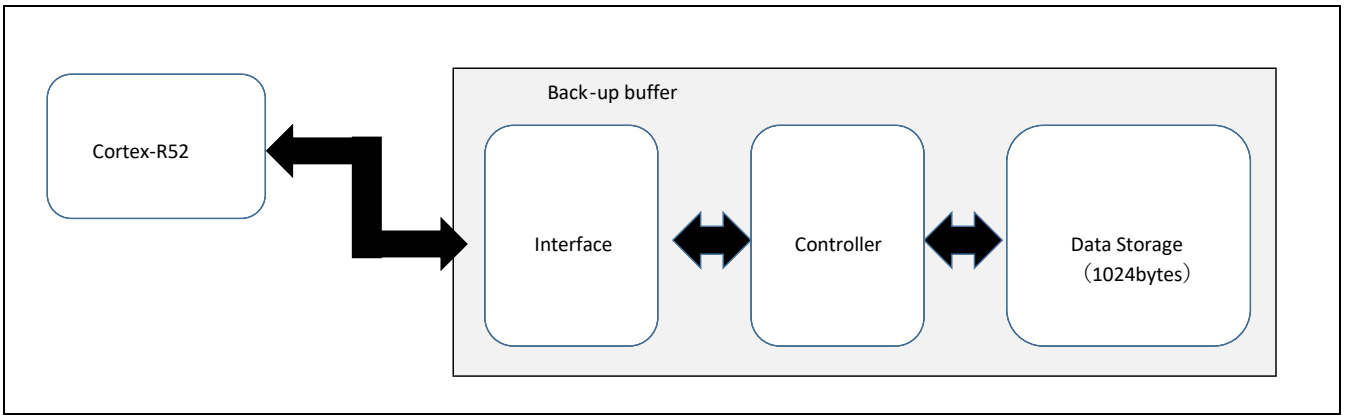

Figure 37.1 Block Diagram of the Back-up Buffer

37.1.3 External Pins

The Back-up Buffer does not have any external pins.

37.1.4 Connected module

Table 37-1 Connected Modules

Module Name	Connected Module Name	Connected Module Function
Back-up Buffer	CPG	Clock Generation Configuration signal controller
	AXI-bus	AXI Bus

37.1.5 Register configuration

The Back-up Buffer has two address space, the data storage area, and the register area of access protection.

Table 37-2 Address space for Back-up Buffer

Address	Notice
H'EB18 0000 to H'EB18 03FC	The data storage area
H'E615 0280 to H'E615 0283	The register area of access protection

Refer to R-CarV4M_UM_037_BKBUF_r0p50.xlsx.

37.2 Register description

Refer to R-CarV4M_UM_037_BKBUF_r0p50.xlsx.

37.3 Operation

For access to the Back-up Buffer, disable protection of the data storage beforehand. On completion of the required access, re-enable protection of the stored data. The procedure for using the Back-up Buffer is given below.

For details on the register other than the BKBAPR register described here (in section 37.3.1), refer to section 8.2, Register Description, in section 8, Clock Pulse Generator (CPG).

37.3.1 Access to the Back-up Buffer

To use the Cortex-R52 processor to access the Back-up Buffer, proceed with steps 1 to 3 below.

1. Disable protection of the data storage in the Back-up Buffer.
   (1) Write H'FFFF FFFE to the CPG write protect register (CPGWPR).
   (2) Write H'0000 0001 to the Back-up Buffer access protect register (BKBAPR) of the CPG.
2. Use the Cortex-R52 processor to access the data storage in the Back-up Buffer.

On completion of the required access to the Back-up Buffer, re-enable protection of the stored data through the steps below.

3. Enable protection of the data storage in the Back-up Buffer.
   (1) Write H'FFFF FFFF to the CPG write protect register (CPGWPR).
   (2) Write H'0000 0000 to the Back-up Buffer access protect register (BKBAPR) of the CPG.

37.3.2 Module Reset

Back-up buffer is using un-reset F/F.

- Contents of F/F should be clear by write "0" at initialization

Back-up data is not guaranteed when:

- Software Reset is asserted during write transaction to Back-up Buffer
- POST(Power On Self-Test) is executed while protection of the stored data is Disable (BKBAPR.BKBAP bit = 1).

37.4 Usage Notes

— The 1024 bytes of data storage in the Back-up Buffer can only be initialized by using software to write initial values to it.

— Access to the Back-up Buffer from processors other than the Cortex-R52 is prohibited.

— Access to the Back-up Buffer from DMAC is prohibited.

— Calculate CRC in the Cortex-R52.

— Address space assigned to Back-up Buffer (H'00_EB18_0000 to H'00_EB1F_FFFF) is mirrored at each 1024 bytes address boundary.

37.5 Safety Mechanisms

No description on this section.

50. 3D Graphics Processsing Unit（GSX）

50.1 Overview

- R-Car V4M integrates Imagination Technologies IMG BXS-4-64 GPU.

50.1.1 Features

- ZGφ
- 4 pixels/clk
- 64 FLOPs/clk (FP32)
- System Level Cache provides cashing of all types of workload data. 64 KB capacity.
- OpenGL ES 3.2 supported
- ‘per module automatic clock gating’ supported

50.1.2 Block Diagram

Figure 50.1 shows the block diagram of IMG BXS-4-64 and the corresponding power-domains (A23DGB, A33DGA and C4_U3DG).

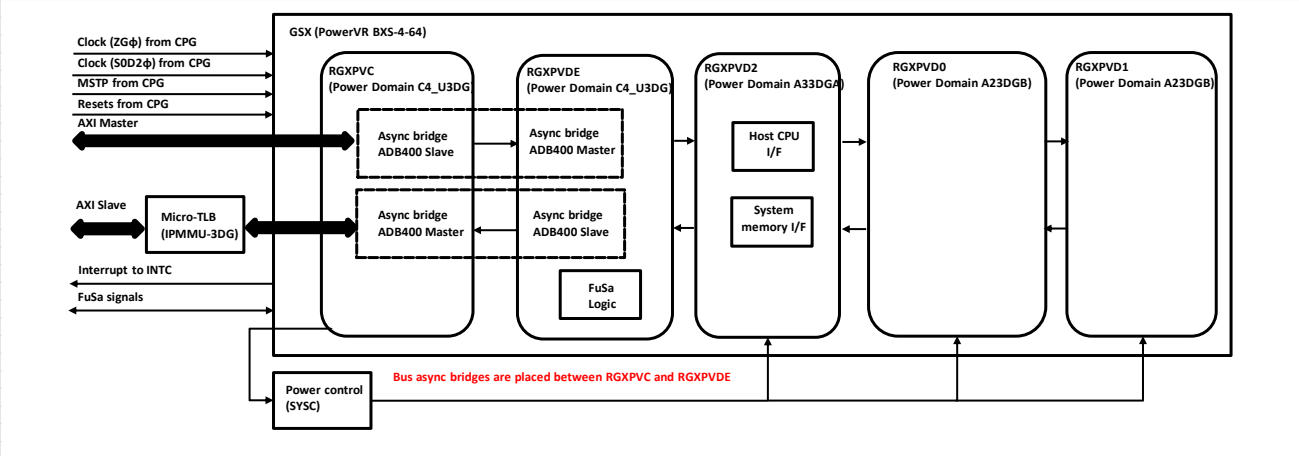

Figure 50.1 Block diagram of IMG BXS-4-64

50.2 Register Configuration

Base address of registers is allocated to H’00 FD00 0000. The address range is 8192 KB (H’00 FD00 0000 - H’00 FD7F FFFF).

50.3 Operation

50.3.1 Power and Clock Supply

The power and clock need to be supplied before IMG BXS-4-64 is used. In the low power mode, all C4 modules are powered OFF, so in order to use IMG BXS-4-64, it must be in full run mode by the following power on sequence: C4 >> A33DGA >> A23DGB. Vice versa, the power off sequence is: A23DGB >> A33DGA >> C4. Figure 50.2 shows the example of initial setting.

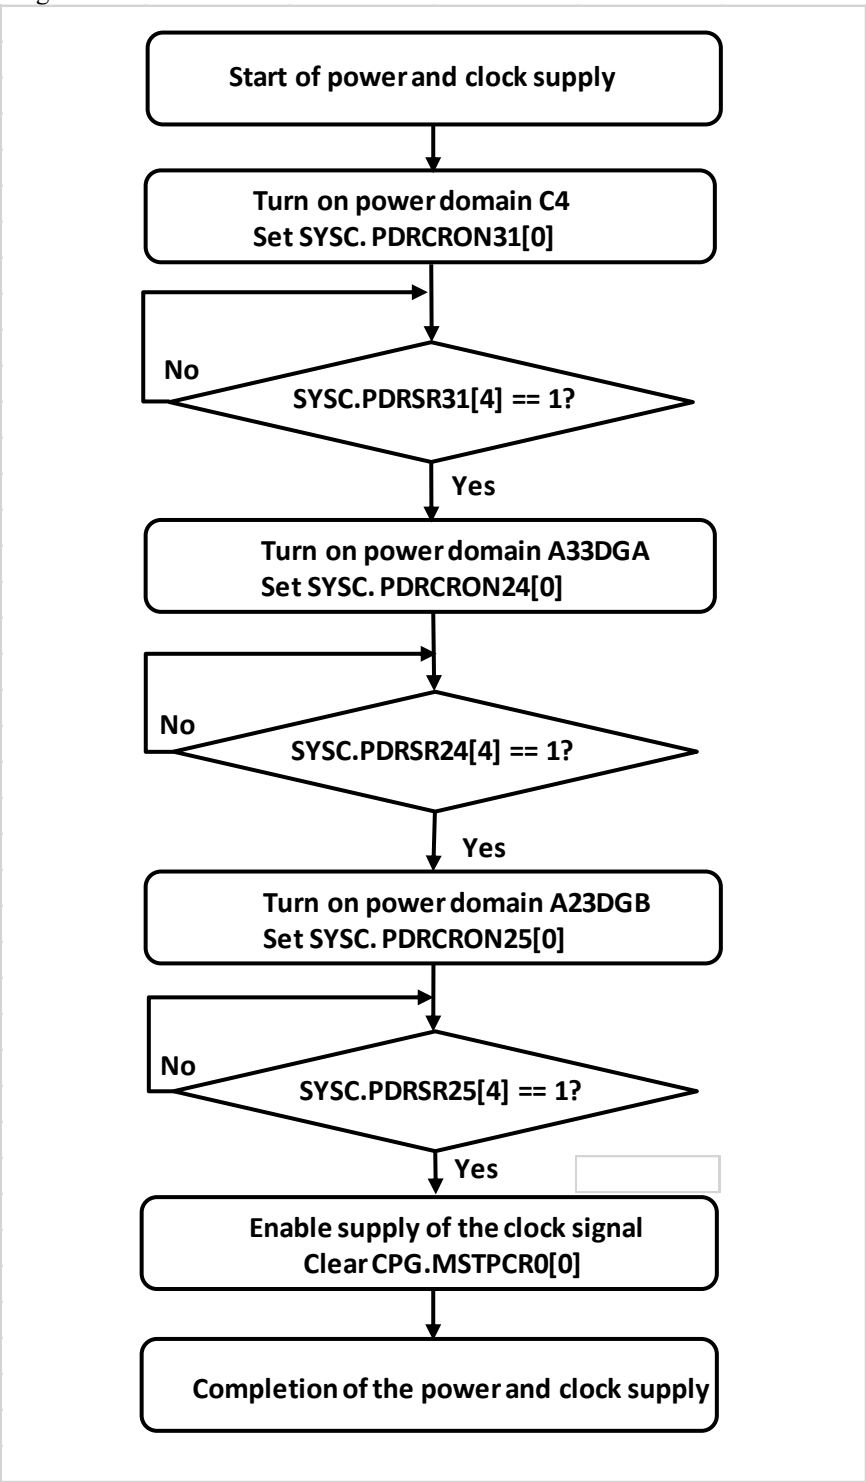

Figure 50.2 IMG BXS-4-64 power and clock supply flowchart

50.4 Usage Notes

Nothing special to note on the usage.

50.5 Safety Mechanisms

There is some safety mechanisms in the bus bridge.

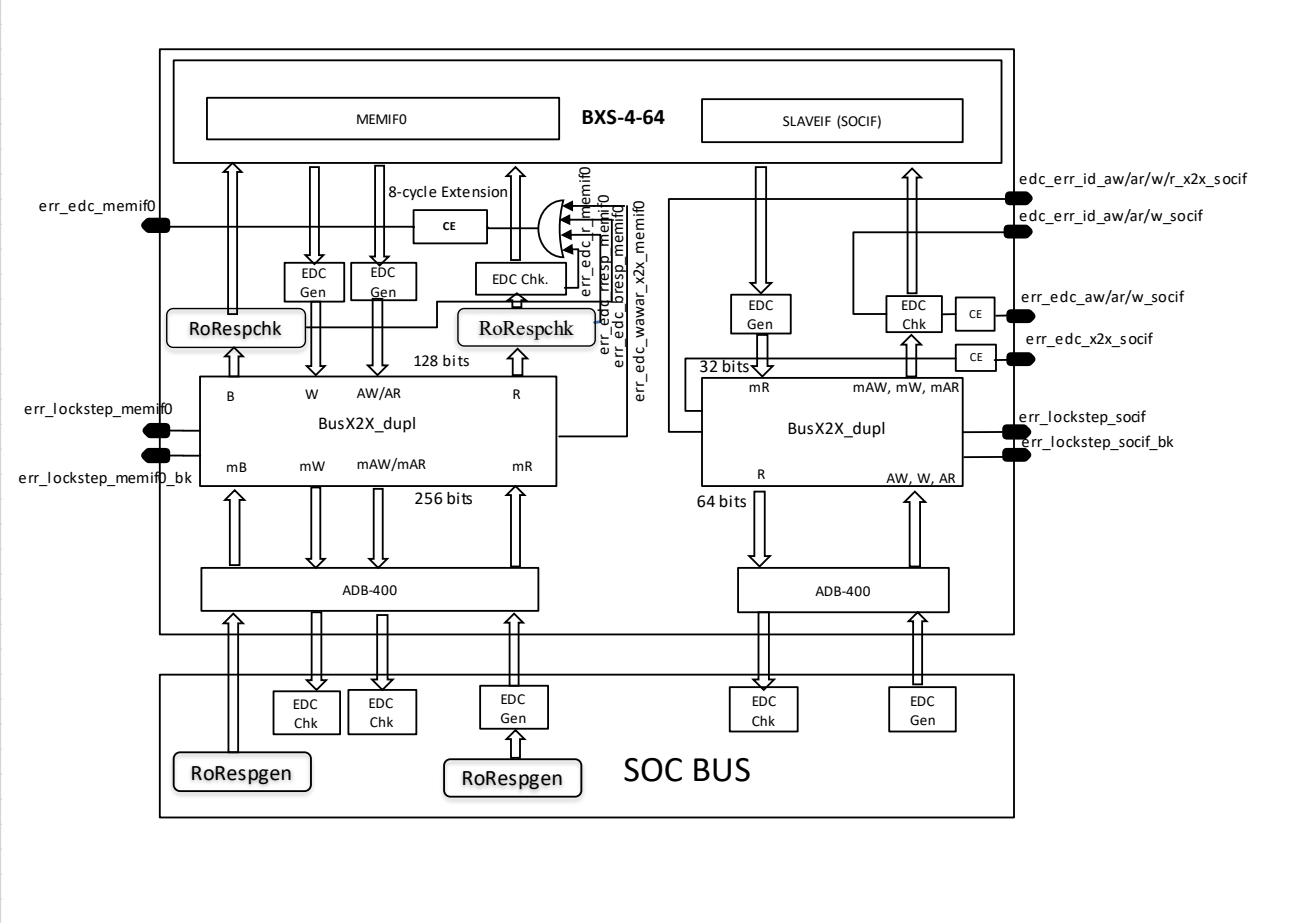

Figure 50.3 Safety mechanisms of IMG BXS-4-64

53. CSI2

53.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

The CSI2 is an MIPI CSI-2 (Camera Serial Interface 2) receiver module.

The R-Car V4M has two CSI2 sets. Two 4-lane D-PHY.

The received signals are input to the PHY modules; the LINK modules receive the byte data output from the PHY modules; and the PHY modules extract the image data (embedded data included), data type, and channel information before outputting the data to the following ISP/CS modules. Here, the LINK modules generate the vertical Blanking Packet Indicator(VD), Horizontal Blanking Packet Indicator(HD), field signals (FLD),data enable signals (PE), byte enable signals (PEB) for each channel, and outputs them to the ISP/CS modules.

53.1.1 Features

The CSI2 module has the following features.

(1) MIPI CSI-2 Version 2.0

(2) MIPI D-PHY Version 2.1
Up to 2.5-Gbps transfer rate per data lane
Maximum throughput is 10-Gbps with 4 data lanes

(3) 4 RX data lanes on D-PHY.

(4) Deskew for PHY-Ex-IF.

(5) Dynamically configurable multi-lane merging

(6) Long and Short packet decoding

(7) Timing accurate signaling of Frame and Line synchronization packets

(8) Several frame formats

- General Frame or Digital Interlaced Video with or without accurate sync timing
- Data Type (Packet or Frame level) and virtual channel interleaving

(9) All primary and secondary data formats

- YUV420 8bit /10bit
- YUV422 8bit / 10bit / Y-12bit,UV-8bit (Transferred as YUV422 10bit)
- RGB888 / RGB565
- RAW8 / RAW10 / RAW12 / RAW14 / RAW16 / RAW20 / RAW24

(10) Error detection and correction

- PHY level
- Packet level
- Line level
- Frame level

Support 16 Virtual Channel

Note) The optional features of MIPI CSI-2 and D-PHY not described in this section are not supported.

53.1.2 Block Diagram

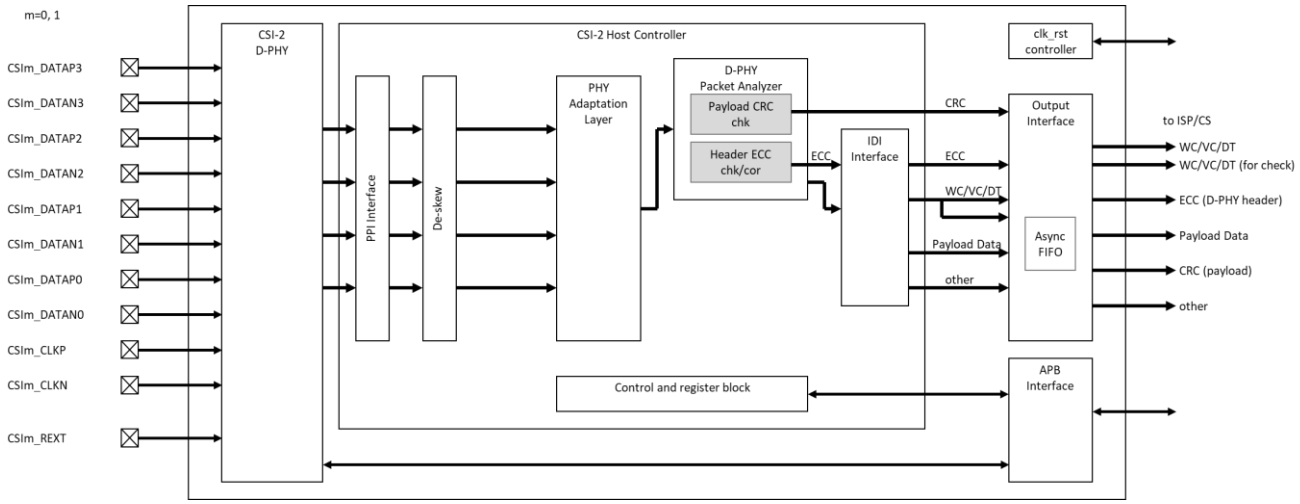

Figure 53.1 Block Diagram

53.1.3 External Pins

Table 53.1 External Pins

Pin Name	Abbreviation	I/O	Function
CSI2 0 lane0 data	CSI0_DATAP0	Input	CSI2 0 : D-PHY data lane 0 positive terminal.
CSI2 0 lane0 data	CSI0_DATAN0	Input	CSI2 0 : D-PHY data lane 0 negative terminal.
CSI2 0 lane1 data	CSI0_DATAP1	Input	CSI2 0 : D-PHY data lane 1 positive terminal.
CSI2 0 lane1 data	CSI0_DATAN1	Input	CSI2 0 : D-PHY data lane 1 negative terminal.
CSI2 0 lane2 data	CSI0_DATAP2	Input	CSI2 0 : D-PHY data lane 2 positive terminal.
CSI2 0 lane2 data	CSI0_DATAN2	Input	CSI2 0 : D-PHY data lane 2 negative terminal.
CSI2 0 lane3 data	CSI0_DATAP3	Input	CSI2 0 : D-PHY data lane 3 positive terminal.
CSI2 0 lane3 data	CSI0_DATAN3	Input	CSI2 0 : D-PHY data lane 3 negative terminal.
CSI2 0 clock	CSI0_CLKP	Input	CSI2 0 : D-PHY clock lane positive terminal.
CSI2 0 clock	CSI0_CLKN	Input	CSI2 0 : D-PHY clock lane negative terminal.
CSI2 0 REXT	CSI0_REXT	Input	CSI2 0 : External precision resistor. 200 ohm precision resistor connected to ground.
CSI2 1 lane0 data	CSI1_DATAP0	Input	CSI2 1 : D-PHY data lane 0 positive terminal.
CSI2 1 lane0 data	CSI1_DATAN0	Input	CSI2 1 : D-PHY data lane 0 negative terminal.
CSI2 1 lane1 data	CSI1_DATAP1	Input	CSI2 1 : D-PHY data lane 1 positive terminal.
CSI2 1 lane1 data	CSI1_DATAN1	Input	CSI2 1 : D-PHY data lane 1 negative terminal.
CSI2 1 lane2 data	CSI1_DATAP2	Input	CSI2 1 : D-PHY data lane 2 positive terminal.
CSI2 1 lane2 data	CSI1_DATAN2	Input	CSI2 1 : D-PHY data lane 2 negative terminal.
CSI2 1 lane3 data	CSI1_DATAP3	Input	CSI2 1 : D-PHY data lane 3 positive terminal.
CSI2 1 lane3 data	CSI1_DATAN3	Input	CSI2 1 : D-PHY data lane 3 negative terminal.
CSI2 1 clock	CSI1_CLKP	Input	CSI2 1 : D-PHY clock lane positive terminal.
CSI2 1 clock	CSI1_CLKN	Input	CSI2 1 : D-PHY clock lane negative terminal.
CSI2 1 REXT	CSI1_REXT	Input	CSI2 1 : External precision resistor. 200 ohm precision resistor connected to ground.

53.1.4 Register Configuration

The following lists the base address of each CSI2 module.

Base Address Name	Base Address
CSI20	H'FE50 0000
CSI21	H'FE54 0000

53.1.4.1 Register Configuration

Module Name	Register Name	Symbol	R/W	Address	Initial Value	Access Size

53.1.5 Connected Module

Table 53.2 Connected Module

Connected Modules	Function of the Connected Modules
CPG	Output and control of the clock signals, execution of software reset
INTC	Interrupt controller
ISP/CS	Image Signal Processor / Channel Selector
ECM	Module related to Functional Safety

For details about interrupt channel, refer to chapter Interrupt Controller (see 15.INTC).

53.2 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/WB: Write-only. The read value is undefined.

53.2.1 CSI2 [n] Core version(n=0-1)(CSI2[n]_VERSION)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved and read as zero.
0	phy_mode	B'0	R/W	Select the PHY interface: Values: 0x0 (DPHY): Select D-PHY 0x1 : prohibit

53.2.7 CSI2 [n] Automotive main interrupt status(n=0-1)(CSI2[n]_INT_ST_AP_MAIN)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	status_int_ecc_corrected	—	status_int_pld_crc_fatal	status_int_phy	—	status_int_seq_frame_fatal	status_int_bndry_frame_fatal	status_int_pkt_fatal	status_int_phy_fatal	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	RC	R	RC	RC	R	RC	RC	RC	RC	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved and read as zero.
9	status_int_ecc_corrected	B'0	RC	Status of int_ecc_corrected.
8	—	B'0	R	Reserved and read as zero.
7	status_int_pld_crc_fatal	B'0	RC	Status of int_pld_crc_fatal.
6	status_int_phy	B'0	RC	Status of int_st_phy.
5	—	B'0	R	Reserved and read as zero.
4	status_int_seq_frame_fatal	B'0	RC	Status of int_seq_frame_fatal.
3	status_int_bndry_frame_fatal	B'0	RC	Status of int_st_bndry_frame_fatal.
2	status_int_pkt_fatal	B'0	RC	Status of int_st_pkt_fatal.
1	status_int_phy_fatal	B'0	RC	Status of int_st_phy_fatal.
0	—	B'0	R	Reserved and read as zero.

53.2.8 CSI2 [n] Virtual Channel fields for Data ID Monitors 1(n=0-1)(CSI2[n]_DATA_IDS_VC_1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	di3_vcx_2	di3_vcx_0_1		di3_vc		—	—	—	di2_vcx_2	di2_vcx_0_1		di2_vc

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved and read as zero.
28	di3_vcx_2	B'0	R/W	Virtual channel extension extra bit for programmed data ID 3
27, 26	di3_vcx_0_1	All 0	R/W	Virtual channel extension for programmed data ID 3.
25, 24	di3_vc	All 0	R/W	Virtual channel for programmed data ID 3.
23 to 21	—	All 0	R	Reserved and read as zero.
20	di2_vcx_2	B'0	R/W	Virtual channel extension extra bit for programmed data ID 2
19, 18	di2_vcx_0_1	All 0	R/W	Virtual channel extension for programmed data ID 2.
17, 16	di2_vc	All 0	R/W	Virtual channel for programmed data ID 2.
15 to 13	—	All 0	R	Reserved and read as zero.
12	di1_vcx_2	B'0	R/W	Virtual channel extension extra bit for programmed data ID 1
11, 10	di1_vcx_0_1	All 0	R/W	Virtual channel extension for programmed data ID 1.
9, 8	di1_vc	All 0	R/W	Virtual channel for programmed data ID 1.
7 to 5	—	All 0	R	Reserved and read as zero.
4	di0_vcx_2	B'0	R/W	Virtual channel extension extra bit for programmed data ID 0
3, 2	di0_vcx_0_1	All 0	R/W	Virtual channel extension for programmed data ID 0.
1, 0	di0_vc	All 0	R/W	Virtual channel for programmed data ID 0.

53.2.9 CSI2 [n] PHY Shutdown(n=0-1)(CSI2[n]_PHY_SHUTDOWNZ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	phy_shutdownz
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved and read as zero.
0	phy_shutdownz	B'0	R/W	Shutdown input. This line is used to place the complete macro in power down. All analog blocks are in power down mode and digital logic is cleared. Active Low.

53.2.10 CSI2 [n] DPHY reset(n=0-1)(CSI2[n]_DPHY_RSTZ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	dphy_rstz
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved and read as zero.
0	dphy_rstz	B'0	R/W	PHY reset output. Active Low.

53.2.11 CSI2 [n] RX PHY status(n=0-1)(CSI2[n]_PHY_RX)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	phy_rxclkactivehs	phy_rxulpsclknot
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	phy_rxulpsesc_3	phy_rxulpsesc_2	phy_rxulpsesc_1	phy_rxulpsesc_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved and read as zero.
17	phy_rxclkactivehs	B'0	R	Indicates that D-PHY clock lane is actively receiving a DDR clock
16	phy_rxulpsclknot	B'1	R	Active Low. This signal indicates that D-PHY Clock Lane module has entered the Ultra Low Power state
15 to 8	—	All 0	R	Reserved and read as zero.
7	—	B'0	R	Reserved and read as zero.
6	—	B'0	R	Reserved and read as zero.
5	—	B'0	R	Reserved and read as zero.
4	—	B'0	R	Reserved and read as zero.
3	phy_rxulpsesc_3	B'0	R	Lane module 3 has entered the Ultra Low Power mode
2	phy_rxulpsesc_2	B'0	R	Lane module 2 has entered the Ultra Low Power mode
1	phy_rxulpsesc_1	B'0	R	Lane module 1 has entered the Ultra Low Power mode
0	phy_rxulpsesc_0	B'0	R	Lane module 0 has entered the Ultra Low Power mode.

53.2.12 CSI2 [n] STOPSTATE PHY status(n=0-1)(CSI2[n]_PHY_STOPSTATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	phy_stopstateclk
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	phy_stopstatedata_3	phy_stopstatedata_2	phy_stopstatedata_1	phy_stopstatedata_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved and read as zero.
16	phy_stopstateclk	B'0	R	D-PHY Clock lane in Stop state
15 to 8	—	All 0	R	Reserved and read as zero.
7	—	B'0	R	Reserved and read as zero.
6	—	B'0	R	Reserved and read as zero.
5	—	B'0	R	Reserved and read as zero.
4	—	B'0	R	Reserved and read as zero.
3	phy_stopstatedata_3	B'0	R	Data lane 3 in Stop state
2	phy_stopstatedata_2	B'0	R	Data lane 2 in Stop state
1	phy_stopstatedata_1	B'0	R	Data lane 1 in Stop state
0	phy_stopstatedata_0	B'0	R	Data lane 0 in Stop state

53.2.13 CSI2 [n] PHY Calibration(n=0-1)(CSI2[n]_PHY_CAL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	rxskewcalhs
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RC

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved and read as zero.
0	rxskewcalhs	B'0	RC	A low-to-high transition on rxskewcalhs signal means that the PHY has initiated the de-skew calibration.

53.2.14 CSI2 [n] Fatal interruption caused by PHY(n=0-1)(CSI2[n]_INT_ST_PHY_FATAL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	ST_PHY_READY	B'0	R	ST_PHY_READY (fixed to 0)
30 to 18	—	All 0	R	Reserved These bits are read as D.C. The write value should always be 0.
17 to 8	—	B'0100001111	R	Reserved
7	ST_STOPSTATE_DCK	B'0	R	ST_STOPSTATE_DCK (stopstateclk)
6 to 4	—	All 0	R	Reserved These bits are read as D.C. The write value should always be 0.
3	ST_STOPSTATE_3	B'0	R	ST_STOPSTATE_3 (stopstatedata_3)
2	ST_STOPSTATE_2	B'0	R	ST_STOPSTATE_2 (stopstatedata_2)
1	ST_STOPSTATE_1	B'0	R	ST_STOPSTATE_1 (stopstatedata_1)
0	ST_STOPSTATE_0	B'0	R	ST_STOPSTATE_0 (stopstatedata_0)

53.3 Operation

53.3.1 System

A software reset can be set by controlling the software reset register 3,4 (SRCR3,4) and software reset clear register 3,4 (SRSTCLR3,4) of the clock pulse generator (CPG) module., CSI2 0 correspond to bits 31 in the SRCR3 and SRSTCLR3 registers, respectively. CSI2 1 correspond to bits 0 in the SRCR4 and SRSTCLR4 registers, respectively. To apply a software reset to any of the CSI2 channels, set the corresponding bit in the SRCR3,4 register. Enabling the bit initializes all the registers of the corresponding CSI2 channel. To cancel a software reset of any of the CSI2 channels, set the corresponding bit in the SRSTCLR3,4 register. Starts CFGCLK after canceling the software reset.(Set CSIφ(CFGCLK) to PLL5VCO/2/2/40. see CPG CSICKCR. CSICKCR/DIV[5:0]=H'27. CSIφ frequency [MHz] = PLL5VCO x 1/2 x 1/2 x 1 / (setting + 1)).

To apply a software reset to any of the CSI2 channels, execute the following procedure using the register corresponding to the channel.

1. Set the corresponding bit in the SRCR3,4 register of the Clock Pulse Generator (CPG) module.

To cancel a software reset of any of the CSI2 channels and start the channel, execute the following procedure using the register corresponding to the channel.

2. Set the corresponding bit in the SRSTCLR3,4 register of the Clock Pulse Generator (CPG) module.

53.3.2 LINK

This chapter explains the basics of the controller programming, how to send and receive image or video in high-speed mode, and how to enter and exit ULPS. It has the following topics:

To program LINK, you must be familiar with the MIPI CSI-2, MIPI D-PHY specifications. Every software programmable register of LINK is accessible through the APB interface. For details about the LINK register map and all the LINK registers used for programming, see the "Register Descriptions" chapter 53.2.

53.3.2.1 LINK Functions

Table 53.3 LINK Functions explains some of the main functions of LINK to operate in the CSI2 environment. This table explains when these functions are used and how they are implemented by accessing the APB registers. From this, you can build your own testbench functions or software code.

Table 53.3 LINK Functions

Function Name	Function Usage	Procedure
Set or clear PHY Reset	This function is used during the PHY initialization, to set up the analog and digital part of the PHY in the default state. This function is also used to turn off the PHY for power saving purposes.	1. Clear PHY_SHUTDOWNZ, bit[0] and DPHY_RSTZ, bit[0] to put the PHY in the reset state. 2. Set PHY_SHUTDOWNZ, bit[0] and DPHY_RSTZ, bit[0] to remove the PHY from reset state.

Function Name	Function Usage	Procedure
Configure the number of active lanes	This function configures a static register, which contains the number of lanes to be used by LINK when receiving the data. This function is used during initialization and it should not be used during operational mode.	1. Configure N_LANES, bit[2:0], to define the number of active lanes in the system: - 000: 1 lane - 001: 2 lanes - 010: 3 lanes - 011: 4 lanes
Configure the data ID values	This function is used during initialization to set up the pair that identifies the data type and virtual channel of the lines that are expected to be received from the camera device.	1. Configure DATA_IDS_1 and DATA_IDS_VC_1 to define the first four pairs of data types and virtual channels. 2. The unused monitors must be set with zeros.
Release LINK from reset	This function is mainly used when initializing LINK. It sets the controller's internal logic to the default state. It is also used when changing the configuration. In this case, while changing the static configuration register values, the LINK should be in the reset state.	1. Clear CSI2_RESETN, bit[0] to put the CSI2 internal logic in the reset state. 2. Set CSI2_RESETN, bit[0] to remove the CSI2 internal logic from the reset state.
Define errors to be masked	This function configures errors that are supposed to trigger an interrupt.	1. Assert bit corresponding to the error that is supposed to trigger an interrupt in INT_MSK_<group>
Check that clock lane is in Stop state (For D-PHY only)	This function checks if the clock lane is in the Stop state or not. When the clock lane is correctly initialized it is said to be in a Stop state. This function is used during initialization and also during the enter and exit procedures of ULPS.	1. Read PHY_STOPSTATE, bit[16]. If bit 16 is set, clock lane is detected in Stop state.
Check that data lanes are in Stop state	This function checks if the data lanes are in the Stop state or not. When a data lane is correctly initialized and ready to receive high-speed data, it is said to be in a Stop state. This function is used during initialization and also during the enter and exit procedures of ULPS.	1. Read PHY_STOPSTATE, bit[3:0]. If bits 0 to 3 are set, data lanes 0 to 3 are detected in Stop state, respectively.
Check that clock lane is in High Speed mode (For D-PHY only)	This function checks the status of the clock lane reported by LINK. The clock lane either receives a high-speed clock signal or not. This function is used during initialization, to check if the clock is being correctly received. This function is also used during the enter and exit procedures of ULPS.	1. Read PHY_RX, bit[17]. If set, high-speed clock signal is received in clock lane.
Check ULPS	This function is used during the enter and exit procedures of ULPS. This function checks if the PHY status bits report that the respective lanes are detected in ULPS. In a CSI2 Host system, the enter and exit state of the ULPS is triggered by the camera device, so LINK only observes the status of the lanes.	1. Read PHY_RX, bit[3:0]. If bits 0 to 3 are set, data lanes 0 to 3 are detected in ULPS, respectively. 2. Read PHY_RX, bit[16]. If the bit is clear, clock lane is detected in ULPS. (For D-PHY only).

53.3.2.2 LINK Programming Flow

The following are the main tasks performed when a CSI2 system captures a still image or an image video from a camera device:

Start up LINK: Setting LINK and PHY with the default values.

Start the High Speed Reception Mode: Setting up LINK and PHY to be readyto receive high-speed information.

Detect Errors: Detecting where an error occurs.

Stop the High Speed Reception Mode: Disabling LINK and PHY.

Enter and Exit ULPS: Entering and exiting Ultra Low Power Mode (ULPS). This sequence is optional.

Shutdown: Entering Shutdown mode.

(1) Start up LINK contain the programming sequences for these tasks. For the register configuration details of each step, see Table 53.3.

(1) Start up LINK

Follow the programming sequence shown in **Figure 53.2** to start up LINK.

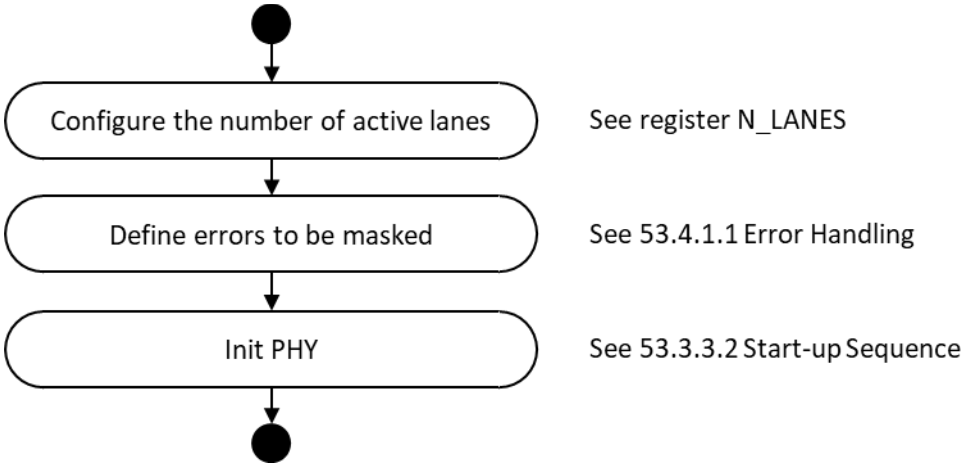

Figure 53.2 Start up LINK

(2) Start the High Speed Reception Mode

Follow the programming sequence shown in Figure 53.3 to start the LINK high-speed reception mode. Set up the camera device to start high-speed clock transmission. At the end of this sequence, LINK is ready to receive high-speed data.

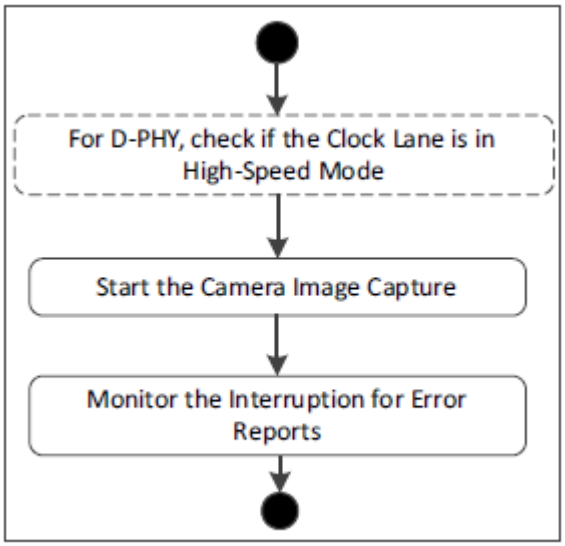

Figure 53.3 Start the High Speed Reception Mode

(3) Detect Errors

Follow the programming sequences shown in Figure 53.4 to detect why the interrupt pin rises.

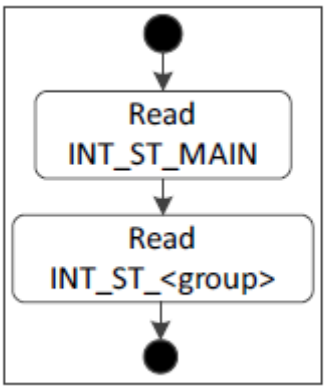

Figure 53.4 Detect Errors

An unmasked error triggers the interrupt pin.

Read INT_ST_MAIN:

Clear on read register. Read this register to know from which group the interruption comes from Reading this register clears the interrupt pin.

Read INT_ST_<group>:

Clear on read register. Read this register in order to know which error occurred. Reading this register does NOT clear the interrupt pin.

For descriptions of all errors that LINK can identify, see 53.4.1.1 “Error Handling” .

(4) Stop the High Speed Reception Mode

Follow the programming sequence shown in Figure 53.5 to stop the LINK high-speed reception mode. After the image or video has been completely received, the CSI2 system is turned off.

If the image or video has not been completely received, an interrupt may be issued such as payload CRC. To prevent unexpected interrupt, set the interrupt mask register to "0" before entering sequence of Stop the High Speed Reception mode.

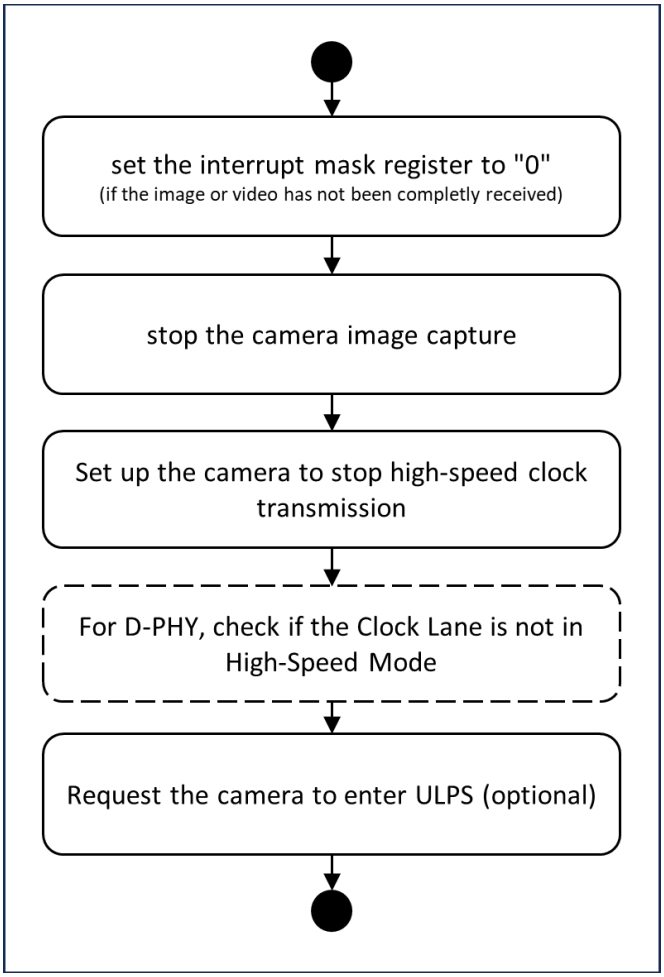

Figure 53.5 Stop the High Speed Reception Mode

(5) Enter and Exit ULPS

Follow the programming sequences shown in Figure 53.6 and Figure 53.7 to enter and exit ULPS respectively. After the image or video has been completely received, the CSI-2 system is turned off.

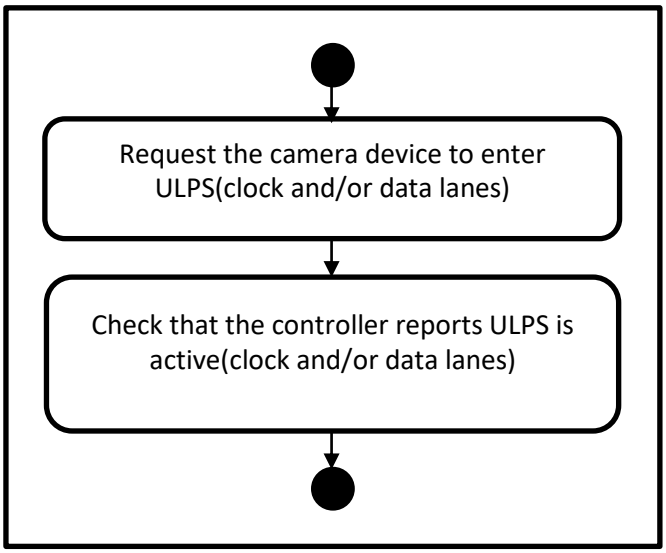

Figure 53.6 Enter ULPS

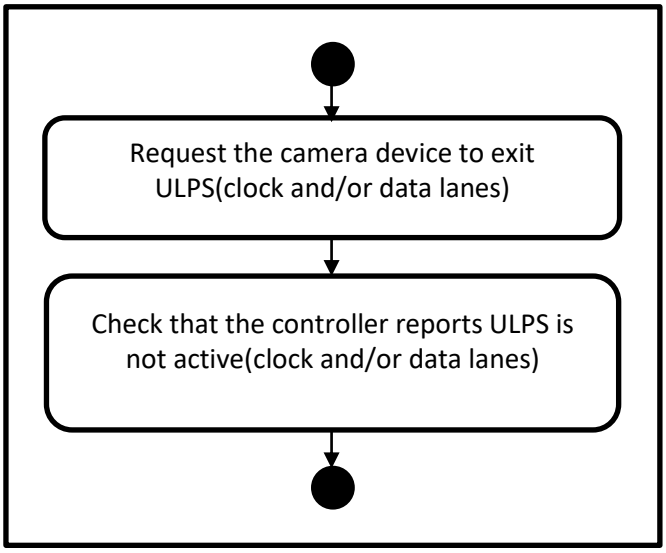

Figure 53.7 Exit ULPS

Note

- The PHY requires over 5ms as the wakeup time by means of ULPS exit.

(6) Shutdown

Stop the camera image and shut down and reset with the PHY register.

CSI2_RESETN/csi2_resetn = 1'b0; DPHY_RSTZ/dphy_rstz = 1'b0; SHUTDOWNZ/phy_shutdownz = 1'b0.

(see register CSI2_RESETN/csi2_resetn ,PHY_SHUTDOWNZ/phy_shutdownz, DPHY_RSTZ/dphy_rstz)

If the image or video has not been completely received, set the interrupt mask register to "0" before stop the camera image to prevent unexpected interrupt.

53.3.2.3 FLD (field) Signals

When a frame start short packet is received, if the field value of the short packet data satisfies the condition specified with the field detection control register (FLD), FLD is driven high. When a frame end short packet is received, FLD is driven low. (This applies to the channel specified with the VC value in the packet header.)

53.3.2.4 Interrupt

Both the interrupt pin as well as the applicable Interrupt Status registers are set at the same time. The default value of the INT_MASK_<group> (Interrupt Mask) registers is 0, thus masking the interrupts. By default, the interrupt pin is disabled.

53.3.3 D-PHY

53.3.3.1 Shutdown Mode

This mode is the lowest power consumption mode, where all analog blocks are disabled, and digital logic is reset. The current consumption is given by the analog standby current and the digital logic leakage current. It is entered asynchronously when DPHY_RSTZ/dphy_rstz and PHY_SHUTDOWNZ/phy_shutdownz are in low state. It should be ensured that PHTC/testclr is in high state by default, as it acts as an active high reset to the control block responsible for the configuration values preset. In this mode, analog pins are in high-impedance (Hi-Z).

All necessary MIPI D-PHY configurations to set the desired operation should be made with the MIPI DPHY on this mode, before Start-up.

53.3.3.2 Start-up Sequence

Before D-PHY Start-up, the D-PHY needs to be properly configured for the desired operation. This needs to be done with the PHY in shutdown mode and it is assumed that such configurations are static or at least are stable prior to leaving the Shutdown mode.

The D-PHY operating frequency, input reference clock frequency and DDL target oscillation frequency need to be configured.

■ D-PHY Operating frequency: HSFREQRANGE[6:0]/hsfreqrange[6:0]

To configure the bit rate operation you should directly configure HSFREQRANGE[6:0] for the desired frequency range . The D-PHY Operating frequency needs to be configured for the desired operating frequency according to Table 53.13 “Frequency Ranges and Defaults”. You can only configure HSFREQRANGE[6:0] before the D-PHY Start-up. You can not change HSFREQRANGE[6:0] setting during active operation.

■ Input reference clock frequency: CSI0CLKFREQRANGE[7:0]/csi0clkfreqrange[7:0]Regarding input system clock frequency, CSI0CLKFREQRANGE[7:0] needs to be H’0C.

■ DDL target oscillation frequency:

This DDL target oscillation frequency(12bit data: osc_freq_target[11:0]) needs to be configured for the desired operating frequency according to Table 53.13 “Frequency Ranges and Defaults”.

The desired operating frequency configuration is required to meet the D-PHY specification global timing parameters and intervals. The D-PHY specification has several global timing parameters and intervals which have to be followed to ensure proper operation.

Table 53.13 Frequency Ranges and Defaults

Range (Mbps)	Default Bit Rate (Mbps)	HSFREQRANGE[6:0] (Binary notation)	Osc_freq_target[11:0] (Decimal notation)
80 - 97.125	80	0000000	425
80 - 107.625	90	0010000	425
83.125 - 118.125	100	0100000	425

2363.125 - 2500	2500	1001001	370

By default, the D-PHY Start-up sequence performs termination calibration considering the presence of an external termination resistor.

The PHY consists of four data lanes, but applications can use four or lesser data lanes. In such cases, you are granted access to individual enabling signals, ENABLE_N(N=0,1,2,3 corresponding to each lanes), that control which lanes should be used and evolve through all the necessary initialization steps. The ENABLE_N must not be changed during operation. They should be set in power-down.

If only a single lane is to be enabled, that lane must be lane 0.

After the reset — DPHY_RSTZ/dphy_rstz and PHY_SHUTDOWNZ/phy_shutdownz—are released, the PHY begins an initialization sequence that allows its correct operation. PHY_SHUTDOWNZ/phy_shutdownz should precede DPHY_RSTZ/dphy_rstz; it is also assumed that the Configuration Clock is available and stable by that time. The initialization sequence determines that the bandgap and biasing blocks are enabled first. After the current references get settled, a second step is triggered where the internal calibrations are performed.

The deskew algorithm selection is done automatically based on HSFREQRANGE/hsfreqrange[6:0] configuration but can be overridden through PHTW, as well as all other Start-up calibration algorithms. When this second step is complete, the control is passed to the lanes, which handle the power management for LP/HS requests, enabling or disabling the corresponding receivers. All initialization steps are complete once the PHY_STOPSSTATE/phy_stopstatedata_N(N=0, 1, 2, 3) and PHY_STOPSSTATE/phy_stopstateclk get asserted (if D-PHY Transmitter is driving LP11).

For operating frequencies > 1.5 Gbps, a deskew compensation calibration algorithm can be executed (enabled by default for operating frequencies > 1.5 Gbps), if the RX D-PHY is triggered through a defined pattern sent by the TX after the D-PHY RX is already powered-up and in STOPSTATE.

Start-up configuration are provided below. For D-PHY configuration must be exercised after setting PHTC/testclr and before D-PHY leaves shutdown mode (both PHY_SHUTDOWNZ/phy_shutdownz and DPHY_RSTZ/dphy_rstz are cleared) and start D-PHY Start-up sequence.

T0: Set CSI2_RESETN/csi2_resetn = 1’b0； DPHY_RSTZ/dphy_rstz = 1'b0; PHY_SHUTDOWNZ/phy_shutdownz = 1'b0; PHTC/TESTCLR = 1'b1.

T1: Set FRXM/FORCERXMODE_N(N=0, 1, 2, 3) = 1'b1, OVR1/forcerxmode_N (N=0, 1, 2, 3) = 1’b1 to force lane into Wait for Stop State.

Set FLDC, FLDD, IDIC.

T2: Set PHTC/TESTCLR = 1'b0; CSI2_RESETN/csi2_resetn = 1’b1.

T3: PHY register is programmed/read with PHY in reset.

T3-1: Set PHYPLL/HSFREQRANGE[6:0] to the target operating frequencies according to Table 53.13 “Frequency Ranges and Defaults”.

T3-2: Refer to Table 53.13 “Frequency Ranges and Defaults” and configure through PHTW with the appropriate DDL target oscillation frequency (defined as osc_freq_target[11:0]) as follows. (*2)

PHTW = H’0100_0100

PHTW = H’01_**pp**_01E2 (where **pp** is osc_freq_target[7:0])

PHTW = H’010_**q**_01E3 (where **q** is osc_freq_target[11:8])

PHTW = H’0101_01E4

T3-3: (Only used in case the speed is less than or equal to 1.5 Gbps.) (*2)

PHTW = H’0100_0100

PHTW = H’013C_0108

T3-4: Set CSI0CLKFCPR/csi0clkfreqrange[7:0] = 8'b00001100.

T3-5: Set PHY_EN/ENABLE_N(N=0,1,2,3 corresponding to each lane) and PHY_EN/ENABLECLK = 1'b1.

T3-6: (Only used in case the speed is higher than 1.5 Gbps.) (*2)

PHTW = H’0100_0100

PHTW = H’0180_01E0

PHTW = H’0131_01E1

PHTW = H’0106_0100

PHTW = H’0111_0111

PHTW = H’0108_0100

PHTW = H’0111_0111

PHTW = H’010A_0100

PHTW = H’0111_0111

PHTW = H’010C_0100

PHTW = H’0111_0111

PHTW = H’0101_0100

PHTW = H’0131_01AA

PHTW = H’0105_0100

PHTW = H’0105_0109

PHTW = H’0107_0100

PHTW = H’0105_0109

PHTW = H’0109_0100

PHTW = H’0105_0109

PHTW = H’010B_0100

PHTW = H’0105_0109

T3-7:

PHTW = H’0101_0100

PHTW = H’0106_01ab

T4: Set PHY_SHUTDOWNZ/phy_shutdownz = 1'b1; DPHY_RSTZ/dphy_rstz = 1'b1.

T5: Internal calibrations ongoing. No configurations are accepted during power-on-reset (POR). Wait for PHTR[19:16] that POR is complete. (*2)

PHTW = H’0100_0100

PHTW = H’0000_011E

read PHTR and wait PHTR[19:16] = H’7

T6: (Skip)

T7: Wait until ST_PHYST/ST_STOPSTATE_N (N=0, 1, 2, 3) and ST_PHYST/ST_STOPSTATE_DCK are asserted indicating PHY is receiving LP11 in enabled datalanes and clocklane. (*1)

T8: Set FRXM/FORCERXMODE_N(N=0, 1, 2, 3) = 1'b0.

Note

- CPG/CSI2 0,1 MSTOP is off and CPG/CSI2 Clock is start before T0. (see 53.3.1 System)
- (*1) It is possible to skip ST_PHYST/ST_STOPSTATE_N (N=0, 1, 2, 3) and ST_PHYST/ST_STOPSTATE_DCK registers confirmation by software at T7. It is necessary to input D-PHY LP-11 to CSI2 and PHY must go through the stop state after T5 PHTR[19:16]=H'7 assertion as hardware. To skip T7 does not affect functional safety.
- (*2) Each step must be issued after both DWEN=0 and CWEN=0 are confirmed.

53.4 Usage Notes

53.4.1 LINK

53.4.1.1 Error Handling

This chapter describes all the errors the LINK can identify. For each identified error, if applicable, a reset is recommended.

Table 53.14 LINK Error List

Register	Field	Description	Error Frequency	Action/Consequence	Recommended reset
INT_ST_PHY_FATAL	phy_rxinvalidcodehs_*	High Speed Invalid Code Word Detection on lane *.	Single	Follow PHY recommendation	-
			Multiple	Follow PHY recommendation	csi2_resetn dphy_rstz
	err_deskew	Reports whenever data is lost due to an existent skew between lanes greater than 2 rxwordclkhs.	Single	No action required. Autonomous Recovery.	-
			Multiple	Reset is recommended.	csi2_resetn
	phy_errsotsynchs_*	Start of transmission error on data lane * (no synchronization achieved).	Single	Follow PHY recommendation	-
			Multiple	Reset is recommended.	csi2_resetn dphy_rstz
INT_ST_PKT_FATAL	err_ecc_double	D-PHY: Header ECC contains at least 2 errors, Unrecoverable	Single	No action required. Packets with this error are not delivered in IDI interface.	-
			Multiple	Reset is recommended. May indicate ecosystem issue.	csi2_resetn dphy_rstz
INT_ST_BNDRY_FRAME_FATAL	err_f_bndry_match_vc*	Error matching Frame Start with Frame End for virtual channel *.	Single	No action required. No consequence.	-
			Multiple	Reset is recommended. May indicate ecosystem issue.	csi2_resetn dphy_rstz
INT_ST_SEQ_FRAME_FATAL	err_f_seq_vc*	Incorrect Frame sequence detected in virtual channel *.	Single	No action required. No consequence.	-
			Multiple	Reset is recommended. May indicate ecosystem issue.	csi2_resetn dphy_rstz
INT_ST_CRC_FRAME_FATAL	err_frame_data_vc*	Last received Frame in virtual channel *, had at least one CRC error.	Single	No action required. May indicate ecosystem issue.	-
			Multiple	Reset is recommended. May indicate ecosystem issue.	csi2_resetn dphy_rstz
INT_ST_PLD_CRC_FATAL	err_crc_vc*	Payload Checksum error detected	Single	No action required. May indicate ecosystem issue.	-

Register	Field	Description	Error Frequency	Action/Consequence	Recommended reset
		on virtual channel *.	Multiple	Reset is recommended. May indicate ecosystem issue.	csi2_resetn dphy_rstz
INT_ST_PHY	phy_erresc*	Escape Entry Error on data lane *.	Single	Follow PHY recommendation.	-
			Multiple	Reset is recommended.	csi2_resetn dphy_rstz
	phy_errsoths_*	Start of transmission error on data lane * (synchronization can still be achieved).	Single	Follow PHY recommendation	-
			Multiple	Reset is recommended.	csi2_resetn dphy_rstz
INT_ST_LINE	err_l_seq_di*	Error in the sequence of lines for vc* and dt*.	Single	No impact on the controller, If no other error is flagged may indicate issues at TX side.	-
			Multiple	No impact on the controller, If no other error is flagged may indicate issues at TX side.	-
	err_l_bndry_match_di*	Error matching line start with line end for vc* and dt*.	Single	No impact on the controller, If no other error is flagged may indicate issues at TX side.	-
			Multiple	No impact on the controller, If no other error is flagged may indicate issues at TX side.	-
INT_ST_DATA_ ID	err_id_vc*	Unrecognized or unimplemented data type detected in virtual channel *.	Single	No impact.	-
			Multiple	Check configurations is recommended. May indicate ecosystem issue.	-
INT_ST_ECC_CORRECTED	err_ecc_corrected*	D-PHY: Header error detected and corrected on virtual channel *.	Single	No impact on the controller.	-
			Multiple	No impact on the controller. May indicate link degradation.	-

53.4.2 PHY

53.4.2.1 D-PHY High-Speed Deskew Calibration (>1.5Gbps)

In order to achieve data rates in the High-Speed Data mode, a calibration mode was introduced in D-PHY 1.2 spec. The implemented algorithm will be exercised while D-PHY is in idle mode.

The initial deskew calibration is mandatory and the periodic deskew calibration is recommended. Over $2^{\wedge 14}$ UI is recommended for $T_{SKEWCAL}$ of the periodic deskew calibration. When "$2^{\wedge 14}$ UI" > 10us, over $2^{\wedge 13}$ UI is recommended.

53.5 Safety Mechanisms

53.5.1 Packet ECC and payload CRC of CSI2

(a) Overview

CSI2 packet ECC/CSI payload checker is to check consistency of incoming MIPI CSI-2 packet header data and packet payload data (pixel stream in one line). When using D-PHY mode, ECC (Error Check Code) code is used to check the packet header. For packet payload checking, CRC is used.

Supports fatal interruption related with Payload Checksum(CRC) error.

Supports interruption related with header error detected and corrected for a specific virtual channel.

54. Image Signal Processor (ISP)/Channel Selector (CS)

54.1 Overview

The image signal processor (ISP) is an image pixel correction engine to correct input image signals from video input interfaces. This module supports one MIPI CSI-2 and two parallel digital video interfaces as the video input interfaces. As image processing algorithms, the ISP supports demosaicing (RGB pixel interpolation from a RAW image), white balance control, color space conversion from RGB to YUV, and the HDR image processing to support the HDR image sensor connection.

54.1.1 Features

- Video Input Interface
  - MIPI CSI-2
    - MIPI CSI-2 Interface (2.5 Gbps x 4 lane@D-PHY, 16 Virtual Channel (VC) supports) x 2 ports
  - Parallel Digital Video Port (DVP)
    - Not supported
- Input format
  - Multi exposure High Dynamic Range (HDR) supports up to 2:1 multi-exposure, or one sensor combined HDR.
  - Maximum resolution:
    - 5120(w) x 4096 (h)
    - Only even numbers are available regarding image width (horizontal picture size).
  - Maximum pixel throughput :
    - 1 pixel/clock de-rated by 2-5% blanking requirement depending on configuration.
    - MIPI CSI-2 input
      - Maximum pixel rate via MIPI CSI-2 input per 1 port : 720 [Mpixel/s]
    - DVP Input
      - DVP input is not supported
  - Sensor data format :
    - MIPI CSI-2 input :
      - RAW8, RAW10, RAW12, RAW14, RAW16, RAW20, RAW24, YUV420 8-bit, YUV420 10-bit, YUV422 8-bit, YUV422 10-bit, YUV422 12-bit (*1), YUV422 Y 12-bit UV 8-bit (*1), RGB565, RGB888

      *1: This format is not supported in the MIPI CSI-2 standard.
    - DVP input :
      - DVP input is not supported
  - CFA patterns :
    - RGGB,
- Output format

- 2 independent image output channels (Human Vision Image and Machine Vision Image) are written out as the DMA via the AXI master interface
- Pixel format for human vision image : RGB, YUV422, YUV420
- Pixel format for machine vision image : RGB, YUV422, YUV420, LUV444, LUV422, LUV420

- Processing Functions
  - Defect Pixel Correction
  - Noise Filter
  - Local Tone Mapping
  - Histogram Generation (4color x 256bin x 16bit)
  - Demosaicing
  - Color Correction
  - Dual Video Output (Human Vision and Machine Vision)
- Color processing
  - : Demosaic RGGB, RCCG, RCCB, RCCC
- Interfaces
  - AXI master interface
    - Number of ports
      - Write only, AXI3, 256bit width x 2 ports for DMA of image output and histogram output
      - Write only, AXI3, 64bit width x 2 ports for DMA of defect pixel information output
    - Clock :
      - S0D1_VIO ϕ
  - APB slave interface
    - Number of ports : 2
    - Bit width : 32 bits
    - Clock
      - S0D2_VIO ϕ
  - Interrupts : 2 ports
  - Error request :
    - 2 ports
  - WUP(Wake UP) interface :
    - 4 ports
- Channel Selector
  - Routing of CSI packet based on VCs, data type, etc.

- Pixel reconstructor
- Supporting 16 VCs . 1 VC can be passed per one channel at VC based filtering.

- Other features
  - Meta data (embedded data) processing
    - Meta data can be transferred to the DRAM by the VIN
  - Image data Capturing
    - Incoming image data can be transferred to the DRAM by the VIN in parallel with ISP processing. This function is achieved by using the channels connected to VIN (Channel 4~11). When using this function, the VIN setting is additionally required.
  - LUT Based Pixel Reconstructor
    - Pixel Reconstructor in the Channel Selector supports non-standard pixel packing for the incoming MIPI CSI-2 pixel stream
    - The unpacking method can be selected by using the LUT. The LUT specifies the bit position in the pixel buffer (32 [bit] x N)
    - The following formats are supported.
      - YUV444 : Y16, U8, V8
      - YUV444: Y16, U10, V10
      - YUV444: Y16, U12, V12
      - YUV444: Y12, U8, V8
      - YUV422: Y12, UV8
  - De-interleaving Filter
    - The LUT based pixel sub-sampling at the last stage of filtering chain of Channel Selector
    - By setting pass/drop for each pixel in one window using the LUT, any sub-samplings can be realized
    - The window size (the LUT size) varies from 1 pixel (minimum) to 512 pixels (maximum)
  - Streaming Bridge (Memory-to-Memory operation with VSPX)
    - Memory-to-Memory operation is supported by using the “Streaming Bridge”
    - The ISP can receive input stream from the VSPX via the “Streaming Bridge”
    - The VSPX reads input images for the ISP from DRAM and provides the ISP with them
    - Segmented image is supported.
    - Static gear down of ISP core clock frequency for the purpose of reduction of power consumption.
  - Pre-processing of RAW Image
    - Supported processing
      - RAW domain image scaling: Scaling horizontal size and vertical size of input image to 1/2.
      - CFA conversion: 4x4 RGB-IR to 2x2 Bayer (RGGB)

✧ Pixel format

- Input pixel format : RAW8, RAW10, RAW12, RAW14, RAW16 , RAW20, RAW24

✧ Input image size :

- Image width : Minimum 128 [pixel/line]. Maximum 5120 [pixel/line].
- Image height : Minimum 128 [line]. Maximum 4096 [line].

✧ Restrictions of image width and image height

- Input image width (number of pixels per one line) must be multiple of 2 (even value only).
- Input image height (number of lines per one frame) must be multiple of 2 (even value only).
- Scaling ratio is only 1/2 and aspect ratio shall be equal to the input image.
  - When 1/2 scaling, both horizontal and vertical shall be scaled. Scaling horizontal only or scaling vertical only is forbidden.
- When 1/2 scaling, simultaneous use with either de-interleaving filter or line count filter is prohibited

54.3 Register Description

54.3.1 ISP Version Register [c](c=0-1)(ISPVCR_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ISPVCR															
Initial value:	0	0	0	0	0	0	0	0	0	1	0	1	0	1	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ISPVCR															
Initial value:	0	0	1	1	0	1	0	0	0	1	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ISPVCR	H'005634 4D	R	ISP Version Control Register H'0056344D

Note 1: The value to be read varies depending on the product

54.3.2 ISP Input FIFO Control Register [c](c=0-1)(ISPFIFOCTRL_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFO_PUSH_CSI	—	—
Initial value:	0	0	1	1	0	0	1	0	0	0	0	0	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0	R/W	Reserved
15 to 12	—	H'3	R/W	Reserved
11 to 8	—	H'2	R/W	Reserved
7 to 3	—	All 0	R	Reserved. (These bits are always read as 0.)
2	FIFO_PUSH_CSI	H'1	R/W	FIFO ENABLE for CSI 0 : CSI FIFO disable 1 : CSI FIFO enable [default]
1, 0	—	H'3	R	Reserved

54.3.3 ISP Input Select Control Register [c](c=0-1)(ISPINPUTSEL0_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEL_CSI0	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TRACE_SEL0				—	—	—	—	CSI_SEL			
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SEL_CSI0	H'0	R/W	Select CSI input for Pixel Reconstructor 0 : CSI input 0 [default] 1 : CSI input 1
30 to 16	—	H'4012	R/W	Reserved bits. Do not write any different value from its initial value.
15 to 12	—	H'1	R/W	Reserved
11 to 8	TRACE_SEL0	H'0	R/W	Selection signal of channels to output to trace port 0 0~11 : Channel n Others : Forbidden
7 to 4	—	All 0	R	Reserved. (These bits are always read as 0.)
3 to 0	CSI_SEL	H'0	R/W	Select of ISP core 0 : Select MIPI CSI-2 input Others : Forbidden

54.3.4 ISP Start Register [c](c=0-1)(ISPSTART_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	START_ISP															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	START_ISP	H'0	W	Starting and stopping control of ISP - H’FFFF : Start ISP - H’0000 : Stop ISP [default] This register is write only. By writing H’FFFF ISP processing is started. By writing H’0000 ISP processing is stopped. To start ISP processing some additional procedure in addition to write this register is needed. All of configuration should be completed before starting ISP processing. Any register writing operations are forbidden during ISP processing is started.

54.3.5 ISP Interrupt Status Register [c](c=0-1)(ISPINT_STATUS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ST31	ST30	ST29	ST28	ST27	ST26	ST25	ST24	ST23	ST22	ST21	ST20	ST19	ST18	ST17	ST16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ST15	ST14	ST13	ST12	ST11	ST10	ST9	ST8	ST7	ST6	ST5	ST4	ST3	ST2	ST1	ST0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	ST31	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
30	ST30	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
29	ST29	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
28	ST28	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
27	ST27	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
26	ST26	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
25	ST25	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.

Bit	Bit Name	Initial Value	R/W	Description
24	ST24	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
23	ST23	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
22	ST22	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
21	ST21	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
20	ST20	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
19	ST19	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
18	ST18	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.

Bit	Bit Name	Initial Value	R/W	Description
17	ST17	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
16	ST16	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
15	ST15	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
14	ST14	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
13	ST13	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
12	ST12	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
11	ST11	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.

Bit	Bit Name	Initial Value	R/W	Description
10	ST10	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
9	ST9	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
8	ST8	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
7	ST7	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
6	ST6	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
5	ST5	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
4	ST4	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.

Bit	Bit Name	Initial Value	R/W	Description
3	ST3	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
2	ST2	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
1	ST1	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.
0	ST0	H'0	R	Interrupt status. - 0: Interrupt is not happened [default] - 1: Interrupt is happened Bit assignment is shown in Section 54.4.6.1 This reister is read only (not writable). It can be cleared to 0 by writing 1 to the corresponding clear register CLR[n] (n=0~31) in ISPINT_CLEAR.

54.3.6 ISP Error Request0 Status Register [c](c=0-1)(ISPERR0_STATUS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	ST31	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
30	ST30	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
29	ST29	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
28	ST28	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
27	ST27	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
26	ST26	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
25	ST25	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
24	ST24	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
23	ST23	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
22	ST22	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
21	ST21	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
20	ST20	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
19	ST19	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
18	ST18	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
17	ST17	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
16	ST16	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
15	ST15	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
14	ST14	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
13	ST13	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
12	ST12	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
11	ST11	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
10	ST10	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
9	ST9	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
8	ST8	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
7	ST7	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
6	ST6	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
5	ST5	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
4	ST4	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
3	ST3	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request0 Clear Register register
2	ST2	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). Bit	Bit Name	Initial Value	R/W	Description
31	ST31	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
30	ST30	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
29	ST29	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
28	ST28	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
27	ST27	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
26	ST26	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
25	ST25	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
24	ST24	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
23	ST23	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
22	ST22	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
21	ST21	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
20	ST20	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
19	ST19	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
18	ST18	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
17	ST17	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
16	ST16	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
15	ST15	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
14	ST14	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
13	ST13	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
12	ST12	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
11	ST11	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
10	ST10	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
9	ST9	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
8	ST8	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
7	ST7	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
6	ST6	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
5	ST5	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
4	ST4	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
3	ST3	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
2	ST2	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
1	ST1	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register
0	ST0	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request2 Clear Register register

54.3.9 ISP Interrupt Clear Register [c](c=0-1)(ISPINT_CLEAR_[c])

Bit	Bit Name	Initial Value	R/W	Description
31	CLR31	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
30	CLR30	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
29	CLR29	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
28	CLR28	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
27	CLR27	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
26	CLR26	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
25	CLR25	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
24	CLR24	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
23	CLR23	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
22	CLR22	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
21	CLR21	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
20	CLR20	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
19	CLR19	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0

Bit	Bit Name	Initial Value	R/W	Description
18	CLR18	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
17	CLR17	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
16	CLR16	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
15	CLR15	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
14	CLR14	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
13	CLR13	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
12	CLR12	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
11	CLR11	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
10	CLR10	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
9	CLR9	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
8	CLR8	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
7	CLR7	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
6	CLR6	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0

Bit	Bit Name	Initial Value	R/W	Description
5	CLR5	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
4	CLR4	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
3	CLR3	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
2	CLR2	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
1	CLR1	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0
0	CLR0	H'0	W	Clear register for interrupt status ST[n] (n=0~31). By writing 1 to CLK[n], ST[n] in ISP Interrupt Status Register register is cleared to 0

Bit	Bit Name	Initial Value	R/W	Description
31	ST31	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
30	ST30	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
29	ST29	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
28	ST28	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
27	ST27	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
26	ST26	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
25	ST25	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
24	ST24	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
23	ST23	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
22	ST22	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
21	ST21	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
20	ST20	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
19	ST19	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
18	ST18	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
17	ST17	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
16	ST16	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
15	ST15	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
14	ST14	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
13	ST13	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
12	ST12	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
11	ST11	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register

Bit	Bit Name	Initial Value	R/W	Description
10	ST10	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
9	ST9	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
8	ST8	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
7	ST7	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). ST[n] (n=0~31) can be cleared to 0 by writing 1 to the corresponding bit in CLR[n] (n=0~31) in ISP Error Request3 Clear Register register
6	ST6	H'0	R	Error status. - 0: Error is not happened [default] - 1: Error is happened Bit assignment is shown in Section 54.4.7.3 This reister is read only (not writable). R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CLEAR_SYNC	H'0	R/W	Selection of period to count pixels 0 : Number of pixels per line [default] 1 : Number of pixels per frame
30 to 26	—	All 0	R	Reserved. (These bits are always read as 0.)
25 to 0	MAX_PIXEL	H'3FFFFFF	R/W	Maximum number of pixels to asset the error status. When number of pixels in the current line or frame is bigger than the value of MAX_PIXEL register, then error status is asserted

54.3.28 Pixel Count Checker MIN Pixel Register CH[d] [c](d=0-11)(c=0-1)(ISP_PIXEL_COUNT_MIN_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	MIN_PIXEL									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MIN_PIXEL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved. (These bits are always read as 0.)
25 to 0	MIN_PIXEL	H'0	R/W	Minimum number of pixels to assert the error status. When number of pixels in the current line or frame is less than the value of MIN_PIXEL register, then error status is asserted

54.3.29 Pixel Count Checker Monitor Pixel Register CH[d] [c](d=0-11)(c=0-1)(ISP_PIXEL_COUNT_MONITOR_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PIXEL_COUNT									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved. (These bits are always read as 0.)
25 to 0	PIXEL_COUNT	H'0	R/W	Number of counted pixels

54.3.30 Channel Selector VC and ID Filter Register CH[d] [c](d=0-11)(c=0-1)(ISPCS_FILER_ID_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SEL_RAW_SCALED	—	—	—	—	—	—	—	—	—	—	LC_FILTER_ID	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VC_EN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
28	SEL_RAW_SCALED	H'0	R/W	A bit to specify the input pixel stream for filter chain to select RAW scaled image In order to use RAW scaler this bit should be set to 1. 0: Not select the RAW scaled image [default] 1: Selects RAW scaled image.
27 to 18	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
17, 16	LC_FILTER_ID	H'0	R/W	Number of ID to pass at line count filter
15 to 0	VC_EN	H'1	R/W	Virtual channel (VC) number to pass is specified at VC_Filter. When VC_EN[n] == 1, VCn is passed. VC_EN shall be either one hot value or two hot value. Up to 2 VCs can be passed per one VC_Filter. Neither one hot value nor two hot value are forbidden

54.3.31 Channel Selector Line Count Modulo Register VC0-7 CH[d] [c](d=0-11)(c=0-1)(ISPCS_LC_MODULO_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MODULO_MINUS1_VC7			—	MODULO_MINUS1_VC3			—	MODULO_MINUS1_VC6			—	MODULO_MINUS1_VC2		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MODULO_MINUS1_VC5			—	MODULO_MINUS1_VC1			—	MODULO_MINUS1_VC4			—	MODULO_MINUS1_VC0		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved. (This bit is always read as 0.)
30 to 28	MODULO_MINUS1_VC7	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC7) for calculating the line count ID
27	—	B'0	R	Reserved. (This bit is always read as 0.)
26 to 24	MODULO_MINUS1_VC3	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC3) for calculating the line count ID
23	—	B'0	R	Reserved. (This bit is always read as 0.)
22 to 20	MODULO_MINUS1_VC6	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC6) for calculating the line count ID
19	—	B'0	R	Reserved. (This bit is always read as 0.)
18 to 16	MODULO_MINUS1_VC2	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC2) for calculating the line count ID
15	—	B'0	R	Reserved. (This bit is always read as 0.)
14 to 12	MODULO_MINUS1_VC5	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC5) for calculating the line count ID
11	—	B'0	R	Reserved. (This bit is always read as 0.)
10 to 8	MODULO_MINUS1_VC1	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC1) for calculating the line count ID
7	—	B'0	R	Reserved. (This bit is always read as 0.)
6 to 4	MODULO_MINUS1_VC4	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC4) for calculating the line count ID
3	—	B'0	R	Reserved. (This bit is always read as 0.)
2 to 0	MODULO_MINUS1_VC0	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC0) for calculating the line count ID

54.3.32 Channel Selector Line Count Modulo Register VC8-15 CH[d] [c](d=0-11)(c=0-1)(ISPCS_LC_MODULO1_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MODULO_MINUS1_VC15			—	MODULO_MINUS1_VC11			—	MODULO_MINUS1_VC14			—	MODULO_MINUS1_VC10		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MODULO_MINUS1_VC13			—	MODULO_MINUS1_VC9			—	MODULO_MINUS1_VC12			—	MODULO_MINUS1_VC8		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved. (This bit is always read as 0.)
30 to 28	MODULO_MINUS1_VC15	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC15) for calculating the line count ID
27	—	B'0	R	Reserved. (This bit is always read as 0.)
26 to 24	MODULO_MINUS1_VC11	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC11) for calculating the line count ID
23	—	B'0	R	Reserved. (This bit is always read as 0.)
22 to 20	MODULO_MINUS1_VC14	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC14) for calculating the line count ID
19	—	B'0	R	Reserved. (This bit is always read as 0.)
18 to 16	MODULO_MINUS1_VC10	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC10) for calculating the line count ID
15	—	B'0	R	Reserved. (This bit is always read as 0.)
14 to 12	MODULO_MINUS1_VC13	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC13) for calculating the line count ID
11	—	B'0	R	Reserved. (This bit is always read as 0.)
10 to 8	MODULO_MINUS1_VC9	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC9) for calculating the line count ID
7	—	B'0	R	Reserved. (This bit is always read as 0.)
6 to 4	MODULO_MINUS1_VC12	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC12) for calculating the line count ID
3	—	B'0	R	Reserved. (This bit is always read as 0.)
2 to 0	MODULO_MINUS1_VC8	H'0	R/W	Divisor minus 1 for modulo calculation on the line number of the input frame (VC8) for calculating the line count ID

54.3.33 Channel Selector DT Code03 Register CH[d] [c](d=0-11)(c=0-1)(ISPCS_DT_CODE03_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ENABLE3	HOLD3	DT_CODE3						ENABLE2	HOLD2	DT_CODE2					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENABLE1	HOLD1	DT_CODE1						ENABLE0	HOLD0	DT_CODE0					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	ENABLE3	H'0	R/W	Enable bit for passing pixel to LC filter .
30	HOLD3	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
29 to 24	DT_CODE3	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
23	ENABLE2	H'0	R/W	Enable bit for passing pixel to LC filter .
22	HOLD2	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
21 to 16	DT_CODE2	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
15	ENABLE1	H'0	R/W	Enable bit for passing pixel to LC filter .
14	HOLD1	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
13 to 8	DT_CODE1	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
7	ENABLE0	H'0	R/W	Enable bit for passing pixel to LC filter .
6	HOLD0	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
5 to 0	DT_CODE0	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed

54.3.34 Channel Selector DT Code47 Register CH[d] [c](d=0-11)(c=0-1)(ISPCS_DT_CODE47_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ENABLE7	HOLD7	DT_CODE7						ENABLE6	HOLD6	DT_CODE6					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENABLE5	HOLD5	DT_CODE5						ENABLE4	HOLD4	DT_CODE4					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	ENABLE7	H'0	R/W	Enable bit for passing pixel to LC filter .
30	HOLD7	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
29 to 24	DT_CODE7	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
23	ENABLE6	H'0	R/W	Enable bit for passing pixel to LC filter .
22	HOLD6	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
21 to 16	DT_CODE6	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
15	ENABLE5	H'0	R/W	Enable bit for passing pixel to LC filter .
14	HOLD5	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
13 to 8	DT_CODE5	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed
7	ENABLE4	H'0	R/W	Enable bit for passing pixel to LC filter .
6	HOLD4	H'0	R/W	Enable bit for increment counter at Line Count ID. 0 : Line count is incremented [default] 1 : Line count is not incremented
5 to 0	DT_CODE4	H'0	R/W	Number of DT_CODE at MD Filter When DT_CODE match setting value by MD Filter and ENABLE is 1, then data be passed

54.3.35 Channel Selector Horizontal Clipping Register DT[h] CH[d] [c](d=0-11)(h=0-3)(c=0-1)(ISPCS_H_CLIP_DT_CODE[h]_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	APPENDED_PIXEL													
Initial value:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PREPENDED_PIXEL													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
30	—	B'0	R	Reserved. (This bit is always read as 0.)
29 to 16	APPENDED_PIXEL	H'3FFF	R/W	This bit specifies the number of removing pixels at the right edge of one line.
15, 14	—	All 0	R	Reserved. (These bits are always read as 0.)
13 to 0	PREPENDED_PIXEL	H'0	R/W	This register specifies the number of removing pixels at the left edge of one line.

54.3.36 Channel Selector Vertical Clipping Register DT[v] CH[d] [c](d=0-11)(v=0-3)(c=0-1)(ISPCS_V_CLIP_DT_CODE[v]_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	APPENDED_LINE													
Initial value:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PREPENDED_LINE													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
30	—	B'0	R	Reserved. (This bit is always read as 0.)
29 to 16	APPENDED_LINE	H'3FFF	R/W	This bit specifies the number of removed lines at the bottom edge of one frame
15, 14	—	All 0	R	Reserved. (These bits are always read as 0.)
13 to 0	PREPENDED_LINE	H'0	R/W	This bit specifies the number of removed lines at the top edge

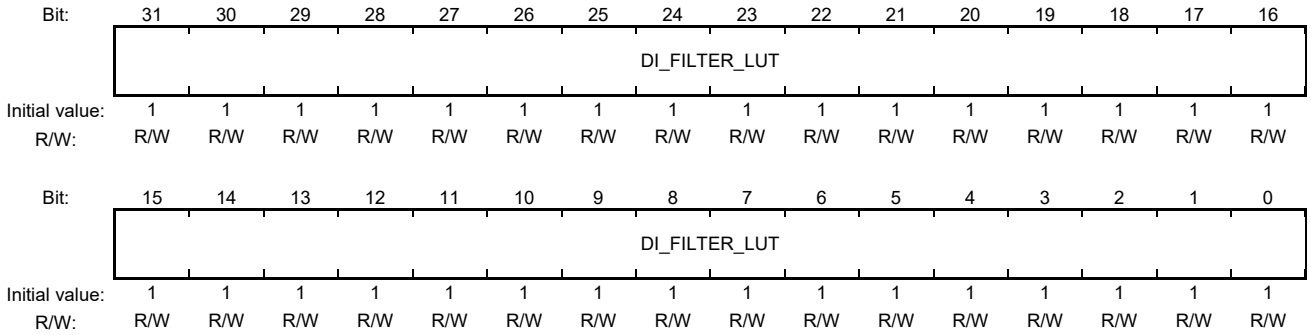
54.3.37 Channel Selector De-Interleaving Filter Control CH[d] [c](d=0-11)(c=0-1)(ISPCS_DI_FILTER_CTRL_CH[d]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CPLX	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LUT_LENGTH_MINUS1								
Initial value:	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CPLX	H'0	R/W	Enabling control of divisor of pixel counter in one line - 0 : Pixel counter divisor is disabled [default] - 1 : Pixel counter is divided by 2
30 to 9	—	All 0	R	Reserved. (These bits are always read as 0.)
8 to 0	LUT_LENGTH_MINUS1	H'1FF	R/W	Value of minus 1 of the number of available bit in de-interleaving filter LUT. For example, if LUT_LENGTH_MINUS1=21, then LUT size is 22 (0 to 21 is available)

54.3.38 Channel Selector De-Interleaving Filter LUT[p] CH[d] [c](d=0-11)(p=0-15)(c=0-1)(ISPCS_DI_FILTER_LUT[p]_CH[d]_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DI_FILTER_LUT	H'FFFFFFFF	R/W	Specify pass/drop control for each pixel in one packet. Each bit correspond to one pixel Meaning the k-th bit of DI_FILTER_LUT[p]_CH[n] is as below - 0 : Drop - 1 : Pass [default]

54.3.39 Write Protect Control Register [c](c=0-1)(ISPWP_CTRL_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UNLOCK_CODE_L															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	UNLOCK_CODE_L	H'0	R/W	Write protection control of ISP_PADDING_CTRL register - H'FB69 : Write protection is disabled. Target register is writable. - H'0000 : Write protection is enabled. Target register cannot be written [default] - Otherwise : Forbidden

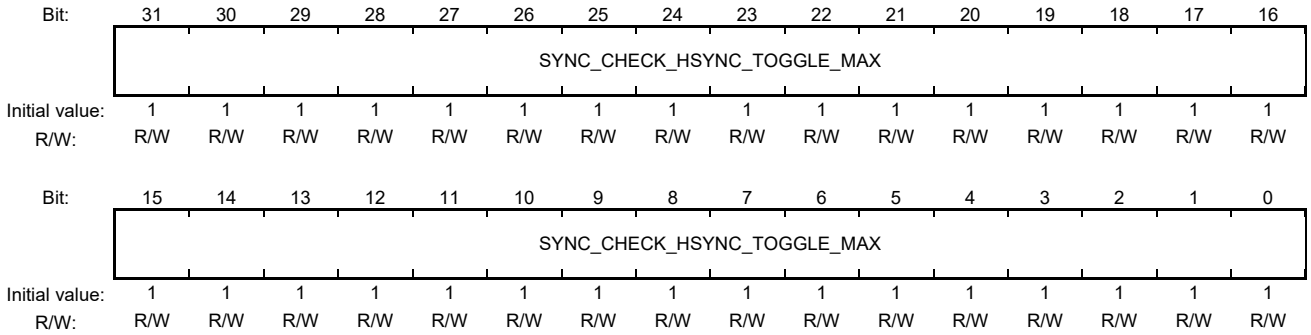
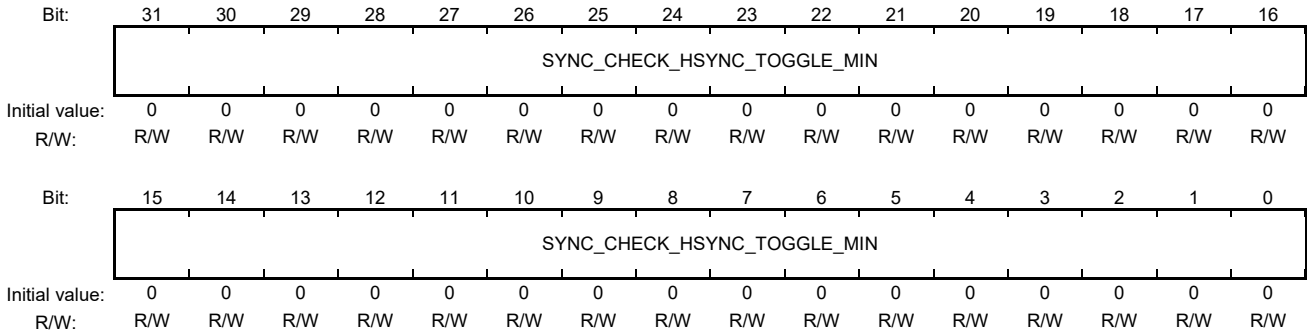
54.3.56 ISP Sync Checker Control HSYNC Toggle MAX VC[g] [c](g=8-15)(c=0-1)(ISP_SYNC_CHECK_HSYNC_TOGGLE_MAX_VC[g]_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SYNC_CHECK_HSYNC_TOGGLE_MAX	H'FFFFFFFF	R/W	Permitted maximum cycles which keeps the same value of the incoming HSYNC signal. If the cycle which keeps the high value or low value exceeds the value specified by this register, then SYNC_ERROR is asserted.

54.3.57 ISP Sync Checker Control HSYNC Toggle MIN VC[g] [c](g=8-15)(c=0-1)(ISP_SYNC_CHECK_HSYNC_TOGGLE_MIN_VC[g]_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SYNC_CHECK_HSYNC_TOGGLE_MIN	H'0	R/W	Permitted minimum cycles which keeps the same value of the incoming HSYNC signal. If the cycle which keeps the high value or low value is less than the value specified by this register, then SYNC_ERROR is asserted.

54.3.58 ISP Sync Checker Control DE MAX VC[g] [c](g=8-15)(c=0-1)(ISP_SYNC_CHECK_DE_MAX_VC[g]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SYNC_CHECK_DE_MAX															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	SYNC_CHECK_DE_MAX	H'FFFF	R/W	Permitted maximum cycles which keeps the same value of the incoming DE signal. If the cycle which keeps the high value or low value exceeds the value specified by this register, then SYNC_ERROR is asserted.

54.3.59 ISP Sync Checker Control DE MIN VC[g] [c](g=8-15)(c=0-1)(ISP_SYNC_CHECK_DE_MIN_VC[g]_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SYNC_CHECK_DE_MIN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	SYNC_CHECK_DE_MIN	H'0	R/W	Permitted minimum cycles which keeps the same value of the incoming DE signal. If the cycle which keeps the high value or low value is less than the value specified by this register, then SYNC_ERROR is asserted.

54.3.60 ISP Streamer Mode Register [c](c=0-1)(ISP_STREAMER_MODE_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	STREAMER_ENABLE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved. (These bits are always read as 0.)
3 to 0	STREAMER_ENABLE	H'0	R/W	On/OFF control of steaming from VSPX. - B’0000 : Streaming mode from VSPX is disabled [default] - B’1111 : Streaming mode from VSPX is enabled. In this case, input stream to ISP core is provided from VSPX instead of CSI via channel selector. - Otherwise : Forbdden

54.3.61 ISP Streamer V Blank Register [c](c=0-1)(ISP_STREAMER_V_BLANK_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STREAMER_V_BLANK															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STREAMER_V_BLANK															
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	STREAMER_V_BLANK	H'800	R/W	Number of cycles of vertical blanking period per one frame for input pixel stream which is provided to ISP core from in streaming mode from VSPX. Unit is cycle.

54.3.62 ISP Streamer H Blank Register [c](c=0-1)(ISP_STREAMER_H_BLANK_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STREAMER_H_BLANK															
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	STREAMER_H_BLANK	H'40	R/W	Number of cycles of horizontal blanking period per line for input pixel stream which is provided to ISP core from in streaming mode from VSPX. Unit is cycle.

54.3.63 ISP Streamer Config DMA Control Register0 [c](c=0-1)(ISP_STREAMER_CONFIG_DMA_CONTROL_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	REG_ADDRESS_UPPER_8BIT								REG_ADDRESS_FILTERING_ENABLE	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	0	1	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BYTE_PER_WORD		—	—	—	ENABLE0
Initial value:	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	REG_ADDRESS_UPPER_8BIT	H'FE	R/W	Specifies the upper 8-bit value of the register address to be written to ISP Core. This register is meaningful only when REG_ADDRESS_FILTERING_ENABLE=1. Has no meaning when REG_ADDRESS_FILTERING_ENABLE=0.
23	REG_ADDRESS_FILTERING_ENABLE	H'1	R/W	・Setting whether or nor REG_ADDRESS_UPPER_8BIT is matched with the upper 8bits of the register address. ・When REG_ADDRESS_FILTERING_ENABLE=1 [default]. When the upper 8 bits of the register address transferred from VSPX match this register, a register write is performed to ISP Core. ・When REG_ADDRESS_FILTERING_ENABLE=0 Always perform a register write to ISP Core (no matching of the upper 8 bits of the register address).
22 to 6	—	H'200C	R/W	Reserved bits. Do not write any different value from its initial value.
5, 4	BYTE_PER_WORD	H'0	R/W	Data format of config data B'00 : 4 byte/word [default] Others: Forbidden
3 to 1	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
0	ENABLE0	H'0	R/W	Enabling config DMA 0 : Config DMA is disabled [default] 1 : Config DMA is enabled

54.3.64 ISP Streamer Config DMA Status [c](c=0-1)(ISP_STREAMER_CONFIG_DMA_STATUS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CONFIG_DMA_READY_BUSY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved. (These bits are always read as 0.)
0	CONFIG_DMA_READY_BUSY	H'0	R	Transfer status of Config DMA 0 : Busy (Config dma is running) 1 : Ready (Config dma is not running)

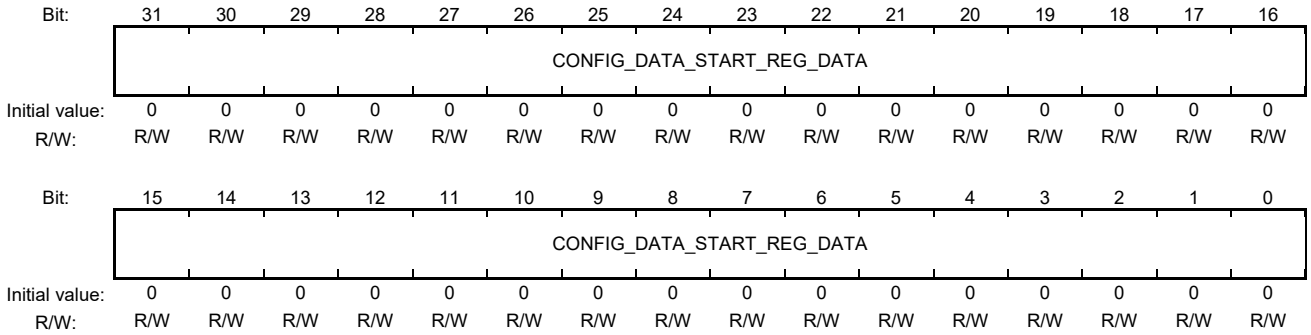
54.3.65 ISP Streamer Config DMA Control Register1 [c](c=0-1)(ISP_STREAMER_CONFIG_DMA_CONTROL1_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ENABLE1	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONFIG_DATA_START_REG_ADDRESS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	ENABLE1	H'0	R/W	Enabling config DMA. In addition to set 1 to ENABLE0, this register should be set to 1 in order to enable Config DMA. 0 : Config DMA is disabled [default] 1 : Config DMA is enabled
30 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 0	CONFIG_DATA_START_REG_ADDRESS	H'0	R/W	The lower 16 bit value of the address of the first (address, write data) pair in the Config Data

54.3.66 ISP Streamer Config DMA Control Register2 [c](c=0-1)(ISP_STREAMER_CONFIG_DMA_CONTROL2_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CONFIG_DATA_START_REG_DATA	H'0	R/W	The write data value of the first (address, write data) pair in the Config Data

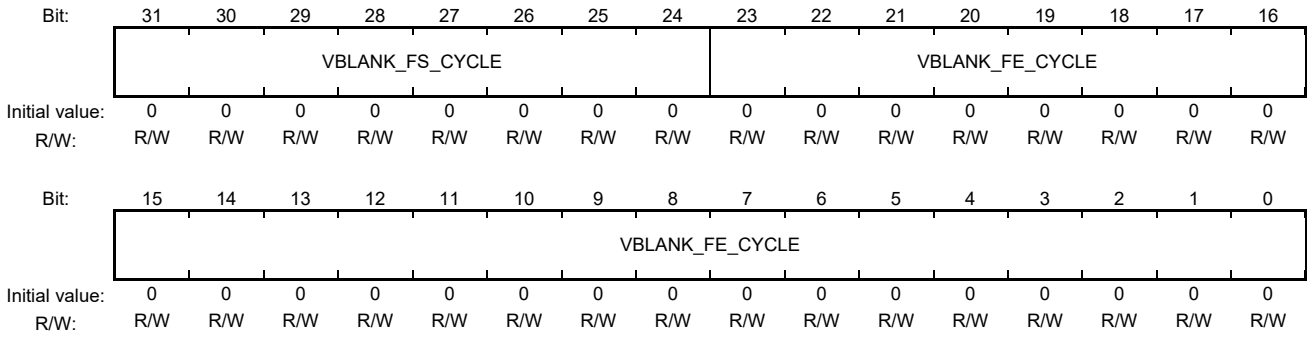
54.3.67 ISP RAW Scaler Mode Register [c](c=0-1)(RAW_SCALER_MODE_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TARGET_VC				—	—	TARGET_DT_CODE					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ENABLE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
27 to 24	TARGET_VC	H'0	R/W	Virtual channel (VC) number to input RAW scaler
23, 22	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
21 to 16	TARGET_DT_CODE	H'0	R/W	Data type (DT) code to input RAW scaler
15 to 1	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
0	ENABLE	H'0	R/W	Enable RAW scaler 0 : RAW scaler is disabled [default] 1 : RAW sacaler is enabled

54.3.68 ISP RAW Scaler Output Vblank Register [c](c=0-1)(RAW_SCALER_OUT_VBLANK_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VBLANK_FS_CYCLE	H'0	R/W	Number of cycles of vertical blanking period at frame start timing of RAW scaler output image
23 to 0	VBLANK_FE_CYCLE	H'0	R/W	Number of cycles of vertical blanking period at frame end timing of RAW scaler output image

54.3.69 ISP RAW Scaler Output Hblank Register [c](c=0-1)(RAW_SCALER_OUT_HBLANK_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	BACK_PORCH_CYCLE				—	—	—	—	FRONT_PORCH_CYCLE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HBLANK_CYCLE											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved. (These bits are always read as 0.)
27 to 24	BACK_PORCH_CYCLE	H'0	R/W	Number of cycles of back porch for each line of RAW scaler output image
23 to 20	—	All 0	R	Reserved. (These bits are always read as 0.)
19 to 16	FRONT_PORCH_CYCLE	H'0	R/W	Number of cycles of front porch for each line of RAW scaler output image
15 to 12	—	All 0	R	Reserved. (These bits are always read as 0.)
11 to 0	HBLANK_CYCLE	H'0	R/W	Number of cycles of horitontal blanking period for each line of RAW scaled image

54.3.70 ISP RAW Scaler Output Sync Interval Register [c](c=0-1)(RAW_SCALER_OUT_VS_HS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VS_HS_FALL_CYCLE							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	VS_HS_RISE_CYCLE							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved. (These bits are always read as 0.)
23 to 16	VS_HS_FALL_CYCLE	H'0	R/W	Number of cycles from VSYNC fall timing to HSYNC fall timing of RAW scaler output image
15 to 8	—	All 0	R	Reserved. (These bits are always read as 0.)
7 to 0	VS_HS_RISE_CYCLE	H'0	R/W	Number of cycles from VSYNC rise timing to HSYNC rise timing of RAW scaler output image

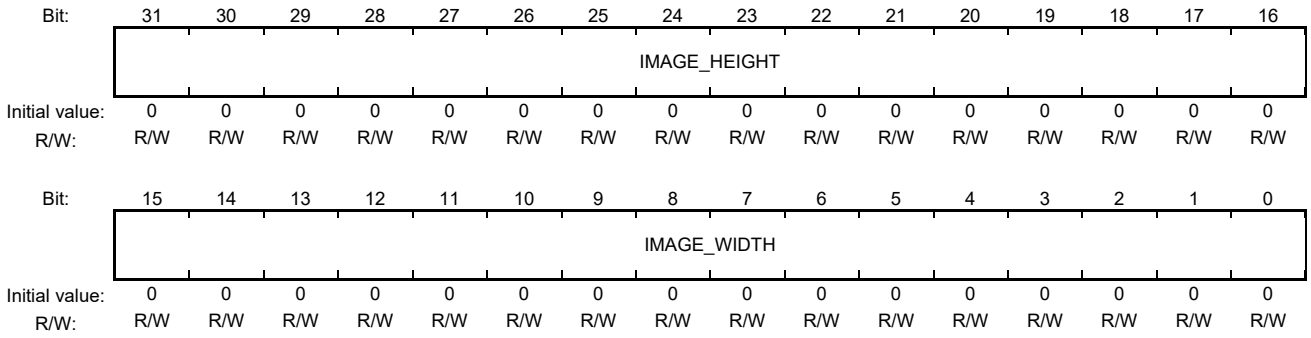
54.3.71 ISP RAW Scaler Input Left Shift Register [c](c=0-1)(RAW_SCALER_INPUT_LSHIFT_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INPUT_LSHIFT				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

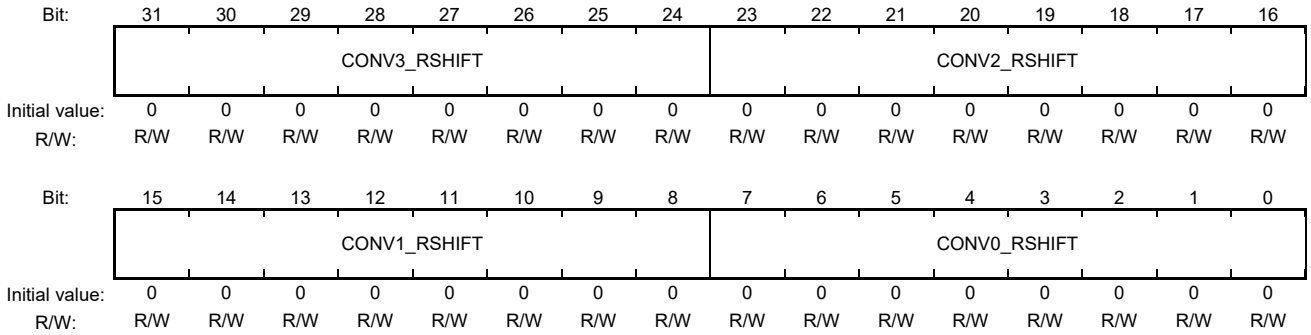
Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved. (These bits are always read as 0.)
4 to 0	INPUT_LSHIFT	H'0	R/W	Left shift amount for RAW scaler input pixel before multiplying convolution coefficient

54.3.72 ISP RAW Scaler Image Size Register [c](c=0-1)(RAW_SCALER_IMAGE_SIZE_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	IMAGE_HEIGHT	H'0	R/W	Image height (number of lines in one frame) of RAW scaler input image
15 to 0	IMAGE_WIDTH	H'0	R/W	Image width (number of pixels per line) of RAW scaler input image

54.3.73 ISP RAW Scaler Convolution Right Shift Register [c](c=0-1)(RAW_SCALER_CONV_RSHIFT_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CONV3_RSHIFT	H'0	R/W	Right shift amount after convolution operation when coeff_select_value(x%4,y%4) is 3. Setting value of conv_rshift(3)
23 to 16	CONV2_RSHIFT	H'0	R/W	Right shift amount after convolution operation when coeff_select_value(x%4,y%4) is 2. Setting value fo conv_rshift(2)
15 to 8	CONV1_RSHIFT	H'0	R/W	Right shift amount after convolution operation when coeff_select_value(x%4,y%4) is 1. Setting value of conv_rshift(1)
7 to 0	CONV0_RSHIFT	H'0	R/W	Right shift amount after convolution operation when coeff_select_value(x%4,y%4) is 0. Setting value of conv_rshift(0)

54.3.74 ISP RAW Scaler Coefficient Select ROW0 Register [c](c=0-1)(RAW_SCALER_COEFF_SEL_ROW0_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFF_SEL_0_3				COEFF_SEL_0_2				COEFF_SEL_0_1				COEFF_SEL_0_0			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
15 to 12	COEFF_SEL_0_3	H'0	R/W	Setting value of coeff_select_table(0,3). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(0,3) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
11 to 8	COEFF_SEL_0_2	H'0	R/W	Setting value of coeff_select_table(0,2). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(0,2) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
7 to 4	COEFF_SEL_0_1	H'0	R/W	Setting value of coeff_select_table(0,1). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(0,1) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
3 to 0	COEFF_SEL_0_0	H'0	R/W	Setting value of coeff_select_table(0,0). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(0,0) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output

54.3.75 ISP RAW Scaler Coefficient Select ROW1 Register [c](c=0-1)(RAW_SCALER_COEFF_SEL_ROW1_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. (These bits are always read as 0.)
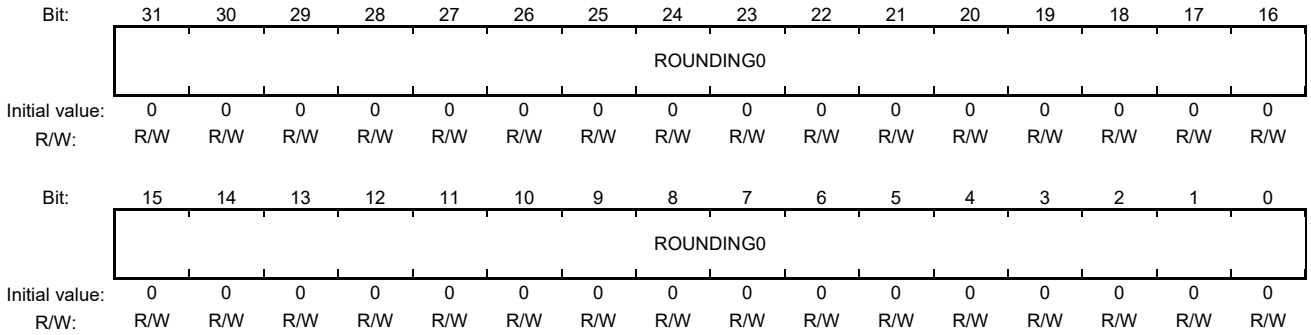
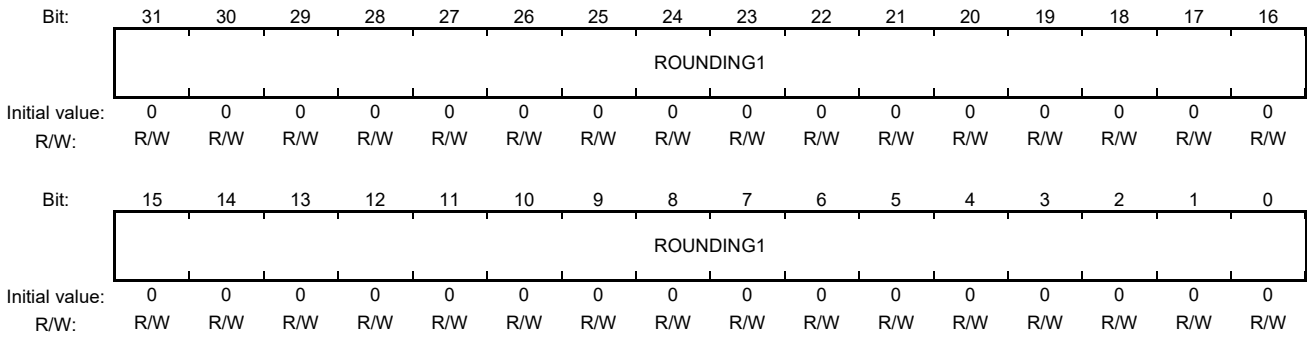
15 to 12	COEFF_SEL_3_3	H'0	R/W	Setting value of coeff_select_table(3,3). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(3,3) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
11 to 8	COEFF_SEL_3_2	H'0	R/W	Setting value of coeff_select_table(3,2). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(3,2) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
7 to 4	COEFF_SEL_3_1	H'0	R/W	Setting value of coeff_select_table(3,1). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(3,1) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output
3 to 0	COEFF_SEL_3_0	H'0	R/W	Setting value of coeff_select_table(3,0). Index of convolution coefficient when pixel coordinate is (x%4,y%4)=(3,0) 0,1,2,3: Uses "Coeff[s]_*_* (s=0,1,2,3)" resigter for convolution coefficient 15: No pixel will be output

54.3.78 ISP RAW Scaler Convolution Rounding0 Register [c](c=0-1)(RAW_SCALER_ROUNDING0_[c])



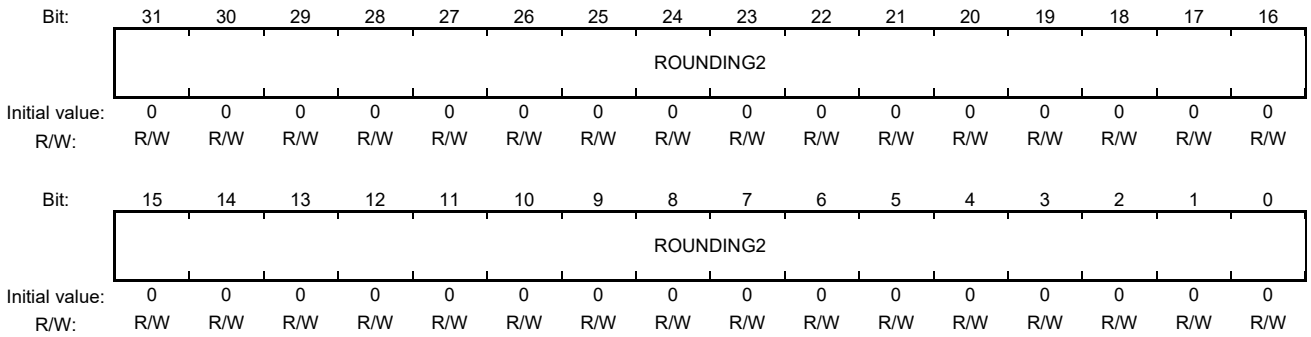
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ROUNDING0	H'0	R/W	Setting value of rounding(0)

54.3.79 ISP RAW Scaler Convolution Rounding1 Register [c](c=0-1)(RAW_SCALER_ROUNDING1_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ROUNDING1	H'0	R/W	Setting value of rounding(1)

54.3.80 ISP RAW Scaler Convolution Rounding2 Register [c](c=0-1)(RAW_SCALER_ROUNDING2_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ROUNDING2	H'0	R/W	Setting value of rounding(2)

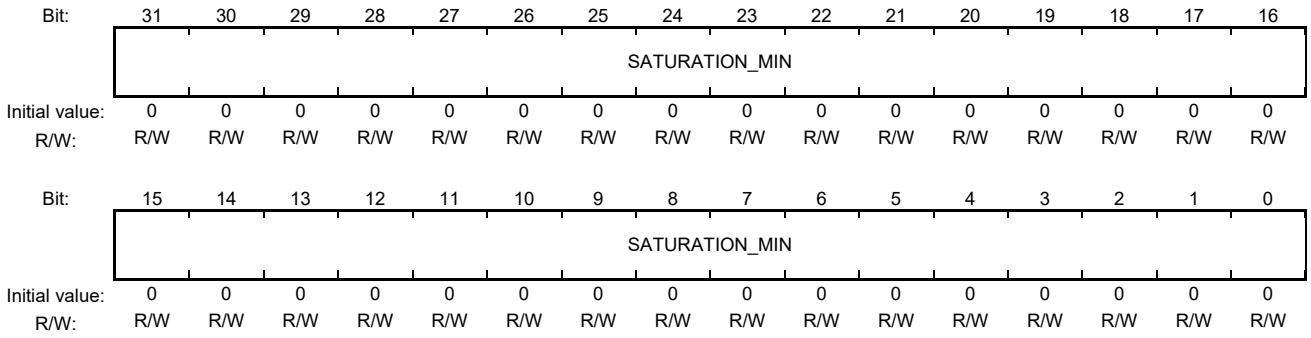
54.3.81 ISP RAW Scaler Convolution Rounding3 Register [c](c=0-1)(RAW_SCALER_ROUNDING3_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ROUNDING3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ROUNDING3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

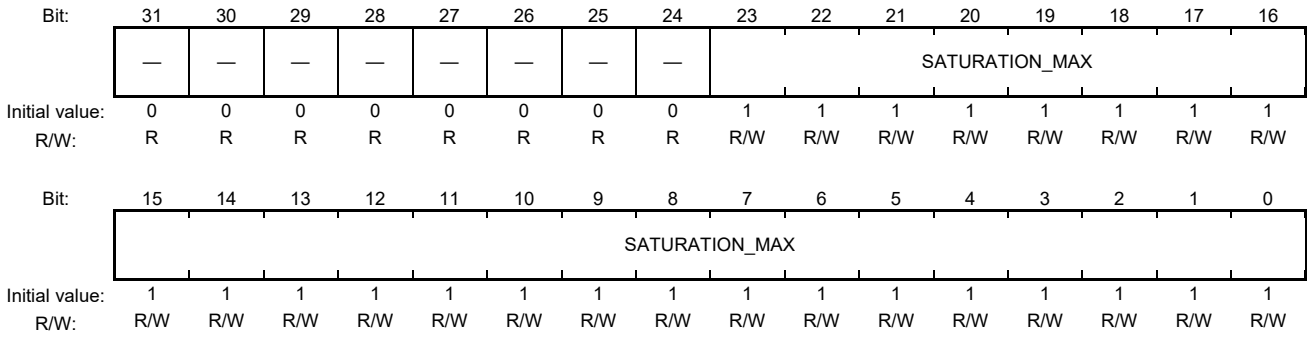
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ROUNDING3	H'0	R/W	Setting value of rounding(3)

54.3.82 ISP RAW Scaler Minimum Saturation Register [c](c=0-1)(RAW_SCALER_SAT_MIN_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SATURATION_MIN	H'0	R/W	Minimum value of saturation operation after convolution

54.3.83 ISP RAW Scaler Maximum Saturation Register [c](c=0-1)(RAW_SCALER_SAT_MAX_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved. (These bits are always read as 0.)
23 to 0	SATURATION_MAX	H'FFFFFF	R/W	Maximum value of saturation operation after convolution

54.3.84 ISP RAW Scaler Final Left Shift Register [c](c=0-1)(RAW_SCALER_SAT_FINAL_LSHIFT_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FINAL_LSHIFT				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved. (These bits are always read as 0.)
4 to 0	FINAL_LSHIFT	H'0	R/W	Left shift amount after convoution

54.3.85 ISP RAW Scaler Convolution Coefficient[e] Register_M2_M2 [c](e=0-3)(c=0-1)(RAW_SCALER_COEFF[e]_M2_M2_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFF_M2_M2

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
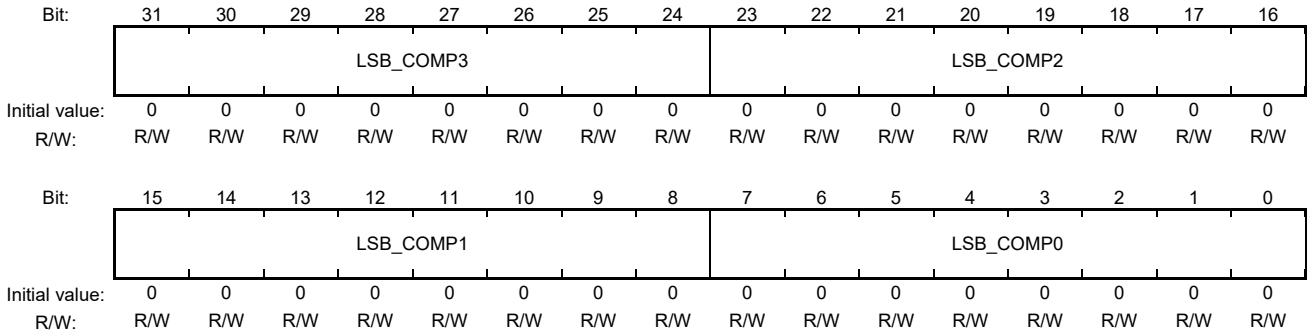
31 to 17	—	All 0	R	Reserved. (These bits are always read as 0.)
16	ENABLE_WUP	H'0	R/W	On/OFF control whether WUP signal is issued in synchronized system with IMR 0 : WUP signal is disabled (Synchoronized system with IMR is not used) 1: WUP signal is enabled
15 to 2	—	All 0	R	Reserved. (These bits are always read as 0.)
1, 0	NUM_OF_COMPONENT_MINUS1	H'0	R/W	Number of components minus 1. For example, in RGB format, there are 3 components (R, G and B), then NUM_OF_COMPONENT_MINUS1 = 2. In YUV422 or YUV420 or LUV420 or LUV420 case, number of components are 2 (Y and UV/LV), therfore NUM_OF_COMPONENT_MINUS1=1.

54.3.111 ISP Core Image[i] Frame[f] Output DMA Pixel LSB Position Register [c](i=0-1)(f=0-3)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FRAME[f]_PIXEL_POSITION_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LSB_COMP3	H'0	R/W	Bit position of LSB bit of pixel in the output image component3
23 to 16	LSB_COMP2	H'0	R/W	Bit position of LSB bit of pixel in the output image component2
15 to 8	LSB_COMP1	H'0	R/W	Bit position of LSB bit of pixel in the output image component1
7 to 0	LSB_COMP0	H'0	R/W	Bit position of LSB bit of pixel in the output image component0

54.3.112 ISP Core Image[i] Frame[f] Output DMA Pixel Bitwidth Register [c](i=0-1)(f=0-3)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FRAME[f]_PIXEL_BITWIDTH_MINUS1_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	BW_MINUS1_COMP3						—	—	BW_MINUS1_COMP2

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

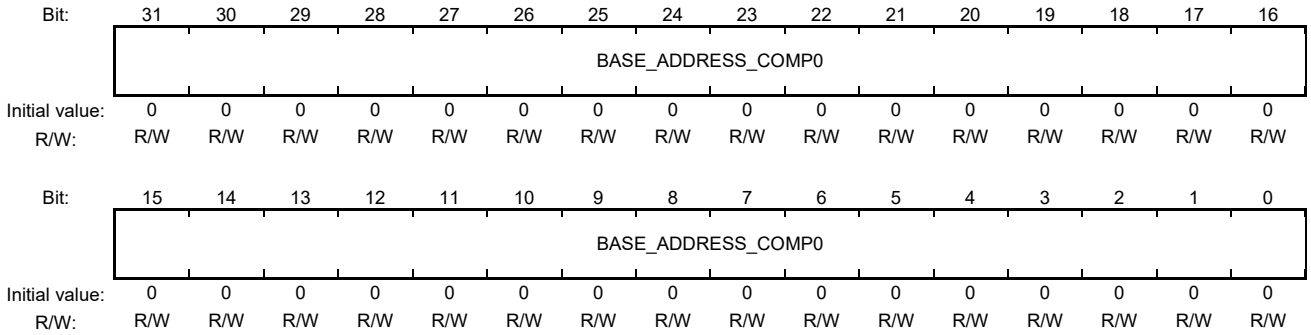
Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved. (These bits are always read as 0.)
29, 28	LINE_EN_COMP3	H'0	R/W	Flags for ON/OFF control of output for each even/odd line of a frame for the output image component 3. This flag is used for chrominance component in case of YUV420 or LUV420. 0 : All lines are not output to AXI 1: Only the even-numbered lines are output to AXI 2: Only the odd-numbered lines are output to AXI. 3 : All lines are output to AXI
27, 26	—	All 0	R	Reserved. (These bits are always read as 0.)
25, 24	BPP_COMP3	H'0	R/W	Bit per pixel of output image component 3 0 : 8bpp, 1: 16bpp, 2: 32bpp, 3: Forbidden
23, 22	—	All 0	R	Reserved. (These bits are always read as 0.)
21, 20	LINE_EN_COMP2	H'0	R/W	Flags for ON/OFF control of output for each even/odd line of a frame for the output image component 2. This flag is used for chrominance component in case of YUV420 or LUV420. 0 : All lines are not output to AXI 1: Only the even-numbered lines are output to AXI 2: Only the odd-numbered lines are output to AXI. 3 : All lines are output to AXI
19, 18	—	All 0	R	Reserved. (These bits are always read as 0.)
17, 16	BPP_COMP2	H'0	R/W	Bit per pixel of output image component 2 0 : 8bpp, 1: 16bpp, 2: 32bpp, 3: Forbidden
15, 14	—	All 0	R	Reserved. (These bits are always read as 0.)
13, 12	LINE_EN_COMP1	H'0	R/W	Flags for ON/OFF control of output for each even/odd line of a frame for the output image component 1. This flag is used for chrominance component in case of YUV420 or LUV420. 0 : All lines are not output to AXI 1: Only the even-numbered lines are output to AXI 2: Only the odd-numbered lines are output to AXI. 3 : All lines are output to AXI
11, 10	—	All 0	R	Reserved. (These bits are always read as 0.)
9, 8	BPP_COMP1	H'0	R/W	Bit per pixel of output image component 1 0 : 8bpp, 1: 16bpp, 2: 32bpp, 3: Forbidden
7, 6	—	All 0	R	Reserved. (These bits are always read as 0.)
5, 4	LINE_EN_COMP0	H'0	R/W	Flags for ON/OFF control of output for each even/odd line of a frame for the output image component 0. This flag is used for chrominance component in case of YUV420 or LUV420. 0 : All lines are not output to AXI 1: Only the even-numbered lines are output to AXI 2: Only the odd-numbered lines are output to AXI. 3 : All lines are output to AXI
3, 2	—	All 0	R	Reserved. (These bits are always read as 0.)

Bit	Bit Name	Initial Value	R/W	Description
1, 0	BPP_COMP0	H'0	R/W	Bit per pixel of output image component 0 0 : 8bpp, 1: 16bpp, 2: 32bpp, 3: Forbidden

54.3.114 ISP Core Image[i] Frame[f] Output DMA Base Address component0 Register [c](i=0-1)(f=0-3)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FRAME[f]_BASE_ADDRESS_COMP0_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_COMP0	H'0	R/W	Start address ot output image component 0

54.3.115 ISP Core Image[i] Frame[f] Output DMA Base Address component1 Register [c](i=0-1)(f=0-3)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FRAME[f]_BASE_ADDRESS_COMP1_[c])

Bit	Bit Name	Initial Value	R/W	Description
31	DMA_ENABLE	H'0	R/W	Enabling image output DMA 0 : Disabled [default] 1: Enabled
30 to 14	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
13 to 8	OUTSTANDING	H'0	R/W	Maximum number of out standing count of AXI write transaction. Minus 1 value is set to this register
7 to 4	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
3 to 0	BURST_LENGTH_MINUS1	H'0	R/W	Burst length of AXI write data transaction. Minus 1 value is set to this register

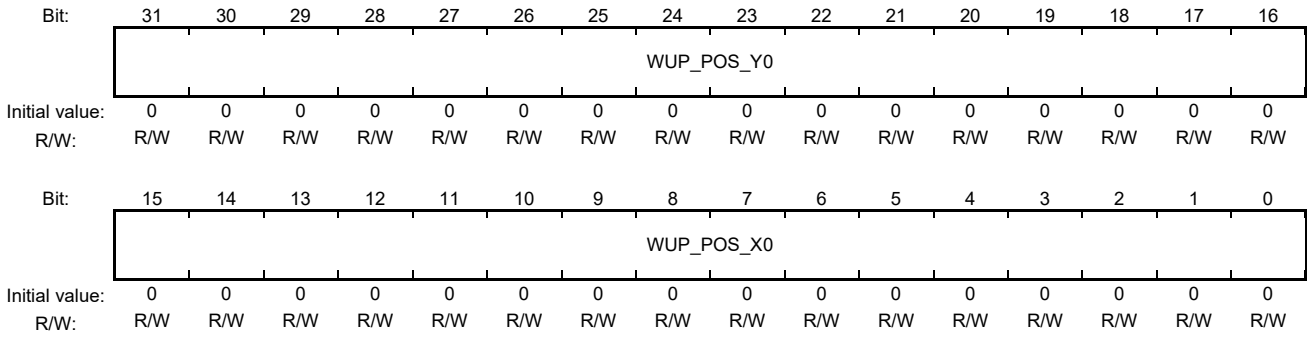
54.3.124 ISP Wakeup Config Register [c](c=0-0)(ISPCORE_WUP_CONFIG_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	WUP_PULSE_LENGTH_MINUS1			—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

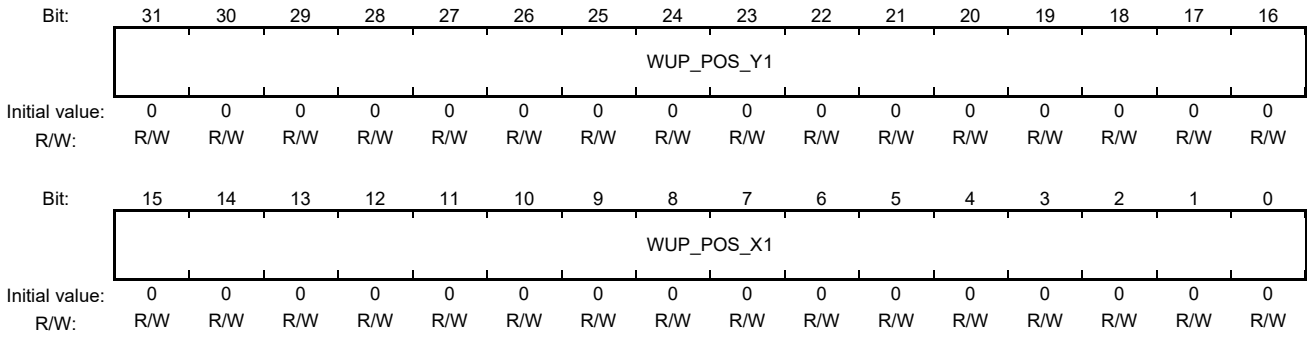
Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
26 to 24	WUP_PULSE_LENGTH_MINUS1	H'0	R/W	Pulse length of WUP signal in synchronized system with IMR
23 to 0	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.

54.3.125 ISP Wakeup Position0 Register [c](c=0-0)(ISPCORE_WUP_POS0_[c])



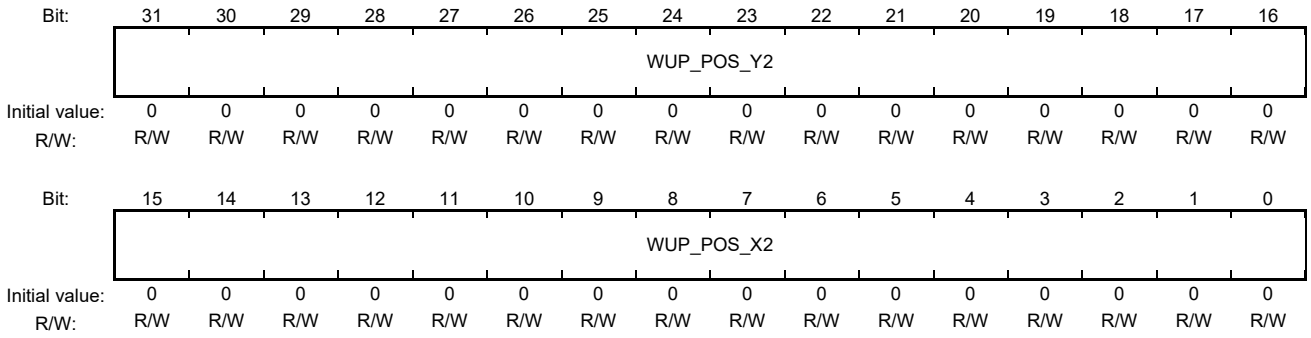
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WUP_POS_Y0	H'0	R/W	Vertical coordinate of pixel which issues the WUP signal
15 to 0	WUP_POS_X0	H'0	R/W	Horizontal coordinate of pixel which issues the WUP signal

54.3.126 ISP Wakeup Position1 Register [c](c=0-0)(ISPCORE_WUP_POS1_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WUP_POS_Y1	H'0	R/W	Vertical coordinate of pixel which issues the WUP signal
15 to 0	WUP_POS_X1	H'0	R/W	Horizontal coordinate of pixel which issues the WUP signal

54.3.127 ISP Wakeup Position2 Register [c](c=0-0)(ISPCORE_WUP_POS2_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WUP_POS_Y2	H'0	R/W	Vertical coordinate of pixel which issues the WUP signal
15 to 0	WUP_POS_X2	H'0	R/W	Horizontal coordinate of pixel which issues the WUP signal

54.3.128 ISP Wakeup Position3 Register [c](c=0-0)(ISPCORE_WUP_POS3_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUP_POS_Y3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WUP_POS_X3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WUP_POS_Y3	H'0	R/W	Vertical coordinate of pixel which issues the WUP signal
15 to 0	WUP_POS_X3	H'0	R/W	Horizontal coordinate of pixel which issues the WUP signal

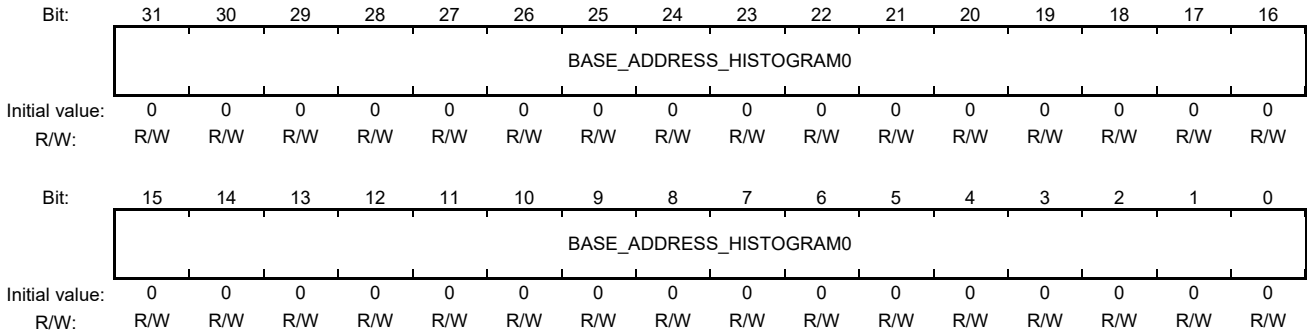
54.3.129 ISP Wakeup Enable Register [c](c=0-0)(ISPCORE_WUP_ENABLE_CHANNELS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	WUP_ENABLE_CHANNELS						—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

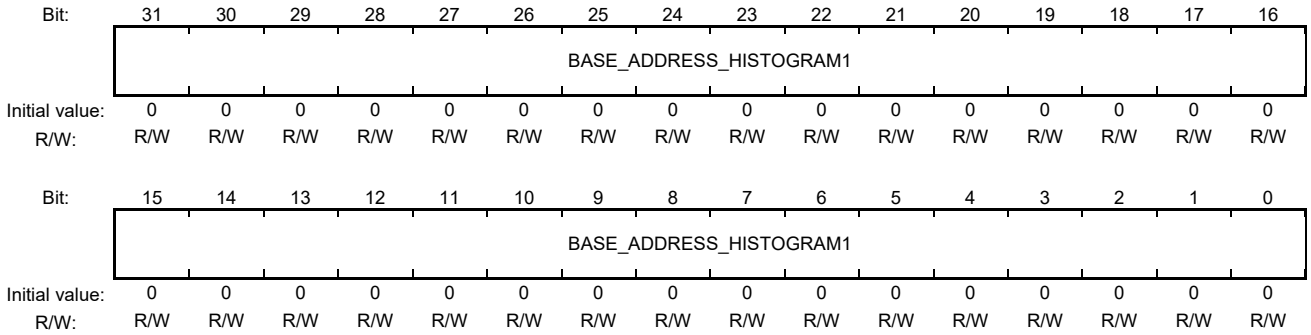
Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
13 to 8	WUP_ENABLE_CHANNELS	H'0	R/W	Enable control register whether IMR channel receives WUP pulse from ISP. Each bit corresponds to each IMR channel.
7 to 0	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.

54.3.130 ISP Core Histogram Output DMA Base Address Frame0 Register [c](c=0-0)(ISPCORE_DMA_HISTOGRAM_BASE_ADDRESS_FRAME0_[c])



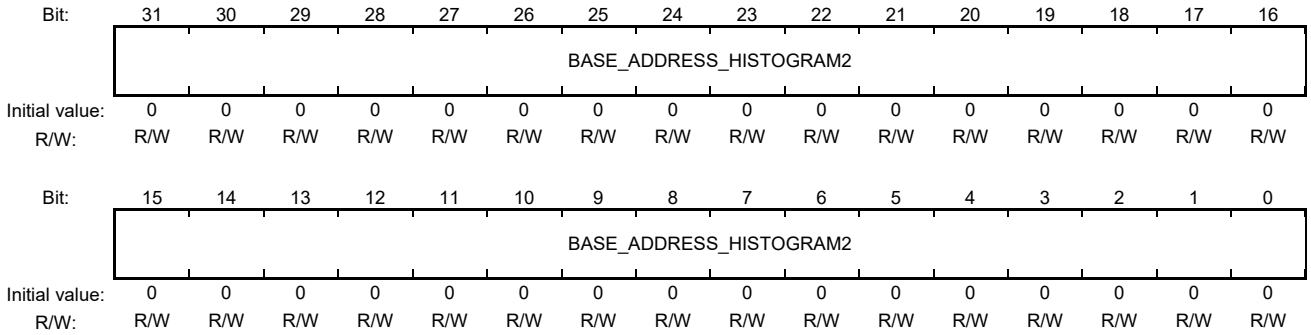
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_HISTOGRAM0	H'0	R/W	Start Address of histogram data(frame 0,4,8...)

54.3.131 ISP Core Histogram Output DMA Base Address Frame1 Register [c](c=0-0)(ISPCORE_DMA_HISTOGRAM_BASE_ADDRESS_FRAME1_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_HISTOGRAM1	H'0	R/W	Start Address of histogram data(frame 1,5,9...)

54.3.132 ISP Core Histogram Output DMA Base Address Frame2 Register [c](c=0-0)(ISPCORE_DMA_HISTOGRAM_BASE_ADDRESS_FRAME2_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_HISTOGRAM2	H'0	R/W	Start Address of histogram data(frame 2,6,10...)

54.3.133 ISP Core Histogram Output DMA Base Address Frame3 Register [c](c=0-0)(ISPCORE_DMA_HISTOGRAM_BASE_ADDRESS_FRAME3_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BASE_ADDRESS_HISTOGRAM3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BASE_ADDRESS_HISTOGRAM3															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

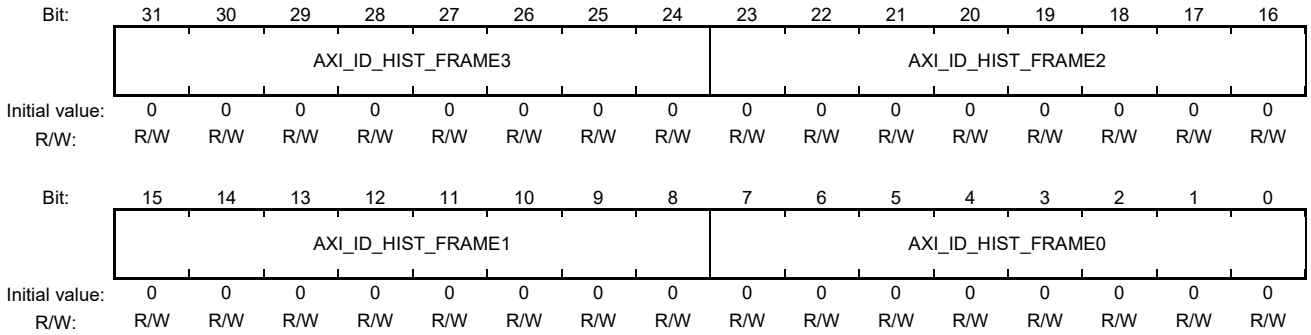
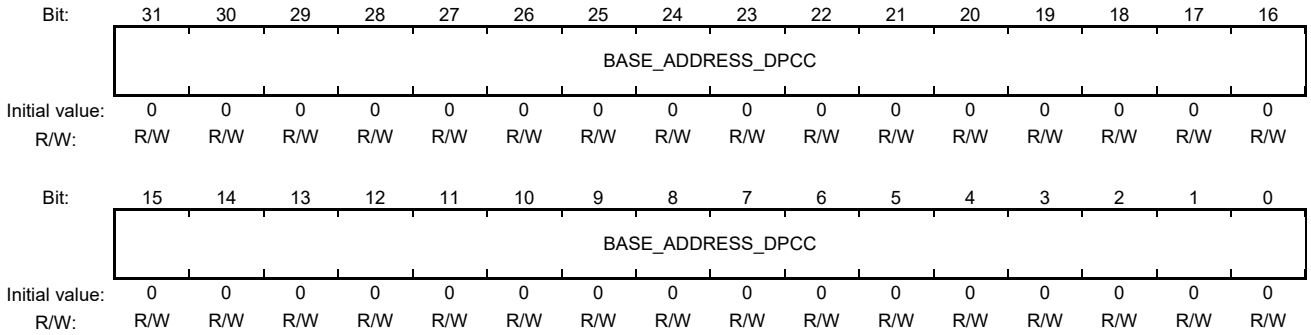
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_HISTOGRAM3	H'0	R/W	Start Address of histogram data(frame 3,7,11...)

54.3.134 ISP Core Histogram Output DMA AXI ID Register [c](c=0-0)(ISPCORE_DMA_HISTOGAM_AXI_ID_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	AXI_ID_HIST_FRAME3	H'0	R/W	AXI transaction ID of histogram data (frame 3,7,11...)
23 to 16	AXI_ID_HIST_FRAME2	H'0	R/W	AXI transaction ID of histogram data (frame 2,6,10...)
15 to 8	AXI_ID_HIST_FRAME1	H'0	R/W	AXI transaction ID of histogram data (frame 1,5,9...)
7 to 0	AXI_ID_HIST_FRAME0	H'0	R/W	AXI transaction ID of histogram data (frame 0,4,8...)

54.3.135 ISP Core Defect Pixel Information[j] Frame[f] DMA Base Address Register [c](j=0-1)(f=0-3)(c=0-0)(ISPCORE_DMA_DPCC[j]_FRAME[f]_BASE_ADDRESS_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BASE_ADDRESS_DPCC	H'0	R/W	Start address of defect pixel information

54.3.136 ISP Core Defect Pixel Information[j] DMA AXI Config Register [c](j=0-1)(c=0-0)(ISPCORE_DMA_DPCC[j]_AXI_CONFIG_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_ENABLE_DPCC	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	BURST_LENGTH_MINUS1_DPCC			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMA_ENABLE_DPCC	H'0	R/W	Enabling defect pixel information DMA 0 : Disabled [default] 1 : Enabled
30 to 4	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
3 to 0	BURST_LENGTH_MINUS1_DPCC	H'0	R/W	Burst length of AXI write data transaction. Minus 1 value is set to this register

54.3.137 ISP Core Interrupt Status [c](c=0-0)(ISPCORE_INT_STATUS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	DPCC_PIXEL_COUNT_OVER_DPCC2	DPCC_PIXEL_COUNT_OVER_DPCC1	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ST0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved. (These bits are always read as 0.)
19	DPCC_PIXEL_COUNT_OVER_DPCC2	H'0	R	Asserted when number of detected defect pixel count is over than upper limitation specified in ISPCORE_DMA_DPCC[1]_PIXEL_COUNT_MAX register
18	DPCC_PIXEL_COUNT_OVER_DPCC1	H'0	R	Asserted when number of detected defect pixel count is over than upper limitation specified in ISPCORE_DMA_DPCC[0]_PIXEL_COUNT_MAX register
17 to 1	—	H'1	R	Reserved
0	ST0	H'0	R	Status of interrupt request signal from ISP core 0 : Interrupt request is not issued from ISP core 1 : Interrupt request is issued from ISP core

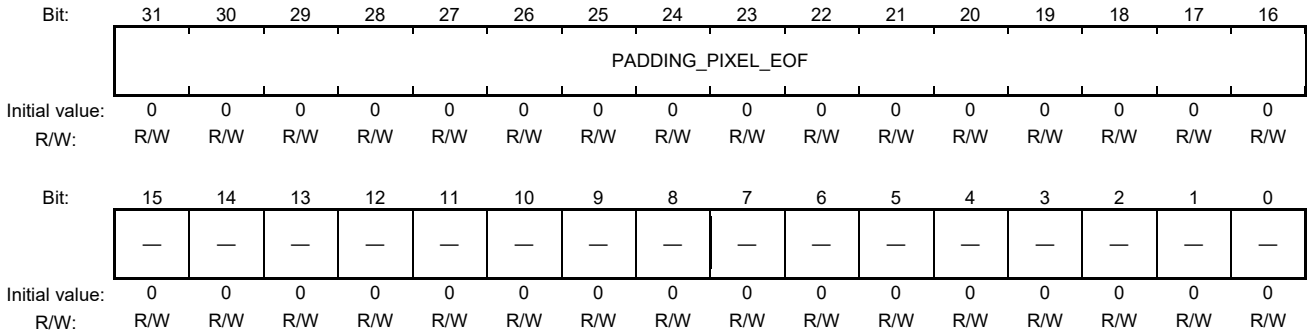
54.3.138 ISP Core Interrupt Enable [c](c=0-0)(ISPCORE_INT_ENABLE_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	DPCC_PIXEL_COUNT_OVER_DPCC2	DPCC_PIXEL_COUNT_OVER_DPCC1	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved. (These bits are always read as 0.)
19	DPCC_PIXEL_COUNT_OVER_DPCC2	H'0	R/W	Interrupt enable of ISPCORE_INT_STATUS[19]
18	DPCC_PIXEL_COUNT_OVER_DPCC1	H'0	R/W	Interrupt enable of ISPCORE_INT_STATUS[18]
17 to 1	—	All 0	R	Reserved. (These bits are always read as 0.)
0	EN0	H'0	R/W	Enable bit of interrupt request signal output from ISP core. 0 : Interrupt is not notified to INTC [default] 1: Interrupt is notified to INTC

54.3.139 ISP Core Image[i] Output DMA Flushing Out Register [c](i=0-1)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FLUSH_OUT_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PADDING_PIXEL_EOF	H'0	R/W	Number of pixels to be appended in the end of frame for flushing out the remained data of ISP output image in DMA pipeline.
15 to 0	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.

54.3.140 ISP Core Back Pressure Setting [c](c=0-0)(ISPCORE_BACK_PRESSURE_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	BP_THRESHOLD				—	—	—	—	—	—	—	BP_STOP_MODE
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
11 to 8	BP_THRESHOLD	H'1	R/W	Watermak level of stopping threshold for back pressure stopping.
7 to 1	—	H'0	R/W	Reserved bits. Do not write any different value from its initial value.
0	BP_STOP_MODE	H'1	R/W	Back pressure stopping mode. 0: Back pressure stopping is disabled. 1: Back pressure stopping is enabled(default)

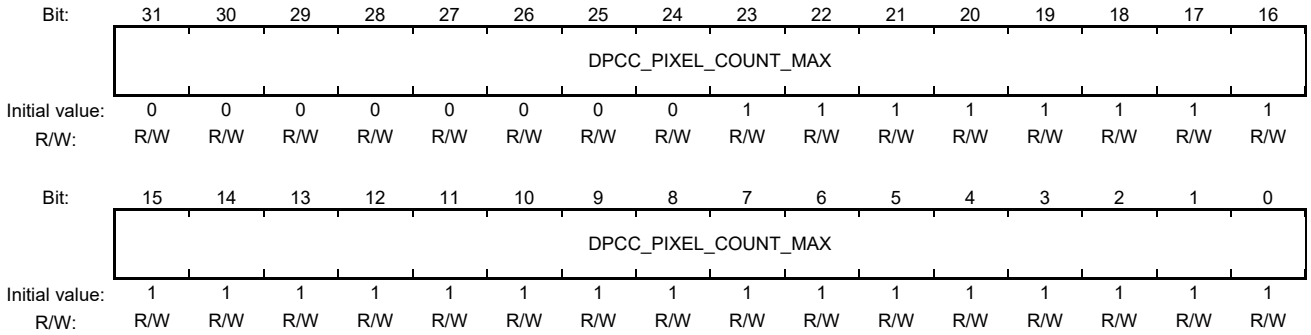
54.3.141 ISP Core Defect Pixel Information[j]. Monitor of the number of detected defect pixel count in previous frame [c](j=0-1)(c=0-0)(ISPCORE_DMA_DPCC[j]_PIXEL_COUNT_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPCC_PIXEL_COUNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DPCC_PIXEL_COUNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DPCC_PIXEL_COUNT	H'0	R	Monitor of the number of detected defect pixel count in previous frame. This value includes the number of one word of the end code (H'FFFFFFFF)

54.3.142 ISP Core Defect Pixel Information[j]. Upper limit of number of defect pixel count [c](j=0-1)(c=0-0)(ISPCORE_DMA_DPCC[j]_PIXEL_COUNT_MAX_[c])



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DPCC_PIXEL_COUNT_MAX	H'FFFFFFF	R/W	Upper limit of number of defect pixel count

54.3.143 Status of Defect Pixel Information[j] DMA [c](j=0-1)(c=0-0)(ISPCORE_DMA_DPCC[j]_STATUS_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPCC_COUNT_OVER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. (These bits are always read as 0.)
16	DPCC_COUNT_OVER	H'0	R/W	Asserted when number of detected defect pixel count is over than upper limitation specified in ISPCORE_DMA_DPCC[j]_PIXEL_COUNT_MAX register. By writing 0 to this register the status bit ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCC[j-1] is cleared.
15 to 0	—	All 0	R	Reserved. (These bits are always read as 0.)

54.3.144 ISP Core Image[i] Frame Monitor Register [c](i=0-1)(c=0-0)(ISPCORE_DMA_IMAGE[i]_FRAME_MONITOR_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FRAME_COUNT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved. (These bits are always read as 0.)
3 to 0	FRAME_COUNT	H'0	R	Frame count value. Incremented at frame by frame. Wrap around to H'0 after H'F

54.3.145 ISP Core Defect Pixel Information[j] DMA Flushing Out Register [c](j=0-1)(c=0-0)(ISPCORE_DMA_DPCC[j]_FLUSH_OUT_[c])

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPCC_PADDING_EOF															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DPCC_PADDING_EOF	H'0	R/W	Number of words to be appended in the end of frame for flushing out the remained data of defect pixel information.
15 to 0	—	All 0	R	Reserved. (These bits are always read as 0.)

54.4 Operation

54.4.1 Configuration (ISP Core)

Please refer to the hardware manual of ISP core.

54.4.2 Configuration (ISP Interface/Channel Selector)

Register setting for Pixel Reconstructor and Channel Selector is needed to make a though pass from CSI input to the ISP core. This section shows reference register setting for each recommended sensor.

54.4.2.1 Architecture of Channel Selector

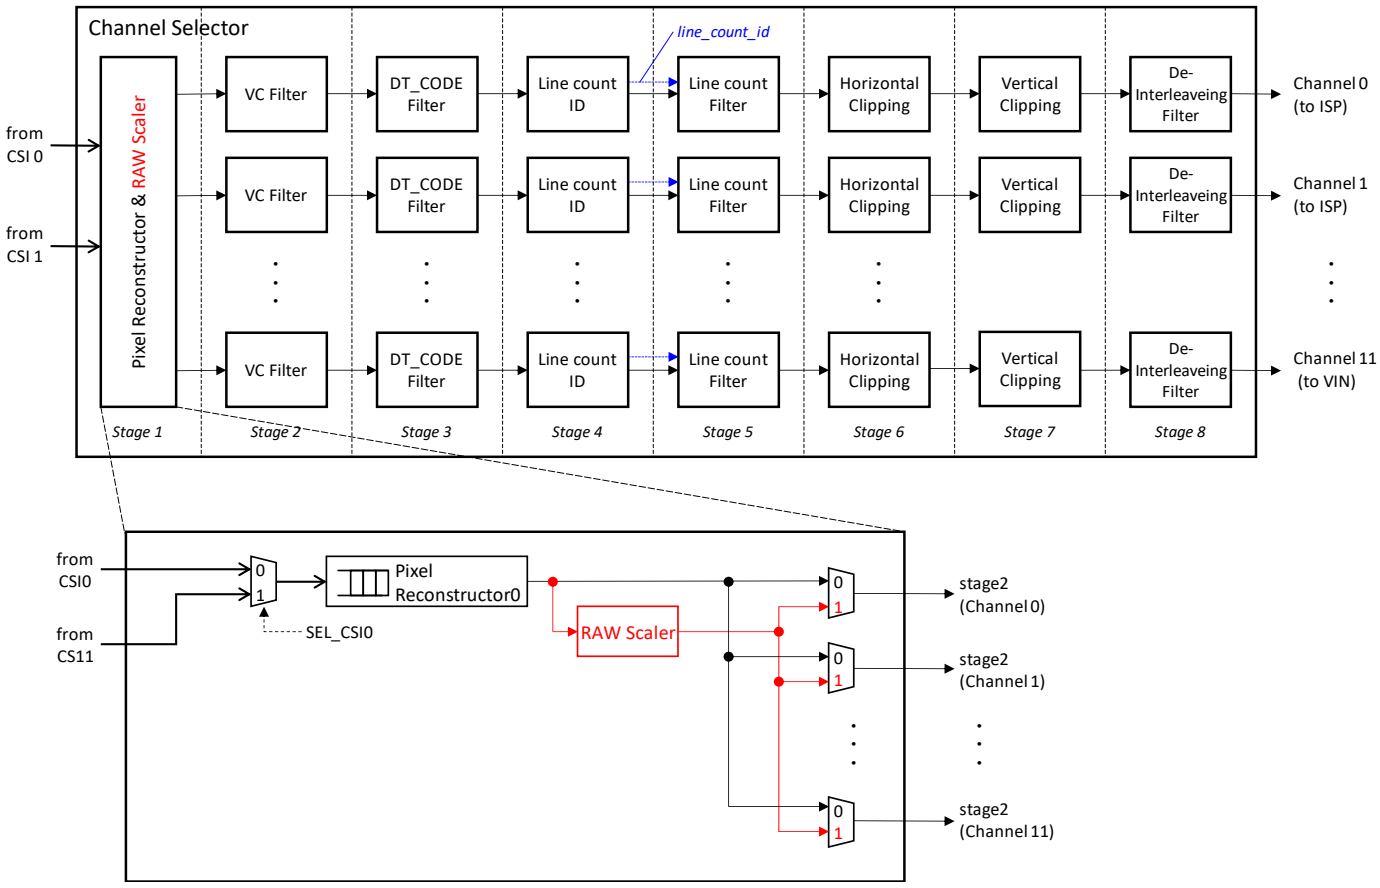


Figure 54.5 Architecture of the Channel selector

1. Stage 1: Pixel reconstructor

(a) Operations for MIPI CSI-2 based data types

In this stage, packed pixel coming from CSI2 is converted to “1 pixel per clock format”. The incoming pixel is packed according to the specification of MIPI CSI-2 standard. Pixel Reconstructor decodes this packed pixel, and converts it to the 1 pixel per one cycle format (This process is called as “pixel unpacking”). Pixel reconstructor has one FIFO (CSI FIFO) for pixel unpacking. If CSI FIFO overflows then FIFO_FULL_CSI_INPUT interrupt is asserted and it is reflected to the ISPINT_STATUS register.

There are several modes of the pixel unpacking shown in Table 54.1. Setting value from 0 to 6 is RAW format, and 7 is embedded data (EMB8). Setting value from 10 to 15 is YUV format. Setting value 20 and 21 is RGB format. Setting value from 56 to 63 is custom format. In this case, unpacking rule is specified by LUT (detail is shown in 54.4.2.3) .

Table 54.1 Meanings of PROC_MODE_VCn register

Setting Value	Meanings
0	RAW8
1	RAW10
2	RAW12
3	RAW14
4	RAW16
5	RAW20
6	RAW24
7	EMB8
10	YUV420 8-bit
11	YUV420 10-bit
12	YUV422 8-bit
13	YUV422 10-bit
14	YUV422 12-bit
15	YUV422 Y12-bit, UV 8-bit
20	RGB565
21	RGB888
56~63	Custom format for LUT based pixel reconstructor
other	Forbidden

Decision of unpacking mode is based on ISPPROCMODE*n* (*n*=0~63) register. The index *n* is the 6-bit value called as "data_type" or "DT_code" in the MIPI CSI standard, which is stored in the packet header of incoming CSI-2 long packet. Its concrete decision flow as shown as below.

switch (*vc_number %4*) {
  case 0 : *proc_mode* = reg_ISPPROCMODE_DT*n*.PROC_MODE_VC0; break;
  case 1 : *proc_mode* = reg_ISPPROCMODE_DT*n*.PROC_MODE_VC1 ; break;
  case 2 : *proc_mode* = reg_ISPPROCMODE_DT*n*.PROC_MODE_VC2; break;
  case 3 : *proc_mode* = reg_ISPPROCMODE_DT*n*.PROC_MODE_VC3; break;
}

switch (*proc_mode*) {
  0 : Incoming CSI-2 pixel is unpacked by RAW8 format.
  1 : Incoming CSI-2 pixel is unpacked by RAW10 format.
  2 : Incoming CSI-2 pixel is unpacked by RAW12 format.
  3 : Incoming CSI-2 pixel is unpacked by RAW14 format.
  4 : Incoming CSI-2 pixel is unpacked by RAW16 format.
  5 : Incoming CSI-2 pixel is unpacked by RAW20 format.
  6 : Incoming CSI-2 pixel is unpacked by RAW24 format.
  7 : Incoming CSI-2 pixel is unpacked by EMB8 format.
 10: Incoming CSI-s pixel is unpacked by YUV420 8-bit
 11: Incoming CSI-s pixel is unpacked by YUV420 10-bit
 12: Incoming CSI-s pixel is unpacked by YUV422 8-bit
 13: Incoming CSI-s pixel is unpacked by YUV422 10-bit
 14: Incoming CSI-s pixel is unpacked by YUV422 12-bit
 15: Incoming CSI-s pixel is unpacked by YUV422 Y 12-bit, UV 8-bit
 20: Incoming CSI-s pixel is unpacked by RGB565
 21: Incoming CSI-s pixel is unpacked by RGB888
 56~63: Incoming CSI-s pixel is unpacked by YUV420 10-bit
 default : Incoming CSI-2 pixel is discarded (No output)
}

[Defines of variables]
- reg_ISPPROCMODE_DTn : Value of ISPPROCMODE_DT*n*.VC*m*(*n*=0~63, *m*=0~3)
- *vc_number* : Virtual channel of the input CSI packet

Example of ISPPROCMODE_DT*n* registers is shown in Table 54.2

Table 54.2 Example of ISPPROCMODE register.

Virtual Channel	DT_code	Format	Register setting
VC0	H'12	EMB8	ISPPROCMODE_DT18.VC0 = 7 (EMB8)
VC0	H'2C	RAW12	ISPPROCMODE_DT44.VC0 = 2 (RAW12)
VC0	H'2F	RAW20	ISPPROCMODE_DT47.VC0 = 5 (RAW20)
VC1	H'2D	RAW14	ISPPROCMODE_DT45.VC1 = 3 (RAW14)
VC1	H'34	RAW10	ISPPROCMODE_DT52.VC1 = 1 (RAW10)
VC1	H'35	RAW10	ISPPROCMODE_DT53.VC1 = 1 (RAW10)
VC2	H'2B	RAW16	ISPPROCMODE_DT43.VC2 = 4 (RAW16)
VC2	H'2C	RAW12	ISPPROCMODE_DT44.VC2 = 2 (RAW12)
VC3	H'2B	RAW8	ISPPROCMODE_DT43.VC3 = 0 (RAW8)

(b) Operations for custom data types (LUT based pixel reconstructor)

By setting pixel format as 0x30～0x3F, custom data types. Custom data type is set by using ISPPROC_CUSTOM_FORMAT_LUT0_* register (LUT register for custom data types) and ISPCS_DI_FILTER_LUT* register (de-interleaving control register). See the 54.4.2.3 for detail

2. Stage 2: VC filter

In this stage, filtering using virtual channel as identifier is performed. [d] means the index of channels (d=0~11).

- Related register
  - ISPCS_FILTER_ID_CH[d].VC_EN (d=0~11)
- Filtering operation: Following process flow is performed for each long packet.

```
if (reg_VC_EN[vc_number] == 1) {
    Passed
} else {
    Discarded
}

[Defines of variables]
・ reg_VC_EN : Value of ISPCS_FILTER_ID_CH[d] register
・ vc_number : Virtual channel of the input CSI packet
```

3. Stage 3: DT code filter

In this stage, filtering using incoming dt_code is performed.

- Related register
  - ISPCS_ DT_CODE03_CH[d].DT_CODE*m* (*d*=0~11, *m*=0~3)
  - ISPCS_ DT_CODE47_CH[d].DT_CODE*m* (*d*=0~11, *m*=4~7)
  - ISPCS_DT_CODE03_CH[d].ENABLE*m* (*d*=0~11, *m*=0~3)
  - ISPCS_DT_CODE47_CH[d].ENABLE*m* (*d*=0~11, *m*=4~7)

- Processing description: Following process flow is performed for each CSI-2 long packet.

```
if ( (reg_ENABLE0==1 && reg_DT_CODE0==dt_code ) || (reg_ENABLE0==1 && reg_DT_CODE1==dt_code) ||
     (reg_ENABLE2==1 && reg_DT_CODE2==dt_code ) || (reg_ENABLE3==1 && reg_DT_CODE3==dt_code) ||
     (reg_ENABLE4==1 && reg_DT_CODE4==dt_code ) || (reg_ENABLE5==1 && reg_DT_CODE5==dt_code) ||
     (reg_ENABLE6==1 && reg_DT_CODE6==dt_code ) || (reg_ENABLE7==1 && reg_DT_CODE7==dt_code) )
{
     Passed
} else {
     Discarded
}
```

[Defines of variables]
- reg_DT_CODE*m* (*m*=0~3) : Value of ISPCS_DT_CODE03_CH[d].DT_CODE*m*
- reg_DT_CODE*m* (*m*=4~7) : Value of ISPCS_DT_CODE47_CH[d].DT_CODE*m*
- reg_ENABLE*m* (*m*=0~3) : Value of ISPCS_DT_CODE03_CH[d].ENABLE*m*
- reg_ENABLE*m* (*m*=4~7) : Value of ISPCS_DT_CODE47_CH[d].ENABLE*m*
- *dt_code* : Value of the “Data Type” code of input CSI packet

4. Stage 4: Line count ID

In this stage, the “Line count ID” is added to for each line in one frame by counting number of long packet of incoming CSI input.

- Related registers
  - ISPCS_LC_MODULO_CH[d]. MODULO_MINUS1_VC*n* (*d*=0~11, *n*=0~15)
  - ISPCS_DT_CODE03_CH[d].HOLD*m* (*d*=0~11, *m*=0~3)
  - ISPCS_DT_CODE47_CH[d].HOLD*m* (*d*=0~11, *m*=4~7)
- Processing description: Following process flow is performed for each CSI-2 long packet.

```
n = vc_number;
modulo_minus1= reg_MODULO_MINUS1_VCn;

if ( dt_code == H’00 ) {      // FS packet at the start of one frame
       line_count(vc_number) = 0 ;
}

line_count_id = line_count(vc_number) % (modulo_minus1 + 1);

if (reg_HOLDk ==0) {
     line_count(vc_number)++ ;
}
```

[Defines of variables]
- reg_MODULO_MINUS1_VC*n* (*n*=0~15): Value of ISPCS_ MODULO_CH[d].MODULO_MINUS1_VC*n*
- reg_HOLD*k* (*k*=0~3) : Value of ISPCS_DT_CODE03_CH[d]. HOLD*k*
- reg_HOLD*k* (*k*=4~7) : Value of ISPCS_DT_CODE47_CH[d]. HOLD*k*
- *vc_number* : Virtual channel of the input CSI packet
- *dt_code* : Value of the “Data Type” code of input CSI packet
- *line_count(vc_number)* : Value of line count for each virtual channel.
- *line_count_id* : Line count ID (output of this stage)

5. Stage 5: Line count filter

In this stage, filtering using the “Line count ID” obtained at stage 3 as identifier is performed.

- Related registers
  - ISPCS_FILTER_ID_CH[d].LC_FILTER_ID (d=0~11)
  - ISPCS_DT_CODE03_CH[d].DT_CODE*m* (d=0~11, *m*=0~3)
  - ISPCS_DT_CODE47_CH[d].DT_CODE*m* (d=0~11, *m*=4~7)
  - ISPCS_DT_CODE03_CH[d].ENABLE*m* (*n*=0~11, *m*=0~3)
  - ISPCS_DT_CODE47_CH[d].ENABLE*m* (*n*=0~11, *m*=4~7)
- Processing description: Following process flow is performed for each CSI-2 long packet.

```
switch (dt_code) {
   case reg_DT_CODE0: k = 0; break;
   case reg_DT_CODE1: k = 1; break;
   case reg_DT_CODE2: k = 2; break;
   case reg_DT_CODE3: k = 3; break;
   case reg_DT_CODE4: k = 4; break;
   case reg_DT_CODE5: k = 5; break;
   case reg_DT_CODE6: k = 6; break;
   case reg_DT_CODE7: k = 7; break;
   default: Not happen because of DT code filter operation at stage 3
}

if ( reg_LC_FILTER_ID == line_count_id(vc_number)  && reg_ENABLEk == 1) {
     Passed
} else {
     Discarded
}

[Defines of variables]
・   reg_LC_FILTER_ID       : Value of ISPCS_FILTER_ID CH[d].LC_FILTER_ID
・   reg_DT_CODEm  (m=0~3) :  Value of ISPCS_DT_CODE03_CH[d].DT_CODEm
・   reg_DT_CODEm  (m=4~7) :  Value of ISPCS_DT_CODE47_CH[d].DT_CODEm
・   reg_ENABLEk  (k=0~3) :  Value of ISPCS_DT_CODE03_CH[d].ENABLEk
・   reg_ENABLEk  (k=4~7) :  Value of ISPCS_DT_CODE47_CH[d].ENABLEk
・   vc_number : Virtual channel of the input CSI packet
・   line_count_id : Value of the line count id added at the stage 3
```

6. Stage 6: Horizontal clipping

In this stage, pixel based clipping in one line is executed. Clipping operation is performed in accordance with the following registers. Index ‘*m*’ is decided by comparing DT_code in incoming CSI packet with ISPCS_DT_CODE03_CH[d].DT_CODE*m*.

- Related registers
  - ISPCS_DT_CODE03_CH[d].DT_CODE*m* (d=0~11, *m*=0~3)
  - ISPCS_H_CLIP_DT_CODE[*h*]_CH[d].APPENDED_PIXEL (*h*=0~3, d=0~11)

- ISPCS_H_CLIP_DT_CODE[*h*]_CH[d].PREPENDED_PIXEL (*h*=0~3, *d*=0~11)

- Processing description: Following process flow is executed for each pixel.

```
switch (dt_code ) {
   case reg_DT_CODE0 : h  = 0; break;
   case reg_DT_CODE1 : h  = 1; break;
   case reg_DT_CODE2 : h  = 2; break;
   case reg_DT_CODE3 : h  = 3; break;
   default : v  = -1; break;
}

if (h < 0) {
    Passed
} else {
    app_pixel = reg_APPENDED_PIXELh ;
    prep_pixel = reg_PREPENDED_PIXELh ;

    if (pixel_count >= app_pixel  && pixel_count < prep_pixel ) {
        Current pixel is passed
    } else {
        Current pixel is discarded
    }
}

pixel_count ++;
```

[Defines of variables]
- reg_DT_CODE*m* : Value of ISPCS_DT_CODE03_CH[d].DT_CODE*m*
- reg_APPENDED_PIXEL*h* : Value of ISPCS_H_CLIP_DT_CODE[*h*]_CH[d].APPENDED_PIXEL
- reg_PREPENDED_PIXEL*h* : Value of ISPCS_H_CLIP_DT_CODE[*h*]_CH[d].PREPENDED_PIXEL
- *dt_code* : Value of the “Data Type” code of input CSI packet

Example of setting value of APPENDED_PIXEL and PREPENDED_PIXEL is shown in the Figure 54.6

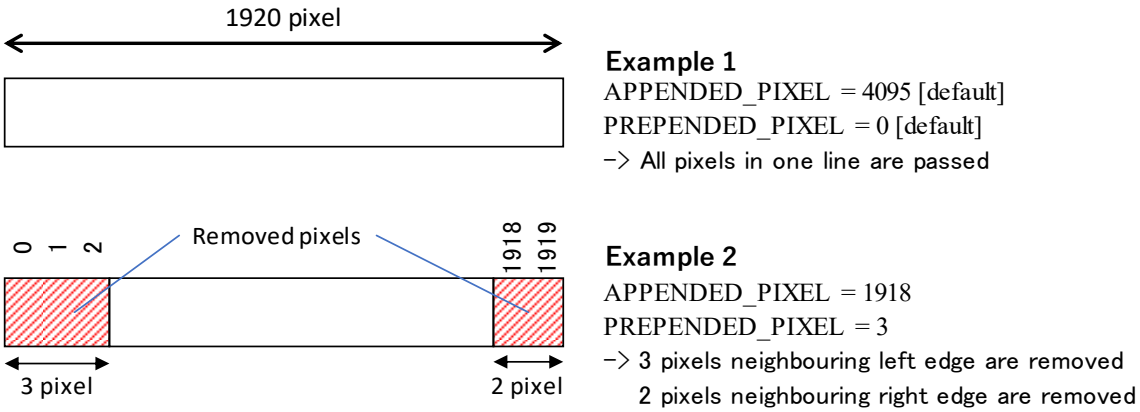

Figure 54.6 Example of horizontal clipping

7. Stage 7: Vertical clipping

In this stage, line clipping is executed. Clipping operation is performed in accordance with the following register. Index '*m*' is decided by comparing the input DT_code with ISPCS_DT_CODE03_CH[d].DT_CODE*m*.

- Related registers
  - ISPCS_DT_CODE03_CH[d].DT_CODE*m* (*d*=0~11, *m*=0~3)
  - ISPCS_ V_CLIP_DT_CODE[*v*]_CH[d].APPENDED_LINE (*v*=0~3, *n*=0~11)
  - ISPCS_ V_CLIP_DT_CODE[*v*]_CH[d].PREPENDDED_LINE (*v*=0~3, *n*=0~11)
- Processing description: Following processing is executed for each CSI-2 long packet.

```
if ( dt_code == 'H00 ) {      // FS packet at the start of one frame
        line_count = 0 ;
}

switch (dt_code ) {
   case reg_DT_CODE0 : v  = 0; break;
   case reg_DT_CODE1 : v  = 1; break;
   case reg_DT_CODE2 : v  = 2; break;
   case reg_DT_CODE3 : v  = 3; break;
   default : v  = -1; break;
}

if (v  < 0) {
    Passed
} else {
    app_line = reg_APPENDED_LINEv  ;
    prep_line = reg_PREPENDED_LINEv  ;

    if (line_count >= app_line = && line_count < prep_line ) {
        Current line is passed
    else {
        Current line is discarded
    }
}

line_count ++;
```

[Defines of variables]
- reg_DT_CODE*m* : Value of ISPCS_DT_CODE03_CH[d].DT_CODE*m*
- reg_APPENDED_LINE*v* : Value of ISPCS_V_CLIP_DT_CODE[*v*]_CH[d].APPENDED_LINE
- reg_PREPENDED_LINE*v* : Value of ISPCS_V_CLIP_DT_CODE[*v*]_CH[d].PREPENDED_LINE
- *dt_code* : Value of the "Data Type" code of input CSI packet

Example of setting value of APPENDED_PIXEL and PREPENDED_PIXEL are shown in the Figure 54.7.

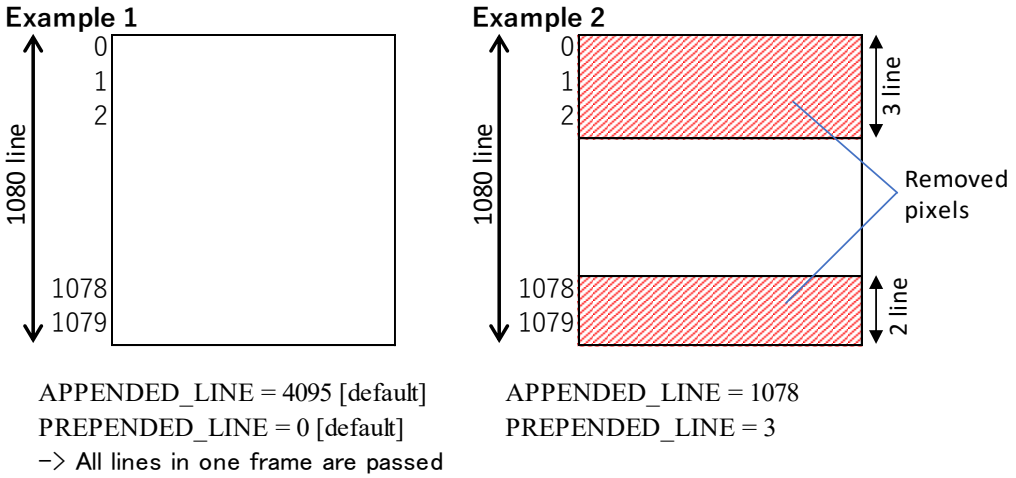

Figure 54.7 Example of vertical clipping

8. Stage 8: De-interleaving filter

In this stage, pixel-by-pixel filtering in one line is executed. DI_FILTER_LUT register is a configuration register to specify pass or drop for each pixel.

- Related registers
  - ISPCS_DI_FILTER_CTRL_CH[d].CPLX(*n*=0~11)
  - ISPCS_DI_FILTER_CTRL_CH[d].LUT_LENGTH_MINUS1 (*n*=0~11)
  - ISPCS_DI_FILTER_LUT[p]_CH[d].DI_FILTER_LUT (*p*=0~15, *d*=0~11)

```
di_filter_length = reg_DI_FILTER_LENGTH_MINUS1 + 1;
di_pixel_count = pixel_count >> reg_CPLX;

p = ( di_pixel_count % di_filter_length ) / 32;
k = ( di_pixel_count % di_filter_length ) % 32;

if ( reg_DI_FILTER_LUT(p,k)==1) {
   Current pixel is passed
}
else {
   Current pixel is discarded
}

pixel_count++;
```

[Defines of variables]
- *pixel_count* : Pixel count of one line after horizontal clipped (Left edge pixel is numbered as 0).
- reg_CPLX : Value of ISPCS_DI_FILTER_CTRL_CH[d].CPLX register
- reg_DI_FILTER_LENGTH_MINUS1 : Value of ISPCS_DI_FILTER_CTRL_CH[d].LUT_LENGTH_MINUS1 registeter
- reg_DI_FILTER_LUT(*p,k*): Value of k-th bit of ISPCS_DI_FILTER_CTRL_LUT[p]_CH[d].DI_FILTER_LUT register

9. RAW Scaler

RAW scaler block is newly added between Pixel Reconstructor (stage1) and VC filter (stage2).

RAW scaler scales incoming RAW image in RAW domain. Scaled ratio is only both 1 or 1/2 horizontal size and 1 or 1/2 vertical size. Horizontal only scaling or vertical only are not supported. Scale factor other than 1/2 is not supported.

Pixel value of RAW scaled image is calculated by linear convolution operation. Sliding window size is 5x5, and convolution coefficient is fixed, and is set by register. There are up to 4 sets of 5x5 convolution coefficients.

Switching of sets of convolution coeffient is done by co-ordinate of input pixel. Typically in RGGB Bayer array, R is located at (x%2,y%2) = (0,0) locatoin, where ((x,y) is co-ordinate of input RAW image, G is located at (x%2, y%2)=(0,1) and (1,0) location, B is located at (x%2,y%2) = (0,0) locatoin. So, user shjuld set 3 sets (R,G,B) of coefficient values to the register in advance. After that, while RAW scaling is running, if current RAW pixel is R, then coefficient set for R pixel is selected. Similarlly, if current RAW pixel is G, then coefficient set for G is selected.

Each channel can select independently either direct connection path (bypassed path) from Pixel Reconstructor or RAW scaled path by setting ISPCS_FILTER_ID.SEL_RAW_SCALED register.

If ISPCS_FILTER_ID.SEL_RAW_SCALED==0, then the bypassed path is selected (default). This means that RAW scaler is not enabled at this channel.

If ISPCS_FILTER_ID.SEL_RAW_SCALED==1, then RAW scaled image is selected. This means that RAW scaler is available at this channel.

54.4.2.2 Example of configuration

1. Example 1: Single sensor, single exposure

In this example, image sensor transfers one long packet per one line with RAW20 or RAW12 format, its *dt_code* is H'2F(RAW20) or H'2C(RAW12) respectively. At the first of frame, the "Front Embedded Data" is transferred. Continuously, Ignored OB packets and Vertical OB packets are transferred.

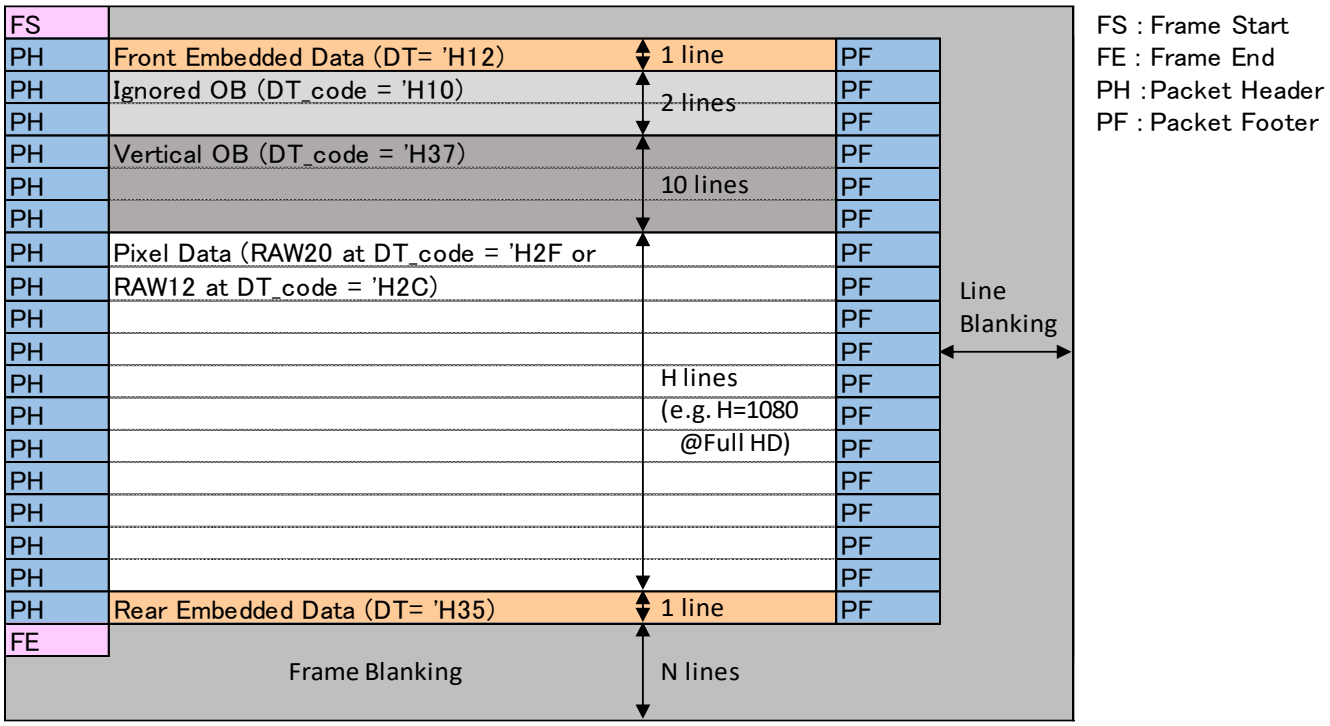

Figure 54.8 Frame structure of example 1

Register configuration of the Pixel Reconstructor and Channel Selector according to the frame structure in Figure 54.8 is shown in Table 54.3. Transferred data on each channel is shown in the Table 54.4

Regarding DT filter setting, up to eight different DT CODE can be set. The first 4 DT CODE values are set in the ISPCS_DT_CODE03_CH[d] (d=0~11) register. The second 4 DT CODE values are set in the ISPCS_DT_CODE47_CH[d] (d=0~11) register. In the following description, the bit fields in which these DT CODE values are set will be referred to as 'slot' or 'Filter slot m (m=0~7)', etc.

At the ISPCS_ DT_CODE03_CH[0] register, DT_CODE0 = H'2C is set as "Filter slot 0" to pass the incoming RAW12 pixel, and DT_CODE1 = H'2F is set as "Filter slot 1" to pass the incoming RAW20 pixel. By this configuration, any cases of either RAW12 case or RAW20 case can be passed by one configuration.

In this example, embedded data (meta data) transfer is also enabled. Incoming pixel data (DT_code = H'2C or H'2F) is transferred on the Channel 0 to the ISP core The Front Embedded Data and Rear Embedded Data are transferred on the Channel 5 to DRAM via VIN. Ignored OB and Vertical OB are discarded.

Table 54.3 Register setting for the example 1

Register Name	Offset	Value	Remarks
ISPPROCMODE_DT[18]	H'0000_1148	H'0000_0007	Front embedded data is processed as EMB8

ISPINPUTSEL0	H0000_0008	H'0000_0000	Default value
ISPSTART	H0000_0014	H'0000_FFFF	ISP processing start.

Table 54.4 Transferred data for each channel (Example 1)

Channel	Transferred data
Channel 0	Pixel data (RAW20 *dt_code*=H'2F or RAW12 *dt_code*=H'2C) for ISP processing
Channel 1~4	(nothing)
Channel 5	Meta data (embedded data) ・ Front embedded data (*dt_code* = H'12) ・ Rear embedded data (*dt_code* = H'35)
Channel 6~11	(nothing)

2. Example 2: Single sensor, triple exposure, same DT_code for each exposure, line interleaved (only used VC0).

In this example, image sensor transfers 3 types of long packet with different exposures by line interleaved order (so-called as line-by-line). The same format (RAW12) is used and common *dt_code* (H'2C) is used for each exposure (H'2C

is MIPI CSI-2 standard defined value for RAW12 format). Configuration of line count ID (stage4) and line count filter (stage5) is needed for filtering each exposure data to each input port of ISP core because one common *dt_code* is shared around each exposure. 4 pixels at the beginning of one packet is not pixel data. These should be eliminated at the horizontal clipping (stage6).

If ISP core cannot receive 3 exposures (e.g. in case of up to 2 exposure), pixel data transferred on Channel2 is not available even if Channel 2 is configured properly.

Register configuration of the Pixel Reconstructor and Channel Selector according to the Figure 54.9 is shown in Table 54.5, and Table 54.6. Transferred data on each channel in ISP Interface/Channel Selector is shown in Table 54.7.

Table 54.7 Data for transferred on each channel (Example 2)

Channel	Transferred data
Channel 0	Pixel data (exposure 0, RAW12, *dt_code* = H'2C) for ISP processing
Channel 1	Pixel data (exposure 1, RAW12, *dt_code* = H'2C) for ISP processing
Channel 2	Unavailable pixel data (exposure 2, RAW12, *dt_code* = H'2C) (Reasion: Channel 2 is not connected to the ISP core)
Channel 3~4	(nothing)
Channel 5	Meta data (embedded data) ・ Front embedded data (*dt_code* = H'12) ・ Rear embedded data (*dt_code* = H'35)
Channel 6~11	(nothing)

3. Example 3: Single sensor, triple exposure with different *dt_code* for each exposure, line interleaved (only VC0).

In this example, image sensor transfers 3 types of long packet with different exposures by line interleaved order. Pixel format of each exposure is RAW14 (exposure0), RAW10 (exposure1) and RAW10 (exposure2) respectively. The *dt_code* of each exposure are particular values, which does not equal to the MIPI CSI-2 standard defined ones. Because

different *dt_code* values are assigned for each exposure packet filtering can be done by referring *dt_code* instead of line count ID. Therefore, configuration of line count ID (stage4) and line count filter (stage5) are not needed.

In this configuration, the ASIL Lines and the Voltage ASIL Lines are transferred to VIN via channel 4 and stored to the DRAM with the Embedded Data.

If ISP core cannot receive 3 exposures (e.g. in case of up to 2 exposure), pixel data transferred on Channel2 is not available even if Channel2 is configured properly.

Register configuration of the Pixel Reconstructor and Channel Selector according to the Figure 54.10 is shown in Table 54.8 and Table 54.9. Transferred data on each channels in ISP Interface/Channel Selector is shown in Table 54.10.

Table 54.10 Transferred data for each channel (Example 3)

Channel	Transferred data
Channel 0	Pixel data (exposure 0, RAW14, *dt_code* = H'2D) for ISP processing
Channel 1	Pixel data (exposure 1, RAW10, *dt_code* = H'34) for ISP processing
Channel 2	Unavailable pixel data (exposure 2, RAW10, *dt_code* = H'35) (Reasion: Channel 2 is not connected to the ISP core)
Channel 3~4	(nothing)
Channel 5	Meta data ・ Embedded data (*dt_code* = H'12) ・ ASIL Lines (*dt_code* = H'30) ・ Voltage ASIL Lines (*dt_code* = H'31)
Channel 6~11	(nothing)

4. Example 4: Single sensor, triple exposure with virtual channel based interleaving (VC0, VC1 and VC2 are used for each exposure).

In this example, image sensor transfers 3 types of long packet with different exposures by VC based interleaving. Pixel format of each exposure is RAW14 (exposure0), RAW10 (exposure1) and RAW10 (exposure2) respectively. Each exposure uses different virtual channels (VC) each other. Filtering can be done by referring VC. Configuration of VC

filtering (stage2) is needed to enable VC based filtering. Configuration of line count ID and line count filtering are not needed.

If ISP core cannot receive 3 exposures (e.g. in case of up to 2 exposures), pixel data transferred on Channel2 is not available even if Channel2 is configured properly.

Register configuration of the Pixel Reconstructor and Channel Selector according to the Figure 54.11 is shown in Table 54.11 and Table 54.12. Transferred data on each channels in ISP Interface/Channel Selector is shown in Table 54.13.

Channel 2	Unavailable pixel data (exposure 2, RAW10, VC2, *dt_code* = H'2B) (Reasion: Channel 2 is not connected to the ISP core)
Channel 3~4	(nothing)
Channel 5	Meta data ・ Embedded data (*dt_code* = H'12) ・ ASIL Lines (*dt_code* = H'30) ・ Voltage ASIL Lines (*dt_code* = H'31)
Channel 6~11	(nothing)

5. Example 5: Single sensor, quad exposure with line interleaved (only used VC0)

In this example, image sensor transfers 4 types of long packet with different exposure by line interleaved order. Pixel format of each exposure is RAW20 (exposure0), RAW16 (exposure1), RAW12 (exposure2) and RAW12 (exposure 3) respectively. *dt_code* value of each exposure is in accordance with MIPI CSI-2 standard. However, sending timing of

each exposure is different. Some vertical blanking (V-blanking) packet are transferred for padding of transfer timing of each exposure. Because the same dt_code is used between exposure 2 and exposure 3, configuration of line count ID (stage4) and line count filter (stage5) is needed.

If ISP core cannot receive 3 exposures (e.g. in case of up to 2 exposure), pixel data transferred on Channel2 and Channel3 is not available even if Channel2 and Channel3 are configured properly.

Register configuration of the Pixel Reconstructor and Channel Selector according to the Figure 54.12 is shown in the Table 54.14, Table 54.15 and Table 54.16. Transferred data on each channels in ISP Interface/Channel Selector is shown in Table 54.17.

Table 54.17 Transferred data for each channel (Example 5)

Channel	Transferred data
Channel 0	Pixel data (exposure 0, RAW20, *dt_code* = H'2B) for ISP processing
Channel 1	Pixel data (exposure 1, RAW16, *dt_code* = H'2A) for ISP processing
Channel 2	Unavilable pixel data (exposure 2, RAW12, *dt_code* = H'2C) . (Reason: Channel2 is not connected to the ISP core)
Channel 3	Unavailable Pixel data (exposure 3, RAW12, *dt_code* = H'2C) (Reason: Channel3 is not connected to the ISP core)
Channel 4	(nothing)
Channel 5	Embedded data (*dt_code* = H'12)
Channel 6~11	(nothing)

54.4.2.3 Configuration of LUT based pixel reconstructor

LUT based pixel reconstructor supports some packing formats which are not defined in MIPI CSI-2. Supporting format are the following types. However, only 1 format are available simultaneously.

- YUV444: Y16, U8, V8 (Y 16bit, U 8bit, V 8bit)
- YUV444: Y16, U10, V10 (Y 16bit, U 10bit, V 10bit)
- YUV444: Y16, U12, V12 (Y 16bit, U 12bit, V 12bit)
- YUV444: Y12, U8, V8 (Y 16bit, U 8bit, V 8bit)
- YUV422: Y12, UV8 (Y 12bit, UV 8bit)

This function can be used by setting H'3F to the ISPPCS_PROC_MODE_DT[n].PROC_MODE_VCm (n=0~63, m=0~3) register.

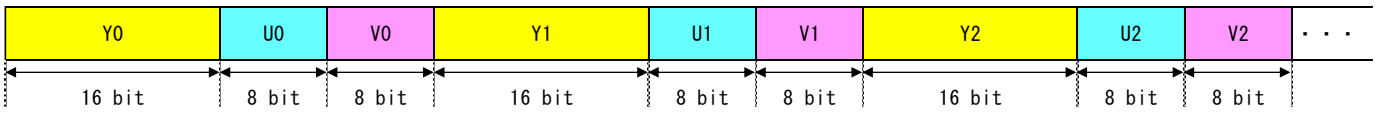
Each color components (Y, U, V) should be transferred on separate channels. Configuration to transfer with mixing several components on one channel are forbidden. Color component separation is done at the De-interleaving filter. So, configuration of De-interleavling filter is also needed.

Following configuration uses the Channel 4 for Y-component, Channel 5 for U-component and the Channel 6 for V-component, respectively.

In addition to the following configuration, configuration which relates to the Stage1~ Stage8.

1. YUV444, Y16, U8, V8

Incoming pixel sequence which is packed in one CSI long packet is shown as below.



Configuration of LUT based pixel reconstructor

54.4.3 Boot up sequence

54.4.3.1 Boot up sequence type 1

Flow of boot up sequence Type1 is shown in the Figure 54.19

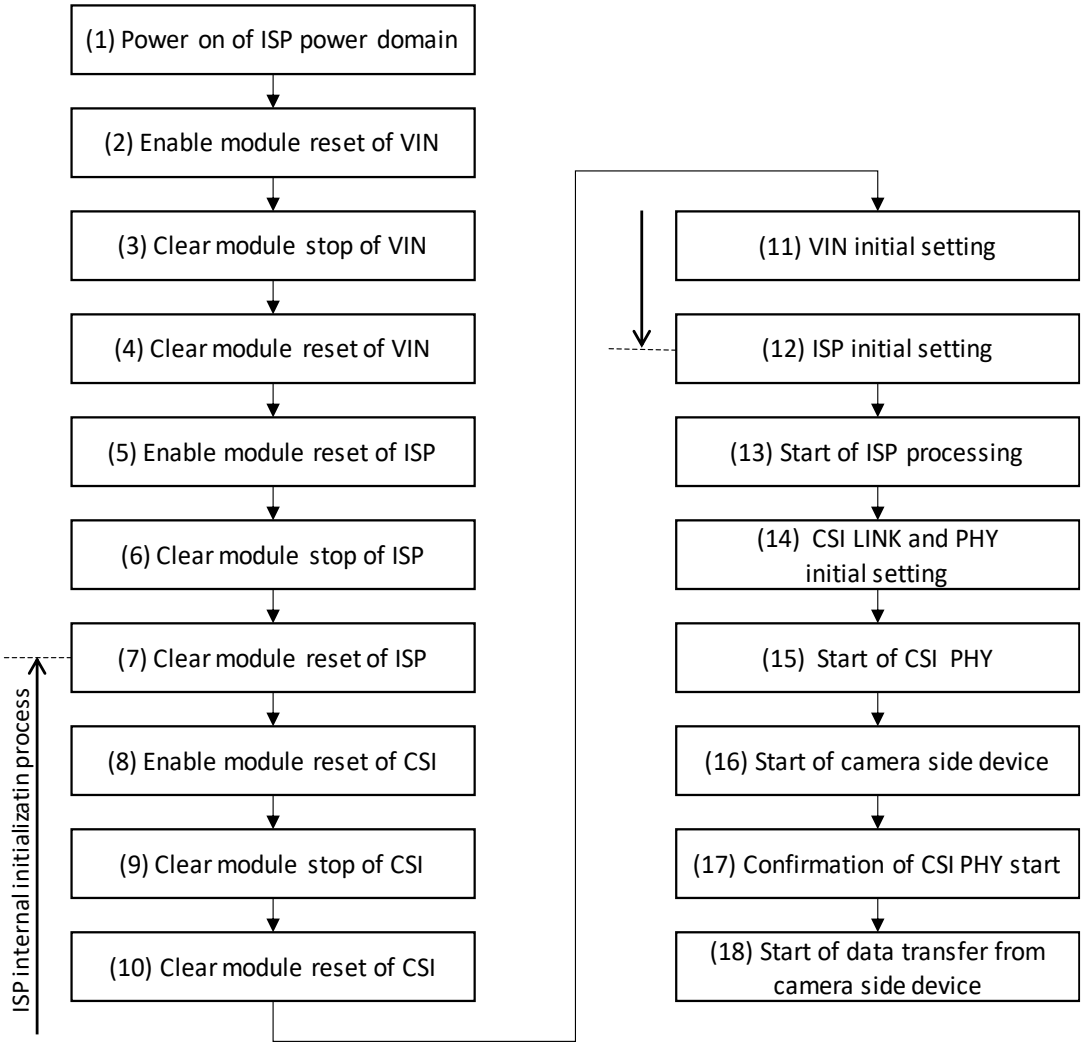

Figure 54.19 Flow of boot up sequence type 1

1. Power on of ISP

ISP is located in a dedicated power domain. When the boot up of SoC, ISP power domain is shut-off state. Before using ISP, an power supply operation for ISP power domain is required. Refer to the “Power Domain power-ON Control Register n (PDRONCRn)” register section in the hardware manual of SYSC.

2. Enable module reset of VIN

An explicit module resetting to VIN is done before clear module stop. See the hardware manual of CPG for detail.

3. Clear module stop of VIN

At the boot up of SoC, VIN, ISP and CSI are in the state of module stop. During module stop state, clock signal is not supplied. Explicitly clear the module stop state to supply clock to VIN. If this operation is skipped, any access to VIN are locked and it may bring hang up.See the hardware manual of CPG for detail.

4. Clear module reset of VIN

At this stage clock supply is enabled. Explicitly clear the reset of VIN.

5. Enable module reset of ISP

An explicit module resetting to ISP is done before clear module stop. See the hardware manual of CPG for detail.

6. Clear module stop of ISP

Explicitly clear the module stop state to supply clock to ISP. If this operation is skipped, any access to ISP are locked and it may bring hang up. See the hardware manual of CPG for detail.

7. Clear module reset of ISP

At this stage clock supply is enabled. Explicitly clear the reset of ISP. See the hardware manual of CPG for detail. At the timing of reset clear, ISP starts internal initialization processing. User shall wait for completion of this process, and see 54.4.3.1.12 or 54.4.3.2.16 for the actual value of it.

8. Enable module reset of CSI

An explicit module resetting to CSI is done before clear module stop. See the hardware manual of CPG for detail.

9. Clear module stop of CSI

Explicitly clear the module stop state to supply clock to CSI. If this operation is skipped, any access to CSI are locked and it may bring hang up. See the hardware manual of CPG for detail.

10. Clear module reset of CSI

At this stage clock supply is enabled. Explicitly clear the reset of CSI.

11. VIN initial setting

Register setting to capture using VIN, such as image size, stride and base address, color format, and etc. See the hardware manual of VIN for more information

12. ISP initial setting

Register setting of both ISP core and ISP Interface. See 54.4.1 and 54.4.2 for more information.

Before starting this step, over 6.250 [us] (*) waiting period from clear timing of module reset is required due to internal initialization processing of the ISP. User shall wait for completion of this period before configuring the ISP. Since there are no registers to indicate the completion, user shall use a system timer to obtain a time.

(*) This waiting period corresponds to 5000 cycles when frequency of S0D1_VIO ϕ clock is 800 MHz. If the frequency of S0D1_VIO ϕ clock is not 800 MHz, then it is required to recalculate this waiting period by the following formula. In this formula, *clock_frquency* denotes the frequency of S0D1_VIO ϕ clock and *waiting_period* denotes the waiting period to be recalculated.

waiting_period [us] = 5000 / *clock_frequency* [MHz]

13. Start of ISP processing

ISP processing is started by writing ISPSTART register. For register access while ISP is running, see 54.5.2.

14. CSI LINK and PHY initial setting

15. Start of cSI PHY

16. Start of camera side device

17. Confirmation of CSI PHY start

(14)-(17) are steps to use external camera device which are connected via CSI interface. See the hardware manual of CSI for more information.

18. Start of data transfer from external camera side device

This step is to enable data transfer from external camera side devices to provide an image data to the SoC. See the manual of camera(sensor) module for more information.

54.4.3.2 Boot up sequence type 2

In the “Boot up sequence Type 1”, “Confirmation of CSI PHY available” takes longer time than other steps. This method overlaps ISP initialization process on the “Confirmation of CSI PHY available” step in order to shorten boot up time. Boot up sequence of this method is shown **Figure 54.20**

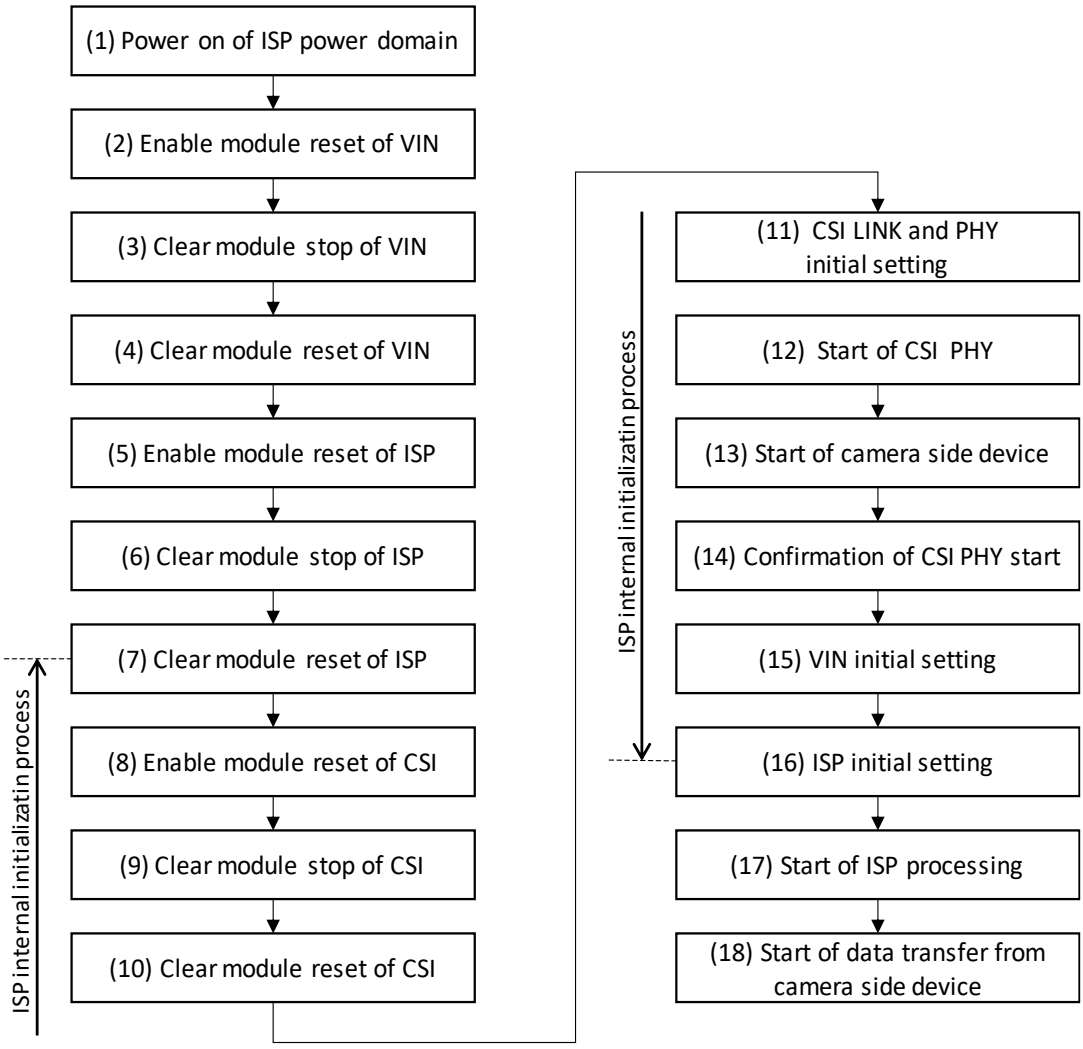

Figure 54.20 Flow of boot up sequence type 2

1. **Power on of ISP**
2. **Enable module reset of VIN**
3. **Clear module reset of VIN**
4. **Clear module reset of VIN**
5. **Enable module reset of ISP**
6. **Clear module stop of ISP**
7. **Clear module reset of ISP**
8. **Enable module reset of CSI**
9. **Clear module stop of CSI**
10. **Clear module reset of CSI**

Detail of each step of (1)-(10) are same as the “Boot up sequence type 1”.

11. **CSI LINK and PHY initial setting**
12. **Start of CSI PHY**
13. **Start of camera side device**
14. **Confirmation of CSI PHY start**

(11)-(14) are steps to use external camera device which are connected via CSI interface. See the hardware manual of CSI for more information.

15. **VIN initial setting**

Register setting to capture using VIN, such as image size, stride and base address, color format, and etc. See the hardware manual of VIN for more information.

16. **ISP initial setting**

Register setting of both ISP core and ISP Interface. See 54.4.1 and 54.4.2 for more information.

Before starting this step, over 6.250 [us] (*) waiting period from clear timing of module reset is required due to internal initialization processing of the ISP. User shall wait for completion of this period before configuring the ISP. Since there are no registers to indicate the completion, user shall use a system timer to obtain a time.

(*) This waiting period corresponds to 5000 cycles when frequency of S0D1_VIO ϕ clock is 800 MHz. If the frequency of S0D1_VIO ϕ clock is not 800 MHz, then it is required to recalculate this waiting period by the following formula. In this formula, *clock_frquency* denotes the frequency of S0D1_VIO ϕ clock and *waiting_period* denotes the waiting period to be recalculated.

waiting_period [us] = 5000 / *clock_frequency* [MHz]

17. **Start of ISP processing**

ISP processing is started by writing ISPSTART register. For register access while ISP is running, see 54.5.2.

18. **Start of data transfer from external camera side device**

This step is to enable data transfer from external camera side devices to provide an image data to the SoC. See the manual of camera(sensor) module for more information.

54.4.4 Stop sequence

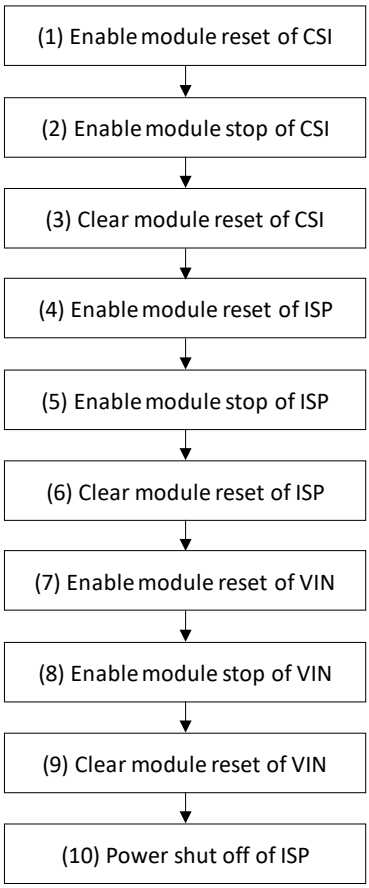

Figure 54.21 Stop sequence

1. Enable module reset of CSI

By enabling module reset, CSI processing is stopped. Detailed operation is same as the corresponding step in the boot up sequence flow.

2. Enable module stop of CSI

By enabling module stop, clock supply is stopped. See the hardware manual of CPG for detail.

3. Clear module reset of CSI

Module reset is cleared for the boot up at next time. Detailed operation is same as the corresponding stop in boot up sequence flow

4. Enable module reset of ISP

By enabling module reset, ISP processing is stopped. Detailed operation is same as the corresponding step in the boot up sequence flow.

5. Enable module stop of ISP

By enabling module stop, clock supply is stopped. See the hardware manual of CPG for detail.

6. Clear module reset of ISP

Module reset is cleared for the boot up at next time. Detailed operation is same as the corresponding stop in boot up sequence flow

7. Enable module reset of VIN

By enabling module reset, ISP processing is stopped. Detailed operation is same as the corresponding step in the boot up sequence flow.

8. Enable module stop of VIN

By enabling module stop, clock supply is stopped. See the hardware manual of CPG for detail.

9. Clear module reset of VIN

Module reset is cleared for the boot up at next time. Detailed operation is same as the corresponding stop in boot up sequence flow

10. Power shut off of ISP

After ISP has been stopped, power domain of ISP shall be shut-off. Refer to the “Power Domain power-OFF Control Register n (PDROFFCRn)” register section in the hardware manual of SYSC.

See the hardware manual of SYSC for detail.

Note: If this procedure applied, VIN memory writing finish in the middle of the frame. If it needs to finish VIN in frames, see the hardware manual of VIN for detail.

54.4.5 Synchronized system with IMR

ISP supports synchronized system with IMR. In this function, ISP issues a start signal called as “WUP signal” to IMR during one frame processing is still on-going. IMR can start image rendering processing without waiting a completion of one frame. Therefore, low delay processing can be realized. However, take care that you should boot up IMR before ISP when you use this function. See the hardware manual of IMR for more information.

54.4.5.1 Configuration register

- ENABLE_WUP
  - ENABLE_WUP reigster specifies enabling of synchronized system with IMR. In order to activate this function, ENABLE_WUP should be set to 1.
- WUP_ENABLE_CHANNELS
  - WUP_ENABLE_CHANNELS register controls whether IMR channel receives WUP pulse from ISP. Each bit corresponds to one IMR channel. In order to issue a WUP signal to IMR, corresponsinding bits of WUP_ ENABLE_CHANNELS should be set to 1 in addition to set ENABLE_WUP = 1. For example, when WUP_ENABLE_CHANNELS = H’1F , all IMR channels receive the WUP signal
  - In R-Car V4M, WUP_ENABLE_CHANNELS[5:4] is no effect (dummy bit) . Only WUP_ENABLE_ CHANNEL[3:0] is available because number of IMR channels is 4 in R-Car V4M.
- WUP_PULSE_LENGTH_MINUS1
  - This register specifies a subtraced value of number of cycles of WUP signal pulse (WUP signal is N-cycled pulse). For example, when WUP_PULSE_LENGTH=1, pulse length is 2 cycles.
  - 5 cycles is recommended as WUP signal pulse length. Recommended value for WUP_PULSE_LENGTH register is 4.
- WUP_POS_Xn (n=0,1,2,3), WUP_POS_Yn (n=0,1,2,3)

- This register specifies the timing for issuing WUP pulse. Issue timing is specified by the coordinate value of pixel of output human vision image. However, issue timing at (WUP_POS_Xn, WUP_POS_Yn)=(0, 0) is not supported. Therefore, setting of both WUP_POS_Xn==0 and WUP_POS_Yn=0 is forbidden.
- The coordinates for issuing WUP pulses must be spaced a certain distance (at least several lines) from each other. So, setting to specify multiple WUP pulse coordinates on a single line is prohibited.
- WUP pulse can be issued up to 4 times per frame.
- For example, in order to issue WUP pulse at 3 times per one frame and its issueing timing is at outputting (x0,y0) pixels, (x1,y1) pixels or (x2,y2) pixels, setting of WUP_POS_Xn and WUP_POS_Yn register is whowns as below. The number of WUP pulse can be specified by setting a value larger than output image size in the WUP_POS_Xn or WUP_POS_Yn. In this example, (WUP_POS_X3, WUP_POS_Y3) is set as (H'FFFF, H'FFFF), so WUP_POS_X3 and WUP_POS_Y3 is not effected to the WUP pulse issuing.

Register	Setting value	Register name	Setting value
WUP_POS_X0	x0	WUP_POS_Y0	y0
WUP_POS_X1	x1	WUP_POS_Y1	y1
WUP_POS_X2	x2	WUP_POS_Y2	y2
WUP_POS_X3	H'FFFF	WUP_POS_Y3	H'FFFF

Figure 54.22 shows a timing chart of WUP pulse issue timing in one frame

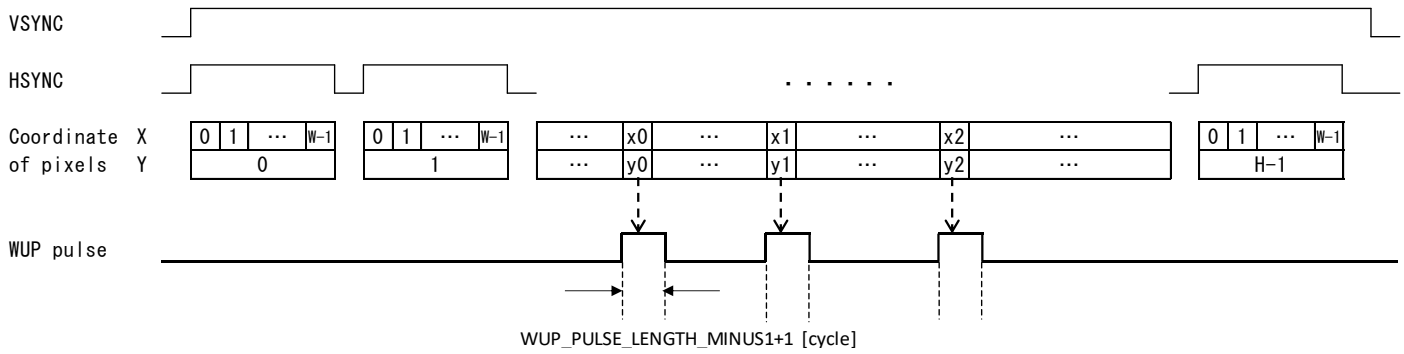

Figure 54.22 Timing chart of WUP pulse issue

54.4.5.2 WOVF and WERR error at IMR

IMR may notify either WOVF error or WERR error to CPU as interrupt request. When the synchronization timing between ISP and IMR is not correct. CPU should apply appropriate action when receiving these errors.

1. WOVF error

Processing start timing for each frame of ISP is in accordance with incoming video timing from external connected sensors. ISP does not have a function which corresponds to SLP instruction in IMR (SLP instruction is to wait start of image rendering processing). Because ISP cannot wait image processing there are cases where ISP issues 2 WUP signals continuously. In this case IMR notifies WOVF error. If WOVF error is issued, you should stop ISP processing after confirming that IMR has been terminated by TRAP instruction. Refer to the HW manual of IMR for more information.

2. WERR error

WERR error is notified when the following either (i) or (ii) cases.

(i) WUP signal is issued when boot up sequence and initialization of IMR has not been completed.

(ii) WUP signal is issued when the interrupt service routine caused by IMR interrupt has not been completed.

If WERR is issued in case of (i), then you should stop the ISP processing without boot up of IMR. If WERR error is issued in case of (ii), then you should stop the ISP processing after confirming that IMR has been terminated by TRAP instruction. Refer to the HW manual of IMR for more information.

54.4.6 Interrupts

54.4.6.1 Interrupt from ISP Interface/Channel Selector

1. Interrupt sources

Interrupt source is stored in the ISPINT_STATUS register. This register is read only.

2. Enabling method

When writing 1 into a particular bit in ISPINT_ENABLE register, then interrupt signal is asserted to INTC (Interrupt Controller) at the timing of assertion of corresponding interrupt source.

Example： Setting to notify INTC of an interrupt when tither RAW_SCALER_PIXEL_DROP or FIFO_FULL_CSI_INPUT interrupt source occurs. In this setting, even if other interrupt source is asserted, interrupt is not notified to INTC.

Register Name	Writing value	Remarks
ISPINT_ENABLE	H’0001_00004	bit16: RAW_SCALER_PIXEL_DROP bit2: FIFO_FULL_CSI_INPUT

3. Clear method

When writing 1 into a particular bit in ISPINT_CLEAR, then corresponding interrupt status bits in ISPINT_STATUS register are cleared.

Example：To clear RAW_SCALER_PIXEL_DROP and FIFO_FULL_CSI_INPUT interrupt status.

Register name	Writing value	Remarks
ISPINT_CLEAR	H’0001_0004	bit16: RAW_SCALER_PIXEL_DROP bit2: FIFO_FULL_CSI_INPUT

4. Connection structure

Connection structure of interrupt status register (ISPINT_STATUS) and interrupt enable register (ISPINT_ENABLE) is shown in Figure 54.23

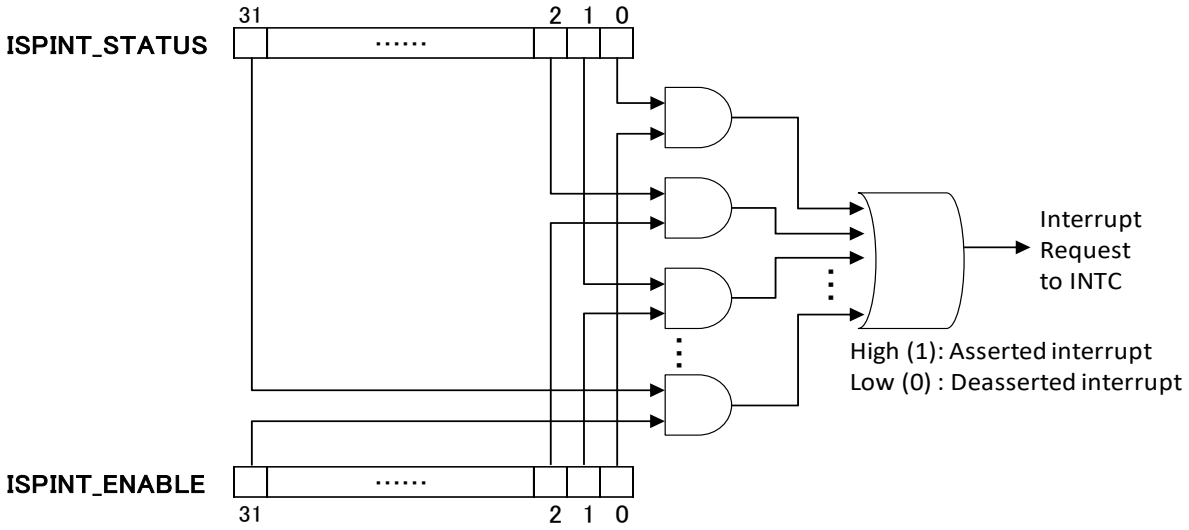

Figure 54.23 Connection structure of interrupt register signals

5. Bit assignment of Interrupt

Bit	Status Register	Clear Register	Enable Register	Interrupt Source

Figure 54.24 Bit assignment of ISP interrupt

54.4.6.2 Interrupt from ISP Core

Interrupt request from ISP core is connected to ISPCORE_INT_STATUS.ST0 register (bit 0). By reading ISPCORE_INT_STATUS.ST0, it is possible to obverve whether interrupt request from ISP core is issueed or not.

In order to issue interrupt to INTC, ISPCORE_INT_ENABLE.EN0 is set to 1.

Regarding how to clear interrupt request or more detail, refer to the manual of ISP core released from IP vendor.

In addition to interrupt from ISP core, interrupt from “Defect Pixel Information DMA” is connected to ISPCORE_INT_ STATUS.

Bit 18 is assigned to ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_ OVER_DPCC1 interrupt. In order to issue an interrupt to INTC from this interrupt source, ISPCORE_INT_ENABLE. DPCC_PIXEL_COUNT_ OVER_DPCC1 is set to 1.

Bit 19 is is assigned to ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_ OVER_DPCC2 interrupt. In order to issue an interrupt to INTC from this interrupt source, ISPCORE_INT_ENABLE. DPCC_PIXEL_COUNT_ OVER_DPCC2 is set to 1.

See 54.4.11.3 for more detail.

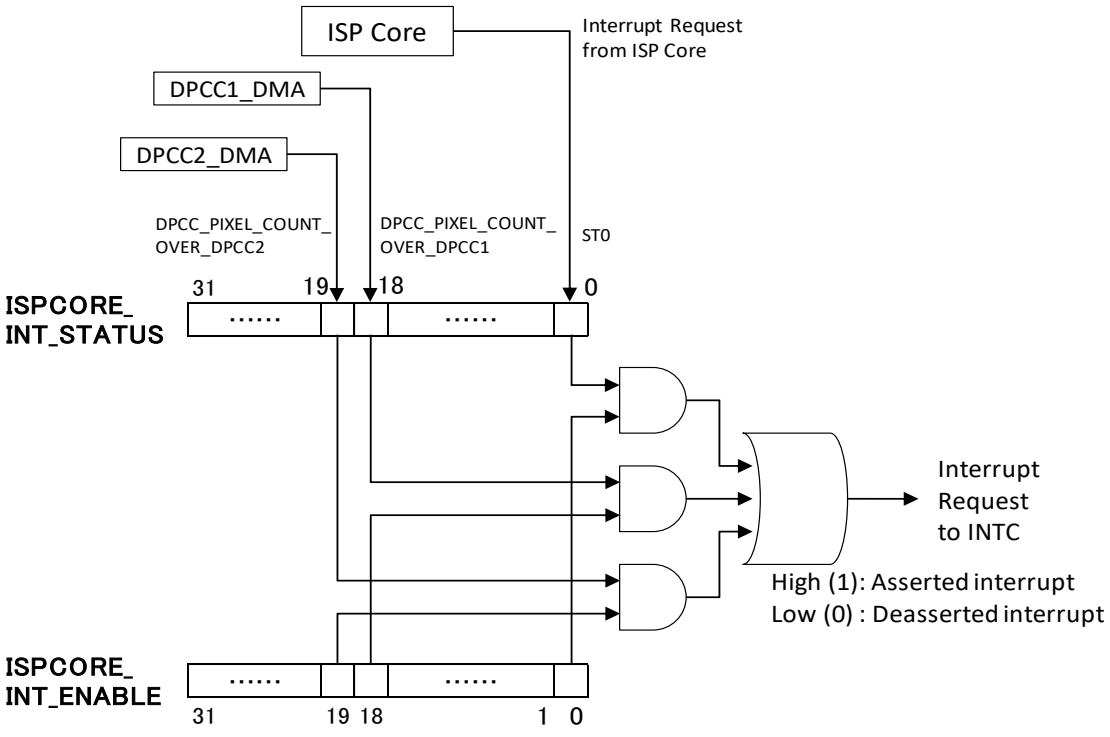

Figure 54.25 Connection structure of interrupt register from ISP core

54.4.7 Error Request

54.4.7.1 Error request of ISP Interface/Chanel Selector

1. Error request sources

Error request sources from ISP Interface/Channel Selector are stored in ISPERR1_STATUS register or ISPERR2_STATUS register. This registers are read only.

2. Enabling method

When writing 1 to particular bits in ISPERR1_ENABLE or ISPERR2_ENABLE register, then an error request signal is asserted to ECM (Error Control Module) at the timing of assertion of corresponding error source.

Example: Setting to notify ECM of an error request when either CHANNEL_SELECT_CH9_PIXEL_COUNT_ MIN_ERROR (bit 31 in ISPERR1) or SYNC_ERROR_VC14 (bit 14 in ISPERR2) error source occurs.

Register Name	Writing value	Remarks
ISPERR1_ENABLE	H'8000_0000	bit31: CHANNEL_SELECT_CH9_PIXELCOUNT_MIN_ERROR
ISPERR2_ENABLE	H'0000_4000	bit 14: SYNC_ERROR_VC14

3. Clear method

When writing 1 to particular bits in ISPERR1_CLEAR or ISPERR2_CLEAR register, then corresponding error status bits in ISPERR1_STATUS or ISPERR2_STATUS register are cleared to 0.

Example: To clear CHANNEL_SELECT_CH9_PIXEL_COUNT_ MIN_ERROR (bit 31 in ISPERR1) or SYNC_ERROR_VC14 (bit 14 in ISPERR2) error status

Register Name	Writing value	Remarks
ISPERR1_CLEAR	H'8000_0000	bit31: CHANNEL_SELECT_CH9_PIXELCOUNT_MIN_ERROR
ISPERR2_CLEAR	H'0000_4000	bit 14: SYNC_ERROR_VC14

4. Connection structure

Connection structure of error status register (ISPERR1_STATUS, ISPERR2_STATUS) and error enable register (ISPERR1_ENABLE, ISPERR2_ENALBLE) is shown in Figure 54.26.

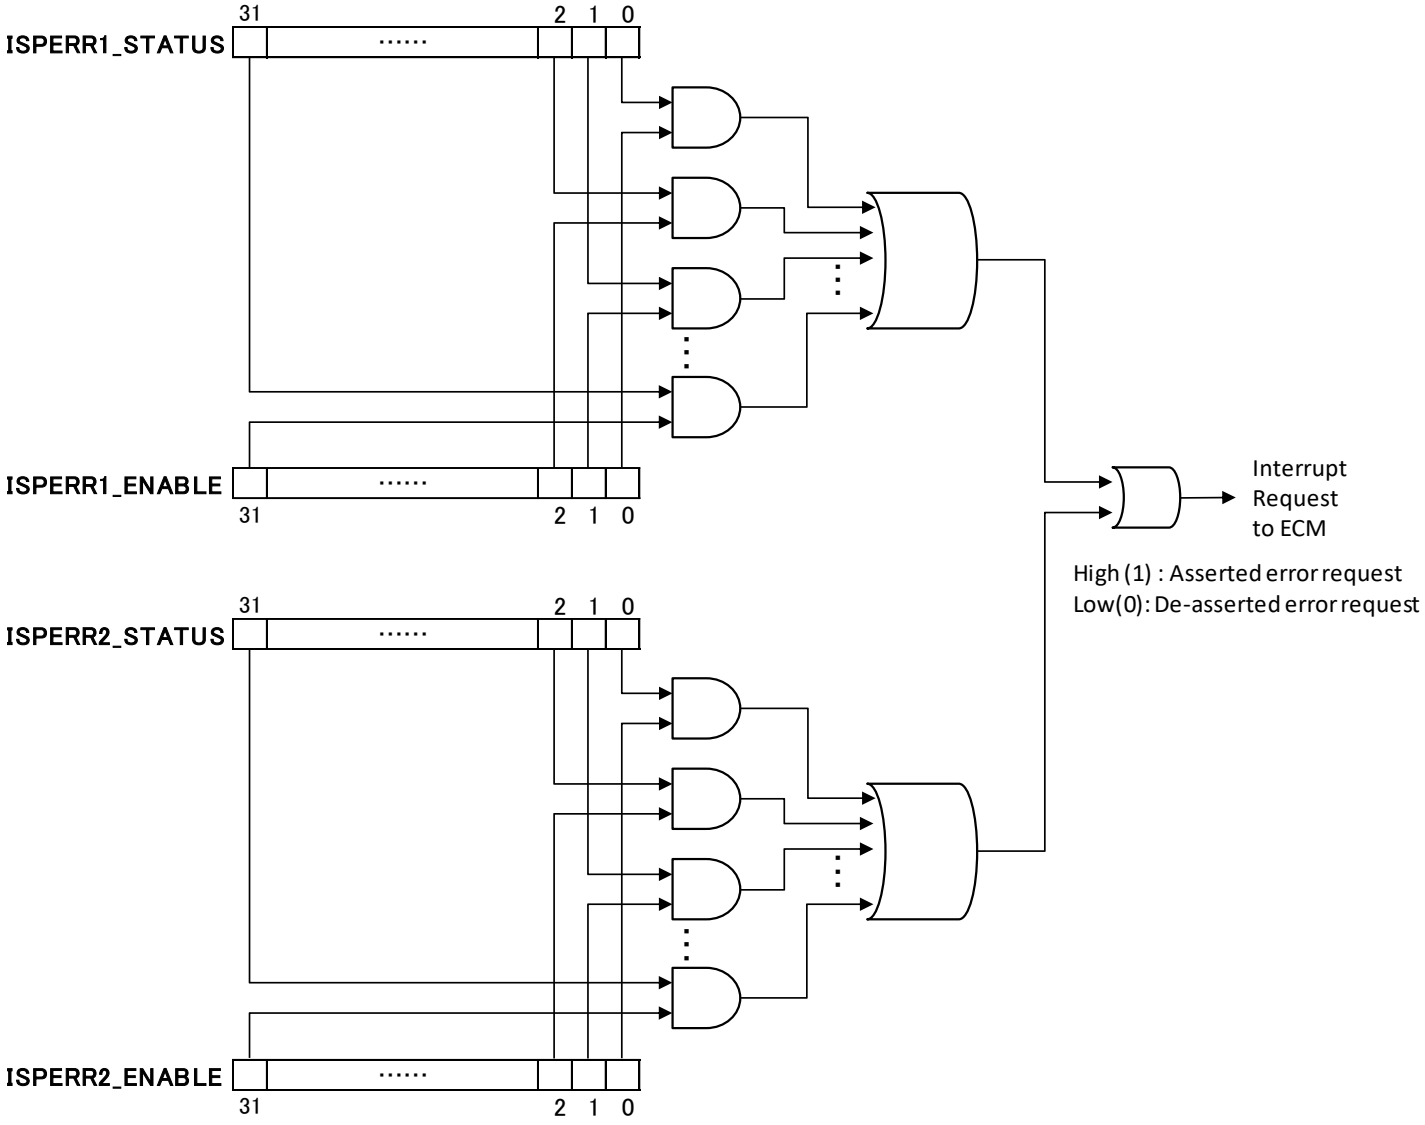

Figure 54.26 Connection structure of error request from ISP Interface

54.4.7.2 Error request sourced from ISP core

1. Error request sources

Error request sources from ISP core are stored in ISPERR0_STATUS or ISPERR3STATUS or ISPERR4_STATUS register. There registers are read only.

2. Enabling method

When writing 1 to particular bits in ISPERR0_ENABLE or ISPERR3_ENABLE or ISPERR4_ENABLE register, then an error request signal is asserted to ECM (Error Control Module) at the timing of assertion of corresponding error source

Example: Setting to notify ECM of an error request when either ISP Core SRAM EDC error (RPP_MAIN_PRE2_LSC _GB_MEM) (bit 12 in ISPERR0) or ISP Core SRAM EDC error (RPP_MAIN_PRE1_LSC_B_MEM) (bit 3 in ISPERR0) or ISP Core SRAM EDC error (RPP_MAIN_POST_SHRPCNR_MEM) (bit 7 in ISPERR3) error source occurs.

Register Name	Writing value	Remarks
ISPERR0_ENABLE	H'0000_1008	bit12: ISP Core SRAM EDC error (RPP_MAIN_PRE2_LSC_GB_MEM)

		bit 3: ISP Core SRAM EDC error (RPP_MAIN_PRE1_LSC_B_MEM)
ISPERR3_ENABLE	H'0000_0080	bit 7: ISP Core SRAM EDC error (RPP_MAIN_POST_SHRPCNR_MEM)

3. Clear method

When writing 1 to particular bits in ISPERR0_CLEAR or ISPERR3_CLEAR or ISPERR4_CLEAR register, then corresponding error status bits in ISPERR0_STATUS or ISPERR3_STATUS or ISPERR4_STATUS register are cleared to 0.

Example: To clear ISP Core SRAM EDC error (RPP_MAIN_PRE2_LSC _GB_MEM) (bit 12 in ISPERR0) and ISP Core SRAM EDC error (RPP_MAIN_PRE1_LSC_B_MEM) (bit 3 in ISPERR0) and ISP Core SRAM EDC error (RPP_MAIN_POST_SHRPCNR_MEM) (bit 7 in ISPERR3) error status

Register Name	Writing value	Remarks
ISPERR0_CLEAR	H'0000_1008	bit12: ISP Core SRAM EDC error (RPP_MAIN_PRE2_LSC_GB_MEM) bit 3: ISP Core SRAM EDC error (RPP_MAIN_PRE1_LSC_B_MEM)
ISPERR3_CLEAR	H'0000_0080	bit 7: ISP Core SRAM EDC error (RPP_MAIN_POST_SHRPCNR_MEM)

4. Connection structure

Connection structure of error status register (ISPERR0_STATUS, ISPERR3_STATUS, ISPERR4_STATUS) and error enable register (ISPERR0_ENABLE, ISPERR3_ENABLE, ISPERR4_ENALBLE) is shown in Figure 54.27.

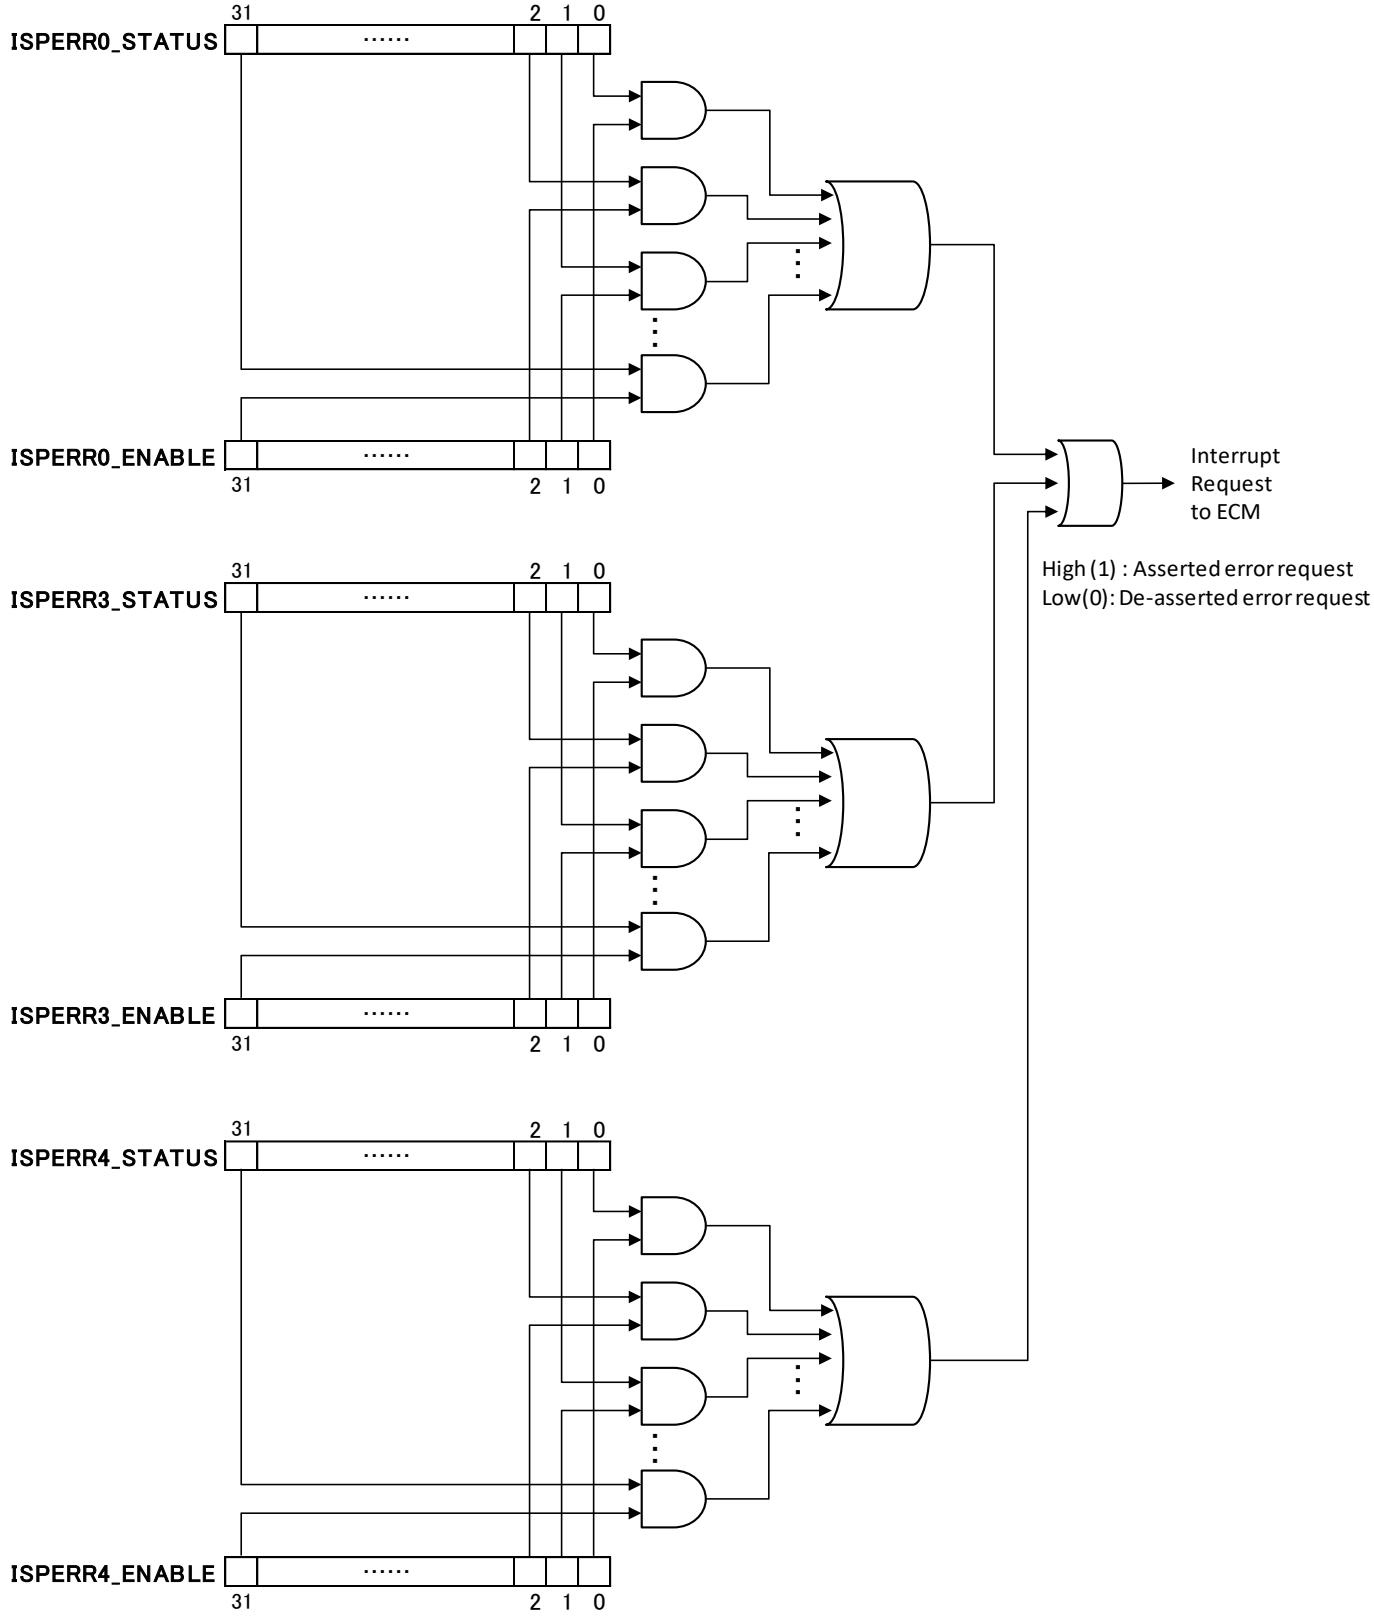

Figure 54.27 Connection structure of error request from ISP core

Figure 54.32 Bit assignment of ISPERR4

54.4.8 Streaming Bridge

Streaming Bridge function realizes “Memory-to_memory” operation, which gets the input image data from DRAM, processes it and output to the DRAM by collabolated operation with VSPX.

Number of exposures is up to 2 exposures. So, two VSPX RPFs (Read Pixel Formatter), i.e. RPF0 and RPF1 are available for input image transfer use (RPF2 and RPF3 are not used).

1. Configuration of VSPX

Parameter of input image (base address, width, height and pixel format, etc.) are set to VSPX register or VSPX display list. When multiple exposure is used then, image parameter should be set for each exposure.

2. Configuration of CSI, Channel Selector and VIN for image capture path.

In order to activate image capture path from CSI to DRAM via VIN, configuration of CSI, Channel Selector and VIN is needed. Regarding configuration of Channel Selector, refer to the 54.4.2 for detail. Regarding configuration CSI and VIN, refer to the users manual of CSI or VIN.

3. Configuration of Streaming Bridge

Write B’1111 to ISP_STREAMER_MODE.STREAMER_ENABLE register. Streaming path is activated after that.

Write vertical blanking period (unit : cycle) to STREAMER_V_BLANK register.

Write horizonal blanking period (unit : cycle) to the STREAMER_H_BLANK register.

During the Streaming Bridge is feeding an input image to the ISP core, Streaming Bridge generates horizontal blanking cycles at the line boundary (end of one line) of every line. Period of horizontal blanking cycle is set by ISP_STREAMER_H_BLANK register

During the Streaming Bridge is feeding an input image to the ISP core, Streaming Bridge generates virtual blanking cycles at the frame boundary (end of one frame) of every frame. Period of virtual blanking cycle is set by ISP_STREAMER_V_BLANK register

4. Configuration of ISP core

Set the ISP core register according to ISP processing.

5. Start image input

Write H’FFFF to ISPSTART register to activate image capturing from CSI.

Write H’00000001 to VI6_CMD0 register (start register of VSPX) to trigger image input from DRAM to VSPX.

6. Waiting complete of one frame processing

ISP core and VSPX asserts end of frame interrupts. To notify complete of one frame processing, wait both interrupts from ISP core and VSPX (FRE interrupt).

54.4.9 RAW Domain Scaler (RAW Scaler)

RAW domain scaling function (RAW scaler) is newly added. RAW scaler is placed between Pixel Reconstructor (stage1) and VC filter(stage2) in pixel processing pipeline.

54.4.9.1 Overview

RAW scaler scales incoming RAW image from CSI in RAW domain. There are 2 use-case in RAW scaler, one is 1/2 scaling and the another one is RGB-Ir conversion.

In 1/2 scaling usecase, scaled ratio is only both 1/2 horizontal and 1/2 vertical. Scale ratio other than 1/2 is not supported. And, horizontal only scaling or vertical only scaling is not supported.

In RGB-IR conversion usecase, scaled ratio is only 1.0 horizontal and 1.0 vertical. This usecase converts from non-Bayer and 4x4 based RGB-IR color filter array into Bayer color filter array by using convolution operation.

54.4.9.2 Preparation of of RAW Scaler

Before setting convolutional operation in RAW scaler, following settings are needed.

RAW_SCALER_MODE.ENABLE should be set to 1.

ISPCS_FILTER_ID_ID_CHc.SEL_RAW_SCALED should be set to 1, where c (c=0~11) is the channel number through which the output from the RAW Scaler is to be passed. For example, if the RAW scaler output is to be passed through the channel 2 and channel6 , then ISPCS_FILTER_ID_ID_CH2.SEL_RAW_SCALED =1 ISPCS_FILTER_ID_ID_CH6.SEL_RAW_SCALED =1.

Set the virtual channel number to be input to the RAW scaler to the RAW_SCALER_MODE.TARGET_VC register

Set the data type code to be input to the RAW scaler to the RAW_SCALER_MODE.TARGET_DT_CODE register

Set the image width to the RAW_SCALER_IMAGE_SIZE.IMAGE_WIDTH register. Its unit is number of pixels per line

Set the image height to the RAW_SCALER_IMAGE_SIZE.IMAGE_HEIGHT register. Its unit is number of lines in one frame to be processed by RAW scaler.

Set the toggle timing of the VSYNC, HSYNC and DE signals of RAW scaler output to the RAW_SCALER_OUT_VLANK and RAW_SCALER_OUT_HBLANK and RAW_SCALER_OUT_VS_HS register.

In the following description, register symbol name such as “RAW_SCAER_MODE” or RAW_SCALER_COEFF_SEL_ROWn”, etc which are defined as the RAW scaler-related registers is omitted.

54.4.9.3 Calculation operation

RAW scaler performs convolutional calculation on the input pixels. Convolution coefficient is switched by pixel-by-pixel according to the co-ordinate of input RAW pixel. The formula of this convolution operation is as follows.

$$Q'(x,y) = \left[\sum_{m=-2}^{2}\sum_{n=-2}^{2}\{P(x+m,y+n) << input_lshift\} * C(s,m,n) + rounding(s)\right] >> conv_shift(s)$$

$$s = coeff_select_table(x\%4, y\%4)$$

$$Q(x,y) = Sat\{Q'(x,y), sat_min, sat_max\} << final_lshift$$

$$Sat\{Q', m, n\} = \begin{cases} Q' \ if \ sat_min \le Q \le sat_max \\ sat_min \ if \ Q' < sat_min \\ sat_max \ if \ Q' > sat_max \end{cases}$$

$P(x,y)$: Input pixel to RAW scaler
$Q(x,y)$: Output pixel from RAW scaler

$C(s,m,n)$: The s-th convolution coefficient(its size is 5x5). The number of convolution coefficient set is 4 (s=0,1,2,3). Size of a convolution coefficient set is 5x5 *(m=-2,-1,0,1,2. n=-2,-1,0,1,2).* $C(s,m,n)$ is set by using RAW_SCALER_ COEFF[s]_* register (hereafter, "RAW_SCALER_" will be omitted and will be referred to as COEFF[s]_*) . Correspondence between $C(s,m,n)$ and register is shown as below.

$C(s,m,n)$	Register	$C(s,m,n)$	Register
C(s,-2,-2)	COEFF[s]_M2_M2	*C(s,-1,-2)*	COEFF[s]_M1_M2
C(s,-2,-1)	COEFF[s]_M2_M1	*C(s,-1,-1)*	COEFF[s]_M1_M1
C(s,-2,0)	COEFF[s]_M2_00	*C(s,-1, 0)*	COEFF[s]_M1_00
C(s,-2,1)	COEFF[s]_M2_P1	*C(s,-1, 1)*	COEFF[s]_M1_P1
C(s,-2,2)	COEFF[s]_M2_P2	*C(s,-1, 2)*	COEFF[s]_M1_P2
C(s, 0,-2)	COEFF[s]_00_M2	*C(s, 1,-2)*	COEFF[s]_P1_M2
C(s, 0,-1)	COEFF[s]_00_M1	*C(s, 1,-1)*	COEFF[s]_P1_M1
C(s, 0, 0)	COEFF[s]_00_00	*C(s, 1, 0)*	COEFF[s]_P1_00
C(s, 0, 1)	COEFF[s]_00_P1	*C(s, 1, 1)*	COEFF[s]_P1_P1
C(s, 0, 2)	COEFF[s]_00_P2	*C(s, 1, 2)*	COEFF[s]_P1_P2
C(s, 2,-2)	COEFF[s]_P2_M2		
C(s, 2,-1)	COEFF[s]_P2_M1		
C(s, 2, 0)	COEFF[s]_P2_00		
C(s, 2, 1)	COEFF[s]_P2_P1		
C(s, 2, 2)	COEFF[s]_P2_P2		

$input_lshift$: Setting value of INPUT_LSHIFT register

$rounding(s)$: Setting value of ROUNDINGs register(s=0,1,2,3)

$conv_rshift(s)$: Setting value of CONVs_RHSHIFT register (s=0,1,2,3)

$coeff_select_table(x\%4, y\%4)$: This indicates the index 's' of the convolution coefficient. The available value is any of 0,1,2,3, and 15. However, in case of *coeff_select_table(x%4,y%4)*=15, no pixel will be output corresponding to this input pixel. Setting as *coeff_select_table(x%4,y%4)*=15 is used for 1/2 scaling usecase

$Sat\{Q'(x,y), sat_min, sat_max\}$: Saturation operation. If Q'(x,y) value exceeds in range of *[sat_min, sat_max]* then saturation output is limited to *sat_min* or *sat_max*. *sat_min* is a setting value of SATURATION_MIN register. *sat_max* is a setting value of SATURATION_MAX register.

$final_lshift$: Setting value of FINAL_LSHIFT register. FINAL_LSHIFT register is used when packing output pixel as MSB aligned. For LSB aligned case, FINAL_LSHIFT register is set to 0.

54.4.9.4 Configuration for each usecase

1. Scaling usecase

This section describes an example of convolution coefficient setting in 1/2 scaling case. Output pixels in RAW scaled image is calculated by convolution operation using the pixel surrounding the current pixel. Its convolution coefficient is switched on a pixel-by-pixel of the output image. Figure 54.33 shows an example of calculation of pixels of RAW scaled image.

This section describes the principle of calculation for each pixel of a RAW scaled image using Figure 54.33. However, convolution kernel shown in this section is just an example. Actual setting of convolution coefficients are configurable. If there are any other more optimized coefficients or kernel window setting, it is possible to apply these optimized settings.

(a) Pixel calculation of RAW scaled image

To calculate the pixels corresponding to the R component, extract the R component pixels of the input RAW image and perform convolution operation. For example in Figure 54.33, the output pixel Q(4,2) at “Output Image” is regarded as R component in the Bayer array. Therefore, in calculating Q(4,2), a convolution operation is performed with the input pixel P(8,4) (=R4) as the center, and the R component pixels around it are extracted.

The calculation of the G and B component pixels of RAW scaled output image is the same as for the R component

In Figure 54.33, the output pixel Q(3,2) is regarded as G component in the Bayer array. Therefore, in calculating Q(3,2), a convolution operation is performed with the input pixel P(7,4) (=G2) and P(6,5) (=G3) as the center and the G-component pixels around it are extracted.

In Figure 54.33, the output pixel Q(3,1) is regarded as B component in the Bayer array. Therefore, in calculating Q(3,1), a convolution operation is performed with the input pixel P(7,3) (=B4) as the center, and the B component pixels around it are extracted.

(b) Selection of convolution coefficient

Convolution coefficient is switched by pixel-by-pixel. To specify appropriate convolution coefficients coefficient select table (*coeff_select_table*)is used. The *coeff_select_table* determines the index number of convolution coefficient set to be applied in the above convolution operation, using the remainder of the X and Y coordinates of the input RAW image divided by 4 as the index of this table (X denotes a horizontal location, and Y denotes a vertical location). Here, *coeff_select_ table(0,0)* denotes the case where the X and Y coordinates of the input RAW image are both multiples of 4.

Since R component pixels are located at coordinates *(4*I,4*j), (4*i+2,4*j), (4*i+2,4*j)* and *(4*i+2,4*j)* in the input image (*i* and *j* are integer) , *coeff_select_table(0,0), (2,0), (0,2), (2,2)* specifies the index number of the convolution coefficient for calculating the R component. However, considering 1/2 scaling, coordinate of R component pixels in the input image which will be output after 1/2 scaling is only *(4*i,4*j)*. Other R component pixels located at *(4*i+2,4*j), (4*i+2,4*j)* and *(4*i+2,4*j)* will not be output. Therefore, in the setting of coeff_seletct_table, coeff_select_table(2,0), (0,2), (2,2) should be set to 15, which represents the pixel output OFF.

Regarding *coeff_select_table* for G and B component is same as for the R component.

Figure 54.34 is an example of *coeff_select_table* setting, where 0-th convolution coefficient set is used to calculate R-component, 1st convolution coefficient set is used to calculate G-component, and the 2nd convolution coefficient set is used to calculate B component of output image.

Considering 1/2 scaling, *(4*i,4*j)* in input RAW image corresponds to the *(2*i,2*j)* in output RAW image, and it is regarded as R-component. *(4*i+3,4*j+3)* in input image corresponds to the *(2*i+1,2*j+1)* in output image, and it is regarded as B-component. *(4*i+3,4*j)* and *(4*i+3,4*j)* in input image corresponds to the *(2*i+1,2*j) and (2*i,2*j+1)* respectively in output image, and these are regarded as G-component. Other pixels are not output, so coeff_select_table for other pixels are set to 15.

(c) Register setting

Figure 54.35 is a register setting of convolution coefficient and coeff_select_table in 1/2 scaling use-case. Here, r0,r1,…r8 and g0,g1,…g8 and b0, b1, … b8 in Figure 54.34 and Figure 54.35 are setting value of convolution coefficient. The following is an example of a specific value of convolution coefficient. This example shows decimal point of coefficient value is represented with 12 bit precision. Note that this is just one example, and the coefficient value itself is configurable.

coef.	setting value	real number value
r0	6	0.001
r1	592	0.145
r2	6	0.001
r3	592	0.145
r4	1657	0.405
r5	592	0.145
r6	6	0.001
r7	592	0.145
r8	6	0.001

coef.	setting value	real number value
b0	6	0.001
b1	592	0.145
b2	6	0.001
b3	592	0.145
b4	1657	0.405
b5	592	0.145
b6	6	0.001
b7	592	0.145
b8	6	0.001

coef.	setting value	real number value
g0	1205	0.294
g1	1205	0.294
g2	717	0.175
g3	717	0.175

If the Bayer array is not RGGB order, such BGGR, etc., it can still be handled by setting the coeff_select_table to an appropriate value.

2. RGB-IR conversion

This usecase targets color filter array conversion from 4x4 RGB-Ir to Bayer. This conversion is called as “RGB-IR conversion” in the following description. Similar to the “1.Scaling usecase”, actual setting value of convolution coefficients in this case are also configurable. It is possible to adapt its value according to the applications.

(a) B component pixels

In RGB-Ir conversion, the Ir component is located at the coordinates where the B component is located in RGGB type Bayer array. Therefore, the B component pixel at the same position is calculated by interpolating from rounding B component pixels in RGB-Ir format.

There are 2 formulas for interpolation according to coordinate of B component pixels in RGB-Ir format. Regarding B component pixels located at *(4*i+1,4*j+1)* and *(4*i+3,4*j+3)*, B component pixel for interpolation is placed at upper right and lower left from its center in RGB-Ir format. Therefore B component pixel is calculated by (B_ur+B_ll)/2 in this case, where B_ur denotes upper right pixel and B_ll denotes lower left pixel. Regarding B component pixel located at *(4*i+3,4*j+1)* and *(4*i+1,4*j+3)*, B component pixel for interpolation is placed at upper left and lower right from its center. Therefore B component pixel is calculated by (B_ul+B_lr)/2 in this case, where B_ul denotes upper left pixel and B_lr denotes lower right pixel

(b) R component pixels

In 4x4 RGB-Ir format, R component pixels are not fully existing. In Bayer format, R component pixels exist in 2 step increments in the horizontal and vertical directions, such as at (0,0), (0,2), (2,0), (2,2) coordinate In RGB-Ir format, R component pixels exists in 4 step increments, such as at (0,0), (0,4), (4,0), (4,4) coordinate. In order to convert to Bayer format, interpolation using the surrounding R component pixels in RGB-Ir format is needed for R-component pixels located at at *(4*i,4*j+2)* or *(4*i+2,4*j)* or *(4*i,4*j+2)* such as (0,2), (2,0) or (2,2). On the other hands, regarding R component pixels located at *(4*i,4*j)* or *(4*i+4,4*j)* or *(4*i,4*j+4)* , interpolation is not needed, and the output R component pixel can be get by pass-though without any calculation.

(c) G component pixels

Regarding G component pixels, since the location of G component pixels do not change before and after conversion, it is treated as a pass-through. Therefore, convolution coefficient should be set as pass-through, i.e. center coefficient is set to 1 and other ones are set to 0.

(d) Register setting

Register setting for RGB-Ir conversion to realize above mentioned interpolation is shown in Figure 54.38. In Figure 54.38, each coefficient value is represented by 8 bit fixed-point number. Therefore, H’100 represents 1.0, H’80 represents 0.5, and H’40 represents 0.25 respectively.

(e) Ir pixel handling

When applied above mentioned settings, RAW scaler itself discards Ir pixels. In order to capture Ir pixels, use a other channel which is not enabled RAW scaler output (channel with SEL_RAW_SCALED=0) and apply line count filter setting and de-interleave filter setting into this channel.

Regarding line count filtering, apply the settings that only odd-numbered lines in one frame are acquired. Regarding de-interleaving filter, apply the settings to pick up only odd-numbered pixels in one line.

Figure 54.38 Register setting of coefficient value and coefficient select table (RGB Ir conversion and 8 bit fixed-point precision)

54.4.9.5 Precision of convolution coefficient

The convolution coefficients which are set to the COEFF[s]_* registers are defined as fixed-point number. The bit width of the decimal area in fixed-point representation is determined by the $conv_rshift(s)$ and $input_lshift$.

$conv_rshift(s)$ and $input_lshift$ are configured by CONVs_RSHIFT (s=0,1,2,3) and INPUT_LSHIFT reigster respectively. For example, in the case of 8-bit precision, the INPUT_LSHIFT and CONVs_RHISFT registers should be set to 8. In this case, the lower 8 bits of the coefficient value in COEFF[s]_* are regarded as the decimal point area.

54.4.9.6 Toggle timing of VSYNC, HSYNC and DE in RAW scaler output pixel stream

RAW scaler discards incoming VSYNC, HSYNC and DE signals in input pixel stream. RAW scaler newly generates VSYNC, HSYNC and DE signals of output pixel stream from RAW scaler. Toggle timing of these sync signals are controlled by VBLANK_FE_CYCLE, VBLANK_FS_CYCLE, HBLANK_CYCLE, FRONT_PORCH_CYCLE, BACK_PORCH_CYCLE, VS_HS_RISE_CYCLE, VS_HS_FALL_CYCLE registers. Unit of each register is “cycle”.

It is necessary to set the value such that subsequent IPs (VIN or ISP core) can correctly capture the output pixel stream from RAW scaler. See Figure 54.39 for the effect of each register.

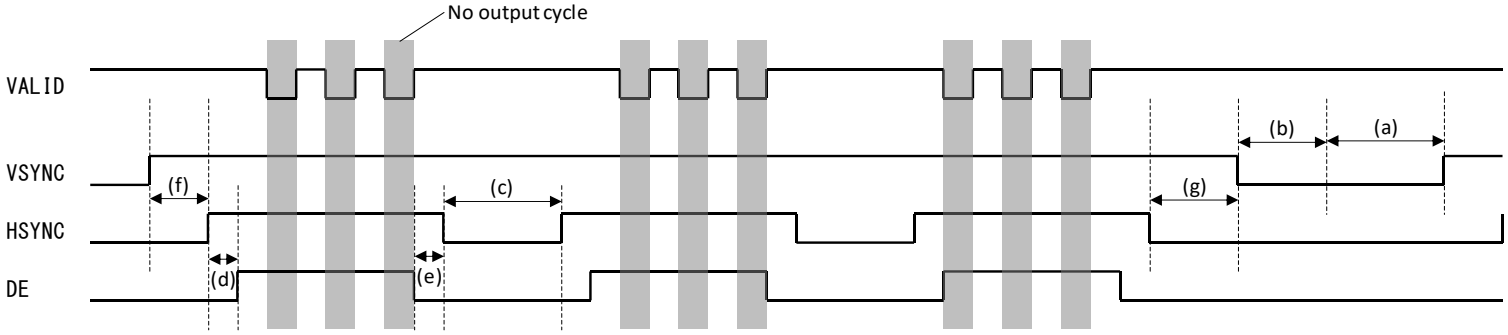

Figure 54.39 Toggle timing of VSYNC, HSYNC and DE of RAW scaler output

Correspondence of symbol (a), (b), (c), (d), (e), (f), (g) in Figure 54.39 to each register is shown as below

Symbol	Register
(a)	VBLANK_FS_CYCLE
(b)	VBLANK_FE_CYCLE
(c)	HBLANK_CYCLE
(d)	FRONT_PORCH_CYCLE
(e)	BACK_PORCH_CYCLE
(f)	VS_HS_RISE_CYCLE
(g)	VS_HS_FALL_CYCLE

54.4.10 Configuration DMA

Configuration DMA (Config DMA) is a function which realizes ISP core register setting by using DMA. Configuration data (a sequence of pair of register address and write data for writing to the ISP core) which is stored in main memory (DRAM) is read by DMA, and this configuration data is applied to the ISP core.

DMA transfer is realized by VSPX. VSPX reads configuration data via RPF0 (Read Pixel Formatter), and read RAW image via RPF0 and RPF1. RPF0 is used both configuration data and RAW image. Image data transfer and configuration data transfer via RPF0 is done at separate times and cannot be done simultaneously.

-RPF0 : ISP input RAW image (long exposure). Register configuration data

- RPF1 : ISP input RAW image (short exposure)

- RPF2 : Not used

- RPF3: Not used

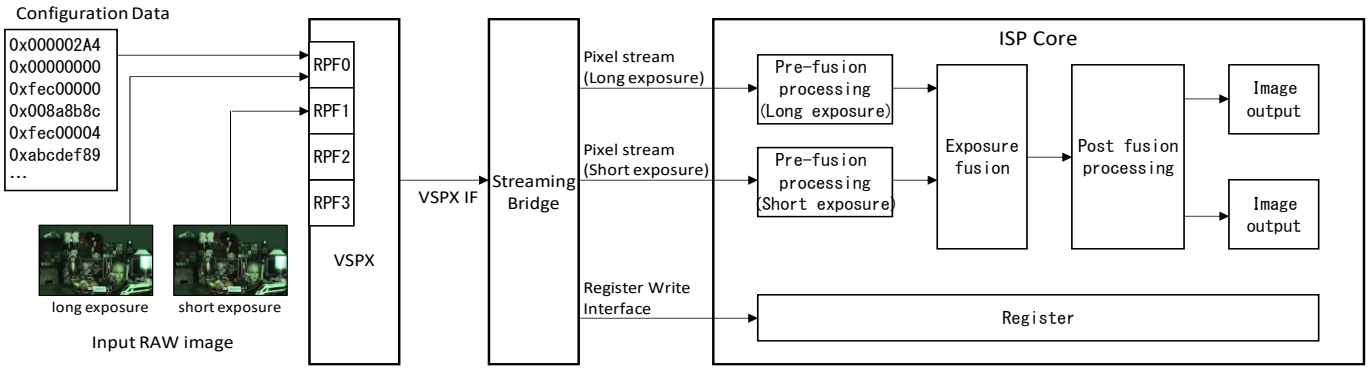

Figure 54.40 Concept of configuration DMA

- Structure of configuration data
  - Configuration data is a sequence of pair of register address and register writing data for ISP core. As a memory image, it is a sequence of alternating register address and writing data are
  - The first word denotes a length of configuration data (number of pairs of register address and register writing data)
  - The second word denotes Reserved Data. It should be H'0000 0000.
  - Sequence of pairs of (Register Address, Write data) is followed by the Reserved Data. The number of pair is shown by the first word.
  - Following is an example which shows that configuration data is consist of 674 pairs of (Register Address, Write data) .

H'0000_02A4	Length of Configuration data. 674 (=H'2A4) pairs of (Register Address, Write Data) are followe by the "Reserved Data")	
H'0000_0000	Reserved Data (Should be H'0000_0000)	
H'FEC0_0000	Register address 0	Number of (Register Address, Write Data) pair is 674
H'008A_8B8C	Write data 0	
H'FEC0_0004	Register address 1	
H'ABCD_EF89	Write data 0	
...	...	
...	...	
H'FEC0_1384	Register address 673	
H'FFFF_FFFF	Write data 673	

Figure 54.41 Data structure of config data

- Display list for VSPX (VSPX-DL) for configuration DMA
  - A dedicated VSPX-DL for configuration data transfer is needed. This VSPX-DL is defined as "Configuration VSPX-DL" in the following description. Therefore, 2 types of VSPX-DL should be prepared. One is a VSPX-DL for input image transfer, -- this is defined as "Image Data VSPX-DL" in the following description --, and the another one is the Configuration VSPX-DL.
  - Start address of Image Data VSPX-DL is set into pNext_header field in the Configuration VSPX-DL.
  - Start address of Configuration VSPX-DL for subsequent frame is set into pNext_header field in the Image Data VSPX-DL, when different configuration from a previous frame is applied.
  - By setting pNext_header field for each VSPX-DL, sequence structure of VSPX-DLis realized

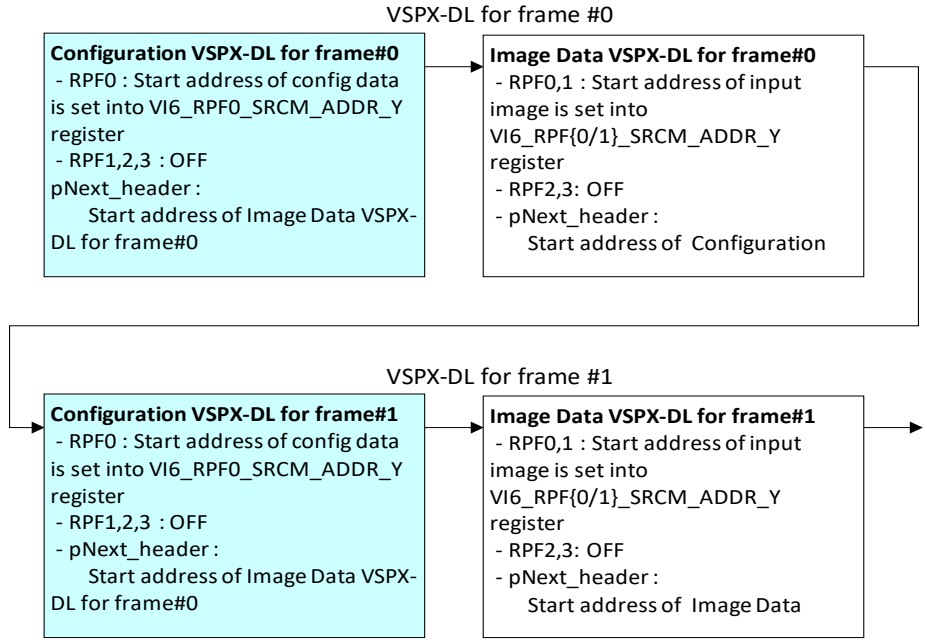

Figure 54.42 Sequence structure of VSPX-DL

- Setting of VI6_WPFn_SRCRPF register
  - Setting of RPFn_ACT[1:0] (n=0,1,2,3) field in VI6_WPFn_SRCRPF register is required in order to transfer input image and configuration data.

- RPFn_ACT[1:0] setting for Image Data VSPX-DL and Configuration VSPX-DL is shown as following table. Regarding other bit field, VIR_ACT[1:0] should be 0 and VIR_ACT2[1:0] should be 0

	RPF3_ACT[1:0]	RPF2_ACT[1:0]	RPF1_ACT[1:0]	RPF0_ACT[1:0]
Image Data VSPX-DL (single exposure case)	B'00	B'00	B'00	B'10
Image Data VSPX-DL (dual exposure case)	B'00	B'00	B'01	B'10
Configuration Data VSPX-DL	B'00	B'00	B'00	B'10

- According to the above table, VI6_WPFn_SRCRPF in Image Data VSPX-DL should be set as H'0000_0002 (single exposure) or H'0000_0006 (dual exposure).
- According to the above table, VI6_WPFn_SRCRPF in Configuration VSPX-DL should be set as H'0000_0002.
- See the VSPX manual for bit field definition of VI6_WPFn_SRCRPF register.

- Setting of VI6_DPR_RPF0_ROUTE
  - For routing configuration data read via RPF0 to the register write interface of ISP core, VI6_DPR_RPF0_ROUTE register should be set to H'1A.
- Setting of VI6_IIF_CTRL.CTRL register and ISP_STREAMER_CONFIG_DMA_CONTROL.BYTE_PER_WORD register
  - For setting of data format of configuration data, VI6_IIF_CTRL.CTRL and ISP_STREAMER_CONFIG_DMA_CONTROL.BYTE_PER_WORD should be set according to the following.

Register	Setting value
VI6_IIF_CTRL.CTRL	H'13
ISP_STREAMER_CONFIG_DMA_CONTROL.BYTE_PER_WORD	B'00

- When using Config DMA, display list of VSPX and ISP_STREAMER_CONFIG_DMA register should be set. Regarding register setting, both ISP_STREAMER_CONFIG_DMA_CONTROL.ENABLE0 register and ISP_STREAMER_CONFIG_DMA_CONTROL1.ENABLE1 register should be set to 1.
- Only memory-to-memory operation is supported when using Config DMA. Start trigger of input image under control from CPU.
- Register access from CPU to the ISP core during config DMA is running are forbidden. By reading ISP_STREAMER_CONFIG_DMA_STATUS.CONFIG_DMA_READY_BUSY register, status whether config DMA is running or not can be known. If register access to the ISP core during config DMA running is needed, it is necessary to wait completion of config DMA. See the 54.5.2 for detail.

54.4.11 Output DMA

A DMA function is implemented on the output side of ISP. This DMA function is a rectangle-based DMA, which transfers stream data output from ISP to the external memory (DRAM) in the form of 2D rectangle data via AXI interface. This DMA has three types of functions, DMA for output image transfer (Image Output DMA), DMA for histogram data transfer (Histogram Output DMA) and DMA for defect pixel information transfer (Defect Pixel Information DMA) . To use the output DMA, it is necessary to set related registers. However, do not overwrite registers related to DMA during ISP running.

54.4.11.1 Image Output DMA

1. Operation

Image output DMA setting is used to transfer and store ISP output image to the external memory (DRAM).

- Register set for each image

There are two types of ISP output image (human vision image and machine vision image), and DMA settings are required for each of this two types of output images. Use the ISPCORE_DMA_IMAGE[0]_* register to set the human vision image (HV image), and use the ISPCORE_DMA_IMAGE[1]_* register to set the DMA for the machine vision image (MV image).

- Pixel format settings

Figure 54.43 shows example settings for the various formats listed under "Pixel Format" in the table. However, it does not describe settings for all case of pixel bit width. The number of pixel bit width for each color component can be set independently. In this case, pixel bit width for each color component should be less or equal to the maximal depth provided by the ISP shown in Figure 54.45. For example, “YUV422, 12Y, 12UV for HV image” pixel format in HV image, the bit depth that can be set for Y and UV components must be less than 12 bits.

PIXEL_POSITION.LSB_COMPc, PIXEL_BITWIDTH_MINUS1.BW_MINUS1_COMPc, and PIXEL_BPP.BPP_COMPc (c is index of color components, c=0,1,2,3) register should be set according to the pixel format of the HV images and MV images.

Pixel bit width for each color component is set by using PIXEL_POSITION and PIXEL_BITWIDTH_MINUS1 registers . For example, in 12 bit pixel case such as Y12 in YUV422 in HV image, Y component is packed between bit-23(MSB) and bit-12(LSB) according to Figure 54.43. Therefore, PIXEL_POSITION.LSB_COMP1=12 and PIXEL_BITWIDTH_MINUS 1.BW_MINUS1_COMP1 = 11 (=12 -1) .

- Base address and stride

For the start address of the output image, use the BASE_ADDRESS register to specify the start address of the output image for each component. For example, in the case of RGB images, set the starting address of the R component image to the BASE_ADDRESS_COMP0 register, the starting address of the G component image to the BASE_ADDRESS_COMP1 register, and the B component image to the BASE_ADDRESS_COMP2 register. In this case, the output image is 3-plannar RGB format.

Base address of output image must be aligned to 256 bytes boundary. So, setting value of BASE_ADDRESS_COMPc (c=0,1,2,3) must be multiple of 256.

As for the stride (line offset) of the output image, use the STRIDE register to set the value of the stride of the output image in bytes for each component. The setting value of this register does not depend on the pixel format or the number of bytes per pixel. For example, in the case of the RGB image, set the stride of the R component image to the STRIDE_COMP0 register, the stride of the G component image to the STRIDE_COMP1 register, and the stride of the B component image to the STRIDE_COMP2 register.

Stride, i.e., the setting value of STRIDE_COMPc (c=0,1,2,3) register, must be a multiple of 256.

- Register settings for each frame

The pixel format, start address, and stride settings described above are set individually for each frame. The FRAME[n] keyword in the register name identifies the frame number. The [n] in FRAME[n] denotes the remainder of the frame number divided by 4, i.e., use FRAME[0] for DMA settings for frames 0, 4, 8, …, and FRAME[1] for frames 1, 5, 9, …..

- AXI transaction ID

AXI transaction ID (AWID, WID, BID) can be set individually for each component. AXI_ID.AXI_ID_COMP0 register is the AXI transaction ID for component 0 (R component for RGB images), AXI_ID.AXI_ID_COMP1 register is the AXI transaction ID for component 1 (G component for RGB images), and AXI_ID.COMP2 register is the AXI transaction ID for component 2 (B component for RGB images).

- AXI burst length

The AXI burst length is fixed and is specified by ISPCORE_DMA_IMAGE[k]_AXI_CONFIG.BURST_LENGTH_ MINUS1 register. This register is set to the AXI burst length minus one. The supported burst length is only 8. Therefore, the ISPCORE_DMA_IMAGE[k]_AXI_CONFIG.BURST_ LENGTH_MINUS1 should be set to 7.

- Activation (enabling) of DMA

By setting 1 to the ISPCORE_DMA_IMAGE[k]_AXI_CONFIG.DMA_ENABLE register, the image output DMA is activated.

- Flush out setting

If ISP output image is used immediately after the end of frame interrupt is asserted, a flush out setting is needed for flushing out the remained data in image output DMA pipeline at the end of frame. To use flushing out, set the PADDING_EOF register to a non-zero value.

The minimum value for ISPCORE_DMA_IMAGE[k]_FLUSH_OUT.PADDING_PIXEL_EOF (hereafter, called PADDING_EOF) register is 512, and setting value of this register must be a multiple of 256. On the other hand, considering the data transfer of output image on SoC memory bus, larger value for this register is better. In this case, the setting value of this register should be obtained based on the image width (unit is pixel).

If image width is not a multiple of 256, the PADDING_PIXEL_EOF register should be set to a value that is both greater than image width and a smallest value in a multiple of 256. For example, if image width is 770 (=256x3+2) pixel, then the setting value of PADDING_EOF register is 1024 (256x4). If image width is not a multiple of 256, set the PADDING_EOF register to the image width value.

- Back Pressure Stopping

ISPCORE_BACK_PRESSURE.BP_STOP_MODE register is used to set enable/disable of back pressure stopping control. By default, back pressure stopping is enabled.

When back pressure stopping control is enabled, if the memory bandwidth of AXI write from ISP is insufficient, the ISP processing pipeline is automatically paused according to the AXI write response latency. In addition, during ISP pipeline is paused stopping signal is asserted to VSPX, and pixel streaming from VSPX to ISP is also stopped. That is, pixel streaming from VSPX is stopped in conjunction with ISP pipeline pause. This control can prevent ISP output images from collapsing due to insufficient memory bandwidth for ISP.

When back pressure stopping control is enabled, ISPCORE_BACK_PRESSURE.BP_THRESHOLD register must be set to 1

	Pixel Format	Register Settings

Figure 54.43 Setting examples for some pixel format

2. Packing Format and storing image on external memory

This section describes data image for the 3 observation points (A), (B) and (C). The location of each observation points for (A), (B) and (C) is shown in Figure 54.44.

Observation point (A) is the pixel stream port that connects the ISP processing pipeline to the DMA function, and is the data path for one packed pixel per one clock.

Observation point (B) is AXI Write channel, indicating the packing of the WDATA[255:0] signal.

Observation point (C) indicates the rectangle based storing format of the image data in the external memory (DRAM).

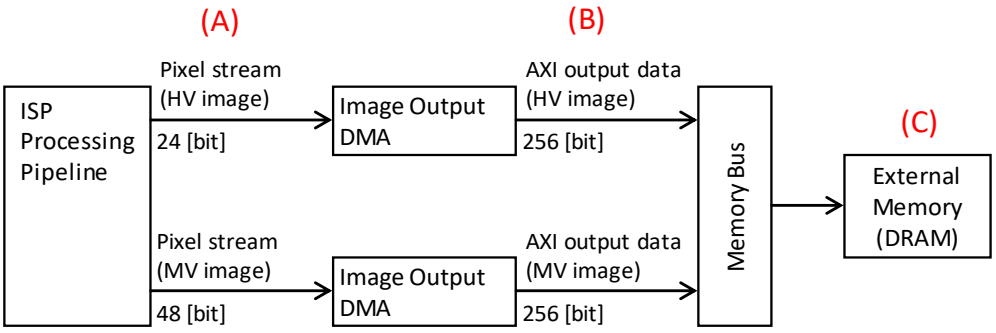

Figure 54.44 Observation points of pixel packing

Packing format on pixel stream port (Observation point (A)) for each pixel format is shown in the Figure 54.45. This packing shown in the Figure 54.45 is fixed by the ISP IP specification, and the allocation of each bit cannot be changed.

Note: There are no specific setting for “YUV422, 8Y,8V” in the ISP IP. In case of “YUV422, 8Y,8V”, the same setting as “YUV422 12Y, 12UV” should be applied to the ISP IP. By applying the setting shown in the Figure 54.43 to the image output DMA, upper 8 bit value in 12 bit pixel is extracted and transferred to the external memory.

Note: There are no specific setting for “YUV420, 8Y,8V” in the ISP IP. In this case, the same settings as for “YUV420 12Y, 12UV” should be applied to the ISP IP. This is the same concept as in case of “YUV422, 8Y, 8UV”, i.e., extracting upper 8 bit value in 12 bit pixel.

Figure 54.45 Pixel packing format on observation point (A) (24bit@HV image, 48bit@MV image)

Packing format on the AXI interface (observation point (B)) for each pixel format and component is shown in Figure 54.46 and Figure 54.47. These figures show the bit allocation in the form of a 32-bit area extracted from the AXI WDATA[255:0]. This bit allocation appears when the value shown in Figure 54.43 is applied to the Image Output DMA.

Figure 54.48 shows the storing format on the external memory (observation point (C)) in the RGB16 format case. Each of the components is assigned a separated memory area. B, G and R components are separated and expanded into three rectangular areas in the external memory.

In this format, one pixel uses 2 bytes (2 byte per pixel). One line (W pixel) in one frame uses 2xW bytes. Line offset (stride) for each components are specified by the STRIDE_COMPn (n=0,1,2) register (unit is byte). Therefore, start address of each line is calculated by BASE_ADDRESS_COMPn + STRDE_COMPn * h (h is line index).

3. Operation of Frame Count Register

Image Output DMA has 4 planed cyclic frame buffer. This is implemented in both Image DMA for HV (HV image DMA) and Image Output DMA for MV (MV image DMA). Each plane is switched frame by frame. Thus, plane index (frame buffer index) is incremented at the timing when the final pixel in one frame is transferred from ISP Core.

By using the ISPCORE_DMA_IMAGE[k]_FRAME_MONITOR.FRAME_COUNT register (hereafter it is referred to as FRAME_COUNT register), it is possible to know which buffer was used (frame buffer index) most recently. This section describes a recommended operation to use FRAME_COUNT register.

- Assumptions

There are several prerequisites to use FRAME_COUNT register.

- The memory bandwidth for the writing output image from ISP must be sufficient to transfer the real-time input image.
- The flush completion time (T1) of the previous frame must be before the start timing of pixel input (T2) of the following frame (T1<T2). For detail of T1 and T2, refer to Figure 54.49. If this assumption is not satisfied, pixels of subsequent frames are input during processing the previous frame. It results an overflow of the pixel acquisition FIFO in the ISP core.

- Operations

Before starting ISP processing, an interrupt which is asserted at VSYNC rising edge (v_start_edge interrupt) as a interrupt source is enabled. By this setting, an interrupt to be issued when the first pixel is input to the ISP Core. When detecting interrupt from the ISP core, the processing shown below is performed depending on each interrupt factor.

(1) If interrupt source is VSYNC rising edge interrupt, read the FRAME_COUNT register of HV image DMA and MV image DMA. The value of each read should be retained.

(2) If interrupt source is HV image output completed (rpp_out_frame_out), the modulo divided by 4 of the read value at (1) is used as a frame buffer index for the HV image

(3) If interrupt source is MV image output completed (mv_out_frame_out), the modulo divided by 4 of the the read value at (1) is used as a frame buffer index for the MV image.

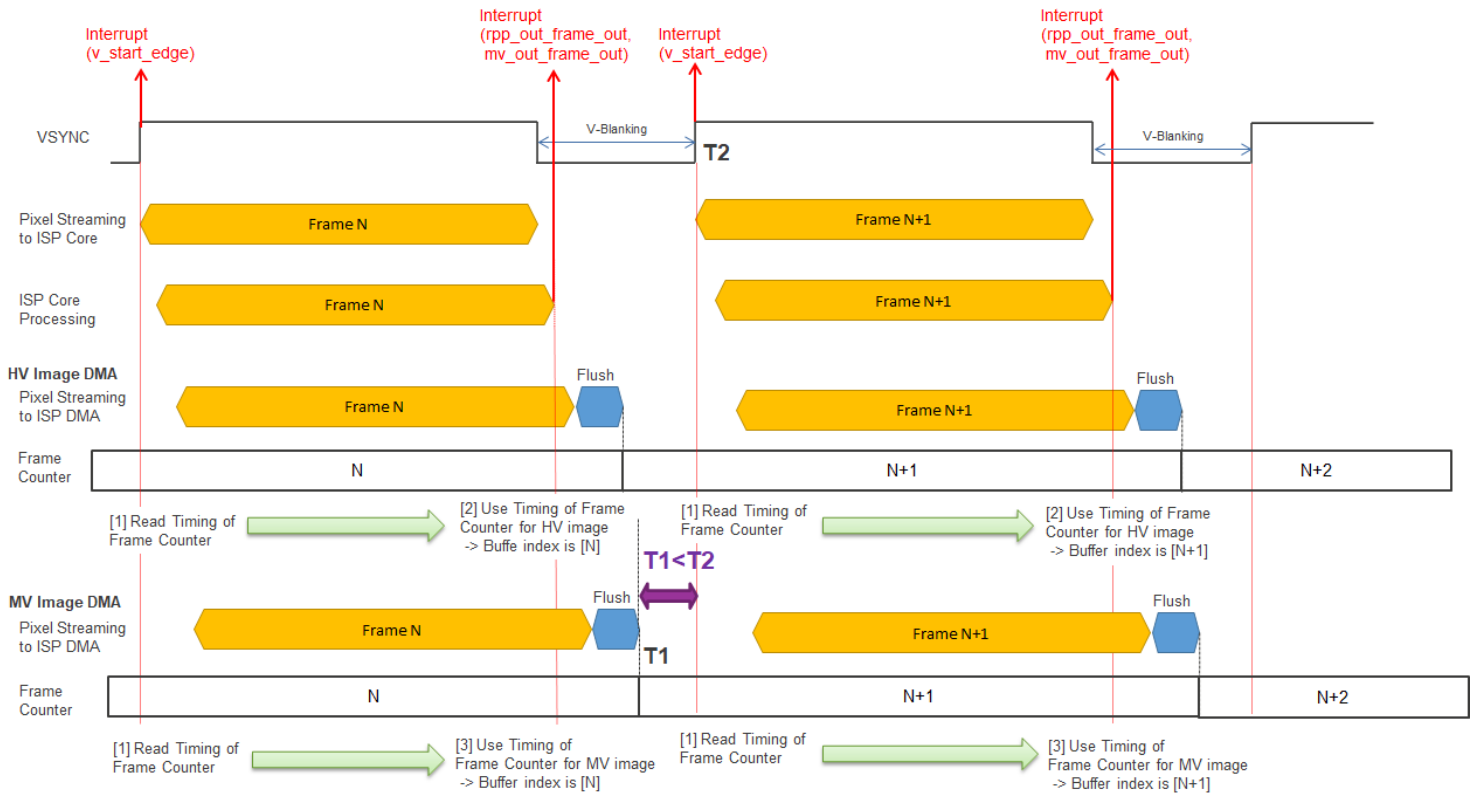

Figure 54.49 Timing chart of frame count register operation.

54.4.11.2 Histogram Output DMA

Histogram Output DMA transfers 1024 bin histogram data which is streamed out from ISP to the external memory via AXI as 2D rectangle data. The stored histogram data on the external memory consists of [64 bin per line] x [16 lines] rectangle format, and its stride is fixed at 512 bytes

1. Operation

- Activation of histogram output

  In order to stream out histogram data from ISP, it is necessary to activate histogram output function. For more information, please refer to the user's manual released from ISP IP developer.

- Base address (start address)

Base address (start address) of histogram data is specified by ISPCORE_DMA_HISTOGRAM_BASE_ADDRESS_ FRAME[n] register. Same as Image Output DMA, [n] in "FRAME[n]" denotes the remainder of the frame number divided by 4.

Set the start adderss of the histogram data for frame 0, 4, 8.,,, to the ISPCORE_DMA_HISTOGRAM_BASE_ ADDRESS_ FRAME[0]. The same applies to the other frames.

- AXI burst length

Setting register for AXI burst length is shared to the Image output DMA (human vision image). So, ISPCORE_DMA_ IMAGE[0]_AXI_CONFIG.BURST_LENGTH_MINUS1 is also used for histogram. Same as image output DMA, this register is also should be set to7.

- Activation (enabling) of DMA

Setting register of activation of histogram output DMA is shared to the Image Output DMA (human vision image). So, when enabling Image output DMA by setting 1 to ISPCORE_DMA_IMAGE[0]_AXI_CONFIG.DMA_ENABLE register, then histogram output DMA is activated automatically

2. Memory image

Memory image stored on external memory is shown in Figure 54.50. One word (1 bin) of histogram data is 4 bytes, and 64 bins (256 byte data) make up one line. By aligning one line histogram data (64 bins) for 16 lines, the histogram data of one frame (1024bins) is composed and output to the external memory. The line offset, i.e. stride is always 512 bytes (fixed). Therefore, the latter 256 bytes area in one line is reserved area.

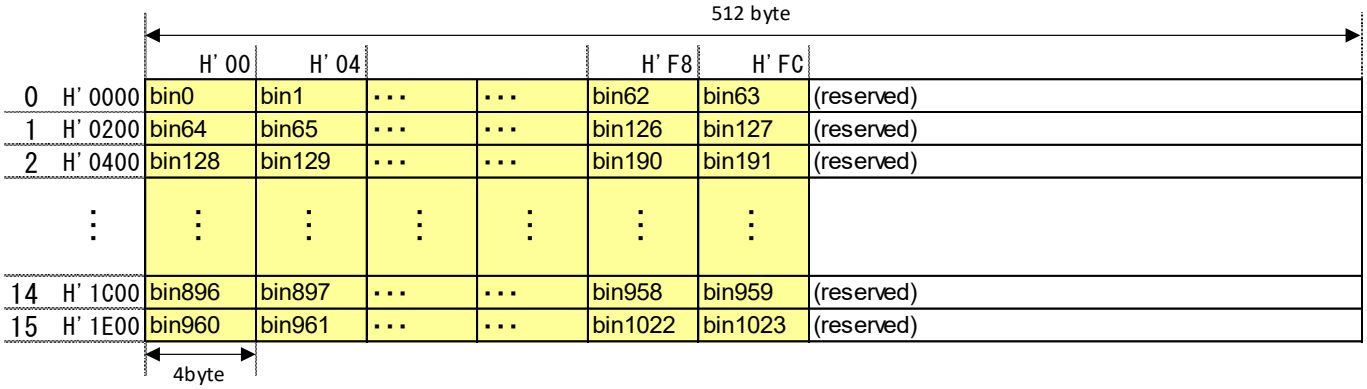

Figure 54.50 Memory image on DRAM of Histogram Data

54.4.11.3 Defect Pixel Information DMA

Defect pixel information is a sequence of coordinate of defect pixels included in one input frame. Defect pixel information DMA transfers defect pixel information which is streamed out from ISP to the external memory via AXI.

Defect pixel information DMA uses 64 bit type AXI (AXI64) interface. There are 2 ports of AXI 64 interface. Each AXI64 port is assigned each pre-fusion pipe of ISP IP.

1. Operation

- Activation of defect pixel correction

  In order to stream out defect pixel information from ISP, it is necessary to activate defect pixel correction. For more information, please refer to the user's manual released from ISP IP developer.

- Base address (start address)

Base address (start address) of defect pixel information is specified by ISPCORE_DMA_DPCC[k]_BASE_ADDRESS_ FRAME[n] register. The index [k] in "DPCC[k]" denotes a index of pre-fusion pipe of ISP IP. DPCC[0] means pre-fusion pipe1 (long exposure pipe) and DPCC[1] is pre-fusion pipe2 (short exposure pipe), respectively.

The index [n] in "FRAME[n]" denotes the remainder of the frame number divided by 4. Set the start adderss of the defect pixel information for frame 0, 4, 8.,,, to the ISPCORE_DMA_DPCC[k]_BASE_ ADDRESS_ FRAME[0]. The same applies to the other frames.

- AXI burst length

AXI burst length is fixed and is specified by ISPCORE_DMA_DPCC[k]_AXI_CONFIG.BURST_LENGTH_MINUS1 register. The supported burst length is only 8. Therefore, ISPCORE_DMA_DPCC[k]_AXI_CONFIG.BURST_LENGTH_MINUS1 must be set to 7.

- Flush out setting

  After all defect pixel information in one frame has been output from ISP, flush out operation should be executed for the DMA. For the flushing out operation, DPCC_PADDING_EOF register should be set to 16.

  With this setting, after the final word of defect pixel information is output from the ISP at the end of one frame, the DMA writes the defect pixel information data that remains in the DMA (such as internal FIFO of DMA) to the memory by writing padding data.

- Activation (enabling) of DMA

By setting 1 to the ISPCORE_DMA_DPCC[k]_AXI_CONFIG.DMA_ENABLE register, the defect pixel information DMA is activated.

2. Memory image

Memory image stored on external memory is shown in Figure 54.52, Figure 54.53 and Figure 54.54. In these figures, M is the number of defect pixel information (length of defect pixel information).

One word (4bytes) of defect pixel information is described as DP(*i*) (*i*=0,1,…M-1). DP(*i*) shows the coordinate of detected defect pixel in the ISP. Therefore, the defect pixel information that is output to the the external memory is composed a sequence of DP(*i*).

Following the final data of defect pixel information, an end code (EndC: H'FFFFFFFF) is output from ISP. Even if length of defect pixel information is 0 (M=0), this end code H'FFFFFFFF is output from ISP when ISP is configured as defect pixel detection function is enabled.

Following the end code, padding code (PadC:H'FFFFFFFE) is output from DMA. These padding codes are generated by the DMA for the purpose of flushing out the defect pixel information which are remained at the internal FIFO of DMA.

As shown in these figures, padding codes are output until it reaches the aligned length to the AXI burst length boundary (8 burst: 64 byte). Notes that 16 must be set in the DPCC_PADDING_EOF register in order for padding data to be output as shown in these figures. However, in case of M=16×n+15, padding code is not output because the length M including the end code is aligned to the AXI burst length.

The 64-byte area following the padding area should be reserved as a reserved area (forbidden use). This area is prohibited to use.

EndC = H'FFFFFFFF
PadC = H'FFFFFFFE

Figure 54.54 Memory image on defect pixel information (In case of M=16×n+14 and M=16×n+15)

3. Upper limitation of length of defect pixel information.

- By setting the ISPCORE_DMA_DPCC[j]_PIXEL_COUNT.DPCC_PIXEL_COUNT_MAX register (hereafter it denoted as DPCC_PIXEL_COUNT_MAX) , it is possible to set the upper limit of length of defect pixel information to be written to the memory.
  - The maximum value of that can be set in this register is 16384
- With this setting, even if the length of defect pixel information (number of defect pixel coordinate) output from the ISP IP exceeds the DPCC_PIXEL_COUNT_MAX register setting, no more than the DPCC_PIXEL_COUNT_MAX setting value will be written to the memory.
- If the length of defect pixel information output from the ISP IP exceeds the DPCC_PIXEL_COUNT_MAX register, then interrupt status ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCCn (n=1, 2) is asserted.
  - Setting of ISPCORE_DMA_DPCC[0]_PIXEL_COUNT.DPCC_PIXEL_COUNT_MAX corresponds to the ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCC1
  - Setting of ISPCORE_DMA_DPCC[1]_PIXEL_COUNT.DPCC_PIXEL_COUNT_MAX corresponds to the ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCC2
- By writing 0 to the ISPCORE_DMA_DPCC[0]_STATUS.DPCC_COUNT_OVER register, then the status bit of interrupt status register ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCC1 can be cleared to 0.
- By writing 0 to the ISPCORE_DMA_DPCC[1]_STATUS.DPCC_COUNT_OVER register, then the status bit of interrupt status register ISPCORE_INT_STATUS.DPCC_PIXEL_COUNT_OVER_DPCC2 can be cleared to 0.
- By reading ISPCORE_DMA_DPCC[j]_PIXEL_COUNT.DPCC_PIXEL_COUNT register, it is possible to observe the actual length of defect pixel information output from the ISP IP. The read value of this register includes the number of one word of the end code (H'FFFFFFFF). This register is not affected by the upper limit setting by the

DPCC_PIXEL_COUNT_MAX register. Therefore, the true length of defect pixel information output from the ISP IP is observed from this register.

54.4.12 Initialization of SRAM EDC error flag

The SRAM used in ISP has an error detection function by using EDC (Error Detection Code). After powering (*1) on the ISP and before starting the ISP processing, undefined values are stored in these SRAM. Therefore, an EDC error of the SRAM (hereafter, SRAM EDC error) is always detected when the first frame of the ISP is processed.

To avoid these phenomena, it is necessary to initialize the SRAM and clear notification flag of the SRAM EDC error which are defined in ISPERRn_STATUS register, before starting the original processing of the ISP. The procedure is shown below.

- After power on of the ISP, set a larger image width value than the image width of target image for processing by the ISP, and then execute one frame processing.
  - For example, if the image width of the target image for the original ISP processing is W [pixel], set a value of W+2 [pixel] or higher as the image width.
  - At this time, setting of the image height is arbitrary, but at least 40 lines or more and with minimal impact on processing time is recommended. Also, the content of the input image at this time is arbitrary. This procedure corresponds to the processing with a dummy image input.
- After one frame processing of the ISP at this setting is finished, refer to the ISPERRn_STATUS register and check the bit that is set to 1 in this register. Regarding detail of ISPERRn_STATUS register, see the 54.4.7.
- By writing 1 to the target bit of the ISPERRn_CLEAR register, clear the target bit in the ISPERRn_STAUS register. Regarding the clearing method, see the 54.4.7.
  - When clearing the error flag, all bits in the ISPERRn_STATUS register can be cleared at once by writing H'FFFFFFFF to ISPERRn_CLEAR register.
- Thereafter, the original processing by the ISP is executed.

(*1) This initialization needs to after the module stop (MSTP) ON/OFF and the real time test (RTT).

54.5 Usage Notes

When using the ISP core, note the following points.

54.5.1 Notes of register access

54.5.1.1 Access size of register

Access size of each register should be 32 bit. Access size other than 32 bit is not supported

54.5.1.2 Unassigned offset address

Write access to the un-assigned offset address in register address area is forbidden. Do not write to address which offset is not assigned.

54.5.1.3 Write access of reserved bits or un-used bits

Do not write any different value from its initial value to reserved bits or un-used bits. Note that there are some writable bits (R/W) in reserved bits or un-used bits in each register.

54.5.2 Register access from host CPU during running ISP

54.5.2.1 Basic principle of availability of register access

The availability of register access from host CPU while the ISP is running depends on the address region to be accessed and whether Config DMA is used or not, as specified in the Table 54.55 and Table 54.56.

However, all of register settings (configuration of ISP) should be completed before ISP running. Write access during ISP running is prohibited regardless of the address region or whether Config DMA is used or not. During ISP running, do not change any settings.

Table 54.55 Availability of register access during ISP running (Config DMA is not used)

	Address region (ISP ch0)	Address region (ISP ch1)	Read	Write
ISP Interface	H'FED00000 ~ H'FED0FFFF	H'FED20000 ~ H'FED2FFFF	Available	Forbidden (*2)(*3)
ISP Core	H'FEC00000 ~ H'FEC7FFFF	-	Available	Forbidden(*2)
	H'FEC80000 ~ H'FEC8FFFF	-	Available	Forbidden(*2)

Table 54.56 Availability of register access during ISP running (Config DMA is used)

	Address region (ISP ch0)	Address region (ISP ch1)	Read	Write
ISP Interface	H'FED00000 ~ H'FED0FFFF	H'FED20000 ~ H'FED2FFFF	Available	Forbidden (*2)(*3)
ISP Core	H'FEC00000 ~ H'FEC7FFFF	-	NotAvailable (*1)	Forbidden (*1)(*2)
	H'FEC80000 ~ H'FEC8FFFF	-	NotAvailable (*1)	Forbidden (*1)(*2)

(*1) When Config DMA is used register access is not available. However, in order to access this area during ISP running, following procedure is needed. Set the ISP_STREAMER_CONFIG_DMA_CONTROL.ENABLE0 register to 0 after receiving an interrupt for the notification of Config DMA transfer completion from VSPX. In addition, set the ISP_STREAMER_CONFIG_DMA_CONTROL.CONFIG_DMA_ENABLE register to 1 before restarting the Config DMA transfer when resuming ISP processing, such as when starting the processing of the next frame. However when using this procedure, do not use the display list link function in VSPX. In this case, switching between configuration data transfer and image data transfer should be done manually.

(*2) This "Forbidden" means that it is prohibited to overwrite the setting of ISP during ISP is running. However, regarding registers related to interrupt functions (e.g. interrupt clear register, interrupt mask register, etc.) and registers such as those with shadow register structure (see the IP manual for details), write access is available.

(*3) However, write access is available regarding registers shown in 54.5.2.2.

54.5.2.2 Configuration of Streaming Bridge during running capture operation

Regarding registers listed in the following, the values themselves can be written even during the Channel Selector is running (after writing 0xFFFF to START_ISP register, and while the Channel Selector routes pixel streams from CSI). However, rewriting is not allowed while configuration data transfer and image data transfer to the ISP core are in operation. It is basically recommended to complete the setting of these registers before starting and to hold its value.

- ISP_STREAMER_MODE
- ISP_STREAMER_V_BLANK
- ISP_STREAMER_H_BLANK
- ISP_STREAMER_CONFIG_DMA_CONTROL
- ISP_STREAMER_CONFIG_DMA_CONTROL1
- ISP_STREAMER_CONFIG_DMA_CONTROL2

54.5.3 Waiting period from clear timing of module reset to the register access to ISP.

At the timing of reset clear, ISP starts internal initialization processing. User shall wait for completion of this process, and see 54.4.3.1.12 or 54.4.3.2.16 for the actual value of it.

54.5.4 Synchronized system with IMR

54.5.4.1 Boot up sequence between ISP and IMR

Boot up sequence should keep the first is IMR and the second is ISP. You should finish boot up sequence and configuration of IMR before starting boot up operation of ISP.

54.5.4.2 Power domain for WUP signals

The WUP signals output from ISP are connected to IMR via C4 domain.

54.5.4.3 Module standby mode

When forcibly stopping the clock of the related modules to synchronization, a critical inconsistency may occurs and it may bring hung-up. Take care not to bring inconsistency when executing module stop operation.

54.5.4.4 Configuration period at frame boundary timing

IMR should be configured at frame boundary timing of every frame. You should keep enough period for this configuration. You should restrict content of configuration so that this configuration has been completed during vertical blanking period. Mainly, configuration at this time is consist of address register setting.

54.5.5 Restrictions of maximum pixel throughput

54.5.5.1 Restrictions in MIPI CSI-2 input

Restriction in MIPI CSI-2 input case is based on the input pixel rate. It is defined as the value obtained by the division number of active pixels per one horizontal line (1H period) by total time per 1H period including horizontal blanking for each inputs. It depends on parameters defined per 1 line for each 4 input ports. Actual parameters are image width

[pixel], number of bit per one pixel [bit/pixel] and horizontal blanking period [ns] as differentiated parameters for each inputs, and CSI bit rate, number of lanes and number of padding cycles at the end of long packet to push CSI FIFO (PADDING_NUM register) as common parameters. Considering these parameters, input pixel rate is calculated by the following equation.

$$Input_pixel_rate\ [Mpixel/s] = \frac{Number\ of\ pixel\ in\ 1H\ peiord}{Time\ in\ 1H\ period}$$

$$= \frac{\sum_{k=1}^{4}\left\{WIDTH(k)\ +\ \frac{32 \times A}{bpp(k)}\ \right\}}{\sum_{k=1}^{4}\left\{\frac{WIDTH(k)\ \times\ bpp(k))}{CSI_rate\ \times\ lane} + h_blank(k)\ \right\}} \ldots (1)$$

Take care that the input pixel rate should be less than upper limitation, which is shown in the 'Maximum pixel throughput' in 54.1.1. If input pixel rate exceeds this limitation, then pixel stream to input the ISP core is corrupted because CSI FIFO inside Channel Selector block (see the Figure 54.5) overflows. Overflow of CSI FIFO is notified as FIFO_FULL_CSI_INPUT interrupt. See 1.4.7 for more information.

Definition of each variable in equation (1) is shown in Table 54.27. When developing imaging application/system with the ISP, user should confirm that the input pixel rate for each use-case does not exceed the upper limit.

Table 54.27 Definition of variables in equation (1)

Variables	Definition	Unit
N	Number of active input ports (*N*=1,2,3,4)	
WIDTH(k)	Number of pixels per one line (image width) of the k-th input (*k*=1,⋯*N*)	[pixel]
bpp(k)	Number of bits per one pixel of the k-th input (*k*=1,⋯*N*). When pixel format of input port 1 is RAW20 format, then *bpp(k)* = 20	[bit/pixel]
H_blank (k)	Horizontal blanking period of the k-th input image (*k*=1,⋯*N*) It is obtained by specification of connected image sensors.	[s]
A	Value of PADDING_NUM register. Number of padding cycles to push CSI FIFO at the end of every long packet.	
CSI_rate	Bit rate of CSI interface per one lane	[bit/s]
Lane	Number of active lane of CSI interface.	

Examples of calculation are shown in Table 54.28. Notes that if calculated input pixel rate exceeds the upper limit, then its configuration is invalid.

Table 54.28 Example of input pixel rate

Parameters	Variables	Example1	Example2	Example 3
Number of active input	*N*	4	4	4
Image width [pixel]	*WIDTH(k)*	1920 (common)	1920 (common)	1920 (common)
Number of bits per pixel [bit/pixel]	*bpp(1)*	20	20	20
	bpp(2)	20	16	16
	bpp(3)	20	16	16
	bpp(4)	20	12	12
Horizontal Blanking [ns]	*H_blank(1)*	500	500	500
	H_blank(2)	500	2000	500
	H_blank(3)	500	2000	500
	H_blank(4)	500	2500	500
PADDING_NUM register	*A*	256	256	256
Bit rate of CSI interface [Gbit/s]	*CSI_rate*	1.5	1.5	1.5
Number of lane	*Lane*	4	4	4
Input pixel rate [Mpixel/s]		337.6	356.5	435.8

54.5.5.2 Impact on memory bandwidth

ISP performance is affected by the memory bus bandwidth of SoC. The available memory bandwidth for ISP can be configured by QoS setting. Therefore, note that pixel throughput (pixel rate) of ISP may vary depending on the QoS setting.

54.5.6 Pixel format of CSI-2 long packet

Figure 54.57 ~ Figure 54.63 show packed pixel format of incoming CSI-2 long packet for each pixel format. Pixel reconstructor converts it to the “1 pixel per clock” format so that ISP core can receive. In MIPI CSI-2 V1.1 standard, RAW16, RAW20 and RAW24 are not defined. Therefore, these formats are treated as combination of two sequential received pixels.

1. Pixel reconstruction of RAW16 format

Pixel reconstructor processes RAW16 pixel as combination of two sequential received RAW8 pixels

The 1st RAW8 pixel corresponds to the upper half of RAW16 pixel (A[15:8] or B[15:8]).

The 2nd RAW8 pixel corresponds to the lower half of RAW16 pixel (A[7:0] or B[7:0]) .

2. Pixel reconstruction of RAW20 format

Pixel reconstructor processes RAW20 pixel as combination of two sequential received RAW10 pixels

The 1st RAW10 pixel corresponds to the upper half of RAW20 pixel (A[19:10] or B[19:10]).

The 2nd RAW10 pixel corresponds to the lower half of RAW16 pixel (A[9:0] or B[9:0]).

3. Pixel reconstruction of RAW24 format

Pixel reconstructor processes RAW24 pixel as combination of two sequential received RAW12 pixels

The 1st RAW12 pixel corresponds to the upper half of RAW24 pixel (A[23:12] or B[23:12]).

The 2nd RAW12 pixel corresponds to the lower half of RAW16 pixel (A[11:0] or B[11:0]).

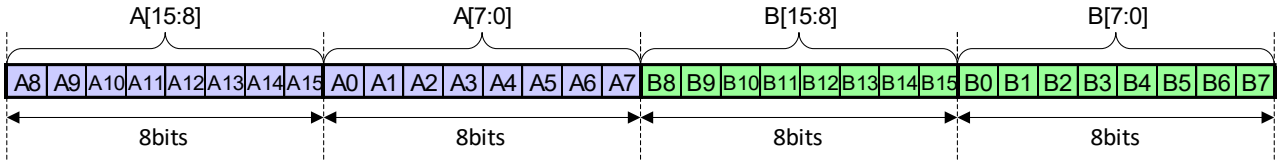

Figure 54.61 Packed pixel format of RAW16

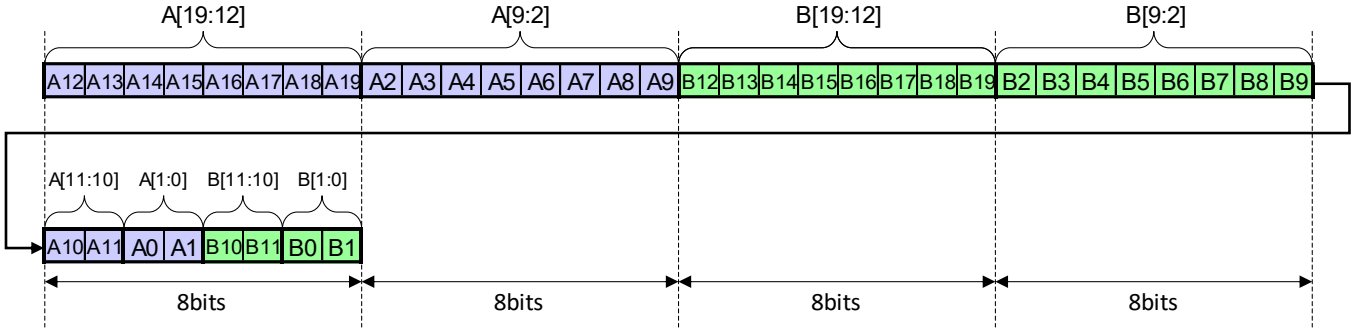

Figure 54.62 Packed pixel format of RAW20

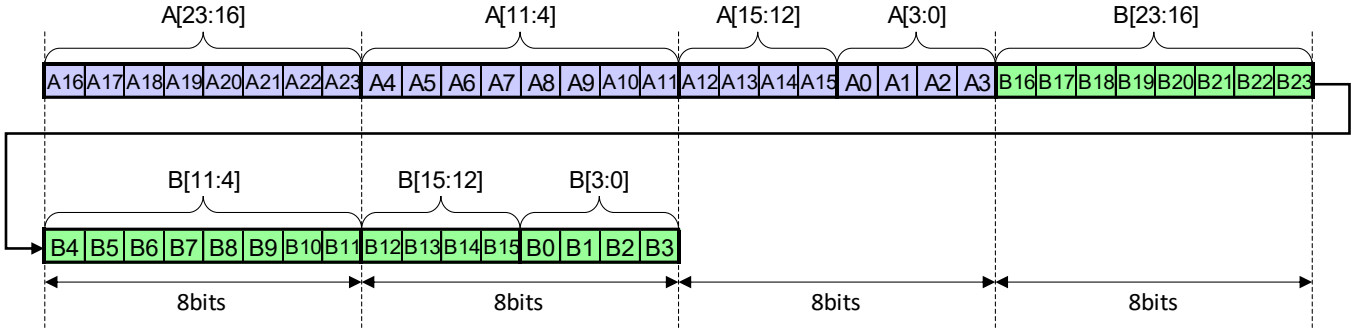

Figure 54.63 Packed pixel format of RAW24

54.5.7 Notes resuming operation after Runtime Test

After the Runtime Test is executed following (i) and (ii) must be applied
(i) Explicitly module resetting by using CPG register
(ii) After (i), 5000 [cycle] waiting

54.5.8 Notes related to RAW Scaler

- When using RAW scaler, RAW_SCALER.IMAGE_WIDTH register should be set a value with adding +1 from image width of input image
- RAW scaler is available at single exposure only. It does not support multiple exposure use-case.

54.5.9 Notes related to image width

When RAW scaling is disabled, image width of incoming image from CSI should always be multiple of 2. Only even value is available (odd value is forbidden)

When RAW scaling is enabled, image width of incoming image from CSI should always be multiple of 4 in order to keep even number of image width after scaled to 1/2 at RAW scaler.

54.5.10 Notes related to setting of Output DMA (Image Output DMA, Histogram Output DMA and Defect Pixel Information DMA)

Image output DMA does not have any mechanism to avoid 4k boundary address crossing. 4k boundary address crossing shall be avoided by setting of base address and stride registers.

Setting value of base address register of the output image (BASE_ADDRESs_COMPc (c=0,1,2,3)) must be a multiple of 256.

Setting value of STRIDE_COMPc (c=0,1,2,3) must be a multiple of 256. Since the unit of the STRIDE_COMPc (c=0,1,2,3) is 'byte', so only multiples of 256 bytes can be set for image stride.

Supported AXI burst length is 8 beat only. Therefore, setting value of AXI_CONFIG.BURST_LENGTH_MINUS1 must be set to 7.

54.5.11 Notes of additional memory area of flush out (Image Output DMA)

When using flush out setting (54.4.11.11), an additional memory area is required to store the pixels to be output by flush out operation to the memory area for rectangle image data. Pixel output by flush out operation is called as "padding pixel". This additional area is required for each component of the output image data (rectangle data) and must be a predetermined length starting from the next address of the final data of rectangle data (rightmost of bottom edge) .

Length of additional area *L(c)* for each component *c* is calculated by following formula.

$$L(c) = ceiling(BPP(c) \times WIDTH,\ 256) - BPP(c) \times WIDTH + BPP(c) \times FLUSH[byte]$$

$$ceiling(x, base) = \left\lceil \frac{x}{base} \right\rceil \times base$$

BPP(c) is byte per pixel of component *c* (In RGB, *c=0,1,2*. In YUV422, *c=0,1*).

WIDTH is number of pixels per one line, i.e. image width (horizontal length) of ISP output image.

FLUSH is setting value of ISPCORE_DMA_IMAGE[k]_FLUSH_OUT.PADDING_PIXEL_EOF register (*k*=0, 1). The value of *FLUSH* is always a multiple of 256.

Figure 54.64 shows a memory image of padding area.

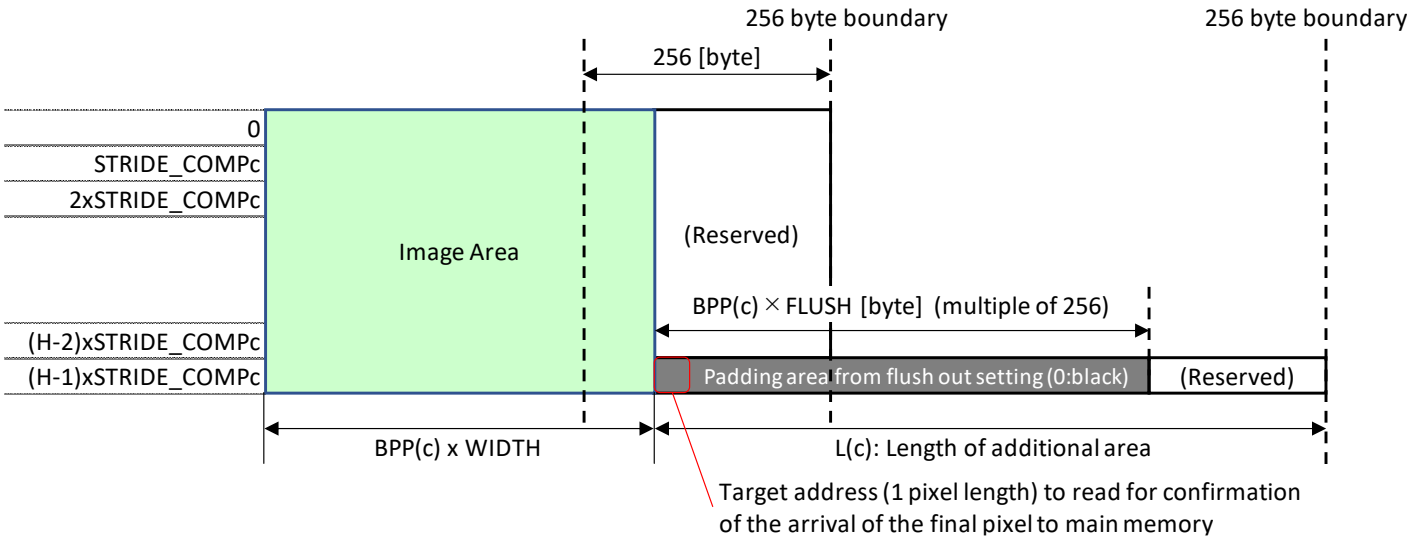

Figure 54.64 Memory Image of padding pixel

54.5.12 Notes on judgement of completion of ISP processing.

In order to accurately detect the completion of ISP processing after asserting the end-of-frame interrupt from ISP, flush out setting (54.4.11.11) is needed.

By flush out setting, remained pixels in DMA pipeline is pushed out to the main memory by padding pixel generated in DMA. Therefore, it is necessary to wait until the final pixel in one frame (the rightmost pixel of the bottom edge line in one frame) arrives in the main memory.

Pixel value of padding area is always 0 (black) (see Figure 54.64). Read the next address area to the final pixel (the area where padding pixel is stored), and confirm that the read value is 0. However, this address area is filled by 0 at every frame, so it is necessary to write explicitly non-zero value to this address area before starting one frame processing of ISP. Therefore, process flow of this sequence is shown in the following.

1. Setting non-zero value to the next address area to the final pixel.
2. Start to run ISP (one frame processing) with flush out setting.
3. Waiting end-of-frame interrupt from ISP
4. Read the next address area to the final pixel
5. If read value is 0 (black), then finish the current frame. If read value is not 0 return to 4.

Actual address to set checking value (non-zero value) and to read check is derived from rectangle size (width and height) of ISP output and stride according to Figure 54.64.

54.5.13 Notes on Module Reset/Module Stop

Before applying Module Reset/Module Stop to the ISP, execute the procedure described in 54.5.12. Module Reset/ Module Stop shall be asserted after confirming that the final pixel of the ISP output image has been written to the main memory. Assert of Module Reset/Module Stop without following the procedure described in 54.5.12 is prohibited.

54.5.14 Notes on using Channel Selector with Sync Interval Checker in VIN or Pixel/Metadata Counter

When using Sync Interval Checker in VIN or Pixel/Metadata Counter to execute capturing operation while counting the number of pixels in one frame, configuration of Horizontal clipping described in 54.4.2.16 is required.

This is because the Pixel Reconstructor processing generates padding pixels at the end of one line, which are transferred to VIN following the active pixel data. This padding data is generated in the process of unpacking the packed pixel data at the rightmost area in one frame according to the MIPI CSI-2 standard, and its amount depends on the pixel format. This phenomenon does not affect the capture operation of the active pixel area, but when observing the image width, it may make a wrong judgment due to the padding pixel.

By using the Horizontal clipping function, it is possible to prevent padding pixels from being transferred. Set the ISPCS_H_CLIP_DT_CODE[h]_CH[d].PREPENDED_PIXEL register (hereafter, denoted as APPENDED_PIXEL) and ISPCS_H_CLIP_DT_CODE[h]_CH[d].APPENDED_PIXEL register (hereafter, denoted as APPENDED_PIXEL) according to the image width. For example, if the image width is 1920 pixels, setting PREPENDED_PIXEL=0 and APPENDED_PIXEL=1920 will transmit only 1920 pixel areas starting from the leftmost pixel. This prevents the transfer of padding pixels generated in the Pixel Reconstructor processing.

Therefore, when using Sync Interval Checker or Pixel/Metadata Counter together, activate the Horizontal clipping in order to pass only valid pixel areas. Note that in the setting examples listed in 54.4.2.2, Examples 1~5, the Horizontal clipping register are examples with default values and these settings do not activate Horizontal clipping operation.

54.5.15 Notes on HSYNC Rise Count Checker at Sync Interval Checker in VIN

Regarding the behavior of the filter function described in 54.4.2.1, the Channel Selector sets an invalid value (low) to the Data Enable signal (named as CLKENB at VIN) at the line or pixel blocked by the filter. In the other hand, the HSYNC signal is passed through even if the corresponding line or pixel are blocked. That is, the HSYNC signal is propagated to VIN regardless of whether it is blocked or passed through.

For example, as shown in Figure 54.65, this example shows that 5 lines (a), (b), (c), (d), and (e) are input to the filter. Line (a), (c) and (e) represent one line which are sent as a long packet belonging to VC0. Line (b) and (d) represent one line which are sent as a long packet belonging to VC1. And Figure 54.65 shows an example where only the lines corresponding to VC0 is passed through and transferred to VIN.

At this time, when blocking the line (b) and (d), the Channel Selector controls the CLKENB signal on lines (b) and (d) to the invalid side (low), but the HSYNC signal during the same period remains valid value (high).

This example shows the result of filter processing by the VC Filter, but the same applies to other filters. That is, even filters other than the VC Filter control the CLKENB signal, and the HSYNC signal is passed through regardless of the filter processing result.

Considering above mentioned behavior, when counting the rise edge of HSYNC using the Sync Interval Checker in VIN, the number of rise edge of HSYNC is counted at the timing of line (b) and (d) even if these lines are blocked by the filter.

Therefore, it is necessary to set the number of HSYNC rise edge count at the HSYNC Rise Time Measurement in VIN considering the number of long packets (*) transmitted from CSI during the observation period (active period of VSYNC).

(* The number of long packets is equal to the rise count of HSYNC)

Similarly, registers related to the HSYNC Toggle Cycle Measurement in VIN shall also be set based on the above specification. See the section 55. Video Input Module (VIN) for more information on these registers.

If 5 lines (a), (b), (c), (d), and (e) are input to CSI, as shown in Figure 54.65, the maximum number of rise edge of HSYNC should be set as 5, even if the image size (number of line) to be captured by VIN is 3 lines. In particular, when using multiple sensors, the maximum number of rise edge of HSYNC should be set to the total number of lines transmitted from each sensor within the observation period.

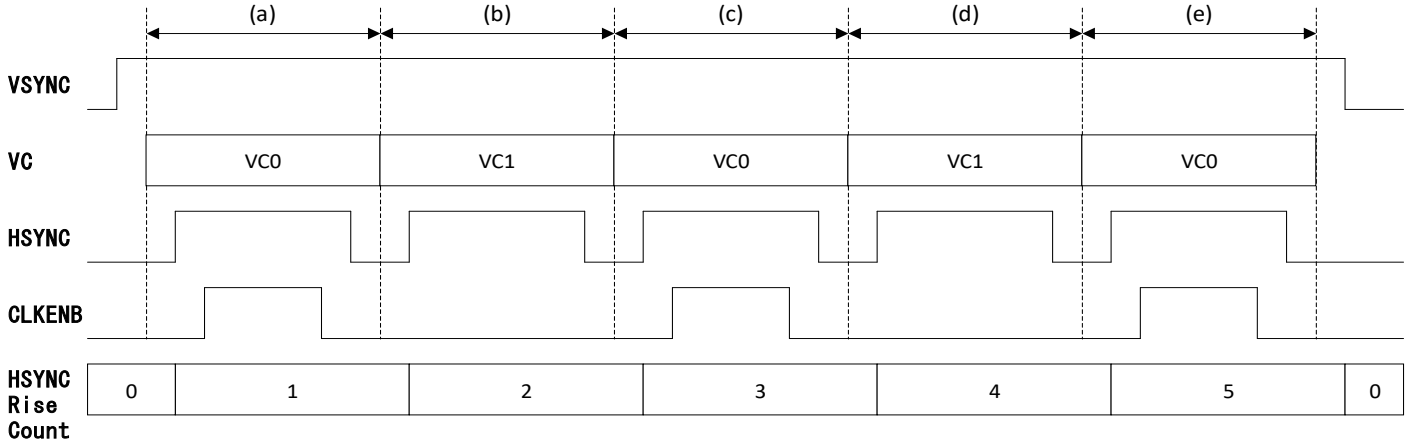

Figure 54.65 Timing example of VSYNC, HSYNC and CLKENB for VIN

54.5.16 Notes on using the HIST256/AWB/LSC function

Notes on using the Histogram (HIST256) function:

- Note that for continuous processing of frames, there is no direct support for on-the-fly switching between the different inputs. For input channel switching with intermediate reset, it is mandatory to execute the following programming sequence after frame processing and before reset:
  RPP_MAIN_PRE1_HIST256_CHANNEL_SEL = 0
  RPP_HDR_UPD = 1
  It is recommended to also set all other registers of the module RPP_MAIN_PRE1_HIST256 to their reset values and confirm with RPP_HDR_UPD = 1 before the reset.

Notes on using the Auto White Balance Measurement function:

- For correct operation it is mandatory that the module is disabled during configuration. The generic recommended way is to disable the module before configuration with RPP_MAIN_POST_AWB_MEAS_PROP::awb_mode = 0 and enable after configuration with RPP_MAIN_POST_AWB_MEAS_PROP::awb_mode = 2.
  Alternatively, a not-recommended disable/enable cycle after configuration works as well.

Notes on using the Lens Shade Correction function:

- Programming sequence for retriggering the prefetch: For disable:
  RPP_MAIN_PRE1_LSC_CTRL = 0x0
  RPP_HDR_UPD::regs_cfg_upd = 0x1
  This sets the internal status of LSC to disabled.

  Set each parameter configuration for LSC For enable:
  RPP_MAIN_PRE1_LSC_CTRL = 0x1
  RPP_HDR_UPD::regs_cfg_upd = 0x1
  This sets the internal status of LSC to enabled.

  In option to perform the same results without CPG Reset, use the following setting order:
  1. CPG Reset
  2. LSC Table(Previous)
  3. LSC Enable
  4. LSC Table(Current)

54.6 Safety Mechanism (SM)

54.6.1 EDC for SRAM in the ISP and Channel Selector

1. Overview

EDC protection is applied to SRAMs in the ISP and Channel Selector.

2. Hardware Description

Table 54.66 shows a SRAM list in the ISP core which are protected by EDC.
If an EDC error in these SRAM is detected, then ISPERR*n*_STATUS register (*n*=0,3) is updated.

Table 54.67 shows a SRAM list in the Channel Selector which are protected by EDC. If an EDC error in these SRAM is detected, then ISPERR*n*_STATUS register (*n*=1,2) is updated.

To use this function, the initialization of SRAM EDC error flag is required before operating the ISP. See the 54.4.12 for details.

Table 54.66 SRAM list in ISP Core

SRAM Name	Block	Category	EDC protected
RPP_MAIN_PRE1_ACQ_FIFO_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for input FIFO	Yes
RPP_MAIN_PRE1_LSC_R_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE1_LSC_GR_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE1_LSC_B_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE1_LSC_GB_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE1_DPCC_MEM	rpp_main_pre1	SRAM for local storage	Yes
RPP_MAIN_PRE1_DPCC_BPRAM_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE1_DPF_MEM	rpp_main_pre1	SRAM for local storage	Yes
RPP_MAIN_PRE2_ACQ_FIFO_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for input FIFO	Yes
RPP_MAIN_PRE2_LSC_R_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_LSC_GR_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_LSC_B_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_LSC_GB_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_DPCC_MEM	rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_DPCC_BPRAM_MEM	rpp_main_pre1, rpp_main_pre2	SRAM for local storage	Yes
RPP_MAIN_PRE2_DPF_MEM	rpp_main_pre2	SRAM for local storage	Yes
RPP_RMAP_PINTL_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_PINTS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_PINTVS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_BLMFL_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_BLMFS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_BLSFL_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_BLSFS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_DELAYL_MEM	rpp_rmap	SRAM for local storage	Yes

RPP_RMAP_DELAYS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_RMAP_DELAYVS_MEM	rpp_rmap	SRAM for local storage	Yes
RPP_MAIN_POST_FILT_MEM	rpp_main	SRAM for local storage	Yes
RPP_MAIN_POST_LTM0_MEM	rpp_main	SRAM for local storage	Yes
RPP_MAIN_POST_LTM1_MEM	rpp_main	SRAM for local storage	Yes
RPP_MAIN_POST_LTM2_MEM	rpp_main	SRAM for local storage	Yes
RPP_MAIN_RGBDENOISE_MEM	rpp_main	SRAM for local storage	Yes
RPP_MAIN_POST_SHRPCNR_MEM	rpp_main	SRAM for local storage	Yes
RPP_HDR_MV_OUT_RAM_MEM	mv_out	SRAM for local storage	Yes
RPP_OUT_CONV_420_MEM	rpp_out	SRAM for local storage	Yes

axviff_spram_awchmem_128w256b	AXI FIFO	SRAM for AXI FIFO	No
axviff_spram_awchmem_128w6b	AXI FIFO	SRAM for AXI FIFO	No

Table 54.67 EDC protected SRAM list in Channel Selector

SRAM Name	Block	Category	EDC protected
CSI FIFO SRAM	Pixel Reconstructor	SRAM for FIFO of Pixel Reconstructor	Yes
Line Memory SRAM	RAW Scaler	Line Memory of RAM Scaler	Yes

3. Control Register

(a) Control Register for EDC for SRAM in the ISP core.

There are no control register which selects enable/disable of this SM. This SM is always enabled.
By using ISPERR*n*_ENABLE register (*n*=0, 3), enable/disable selection for each error notification to ECM can be controlled.
If ISPERR*n*_ENABLE.EN*k* is set to 1, then error is notified to ECM.
If ISPERR*n*_ENABLE.EN*k* is set to 0, then error is not notified to ECM
In both case, status bit in ISPERRn_STATUS*n*.ST*k* is updated when error is occurred.
k is derived from the tables shown in the 54.4.7.3 for bit assignment of each enable bit in ISPERR*n*_ENABLE register.

(b) Control Register for EDC for SRAM in the Channel Selector.

There are no control register which selects enable/disable of this SM. This SM is always enabled.
By using ISPERR*n*_ENABLE register (*n*=1,2), enable/disable selection for each error notification to ECM can be controlled.
If ISPERR*n*_ENABLE.EN*k* is set to 1, then error is notified to ECM.
If ISPERR*n*_ENABLE.EN*k* is set to 0, then error is not notified to ECM
In both case, status bit in ISPERRn_STATUS*n*.ST*k* is updated when error is occurred.
k is derived from the tables shown in the 54.4.7.3 for bit assignment of each enable bit in ISPERR*n*_ENABLE register.

54.6.2 EDC with ID Checker for Channel Selector Data Path

1. Overview

EDC protection with ID is applied to pixel data in the data path of channel selector in order to detect fault in the filter processing (VC filter, line count filter, meta data filter, Horizontal/Vertical clipping and de-interleaving filter).

2. Hardware Description

(a) EDC check of filter chain in Channel Selector (ID='B00)

At the input of each filter chain in the Channel Selector, an EDC code is calculated for the pixel value with a 2-bit ID code (2'B00) added. At the output of the final stage (de-interleaving filter) of the pipeline, EDC checking is performed. If

EDC error issued, then ISPERR1_STATUS. CHANNEL_SELECT_CHn_ERROR (n is an index of each channel) is asserted. See the 54.4.7.3 for bit assignment of each error status in ISPERR1_STATUS register.

(b) Control Register

There are no control register which selects enable/disable of this SM. This SM is always enabled.

By using ISPERR1_ENABLE register, enable/disable selection for each error notification to ECM can be controlled.

If ISPERR1_ENABLE.EN*k* (*k*=8~19) is set to 0, then error is not notified to the ECM.

If ISPERR1_ENABLE.EN*k* (*k*=8~19) is set to 1, then error is notified to the ECM.

In both case, status bit in ISPERR1_STATUS.ST*k* (*k*=8~19) is updated when error is occurred.

See the 54.4.7.3 for bit assignment of each enable bit in ISPERR1_ENABLE register.

54.6.3 ECC check of CSI header of long packet and CRC check of CSI long packet payload

1. Overview

ECC (error check code) is applied to incoming CSI header of long packet. Correction feature of ECC is not supported, and only VC 0 to 3 is supported for checking. ECC checker must be disabled in case that VC 4 to 15 is used.
ECC check is used only for D-PHY mode.

CRC (cyclic redundancy check) is applied to incoming CSI long packet payload.

Check timing of CRC is at the rising edge of Hsync on the next line.

The CRC Check timing of last line of the frame is carried over until the rising edge of Hsync in the next frame.

CRC check is not performed at the rising edge of Hsync immediately after starting ISP (ISPSTART_[c]).

2. Hardware Description

Channel Selector calculates ECC and CRC of incoming CSI long packets and compares it with its expected value transferred with pixel data from CSI-2 link. If calculated ECC/CRC and its expected value is mismatch, then ISPERR1.STATUS.ST4 (CSI_ECC_ERROR) or ISPERR1_STATUS.ST5 (CSI_CRC_ERROR) is updated.

The unexpected error of CRC may be notified, therefore the status of ISPERR1_STATUS.ST5 can be ignored.

3. Control Register

There are no control register which selects enable/disable of this SM. This SM is always enabled.
By using ISPERR1_ENABLE register, enable/disable for each error notification to ECM can be controlled

If ISPERR1_ENABLE.EN*k* (*k*=4,5) is set to 0, then error is not notified to the ECM.

If ISPERR1_ENABLE.EN*k* (*k*=4,5) is set to 1, then error is notified to the ECM.

In both case, status bit in ISPERR1_STATUS.ST*k* (*k*=4,5) is updated when error is occurred.

See the 54.4.7.3 for bit assignment of each enable bit in ISPERR1_ENABLE register.

ISPERR1_ENABLE.EN5 shall be set to 0, due to disable CRC error notification to ECM.

54.6.4 Hardware Redundancy for Pixel Reconstructor in Channel Selector

1. Overview

Hardware redundancy is applied to the Pixel reconstructor in the Channel selector to detect fault of pixel reconstruction logic of incoming packed pixel from MIPI CSI-2 interface.

2. Hardware Description

Pixel reconstructor receives input pixel as packed pixel format, and outputs pixel stream as 1 pixel per clock format (unpacked pixel). There are 2 instances of pixel reconstructor. Pair of output pixel from each pixel reconstructor are always compared.
If pixel value form both pixel reconstructor does not match each other, then error status ISPERR2_STATUS.ST27 (CSI_LOCK_STEP_ERROR) is asserted.

There is no control register. This function is always enabled. User can control ON/OFF of notification to ECM for each error status bit by using ISPERR2_ENABLE register.

Note: For details of ISPERR2_STATUS and ISPERR2_ENABLE, see the 54.4.7.1.

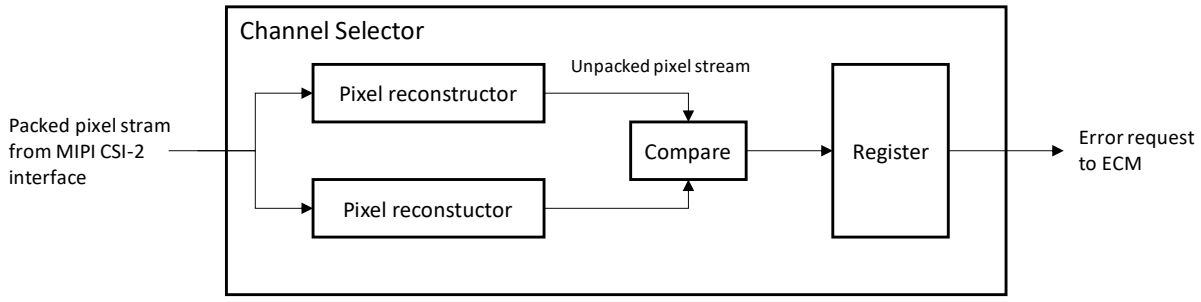

Figure 54.68 Block Diagram of Hardware redundancy for Pixel reconstructor

3. Control Register

There are no control register which selects enable/disable of the SM. This SM is always enabled.

By using ISPERR2_ENABLE register, enable/disable selection for each error notification to ECM can be controlled.
If ISPERR2_ENABLE.EN27 is set to 1, then error is not notified to ECM.
If ISPERR2_ENABLE.EN27 is set to 0, then error is not notified to ECM.
In both case, status bit in ISPERRn_STATUS2.ST27 is updated when error is occurred.

54.6.5 Pixel/Metadata Counter in Channel Selector

1. Overview

Pixel/Metadata counter is to detect fault of channel selector by counting number of pixels in one frame or in one line of incoming image. If number of pixels exceeds pre-defined maximum value or less than pre-defined minimum value, then error signal is asserted.

2. Hardware Description

If pixel count exceeds the value of ISP_PIXELCOUNT_MAX_CHn.MAX_PIXEL register (n=4~11), then error status ISPERR1_STATUS.CHANNEL_SELECT_CHn_PIXELCOUNT_MAX_ERROR (n=4~9) or ISPERR2_STATUS.CHANNEL_SELECT_CHn_PIXELCOUNT_MAX_ERROR (n=10,11) is asserted.

If pixel count is less than the value of ISP_PIXELCOUNT_MIN_CHn.MIN_PIXEL register (n=4~11), then error status ISPERR1_STATUS.CHANNEL_SELECT_CHn_PIXELCOUNT_MIN_ERROR (n=4~9) or ISPERR2_STATUS.CHANNEL_SELECT_CHn_PIXELCOUNT_MIN_ERROR (n=10,11) is asserted.

This function is always enabled. User can control ON/OFF of notification to ECM for each error status bit by using ISPERR1_ENABLE or ISPERR2_ENABLE register.

Note: For details of ISPERRn_STATUS and ISPERRn_ENABLE (n=1,2), see section the 54.4.7.3.

Principle of Pixel Count Checking

- Pixel/Metadata counter checker watches pixel stream which pass through each channel.
- It counts number of pixels in this pixel stream.
- Pixel count is cleared at horizontal blanking period or vertical blanking period.
- Pixel count does not depend on the length of horizontal/vertical blanking period.
- Some invalid cycles may exist in the pixel stream. VALID signal is low at the invalid cycle. Pixel count does not count up at the invalid cycles.

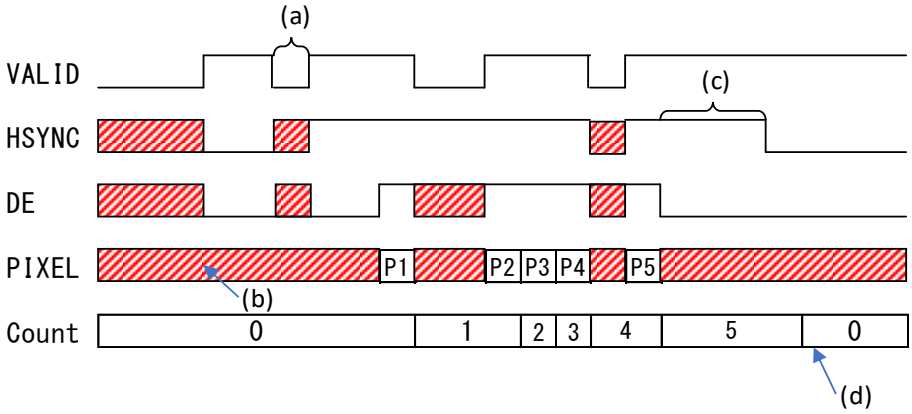

Figure 54.69 Timing Chart of pixel count check

Figure 54.69 is a timing chart of pixel counting. The important point is as below.

(a) When VALID==0, all corresponding signals (VSYNC, HSYNC, DE, PIXEL) are invalid
(b) When DE==0 or VALID==0, corresponding PIXEL signal is invalid. It means blanking period
(c) Period of HSYNC==1 && DE==0 is guaranteed by Pixel Reconstructor
(d) Pixel Count is cleared at the falling edge of HSYNC

When CLEAR_SYNC==1, HSYNC is not cleared at the falling edge of HSYNC, In this case, pixel count is cleared at the falling edge of VSYNC instead of falling edge of HSYNC.

54.6.6 Sync Interval Checker

1. Overview

Sync Interval Checker detects “stuck at high” or “struck at low” by observing either the continuous high period or the continuous low period of the VSYNC, FIELD, HSYNC and DE (data enable) signal of the input image. This function is performed on the signal before the filtering process. However, this function observes the sticking period of the sync signal and it is not targeted to count the number of pixels in one frame. For counting the number of pixels, use the Pixel/Metadata Counter.

2. Hardware Description

VSYNC, FIELD, HSYNC and DE (data enable) signals are checked with the Sync Interval Checker. The Sync Interval Checker probes these sync signals and monitors whether these signal falls into “stuck at high” or "stuck at low".

A block diagram is shown in Figure 54.70. Sync Interval Checker is executed by each virtual channel (VC). Error notification signal SYNC_ERROR_VCn (n=0,1,⋯15) is output individually for each VCs.

Regarding FIELD, VSYNC HSYNC and DE, the checker block denoted as “Sync Interval Checker (VCn) (n=0,1,⋯ 15)“ in Figure 54.70 probes these sync signals for each VC. That is, it observes the period that keeps taking a certain value. For FIELD and VSYNC, a signal exists for each VC. For DE, a signal masked by each VC is the target of observation.

Regarding HSYNC, the checker block observes both the period what keeps taking a certain value (HSYNC toggle interval check) and the number of rise edge of HSYNC (HSYNC rise count check) in one frame.

If the observed values of the above sync signals deviate from the range previously set in the register, then an error notification signal is asserted.

Error notification signal (Sync Error) is asserted when an error occurs in any of the 5 types of observations.

A point of note is, for FIELD, VSYNC and DE, the corresponding interval check block monitors them for each VC. On the other hand, the incoming HSYNC is a common signal between the VCs. Therefore, note that the observation result for the HSYNC signal is a common value for each VC.

The maximum and minimum value is defined as cycle in the ISP_SYNC_CHECK_*_MIN register and ISP_SYNC_CHECK_*_MAX register. The time for one cycle is calculated by the following formula.In this formula, *clock_frequency* denotes the frequency of S0D1_VIO ϕ clock.

The time for one cycle [us] = 1 / *clock_frequency* [MHz].

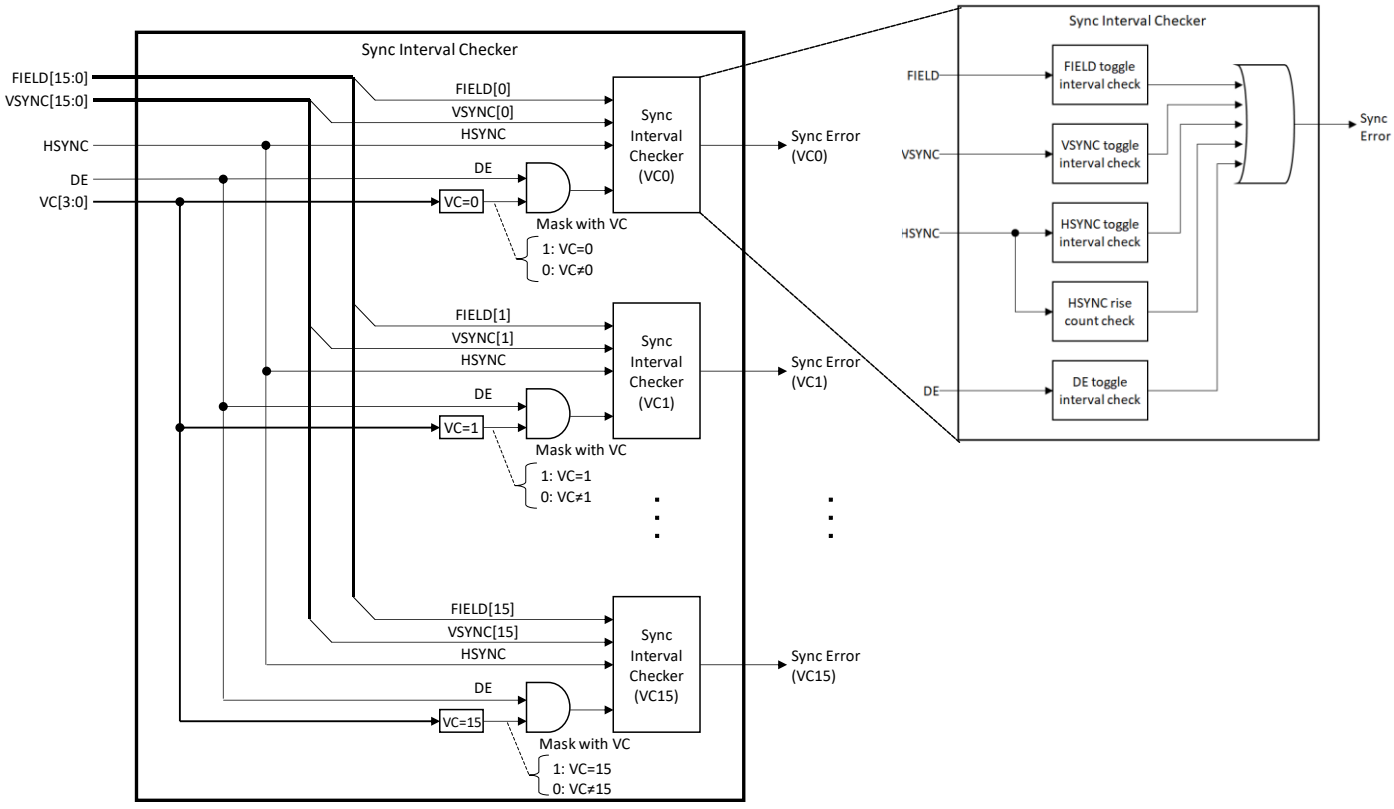

Figure 54.70 Block diagram of Sync Interval Checker

3. Control Register

(a) Enable/disable control.

This SM has enable/disable control register for each VC and type of sync signal. For VC that are not used, this SM shall be set to disabled.

Regarding FIELD toggle interval check, enable/disable is controlled by ISP_SYNC_CHECK_HSYNC_RISE_MAX. FIELD_CHECK_EN register.

Regarding VSYNC toggle interval check, enable/disable is controlled by ISP_SYNC_CHECK_HSYNC_RISE_MAX. VSYNC_CHECK_EN register.

Regarding HSYNC toggle interval check, enable/disable is controlled by ISP_SYNC_CHECK_HSYNC_RISE_MAX. HSYNC_TOGGLE_CHECK_EN register.

Regarding HSYNC rise count check, enable/disable is controlled by ISP_SYNC_CHECK_HSYNC_RISE_MAX. HSYNC_RISE_CHECK_EN register.

Regarding DE toggle interval check, enable/disable is controlled by ISP_SYNC_CHECK_HSYNC_RISE_MAX. DE_CHECK_EN register.

These enable/disable control register is 2-bit register. Setting value is shown as below (* is either FIELD, VSYNC, HSYNC_RISE, HSYNC_TOGGLE or DE).

- 2'B00 : Disable (default)
- 2'B01 : Checks only minimum value. Checks whether target period, i.e. period that keeps constant value, of observed sync signal gets less than the setting value of ISP_SYNC_CHECK_*_MIN register
- 2'B10 : Checks only maximum value. Checks whether target period, i.e. period that keeps constant value, of observed sync signal exceeds the setting value of ISP_SYNC_CHECK_*_MAX registers.
- 2'B11 : Checks both minimum value and maximum value simultaneously. Checks whether target period, i.e. period that keeps constant value, of observed signal is within the range from setting value of ISP_SYNC_CHECK_*_MIN register to the setting value of ISP_SYNC_CHECK_*_MAX register

Overwriting of these register during running is forbidden.

(b) Notification of error

When error is detected in the incoming image transferred on virtual channel 0 (VC0), then ISPERR2_STATUS.ST20 (SYNC_ERROR_VC0) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 1 (VC1), then ISPERR2_STATUS.ST21 (SYNC_ERROR_VC1) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 2 (VC2), then ISPERR2_STATUS.ST22 (SYNC_ERROR_VC2) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 3 (VC3), then ISPERR2_STATUS.ST23 (SYNC_ERROR_VC3) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 4 (VC4), then ISPERR2_STATUS.ST2 (SYNC_ERROR_VC4) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 5 (VC5), then ISPERR2_STATUS.ST3 (SYNC_ERROR_VC5) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 6 (VC6), then ISPERR2_STATUS.ST4 (SYNC_ERROR_VC6) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 7 (VC7), then ISPERR2_STATUS.ST5 (SYNC_ERROR_VC7) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 8 (VC8), then ISPERR2_STATUS.ST6 (SYNC_ERROR_VC8) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 9 (VC9), then ISPERR2_STATUS.ST7 (SYNC_ERROR_VC9) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 10 (VC10), then ISPERR2_STATUS.ST10 (SYNC_ERROR_VC10) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 11 (VC11), then ISPERR2_STATUS.ST11 (SYNC_ERROR_VC11) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 12 (VC12), then ISPERR2_STATUS.ST12 (SYNC_ERROR_VC12) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 13 (VC13), then ISPERR2_STATUS.ST13 (SYNC_ERROR_VC13) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 14 (VC14), then ISPERR2_STATUS.ST14 (SYNC_ERROR_VC14) is updated to 1.

When error is detected in the incoming image transferred on virtual channel 15 (VC15), then ISPERR2_STATUS.ST15 (SYNC_ERROR_VC15) is updated to 1.

By using ISPERR2_ENABLE register, enable/disable of notification to ECM for each error status bit can be controlled.

ISPERR2_ENABLE.EN*k* (*k*=2,3,4,5,6,7,10,11,12,13,14,15,20,21,22,23) is set 0, then error is not notified to ECM.

ISPERR2_ENABLE.EN*k* (*k*=2,3,4,5,6,7,10,11,12,13,14,15,20,21,22,23) is set 1, then error is notified to ECM.

Regardless of ISPERR2_ENABLE register value, status bit in ISPERR2_STATUS.ST*k* (*k*=2,3,4,5,6,7,10,11,12,13,14,15, 20,21,22,23) is updated when error is occurred.

54.6.7 Safety Mechanism of RAW Scaler in Channel Selector

1. Overview

As a safety mechanism of RAW Scaler, EDC for SRAM and hardware redundancy is applied. EDC is used for line memory SRAM. Hardware redundancy is used for convolution logic to calculate pixels of converted RAW image.

2. Hardware Description

RAW scaler has line memory SRAM. It is used for gathering surrounding pixels of the current pixel. This SRAM is protected by EDC.

As a safety mechanism of convolution operation, there are 2 instance of convolution circuits. Hardware redundancy is consisting of “Master convolution” and “Checker convolution”. Master convolution calculates pixels of converted RAW image. Checker convolution calculates pixels also by using same input (pixel and coefficients) as master convolution logics. Both results are compared mutually. If calculated value from between Master and Checker does not match each other, then error request (mismatch error) is asserted.

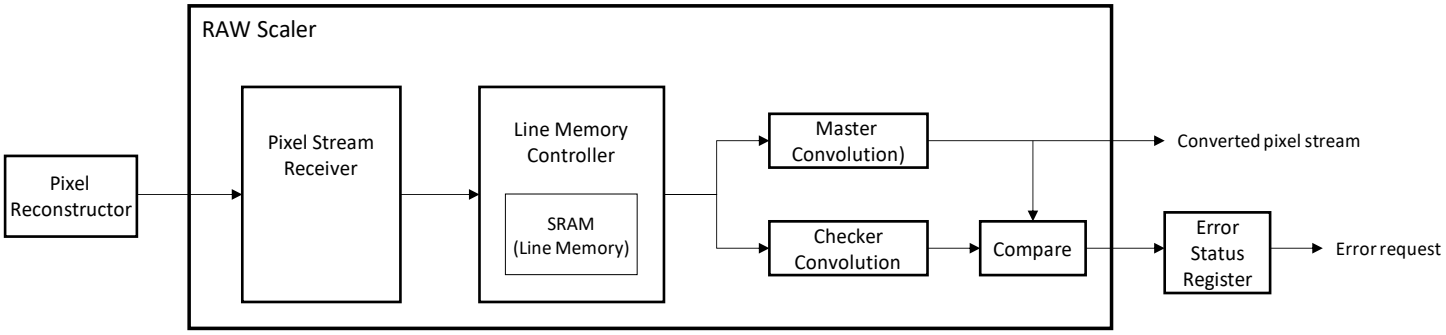

Figure 54.71 Block Diagram of Safety Mechanism of RAW Scaler

55. Video Input Module (VIN)

55.1 Overview

This module is treated as safety-related function in case of the products supporting functional safety. For details, refer to the functional safety documents.

In addition, it includes safety mechanisms. For the detail, refer to functional safety documents.

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores the YCbCr, RGB, RAW data from the MIPI Alliance CSI-2 interfaces in an external memory.

The module has up to eight video channels that independently controls capture of data into a capture area of up to 4096x4096 pixels.

VIN assumes that the input signal is an interlace video in which one frame consists of two fields. If the input signal is a progressive video, VIN generates a field identification signal by itself and captures it as a field image. Note that VIN captures in two frames at progressive input.

Input of data through the MIPI Alliance CSI-2 interfaces is possible.

Notes: 1. For detailed specifications of the MIPI CSI-2 interface, refer to section 53.
2. For detailed specifications of ISP/channel selector module, refer to section 54.
3. The maximum limits of the clipping size depend on each case of usage.
4. The number of video input channels for R-Car V4M is 16.

55.1.1 Features

(1) Video Channels 0 to 15

Input Interface for Video Channels 0 to 15

Interface	Data Format	Data Type Number
MIPI CSI-2*1*2	Embedded 8-bit non-Image Data	0x12
MIPI CSI-2*1*2	YUV420 8-bit	0x19, 0x1C(CSPS)
MIPI CSI-2*1*2	YUV420 10-bit	0x19, 0x1D(CSPS)
MIPI CSI-2*1*2	YUV422 8-bit	0x1E
MIPI CSI-2*1*2	YUV422 10-bit	0x1F
MIPI CSI-2*1*2	YUV422, Y 12-bit/UV 8-bit	0x1F (Transferred as YUV422 10-bit)
MIPI CSI-2*1*2	RGB565	0x22
MIPI CSI-2*1*2	RGB888	0x24
MIPI CSI-2*1*2	RAW8	0x2A
MIPI CSI-2*1*2	RAW10	0x2B
MIPI CSI-2*1*2	RAW12	0x2C
MIPI CSI-2*1*2	RAW14	0x2D
MIPI CSI-2*1*2	RAW16	0x2E
MIPI CSI-2*1*2	RAW20	0x2F
MIPI CSI-2*1*2	RAW24	0x2C (Transferred as RAW12)
MIPI CSI-2*1*2	User Defined 8-bit Data	From 0x30 to 0x37
—	Unsupported	Others

Notes: *1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.
*2. Receives MIPI CSI-2 interface via ISP (Channel Selector). The ISP (Channel Selector) setting is necessary.

(2) Internal Sync Signal Generation

For the progressive video from CSI-2(via ISP Channel Selector), the field signal can be internally generated.

(3) Capture Mode

The following four modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.

Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode
- Full interlace capture mode

(4) Size Clipping

- Video channels 0 to 15

  The VIN module has one clipping circuits, which independently handle images with up to 4096 × 4096 pixels.

(5) Image Data Format Conversion

The following data format conversions are available:

- YCbCr image data
  - Y/Cb/Cr 8-bit multiplex conversion
  - YC separation (separated into Y and CbCr components.)
  - Y component extraction
- RGB image data
  - RGB-888 → 32 bits/pixel conversion
  - RGB-888 → RGB-565 (16 bits/pixel) conversion
  - RGB-888 → ARGB-1555 (16 bits/pixel) conversion
  - RGB-888 → RGB-888 (32 bits/pixel) conversion
- RAW image data, Embedded 8-bit non Image Data, User Defined 8-bit Data
  - RAW8 → 8 bits/pixel conversion
  - Embedded 8-bit non Image Data, User Defined 8-bit Data → 8 bits/pixel conversion
  - RAW10 → 16 bits/pixel conversion
  - RAW12 → 16 bits/pixel conversion
  - RAW14 → 16 bits/pixel conversion
  - RAW16 → 16 bits/pixel conversion
  - RAW20 → 32 bits/pixel conversion
  - RAW24 → 32 bits/pixel conversion

(6) Memory Output Data Format

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
  - Y/Cb/Cr422, 8-bit multiplexed
  - Y/Cb/Cr, 10-bit multiplexed
  - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr420, Y, 8-bit Cb/Cr, 8-bit multiplexed

— YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
— YC separation, YCbCr422, Y, 12-bit Cb/Cr, 8-bit multiplexed
— YC separation, YCbCr422, Y, 10-bit Cb/Cr, 10-bit multiplexed
— YC separation, Y data, 8-bit
— YC separation, Y data, 10-bit
— YC separation, Y data, 12-bit
— YC separation, YCbCr420, Y, 10-bit Cb/Cr, 8-bit multiplexed
— YC separation, YCbCr420, Y, 12-bit Cb/Cr, 8-bit multiplexed

- RGB image data
  — RGB-565 (16 bits/pixel)
  — ARGB-1555 (16 bits/pixel)
  — RGB-888 (32 bits/pixel)
  — ARGB-8888 (32 bits/pixel)

- RAW image data, Embedded 8-bit non Image Data, User Defined 8-bit Data
  — RAW8 (8 bits/pixel)
  — RAW8 (16 bits/pixel)
  — Embedded 8-bit non-Image Data, User Defined 8-bit Data (8 bits/pixel)
  — RAW10 (16 bits/pixel)
  — RAW12 (16 bits/pixel)
  — RAW14 (16 bits/pixel)
  — RAW16 (16 bits/pixel)
  — RAW20 (32 bits/pixel)
  — RAW24 (32 bits/pixel)

55.1.2 Block Diagram

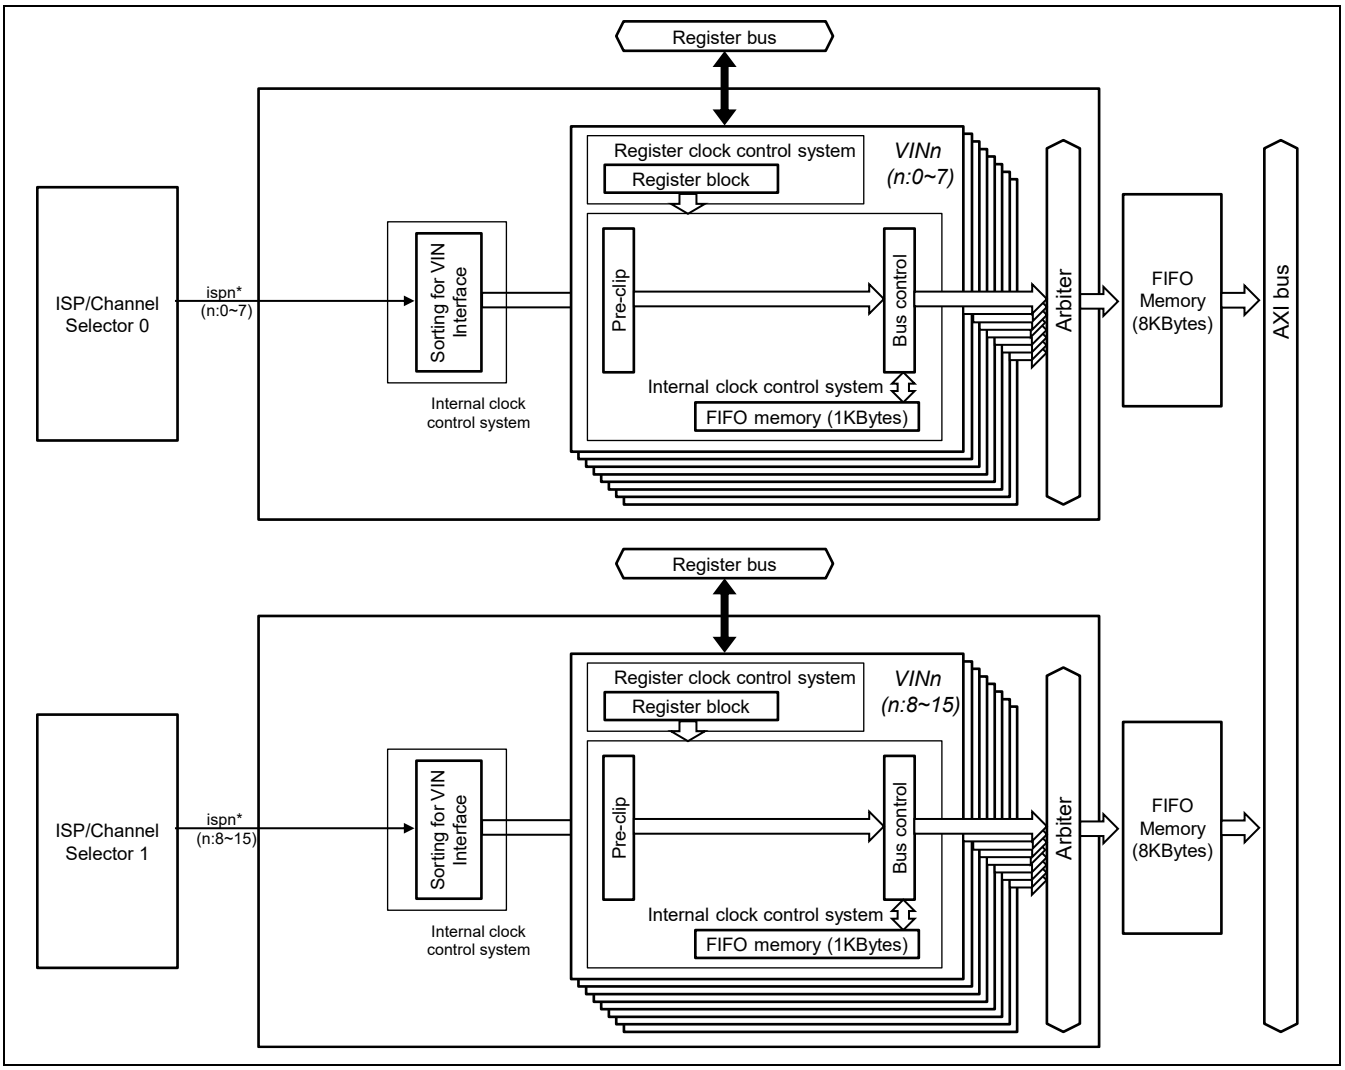

Figure 55.1 Functional Block Diagram of Video Input Modules

55.1.3 External Pins

VIN doesn't have external pins.

55.1.4 Register Configuration

Table 55.1 shows the VIN register configuration for each channel. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. The access size is no supported except for 32 bits.

For the internal update mode, refer to the description of the VUP bit in the main control register (VnMC).

Table 55.1 Base Address of Each VIN Channel

Base Address Name	Base Address
VIN0	H'E6EF 0000
VIN1	H'E6EF 1000
VIN2	H'E6EF 2000
VIN3	H'E6EF 3000
VIN4	H'E6EF 4000
VIN5	H'E6EF 5000
VIN6	H'E6EF 6000
VIN7	H'E6EF 7000
VIN8	H'E6EF 8000
VIN9	H'E6EF 9000
VIN10	H'E6EF A000
VIN11	H'E6EF B000
VIN12	H'E6EF C000
VIN13	H'E6EF D000
VIN14	H'E6EF E000
VIN15	H'E6EF F000

Table 55.2 Register Configuration of VIN (n = 0 to 15)

Module Name	Register Name	Symbol	R/W	Address n=0-15	Initial Value	Access Size	Internal Update Mode Support*	Note

55.1.5 Connected Module

Table 55.3 Connected Modules

Connected Modules	Function of the Connected Modules
ISP	Channel Selector: Demultiplexing MIPI/CSI-2 input data
CPG	Input reset and clock stop signal
INTTOP	Interrupt controller
ECM	Module related to Functional Safety
IMR	Output Wake Up signal
VSPX	Output Wake Up signal
VSPD	Output write buffer pointer for auto display function For detaiis, refer to Section 60.

55.2 Register Description

[Legend]

—: Reserved. The write value should always be 0.

Initial value: Register value after a reset

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

Vn: Video channel n

55.2.1 Video [n] Main Control Register(V[n]MC)(n=0-15)

Notes: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WLCEN	—	—	—	—	—	—	—	—	—	FOC	—	—	INF[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	EXINF[1:0]		—	VUP	—	—	—	EN	—	IM[1:0]		—	—	ME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R/W	R	R	R	R/W	R	R/W	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	WLCEN	H'0	R/W	Write Line Counter Enable This is the enable bit for that the write line count (VnWLC) register is used. When this bit is set to 0, the VnWLC register is always initial value. As a result, the following two functions become unavailable: - Wakeup signals to IMR and VSPX modules - Wakeup Notification Interrupt Status (VnINTS.WUS) 0: Disables the write line count (VnWLC) register 1: Enables the write line count (VnWLC) register
30 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	FOC	B'0	R/W	Field Order Control This bit controls the field order for full interlace capturing. 0: Top field = Odd field (field 1) 1: Top field = Even field (field 2) Note: This bit supports the internal update mode.
20, 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	INF[2:0]	All 0	R/W	Input Interface Format These bits specify the image format input to the VIN. [Input from Channel Selector] 000: Setting prohibited 001: YUV422 8-bit or YUV420 8-bit input*1 010: Setting prohibited 011: YUV422 10-bit or YUV420 10-bit or YUV422 12-bit (Y-12bit / UV 8-bit) input*1 100: Embedded 8-bit non Image Data or RAW8 input*1 101: Setting prohibited 110: RAW20 or RAW24 or RGB888 input*1 111: RAW8 (16 bits/pixel) or RAW10 or RAW12 or RAW14 or RAW16 or RGB565 input*1
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	EXINF[1:0]	H'0	R/W	Extension Interface Select These bits are used combined with the INF setting.
11	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	VUP	H'0	R/W	VIN Register Update Control This bit specifies the internal register update timing after writing register. See the list of registers for applicable registers. 0: The register contents are updated immediately after register writing. 1: The register contents are updated after a valid field is detected.
9 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	EN	H'0	R/W	Endian Type This bit specifies the endian type for data to be output to external memory. 0: Image data is packed and allocated in little endian. 1: Image data is packed and allocated in big endian. Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.
5	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
4, 3	IM[1:0]	H'0	R/W	Interlace Mode These bits specify the capture mode. Do not modify this setting during capture operation. 00: Odd-field (field 1) capture mode Handles only odd fields as frames and stores them in external memory. 01: Odd-/even-field capture mode Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode. 10: Even-field (field 2) capture mode Handles only even fields as frames and stores them in external memory. 11: Full interlace mode Handles combinations of odd and even fields as single frames and stores them in external memory. Note: Set 01 in case MFC is set to 1
2, 1	—	H'0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ME	H'0	R/W	Module Enable This is the enable bit for the VIN. Set this bit before setting the Frame Capture (VnFC) register. 0: The module operation is stopped. 1: The module operation is enabled. *2

Note 1: Table 55.4 shows the combinations of interfaces which can be set by the input interface format (the INF bits in VnMC) and extension interface select (the EXINF bit in VnMC). Do not make the other settings.

Note 2: To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

55.2.2 Video [n] Module Status Register(V[n]MS)(n=0-15)

Notes: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FBS[1:0]		FS	AV	CA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	FBS[1:0]	B'11	R	Frame Buffer Status These bits show the frame buffer status. 00: The latest valid frame buffer has the base address defined by the memory base 1 register. 01: The latest valid frame buffer has the base address defined by the memory base 2 register. 10: The latest valid frame buffer has the base address defined by the memory base 3 register. 11: There is no valid frame buffer. Note: When video capture is operating, this bit should be read after the FIS bit in VnINTS is set to 1.
2	FS	H'0	R	Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2).
1	AV	H'0	R	Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured.
0	CA	H'0	R	Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data.

55.2.3 Video [n] Frame Capture Register(V[n]FC)(n=0-15)

Note: Availability of channels: n=0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CC	SC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CC	H'0	R/W	Continuous Frame Capture Mode This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. After that, the capture operation is repeated in the order of MB2, MB3, MB1, MB2, and such. Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured. 0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set.
0	SC	H'0	R/W	Single Frame Capture Mode This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. Immediately after this bit is set to 1, the frame buffer status (FBS) bits in MS are initialized and the SC bit is also cleared to 0. 0: The single frame capture mode is not set. 1: The single frame capture mode is set. Note: Do not set this bit to 1 when the interlace mode (IM) bits in the main control register (VnMC) are set to 01 (odd-/even-field capture mode).

Note 1: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

55.2.4 Video [n] Start Line Pre-Clip Register(V[n]SLPrC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SLPrC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SLPrC[11:0]	H'000	R/W	Start Line Pre-Clip These bits specify the (pre-clipping start line - 1) value in line units. Specify a value in the range from 0 to 4094 so that the number of lines after pre-clipping will be 2 or more. (The value of 0 indicates the first valid line.)

55.2.5 Video [n] End Line Pre-Clip Register(V[n]ELPrC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	ELPrC[11:0]	H'000	R/W	End Line Pre-Clip These bits specify the (pre-clipping end line - 1) value in line units. Specify a value in the range from 1 to 4095 so that the number of lines after pre-clipping will be 2 or more. Note: If the interlace images are input, the value here should be such that (ELPrC - SLPrC + 1) is half of the value of the number of the original line.

55.2.6 Video [n] Start Pixel Pre-Clip Register(V[n]SPPrC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SPPrC[11:0]	H'000	R/W	Start Pixel Pre-Clip These bits specify the (pre-clipping start pixel - 1) value in pixel units. Specify a value in the range from 0 to 4090 so that the number of pixels after pre-clipping will be an even number greater than or equal to 6. Notes: 1. When SPPrC is set to 0x0, the first valid pixel is specified. 2. Specify an even number. 3. When Embedded 8-bit non-Image Data or RAW8 format are input, these bits should be even number.

55.2.7 Video [n] End Pixel Pre-Clip Register(V[n]EPPrC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
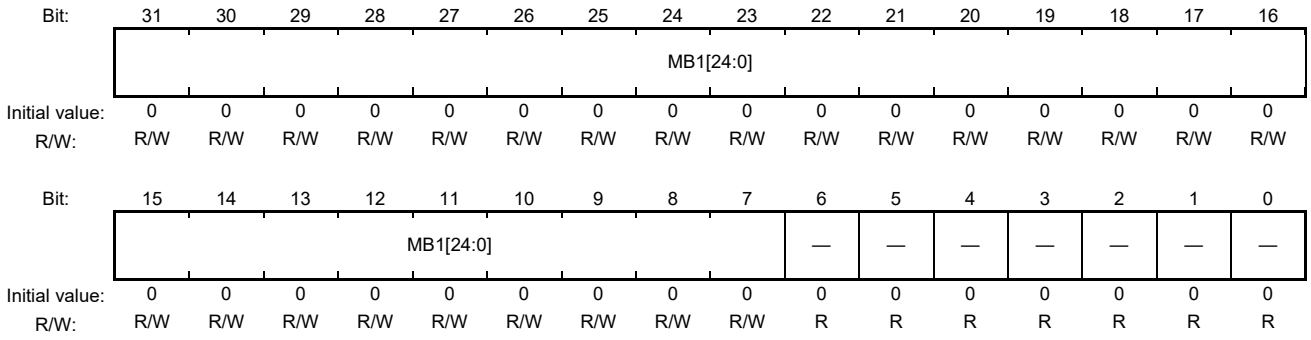
	IS[11:0]												—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 4	IS[11:0]	H'000	R/W	Image Stride These bits specify the width of the transfer destination memory in 16-pixel unit. Specify a value no less than the pre-clipping width (EPPrC - SPPrC + 1). Note: When output format is other than RGB888 and ARGB8888, IS[0] bit shall be set to 0.
3 to 0	—	All 0	R	Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0.

55.2.9 Video [n] Memory Base 1 Register(V[n]MB1)(n=0-15)

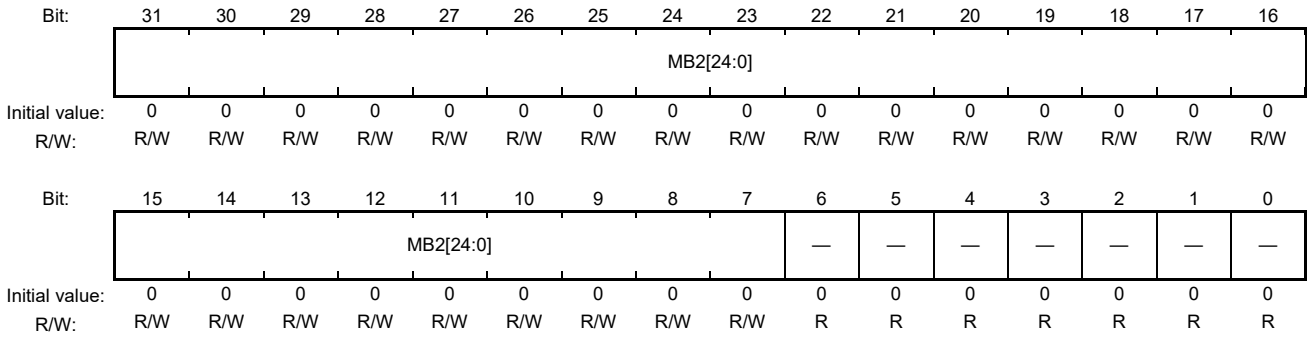
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB1[24:0]	H'0000000	R/W	Memory Base Address 1 These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1→ MB2 → MB3 → MB1 → MB2 → MB3. In single frame capture mode, this value is used as the capture address. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

55.2.10 Video [n] Memory Base 2 Register(V[n]MB2)(n=0-15)

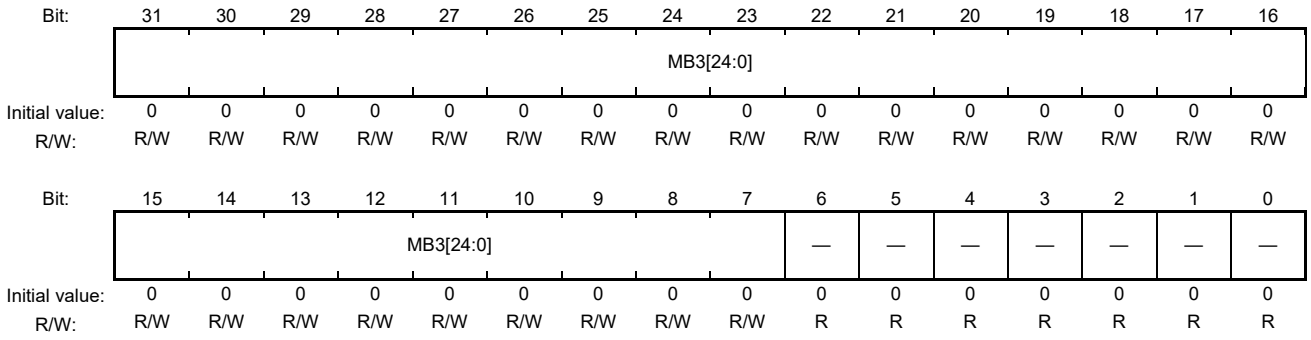
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB2[24:0]	H'0000000	R/W	Memory Base Address 2 These bits specify the transfer start address in frame buffer 2. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB2 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 2 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

55.2.11 Video [n] Memory Base 3 Register(V[n]MB3)(n=0-15)

Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB3[24:0]	H'0000000	R/W	Memory Base Address 3 These bits specify the transfer start address in frame buffer 3. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB3 address in the following capture sequence: MB1→ MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 3 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

55.2.12 Video [n] Line Count Register(V[n]LC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	LC[11:0]	All 0	R	Line Count These bits show the line position in the current capture field. The VnLC counts up at the rising edge of the next Hsync of captured line. The VnLC stops counting up after the input of the line specified by the Line preclip register.

55.2.13 Video [n] Interrupt Enable Register(V[n]IE)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIE2	—	—	—	—	—	—	WUE	—	—	—	—	—	—	VFE	VRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIE	—	SIE	EFE	FOE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIE2	H'0	R/W	Field Interrupt Enable 2 This bit enables or disables INTC output for field interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Field interrupts are disabled. 1: Field interrupts are enabled.
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	WUE	H'0	R/W	Wake-up Notification Interrupt Enable This bit enables or disables INTC output for wake-up notification interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Wake-up notification interrupts are disabled. 1: Wake-up notification interrupts are enabled.
23 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	VFE	H'0	R/W	VSYNC Falling Edge Detect Interrupt Enable This bit enables or disables VSYNC falling edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC falling edge detect interrupts are disabled. 1: VSYNC falling edge detect interrupts are enabled.
16	VRE	H'0	R/W	VSYNC Rising Edge Detect Interrupt Enable This bit enables or disables VSYNC rising edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC rising edge detect interrupts are disabled. 1: VSYNC rising edge detect interrupts are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIE	H'0	R/W	Field Interrupt Enable This bit enables or disables field-switching interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Field-switching interrupts are disabled. 1: Field-switching interrupts are enabled.
3	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	SIE	H'0	R/W	Scanline Interrupt Enable This bit enables or disables scanline interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Scanline interrupts are disabled. 1: Scanline interrupts are enabled.

Bit	Bit Name	Initial Value	R/W	Description
1	EFE	H'0	R/W	End of Frame Interrupt Enable This bit enables or disables end of frame interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: End of frame interrupts are disabled. 1: End of frame interrupts are enabled.
0	FOE	H'0	R/W	FIFO Overflow Interrupt Enable This bit enables or disables FIFO overflow interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: FIFO overflow interrupts are disabled. 1: FIFO overflow interrupts are enabled.

55.2.14 Video [n] Interrupt Status Register(V[n]INTS)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIS2	—	—	—	—	—	—	WUS	—	—	—	—	—	—	VFS	VRS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIS	—	SIS	EFS	FOS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIS2	H'0	R/W	Field Interrupt Status 2 This bit shows that the field has changed. This bit is set to 1 when a valid field is detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
30 to 25	—	All 0	R	Reserved Each bit is read as 0 or 1. The write value should always be 0.
24	WUS	H'0	R/W	Wake-up Notification Interrupt Status This bit is set to 1 when wake up notification event described in section 55.3.7 has occurred. If WLC Error occurs (refer to description of V[n]INTS.FOS), the value of the Write Line Counter may be smaller than expected, which may delay the Wakeup or cause it not to be generated. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
23 to 18	—	All 0	R	Reserved These bits are always read as 0 or 1. The write value should always be 0.
17	VFS	H'0	R/W	VSYNC Falling Edge Detect Interrupt Status This bit shows that a VSYNC falling edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
16	VRS	H'0	R/W	VSYNC Rising Edge Detect Interrupt Status This bit shows that a VSYNC rising edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
15 to 5	—	All 0	R	Reserved Each bit is read as 0 or 1. The write value should always be 0.
4	FIS	H'0	R/W	Field Interrupt Status This bit shows that a field has been captured in the active capture operation. This bit is set to 1 when a valid field is detected. After being set to 1, this bit is cleared to 0 by writing 1.
3	—	H'0	R	Reserved This bit is read as 0 or 1. The write value should always be 0.
2	SIS	H'0	R/W	Scanline Interrupt Status This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 when the value in the VnLC register matches the value in the VnSI register.

Bit	Bit Name	Initial Value	R/W	Description
1	EFS	H'0	R/W	End of Frame Interrupt Status This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1.
0	FOS	H'0	R/W	FIFO Overflow Interrupt Status This bit shows that either of the following two conditions has occurred during the active capture operation: • FIFO has overflowed. • When VnMC.WLCEN = 1 (VnWLC is operating), if all response of one line of data is not returned from the AXI bus before the falling edge of Hsync for the next line (WLC Error). After being set to 1, this bit is cleared to 0 by writing 1. If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer. If WLC Error occurs, the value of the Write Line Counter may be smaller than expected, which may delay the Wakeup or cause it not to be generated.

55.2.15 Video [n] Scanline Interrupt Register(V[n]SI)(n=0-15)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	SI[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 0	SI[11:0]	All 0	R/W	Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted. Note that the first and last lines of the capture cannot be specified in this register.

55.2.16 Video [n] Data Mode Register(V[n]DMR)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R/W	R/W	R/W	R/W	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	H'00	R/W	Alpha 8 These bits set the alpha value for the ARGB8888 format output.
23	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	FDS	H'0	R/W	Fill Data Select This bit specifies selection of fill data for MSB bit when output data format is 8bits, 10 bits, 12 bits, 14 bits, 20bits, 24bits. 0: Fill data is 0 1: Fill data is sign data
21 to 19	RMODE[2:0]	H'0	R/W	RAW Data Transfer Mode These bits specify the bits of RAW data. 000: 8-bit RAW data, 16-bit RAW data, 24-bit RAW data 001: Setting prohibited 010: 10-bit RAW data 011: 12-bit RAW data 100: 14-bit RAW data 101: 20-bit RAW data 110: Setting prohibited 111: Setting prohibited
18, 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EVA	H'0	R/W	Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory.
15	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	YMODE[2:0]	H'0	R/W	YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). 000: Both Y and CbCr data are transferred to memory 001: Only Y data is transferred to memory as 8-bit data 010: 10-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 011: 10-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 100: 12-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 101: 12-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 110: Setting prohibited 111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11	YC_THR	H'0	R/W	YC Data Through Mode Y and CbCr data are transferred to memory as 10-bit or 12-bit data according to the input format by setting this bit. 0: Y and CbCr data are transferred to memory according to YMODE[2:0] bits. 1: Y and CbCr data are transferred to memory as 10-bit or 12-bit data according to the input format.
10, 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	EXRGB	H'0	R/W	Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	BPSM	H'0	R/W	Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1.
3	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABIT	H'0	R/W	Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1.
1, 0	DTMD[1:0]	H'0	R/W	Data Conversion Mode These bits set the format for storing RGB888 or YCbCr444 data in the external memory. *1 00: Data is not converted. 01: RGB is converted to ARGB before output. 10: YC is separated before output. *2 11: YC is separated before output (YCbCr420 format)

Note 1: The data conversion modes that can be set are shown in Table 55.5. Do not set any other mode that is not listed in the table. RGB and YCbCr data should be set as shown in Table 55.5.

Note 2: Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.

55.2.17 Video [n] Data Mode Register 2(V[n]DMR2)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MFC	—	—	FTEV	—

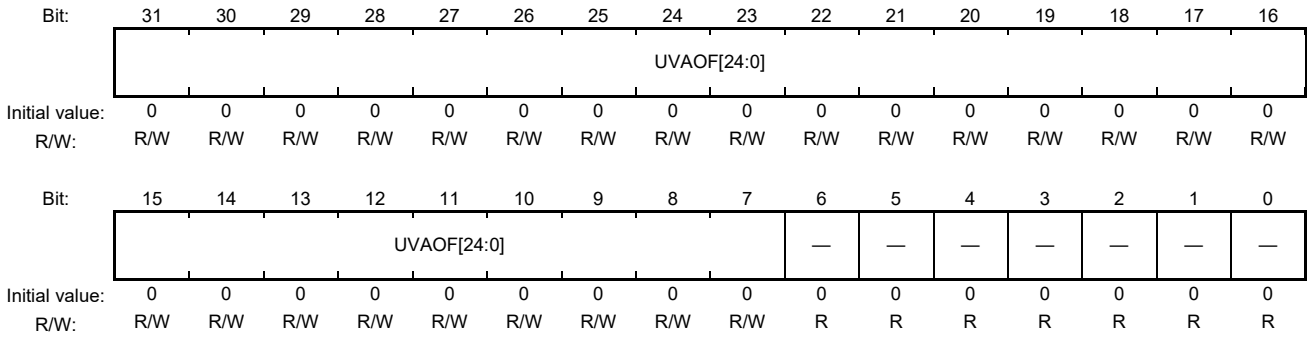
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VLV[3:0]				—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	MFC	H'0	R/W	Multi Frame Capture Mode This is the enable bit for that the multi frame data is output to one frame buffer. When this bit is set to 1, it is necessary to set the VLV[3:0] bits. 0: Disables multi frame capture mode 1: Enables multi frame capture mode. In this mode, VIN captures from the first frame in case of progressive image. Note: 1. Do not set both MFC and FTEV
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	FTEV	H'0	R/W	VSYNC Field Toggle Mode Enable The VSYNC field toggle mode changes the capture field signal level according to the count of input VSYNC signal assertion. As the VIN controls capture operation only when the input field signal level changes, select the VSYNC field toggle mode or multi frame capture mode when capturing progressive images. 0: The field toggle function according to the VSYNC count is disabled. 1: The field toggle function according to the VSYNC count is enabled. The period before a toggle should be specified in the VLV bits. Note: Do not set both FTEV and MFC at the same time.
16	—	H'0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	VLV[3:0]	H'0	R/W	VSYNC Field Toggle Mode Transition Period These bits specify the count of vertical sync signal input before the VSYNC field toggle mode is entered. After a transition to the VSYNC field toggle mode, the capture field signal is toggled every time VSYNC is input. When a change in the input field signal is detected, the toggle mode is canceled. H'0: The field signal is toggled at every VSYNC input. H'1: Toggle mode is entered after VSYNC is input once. H'2: Toggle mode is entered after VSYNC is input two times. H'3: Toggle mode is entered after VSYNC is input three times. : H'E: Toggle mode is entered after VSYNC is input 14 times H'F: Toggle mode is entered after VSYNC is input 15 times. Note: If the field signal changes while the transition period is counted, the counter is initialized.
11 to 0	—	H'000	R	Reserved These bits are always read as 0. The write value should always be 0.

55.2.18 Video [n] UV Address Offset Register(V[n]UVAOF)(n=0-15)

Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	UVAOF[24:0]	All 0	R/W	UV Data Address Offset These bits specify the transfer offset address for the YC separation YCbCr-422 UV and YCbCr-420 UV data. Specify bits 31 to 7 of the physical address in 128-byte units. Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs.
6 to 0	—	All 0	R	Reserved bits that indicate the 128-byte boundary of the UVAOF value. These bits are always read as 0. The write value should always be 0.

55.2.19 Video [n] Write Line Count Register(V[n]WLC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	SWFBS[1:0]	B'11	R	Smallest Writing Frame Buffer Status These bits show the smallest status buffer. [VnIMWUCH.SVMD=0] Video channels 0 to 7, 8 to 15: Show the smallest frame buffer under writing among video channels 0 to 7, 8 to 15, respectively. [VnIMWUCH.SVMD=1] Video channels 0 to 2, 8 to 10: Show the smallest frame buffer under writing among video channels 0 to 2, 8 to 10, respectively. Video channels 3 to 5, 11 to 13: Show the smallest frame buffer under writing among video channels 3 to 5, 11 to 13, respectively. Video channels 6 and 7, 14 and 15: Show the smallest frame buffer under writing among video channels 0 to 7, 8 to 15, respectively.
29 to 16	SWLC[13:0]	H'0000	R	Smallest Write Line Count These bits show the smallest write line count value. [VnIMWUCH.SVMD=0] Video channels 0 to 7, 8 to 15: Show the smallest write line count value among video channels 0 to 7, 8 to 15, respectively. [VnIMWUCH.SVMD=1] Video channels 0 to 2, 8 to 10: Show the smallest write line count value among video channels 0 to 2, 8 to 10, respectively. Video channels 3 to 5, 11 to 13: Show the smallest write line count value among video channels 3 to 5, 11 to 13, respectively. Video channels 6 and 7, 14 and 15: Show the smallest write line count value among video channels 0 to 7, 8 to 15, respectively.
15, 14	WFBS[1:0]	B'11	R	Writing Frame Buffer Status These bits show the status of frame buffer under writing. 00: Frame buffer under writing has the base address defined by the memory base 1 register. 01: Frame buffer under writing has the base address defined by the memory base 2 register. 10: Frame buffer under writing has the base address defined by the memory base 3 register. 11: There is no frame buffer under writing.
13 to 0	WLC[13:0]	H'0000	R	Write Line Count These bits show the line position which has been written to memory in the current capture field

55.2.20 Video [n] IMR_VSPX Wake Up Channel Register(V[n]IMWUCH)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	WUMD	H'0	R/W	Wake Up Mode Specify 0 for using WLC. Selecting SWLC is prohibited. This bit selects the counter value used for issuing IMR and VSPX wake up signals. 0: The WLC[13:0] bits value in the VnWLC 1: The SWLC[13:0] bits value in the VnWLC
30	SVMD	H'0	R/W	Smallest Value Mode This bit selects the SWLC[13:0] value. 0: The SWLC[13:0] bits value between video channel 0 to 7 is used 1: The SWLC[13:0] bits value between the below video channel is used [The video channels 0 to 2, 8 to 10] Between video channels 0 to 2, 8 to 10 [The video channels 3 to 5, 11 to 13] Between video channels 3 to 5, 11 to 13 [The video channels 6, 7, 14, 15] Between video channel 0 to 7, 8 to 15 Note: This bit is should be set to 0 in other than the video channels 0, 3, 8, 11.
29 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18	WUE3	H'0	R/W	Wake Up Enable 3 This is the enable bit of the IMR/VSPX wake up notification 3 which is issued after all frame data is stored to memory. 0: Disables the issue of IMR/VSPX wake up notification 3 1: Enables the issue of IMR/VSPX wake up notification 3
17	WUE2	H'0	R/W	Wake Up Enable 2 This is the enable bit of the IMR/VSPX wake up notification 2 which is issued by the WUL2[13:0] bits in the VnIMWUL. 0: Disables the issue of IMR/VSPX wake up notification 2 1: Enables the issue of IMR/VSPX wake up notification 2
16	WUE1	H'0	R/W	Wake Up Enable 1 This is the enable bit of the IMR/VSPX wake up notification 1 which is issued by the WUL1[13:0] bits in the VnIMWUL. 0: Disables the issue of IMR/VSPX wake up notification 1 1: Enables the issue of IMR/VSPX wake up notification 1
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	WUCH	H'0	R/W	Wake Up Enable 0: Disables wake up notification to IMRn and VSPXn 1: Enables wake up notification to IMRn and VSPXn

Note 1: The setting of VnIMWUCH register shall not be changed while VIN captures.

55.2.21 Video [n] IMR_VSPX Wake Up Line Register(V[n]IMWUL)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	WUL2[13:0]	H'0000	R/W	Wake Up Line 2 These bits specify a value to be compared with the WLC[13:0] bits or the SWLC[13:0] bits value in the VnWLC register in each field while the WUE2 bit in the VnIMWUCH register is set to 1. When this value matches the WLC bits or the SWLC[13:0] bits value in the VnWLC register, wake up signal is notified to IMR/VSPX. Note that when this value is set to 0, no wake up signal is notified even if WUE2 bit in VnIMWUCH is set to 1. Whether to use the WLC[13:0] bits or the SWLC[13:0] bits are selected by the WUMD bit in the VnWUCH.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	WUL1[13:0]	H'0000	R/W	Wake Up Line 1 These bits specify a value to be compared with the WLC[13:0] bits or the SWLC[13:0] bits value in the VnWLC register in each field while the WUE1 bit in the VnIMWUCH register is set to 1. When this value matches the WLC bits or the SWLC[13:0] bits value in the VnWLC register, wake up signal is notified to IMR/VSPX. Note that when this value is set to 0, no wake up signal is notified even if WUE1 bit in VnIMWUCH is set to 1. Whether to use the WLC[13:0] bits or the SWLC[13:0] bits are selected by the WUMD bit in the VnWUCH.

Note 1: The difference value between WUL2[13:0] bits and WUL1[13:0] shall be set to more than 2.

Note 2: The setting of VnIMWUL register shall not be changed while VIN captures.

55.2.22 Video [n] IMR_VSPX Wake Up Line Register 2(V[n]IMWUL2)(n=0-15)

Bit	Bit Name	Initial Value	R/W	Description
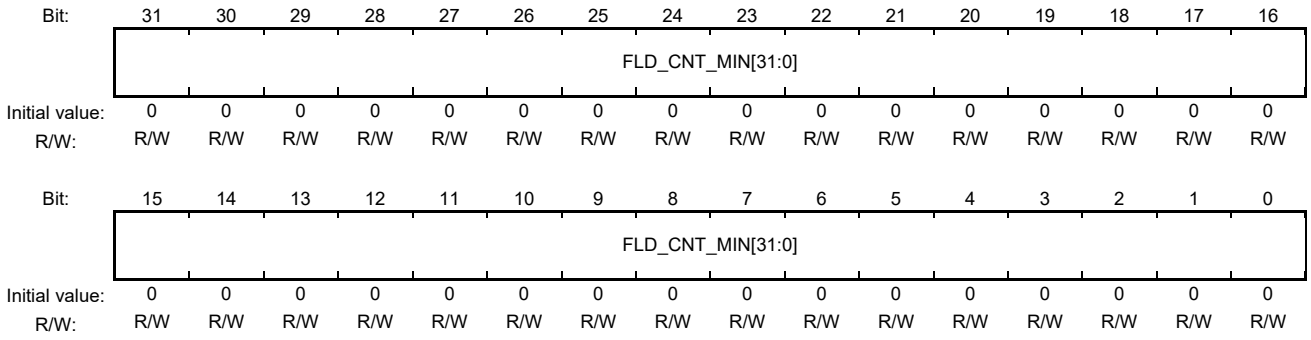
31	HRCHK	H'0	R/W	HW Redundancy Error check This bit enables or disables VIN HW Redundancy error detection. 0: Disable error of HW Redundancy detection 1: Enable error of HW Redundancy detection
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27, 26	HCEN[1:0]	H'0	R/W	Enable Hsync Rise Time Measurement These bits enable or disable to measure time of Hsync rise. 00: Disable Hsync rise time measurement 01: Enable minimum Hsync rise time measurement 10: Enable maximum Hsync rise time measurement 11: Enable minimum and maximum Hsync rise time measurement Note: VnHRT setting are valid when this bit is 1.
25, 24	—	H'0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	CRM	H'0	R/W	CRC Calculation Mode This bit specifies CRC calculation mode. When this bit is set to 1 and ERR bit in the FrameID is 0, if CRC calculation result is mismatched with the expected value, the error is detected. 0: Only calculate CRC 1: Input expected value and compare the CRC calculation result and expected value Note: 1. This bit should be set to 0 in video channels 4 to 7, 12 to 15. 2. When ERR bit in the FrameID is 1, the error is not detected even if CRC calculation result is mismatched with expected value.
22, 21	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
20, 19	EDID[1:0]	H'0	R/W	EDC ID These bits specify the ID number of Channel Selector EDC. 00: Channel Selector 01: Prohibit 10: Prohibit 11: Prohibit Note: These bits are valid when the CDE_EN bit is set to 1.
18	FED_EN	H'0	R/W	FIFO EDC Enable This bit enables or disables EDC error of Write FIFO detection. 0: Disable EDC error of Write FIFO detection 1: Enable EDC error of Write FIFO detection
17	CED_EN	H'0	R/W	Channel Selector EDC Enable This bit enables or disables EDC error of channel selector detection. 0: Disable EDC error of channel selector detection 1: Enable EDC error of channel selector detection Note: When this bit is set to 1, the EDID[1:0] bits should be set to 2'b00.
16	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15	EDCDEI	H'0	R/W	EDC Dummy Error Injection This bit issues EDC error (errreq_vin_vin_edc_p) for ECM module as dummy error. 0: Not issue dummy EDC error 1: Issue dummy EDC error Note: n = 0 to 15
14	DEI	H'0	R/W	Dummy Error Injection This bit issues error (errreq_vin_vin_p) for ECM module as dummy error. 0: Not issue dummy error 1: Issue dummy error Note: n = 0 to 15
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	DEER_DM	H'0	R/W	Data Enable Assert Cycle Error Detection Mode This bit specifies whether minimum error of Data enable assert cycle is detected when Data enable assert cycle is 0. 0: Data enable assert cycle error is not detected 1: Data enable assert cycle error is detected Note: This bit setting is valid when the DECE[0] bit in VnFNSC is 1.
10, 9	DECE[1:0]	H'0	R/W	Enable CLKENB Assert Cycle Measurement This bit enables or disables to measure assert cycle of Data enable. 00: Disable Data enable assert cycle measurement 01: Enable minimum Data enable assert cycle measurement 10: Enable maximum Data enable assert cycle measurement 11: Enable minimum and maximum Data enable assert cycle measurement. Note: VnDEMIN and VnDEMAX setting are valid when this bit is 1.
8 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	VSCE[1:0]	H'0	R/W	Enable VSYNC Toggle Cycle Measurement These bits enable or disable to measure toggle cycle of VSYNC. 00: Disable VSYNC toggle cycle measurement 01: Enable minimum VSYNC toggle cycle measurement 10: Enable maximum VSYNC toggle cycle measurement 11: Enable minimum and maximum VSYNC toggle cycle measurement Note: VnVSTMIN and VnVSTMAX setting are valid when this bit is 1.
3, 2	HSCE[1:0]	H'0	R/W	Enable HSYNC Toggle Cycle Measurement These bits enable or disable to measure toggle cycle of HSYNC. 00: Disable HSYNC toggle cycle measurement 01: Enable minimum HSYNC toggle cycle measurement 10: Enable maximum HSYNC toggle cycle measurement 11: Enable minimum and maximum HSYNC toggle cycle measurement Note: VnHSTMIN and VnHSTMAX setting are valid when this bit is 1.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	FLCE[1:0]	H'0	R/W	Enable FIELD Toggle Cycle Measurement These bits enable or disable to measure toggle cycle of FIELD. 00: Disable FIELD toggle cycle measurement 01: Enable minimum FIELD toggle cycle measurement 10: Enable maximum FIELD toggle cycle measurement 11: Enable minimum and maximum FIELD toggle cycle measurement Note: VnFTMIN and VnFTMAX setting are valid when this bit is 1.

55.2.24 Video [n] FIELD Toggle Minimum Register(V[n]FTMIN)(n=0-15)

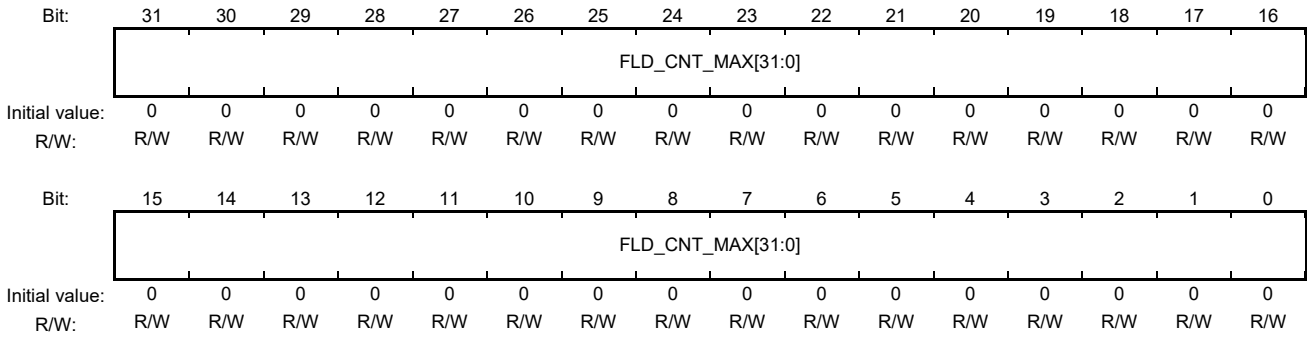
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FLD_CNT_MIN[31:0]	H'00000000	R/W	FIELD Toggle Cycle Minimum Value These bits specify the minimum value of FIELD toggle cycle. If FIELD toggle cycle is smaller than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the FLCE[0] bit in VnFNSC is 1.

55.2.25 Video [n] FIELD Toggle Maximum Register(V[n]FTMAX)(n=0-15)

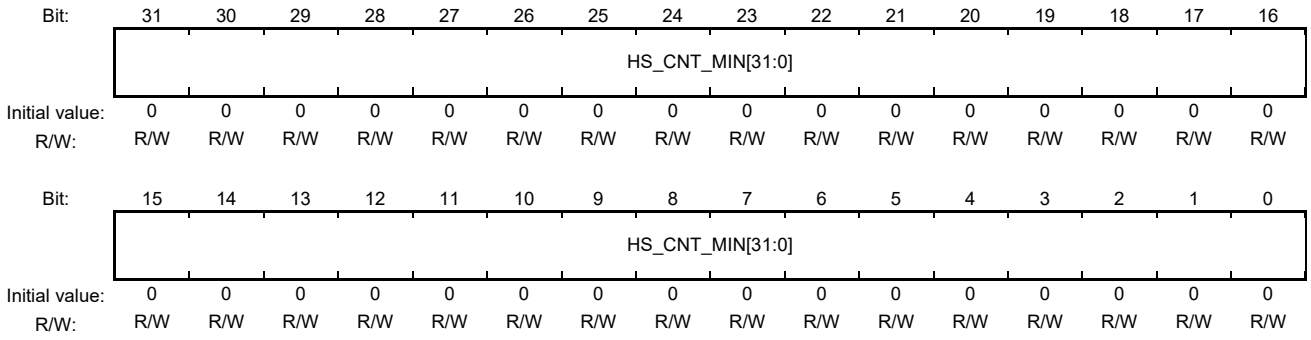
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FLD_CNT_MAX[31:0]	H'00000000	R/W	FIELD Toggle Cycle Maximum Value These bits specify the maximum value of FIELD toggle cycle. If FIELD toggle cycle is larger than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the FLCE[1] bit in VnFNSC is 1.

55.2.26 Video [n] HSYNC Toggle Minimum Register(V[n]HSTMIN)(n=0-15)

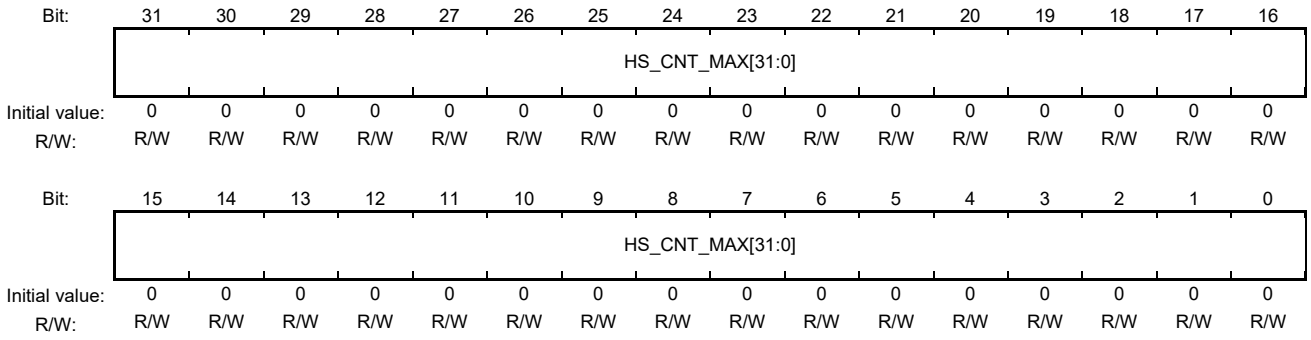
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	HS_CNT_MIN[31:0]	H'00000000	R/W	HSYNC Toggle Cycle Minimum Value These bits specify the minimum value of HSYNC toggle cycle. If HSYNC toggle cycle is smaller than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the HSCE[0] bit in VnFNSC is 1.

55.2.27 Video [n] HSYNC Toggle Maximum Register(V[n]HSTMAX)(n=0-15)

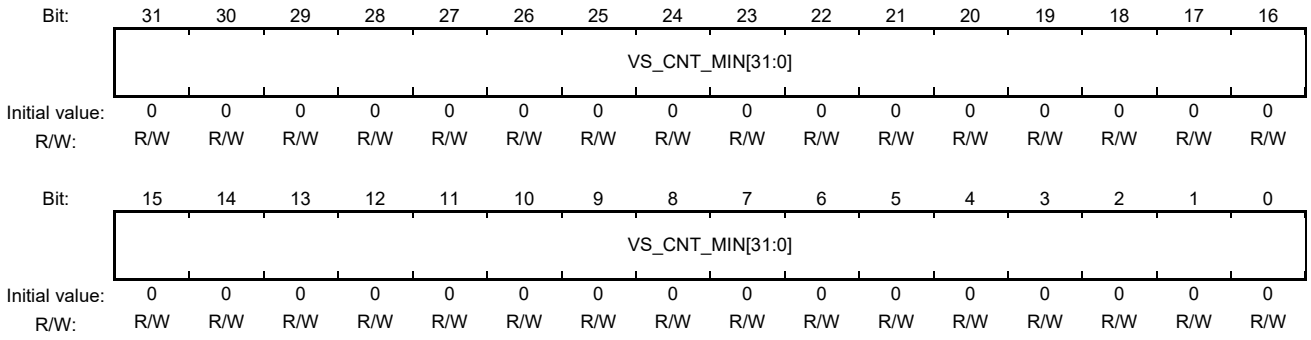
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	HS_CNT_MAX[31:0]	H'00000000	R/W	HSYNC Toggle Cycle Maximum Value These bits specify the maximum value of HSYNC toggle cycle. If HSYNC toggle cycle is larger than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the HSCE[1] bit in VnFNSC is 1.

55.2.28 Video [n] VSYNC Toggle Minimum Register(V[n]VSTMIN)(n=0-15)

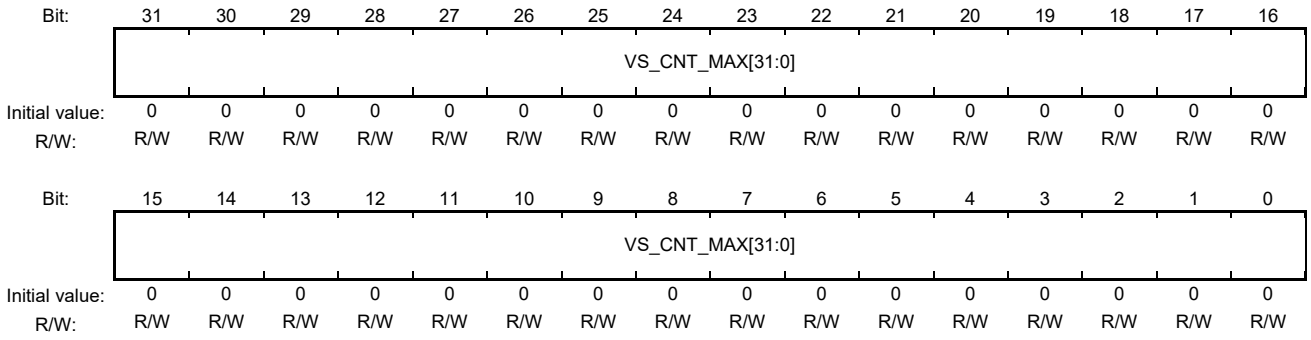
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VS_CNT_MIN[31:0]	H'00000000	R/W	VSYNC Toggle Cycle Minimum Value These bits specify the minimum value of VSYNC toggle cycle. If VSYNC toggle cycle is smaller than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the VSCE[0] bit in VnFNSC is 1.

55.2.29 Video [n] VSYNC Toggle Maximum Register(V[n]VSTMAX)(n=0-15)

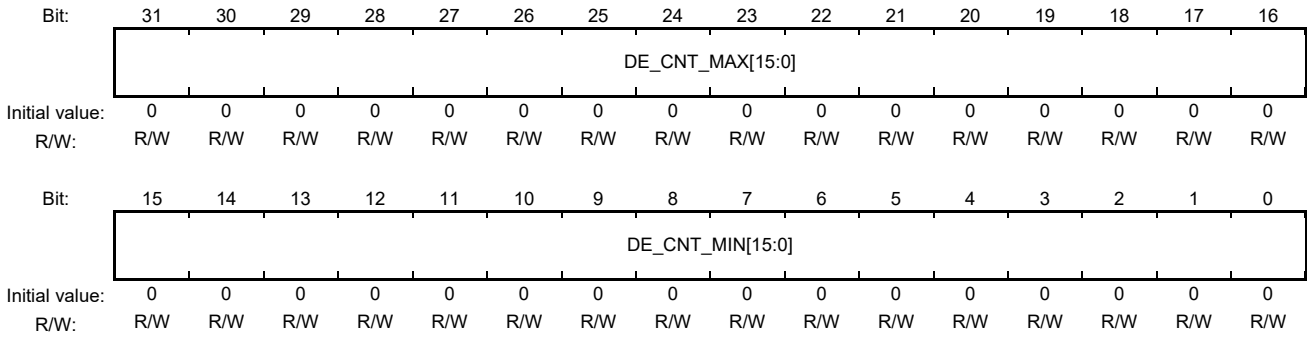
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VS_CNT_MAX[31:0]	H'00000000	R/W	VSYNC Toggle Cycle Maximum Value These bits specify the maximum value of VSYNC toggle cycle. If VSYNC toggle cycle is larger than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the VSCE[1] bit in VnFNSC is 1.

55.2.30 Video [n] Data Enable Term Register(V[n]DET)(n=0-15)

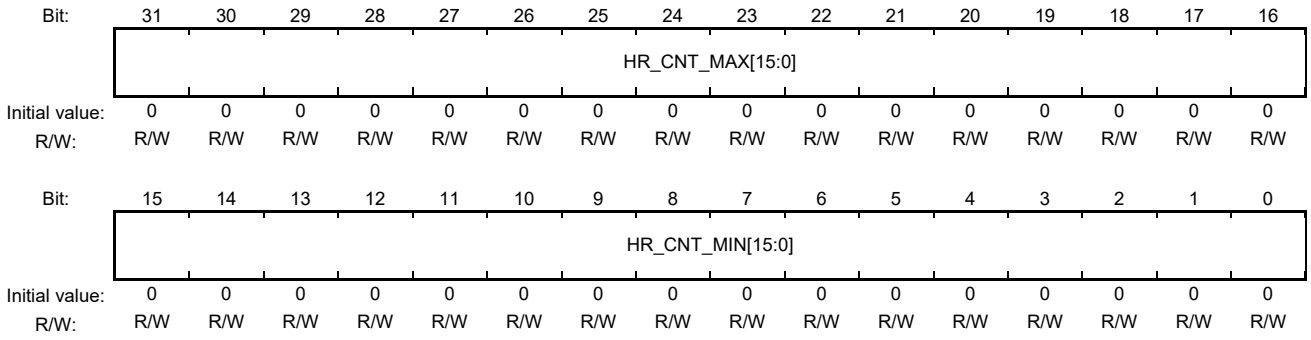
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DE_CNT_MAX[15:0]	H'0000	R/W	CLKENB Enable Cycle Maximum Value These bits specify the maximum value of CLKENB enable cycle. If CLKENB enable cycle is larger than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the DECE[1] bit in VnFNSC is 1.
15 to 0	DE_CNT_MIN[15:0]	H'0000	R/W	CLKENB Enable Cycle Minimum Value These bits specify the minimum value of CLKENB enable cycle. If CLKENB enable cycle is smaller than the value specified by these bits, Sync error is detected. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the DECE[0] bit in VnFNSC is 1.

55.2.31 Video [n] Hsync Rise Time Register(V[n]HRT)(n=0-15)

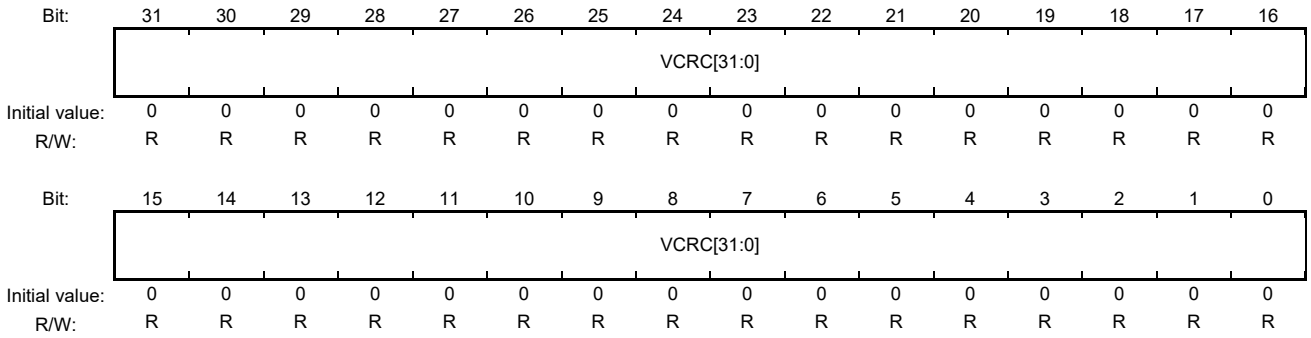
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HR_CNT_MAX[15:0]	H'0000	R/W	Hsync Rise Time Maximum Value These bits specify the maximum number of rising edges of Hsync in one frame. If the number of rising edges of Hsync is larger than the value specified by these bits, it is detected as Sync error. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the HCEN[1] bit in VnFNSC is 1.
15 to 0	HR_CNT_MIN[15:0]	H'0000	R/W	Hsync Rise Time Minimum Value These bits specify the minimum number of rising edges of Hsync in one frame. If the number of rising edges of Hsync is smaller than the value specified by these bits, it is detected as Sync error. If Sync error is detected, VnINTS.SER bit is set to 1. Note: These bits setting is valid when the HCEN[0] bit in VnFNSC is 1.

55.2.32 Video [n] VCRC Code Register(V[n]VCRC)(n=0-15)

Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VCRC[31:0]	H'00000000	R	VCRC Code These bits are show the results of the VCRC calculation. It is updated when VSYNC becomes to high (rise edge). When the CRM bit in the VnFNSC is set to 1, the results of the VCRC calculation is compared with the expected value.

55.2.33 Video [n] CRC Calculation Configuration Register(V[n]CRCC)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IDBOE[2:0]			—	—	—	Y420MD	INSEL	—	IDRE	—	—	—	—	IDBLE[1:0]

R/W:	R/W	R/W	R/W	R	R	R	R/W	R/W	R	R/W	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IDBO[2:0]			PDBL[4:0]					ROR	IDR	—	—	—	—	IDBL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W

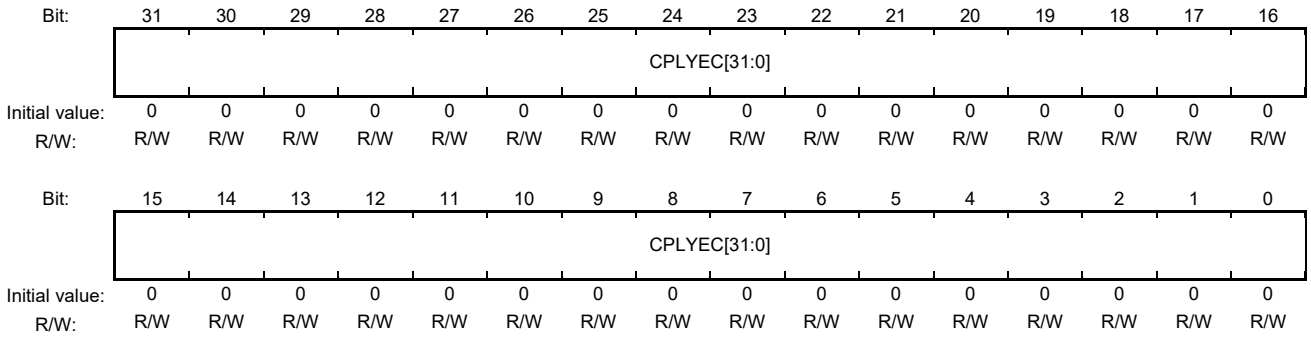
Bit	Bit Name	Initial Value	R/W	Description
31 to 29	IDBOE[2:0]	H'0	R/W	Set 0 to these bits.
28 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	Y420MD	H'0	R/W	Set 0 to this bit.
24	INSEL	H'0	R/W	Input Data Select This bit is used to select the input data to CRC calculation. 0: Before image size clip 1: After image size clip
23	—	H'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	IDRE	H'0	R/W	Set 0 to this bit.
21 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	IDBLE[1:0]	H'0	R/W	Set 0 to these bits.
15 to 13	IDBO[2:0]	H'0	R/W	Input Data Byte Order This bit specifies the byte swap setting for input data. H'0: The bit order from MSB is bit 31 to 0 H'1: The bit order from MSB is bit 23 to 16, 31 to 24, 7 to 0, 15 to 8 H'2: The bit order from MSB is bit 15 to 0, 31 to 16 H'3: The bit order from MSB is bit 7to 0, 15 to 8, 23 to 16, 31 to 24 H'4: The bit order from MSB is bit 23 to 0, 31 to 24 H'5: The bit order from MSB is bit 15 to 8, 23 to16, 31 to 24, 7 to 0 H'6: Setting prohibited H'7: Setting prohibited
12 to 8	PDBL[4:0]	H'00000	R/W	Polynomial Equation Coefficient Data Bit Length These bits specify the valid bit of coefficient which is specified by the VnCRPEC, VnCRIR, VnCRXRC. H'00: 1-bit data (bit 0) is valid H'01: 2-bit data (bit 1 and 0) are valid H'02: 3-bit data (bit 2 to 0) are valid H'03: 4-bit data (bit 3 to 0) are valid ~ H'0F: 16-bit data (bit 15 to 0) are valid H'10: 17-bit data (bit 16 to 0) are valid ~ H'1E: 31-bit data (bit 30 to 0) are valid H'1F: 32-bit data (bit 31 to 0) are valid
7	ROR	H'0	R/W	Remainder Output Reflection This bit specifies the reflection flag of remainder output. When this bit is set to 1, the bit order of remainder output data is reversed. 0: No reflection 1: Apply reflection
6	IDR	H'0	R/W	Input Data Reflection This bit specifies the reflection flag of input byte data. After applying byte order modification by IDBO[2:0] bits, the bit order of each byte of input data is reversed before CRC operation when this bit is set to 1. 0: No reflection 1: Apply reflection

Bit	Bit Name	Initial Value	R/W	Description
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IDBL[1:0]	H'0	R/W	Input Data Byte length These bits specify the value of byte length of input data. 00: 1-byte data (bit 31 to 24) are valid 01: 2-byte data (bit 31 to 16) are valid 10: 3-byte data (bit 31 to 8) are valid 11: 4-byte data (bit 31 to 0) are valid Note: This bit specifies the byte length of modified data by IDBO[2:0] and IDR bits.

Note 1: Figure 55.2 shows the specifications of CRC calculation.
Figure 55.3 to Figure 55.7 show the specifications of each bit.

55.2.34 Video [n] CRC Polynomial Equation Coefficient Register(V[n]CRPEC)(n=0-15)

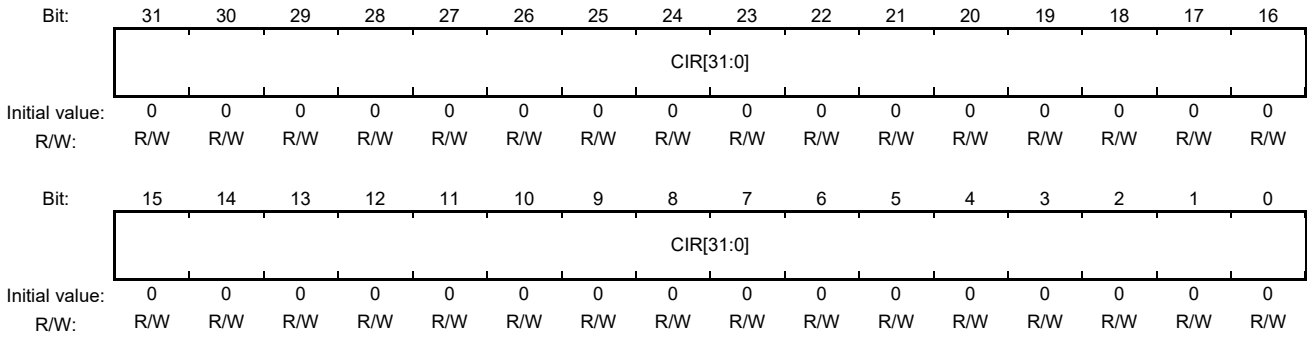
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CPLYEC[31:0]	H'00000000	R/W	CRC Polynomial Equation Coefficient These bits specify the coefficient of CRC polynomial equation. if polynomial is smaller than 32-bit, set to LSB side.

55.2.35 Video [n] CRC Initial Remainder Register(V[n]CRIR)(n=0-15)

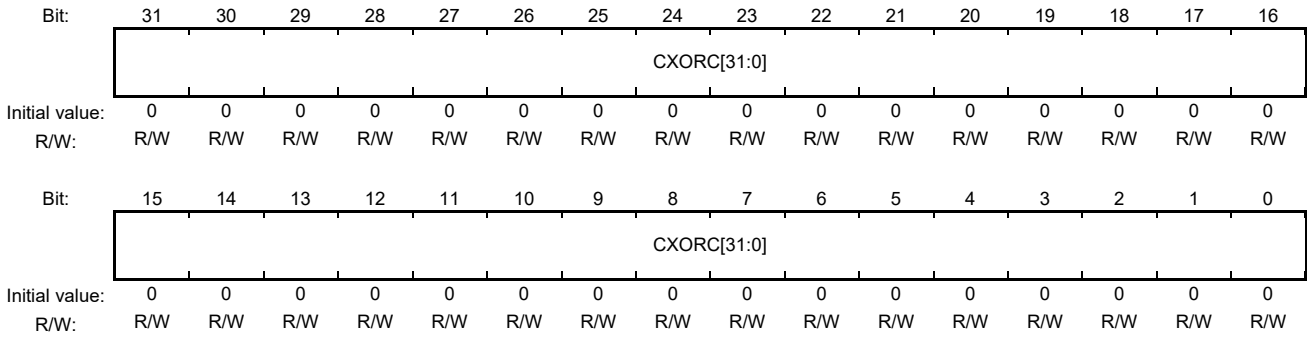
Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIR[31:0]	H'00000000	R/W	CRC Initial Remainder These bits specify the initial value of reminder. if size of polynomial is smaller than 32-bit, set to LSB side.

55.2.36 Video [n] CRC XOR Coefficient Register(V[n]CRXRC)(n=0-15)

Note: Availability of channels: n = 0 to 15



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CXORC[31:0]	H'00000000	R/W	CRC Final XOR Coefficient These bits specify the XOR operation coefficient to remainder. if size of polynomial is smaller than 32-bit, set to LSB side. If no XOR operation is applied, set these bits to H'0000 0000.

55.2.37 Video [n] Error Enable Register(V[n]EE)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	HREE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CCEE	EFEE	ECEE	—	SEE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	HREE[10:0]	H'000	R/W	HW Redundancy Error Detection Interrupt Enable Each bit enables or disables HW redundancy logic error detection interrupt when HW redundancy logic error is detected. This interrupt enable setting is valid when the HRCHK bits in VnFNSC is 1. 0: HW redundancy logic error detection interrupts are disabled. 1: HW redundancy logic error detection interrupts are enabled. Each bit specifies the below. HREE[0]: AXI write request comparison error HREE[1]: APB read data comparison error HREE[2]: No operation HREE[3]: Interrupt (For INTTOP module) comparison error HREE[4]: Isack (For CPG module) comparison error HREE[5]: Async or Sync reset (For CPG module) monitor comparison error HREE[6]: Write Buffer (SRAM) access command comparison error HREE[7]: IMR/VSPX Wake Up signal comparison error HREE[8]: Frame Buffer ID (For VPS module) comparison error HREE[9]: BUS(APB)-EDC output signals comparison error HREE[10]: BUS(AXI)-EDC output signals comparison error
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CCEE	H'0	R/W	ECRC Comparison Error Detection Interrupt Enable This bit enables or disables ECRC comparison error detection interrupt when ECRC comparison error is detected. This interrupt enable setting is valid when the CRM bit in VnFNSC is 1. 0: ECRC comparison error detection interrupts are disabled. 1: ECRC comparison error detection interrupts are enabled.
3	EFEE	H'0	R/W	EDC of FIFO Error Detection Interrupt Enable This bit enables or disables EDC error of Write FIFO detection interrupt when EDC error of Write FIFO is detected. This interrupt enable setting is valid when the FED_EN bit in VnFNSC is 1. 0: EDC error of Write FIFO detection interrupts are disabled. 1: EDC error of Write FIFO detection interrupts are enabled.
2	ECEE	H'0	R/W	EDC of Channel Selector Conversion Error Detection Interrupt Enable This bit enables or disables EDC error of Channel Selector conversion logic detection interrupt when EDC error of Channel Selector conversion logic is detected. This interrupt enable setting is valid when the CED_EN bit in VnFNSC is 1. 0: EDC error of Channel Selector conversion logic detection interrupts are disabled. 1: EDC error of Channel Selector conversion logic detection interrupts are enabled.
1	—	B'0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SEE	H'0	R/W	Sync Interval Checker Error Detect Interrupt Enable This bit enables or disables Sync Interval Checker error detect interrupts. This interrupt enable setting is valid when either of the DECE[1:0], VSCE[1:0], HSCE[1:0], FLCE[1:0] or HCEN[1:0] bits in VnFNSC are 1. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Sync Interval Checker error detect interrupts are disabled. 1: Sync Interval Checker error detect interrupts are enabled.

55.2.38 Video [n] Error Status Register(V[n]ERS)(n=0-15)

Note: Availability of channels: n = 0 to 15

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	HRER[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CCER	EFER	ECER	—	SER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	HRER[10:0]	H'000	R/W	HW Redundancy Error Detection Interrupt Status Each bit shows that HW redundancy logic error has been detected. Each bit is set to 1 when HW redundancy logic error is detected after being set to 1, this bit is cleared to 0 by writing 1. Each bit specifies the below. HRER[0]: AXI write request comparison error HRER[1]: APB read data comparison error HRER[2]: Removed feature HRER[3]: Interrupt (For INTTOP module) comparison error HRER[4]: Isack (For CPG module) comparison error HRER[5]: Async or Sync reset (For CPG module) monitor comparison error HRER[6]: Write Buffer (SRAM) access command comparison error HRER[7]: IMR/VSPX Wake Up signal comparison error HRER[8]: Frame Buffer ID (For VPS module) comparison error HRER[9]: BUS(APB)-EDC output signals comparison error HRER[10]: BUS(AXI)-EDC output signals comparison error
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CCER	H'0	R/W	ECRC Comparison Error Detection Interrupt Status This bit shows that ECRC comparison error has been detected. This bit is set to 1 when ECRC comparison error is detected after being set to 1, this bit is cleared to 0 by writing 1.
3	EFER	H'0	R/W	EDC of FIFO Error Detection Interrupt Status This bit shows that EDC error of Write FIFO has been detected. This bit is set to 1 when EDC error of Write FIFO is detected after being set to 1, this bit is cleared to 0 by writing 1.
2	ECER	H'0	R/W	EDC of Channel Selector Conversion Error Detection Interrupt Status This bit shows that EDC error of Channel Selector conversion logic has been detected. This bit is set to 1 when EDC error of Channel Selector conversion logic is detected after being set to 1, this bit is cleared to 0 by writing 1.
1	—	B'0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SER	H'0	R/W	Sync Interval Checker Error Detect Interrupt Status This bit shows that Sync error has been detected. This bit is set to 1 when Sync Interval Checker error is detected after being set to 1, this bit is cleared to 0 by writing 1. For detail of Sync Interval Checker error control, refer VnFNSC, VnFTMIN, VnFTMAX, VnHSTMIN, VnHSTMAX, VnVSTMIN, VnVSTMAX, VnVETMIN, VnVETMAX, VnDET and VnHRT registers.

55.2.39 Tables and Figures

Table 55.4 Capture Interface Settings (from Channel Selector)

Interface	VnMC/EXINF	VnMC/INF
YUV422 8-bit or YUV420 8-bit	00	001
YUV422 10-bit or YUV420 10-bit	00	011
YUV422 12-bit (Y-12bit / UV-8bit)	11	011
Embedded 8-bit non-Image Data or RAW8	01	100
RAW8 (16 bits/pixel) or RAW10 or RAW12 or RAW14 or RAW16 or RGB565	00	111
RAW20 or RAW24 or RGB888	00	110

Table 55.5 Data Conversion Settings

- RGB Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	VnDMR/ RMODE[2:0]	Remarks
RGB-565 (16 bits/pixel) format	000	0	0	00	000	
RGB-888 (32 bits/pixel) format	000	1	0	00	000	
ARGB-1555 (16 bits/pixel) format	000	0	0	01	000	The alpha bit is set with the ABIT bit in VnDMR.
ARGB-8888 (32 bits/pixel) format	000	1	0	01	000	The alpha bit is set with the A8BIT bit in VnDMR.

- YCbCr Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	VnDMR/ RMODE[2:0]	Remarks
YCbCr-422 (8 bits) transfer	000	0	0	00	000	Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian. Make these settings if the setting of the INF[2:0] bits in VnMC is B'100.
YCbCr-422 (10 bits) transfer*	000	0	1	00	000	
Y (8 bits)/CbCr separation transfer	000	0	0	10/11	000	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (10 or 12 bits)/CbCr separation transfer*	000	0	1	10	000	Data selection of 10-bit or 12-bit is according to the input format.
Y (8 bits) transfer	001	0	0	10	000	
Y (16 bits)/CbCr separation transfer	010/100	0	0	10	000	CbCr transfer destination is determined by the VnUVAOF register setting.

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	VnDMR/ RMODE[2:0]	Remarks
Y (16 bits)/CbCr separation transfer (YCbCr-420 format)	010/100	0	0	11	000	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (16 bits) transfer	011/101	0	0	10	000	

Notes: If any combination of values not listed above is specified, correct operation is not guaranteed.

- RAW Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	VnDMR/ RMODE[2:0]	Remarks
RAW8 (8 bits/pixel) format	000	0	0	00	000	
RAW8 (16 bits/pixel) format	000	0	0	00	000	
RAW10 (16 bits/pixel) format	000	0	0	00	010

55.3.2 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.

Specifying the capture field in IM bits of the main control (VnMC) register and then setting the SC bit in the frame capture (VnFC) register to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the start line pre-clip (VnSLPrC) register, or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the memory base 1 (VnMB1) register. For using single frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable (ME) bit in the main control register (VnMC).
2. Set 1 to the single frame capture mode (SC) bit in the frame capture register (VnFC).

Note: When using this setting, don't set 2'b01 to the interlace mode (IM) bits in the main control register (VnMC).

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the module status (VnMS) register. For using continuous frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable (ME) bit in the main control register (VnMC).
2. Set 1 to the continuous frame capture mode (CC) bit in the frame capture register (VnFC).

Note: Don't set 1 to the single frame capture mode (SC) bit and the continuous frame capture mode (CC) bit at the same time.

When the IM bits in VnMC are set to the full interlace mode, data in the capture start field is stored in every other line in the memory as the odd field (field 1) data and then data in the next field is stored as the even field (field 2) between the written lines so that the top and bottom field lines alternate with each other for interlace composition. The capture start field (top field) can be changed through the FOC bit in VnMC.

The following is a schematic diagram of capturing in full interlace mode when the odd field (field 1) is selected as the top field, the memory width is set to H'200, and VnMB1 is set to H'0000.

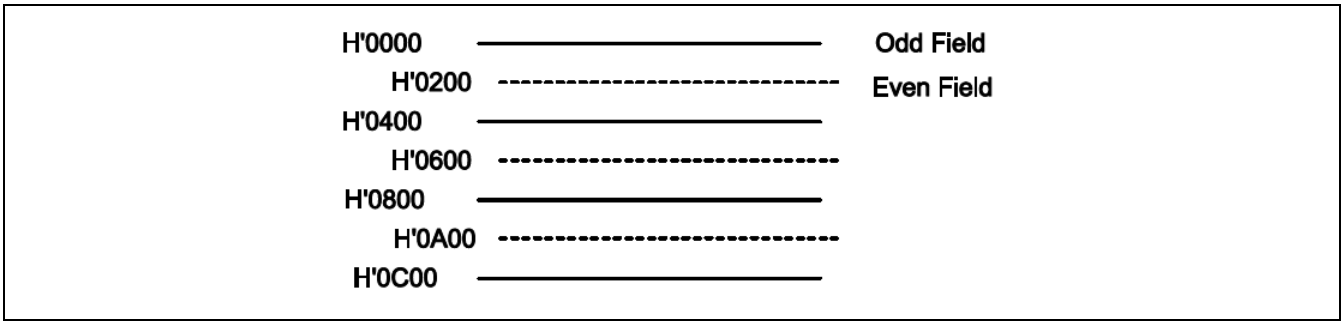

Figure 55.8 Example of Capturing Full Interlace

The VIN starts capture operation after detecting a frame signal switching. When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal or use multi frame capture mode. For details, see VnDMR2 register description.

55.3.3 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC).

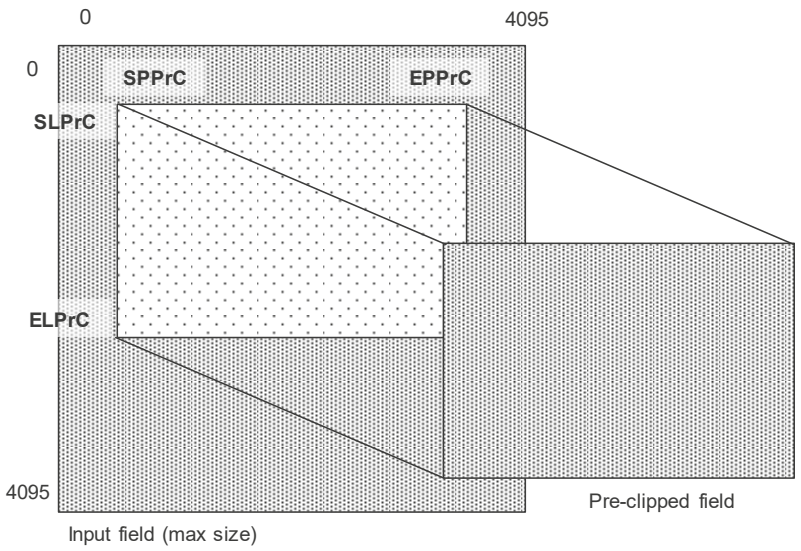

Figure 55.9 Example of Clipping

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the image stride (VnIS) register. The setting can be larger than the post-clipped frame width but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC).

55.3.4 Internal Field Signal Generation

As the video input module controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function the FTEV in the data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)
  When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).

Notes: Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

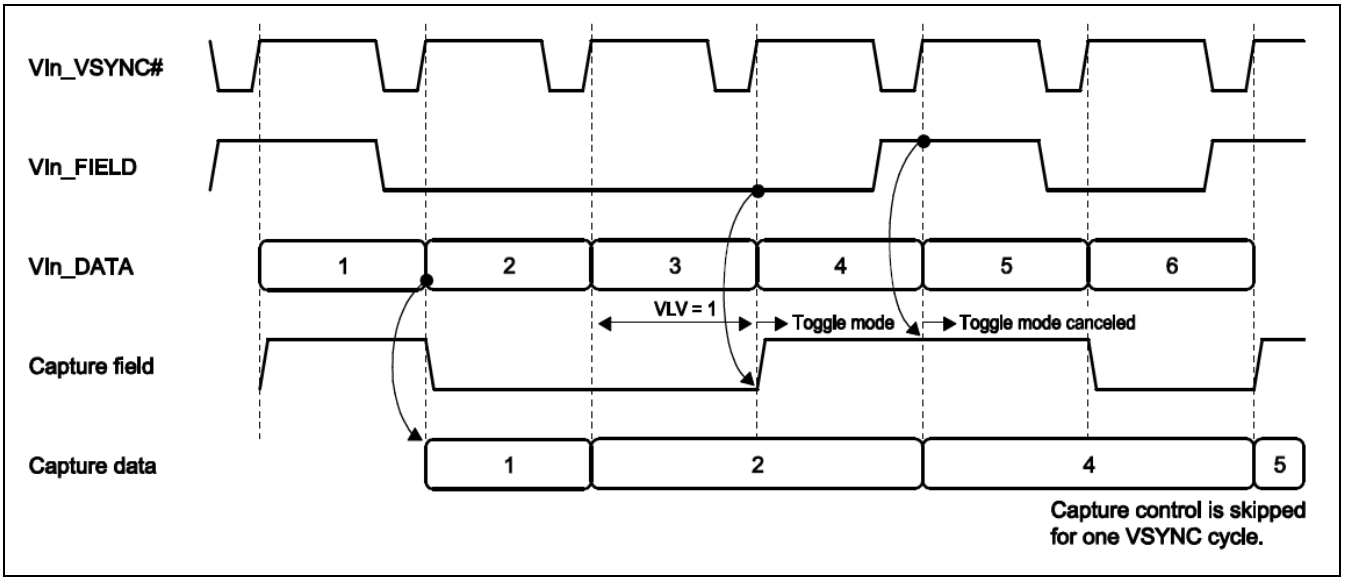

Figure 55.10 Overview and Notes of VSYNC Field Toggle Mode

55.3.5 Write Line Counter and Writing Frame Buffer Status

When the WLCEN bit in the VnMC is set 1, the write line counter and writing frame buffer status is available.

The initial value of write line counter is 0. When all data of line was stored to memory, the write line counter is counted by 1. When all data of frame was stored to memory, the write line counter is reset to 0. The write line counter is shown as the WLC[13:0] bits in the VnWLC. The maximum value of WLC[13:0] bits are (ELPrC – SLPrC + 1).

The initial value of writing frame buffer status is B'11. When all data of frame was stored to memory, the writing frame buffer status is updated. Each status shows the below.

B'00: The writing frame buffer has the base address defined by the memory base 1 register.

B'01: The writing frame buffer has the base address defined by the memory base 2 register.

B'10: The writing frame buffer has the base address defined by the memory base 3 register.

B'11: There is no writing frame buffer.

The writing frame buffer status updates as the below order.

B'11 (Initial) -> B'00 -> B'01 -> B'10 -> B'00 -> B'01 -> …

The writing frame buffer status is shown as the WFBS[1:0] bits in the VnWLC.

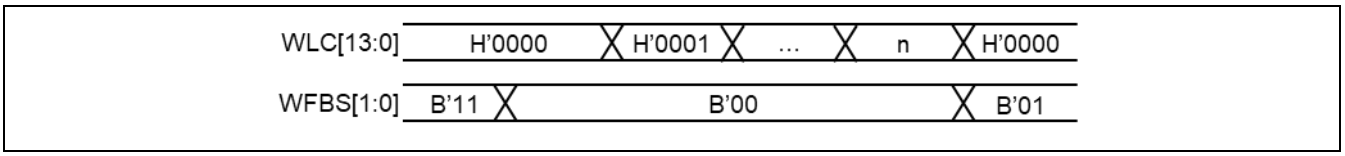

Figure 55.11 Transition of write line counter and writing frame buffer status

The smallest write line counter and smallest writing frame buffer status are also managed as SWLC[13:0] bits and SWFBS[1:0] bits in the VnWLC respectively. The SWLC[13:0] bits and SWFBS[1:0] bits in the VnWLC are available when channel combinations are channel 0 to 1, 0 to 2, 0 to 3, 0 to 4, 0 to 5, 0 to 6, and 0 to 7.

55.3.6 Multi Frame Capture Function

When the MFC bit in the VnDMR2 is set 1, the multiple frames data are stored to one frame buffer. The number of frames to be stored is controlled by the VLV[3:0] bits in the VnDMR2. The number of frames to be stored is (VLV[3:0] + 1). The number of frames can be specified from 1 (VLV[3:0] is H'0) to 16 (VLV[3:0] is H'F).

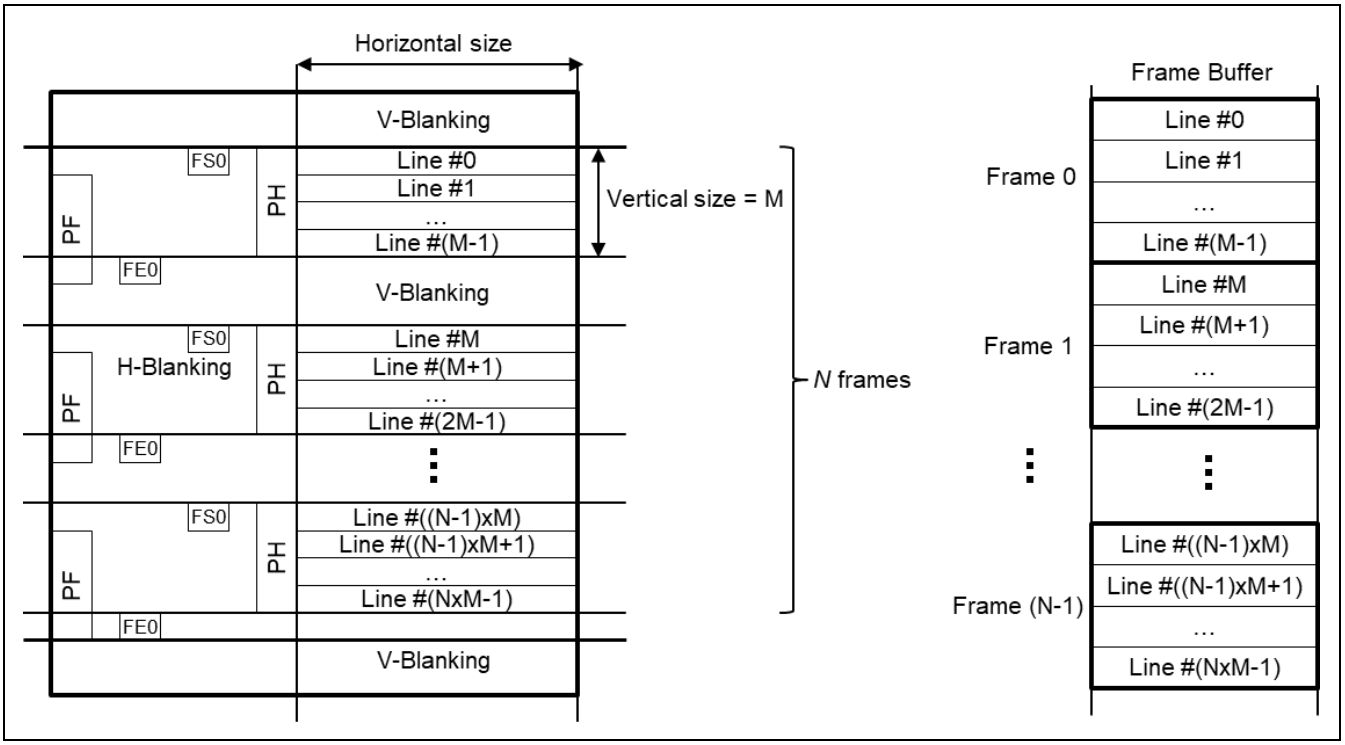

Figure 55.12 Multi frame capture function

When the multi frame capture function is used, there are below limitations.

- It is necessary that the start setting of video input module is finished before inputting image data
- The interlace image inputting is not available
- It is prohibited that the MFC and FTEV bits in the VnDMR2 are set to 1 at the same time

55.3.7 Wake Up Signals Generation

The video input module can output wake up signals to IMR and VSPX module. It is necessary that the WLCEN bit in the VnMC is set 1 to use this function.

Each video channel in the video input module have a wake up signal and contolled by the WUCH bit in the VnIMWUCH. A common wake up signal is connected to IMR and VSPX. The IMR and VSPX select which channel's wake up signal to use. When 1 is set to Wake-up Notification Interrupt Enable (VnIE.WUE), Wake-up Notification Interrupt Status (VnINTS.WUS) is set to 1 at the timing of wake up signal asserted.

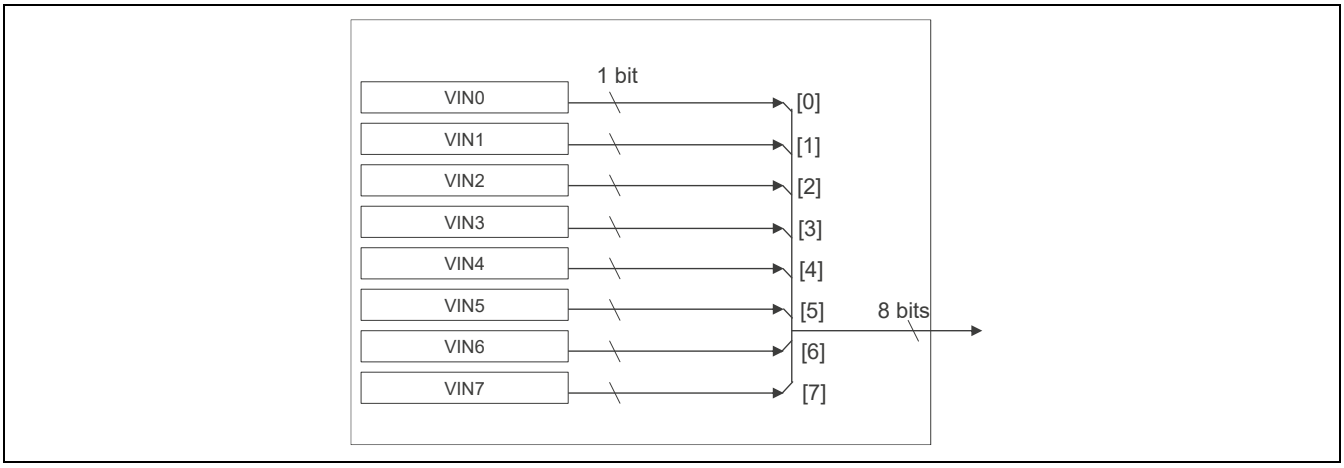

Figure 55.13 Configuration of wake up signals

The wake up signal is output at the below timing.

- After line data of specified vertical position (up to 2 positions) was stored to memory.
- After all data of frame was stored to memory.

The vertical position can be specified by the WUL1[13:0] and WUL2[13:0] bits in the VnIMWUL. In addition, the wake up signals of each timing can be controlled to output or not by WUE1, WUE2 and WUE3 bits in the VnIMWUCH respectively.

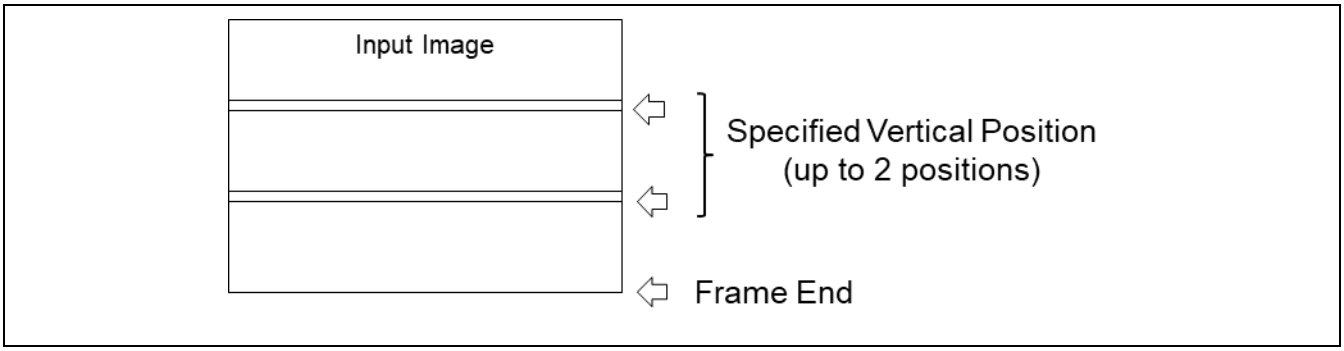

Figure 55.14 Wake up signals output timing

55.3.8 Output Data Format

The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

(1) YC: YcbCr-422, 8 Bits

The 8-bit YUV image data in the YC (YcbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

- BPSM = 0 in VnDMR: UYVY format

8-bit YcbCr-422 data (UYVY format)

D63 to D48	63	56	55	48
Image data 3 and 4	Y3[7:0]		Cr2[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Y2[7:0]		Cb2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Y1[7:0]		Cr0[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y0[7:0]		Cb0[7:0]	

- BPSM = 1 in VnDMR: YUYV format

8-bit YcbCr-422 data (YUYV format)

D63 to D48	63	56	55	48
Image data 3 and 4	Cr2[7:0]		Y3[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Cb2[7:0]		Y2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Cr0[7:0]		Y1[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cb0[7:0]		Y0[7:0]	

(2) YC: YcbCr-422, 10 Bits

The 10-bit YUV image data in the YC (YcbCr) = 4:2:2 format is shown below.

Notes: 1. This format needs to set “1” to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

10-bit YcbCr-422 data (UYVY format)

D127 to D112	127					122	121	112
Image data 8	*	*	*	*	*	*	Y3[9:0]	
D111 to D96	111					106	105	96
Image data 7	*	*	*	*	*	*	Cr2[9:0]	
D95 to D80	95					90	89	80
Image data 6	*	*	*	*	*	*	Y2[9:0]	
D79 to D64	79					74	73	64
Image data 5	*	*	*	*	*	*	Cb2[9:0]	
D63 to D48	63					58	57	48
Image data 4	*	*	*	*	*	*	Y1[9:0]	
D47 to D32	47					42	41	32
Image data 3	*	*	*	*	*	*	Cr0[9:0]	
D31 to D16	31					26	25	16
Image data 2	*	*	*	*	*	*	Y0[9:0]	
D15 to D0	15					10	9	0
Image data 1	*	*	*	*	*	*	Cb0[9:0]	

Note: * This bit is transferred to memory as 0 or sign data (Yn[9], Cbn[9], Crn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(3) YC: YC Separation YcbCr-422, 8 Bits

This is 8-bit YUV image data in the YC separated YC (YcbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y3[7:0]		Y2[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y1[7:0]		Y0[7:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(4) YC: YC Separation YcbCr-420, 8 Bits

This is 8-bit YUV image data in the YC separated YC (YcbCr) = 4:2:0 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000, setting the DTMD[1:0] bits in VnDMR to B'11 changes the format to 4:2:0 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. The UV data are transferred to memory every even line.

Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y3[7:0]		Y2[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y1[7:0]		Y0[7:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr02[7:0]		Cb02[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cr00[7:0]		Cb00[7:0]	

(5) YC: YC Separation YcbCr-422, Y(10 Bits) / C(10 Bits)

This is 10-bit YUV image data in the YC separated YC (YcbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

Y data (10 bits)

	63					58	57	48
D63 to D48								
Image data 4	*	*	*	*	*	*	Y3[9:0]	
D47 to D32	47					42	41	32
Image data 3	*	*	*	*	*	*	Y2[9:0]	
D31 to D16	31					26	25	16
Image data 2	*	*	*	*	*	*	Y1[9:0]	
D15 to D0	15					10	9	0
Image data 1	*	*	*	*	*	*	Y0[9:0]	

Note: * This bit is transferred to memory as 0 or sign data (Yn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

Cb, Cr data (10 bits)

	63					58	57	48
D63 to D48								
Image data 4	*	*	*	*	*	*	Cr2[9:0]	
D47 to D32	47					42	41	32
Image data 3	*	*	*	*	*	*	Cb2[9:0]	
D31 to D16	31					26	25	16
Image data 2	*	*	*	*	*	*	Cr0[9:0]	
D15 to D0	15					10	9	0
Image data 1	*	*	*	*	*	*	Cb0[9:0]	

Note: * This bit is transferred to memory as 0 or sign data (Cbn[9], Crn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(6) YC: YC Separation YcbCr-422, 10 Bits

This is 10-bit YUV image data in the YC separated YC (YcbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 converts 10-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31					26	25									16
Image data 3 and 4	*	*	*	*	*	*	Y1[9:0]									
D15 to D0	15					10	9									0
Image data 1 and 2	*	*	*	*	*	*	Y0[9:0]									

Cb, Cr data

D31 to D16	31							24	23							16
Image data 3 and 4	Cr2[7:0]								Cb2[7:0]							
D15 to D0	15							8	7							0
Image data 1 and 2	Cr0[7:0]								Cb0[7:0]							

Note: * This bit is transferred to memory as 0 or sign data (Yn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(7) YC: YC Separation YcbCr-422, 12 Bits

This is 12-bit YUV image data in the YC separated YC (YcbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'100 or B'101, setting the DTMD[1:0] bits in VnDMR to B'10 converts 12-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'101, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31				28	27										16
Image data 3 and 4	*	*	*	*	Y1[11:0]											
D15 to D0	15				12	11										0
Image data 1 and 2	*	*	*	*	Y0[11:0]											

Note: * This bit is transferred to memory as 0 or sign data (Yn[11]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

Cb, Cr data

D31 to D16	31								24	23							16
Image data 3 and 4	Cr2[7:0]									Cb2[7:0]							
D15 to D0	15								8	7							0
Image data 1 and 2	Cr0[7:0]									Cb0[7:0]							

(8) 16 Bits/Pixel: RGB-565

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16 bits/pixel data (RGB data) format

D15 to D0	15					11	10					5	4				0
Image data	R[4:0]						G[5:0]						B[4:0]				

(9) 16 Bits/Pixel: ARGB-1555

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

16 bits/pixel data (ARGB data) format

D15 to D0	15	14				10	9				5	4				0
Image data	A	R[4:0]					G[4:0]					B[4:0]				

(10) 32 Bits/Pixel: RGB-888

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

32 bits/pixel data (RGB data) format

D31 to D16	31								24	23							16
Image data	*	*	*	*	*	*	*	*		Rn[7:0]							
D15 to D0	15								8	7							0
Image data	Gn[7:0]									Bn[7:0]							

Note: * This bit is transferred to memory as 0 or sign data (Rn[7]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(11) 32 Bits/Pixel: ARGB-8888

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32 bits/pixel data (ARGB data) format

D31 to D16	31								24	23							16
Image data	A[7:0]									R[7:0]							
D15 to D0	15								8	7							0
Image data	G[7:0]									B[7:0]							

(12) RAW: 8 Bits and Embedded 8-Bit Non-Image Data, User Defined 8-bit Data

The 8-bit RAW image data format, Embedded 8-bit non image data and User Defined 8-bit data format are shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data and 8-bit non-image data according to the VnIS register setting.

- When even pixels are input

8-bit data format

D15 to D0	15							8	7							0
Image data 1 and 2	P1[7:0]								P0[7:0]							

- When odd pixels are input (8-bit RAW data format)

8-bit data format

D15 to D0	15							8	7							0
Image data 1	*	*	*	*	*	*	*	*	P0[7:0]							

Note: * This bit is transferred to memory as 0 or sign data (Pn[7]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

- When odd pixels are input (8-bit non-image data format)

8-bit data format

D15 to D0	15							8	7							0
Image data 1	0	0	0	0	0	0	0	0	P0[7:0]							

(13) RAW: 10 Bits

The 10-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.

10-bit RAW data format

D31 to D16	31						26	25								16
Image data 2	*	*	*	*	*	*	P1[9:0]									
D15 to D0	15						10	9								0
Image data 1	*	*	*	*	*	*	P0[9:0]									

Note: * This bit is transferred to memory as 0 or sign data (Pn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(14) RAW: 12 Bits

The 12-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.

12-bit RAW data format

D127 to D112	127			124	123		112
Image data 8	*	*	*	*	P7[11:0]		
D111 to D96	111			108	107		96
Image data 7	*	*	*	*	P6[11:0]		
D95 to D80	95			92	91		80
Image data 6	*	*	*	*	P5[11:0]		
D79 to D64	79			76	75		64
Image data 5	*	*	*	*	P4[11:0]		
D63 to D48	63			60	59		48
Image data 4	*	*	*	*	P3[11:0]		
D47 to D32	47			44	43		32
Image data 3	*	*	*	*	P2[11:0]		
D31 to D16	31			28	27		16
Image data 2	*	*	*	*	P1[11:0]		
D15 to D0	15			12	11		0
Image data 1	*	*	*	*	P0[11:0]		

Note: * This bit is transferred to memory as 0 or sign data (Pn[11]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(15) RAW: 14 Bits

The 14-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.

14-bit RAW data format

D31 to D16	31	30	29 to 16
Image data 2	*	*	P1[13:0]
D15 to D0	**15**	**14**	**13 to 0**
Image data 1	*	*	P0[13:0]

Note: * This bit is transferred to memory as 0 or sign data (Pn[13]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(16) RAW: 16 Bits

The 16-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.

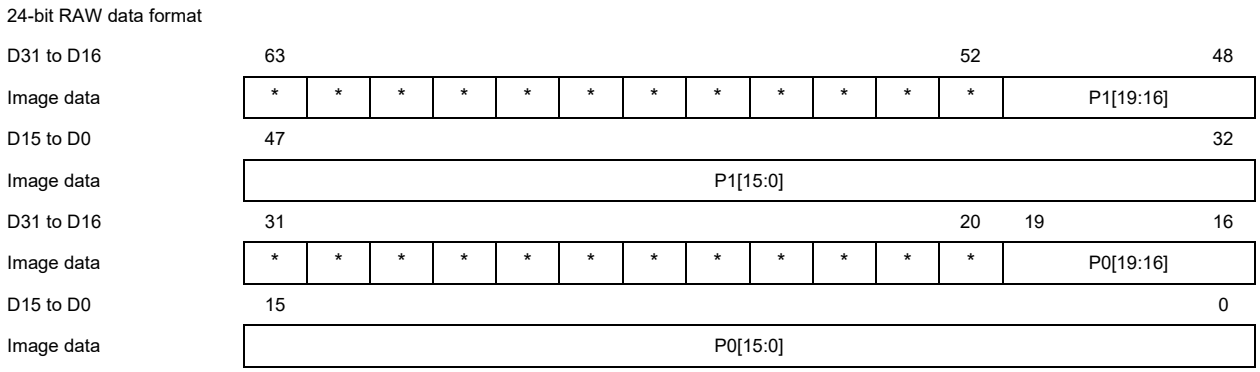
16-bit RAW data format

D31 to D16	31	16
Image data 2	P1[15:0]	
D15 to D0	15	0
Image data 1	P0[15:0]	

(17) RAW: 20 Bits

The 20-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 4-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.



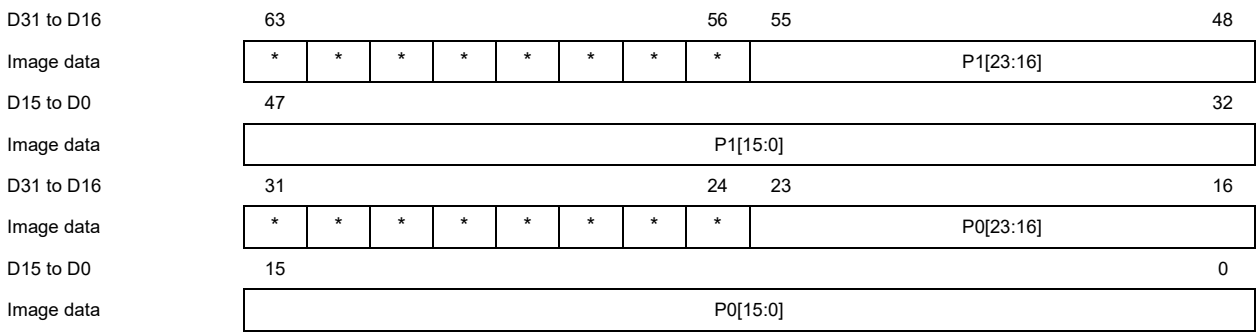
Note: * This bit is transferred to memory as 0 or sign data (Pn[19]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(18) RAW: 24 Bits

The 24-bit RAW image data format is shown below.

Notes: 1. These data are transferred by 4-Byte unit.
2. A word address is output for RAW data according to the VnIS register setting.

24-bit RAW data format



Note: * This bit is transferred to memory as 0 or sign data (Pn[23]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(19) YC: YC Separation YcbCr-420, 10 Bits

This is 10-bit YUV image data in the YC separated YC (YcbCr) = 4:2:0 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'010, setting the DTMD[1:0] bits in VnDMR to B'11 converts 10-bit Y data to 16-bit and changes the format to 4:2:0. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. The UV data are transferred to memory every even line.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31					26	25									16
Image data 3 and 4	*	*	*	*	*	*	Y1[9:0]									
D15 to D0	15					10	9									0
Image data 1 and 2	*	*	*	*	*	*	Y0[9:0]									

Cb, Cr data

D31 to D16	31							24	23							16
Image data 3 and 4	Cr2[7:0]								Cb2[7:0]							
D15 to D0	15							8	7							0
Image data 1 and 2	Cr0[7:0]								Cb0[7:0]							

Note: * This bit is transferred to memory as 0 or sign data (Yn[9]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

(20) YC: YC Separation YcbCr-420, 12 Bits

This is 12-bit YUV image data in the YC separated YC (YcbCr) = 4:2:0 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'100, setting the DTMD[1:0] bits in VnDMR to B'11 converts 12-bit Y data to 16-bit and changes the format to 4:2:0. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. The UV data are transferred to memory every even line.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31			28	27	16
Image data 3 and 4	*	*	*	*	Y1[11:0]	
D15 to D0	15			12	11	0
Image data 1 and 2	*	*	*	*	Y0[11:0]	

Note: * This bit is transferred to memory as 0 or sign data (Yn[11]).
When the FDS bit in the VnDMR is set to 1, this bit is filled with sign data.

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(21) RAW: 8 Bits (16 Bits/Pixel) Data

The 8-bit RAW (16 bits/pixel) image data format is shown below.

Notes: 1. These data are transferred by 2-Byte unit.
2. A word address is output for RAW data and 8-bit non-image data according to the VnIS register setting.

8-bit data format

D15 to D0	15							8	7	0
Image data 1	0	0	0	0	0	0	0	0	P0[7:0]	

55.3.9 Endian Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the main control register (VnMC) to 1 to convert data into big endian before storing in memory.

Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR.

Table 55.7 Endian Conversion Unit

Data Format	DTMD[1:0] in VnDMR	EXRGB in VnDMR	BPSM in VnDMR	Endian Conversion Unit
RGB-565	00	0	0	Word units
RGB-888	00	1	0	Longword units
YcbCr-422	00	0	1	Byte units
ARGB-1555	01	0	0	Word units
ARGB-8888	01	1	0	Longword units
YC	10	0	0	Byte units

The following figures show endian conversions in byte, word, and longword units.

Endian conversion in byte units:

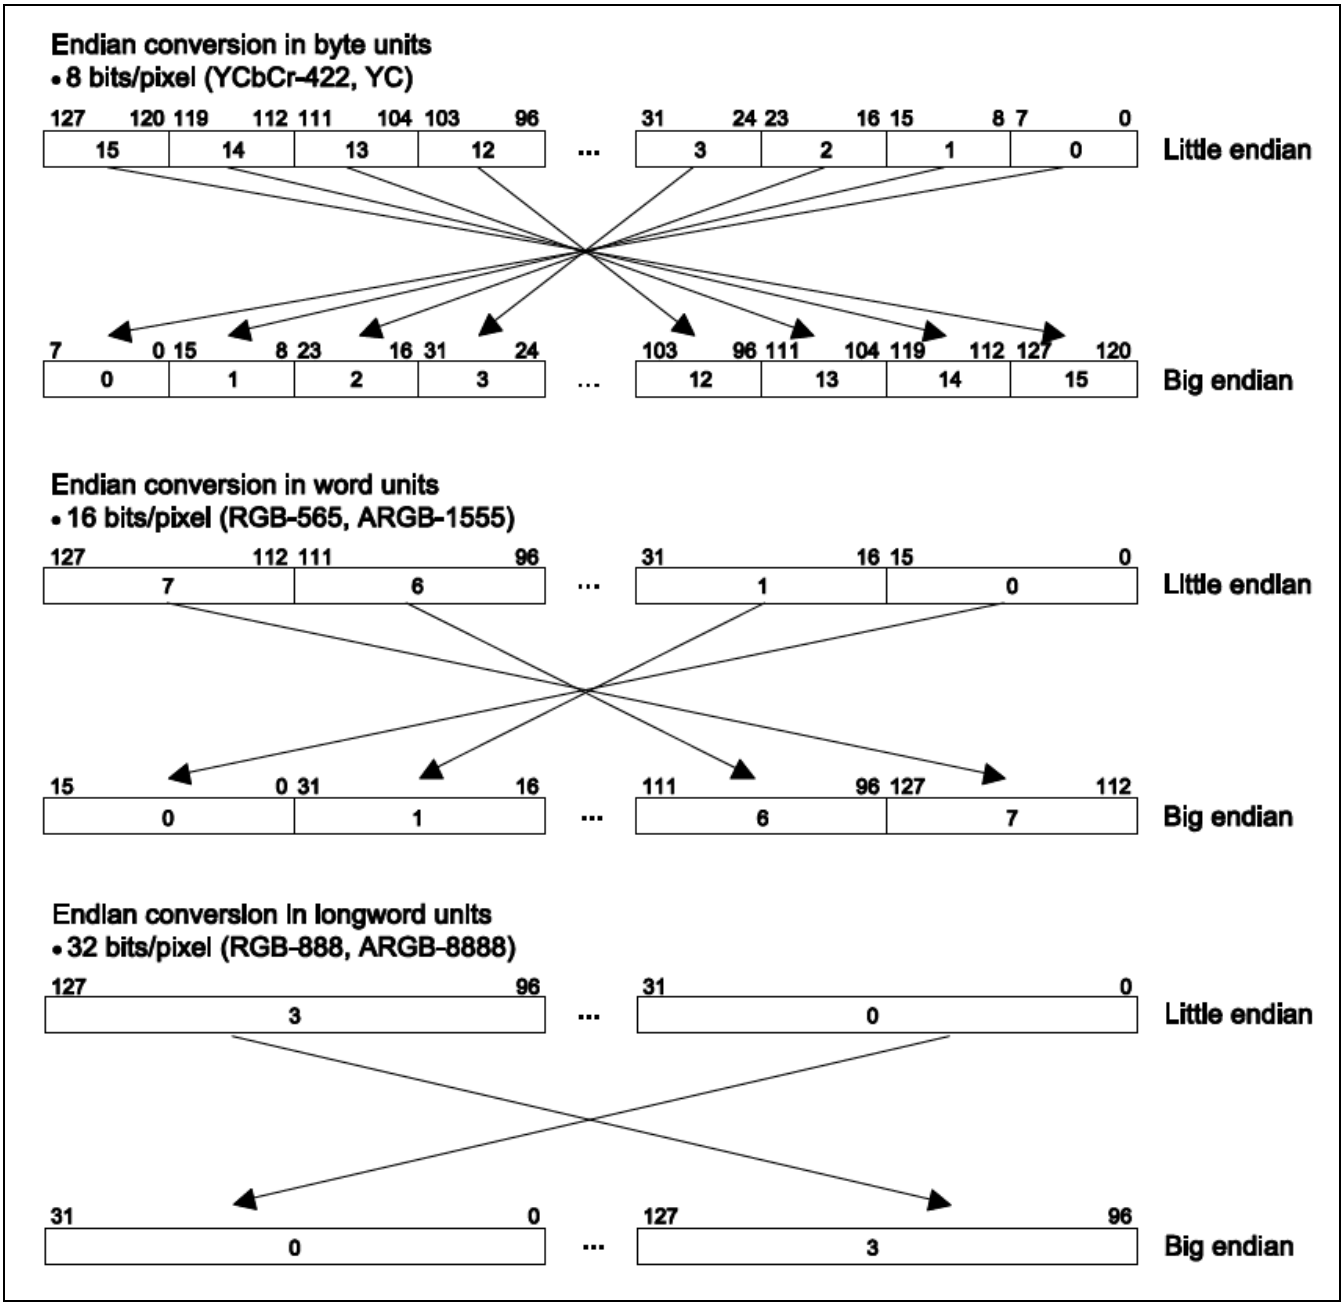


Figure 55.15 Data Alignment Conversion from Little Endian to Big Endian

55.3.10 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The video input module should not be accessed during module standby mode.

55.3.11 Transition to Module Standby Mode

1. Execute capture stop procedure described in section 55.3.15 if VIN is in capture operation.
2. Enable Module Stop in the Module Stop Control Register.
3. Check the bit that the target module of MSTPSRn is 1.

For detail of registers of Module Standby, refer to section 9.

55.3.12 Cancellation of Module Standby Mode

1. Disable Module Stop in the Module Stop Control Register.
2. Check the bit that the target module of MSTPSRn is 0.
3. Apply Software Reset in the Software Reset Register.
4. Clear Software Reset in the Software Reset Clearing Register.

For detail of registers of Module Standby , refer to section 9.

55.3.13 Interrupts

The Video Input Module can generate 100 interrupts. For details, refer to section 15 and 16.

Table 55.8 Interrupt Assignment

Interrupt Name	Cause of interrupt
VIN.chX	FIS2 or VFS or VRS or FIS or CES or SIS or EFS or FOS bit in VnINTS
errreq_vin_viX_p	*
errreq_vin_viX_edc_p	*
errreq_vin_vin0_clm_p	*
errreq_vin_vin1_clm_p	*
errreq_vin_vin2_clm_p	*
errreq_vin_vin3_clm_p	*

Notes: X = 0 to 15
*: This interrupt is functional safety use only.

55.3.14 Initialize Procedure

The initialization and capture start procedure of VIN is as followings.

1. Set VUP bit in VnMC to 0.
2. Set other configuration bits in VnMC and keep this bit during the following sequence.
3. Set VUP bit in VnMC to the desired value.
4. Set VIN registers.
5. Set the VSYNC field toggle mode enable (FTEV) bit in the Video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period (VLV[3:0]) bits in VnDMR2 shall be set to 4'h0.
6. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
7. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.
8. Set the ISP module registers*1.
9. Set the Link and PHY of CSI-2 module registers*2.
10. Start camera device.
11. Confirm PHY of CSI-2 module starts.

Notes: *1. For detail, refer section 54.
*2. For detail, refer section 53.

55.3.15 Capture Stop procedure

The capture stop procedure of VIN is as followings.

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0.
3. Reset the ISP module*1.
4. Reset the Link and PHY of CSI-2 module*2.
5. Stop camera device of MIPI-CSI-2 side.

Notes: *1. For detail, refer section 54.
*2. For detail, refer section 53.

55.3.16 Capture Restarting procedure

The capture restarting procedure of VIN is same as the initialize procedure described in section 55.3.14.

55.3.17 Reset Procedure

There are two reset sequences.

(1) Power-on Reset

The VIN is in a module-stopped state after power is turned on. The procedure of module stop release described in section 55.3.12 includes the VIN reset process.

(2) Reset when VIN gets Hang Up

If VIN gets hang up such as:

- The capture active (CA) bit in the module status register (VnMS) is not set to 1 after executing the initialize procedure in section 55.3.14 or the capture restarting procedure in section 55.3.16.
- The capture active (CA) bit in the module status register (VnMS) is not cleared to 0 after executing the capture stop procedure described in section 55.3.15.
- The end of frame interrupt status (EFS) bit or field interrupt status (FIS) bit is not set to 1 after more than one V-period of input video sequence.
- Or when it is judged that the VIN is not working,

VIN must be reset as follows.

1. Apply Software Reset in the Software Reset Register.
2. Clear Software Reset in the Software Reset Clearing Register.

For detail of registers of Software Reset, refer to section 9.

55.4 Usage Notes

55.4.1 Specification

The following shows the specification.

Table 55.9 Specification

Item	Description
Limitation on size clipping	The upper limits on size clipping depends on the use case.
Capture in progressive mode	Use the internal field signal generation function or multi frame capture mode with an input interface in progressive mode. For details, see VnDMR2 register description.
Limitation on register update	If a register is updated during capture, data captured immediately after the register update cannot be guaranteed. To update a register which supports the internal update mode as shown in Table 55.2. VIN Registers, specify an internal update for VIN registers by using the MC/VUP bit. To update other registers, stop capture operation and then update them.
Field capture mode image quality	Images of odd-numbered, odd/even-numbered and even-numbered fields, captured by VnMC/IM interlace mode bit settings, contain every other line from the input interlace images. Therefore, note that the horizontal resolution for video display is in units of fields.
Full interlace mode image quality	In full interlace composition mode, horizontal stripe noise (such as combing noise) is generated in composite images as fields based on different timelines are combined in memory due to the interlacing method.
Interrupt event timing	Interrupt event asserted by this module indicates the time when an interrupt event occurs in VIN, not the time when the transfer of capture data to memory is completed.
YC Restrictions on YC separation function	Set the offset register that stores UV data (VnUVAOF) such that the storage areas of Y and UV data are not the same. If the same storage area is set for both data, Y data will be overwritten.
Video display operation	This module performs capture control based on the external input synchronization signal. Note that it is not synchronous to the timing of frame update set in the Display Unit and thus video display in sync with the capture frame is disabled.
Clip size setting	Pre-Clip size of Odd and Even field is set to the common by VnSLPrC, VnELPrC, VnSPPrC and VnEPPrC.
Limitation on interlace input	When the interlace image is input, be sure to supply the field signal to VIN. When the interlace image is input from the MIPI CSI-2 interface, it is necessary to create the field signal in CSI-2 module. For the detail of the field signal creation in CSI-2, see section 53.
Horizontal clipping specification	Refer to the 55.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC) and 55.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC).
Vertical clipping specification	When YcbCr420 format is output, the vertical clipping size shall be set to even lines.

55.4.2 Limitations on Usage

The VIN does not operate correctly in some cases depending on the usage. The following shows cases that require attention.

Table 55.10 Limitations on Usage

Item	Description
Image Stride setting	When outputting the NV16 format and NV12 format, set value of 32pixel unit to the image stride (IS) bit in the image stride register (VnIS).

55.4.2.1 Limitations and Handling when WLC Errors Occur

Both WLC error and FIFO overflow error assert the same error flag: V[n]INTS.FOS. Since this flag does not distinguish between the two error types, systems that require accurate detection of FIFO overflow must disable WLC function by setting V[n]MC.WLCEN=0. The conditions under which WLC errors occur are described in the register explanation section for V[n]INTS.FOS.

However, as explained in section 55.4.2.2, all 8 channels in a VIN must be configured to operate with either V[n]MC.WLCEN=0 or V[n]MC.WLCEN=1.Therefore, if any channel is used under conditions where WLC errors may occur, all 8 channels must be set to V[n]MC.WLCEN=0, and Wakeup interrupts cannot be used.

In such case, use the following alternatives:

When using frame completion interrupts: use V[n]INTS.FIS instead of V[n]INTS.WUS

When using line completion interrupts: use V[n]INTS.SIS (*3) instead of V[n]INTS.WUS

(*1) Frame completion interrupt: Triggered when one frame of data has been written to memory.

(*2) Line completion interrupt: Triggered when the specified number of lines of data has been written to memory.

(*3) There is a certain delay from data input to the VIN and completion of data output to memory. Therefore, when using line completion interrupts (V[n]INTS.SIS), set the V[n]SI value to the desired interrupt line count plus 4.

55.4.2.2 Pseudo DCLS Error and Countermeasures

VIN accesses the AXI bus using the AXI-ID configuration shown in the table below:

AXI access mode	V[n]MC.WLCEN Setting	AXI-ID Behavior
AXI Mode 1	All channels set to 0	Shared across channels
AXI Mode 2	Any channel set to 1	Individual per channel

If VIN channels operating with V[n]MC.WLCEN=0 and V[n]MC.WLCEN=1 are mixed, switching between AXI Mode 1 and AXI Mode 2 may occur during capture operations. This mode switching during capture operation can cause invalid AXI bus access for channels operating with V[n]MC.WLCEN=0, potentially resulting in image distortion and pseudo DCLS error.

Examples:

While VIN3 is capturing with V[3]MC.WLCEN=0, if VIN0 (operating with V[0]MC.WLCEN=1) is reset and V[0]MC.WLCEN changes to 0, AXI mode switches from 2 to 1 during VIN3's operation.

While VIN3 is capturing with V[3]MC.WLCEN=0, if VIN0 (operating with V[0]MC.WLCEN=1) is initialized, V[0]MC.WLCEN changes to 1, switching AXI mode from 1 to 2 during VIN3's operation.

To prevent such mode switching during capture operation, configure all 8 VIN channels to operate with either V[n]MC.WLCEN=0 or V[n]MC.WLCEN=1.

55.4.2.3 Pseudo FIFO-EDC Error During FIFO Overflow and Countermeasures

When a FIFO overflow occurs in VIN, a pseudo FIFO-EDC error flag may be asserted even if the FIFO itself is not faulty. To determine whether a true FIFO-EDC error has occurred, check both the FOS and EFER flags after frame processing is completed (i.e., after V[n]INTS.VFS is asserted) and before the next frame capture begins.

The judgment criteria are shown in the table below:

V[n]INTS.FOS	V[n]ERS.EFER	Actual Error Description
0	0	No error
0	1	[EFER occurred once] Cannot distinguish between FIFO overflow and true EDC error. [EFER occurred in two consecutive frames] True EDC error
1	0	FIFO overflow
1	1	FIFO overflow

Note: To check the FOS and EFER flags after frame processing, ensure both V[n]IE.FOE and V[n]EE.EFEE are set to 0.

55.4.3 Clock to Use

VIN uses following clocks.

S0D1_VIOφ 800MHz
S0D4_VIOφ 200MHz

55.5 Safety Mechanism

Note: The suitability of the safety mechanisms referenced in this manual will finally be judged during the safety analysis and safety assessment of the SoC. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

55.5.1 EDC for VIN

55.5.1.1 Overview

VIN has two kinds of EDC protection function; first is EDC protection for write data FIFO, second is EDC checking data from ISP.

55.5.1.2 Hardware Description

Figure 55.16 shows EDC protection for write data FIFO. FIFO controller generates 16-bit EDC code at the timing of write access to FIFO. Then it concatenates the EDC code and the write data (256 bits) and stores in FIFO. FIFO controller also checks whether the EDC code is consistent with the read data at the read access timing.

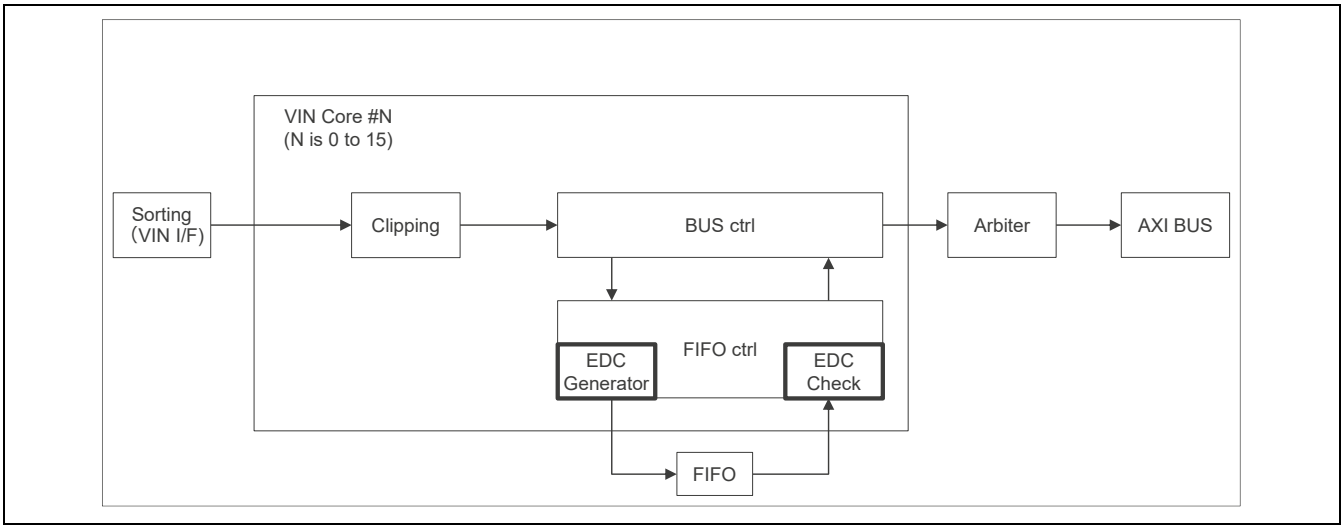

Figure 55.16 Overview of EDC for Write FIFO

Figure 55.17 shows EDC checking data from ISP. This EDC value is determined from 2-bit source ID and 24-bit data. The source ID is used to confirm that the data transfer path is correct. The value of the source ID used by the EDC checker on the VIN side is set by a register.

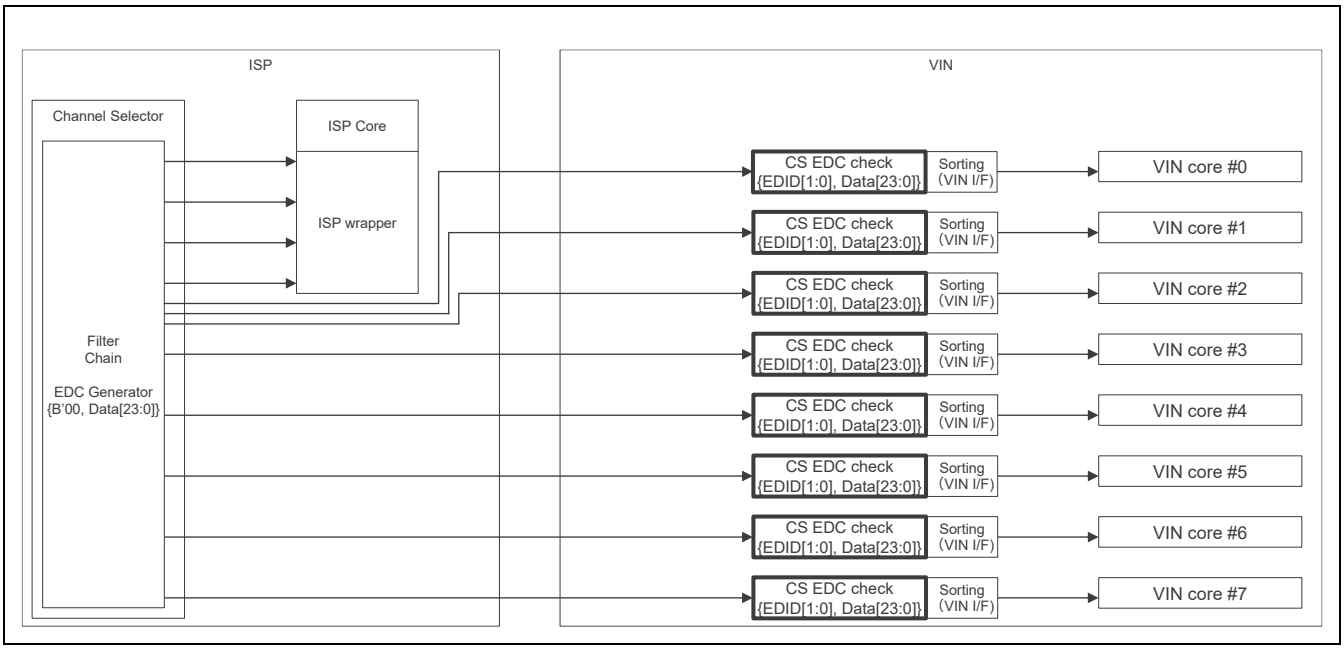

Figure 55.17 Overview of EDC for Data from ISP

Below table shows the registers related to EDC function.

Table 55.11 Registers for EDC function

Name	Symbol
Video n Functional Safety Control Register	VnFNSC
Video n Error Enable Register	VnEE
Video n Error Status Register	VnERS

If VnFNSC.FED_EN is 1, EDC protection for write data FIFO is enabled. When EDC error of write FIFO is detected, EFER bit in VnERS is set to 1.

If VnFNSC.CED_EN is 1, EDC checking for input data from channel selector is enabled. In this case VnFNSC.EDID[1:0] should be set to B'00. When EDC error of input data from channel selector is detected, ECER bit in VnERS is set to 1.

Below table shows an error interrupt signal related to EDC function.

Table 55.12 Error Interrupt Signals and Register Mapping of EDC function (*n* = 0 to 15)

Error Interrupt Name	Bit	Register	Error Content in ECM

55.5.2 Hardware Redundancy for VIN

55.5.2.1 Overview

VIN has redundancy logic to detect a temporary failure.

55.5.2.2 Hardware Description

Below figure shows overview of hardware redundancy for VIN. All outputs of VIN logic marked as master core are checked. The redundancy target logic are the followings.

- Interface logic from ISP
- Sync interval checker
- Each video channel logic (excluding internal write FIFO (SRAM))
- Arbiter
- Conversion logic from an internal data bus to AXI-IF (s2X)
- Conversion logic from APB-IF to an internal register interface (BUS I/F of APB BUS)

The non-redundancy logic are the followings.

- Internal write buffer (SRAM)
- Synchronization logic

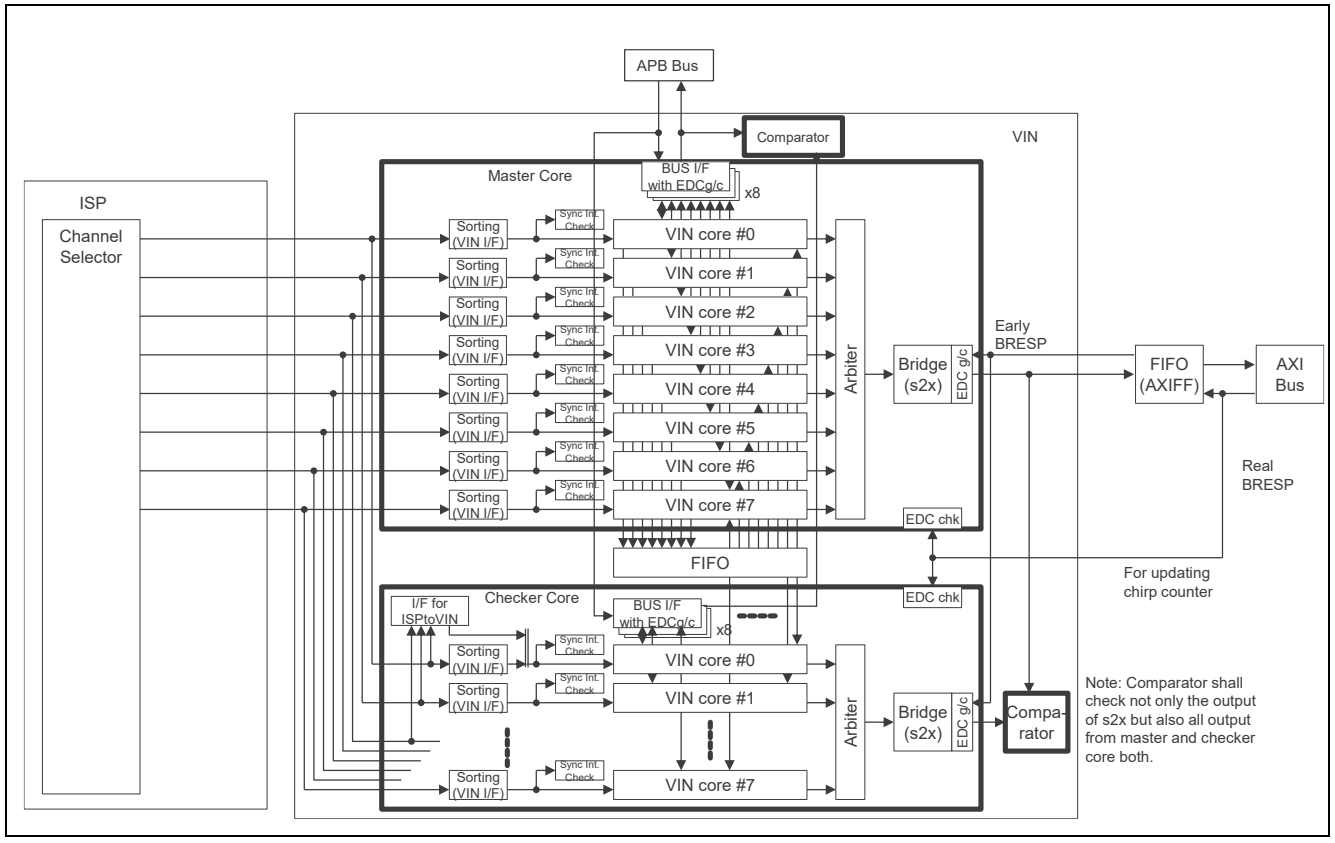

Figure 55.18 Overview of Hardware Redundancy

Below table shows the registers related to EDC function.

Table 55.15 Registers for Hardware Redundancy

Name	Symbol
Video n Functional Safety Control Register	VnFNSC
Video n Error Enable Register	VnEE
Video n Error Status Register	VnERS

If VnFNSC.HRCHK is set to1, VIN check all output signals of master core. They are classified into eleven. If a mismatched error occurs in the signal of each classification, HRER[10:0] bits in VnERS is set to 1 according signal category.

Below table shows an error interrupt signal related to hardware redundancy.

Table 55.16 Error Interrupt Signals and Register Mapping of Hardware Redundancy (*n = 0 to 15*)

55.5.3 Sync Interval Checker

55.5.3.1 Overview

This safety mechanism checks the interval of sync signals to detect whether the sync signal from ISP is stuck.

55.5.3.2 Hardware Description

VSYNC, HSYNC, and FIELD signals can be checked with sync interval timers. Interval timer checks both the signal high state interval and low state interval. To check signal high state interval, the timer starts when the signal changes from low to high and ends when signal changes from high to low. To check signal low state interval, the timer starts when the signal changes from high to low and ends when signal changes from low to high. In both case the interval time shall be less than the maximum interval time and greater than the minimum interval time. HSYNC checker doesn't check the interval if VSYNC is low (during V-blanking period). In addition, HSYNC checker also has the rise edge counter and can check HSYNC rise count by each frame. CLKENB (Data Enable) signal can be checked for each line by pixel counter. The expected range of each sync interval can be configured by software.

Sync Interval Checker is implemented for each VIN channel. Figure 55.19 shows the location where Sync Interval Checker is implemented.

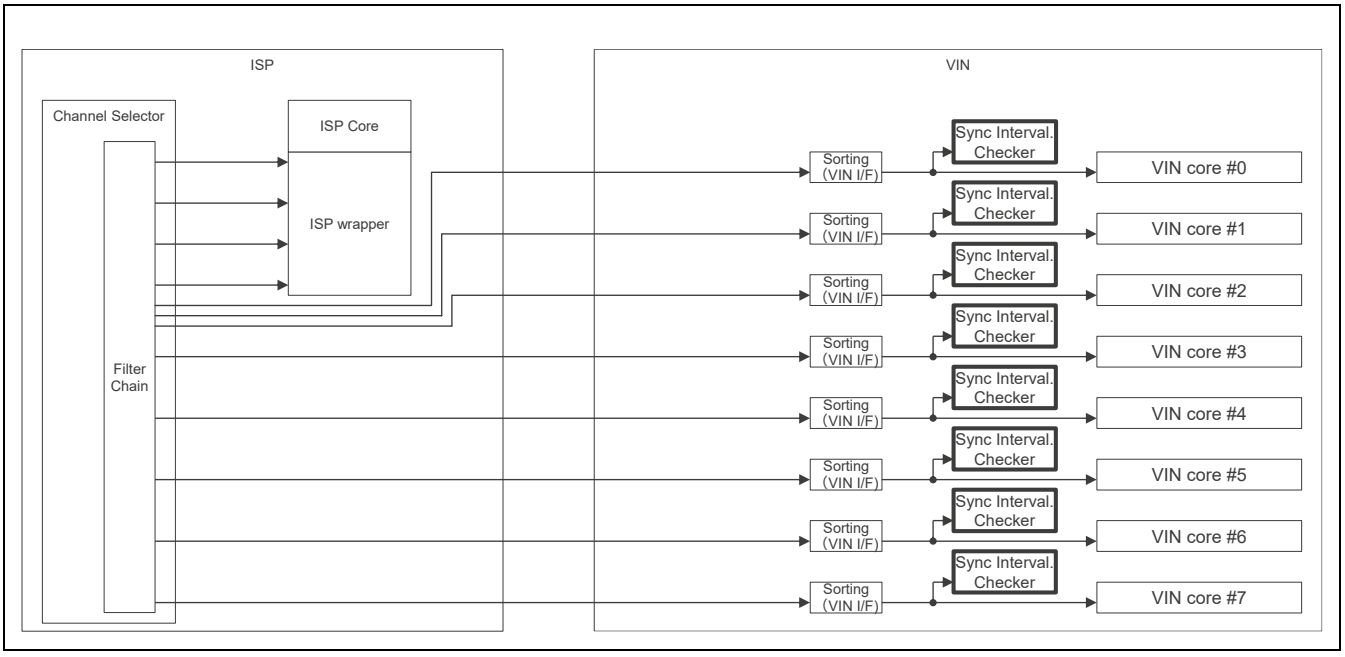

Figure 55.19 Location the Sync Interval Checker is implemented

Figure 55.20 shows block diagram of Sync Interval Checker. It captures four signals and counts cycle and edge number. Note that the clock frequency of VIN is 800MHz. The maximum and minimum interval time are approximated by the setting value in each register multiplied by 1/(800,000,000) second.

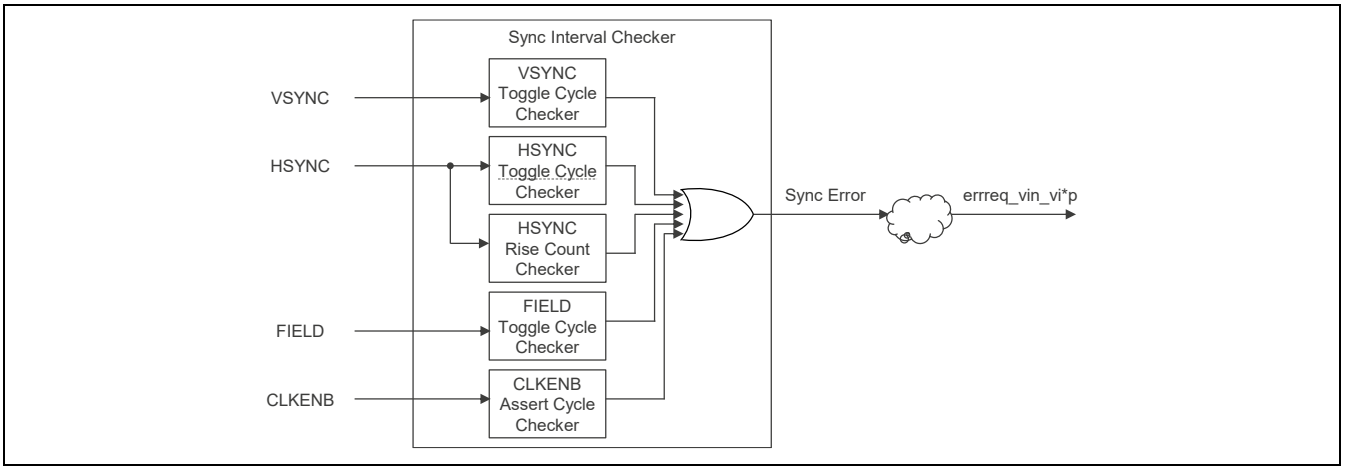

Figure 55.20 Block Diagram of Sync Interval Checker

Below table shows the registers related to the sync interval checker.

Table 55.19 Registers for Sync Interval Checker

Name	Symbol

Video n Data Enable Term Register	VnDET
Video n Hsync Rise Time Register	VnHRT

When the toggle term of VSYNC, HSYNC, FIELD is less than minimum expected value or more than maximum expected value, the error is detected. When the assert term of CLKENB is less than minimum expected value or more than maximum expected value, the error is detected. When the error was detected, the SER bit in the VnERS is set to 1.

SyncIntervalChecker starts checking the Sync signal input to VIN by turning on the SyncIntervalChecker Enable (VnFNSC). It operates independently of the capture operation. To avoid starting monitoring with unintended Min/Max values, set the SyncIntervalChecker Config (Max/Min) before turning on the SyncIntervalChecker Enable. Additionally, to avoid starting monitoring without SYNC signal input, turn on the SyncIntervalChecker Enable (VnFNSC) after the camera input starts.

The minimum expected value and the maximum expected value can be set by the VnFTMIN, VnFTMAX, VnHSTMIN, VnHSTMAX, VnVSTMIN, VnVSTMAX, VnDET and VnHRT.

The error detection is controllable by FLCE[1:0], HSCE[1:0], VSCE[1:0], DECE[1:0] and HCEN[1:0] bits in the VnFNSC. When the bit[0] is set to 1, error of minimum can be checked. When the bit[1] is set to 1, error of maximum can be checked.

When VSCE is set to enabled, the VSYNC toggle cycle checker becomes effective after the next VSYNC toggle. When FLCE, HSCE, and HCEN are set to enabled, the FIELD toggle cycle checker, the HSYNC toggle cycle checker, and

HSYNC rise count checker become effective after the next VSYNC toggle, too. When HCEN is set to enabled, CLKENB assert cycle checker becomes effective after the next HSYNC fall toggle.

When each checker is enabled, all checkers must be disabled before VIN stops the capture process.

The DEER_DM bit in the VnFNSC controls the error detection mode of CLKENB. When DEER_DM bit is set to 0, if CLKENB pixel counter is 0, the error of minimum can't be detected. When DEER_DM bit is set to 1, the error of minimum can be detected even if CLKENB pixel counter is 0.

- **Notes on HSYNC Rise Count Checker at Sync Interval Checker**

Regarding the behavior of the filter function described in 54.4.2.1 in section 54. Image Signal Processor (ISP)/Channel Selector (CS), the Channel Selector sets an invalid value (low) to the Data Enable signal (named as CLKENB) at the line or pixel blocked by the filter. In the other hand, the HSYNC signal is passed through even if the corresponding line or pixel are blocked. That is, the HSYNC signal is propagated from Channel Selector to VIN regardless of whether it is blocked or passed through.

For example, as shown in Figure 55.21, this example shows that 5 lines (a), (b), (c), (d), and (e) are input to the filter. Line (a), (c) and (e) represent one line which are sent as a long packet belonging to VC0. Line (b) and (d) represent one line which are sent as a long packet belonging to VC1. And Figure 55.21 shows an example where only the lines corresponding to VC0 is passed through and transferred from Channnel Selector to VIN.

At this time, when blocking the line (b) and (d), the Channel Selector controls the CLKENB signal on lines (b) and (d) to the invalid side (low), but the HSYNC signal during the same period remains valid value (high).

This example shows the result of filter processing by the VC Filter, but the same applies to other filters. That is, even filters other than the VC Filter control the CLKENB signal, and the HSYNC signal is passed through regardless of the filter processing result.

Considering above mentioned behavior, when counting the rise edge of HSYNC using the Sync Interval Checker, the number of rise edge of HSYNC is counted at the timing of line (b) and (d) even if these lines are blocked by the filter.

Therefore, it is necessary to set the number of HSYNC rise time (VnHRT) at the HSYNC Rise Time Measuremnt considering the number of long packets (*) transmitted from CSI during the observation period (active period of VSYNC).

(* The number of long packets is equal to the rise count of HSYNC)

Similarly, the Max (VnHSTMAX) and Min (VnHSTMIN) registers of the Hsync Toggle Cycle Measurement shall also be set based on the above specification.

If 5 lines (a), (b), (c), (d), and (e) are input to CSI, as shown in Figure 55.21, the maximum number of rise edge of HSYNC should be set as 5, even if the image size (number of line) to be captured by VIN is 3 lines. In particular, when using multiple sensors, the maximum number of rise edge of HSYNC should be set to the total number of lines transmitted from each sensor within the observation period.

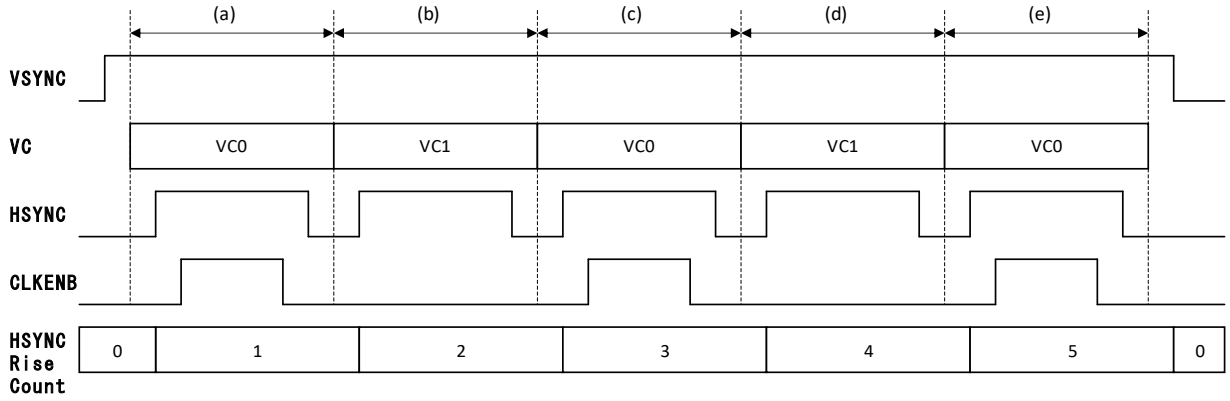

Figure 55.21 Timing example of VSYNC, HSYNC and CLKENB from Channel Selector (CS)

55.5.4 Frame CRC Calculation

55.5.4.1 Overview

This safety mechanism is used in two cases. First is detecting frozen image by comparing the CRC value of a frame and previous frame. Second is checking the integrity of the data sent from another R-Car V4M.

55.5.4.2 Hardware Description

VIN has an operator capable of CRC of any polynomial and there are two CRC operation mode.

First mode is only calculation CRC. In this mode, each channels of VIN can calculate CRC of the input data. VIN can select either before or after clipping data to input to CRC. The result of CRC is reflected to register at the rising edge of VSYNC signal.

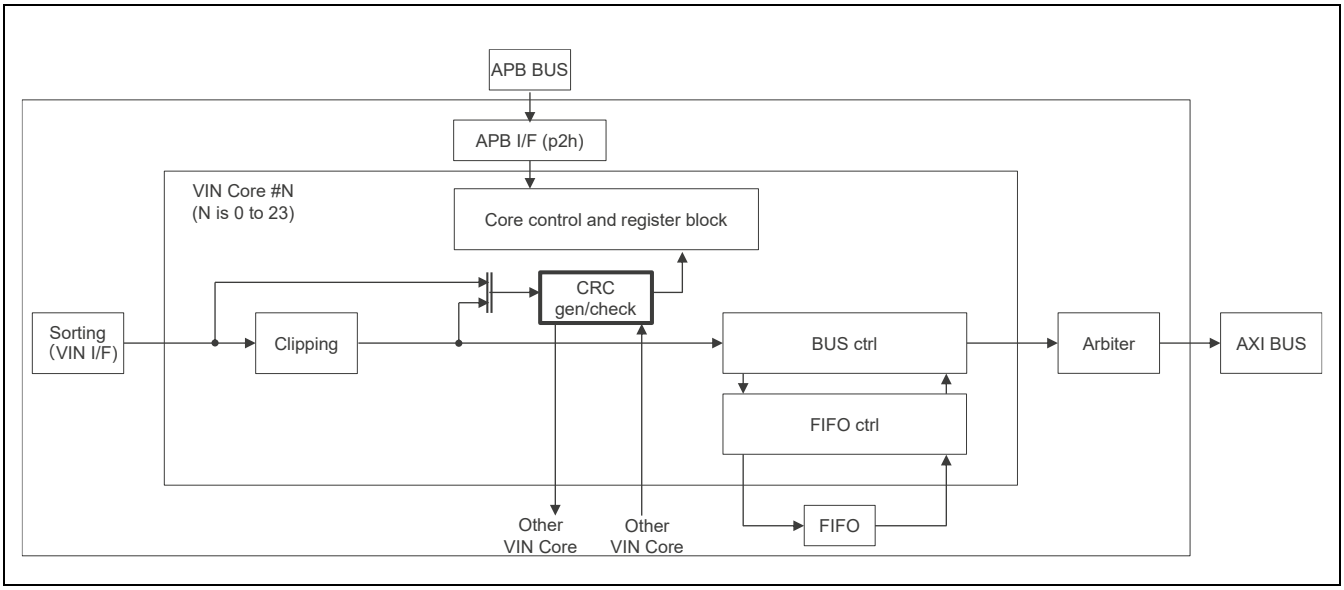

Figure 55.22 Overview of CRC operation

Second mode, VIN calculates CRC and compares with expection value. This mode is used for checking the integrity of the data sent via inter-chip connection using MIPI/CSI-2. Figure 55.23 shows a concept of end-to-end protection by CRC. VSPD of R-Car V4M #0 generates CRC of data sent and information linked to the data called “FrameID”. They are sent in MIPI/CSI-2 embedded 8-bit non image data type. On the receiving side R-Car V4M, ISP/ChannelSelector extracts the data and CRC/FrameID, and sends to VIN. VIN calculates CRC of input data and compares with CRC sent from VSPD to check the integrity of the data.

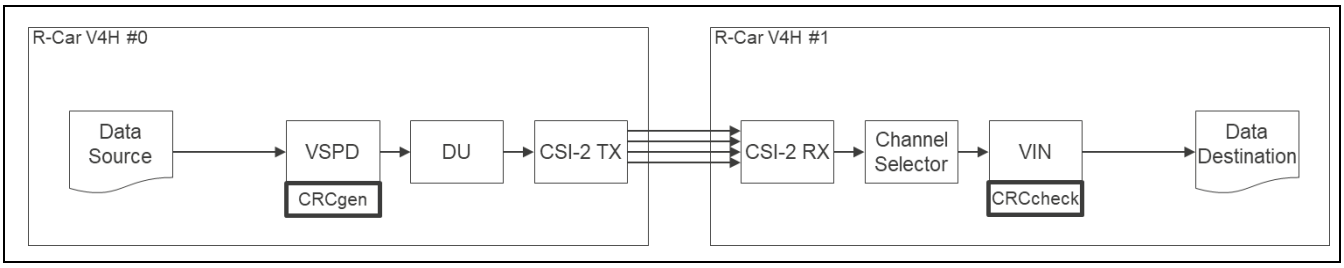

Figure 55.23 Concept of End-to-End Protection by CRC

In this mode, the data is input to channel 0 to 3 of each VIN instance (channel 0 to 3, 8 to 11), and these channels calculate CRC of the input data. The CRC/FrameID is input to channel 4 to 7 of each VIN instance (channel 4 to 7, 12 to 15), and these channels only send CRC as expected to channel 0 to 3 of each VIN instance. Below figure shows flow of CRC/FrameID.

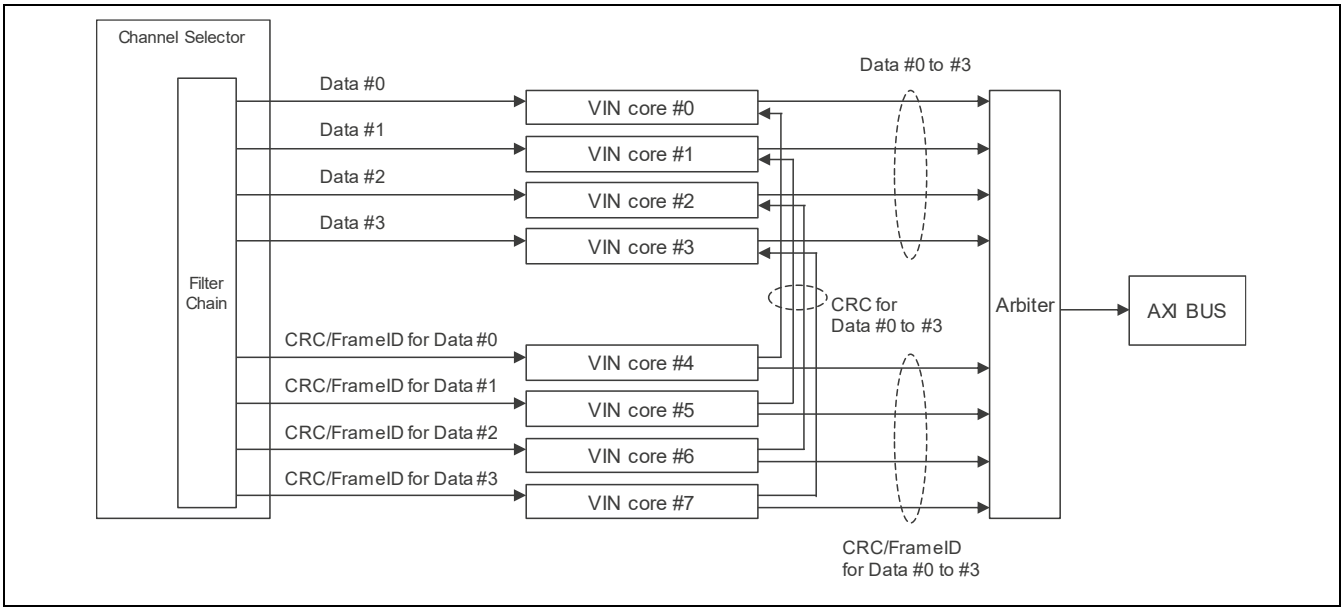

Figure 55.24 Flow of CRC and FrameID for each VIN instance

FrameID is 16-bit value and consists of the following three fields.

Error Flag:
1-bit error flag of CRC data, “0” means the CRC is valid and “1” means the CRC is not valid. If Error Flag is 1, channel 0 to 3 doesn’t compare CRC and expected.

Unique ID:
3-bit fixed number indicates source VSPD instance number. It is used for checking routing from VSPD to VIN.

Frame Num:
12-bit increment value for each frame. It is used for checking whether frame data dropping is occurred.

Below is a format of CRC/FrameID.

Byte 0: CRC [31:24]
Byte 1: CRC [23:16]
Byte 2: CRC [15:8]
Byte 3: CRC [7:0]
Byte 4: {Error Flag [0], Unique ID [2:0], Frame Num [11:8]}
Byte 5: Frame Num [7:0]
Byte 6: 8’h00
Byte 7: 8’h00

The channel 4 to 7 not only send CRC data to channel 0 to 3 but also store both CRC and FrameID to DRAM.

Below table shows the registers related to the frame CRC.

Table 55.23 Registers for Frame CRC Calculation

Name	Symbol
Video n Functional Safety Control Register	VnFNSC
Video n Error Enable Register	VnEE
Video n Error Status Register	VnERS

Name	Symbol
Video n CRC Code Register	VnVCRC
Video n CRC Calculation Configuration Register	VnCRCC
Video n CRC Polynomial Equation Coefficient Register	VnCRPEC
Video n CRC Initial Remainder Register	VnCRIR
Video n CRC XOR Coefficient Register	VnCRXRC

CRC operation mode is specified by V*n*FNSC.CRM bit. Only CRM bit of channel 0 to 3 in each VIN instance can be set to 1. If VnFNSC.CRM is 0:

- The channel-n calculate CRC and set to VnVCRC.VCRC[31:0] at the rising edge of VSYNC signal.

Othrewise (VnFNSC.CRM is 1):

- The channel-n should calculate CRC of entire frame (VnCRCC.INSEL is 0). The result is set to VnVCRC.VCRC[31:0] at the rising edge of VSYNC signal.
- The channel-n compares the calculation result and the expectation value when Error Flag in FrameID from the channel-(n+4) is 0. If they are mismatched, VnERS.CCER bit is set to 1. If the Error Flag is 1, the channel-n doesn't compare with the expected value.
- VCRC[31:0] for channel-(n+4) is not available.
- The channel-(n+4) outputs the expected CRC value and FrameID to DRAM.

VIN can calculate CRC without storing data to DRAM if VnCRCC.INSEL is 0. In other words, the CRC operation of the entire frame becomes valid when data is input.

Below table shows an error interrupt signal related to CRC checking if VnFNSC.CRM is 1.

Table 55.24 Error Interrupt Signals and Register Mapping of CRC checking (*n = 0 to 15*)

56. IMR-LX6

56.1 Overview

The image renderer light extended 6 (IMR-LX6*), or the distortion correction engine, is a drawing processor with a simple instruction system capable of referencing data on an external memory as two-dimensional texture data and performing texture mapping and drawing with respect to any shape that is split into triangular objects. By modifying the shape of an image, the IMR-LX6 can be used in such applications as surroundings monitoring and backward monitoring. The IMR-LX6 also allows setting the values for correcting luminance/hue of each vertex, which enables correction of luminance/hue difference within a camera lens, and that among multiple lenses.

Note: The actual modules are referred to as the IMR-LX6-V4M in the R-Car V4M.

The R-Car V4M has four IMR-LX6-V4M modules (Four channels). IMR channel 0/1 is also specified by IMS0/1. IMR channel2/3 is also specified by IMR0/1

Table 56.2 Base Addresses and Connected Clock Signals of IMR-LX6-V4M

Channel	Base Address	Rotator & Scaler Availability	Clock
0 (IMS0)	H'FE86 0000	—	VCBUSD2ϕ (for access to the registers), VCBUSϕ (for operations other than access to registers)
1 (IMS1)	H'FE87 0000	—	
2 (IMR0)	H'FE88 0000	√	
3 (IMR1)	H'FE89 0000	√	

56.1.1 Features

- Pixel performance:
  - 533 Mpixel/sec (peak, @VCBUSϕ)
- Display list (DL*1) system
- Drawing functions
  - Texture mapping
  - Bilinear filtering
  - Filtering using pyramidal images
  - Automatic coordinate generation
  - Luminance/hue correction
  - Luminance conversion using lookup table (LUT)
  - Rotation and scaling-down*6
- Input image data formats
  - Luminance: Y 8 bpp, 10 bpp, 12 bpp, 14bpp, 16bpp; Color difference: UV*2 8 bpp, 10 bpp, 12 bpp, 14 bpp, 16 bpp; Data: 16 bpp; Data: 32 bpp
  - Double luminance plane(DYP mode) *9: Y 8 bpp, 10 bpp, 12 bpp, 14bpp, 16bpp
  - YUV422 interleaved mode
  - YUV422 semi-planar mode
  - YUV420 semi-planer mode
  - Linear and tile addressing modes
- Output image data formats*3
  - Luminance: Y 8 bpp, 10 bpp, 12 bpp, 14bpp, 16bpp; Color difference: UV*2 8 bpp, 10 bpp, 12 bpp, 14 bpp, 16 bpp; Data: 16 bpp, Data: 32 bpp
  - Double luminance plane(DYP mode) *9: Y 8 bpp, 10 bpp, 12 bpp, 14bpp, 16bpp
  - YUV422 interleaved mode
  - YUV422 semi-planar mode
  - YUV420 semi-planer mode
  - Linear and tile addressing modes
- Instruction set
  - Single draw instruction: TRI for drawing a triangle strip.
  - Fourteen control instructions: TRAP, INT, NOP, SYNCM, WTL, WTL2, WTS, GOSUB, RET, WUP, SLP, STRECT*6, OUTNOR*6, and OUTROT*6
- Drawing space
  - Destination coordinates (X, Y) are 16bit, drawing space (XMAX, YMAX) : 0 ≤ XMAX ≤ 2,047, 0 ≤ YMAX ≤ 2,047

    The size of the circumscribed rectangle of a triangle must be less than 128 pixels for both X-direction and Y-direction
  - Source*4 coordinates (u, v)*2: 0 ≤ u*2 < 2,048, 0 ≤ v*2 < 2,048
- Endian and address mode
  - Little endian and 32-bit address mode are supported for DL and pixel (source and destination) data.
- Destination cache
  - Includes a dedicated destination cache (4 Kbytes x 2 = 64 lines × 64 bytes/line x 2)*5
- Source cache
  - Includes a dedicated source cache (16 Kbytes x 2)*7
  - Double source cache mode (32 Kbytes x 2)*8
  - Non-blocking Cache Mode

Notes: 1. This manual uses DL as the abbreviation of the display list (a drawing/control instructions).

2. This manual uses uppercase letters U and V to express the color difference in the YUV data format, and uses lowercase letters u and v to express the axes and coordinates in the source coordinate space.

   In this section, YCbCr is written as YUV.

3. When the EFPE bit in the CMRCR register is set to 0, the output bit precision should be equal to or lower than the input bit precision. If the output bit precision is lower than the input bit precision, the output data is truncated from LSB to adjust the input bit precision.

   When the EFPE bit in the CMRCR register is set to 1 and the SHFE bit in the TRIMR register is set to 0, the output bit precision should be equal to the input bit precision.

   When the EFPE bit in the CMRCR register and the SHFE bit in the TRIMR register are both set to 1, specify the output precision in bits according to the combinations shown in Table 56.19 and Table 56.20.

4. The terms “texture” and “source” in this section indicate the two-dimensional data that are referred to for texture mapping during the drawing of triangles.

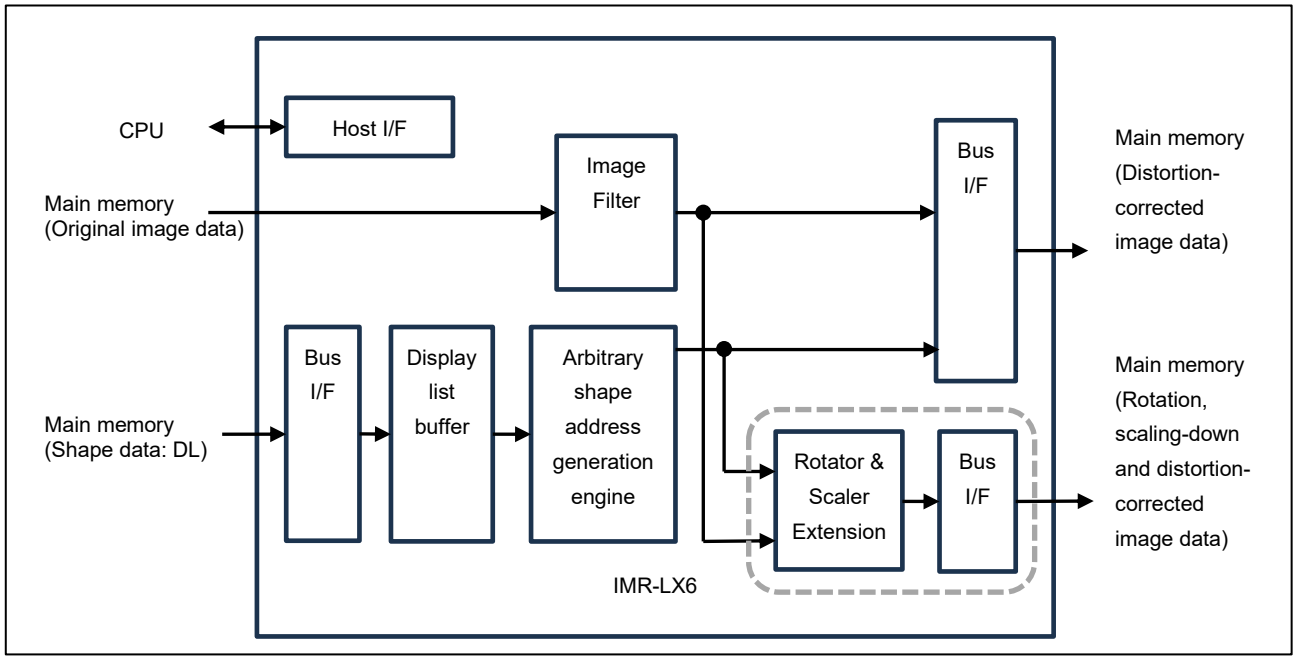
5. When the YISM bit in the CMRCR register and the YUV422E or YUVSEMI bit in the CMRCR2 register are both set to 1,
   8 Kbytes of the destination cache are used, with 4 Kbytes for luminance (Y) and 4 Kbytes for color difference (UV) data. With other settings, only 4 Kbytes of the destination cache are used.

6. STRECT, OUTNOR, and OUTROT are only applicable for those channels that support rotation and scaling down. See Table 56.2regarding the availability of rotation and scaling down.

7. In the linear addressing mode, the source cache is configured as 64 lines × 256 bytes/line x 2. The configuration in tile addressing mode is 256 lines × 64 bytes/line x 2. When the TFE bit in the TRIMR register is set to 1, 64 Kbytes of the source cache are used.

8. When pyramidal images filtering is not used, 64 Kbytes of the source cache can be used as dedicated source cache.

9. Use same data format for input and output when using double luminance plane. And use same bit depth for double (both) Y plane.



Note: The functions indicated in the broken-outlined box are only present in those channels where rotation and scaling-down are available. See Table 56.2 regarding the availability of rotation and scaling-down.

Figure 56.1 Block Diagram

56.1.2 Register Configuration (1)

Do not write to any address other than those listed in the tables. Otherwise, the operation is not guaranteed. Reading a non-listed address returns an undefined value.

56.1.3 Register Configuration (2)

Writing to some registers in the IMR-LX6 while it is drawing is possible by using a WTS, WTL, or WTL2 instruction in the DL or through access from a CPU. In the following tables, √ indicates that the register can be rewritten by using the WTS, WTL, or WTL2 instruction or from a CPU during drawing operations. H: CPG reset, S: Software reset by SWRST bit of CR register.

56.2 Register Description

[Legend]

Initial value: Register value after a power-on reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R: Read-only. The write value should be the same as the read value. Only modify the target bit (Read Modify Write) because the initial value should not be changed.
-/W: Write-only. The read value is undefined.

56.2.1 Control Register (CR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SWRST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15	SWRST	0	R/W	Software Reset Writing 1 to this bit applies a software reset and writing 0 cancels a software reset. 0: Cancels a software reset for this module. 1: Applies a software reset to this module. The following registers are not initialized by a software reset: CR, DSAR, SSAR, DSTR, SSTR, DSOR, SSAR1, SSTR1, SSAR2, SSTR2, SSAR3, SSTR3, SSAR4, SSTR4, DCCR, SCCR, SSAOR, SSAORn, UVSSAOR, UVSSAORn, DSAOR, UVSSTR, UVSSARn, UVSSTRn, UVDSTR .
14 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
0	RS	0	R/W	Rendering Start Writing 1 to this bit reads the DL starting at the address in DLSAR and starts execution. This bit is always read as 0. 0: Does not start rendering. 1: Starts rendering. Writing 1 is prohibited until the TRA bit in SR is set.

Note: This register is not initialized by the SWRST bit in the control register (CR).

56.2.2 Status Register (SR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WERR	WOVF	—	—	—	—	REN	—	—	INT	IER	TRA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11	WERR	0	R	Indicates that this module has received the WUP signal from another module while it is not executing a display list. This bit is cleared to 0 by writing 1 to the WERRCLR bit in SRCR. 0: This module has not received the WUP signal while it is not executing a display list. 1: This module has received the WUP signal while it is not executing a display list. Note: This bit is not set to 1 when the setting of the WERRENB bit in ICR is 0. This bit is only set to 1 when the WERRENB bit in ICR is set to 1 and the above condition is satisfied.
10	WOVF	0	R	Indicates that the number of WUP signals this module has received but not processed has exceeded the maximum number allowed. The maximum number in this product is 1. This bit is cleared to 0 by writing 1 to the WOVFCLR bit in SRCR. 0: The number of WUP signals that have not been processed has not exceeded the maximum number allowed. 1: The number of WUP signals that have not been processed has exceeded the maximum number allowed. Note: This bit is not set to 1 when the setting of the WOVFENB bit in ICR is 0. This bit is only set to 1 when the WOVFENB bit in ICR is set to 1 and the above condition is satisfied.
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
5	REN	0	R	Rendering-in-Progress Flag Indicates whether this IP is currently rendering data. This bit is set to 1 after the rendering start function is activated and is cleared to 0 when the TRA bit is set to 1 or an illegal instruction has occurred. When the INT instruction is executed, the setting of this bit remains 0 until the INT bit in the SR register is cleared, after which this bit is set to 1. The value of this REN bit is not guaranteed when IER or INT interrupt occurs by enabling the IERENB or INTENB bit of Interrupt Control Register (ICR) at the same time. 0: Rendering is not in progress. 1: Rendering is in progress.
4, 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
2	INT	0	R	INT Instruction Decode Indicates whether the INT instruction has been decoded. This bit is cleared by writing 1 to the INTCLR bit in SRCR. 0: The INT instruction in the DL has not been decoded. 1: The INT instruction in the DL has been decoded. Note: When INTENB bit in ICR is 0, this bit is not set to 1 even if the INT instruction is decoded. When INTENB bit in ICR is 1, this bit is set to 1 if the INT instruction is decoded.
1	IER	0	R	Illegal Instruction Decode Indicates whether any illegal instruction has been decoded. This bit is cleared by writing 1 to the IERCLR bit in SRCR. Whether or not a given instruction is an illegal instruction is determined using the OP CODE field assigned to bits 31 to 24 of each instruction; the N field assigned to bits 15 to 0 of the TRI, WTL, and NOP instructions; and the N field assigned to bits 9 to 0 of the WTL2 instruction. Tests on illegal instructions are not performed in terms of the address or write data of the WTL/WTL2 instructions or the vertex data of the TRI instruction. 0: No illegal instruction has been decoded in the DL. 1: An illegal instruction has been decoded in the DL. Notes: 1. These OP CODE values are not detected as illegal instructions: OP CODE described in section 56.4, Display List and a reserved value (H'84, H'85, H'90, and H'91) 2. When IERENB bit in ICR is 0, this bit is not set to 1 even if illegal instructions are decoded. When IERENB bit in ICR is 1, this bit is set to 1 if illegal instructions are decoded. 3. The WUP and SLP instructions are not detected as illegal in those channels where executing these instructions is prohibited. See Table 56.21 for the applicable channels. 4. The instructions listed in section 56.5.4 are detected as illegal in those channels that do not have the rotator & scaler extension. See Table 56.2 for the applicable channels.

Bit	Bit Name	Initial Value	R/W	Description
0	TRA	0	R	Trap Indicates whether rendering operation has been completed. Specifically, this bit is set to 1 after the TRAP instruction is decoded, rendering is completed, and all the dirty lines in the destination cache are written to the memory. 0: Rendering has not been started or is in progress. 1: The TRAP instruction has been decoded and rendering has been completed. Note: When TRAENB bit in ICR is 0, this bit is not set to 1 even if the TRAP instruction is decoded. When TRAENB bit in ICR is 1, this bit is set to 1 if the TRAP instruction is decoded.

56.2.3 Status Clear Register (SRCR)

Writing 1 to a bit in SRCR clears the corresponding status bit in the status register (SR).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	WERR CLR	WOVF CLR	—	—	—	—	—	—	—	INTCLR	IERCL R	TRACL R
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	—/W	—/W	R	R	R	R	R	R	R	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11	WERRCLR	0	—/W	Writing 1 to this bit clears the WERR bit in SR. This bit is always read as 0.
10	WOVFCLR	0	—/W	Writing 1 to this bit clears the WOVF bit in SR. This bit is always read as 0.
9 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
2	INTCLR	0	—/W	Writing 1 to this bit clears the INT bit in SR. This bit is always read as 0.
1	IERCLR	0	—/W	Writing 1 to this bit clears the IER bit in SR. This bit is always read as 0.
0	TRACLR	0	—/W	Writing 1 to this bit clears the TRA bit in SR. This bit is always read as 0.

56.2.4 Interrupt Control Register (ICR)

The effective bits in the ICR are used to enable setting of the corresponding bit in the status register (SR) in response to the corresponding interrupt sources. To allow the generation of an interrupt, this register should be set to enable setting of the corresponding bit in SR and the interrupt mask register (IMR) should also be set for non-masking of the corresponding interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WERR ENB	WOVF ENB	—	—	—	—	—	—	—	INTEN B	IEREN B	TRAEN B
Initial value:	0	0	0	0	1	1	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11	WERRENB	1	R/W	0: Disables the generation of an interrupt when this module receives the WUP signal from another module while it is not executing a display list. 1: Enables the generation of an interrupt when this module receives the WUP signal from another module while it is not executing a display list.
10	WOVFENB	1	R/W	0: Disables the generation of an interrupt when the number of WUP signals this module has received but not processed exceeds the maximum number allowed. 1: Enables the generation of an interrupt when the number of WUP signals this module has received but not processed exceeds the maximum number allowed.
9 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Otherwise, the operation cannot be guaranteed.
2	INTENB	1	R/W	0: Disables the generation of INT interrupts. 1: Enables the generation of an interrupt when an INT instruction is decoded from the DL unless interrupt generation is masked with the INM bit in IMR.
1	IERENB	1	R/W	0: Disables the generation of IER interrupts generation. 1: Enables the generation of an interrupt when an illegal instruction is decoded unless interrupt generation is masked with the IEM bit in IMR.
0	TRAENB	1	R/W	0: Disables the generation of TRAP interrupts. 1: Enables the generation of an interrupt when a TRAP instruction is decoded unless interrupt generation is masked with the TRAM bit in IMR.

56.2.5 Interrupt Mask Register (IMR)

The effective bits in the IMR are used for masking or non-masking of the output of the corresponding interrupt to the interrupt controller when the corresponding interrupt source bits are set in the SR. To allow interrupt generation, this register should be set for non-masking of the corresponding interrupt output and the interrupt control register (ICR) should be set to enable reflection of the corresponding interrupt source in the corresponding bit in SR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

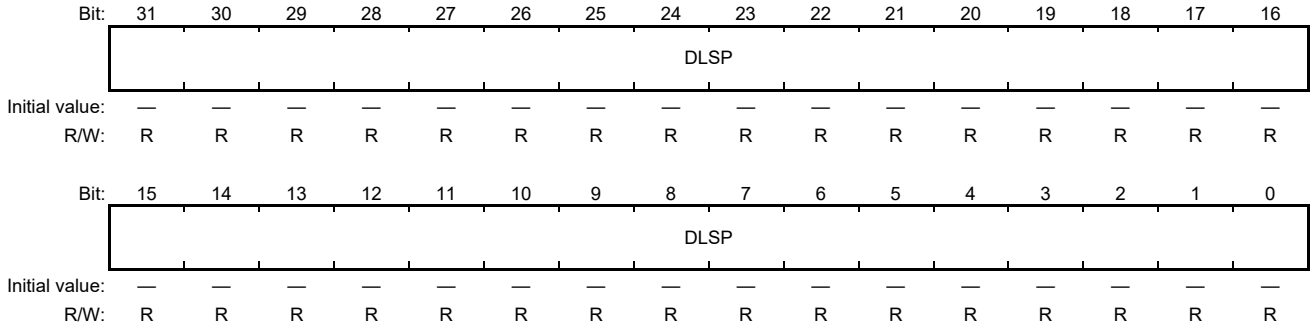
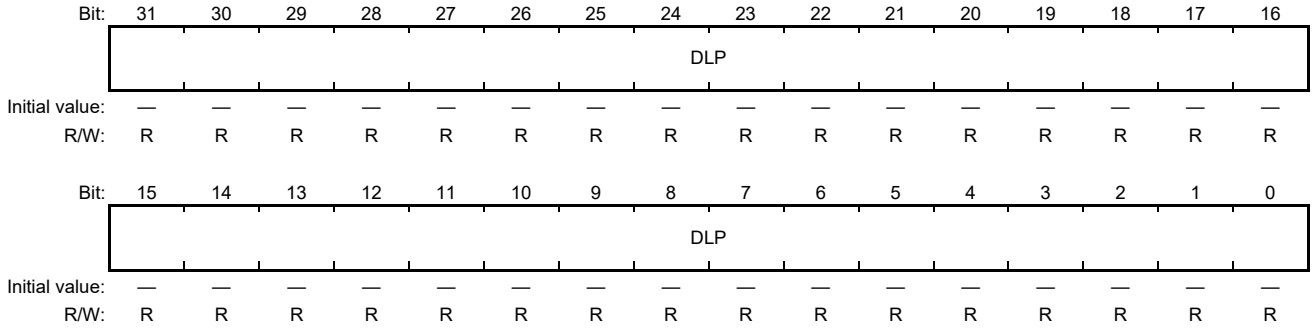
Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11	WERRM	0	R/W	0: The generation of interrupts when this module receives the WUP signal from another module while it is not executing a display list is not masked. 1: The generation of interrupts when this module receives the WUP signal from another module while it is not executing a display list is masked.
10	WOVFM	0	R/W	0: The generation of interrupts when the number of WUP signals this module has received but not processed exceeds the maximum number allowed is not masked. 1: The generation of interrupts when the number of WUP signals this module has received but not processed exceeds the maximum number allowed is masked.
9 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Otherwise, the operation cannot be guaranteed.
2	INM	1	R/W	0: The generation of INT interrupts is not masked. 1: The generation of INT interrupts is masked.
1	IEM	1	R/W	0: The generation of IER interrupts is not masked. 1: The generation of IER interrupts is masked.
0	TRAM	1	R/W	0: The generation of TRAP interrupts is not masked. 1: The generation of TRAP interrupts is masked.

56.2.6 DL Stack Pointer Register (DLSP)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLSP	Undefined	R	DL Stack Pointer The return address to be used upon RET instruction execution, which is saved upon GOSUB instruction execution, can be read out.

56.2.7 DL Status Register (DLPR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLP	Undefined	R	DL Pointer The address of the DL immediately following the currently executed DL can be read out.

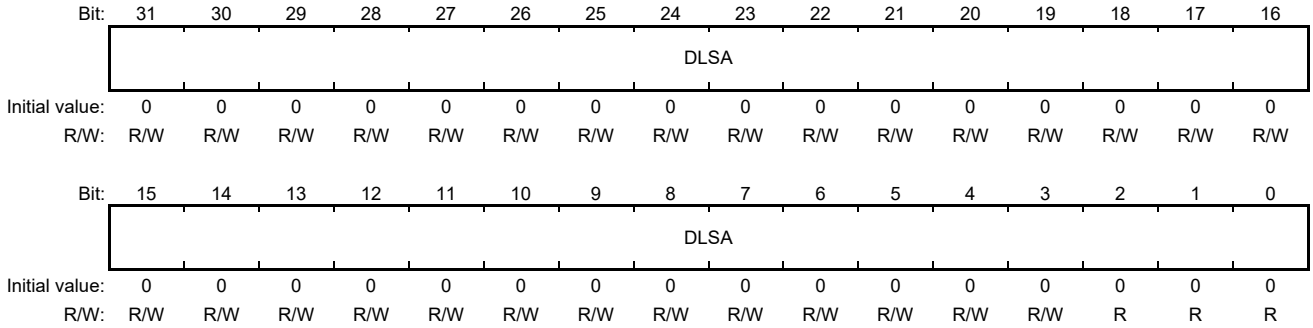
56.2.8 Executed DL Status Register (EDLR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EDL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

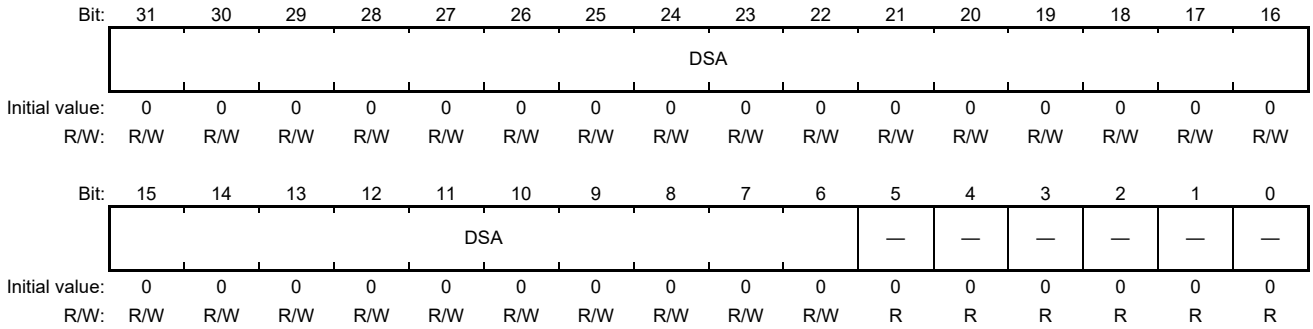
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	EDL	H'0000	R/W	Executed DL Status Any value can be set to these bits from the DL using the WTL, WTL2, or WTS instruction. The set value can be read by the CPU. These bits can be conveniently used to determine the executed DL by the CPU.

56.2.9 DL Start Address Register (DLSAR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLSA	H'0000 0000	[31:3]:R/W [2:0]:R	DL Start Address Specifies the DL start address in 8-byte alignment. The least significant three bits must always be 0.

56.2.10 Destination Start Address Register (DSAR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 6	DSA	H'000 0000	R/W	Destination Start Address Specifies the start address of the destination area in 64-byte alignment. To modify the value during execution, execute the SYNCM instruction before modification.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: This register is not initialized by the SWRST bit in the control register (CR).

56.2.11 Source Start Address Register (SSAR)

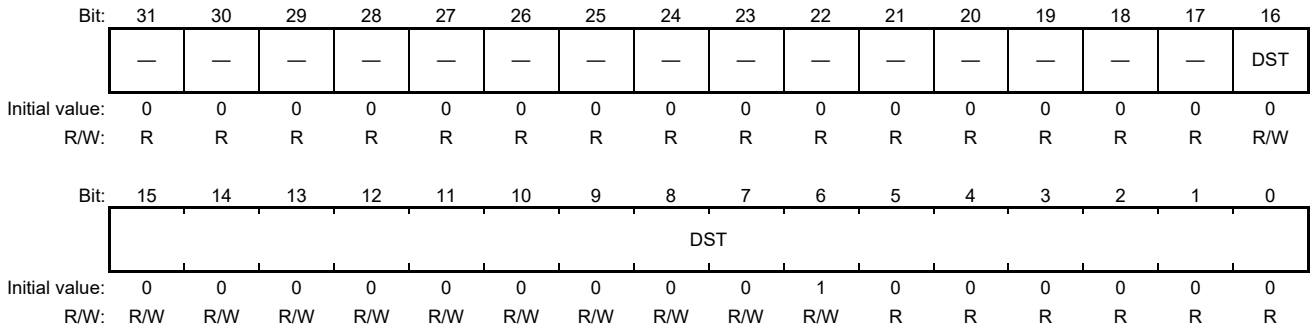
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSAR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSAR								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	SSAR	H'000 0000	R/W	SRC Start Address Specifies the start address of the source area in 256-byte alignment when reading texture data from the external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7, 6	—	All 0	R/W	Reserved The write value should always be 0. Otherwise, the operation cannot be guaranteed.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: This register is not initialized by the SWRST bit in the control register (CR).

56.2.12 Destination Stride Register (DSTR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	DST	H'00040	[16:6]: R/W [5:0]: R	Specifies the memory width of the DST area in bytes within a range from 64 to 65,536 bytes in 64-byte alignment. In tile addressing mode, quadruple the value of the setting is used as the memory width. To modify the value during execution, execute the SYNCM instruction before modification. The least significant 6 bits must always be 0.

Notes: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.13 Source Stride Register (SSTR)

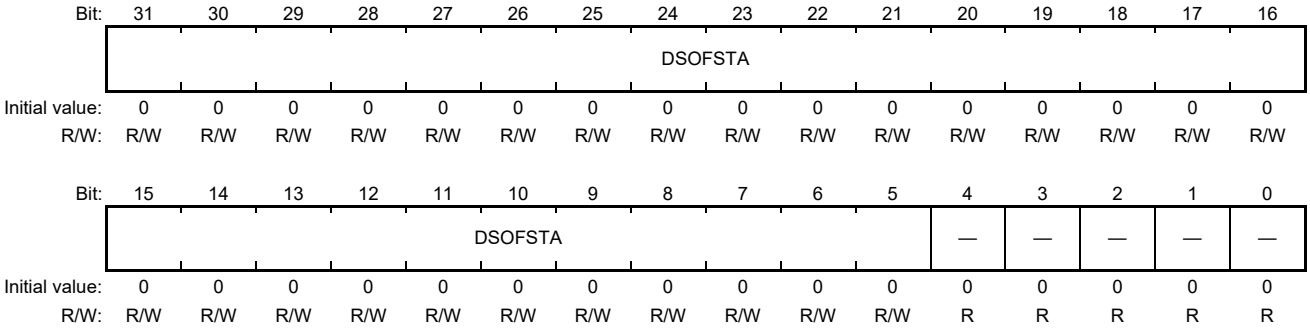
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSTR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSTR															
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	SSTR	H'00100	[16:6]: R/W [5:0]: R	Specifies the memory width of the SRC area in bytes within a range from 256 to 65,536 bytes in 256-byte alignment in the linear addressing mode when reading texture data from the external memory. In tile addressing mode, quadruple the value of the setting is used as the memory width. To modify the value during execution, execute the SYNCM instruction before modification. The least significant 6 bits must always be 0.

Notes: 1. This register is not initialized by the SWRST bit in the control register (CR).

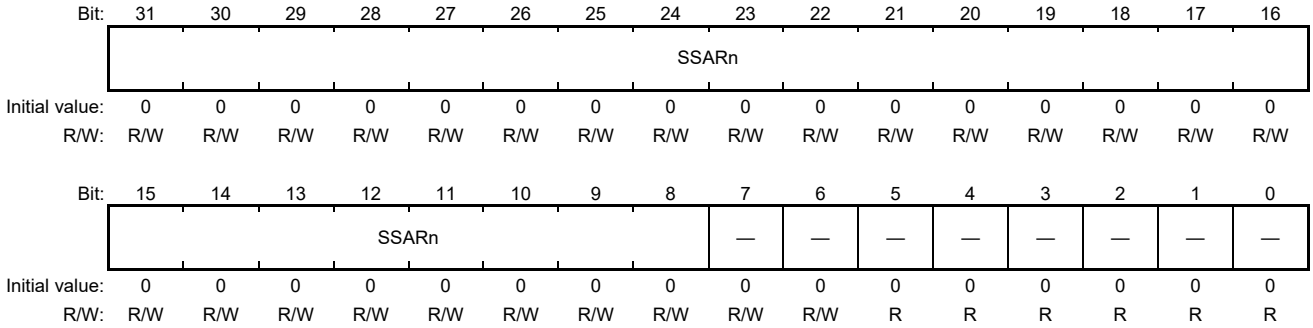
56.2.14 Destination Start Offset Address Register (DSOR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 5	DSOFSTA	H'000 0000	R/W	In Y/UV separate output mode, set an offset value for the UV output destination address that corresponds to the output destination address of Y. The offset must be a signed 32-bit value. Specify the value in 64-byte alignment. The write value to bit 5 should always be 0. To modify the value during execution, execute the SYNCM instruction before modification.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: This register is not initialized by the SWRST bit in the control register (CR).

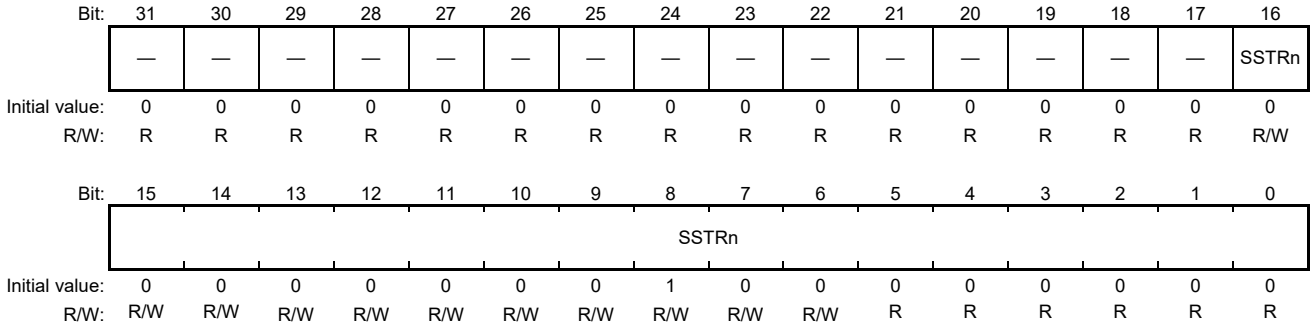
56.2.15 Source Start Address Register for Map n (SSARn)



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	SSARn	H'000 0000	R/W	SRC Start Address for Map n Specifies the address where the source area for the n-th map starts on a 256-byte boundary when reading texture data from the external memory. When modifying the value during execution of a DL, execute the SYNCM instruction before doing so.
7, 6	—	All 0	R/W	Reserved The write value should always be 0. Otherwise, the operation cannot be guaranteed.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Notes: n = 1 to 4.
This register is not initialized by the SWRST bit in the control register (CR).

56.2.16 Source Stride Register for Map n (SSTRn)



Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	SSTRn	H'00100	[16:6]: R/W [5:0]: R	Specifies the memory width of the source area for the n-th map in bytes as an integer multiple of 256 within the range from 256 to 65,536 bytes in the linear addressing mode when reading texture data from the external memory. In tile addressing mode, quadruple the value of this setting is used as the memory width. When modifying the value during execution of a DL, execute the SYNCM instruction before doing so. The less significant 6 bits must always be 0.

Notes: 1. n = 1 to 4.

2. This register is not initialized by the SWRST bit in the control register (CR).

56.2.17 Source Start Address Offset Register (SSAOR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSAOR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSAOR								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	SSAOR	H'000 0000	R/W	SRC Start Address Offset Specifies the offset address of the source area in 256-byte alignment when reading texture data from the external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.18 Source Start Address Offset Register n(SSAORn)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSAORn															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSAORn								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	SSAORn	H'000 0000	R/W	SRC Offset Address for Map n Specifies the offset address where the source area for the n-th map starts on a 256-byte boundary when reading texture data from the external memory. When modifying the value during execution of a DL, execute the SYNCM instruction before doing so.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Notes: 1. n = 1 to 4.
2. This register is not initialized by the SWRST bit in the control register (CR).

56.2.19 UV Source Start Address Register (UVSSAR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVSSAR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSAR								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	UVSSAR	H'00 0000	R/W	SRC Start Address for UV plane Sets the start address in 256-byte unit when reading the UV plane in Semi-planar format as texture data from external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.20 UV Source Stride Register (UVSSTR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UVSSTR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSTR															
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	UVSSTR	H'00100	[16:6]: R/W [5:0]: R	Sets the memory width of texture data read from the external memory of UV plane in Semi-planar format to a range from 256 bytes to 65,536 bytes and in 256-byte unit. In Linear Addressing mode, the value set in this register is used as-is, while in Tile addressing mode, the value is quadrupled and used as the memory width. To modify the value during execution, execute the SYNCM instruction before modification. The least significant 6 bits must always be 0.

Notes: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.21 UV Source Start Address Register n (UVSSARn)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVSSARn															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSARn								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	UVSSARn	H'00 0000	R/W	SRC Start Address for UV plane for Map n Sets the start address in 256-byte unit when reading the UV plane for the n-th Map in Semi-planar format as texture data from external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: 1. n = 1 to 4.
2. This register is not initialized by the SWRST bit in the control register (CR).

56.2.22 UV Source Stride Register n (UVSSTRn)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UVSSTRn
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSTRn															
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	UVSSTRn	H'0100	[16:6]: R/W [5:0]: R	Sets the memory width of texture data read from the external memory of UV plane for the n-th Map in Semi-planar format to a range from 256 bytes to 65,536 bytes and in 256-byte unit. In Linear Addressing mode, the value set in this register is used as-is, while in Tile addressing mode, the value is quadrupled and used as the memory width. To modify the value during execution, execute the SYNCM instruction before modification. The least significant 6 bits must always be 0.

Notes: 1. n = 1 to 4.
2. This register is not initialized by the SWRST bit in the control register (CR).

56.2.23 UV Destination Stride Register (UVDSTR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UVDSTR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVDSTR															
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16 to 0	UVDSTR	H'0040	[16:6]: R/W [5:0]: R	Sets the memory width of destination data of UV plane in Semi-planar format to a range from 64 bytes to 65,536 bytes and in 64-byte unit. If the UVDSTSEL bit of DCCR register is 1, the setting of this register is used as memory stride, while if the bit is 0, the setting of DSTR register is used as memory stride. In Linear Addressing mode, the value set in this register is used as-is, while in Tile addressing mode, the value is quadrupled and used as the memory width. To modify the value during execution, execute the SYNCM instruction before modification. The least significant 6 bits must always be 0.

Notes: 1. This register is not initialized by the SWRST bit in the control register (CR)

56.2.24 Destination Start Address Offset Register (DSAOR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSAO															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSAO										—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	DSAO	H'000 0000	R/W	Destination Offset Address Specifies the offset address of the destination area in 64-byte alignment. To modify the value during execution, execute the SYNCM instruction before modification.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.25 UV Source Start Address Offset Register (UVSSAOR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVSSAOR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSAOR								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	UVSSAOR	H'00 0000	R/W	SRC Start Address Offset for UV plane Sets the offset of start address in 256-byte unit when reading the UV plane in Semi-planar format as texture data from external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Note: 1. This register is not initialized by the SWRST bit in the control register (CR).

56.2.26 UV Source Start Address Offset Register for Map n (UVSSAORn)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVSSAORn															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVSSAORn								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	UVSSAORn	H'00 0000	R/W	SRC Start Address Offset for UV plane for Map n Sets the offset of start address in 256-byte unit when reading the UV plane for the n-th Map in Semi-planar format as texture data from external memory. To modify the value during execution, execute the SYNCM instruction before modification.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Notes: 1. n = 1 to 4.

2. This register is not initialized by the SWRST bit in the control register (CR).

56.2.27 X/Y Offset Register (XYOFSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved These bits are always read as 0. The write value should always be same as bit 27 extended. Otherwise, the operation cannot be guaranteed.
27 to 16	XOFS	H'000	R/W	The value, obtained by adding the offset specified in this field to the X coordinate automatically generated or specified by DL, is used for processing as X coordinate. Specify the offset in signed 12-bit format. When the DDP bit of the UVDPOR register is 1, the lower 2 bits are treated as fractional part, while the remaining ones are treated as sign bit and integer part.
15 to 12	—	H'0	R	Reserved These bits are always read as 0. The write value should always be same as bit 11 extended. Otherwise, the operation cannot be guaranteed.
11 to 0	YOFS	H'000	R/W	The value, obtained by adding the offset specified in this field to the Y coordinate automatically generated or specified by DL, is used for processing as Y coordinate. Specify the offset in signed 12-bit format. When the DDP bit of the UVDPOR register is 1, the lower 2 bits are treated as fractional part, while the remaining ones are treated as sign bit and integer part.

56.2.28 u/v Offset Register (UVOFSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UOFS

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	UOFS	H'0000	R/W	The value, obtained by adding the offset specified in this field to the u coordinate automatically generated or specified by DL, is used for processing as u coordinate. Specify the offset in signed 16-bit format. For the digits specified by the value in UVDPO field of UVDPOR register, the lower bits are treated as fractional part, while the remaining ones are treated as sign bit and integer part.
15 to 0	VOFS	H'0000	R/W	The value, obtained by adding the offset specified in this field to the v coordinate automatically generated or specified by DL, is used for processing as v coordinate. Specify the offset in signed 16-bit format. For the digits specified by the value in UVDPO field of UVDPOR register, the lower bits are treated as fractional part, while the remaining ones are treated as sign bit and integer part.

56.2.29 Rendering Mode Register (CMRCR)

CMRCR indicates the output mode, bit precision, and correction mode for the drawing results. To set each bit in this register to 1, write 1 to the corresponding bit in CMRCSR. To clear each bit to 0, write 1 to the corresponding bit in CMRCCR.

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Note: CMRCR must be initialized (cleared) by using CMRCCR after the software reset.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EFPE	0	R	Enables or disables the extended filtering pipeline. 0: Disabled 1: Enabled The settings of bits SUV1416, DUV1416, SY1416, and DY1416 of this register and bits SHFVAL, SHFE, and RDE bits in TRIMR are only effective when this bit is set to 1. The results of processing may not be the same with each setting (enabled or disabled), even though the same pixel format is specified. This bit should be set to 1 when using DYP mode. Setting this bit to 1 is prohibited when bilinear filtering is not in use (the BFE bit in TRIMR is 0). Also, setting this bit to 1 is prohibited when conversion by the LUT is in use (the LUTE in CMRCR2 is 1) and copying 16-bit data mode is enabled (the CP16E in CMRCR is 1).
30	CP32E	0	R	Copy 32-bit mode Enables copying 32-bit data as it is without complementing the data. When this bit is set to 1 and Texture mapping is used: set the TME bit in the TRIMR register to 1; set all the bits except the CP32E bit in the CMRCR register to 0; set all the bits in the CMRCR2 and TRIMR2 registers to 0; set all the bits except the TME, TCM, AUTOSG and AUTODG bits in the TRIMR register to 0; and set RSCR.RSE bit to 0, Otherwise operation is not guaranteed. When this bit is set to 1 and 32-bits single color is used: Set all the bits (TME = 0 to use single color mode), except the TCM, AUTOSG and AUTODG in the TRIMR register to 0; Set all the bits except the CP32E bit in the CMRCR register to 0. Set all the bits in the CMRCR2 and TRIMR2 registers to 0; Set RSE bit in the RSCR register to 0; Set TRICR2 as Single-Color data. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Disables copying 32-bit data. 1: Enables copying 32-bit data.

Bit	Bit Name	Initial Value	R/W	Description
29, 28	SUV1416	00	R	Specifies the pixel format of the hue of the source data as 14 or 16 bpp or makes neither specification. 00: Does not specify the format as 14 or 16 bpp. 10: Specifies the format as 14 bpp. 11: Specifies the format as 16 bpp. Others: Setting prohibited When the setting of this bit field is 00, specify the pixel format in the SUV bit field. When the setting of these bits is not 00, set the SUV bit field to 00. This setting is only effective when the EFPE bit is set to 1. When the setting of the EFPE bit is 0, setting this bit field to a value other than 00 is prohibited. Make the same setting in this bit field and in the DUV1416 bit field when the setting of the SHFE bit in TRIMR is 0. When the setting of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. When reading texture data from the external memory, 14-bpp precision destination data should be 16-bit data in which data is LSB-justified with 0 in the upper 2 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the source data and the color difference of the source data must have the same precision.
27, 26	DUV1416	00	R	Specifies the pixel format of the hue of the destination data as 14 or 16 bpp or makes neither specification. 00: Does not specify the format as 14 or 16 bpp. 10: Specifies the format as 14 bpp. 11: Specifies the format as 16 bpp. Others: Setting prohibited When the setting of this bit field is 00, specify the pixel format in the DUV bit field. When the setting of these bits is not 00, set the DUV bit field to 00. This setting is only effective when the EFPE bit is set to 1. When the setting of the EFPE bit is 0, setting this bit field to a value other than 00 is prohibited. Make the same setting in this bit field and in the SUV1416 bit field when the setting of the SHFE bit in TRIMR is 0. When the setting of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. In 14-bpp precision output, 16-bit data is output in which U and V are each LSB-justified with 0 in the upper 2 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the destination data and the color difference of the destination data must have the same precision.

Bit	Bit Name	Initial Value	R/W	Description
25, 24	SY1416	00	R	Specifies the pixel format of the luminance of the source data as 14 or 16 bpp or makes neither specification. 00: Does not specify the format as 14 or 16 bpp. 10: Specifies the format as 14 bpp. 11: Specifies the format as 16 bpp. Others: Setting prohibited When the setting of this bit field is 00, specify the pixel format in the SY10 and SY12 bits. When the setting of these bits is not 00, set the SY10 and SY12 bits to 0. This setting is only effective when the EFPE bit is set to 1. When the setting of the EFPE bit is 0, setting this bit field to a value other than 00 is prohibited. Make the same setting in this bit field and in the DY1416 bit field when the setting of the SHFE bit in TRIMR is 0. When the setting of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. When reading texture data from the external memory, 14-bpp precision source data should be 16-bit data in which data is LSB-justified with 0 in the upper 2 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the source data and the color difference of the source data must have the same precision.
23, 22	DY1416	00	R	Specifies the pixel format of the luminance of the destination data as 14 or 16 bpp or makes neither specification. 00: Does not specify the format as 14 or 16 bpp. 10: Specifies the format as 14 bpp. 11: Specifies the format as 16 bpp. Others: Setting prohibited When the setting of this bit field is 00, specify the pixel format in the Y10 and Y12 bits. When the setting of these bits is not 00, set the Y10 and Y12 bits to 0. This setting is only effective when the EFPE bit is set to 1. When the setting of the EFPE bit is 0, setting this bit field to a value other than 00 is prohibited. Make the same setting in this bit field and in the SY1416 bit field when the setting of the SHFE bit in TRIMR is 0. When the setting of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. In 14-bpp precision output, 16-bit data is output in which data is LSB-justified with 0 in the upper 2 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the destination data and the color difference of the destination data must have the same precision.
21, 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
19	CLSM	0	R	Hue Correction Scale Parameter Register Specification Mode When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Uses the hue correction scale parameters specified in the DL. 1: Uses the hue correction scale parameters specified by register settings (UBCPR and VRCPR registers).
18	CLOM	0	R	Hue Correction Offset Parameter Register Specification Mode When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Uses the hue correction offset parameters specified in the DL. 1: Uses the hue correction offset parameters specified by register settings (UBCPR and VRCPR registers).
17	LUSM	0	R	Luminance Correction Scale Parameter Register Specification Mode When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Uses the luminance correction scale parameters specified in the DL. 1: Uses the luminance correction scale parameter specified by register settings (YLCPR register).
16	LUOM	0	R	Luminance Correction Offset Parameter Register Specification Mode When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Uses the luminance correction offset parameters specified in the DL. 1: Uses the luminance correction offset parameter specified by register settings (YLCPR register).
15	CP16E	0	R	Copy 16-bit mode Enables copying 16-bit data as it is without complementing the data. When this bit is set to 1, set the TME bit in the TRIMR register to 1; set all the bits except the CP16E bit in the CMRCR register to 0; set all the bits in the CMRCR2 register to 0; set all the bits except the TME, TCM, AUTOSG and AUTODG bits in the TRIMR register to 0; set RSCR.RSE bit to 0; and setting in TRIMR2 register cannot be usable, otherwise operation is not guaranteed. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Disables copying 16-bit data. 1: Enables copying 16-bit data.
14	YCM	0	R	YC Mode Selects either Y or UV data to be processed when reading texture data from the external memory. Set this bit to 0 when the setting of the YUV422E or YUVSEMI or DYP bit in the CMRCR2 register is 1. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Processes Y. 1: Processes UV.

Bit	Bit Name	Initial Value	R/W	Description
13	UVS	0	R	Specifies whether the input UV plane is in YUV420 format. 0: The input UV plane is not in YUV420 format 1: The input UV plane is in YUV420 format
12	SY12	0	R	Specifies the precision of luminance processing of source data. When this bit is set to 1, set the SY10 bit to 0. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: 8-bpp precision or 10-bpp precision (10-bpp precision when SY10 is 1) 1: 12-bpp precision When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the Y12 bit being set or a higher precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the Y12 bit. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When reading texture data from the external memory, 12-bpp precision source data should be 16-bit data in which data is LSB-justified with 0 in the upper 4 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the source data and the color difference of the source data must have the same precision.
11	SY10	0	R	Specifies the precision of luminance processing of source data. When this bit is set to 1, set the SY12 bit to 0. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: 8-bpp precision or 12-bpp precision (12-bpp precision when SY12 is 1) 1: 10-bpp precision When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the Y10 bit being set or a higher precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the Y10 bit. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When reading texture data from the external memory, 10-bpp precision source data should be 16-bit data in which data is LSB-justified with 0 in the upper 6 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the source data and the color difference of the source data must have the same precision.
10	YOM	0	R	Output only Y data and discard U/V data. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change.

Bit	Bit Name	Initial Value	R/W	Description
9	Y12	0	R	Set this bit when Y data is output in 12-bpp precision. When this bit is set to 1, set the Y10 bit to 0. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Outputs Y data in 8- or 10-bpp precision. (10-bpp precision when Y10 is 1) 1: Outputs Y data in 12-bpp precision. In 12-bpp precision output, 16-bit data is output in which data is LSB-justified with 0 in the upper 4 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the destination data and the color difference of the destination data must have the same precision. When SY12 bit is 0 and EFPE bit is 0, setting 1 is prohibited. When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the SY12 bit being set or a lower precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the SY12 bit. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20.
8	Y10	0	R	Set this bit when Y data is output in 10-bpp precision. When this bit is set to 1, set the Y12 bit to 0. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Outputs Y data in 8- or 12-bpp precision. (12-bpp precision when Y12 is 1). 1: Outputs Y data in 10-bpp precision. In 10-bpp precision output, 16-bit data is output in which data is LSB-justified with 0 in the upper 6 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the destination data and the color difference of the destination data must have the same precision. When SY12, SY10 and EFPE bits are 0, setting 1 is prohibited. When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the SY10 bit being set or a lower precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the SY10 bit. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20.

Bit	Bit Name	Initial Value	R/W	Description
7	YISM	0	R	Selects the output format for YUV data. This bit is valid when the setting of the YUV422E bit or YUVSEMI bit in the CMRCR2 register is 1. Set this bit to 0 when the setting of the YUV422E bit and YUVSEMI bit in the CMRCR2 register is 0. Operation cannot be guaranteed if this bit is set to 1 while the setting of the YUV422E bit or YUVSEMI bit in the CMRCR2 register is 0. When the YUV422E bit and YUVSEMI bit in the CMRCR2 register and this bit are set to 0 at the same time, either Y or UV values are output as selected by the setting of the YCM bit in the CMRCR register. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Produces the interleave output of YUV data. 1: Produces the separate output of Y/UV data. This bit should be set to 1 when using DYP mode.
6, 5	SUV	00	R	Specifies the precision of color difference processing of source data. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 00: 8-bpp precision 01: 10-bpp precision 10: 12-bpp precision 11: Setting prohibited When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the DUV field being set or a higher precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the DUV field. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. When reading texture data from the external memory, 12-bpp precision source data should be 16-bit data in which U and V are each LSB-justified with 0 in the upper 4 bits; and 10-bpp precision source data should be 16-bit data in which U and V are each LSB-justified with 0 in the upper 6 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the source data and the color difference of the source data must have the same precision.

Bit	Bit Name	Initial Value	R/W	Description
4, 3	DUV	00	R	Specifies the precision of color difference of output data. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 00: Outputs UV data in 8-bpp precision. 01: Outputs UV data in 10-bpp precision. 10: Outputs UV data in 12-bpp precision. 11: Setting prohibited. When the setting of the EFPE bit in this register is 0, specify the same precision as specified by the SUV field being set or a lower precision. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 0, specify the same setting in this bit and in the SUV field. When the setting of the EFPE bit in this register is 1 and that of the SHFE bit in TRIMR is 1, set this bit field according to the combinations shown in Table 56.19 and Table 56.20. In 12-bpp precision output, 16-bit data is output in which U and V are each LSB-justified with 0 in the upper 4 bits; and in 10-bpp precision output, 16-bit data is output in which U and V are each LSB-justified with 0 in the upper 6 bits. In YUV422 interleaved mode (YUV422E in the CMRCR2 register is set to 1), the luminance of the destination data and the color difference of the destination data must have the same precision.
2	CLCE	0	R	Hue Correction Enable Enables hue correction using scale and offset values. 0: Disables hue correction. 1: Enables hue correction. If Y data is processed (YCM bit in CMRCR = 0 and YUV422E bit in CMRCR2 = 0 or YOM bit is 1), this bit must be set to 0.
1	LUCE	0	R	Luminance Correction Enable Enables luminance correction using scale and offset values. 0: Disables luminance correction. 1: Enables luminance correction. If UV data is processed (YCM bit in CMRCR = 1 and YUV422E bit in CMRCR2 = 0), this bit must be set to 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Otherwise, the operation cannot be guaranteed.

12	SY12C	0	—/W	0: Does not clear the SY12 bit in CMRCR to 0. 1: Clears the SY12 bit in CMRCR to 0.
11	SY10C	0	—/W	0: Does not clear the SY10 bit in CMRCR to 0. 1: Clears the SY10 bit in CMRCR to 0.
10	YOMC	0	—/W	0: Does not clear the YOM bit in CMRCR to 0. 1: Clears the YOM bit in CMRCR to 0.
9	Y12C	0	—/W	0: Does not clear the Y12 bit in CMRCR to 0. 1: Clears the Y12 bit in CMRCR to 0.
8	Y10C	0	—/W	0: Does not clear the Y10 bit in CMRCR to 0. 1: Clears the Y10 bit in CMRCR to 0.
7	YISMC	0	—/W	0: Does not clear the YISM bit in CMRCR to 0. 1: Clears the YISM bit in CMRCR to 0.
6, 5	SUVC	00	—/W	00: Does not clear either of the SUV bits in CMRCR to 0. 01: Clears bit 0 of the SUV bits in CMRCR to 0. 10: Clears bit 1 of the SUV bit in CMRCR to 0. 11: Setting prohibited.
4, 3	DUVC	00	—/W	00: Does not clear either of the DUV bit in CMRCR to 0. 01: Clears bit 0 of the DUV bits in CMRCR to 0. 10: Clears bit 1 of the DUV bits in CMRCR to 0. 11: Setting prohibited.
2	CLCEC	0	—/W	0: Does not clear the CLCE bit in CMRCR to 0. 1: Clears the CLCE bit in CMRCR to 0.
1	LUCEC	0	—/W	0: Does not clear the LUCE bit in CMRCR to 0. 1: Clears the LUCE bit in CMRCR to 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

56.2.32 Rendering Mode Register 2 (CMRCR2)

CMRCR2 indicates the output mode for the drawing results. To set each bit in this register to 1, write 1 to the corresponding bit in CMRCSR2. To clear each bit to 0, write 1 to the corresponding bit in CMRCCR2.

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Note. CMRCR2 must be initialized (cleared) by using CMRCCR2 after the software reset.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15	DCTE	0	R	Tile Addressing Mode Enable for Destination Data 0: Linear addressing mode 1: Tile addressing mode
14, 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12	TCTE	0	R	Tile Addressing Mode Enable for Texture Data 0: Linear addressing mode 1: Tile addressing mode
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
9 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
6	UVFORM	0	R	Swap the order of adjacent 'U' and 'V' on the YUV422 interleaved/ YUV422 semi-planar/ YUV420 semi-planar texture data. 0: Keeps the original order. 1: Swaps the order. Set this bit to 0 when both YUVSEMI and TCTE bits are 1.
5	YUV422FORM	0	R	Swap the order of adjacent 'Y' and 'U' or 'V' on the YUV422 interleaved texture data. 0: Keeps the original order. 1: Swaps the order.
4	DYP	0	R	DYP: Double luminance plane mode 0: Not use double luminance plane function. 1: Use double luminance plane. When this bit is 1, the data of first Y plane is read from the space set by SSAR and SSTR. The data of second Y plane is read from the space set by UVSSAR and UVSSTR. When this bit is 1, setting of the YUVSEMI and YUV422E bit shall be 0. Set this bit to 0 when the setting of the RSE bit in the RSCR is 1. Operation cannot be guaranteed if this bit is set to 1 while the setting of the RSE bit in the RSCR is 1. Refer to the Table 56.13 for possible combination.
3	YUVSEMI	0	R	YUV Semi-planar mode 0: The input image format is not YUV Semi-planar 1: The input image format is YUV Semi-planar When this bit is 1, the data of Y plane is read from the space set by SSAR, SSARn, SSTR, and SSTRn. The data of UV plane is read from the space set by UVSSAR, UVSSARn, UVSSTR, UVSSTRn. When this bit is 1, setting of the DYP and YUV422E bit shall be 0. Refer to the Table 56.13 for possible combination.
2	YUV422E	0	R	YUV422 Interleaved Mode Enable 0: Processes Y only or UV only plane. 1: Processes YUV422 interleaved plane. Set this bit to 0 when the setting of the RSE bit in the RSCR is 1. Operation cannot be guaranteed if this bit is set to 1 while the setting of the RSE bit in the RSCR is 1. When this bit is 1, setting of the DYP and YUVSEMI bit shall be 0. Refer to the Table 56.13 for possible combination.
1	UVC	0	R	UV plane format conversion When this bit is set, if the input UV plane is in YUV422 Semi-planar format, it will be converted to YUV420 Semi-planar format; if the input UV plane is in YUV420 Semi-Planar format, it will be converted to YUV422 Semi-planar format. Do not set this bit to 1 if the input UV plane is in another format. 0: Does not convert the format of UV plane 1: Converts the format of UV plane When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change.

Bit	Bit Name	Initial Value	R/W	Description
0	LUTE	0	R	Lookup Table Enable When using the LUT to convert the output data from 10 bpp or 12 bpp to 8 bpp, set this bit to 1. In 12 to 8 bpp conversion, the upper 10 bits are converted to 8 bpp using the LUT. Only luminance can be converted. It is prohibited to convert color difference data. When YUV output precision is not 8 bpp, set this bit to 0. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change. 0: Does not convert data using the LUT. 1: Converts data using the LUT.

56.2.33 Rendering Mode Set Register 2 (CMRCSR2)

CMRCSR2 is used to set the corresponding bits in the rendering mode register 2 (CMRCR2). To enable the modes and functions selected by the bits in CMRCR2, write 1 to the corresponding bits in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
24	DIDL	0	R	Disable input information of CLCE or LUCE mode in DL. 0: Enable input information of CLCE or LUCE mode in DL. 1: Disable input information of CLCE or LUCE mode in DL. In case of use CLCE to 1, need to set bit CLSM and CLOM. In case of use LUCE to 1, need to set bit LUSM and LUOM.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
20	UVSHFVAL	0	R	Specifies one bit of logical right-shifting after filtering when the extended filtering pipeline is in use. This setting is applied to the UV plane as described in Table 56.13. Otherwise, SHFE and SHFVAL settings are used. This setting is only possible when the EFPE bit in CMRCR and the UVSHFE bit in this register are both set to 1. Set this bit to 0 when the EFPE in CMRCR and the SHFE bit in this register are not both set to 1. Set this bit in accord with the combinations shown in Table 56.19 and Table 56.20. Set this bit to 0 when using DYP. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16	SHFVAL	0	R	Specifies one bit of logical right-shifting after filtering when the extended filtering pipeline is in use. Sets the UV plane as described in Table 56.13. This setting is only possible when the EFPE bit in CMRCR and the SHFE bit in this register are both set to 1. Set this bit to 0 when the EFPE in CMRCR and the SHFE bit in this register are not both set to 1. Set this bit in accord with the combinations shown in Table 56.19 and Table 56.20. Set this bit to 0 when using DYP. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
15	UVSHFE	0	R	Specifies whether to truncate the fractional part or to retain the specified fractional digits following filtering by the extended filtering pipeline. This setting is applied to the UV plane as described in Table 56.13. Otherwise, SHFE and SHFVAL settings are used. 0: The fractional part is truncated after filtering. 1: Some of the digits of the fractional part after filtering are retained. When the setting of this bit is 1 and the input pixel format is N bpp, data are output in the (N + 3)-bpp format. The number of fractional bits to be retained is 2 in the case of bilinear filtering, selected when the BFE bit in TRIMR is 1 and the TFE bit in TRIMR is 0 (the lowest-order bit is always 0). When filtering using pyramidal images is enabled (the BFE bit in TRIMR is 1 and the TFE bit in TRIMR is 1), the number of fractional bits to be retained is 3. This setting is only enabled when the EFPE bit in CMRCR is 1. When the setting of the EFPE bit is 0, set this bit to 0. Set this bit to 0 when using DYP. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.

Bit	Bit Name	Initial Value	R/W	Description
14	SHFE	0	R	Specifies whether to truncate the fractional part or to retain the specified fractional digits following filtering by the extended filtering pipeline. Set the UV plane as described in Table 56.13. 0: The fractional part is truncated after filtering. 1: Some of the digits of the fractional part after filtering are retained. When the setting of this bit is 1 and the input pixel format is N bpp, data are output in the (N + 3)-bpp format. The number of fractional bits to be retained is 2 in the case of bilinear filtering, selected when the BFE bit in TRIMR is 1 and the TFE bit in TRIMR is 0 (the lowest-order bit is always 0). When filtering using pyramidal images is enabled (the BFE bit in TRIMR is 1 and the TFE bit in TRIMR is 1), the number of fractional bits to be retained is 3. This setting is only enabled when the EFPE bit in CMRCR is 1. When the setting of the EFPE bit is 0, set this bit to 0. Set this bit to 0 when using DYP. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
13	RDE	0	R	Specifies how to round the fractional part in filtering. 0: Truncation 1: Rounding up or down This setting is only enabled when the EFPE bit in CMRCR is 1. When the setting of the EFPE bit is 0, set this bit to 0. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11	TFE	1	R	Pyramidal Image Filtering Enable 0: Disables the filtering between two adjacent pyramidal images. 1: Enables the filtering between two adjacent pyramidal images. When setting this bit to 1, set the BFE bit to 1 as well. When this bit is 1, SCCR.TCMENB must be set to 0. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
10 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6	TCM	0	R	Triangle Clockwise Mode Specifies the order of the first three vertexes of the strip-type triangle with N vertexes that is drawn by the TRI instruction. Any TRI instruction not consistent with the order specified in this bit is not executed. 0: Specifies triangle vertexes counterclockwise. 1: Specifies triangle vertexes clockwise.

Bit	Bit Name	Initial Value	R/W	Description
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
3	AUTOSG	0	R	Automatic Source Coordinate Generation Mode In automatic source coordinate generation mode, the rectangular source coordinates are internally generated according to the mesh generation X size and Y size register settings and mesh generation X and Y start register settings. 0: Disables the automatic source coordinate generation function. 1: Enables the automatic source coordinate generation function. When this bit is set to 1 to enable the automatic source coordinate generation mode, source coordinates cannot be input to the DL.
2	AUTODG	0	R	Automatic Destination Coordinate Generation Mode In automatic destination coordinate generation mode, the rectangular destination coordinates are internally generated according to the mesh generation X size and Y size register settings and mesh generation X and Y start register settings. 0: Disables the automatic destination coordinate generation function. 1: Enables the automatic destination coordinate generation function. When this bit is set to 1 to enable the automatic destination coordinate generation mode, destination coordinates cannot be input to the DL.
1	BFE	1	R	Bilinear Filter Enable Indicates whether bilinear filtering is used for texture mapping. 0: Bilinear filtering is not used. 1: Bilinear filtering is used. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.
0	TME	1	R	Texture Mapping Enable Indicates whether texture mapping is used or the single color specified by TRICR, TRICR2, and TRICR3 is used for triangle drawing. Set the same format on the input image data format and the output image format if this bit is clear to 0. 0: The single color specified by TRICR, TRICR2, and TRICR3 is used. 1: Texture mapping is used. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this bit without executing the SYNCM instruction.

56.2.36 Triangle Mode Set Register (TRIMSR)

TRIMSR is used to set the corresponding bits of the triangle mode register (TRIMR). To enable the modes and functions selected by the bits in TRIMR, write 1 to the corresponding bits in this register.

19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16	SHFVALS	0	—/W	0: The SHFVAL bit is not set to 1. 1: The SHFVAL bit is set to 1.
15	UVSHFES	0	—/W	0: The UVSHFVAL bit is not set to 1. 1: The UVSHFVAL bit is set to 1.
14	SHFES	0	—/W	0: The SHFE bit is not set to 1. 1: The SHFE bit is set to 1.
13	RDES	0	—/W	0: The RDE bit is not set to 1. 1: The RDE bit is set to 1.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
11	TFES	0	—/W	0: The TFE bit is not set to 1. 1: The TFE bit is set to 1.
10 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6	TCMS	0	—/W	0: The TCM bit is not set to 1. 1: The TCM bit is set to 1.
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
3	AUTOSGS	0	—/W	0: The AUTOSG bit is not set to 1. 1: The AUTOSG bit is set to 1.
2	AUTODGS	0	—/W	0: The AUTODG bit is not set to 1. 1: The AUTODG bit is set to 1.
1	BFES	0	—/W	0: The BFE bit is not set to 1. 1: The BFE bit is set to 1.
0	TMES	0	—/W	0: The TME bit is not set to 1. 1: The TME bit is set to 1.

56.2.37 Triangle Mode Clear Register (TRIMCR)

TRIMCR is used to clear the corresponding bits of the triangle mode register (TRIMR). To disable the modes and functions selected by the bits in TRIMR, write 1 to the corresponding bits in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
24	DIDLC	0	—/W	Set bit DIDL in TRIMR 0: Bit DIDL in TRIMR is not clear. 1: Bit DIDL in TRIMR is clear to 0.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
20	UVSHFVALC	0	—/W	0: Does not clear the UVSHFVAL bit to 0. 1: Clears the UVSHFVAL bit to 0.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
16	SHFVALC	0	—/W	0: Does not clear the SHFVAL bit to 0. 1: Clears the SHFVAL bit to 0.
15	UVSHFEC	0	—/W	0: Does not clear the UVSHFVAL bit to 0. 1: Clears the UVSHFVAL bit to 0.
14	SHFEC	0	—/W	0: Does not clear the SHFE bit to 0. 1: Clears the SHFE bit to 0.
13	RDEC	0	—/W	0: Does not clear the RDE bit to 0. 1: Clears the RDE bit to 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
11	TFEC	0	—/W	0: Does not clear the TFE bit to 0. 1: Clears the TFE bit to 0.
10 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6	TCMC	0	—/W	0: Does not clear the TCM bit to 0. 1: Clears the TCM bit to 0.
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
3	AUTOSGC	0	—/W	0: Does not clear the AUTOSG bit to 0. 1: Clears the AUTOSG bit to 0.
2	AUTODGC	0	—/W	0: Does not clear the AUTODG bit to 0. 1: Clears the AUTODG bit to 0.
1	BFEC	0	—/W	0: Does not clear the BFE bit to 0. 1: Clears the BFE bit to 0.
0	TMEC	0	—/W	0: Does not clear the TME bit to 0. 1: Clears the TME bit to 0.

56.2.38 Triangle Color Register (TRICR)

TRICR is used to specify the color for single-color drawing with a TRI instruction when single-color drawing is selected with the TME bit in TRIMR.

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	YCFORM	—	—	—	TCY3		TCY2		TCV							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCU								TCY							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

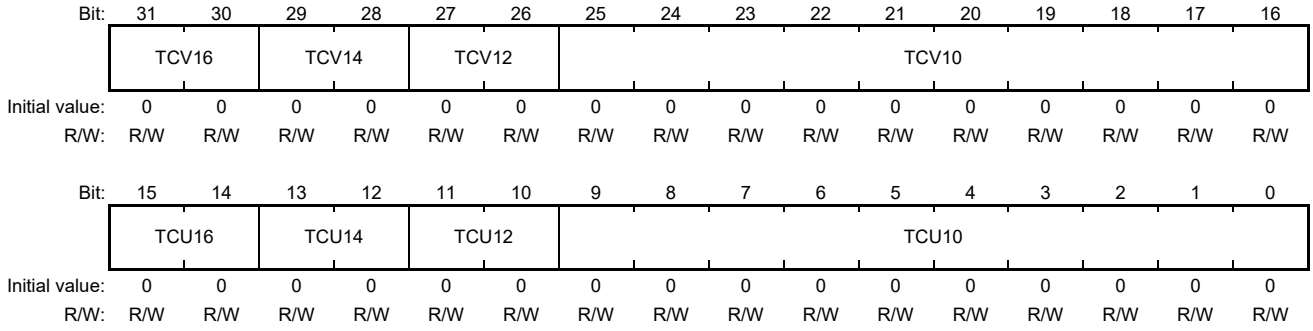
Bit	Bit Name	Initial Value	R/W	Description
31	YCFORM	0	R/W	For interleave output (for which the YISM bit in CMRCR is 0 and the YUV422E bit in CMRCR2 is 1), changes the order of Y and U/V. Normally, Y and U/V are in a {U/V, Y} order; this bit, however, can reverse the order to {Y, U/V}. Setting this bit to 1 is prohibited for operations other than interleave output. 0: For interleave output, does not change the order of Y and U/V. 1: For interleave output, changes the order of Y and U/V. When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
27, 26	TCY3	00	R/W	When Y is to be output in 12 bpp, these bits specify bits 11 and 10 of color Y for single-color drawing with the TRI instruction.
25, 24	TCY2	00	R/W	When Y is to be output in 10/12 bpp, these bits specify bits 9 and 8 of color Y for single-color drawing with the TRI instruction.
23 to 16	TCV	H'00	R/W	When V is to be output in 8 bits, these bits specify color V for single-color drawing with the TRI instruction. When outputting V in 10 bits/12 bits, the V value in the TRICR2 register is used.
15 to 8	TCU	H'00	R/W	When U is to be output in 8 bits, these bits specify color U for single-color drawing with the TRI instruction. When outputting U in 10 bits/12 bits, the U value in the TRICR2 register is used.
7 to 0	TCY	H'00	R/W	Specifies color Y for single-color drawing with the TRI instruction.

56.2.39 Triangle Color Register 2 (TRICR2)

TRICR2 is used to specify the color for single-color drawing with a TRI instruction when single-color drawing is selected with the TME bit in TRIMR. This register is used when UV is output in 10 bpp/12 bpp.

When 32-bits single color mode is selected by the setting of CP32E in CMRCR and TME bit in TRIMR, this register is used as single-Color data.

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	TCV16	00	R/W	When V is to be output in 16 bpp, these bits specify bits 15 and 14 of color V for single-color drawing with the TRI instruction.
29, 28	TCV14	00	R/W	When V is to be output in 14/16 bpp, these bits specify bits 13 and 12 of color V for single-color drawing with the TRI instruction.
27, 26	TCV12	00	R/W	When V is to be output in 12/14/16 bpp, these bits specify bits 11 and 10 of color V for single-color drawing with the TRI instruction.
25 to 16	TCV10	H'000	R/W	When V is to be output in 10/12/14/16 bpp, these bits specify bits 9 to 0 of color V for single-color drawing with the TRI instruction.
15, 14	TCU16	00	R/W	When U is to be output in 16 bpp, these bits specify bits 15 and 14 of color U for single-color drawing with the TRI instruction.
13, 12	TCU14	00	R/W	When U is to be output in 14/16 bpp, these bits specify bits 13 and 12 of color U for single-color drawing with the TRI instruction.
11, 10	TCU12	00	R/W	When U is to be output in 12/14/16 bpp, these bits specify bits 11 and 10 of color U for single-color drawing with the TRI instruction.
9 to 0	TCU10	H'000	R/W	When U is to be output in 10/12/14/16 bpp, these bits specify bits 9 to 0 of color U for single-color drawing with the TRI instruction.

56.2.40 Triangle Mode Register 2 (TRIMR2)

TRIMR2 is used to select the maximum level of detail.

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
11 to 9	MAXLODU	000	R	The maximum level of detail for pyramidal images to be used in the u direction. The setting should be from 0 to 4. Other settings are prohibited. To modify the value during execution, execute the SYNCM instruction before modification. When this bit is not 0, SCCR.TCMENB must be set to 0.
8 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
5 to 3	MAXLODV	000	R	The maximum level of detail for pyramidal images to be used in the v direction. The setting should be from 0 to 4. Other settings are prohibited. To modify the value during execution, execute the SYNCM instruction before modification. When this bit is not 0, SCCR.TCMENB must be set to 0.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.

56.2.41 Triangle Mode Set Register 2 (TRIMSR2)

TRIMSR2 is used to set the corresponding bits of the triangle mode register (TRIMR2). To enable the modes and functions selected by the bits in TRIMR2, write 1 to the corresponding bits in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DDP	—	—	—	—	—	UVDPO		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
8	DDP	0	R/W	Specifies the destination coordinates described in the DL and the registers related to the setting of destination coordinates. 0: Specifies destination coordinates in integer. 1: Specifies destination coordinates in fixed-point number (the lower 2 bits are below the decimal point). (Destination sub-pixel mode) When changing the setting of this bit by the DL, be sure to execute the SYNCM instruction before making the change.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
2 to 0	UVDPO	000	R/W	Source Coordinate Decimal Point Specifies the number of decimal places of the source coordinates described with the DL within a range from 0 to 5. When 0 is specified, source coordinates are represented in integers. When 5 is specified, the coordinates specified with the DL are considered to have an integer part and a 5-bit decimal part.

56.2.44 Source Width Register (SUSR)

SUSR is used to specify the width (horizontal size) of the source. The width value depends on the source data format.

- When using UV data as source, specify the “UV source width − 2” in bits [26:16] and the “UV source width − 1” in bits [10:0]. The UV source width is a sum of the U and V pixels. Specify an even value as the UV source width; therefore, specify an even value in bits [26:16] and an odd value in bits [10:0].
- When using Y data as source, specify the “luminance Y source width − 1” in bits [10:0].
- When using YUV422 interleaved data as source, specify the “source width - 2” in bits [26:16] and the “source width - 1” in bits [10:0]. The source width is a sum of YU and YV pixels. Specify an even value as the source width; therefore, specify an even value in bits [26:16] and an odd value in bits [10:0].
- When using (YUV422 or YUV420) semi-planar data as source, specify the “source width - 2” in bits [26:16] and the “source width - 1” in bits [10:0]. The source width is width of Y pixels.
- When setting 1 to the CP16E bit in the CMRCR register, specify the “source width − 1” in bits [10:0].
- When setting 1 to the CP32E bit in the CMRCR register, specify the “source width - 2” in bits [26:16] and “source width − 1” in bits [10:0].

For example, for the VGA system (width = 640), specify 638 in bits [26:16] and 639 in bits [10:0]. When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SUW

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
26 to 16	SUW	H'4FE	R/W	Specify “source width − 2”. The maximum value is 2,046.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
10 to 0	SVW	H'4FF	R/W	Specify “source width − 1”. The maximum value is 2,047.

56.2.45 Source Height Register (SVSR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this field without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SVS										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
10 to 0	SVS	H'3FF	R/W	Specifies the height (vertical size) of the source. Specify (height – 1) in [10:0]. When processing the UV plane in YUV420 format, perform the setting based on the number of lines of UV plane data rather than the height of the corresponding Y plane. Refer to the Table 56.13 input format UV plane only.

56.2.46 MIN Clipping X Register (XMINR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	XMIN												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	XMIN	H'0000	R/W	X Clip MIN Specify the minimum value of the X coordinate of the clipping area in an integer less than or equal to 2,047. Nothing is drawn at an X coordinate less than this X coordinate. If the destination is in sub-pixel mode, the lower 2 bits will be below the fixed decimal point, in which case 0 must always be assigned to the lower 2 bits. If the destination is not in sub-pixel mode, always assign 0 to the upper 2 bits.

56.2.47 MIN Clipping Y Register (YMINR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	YMIN	H'0000	R/W	Y Clip MIN Specify the minimum value of the Y coordinate of the clipping area in an integer less than or equal to 2,047. Nothing is drawn at a Y coordinate less than this Y coordinate. If the destination is in sub-pixel mode, the lower 2 bits will be below the fixed decimal point, in which case 0 must always be assigned to the lower 2 bits. If the destination is not in sub-pixel mode, always assign 0 to the upper 2 bits.

56.2.48 MAX Clipping X Register (XMAXR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	XMAX												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	XMAX	H'0000	R/W	X Clip MAX Specify the maximum value of the X coordinate of the clipping area in an integer less than or equal to 2,047. Nothing is drawn at an X coordinate greater than this X coordinate. If the destination is in sub-pixel mode, the lower 2 bits will be below the fixed decimal point, in which case 0 must always be assigned to the lower 2 bits. If the destination is not in sub-pixel mode, always assign 0 to the upper 2 bits.

56.2.49 MAX Clipping Y Register (YMAXR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YMAX												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	YMAX	H'0000	R/W	Y Clip MAX Specify the maximum value of the Y coordinate of the clipping area in an integer less than or equal to 2,047. Nothing is drawn at a Y coordinate greater than this Y coordinate. If the destination is in sub-pixel mode, the lower 2 bits will be below the fixed decimal point, in which case 0 must always be assigned to the lower 2 bits. If the destination is not in sub-pixel mode, always assign 0 to the upper 2 bits.

56.2.50 Mesh Generation X Size Register (AMXSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AMXS												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	AMXS	H'0001	R/W	Automatic Mesh X Size Specify the X-direction width of the mesh when destination or source coordinates are to be automatically generated. (Setting 0 is prohibited.) If destination coordinates are generated automatically and the destination is in sub-pixel mode, the lower 2 bits will be below the decimal point. If source coordinates are generated automatically and Source Coordinate Decimal Point (UVDPO) in UVDPOR is set to n (range of n is from 0 to 5), the lower n bits will be below the decimal point. When AUTODG in TRIMR is 1, this register must be less than 128 pixels.

56.2.51 Mesh Generation Y Size Register (AMYSR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AMYS												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	AMYS	H'0001	R/W	Automatic Mesh Y Size Specify the Y-direction width of the mesh when destination or source coordinates are to be automatically generated. (Setting 0 is prohibited.) If destination coordinates are generated automatically and the destination is in sub-pixel mode, the lower 2 bits will be below the decimal point. If source coordinates are generated automatically and Source Coordinate Decimal Point (UVDPO) in UVDPOR is set to n (range of n is from 0 to 5), the lower n bits will be below the decimal point. When AUTODG in TRIMR is 1, this register must be less than 128 pixels.

56.2.52 Mesh Generation X Start Register (AMXOR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AMXO												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	AMXO	H'0000	R/W	Automatic Mesh X Origin Specify the X coordinate of the origin when destination or source coordinates are to be automatically generated. (In case of generating source coordinates, specify the u coordinate.) If destination coordinates are generated automatically and the destination is in sub-pixel mode, the lower 2 bits will be below the decimal point. If source coordinates are generated automatically and Source Coordinate Decimal Point (UVDPO) in UVDPOR is set to n (range of n is from 0 to 5), the lower n bits will be below the decimal point.

56.2.53 Mesh Generation Y Start Register (AMYOR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	AMYO												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
12 to 0	AMYO	H'0000	R/W	Automatic Mesh Y Origin Specify the Y coordinate of the origin when destination or source coordinates are to be automatically generated. (In case of generating source coordinates, specify the v coordinate.) If destination coordinates are generated automatically and the destination is in sub-pixel mode, the lower 2 bits will be below the decimal point. If source coordinates are generated automatically and Source Coordinate Decimal Point (UVDPO) in UVDPOR is set to n (range of n is from 0 to 5), the lower n bits will be below the decimal point.

56.2.54 Minimum Luminance Correction Y Register (YLMINR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	YLMIN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	YLMIN	H'0000	R/W	Specifies the minimum luminance value when luminance correction is applied. If after correction the luminance value is lower than the value specified in this register, the luminance value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DY1416 is B'11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DY1416 is B'10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of Y is not 16 bit or 14 bit and the Y12 bit in the CMRCR register is 1, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of Y is not 16bit or 14 bit and the Y10 bit in the CMRCR register is 1, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. In the other cases, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.55 Minimum Hue Correction U Register (UBMINR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UBMIN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	UBMIN	H'0000	R/W	Specifies the minimum U value when hue correction is applied. If after correction the U value is lower than the value specified in this register, the U value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'10, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'01, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'00, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.56 Minimum Hue Correction V Register (VRMINR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VRMIN															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	VRMIN	H'0000	R/W	Specifies the minimum V value when hue correction is applied. If after correction the V value is lower than the value specified in this register, the V value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'10, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'01, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'00, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.57 Maximum Luminance Correction Y Register (YLMAXR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	YLMAX															
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	YLMAX	H'00FF	R/W	Specifies the maximum luminance value when luminance correction is applied. If after correction the luminance value is higher than the value specified in this register, the luminance value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DY1416 is B'11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DY1416 is B'10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of Y is not 16 bit or 14 bit and the Y12 bit in the CMRCR register is 1, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of Y is not 16bit or 14 bit and the Y10 bit in the CMRCR register is 1, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. In the other cases, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.58 Maximum Hue Correction U Register (UBMAXR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UBMAX															
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	UBMAX	H'00FF	R/W	Specifies the maximum U value when hue correction is applied. If after correction the U value is higher than the value specified in this register, the U value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'10, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'01, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'00, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.59 Maximum Hue Correction V Register (VRMAXR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VRMAX															
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 0	VRMAX	H'00FF	R/W	Specifies the maximum V value when hue correction is applied. If after correction the V value is higher than the value specified in this register, the V value is clamped at the value specified by these bits. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’11, bits 15 to 0 are valid. When the EFPE bit in the CMRCR register is 1 and the DUV1416 is B’10, bits 13 to 0 are valid. In this case, bit [15:14] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'10, bits 11 to 0 are valid. In this case, bit [15:12] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'01, bits 9 to 0 are valid. In this case, bit [15:10] must be set to 0. When the destination data precision of UV is not 16 bit or 14 bit and the DUV bits in the CMRCR register are B'00, only bits 7 to 0 are valid. In this case, bit [15:8] must be set to 0. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.60 Correction Decimal Point Register (CPDPOR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

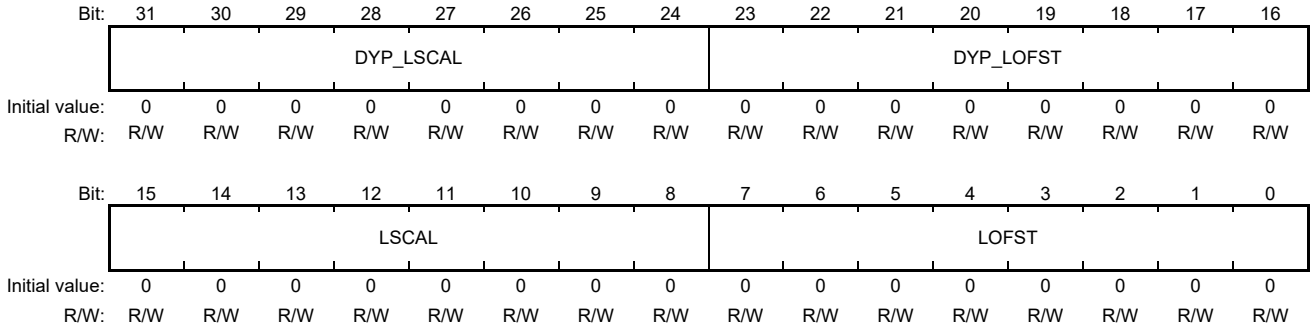
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	YLDPO			—	UBDPO			—	VRDPO		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
10 to 8	YLDPO	000	R/W	Specifies the number of bits after the decimal point for the value specified as the luminance correction scale value. Always execute the SYNCM instruction immediately before updating this register by DL.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
6 to 4	UBDPO	000	R/W	Specifies the number of bits after the decimal point for the value specified as the hue correction U value scale value. Always execute the SYNCM instruction immediately before updating this register by DL.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
2 to 0	VRDPO	000	R/W	Specifies the number of bits after the decimal point for the value specified as the hue correction V value scale value. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.61 Luminance Correction Parameter Y Register (YLCPR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DYP_LSCAL	H'00	R/W	Specifies the scale parameter of second Y plane in DYP mode if the luminance correction scale parameter is specified by a register setting (LUSM = 1 in CMRCR). The setting is passed as unsigned fixed-point data, and the number of decimal places is specified by YLDPO in CPDPOR. Specify the value of these bits as unsigned 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL
23 to 16	DYP_LOFST	H'00	R/W	Specifies the offset parameter of second Y plane in DYP mode if the luminance correction offset parameter is specified by a register setting (LUOM = 1 in CMRCR). Specify the value of these bits as signed 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.
15 to 8	LSCAL	H'00	R/W	Specifies the scale parameter when the luminance correction scale parameter is specified by a register setting (LUSM = 1 in CMRCR). The setting is passed as unsigned fixed-point data, and the number of decimal places is specified by YLDPO in CPDPOR. Specify the value of these bits as unsigned 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.
7 to 0	LOFST	H'00	R/W	Specifies the offset parameter when the luminance correction offset parameter is specified by a register setting (LUOM = 1 in CMRCR). Specify the value of these bits as signed 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.62 Hue Correction Parameter U Register (UBCPR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UBSCL								UBOFS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 8	UBSCL	H'00	R/W	Specifies the U value scale parameter when the hue correction scale parameters are specified by register settings (CLSM = 1 in CMRCR). The setting is passed as fixed-point data, and the number of decimal places is specified by UBDPO in CPDPOR. Specify the value of these bits as unsigned 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.
7 to 0	UBOFS	H'00	R/W	Specifies the U value offset parameter when the hue correction offset parameters are specified by register settings (CLOM = 1 in CMRCR). Specify the value of these bits as signed 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.

56.2.63 Hue Correction Parameter V Register (VRCPR)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.

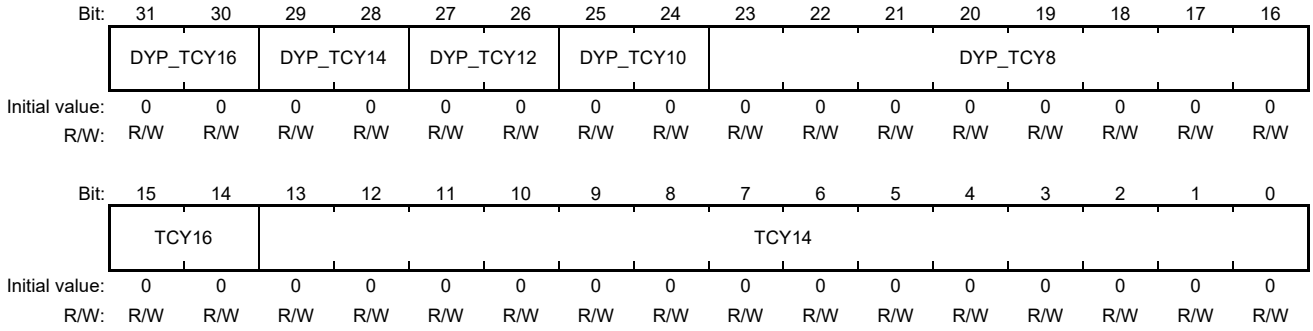
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VRSCL								VROFS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
15 to 8	VRSCL	H'00	R/W	Specifies the V value scale parameter when the hue correction scale parameters are specified by register settings (CLSM = 1 in CMRCR). The setting is passed as fixed-point data, and the number of decimal places is specified by VRDPO in CPDPOR. Specify the value of these bits as unsigned 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.
7 to 0	VROFS	H'00	R/W	Specifies the V value offset parameter when the hue correction offset parameters are specified by register settings (CLOM = 1 in CMRCR). Specify the value of these bits as signed 8-bit data. Always execute the SYNCM instruction immediately before updating this register by DL.

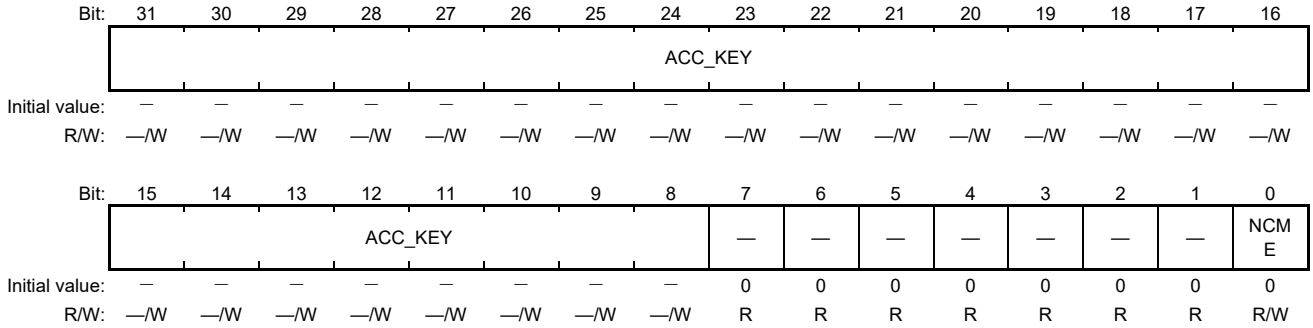
56.2.64 Triangle Color Register 3 (TRICR3)

When the NCME bit in NCMR is 1 for non-blocking cache mode, do not change this register without executing the SYNCM instruction.



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	DYP_TCY16	All 0	R/W	When 2nd Y in DYP mode is to be output in 16 bpp, these bits specify bits 15 and 14 of color 2nd Y for single-color drawing with the TRI instruction.
29 to 28	DYP_TCY14	All 0	R/W	When 2nd Y in DYP mode is to be output in 14 bpp or 16 bpp, these bits specify bits 13 and 12 of color 2nd Y for single-color drawing with the TRI instruction.
27 to 26	DYP_TCY12	All 0	R/W	When 2nd Y in DYP mode is to be output in 12bpp or 14 bpp or 16 bpp, these bits specify bits 11 and 10 of color 2nd Y for single-color drawing with the TRI instruction.
25 to 24	DYP_TCY10	All 0	R/W	When 2nd Y in DYP mode is to be output in 10bpp or 12bpp or 14 bpp or 16 bpp, these bits specify bits 9 and 8 of color 2nd Y for single-color drawing with the TRI instruction.
23 to 16	DYP_TCY8	All 0	R/W	In DYP mode, these bits specify bits 7 to 0 of color 2nd Y for single-color drawing with the TRI instruction.
15 to 14	TCY16	H'0	R/W	When Y is to be output in 16 bpp, these bits specify bits 15 and 14 of color Y for single-color drawing with the TRI instruction.
13 to 0	TCY14	H'0000	R/W	When Y is to be output in 14 bpp or 16 bpp, these bits specify bits 13 to 0 of color Y for single-color drawing with the TRI instruction.

56.2.65 Non-blocking Cache Mode Register (NCMR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	ACC_KEY	—	—/W	Access Key to change NCME bit of this register. It is required write “0xACCE55” to this field to change the value of the bit.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
0	NCME	0	R/W	Non-blocking cache mode enable bit for source data. Allow to issue multiple outstanding requests for fetching the source data if this bit is set to 1. If this bit is clear to 0, no request for fetching the source data is issued if there is a leading on-the-fly request. Please refer to ACC_KEY field of this register to update this bit.

56.2.66 Lookup Table Data Register n (LUTDRn)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

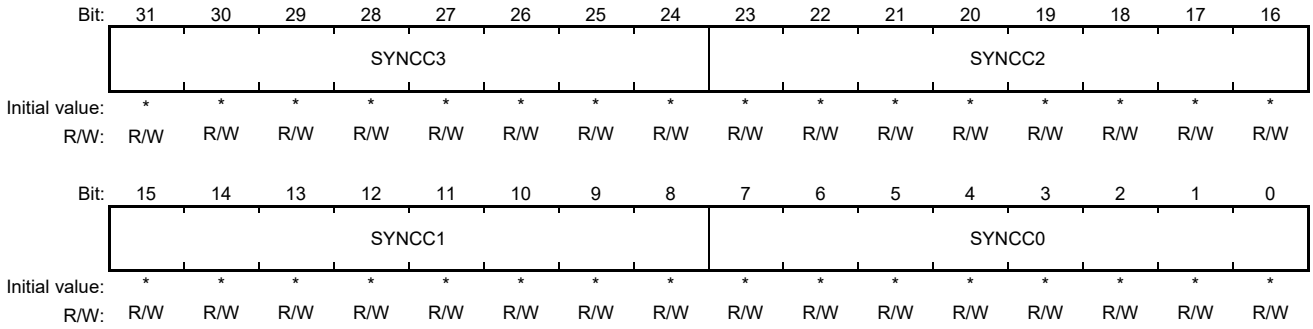
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	LUTDRn							
Initial value:	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
7 to 0	LUTDRn	Undefined	—/W	These bits are used when the LUTE bit in the CMRCR2 register is 1. Set 1,024 entries for the LUT to convert 10- or 12-bit output data to 8-bit data. These bits can be set from the CPU and DL; when DL is used for setting, use the WTL2 instruction. Always execute the SYNCM instruction immediately before updating this register by DL.

Note: $0 \leq n \leq 1023$

56.2.67 Synchronization Control Register 0 (SYNCCR0)

This register specifies the module corresponding to bits 0 to 3 in the SYNCC enable field of the WUP and SLP instructions. Set the number for specifying the module in this register. See **Table 56.22** for the numbers for specifying the module. Do not set a number that is not listed in **Table 56.22**. Do not modify the setting of this register until the value of the TRA bit in SR become 1 and after 1 was written to the RS bit in CR.

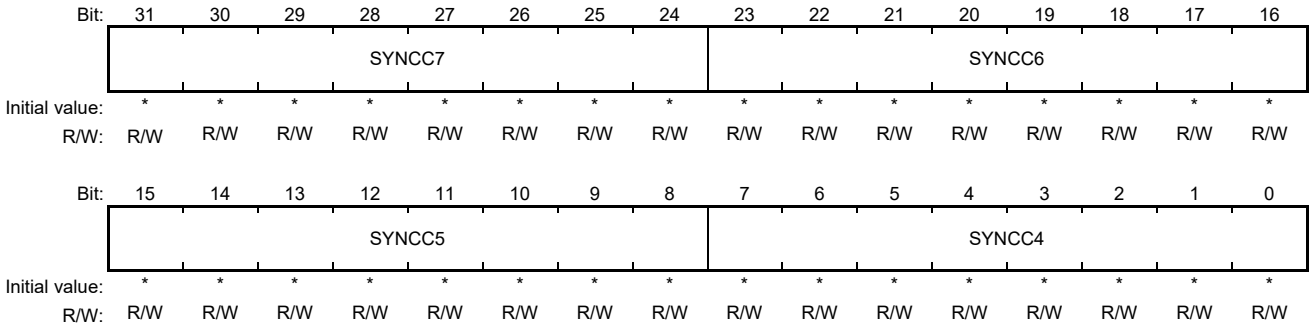


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SYNCC3	*	R/W	Specifies the module corresponding to bit 3 of the SYNCC enable field of the WUP and SLP instructions.
23 to 16	SYNCC2	*	R/W	Specifies the module corresponding to bit 2 of the SYNCC enable field of the WUP and SLP instructions.
15 to 8	SYNCC1	*	R/W	Specifies the module corresponding to bit 1 of the SYNCC enable field of the WUP and SLP instructions.
7 to 0	SYNCC0	*	R/W	Specifies the module corresponding to bit 0 of the SYNCC enable field of the WUP and SLP instructions.

Initial value is 0xFFFFFFFF.

56.2.68 Synchronization Control Register 1 (SYNCCR1)

This register specifies the module corresponding to bits 4 to 7 in the SYNCC enable field of the WUP and SLP instructions. Set the number for specifying the module in this register. See **Table 56.22** for the numbers for specifying the module. Do not set a number that is not listed in **Table 56.22**. Do not modify the setting of this register until the value of the TRA bit in SR become 1 and after 1 was written to the RS bit in CR.

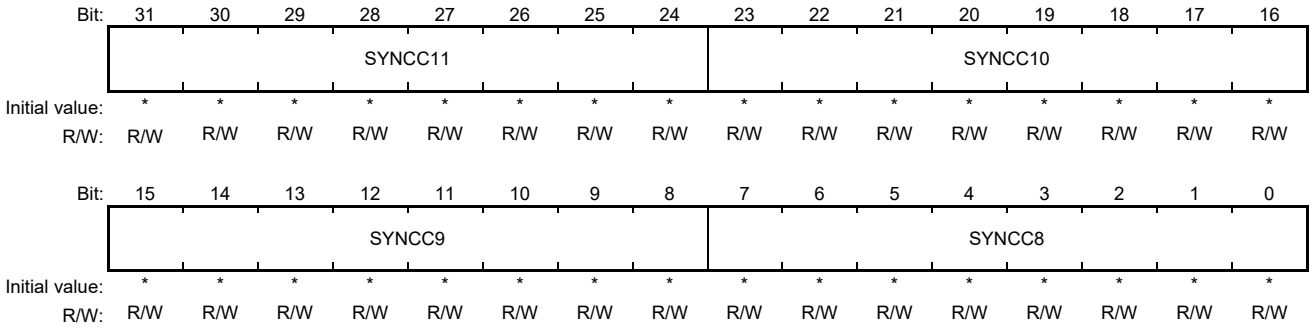


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SYNCC7	*	R/W	Specifies the module corresponding to bit 7 of the SYNCC enable field of the WUP and SLP instructions.
23 to 16	SYNCC6	*	R/W	Specifies the module corresponding to bit 6 of the SYNCC enable field of the WUP and SLP instructions.
15 to 8	SYNCC5	*	R/W	Specifies the module corresponding to bit 5 of the SYNCC enable field of the WUP and SLP instructions.
7 to 0	SYNCC4	*	R/W	Specifies the module corresponding to bit 4 of the SYNCC enable field of the WUP and SLP instructions.

Initial value is 0xFFFFFFFF.

56.2.69 Synchronization Control Register 2 (SYNCCR2)

This register specifies the module corresponding to bits 8 to 11 in the SYNCC enable field of the WUP and SLP instructions. Set the number for specifying the module in this register. See **Table 56.22** for the numbers for specifying the module. Do not set a number that is not listed in **Table 56.22**. Do not modify the setting of this register until the value of the TRA bit in SR become 1 and after 1 was written to the RS bit in CR.

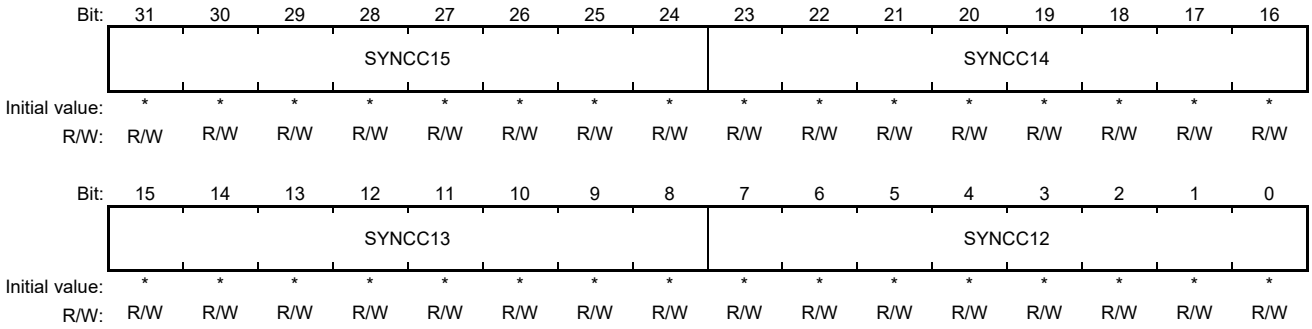


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SYNCC11	*	R/W	Specifies the module corresponding to bit 11 of the SYNCC enable field of the WUP and SLP instructions.
23 to 16	SYNCC10	*	R/W	Specifies the module corresponding to bit 10 of the SYNCC enable field of the WUP and SLP instructions.
15 to 8	SYNCC9	*	R/W	Specifies the module corresponding to bit 9 of the SYNCC enable field of the WUP and SLP instructions.
7 to 0	SYNCC8	*	R/W	Specifies the module corresponding to bit 8 of the SYNCC enable field of the WUP and SLP instructions.

Initial value is 0xFFFFFFFF.

56.2.70 Synchronization Control Register 3 (SYNCCR3)

This register specifies the module corresponding to bits 12 to 15 in the SYNCC enable field of the WUP and SLP instructions. Set the number for specifying the module in this register. See **Table 56.22** for the numbers for specifying the module. Do not set a number that is not listed in **Table 56.22**. Do not modify the setting of this register until the value of the TRA bit in SR become 1 and after 1 was written to the RS bit in CR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SYNCC15	*	R/W	Specifies the module corresponding to bit 15 of the SYNCC enable field of the WUP and SLP instructions.
23 to 16	SYNCC14	*	R/W	Specifies the module corresponding to bit 14of the SYNCC enable field of the WUP and SLP instructions.
15 to 8	SYNCC13	*	R/W	Specifies the module corresponding to bit 13 of the SYNCC enable field of the WUP and SLP instructions.
7 to 0	SYNCC12	*	R/W	Specifies the module corresponding to bit 12 of the SYNCC enable field of the WUP and SLP instructions.

56.2.71 Destination Cache Control Register (DCCR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
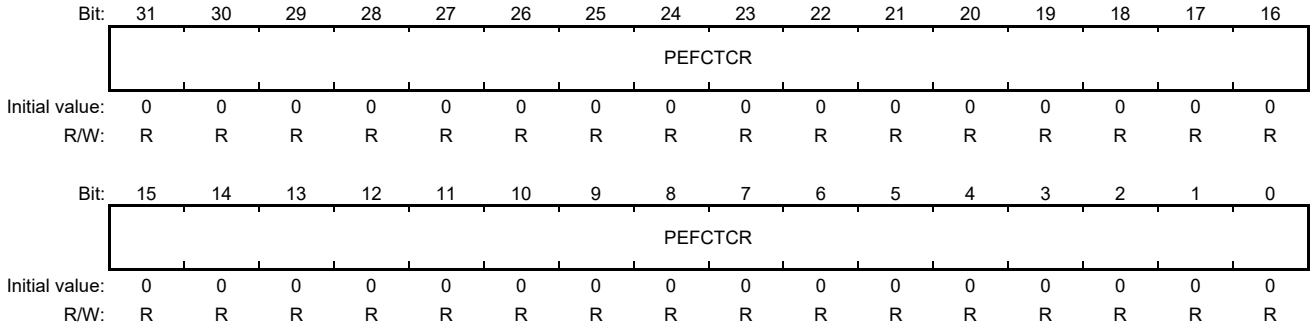
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Otherwise, the operation cannot be guaranteed.
1	CLR	0	R/W	Clear all the performance counter related registers.
0	EN	0	R/W	Enable all performance-counter-related registers. 0: Counting-up by the performance-counter-related registers is disabled. 1: Counting-up by the performance-counter-related registers is enabled.

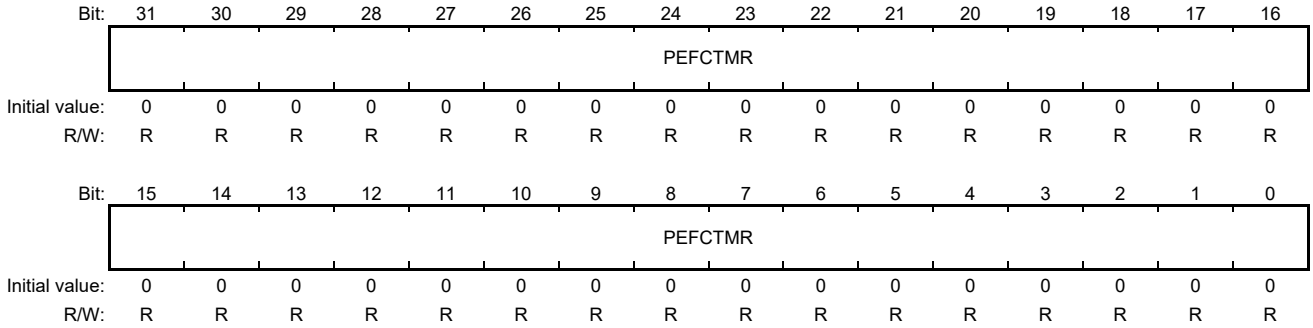
When changing the setting of this register by the DL, be sure to execute the SYNCM instruction before making the change

56.2.74 Total Cycle Count Register (PEFCTCR)



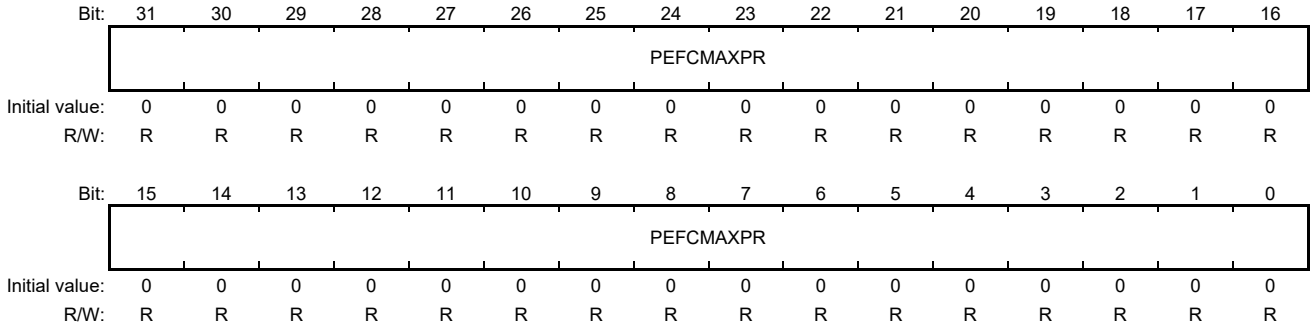
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCTCR	H'0000 0000	R	Performance counter to count the number of cycles when the setting of the EN bit of PEFCCR is 1. Performance counter to count the total number of cycles in rendering by this module.

56.2.75 Total Cache Miss Cycle Count Register (PEFCTMR)



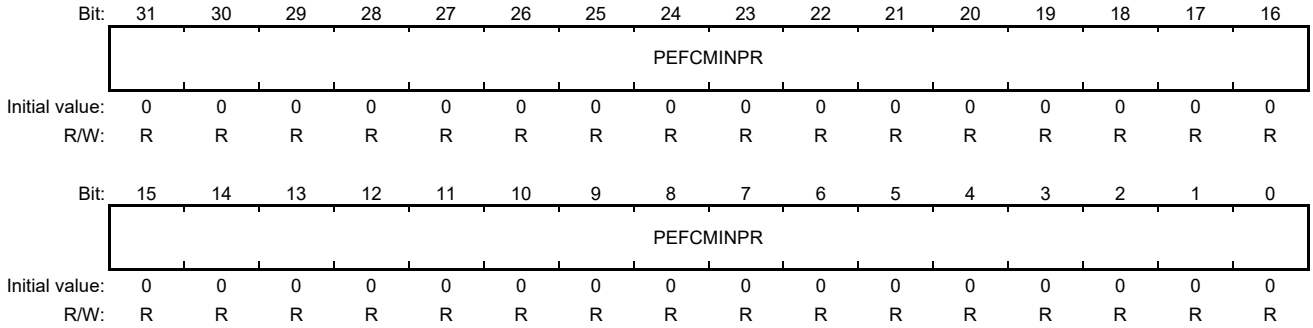
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCTMR	H'0000 0000	R	Performance counter to count the total number of cycles among those counted by PEFCTCR in which the cache is missed. This counter shows the number of cycles of stalling because the cache is missed.

56.2.76 Maximum Cache Miss Penalty Register (PEFCMAXPR)



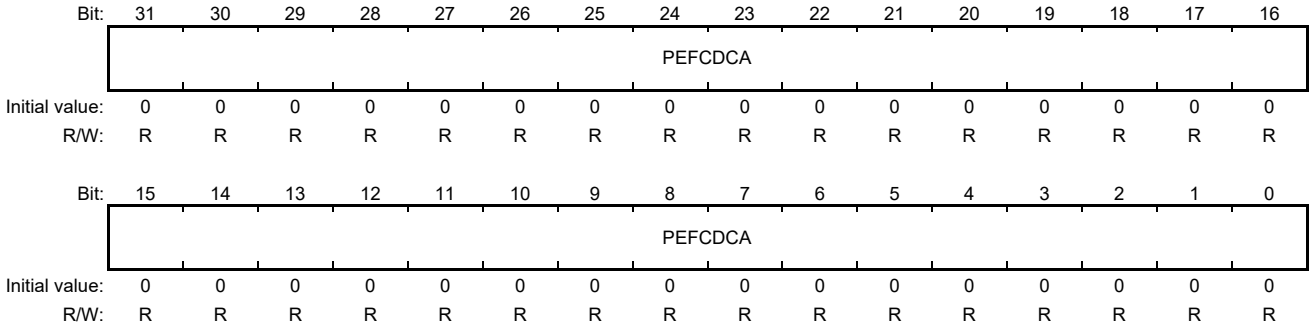
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCMAXPR	H'0000 0000	R	Performance counter to count the maximum number of cycles necessitated by a cache miss. This register does not show the correct value when the non-blocking cache mode is enabled.

56.2.77 Minimum Cache Miss Penalty Register (PEFCMINPR)



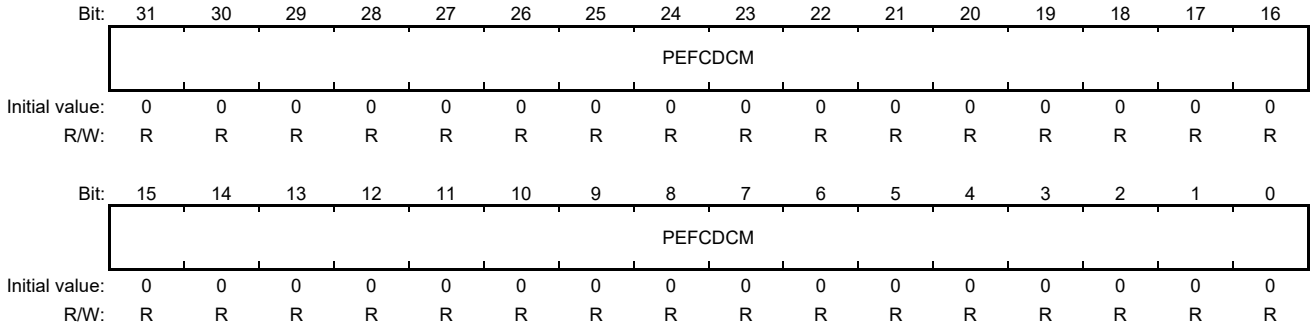
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCMINPR	H'0000 0000	R	Performance counter to count the minimum number of cycles necessitated by a cache miss. This register does not show the correct value when the non-blocking cache mode is enabled.

56.2.78 Number of Destination Cache Access Register (PEFCDCAR)



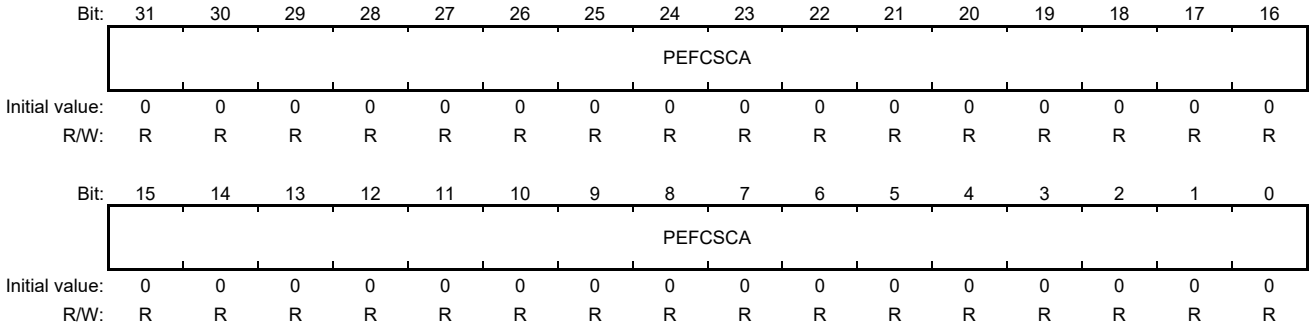
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCDCA	H'0000 0000	R	Performance counter to count the number of times the destination cache is accessed. This register does not show the correct value when the non-blocking cache mode is enabled.

56.2.79 Number of Destination Cache Miss Register (PEFCDCMR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCDCM	H'0000 0000	R	Performance counter to count the number of times the destination cache is missed. This register does not show the correct value when the non-blocking cache mode is enabled.

56.2.80 Number of Source Cache Access Register (PEFCSCAR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCSCA	H'0000 0000	R	Performance counter to count the number of times the source cache is accessed. This register does not show the correct value when the non-blocking cache mode is enabled.

56.2.81 Number of Source Cache Miss Register (PEFCSCMR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEFCSCM															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEFCSCM															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEFCSCM	H'0000 0000	R	Performance counter to count the number of times the source cache is missed. This register does not show the correct value when the non-blocking cache mode is enabled.

56.3 Operation

56.3.1 Triangle Drawing

According to the destination (DST) vertex coordinates and source (SRC) vertex coordinates given by the DL, a triangle is drawn in DST using the SRC texture.

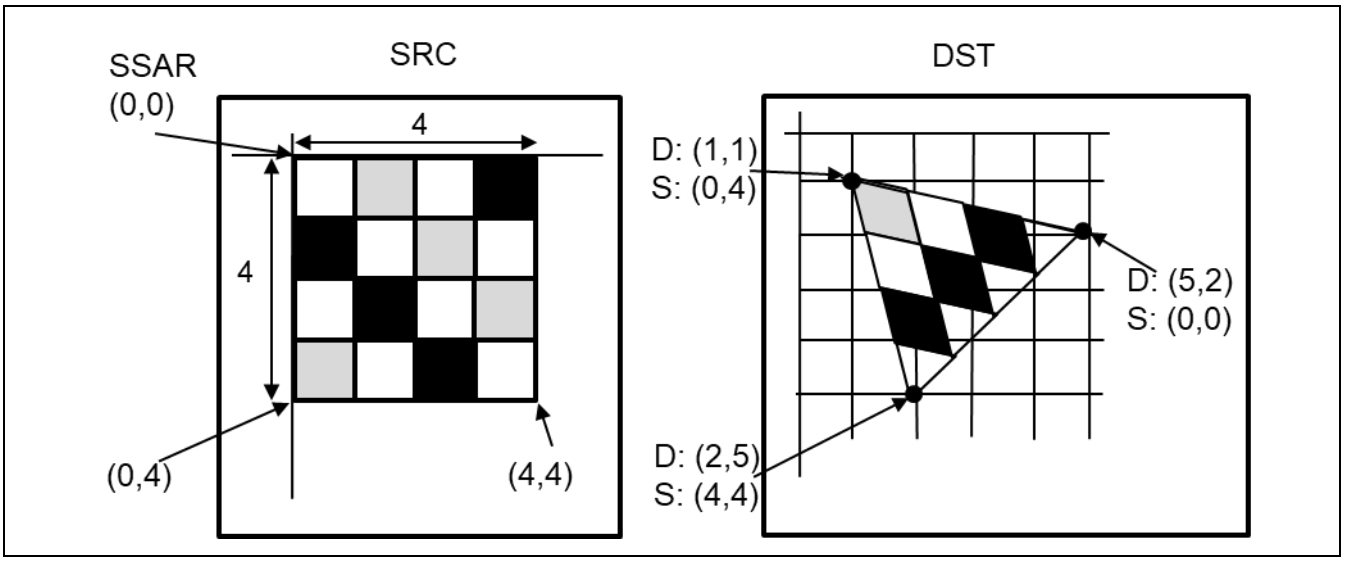


Figure 56.2 Drawing with Texture Mapping

For drawing, the DL is used to specify the (X, Y) coordinates in the DST area and the corresponding (u, v) coordinates in the SRC area of the desired triangle. Figure 56.2 shows an example in which a triangle is drawn in the DST area such that X, Y coordinates of its vertexes are (1, 1), (5, 2), and (2, 5) with texture mapping defined by uv coordinates (0, 4), (0, 0), and (4, 4). Specify the destination coordinates X and Y in an

integer or a fixed-point number (lower 2 bits) according to the mode set by the DDP bit in UVDPOR. Specify source coordinates (u, v) with the precision by the UVDPO bits in UVDPOR.

When the SRC coordinates exceed the values given by the source width SUSR and source height SVSR, SUSR and SVSR are replacing these values.

The size of the circumscribed rectangle of a triangle must be less than 128 pixels for both X-direction and Y-direction.

For setting coordinates to the DL, refer to section 56.5, Display List.

(1) N-Vertex Strip

Vertex data can be shared by multiple triangles to draw strip-type triangles, thus saving DL capacity and improving performance.

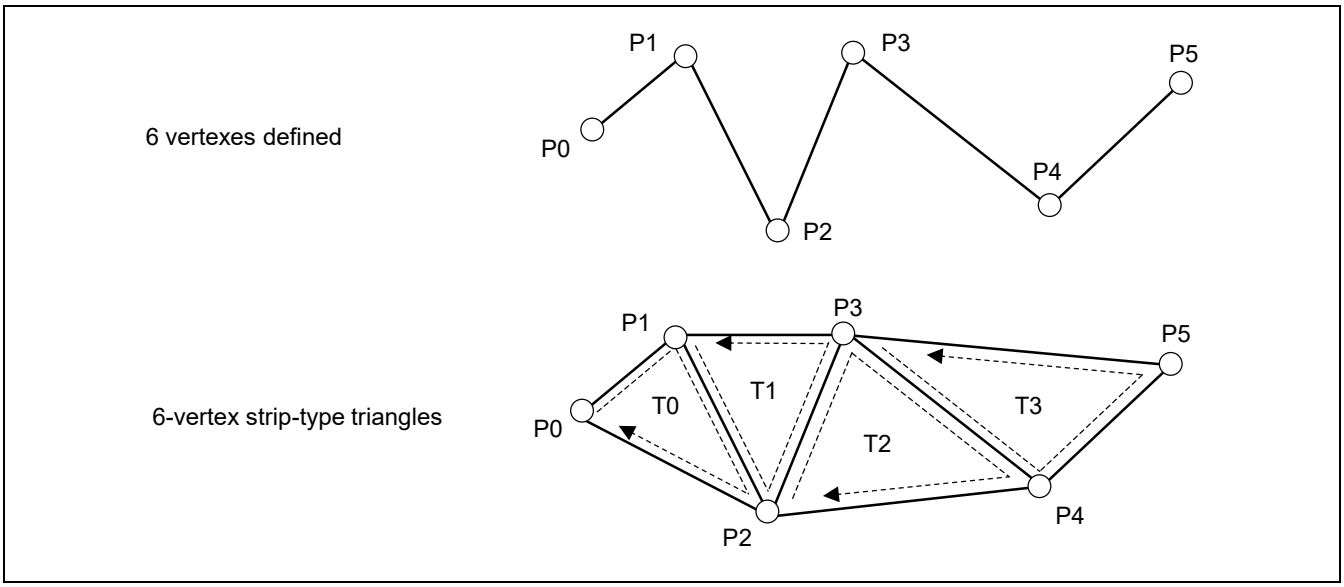

Figure 56.3 N-Vertex Strip

Figure 56.3 shows an example of 6-vertex triangles. First, triangle T0 is drawn using the first three vertexes P0, P1, and P2, and then triangle T1 is drawn using the last two vertexes P1 and P2 of triangle T0 and the next vertex P3. Similarly, the next triangle is drawn using the last two vertexes of the preceding triangle and the next vertex. This process is repeated until the strip is completed.

(2) Clockwise

Drawing is performed only if the order of the first three vertexes of a strip-type triangle matches the order that is specified by the TCM bit in the triangle mode register. If there is no match, the strip-type triangle will not be drawn. In the example given in Figure 56.3, since the order of vertexes of the triangle composed of P0, P1, and P2 is clockwise, the strip-type triangle composed of P0 to P5 will be drawn only when the TCM bit in the triangle mode register is 1.

(3) Rule to Prevent Duplicate Drawing

This module applies the rule described below to prevent duplicate drawing of the pixels for a side shared by the adjacent triangles when drawing triangles. For this reason, some pixels which exist in response to the specified vertex coordinates of triangles may not be drawn if they are for sides.

If either of the two conditions below is met and the vector passes through the corresponding pixel grid (the fractional part in the X and Y coordinates is 0), the pixels will not be drawn.
In case that a triangle is handled as three clockwise vectors, there are the following two conditions:
(a) Component y of the vector is positive.
(b) Component y of the vector is 0 and component x is negative.
In case that a triangle is handled as three counter-clockwise vectors, there are the following two conditions:
(a) Component y of the vector is negative.
(b) Component y of the vector is 0 and component x is positive.
An example is given in the figure below. For the sides indicated by the solid lines, the pixels will be drawn even if the corresponding vector passes through the pixel grid. For the sides indicated by the broken lines, the pixels will not be drawn if the corresponding vector passes through the pixel grid. As result, the pixels with a cross on the pixel grid will be drawn.

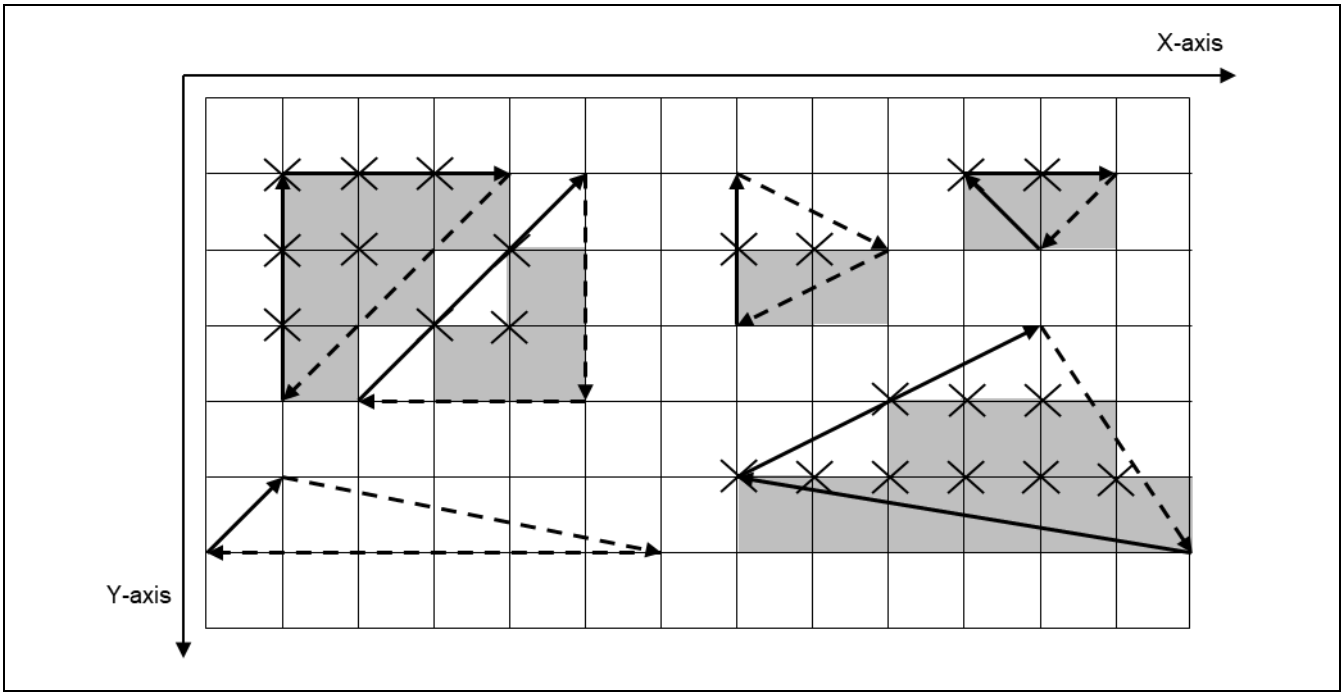

Figure 56.4 Example of Rule to Prevent Duplicate Drawing

The figure below shows an example of using the automatic vertex generation function to draw contiguous triangles with the origins located at coordinates (1, 1) and (1, 4) and the two 3 x 3 meshes used. Each of the triangles has pixels that are not drawn because of this rule. If two triangles are adjacent to each other, the shared side will be drawn on the either of the two sides, so no required pixels are missed. However, since there are no adjacent triangles at the right and bottom edges in this example, the pixels (points indicated by the broken circles) will not be drawn because of this rule.

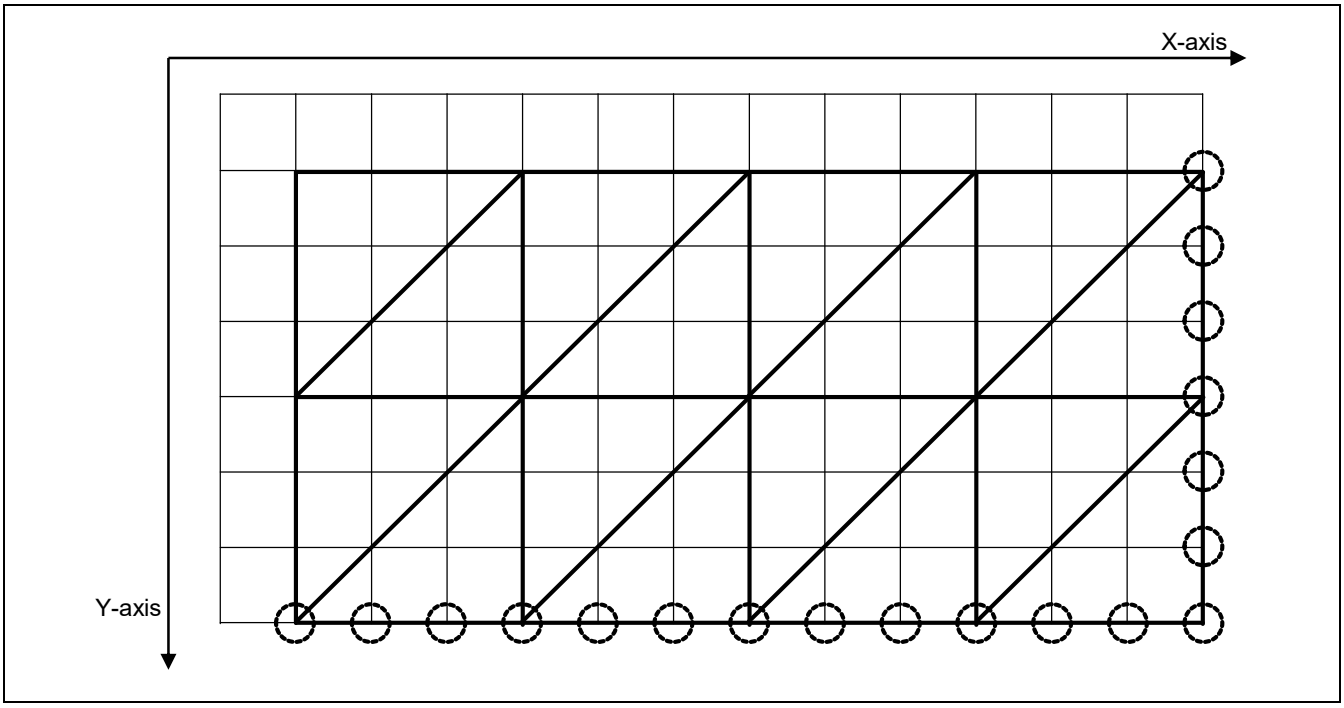

Figure 56.5 Example of Drawing Contiguous Triangles

56.3.2 Coordinate Space

The size of the DST drawing coordinate space is 2,048 x 2,048, in which $0 \leq X \leq 2,048$ and $0 \leq Y \leq 2,048$. An object (triangle) specified with the DL is actually drawn only when it is in the clipping area defined by the MIN and MAX clipping X and Y registers in the drawing coordinate space. In the DL, vertex coordinates can be specified with signed 16 bits if the destination coordinates are in integer, or with a signed fixed-point number (where the lower 2 bits are below the decimal point) if the destination coordinates are in sub-pixels.

The size of the SRC drawing coordinate space is $0 \leq u < 2,048$ and $0 \leq v < 2,048$. The (u, v) values should always be specified in the SRC coordinate space. Note that negative values cannot be used for u or v. If used, operation will be undefined.

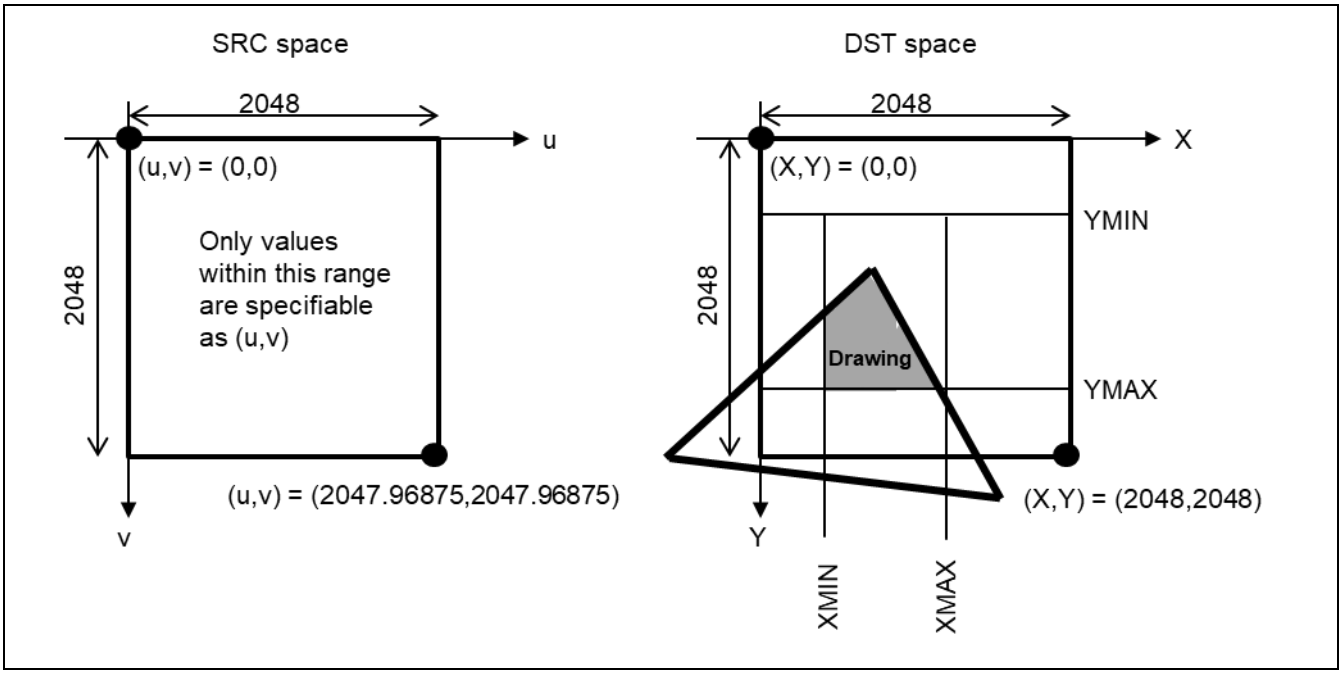

Figure 56.6 Coordinate Space

56.3.3 Automatic Coordinate Generation

When either SRC or DST is a rectangular mesh and the mesh widths (X and Y directions) are set, either SRC or DST coordinates can automatically be generated using the internal counter. According to the mesh width settings, N-vertex triangle strip coordinates are internally generated.Mesh position and size can be specified with registers AMXSR, AMYSR, AMXOR, and AMYOR. Automatic coordinate generation will be available when the AUTOSG and AUTODG bits in the triangle mode register are set to 1 as required.

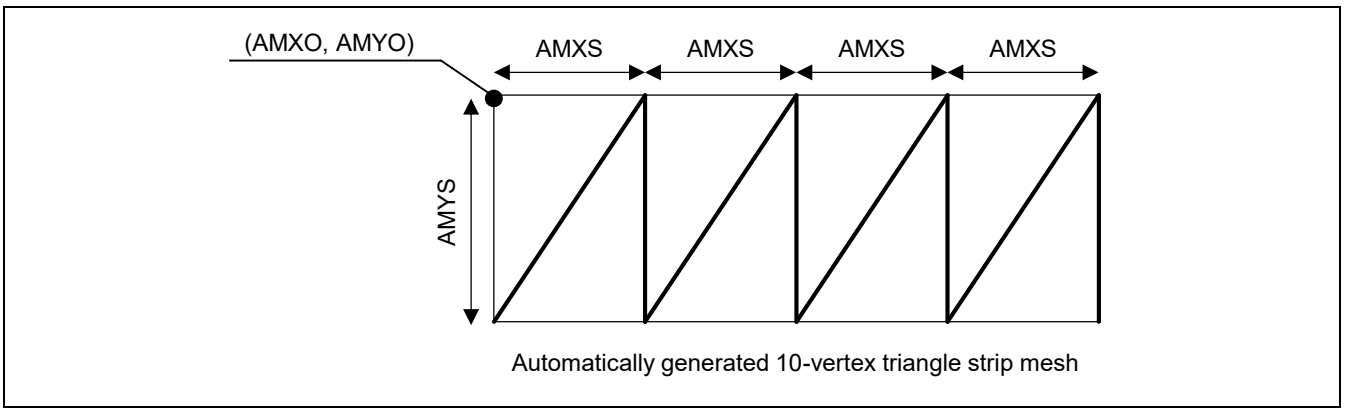

Figure 56.7 Automatic Coordinate Generation

The maximum value of coordinates that can be generated is 2,047 if the destination coordinates are in destination sub-pixel mode (i.e. the DDP bit in UVDPOR is 1) and it is 8,191 if not in destination sub-pixel mode. The source coordinate is 2,047/(2^(UVDPO value in UVDPOR)).

56.3.4 Adding offset to coordinate

It is possible to add offset to the X/Y and u/v coordinates automatically generated or specified by DL. Therefore, it is feasible to parallel shift the triangular mesh in X/Y or u/v space.

Specify the offset to X/Y coordinates using XYOFSR register. Specify the offset to u/v coordinates using UVOFSR register. Note that X/Y and u/v coordinate specified in Figure 56.6 are the coordinates after the addition of the offset set in XYOFSR register and UVOFSR register. Therefore, user need to set the offset XYOFSR register and UVOFSR register so that XY coordinates after addition are not exceed the maximum of X/Y (signed 16bit values) and u/v coordinates before and after the addition are not exceed u/v ($0 \leq u < 2{,}048$ and $0 \leq v < 2{,}048$) specified in Figure 56.6.

$X = X' + XOFS$

$Y = Y' + YOFS$

$u = u' + UOFS$

$v = v' + VOFS$

Where X', Y', u', and v' are the coordinates that are specified by DL or generated by Automatic Coordinate Generation.

The value space of XOFS and YOFS are determined by DDP bit in the UVDPOR register.

DDP bit = 0: $-2048 \leq XOFS/YOFS \leq 2047$

DDP bit = 1: $-512.00 \leq XOFS/YOFS \leq 511.75$

The value space of UOFS and VOFS are from $-1024 \leq UOFS/VOFS < 1024$.

If the lower bits of X/Y coordinates or u/v coordinates in UVDPOR register are set as fractional part, the same number of lower bits of the offset will also be set as fractional part.

Note: In case of using Rotation and scaling-down, X, Y, u and v coordinate after addition of XOFS/YOFS and UOFS/VOFS are used in Sub-divided area.

56.3.5 Bilinear Filtering

In texture mapping by the TRI instruction, when the calculated Y (luminance) coordinates are not integers, the color data of Y is defined by linearly interpolating (bilinear filtering) the four pixels nearby. Bilinear filtering will be unavailable when the BFE bit in the triangle mode register (TRIMR) is set to 0; in this case, the decimal parts of the uv coordinates are omitted and the integer parts alone are used.

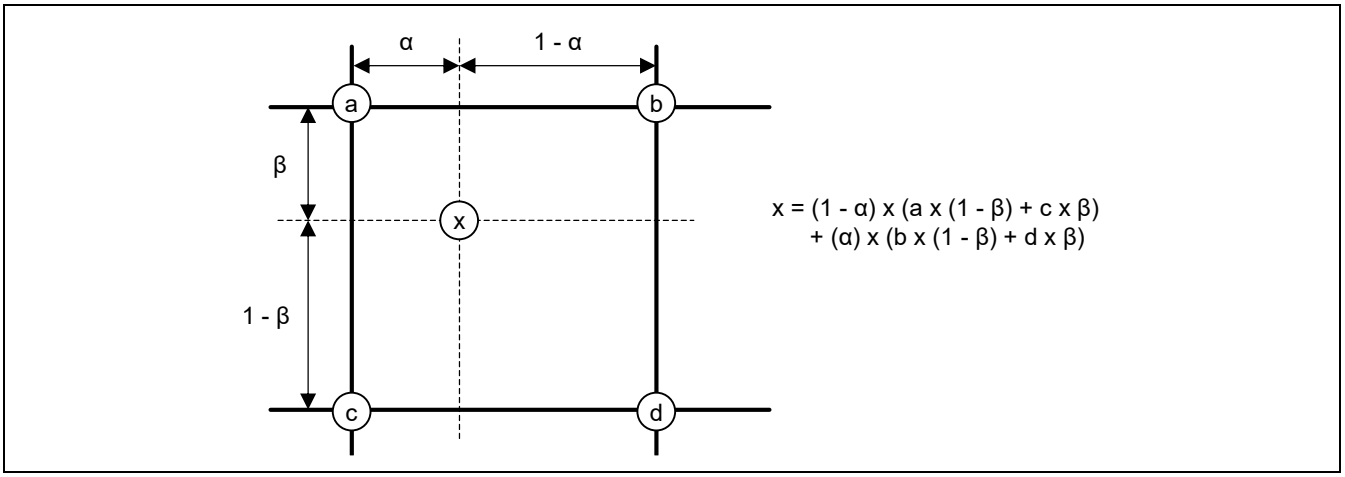

Figure 56.8 Bilinear Filtering for Y (Luminance)

When the UV (color difference) coordinates are not integers, a special bilinear filtering for UV is used. Specifically, for drawing the even-number data (U) of the color difference in the destination, U is defined by linearly interpolating the four even-number data nearby in the source, whereas for drawing the odd-number data (V) of the color difference, V is defined by linearly interpolating the four odd-number data nearby in the source.

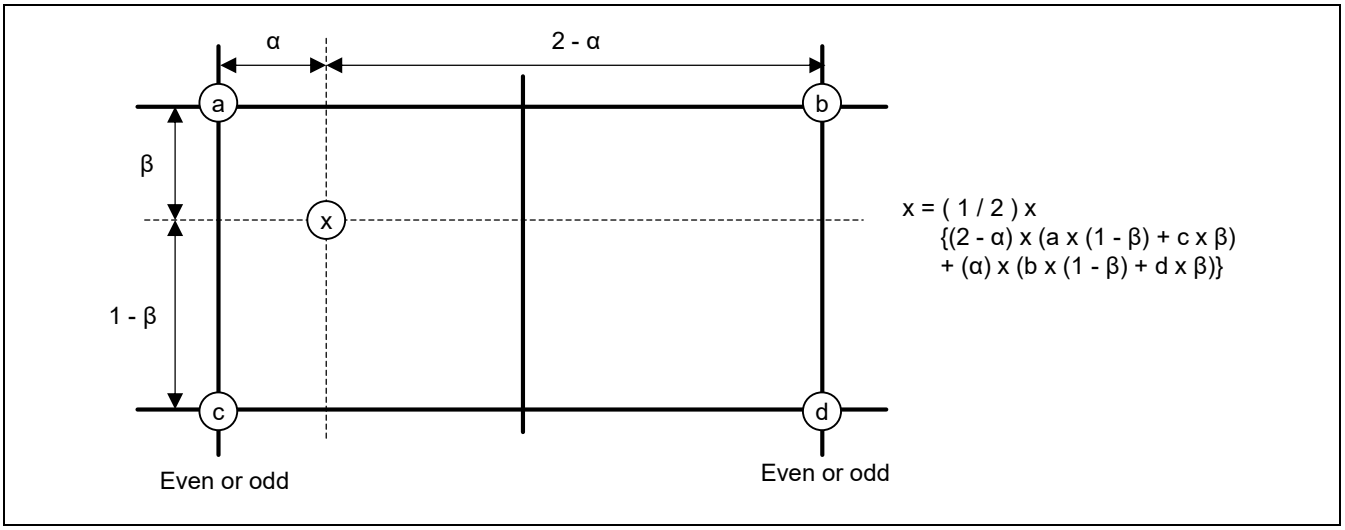

Figure 56.9 Bilinear Filtering for UV (Color Difference)

56.3.6 Data Location in Memory

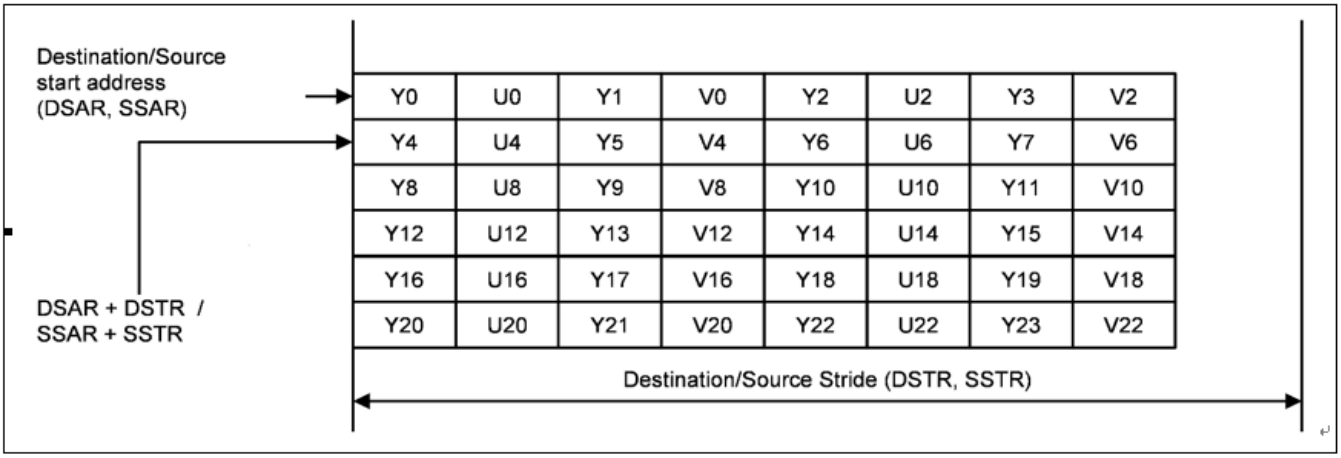

Figure 56.10 Allocation of YUV Data to Memory (YUV422 Interleaved)

In interleaved mode, the YUV data after the drawing are laid out as U data, V data, and Y data, in that order. The vertical orientation on the screen is governed by the memory stride (destination stride) which is used to handle the data in the memory two-dimensionally. On the screen, the pixels below a line are assigned to the addresses that are the original addresses plus the stride. The YUV data are handled in units of 16 bits or 32 bits, each being a combination of Y and U/V values. When using interleaved mode, use the YUV422E bit in CMRCR2. When interchanging Y and U/V, use the YCFORM bit in TRICR for the destination data and YUV422FORM bit in CMRCR2 for the source data. After the replacement, the data will be laid out as shown in the figure below:

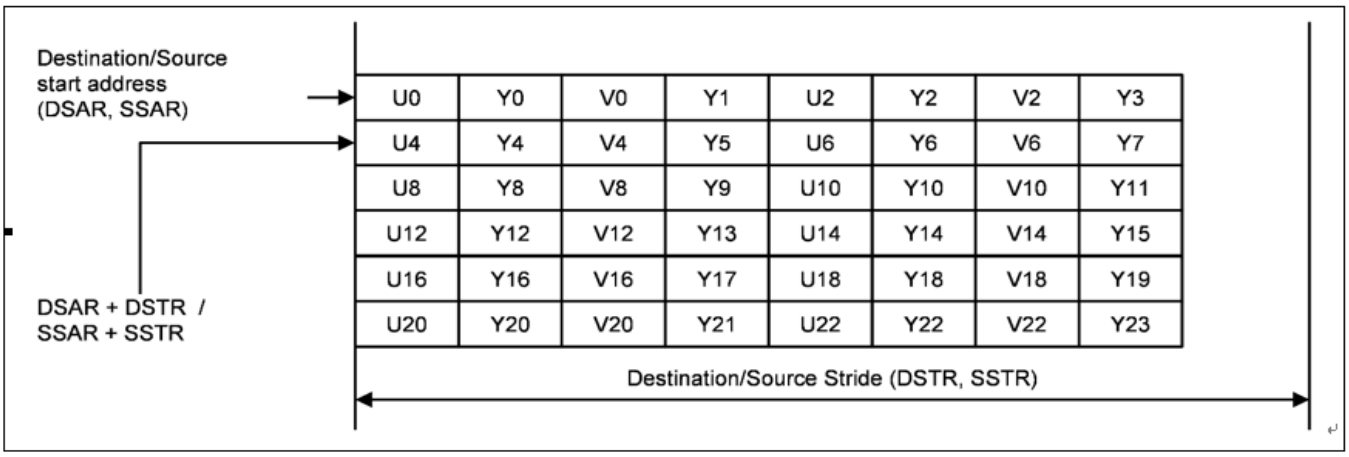

Figure 56.11 Allocation of YUV Data to Memory (Interleaved Output, YCFORM = 1 or Interleaved Input, YUV422FORM = 1)

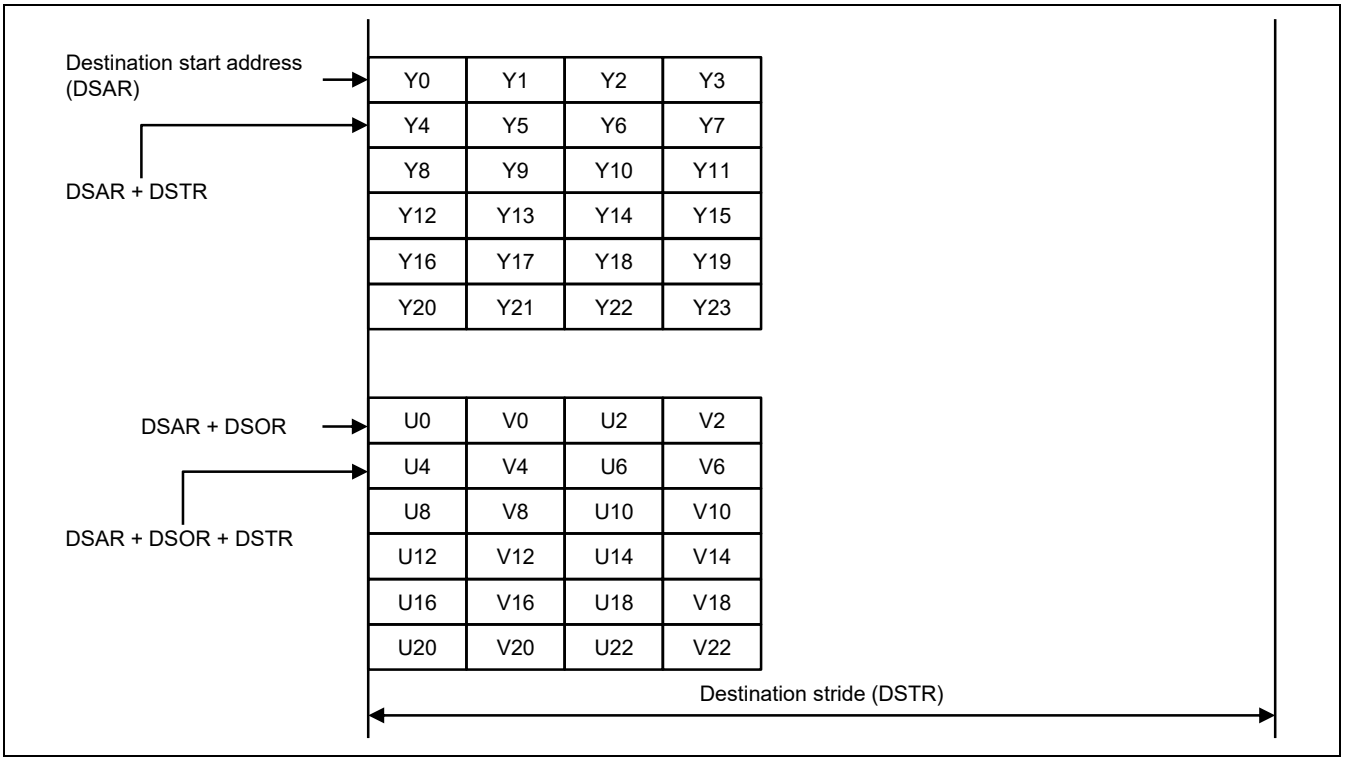

Figure 56.12 Allocation of YUV Data in Memory (Separate Output)

In the case of separate output of YUV422 data, the Y and UV data are assigned to separate areas. The address where the Y data start, as in the case of interleaved output, is specified in the DSAR register.

The size of the Y values is 8 bits if the Y data are 8 bpp; 16 bits (flush to the LSB; the 6 upper bits are 0) if the Y data are 10 bpp; 16 bits (flush to the LSB; the 4 upper bits are 0) if the Y data are 12 bpp; 16 bits (flush to the LSB; the 2 upper bits are 0) if the Y data are 14 bpp; and 16 bits if the Y data are 16 bpp.

The size of both the U and V values is 8 bits if the UV data are 8 bpp; 16 bits (flush to the LSB; the upper 6 bits are 0) if the UV data are 10 bpp; 16 bits (flush to the LSB; the upper 4 bits are 0) if the UV data are 12 bpp; 16 bits (flush to the LSB; the upper 2 bits are 0) if the UV data are 14 bpp; and 16 bits if the UV data are 16 bpp.

The address where the UV data start is the address specified in DSOR added to the start address of the Y data specified in DSAR. The stride is common to both cases, and is specified in DSTR. Set YISM bit in CMRCR to use the separate output mode.

In the case of Y exclusive mode, assignment is in the same manner as the Y data for separate output. In the case of U/V exclusive mode, assignment is in the same manner as the UV data for separate output with DSOR==0. To use the Y or U/V exclusive mode, clear the YUV422E bit in CMRCR2. Also, clear the YCM bit in CMRCR for Y exclusive mode, and set the bit for U/V exclusive mode.

Tile Addressing Mode

This module supports not only linear addressing where the two-dimensional image data are arranged like raster in memory but also a tile addressing mode where the data are arranged like tile.

In tile addressing mode, continuous memory addresses are interleaved with data for multiple Y coordinates, thus improving the cache-hit ratio for vertical access to the image data (e.g., for rotation of an image) and also improving processing performance.

In tile addressing mode, the data are stored with the Y coordinate incremented in 16-byte units within 64-byte sections. An example where 8bpp Y data are exclusively output is shown below. (x, y) in the figure below indicate the x and y coordinates of pixels.

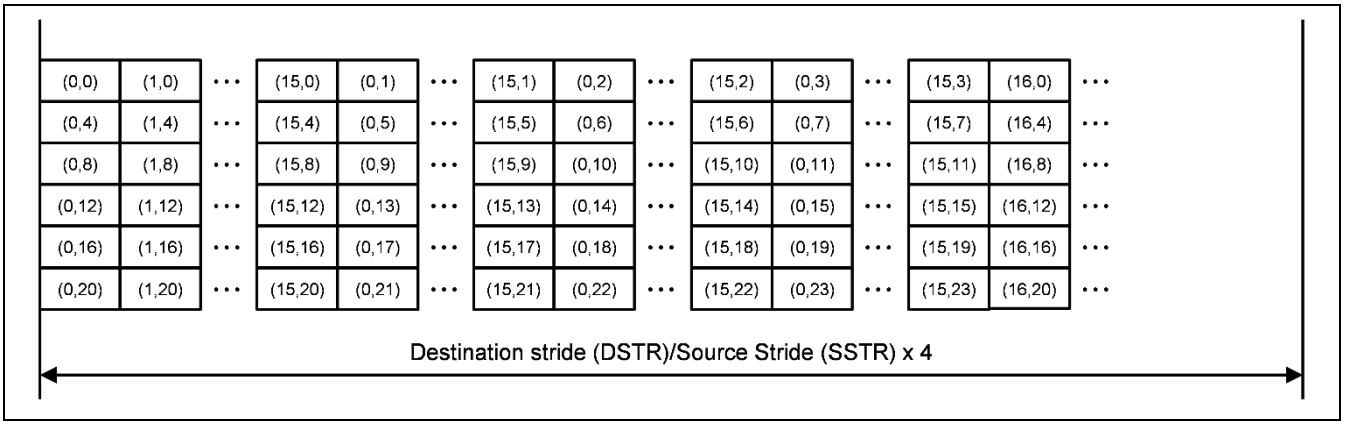

Figure 56.13 Data in Memory in Tile addressing mode (Y Exclusive, 8 bpp)

The tile addressing mode can be set up individually for source and destination images. To set up the tile addressing mode for the source image, set the TCTE bit in CMRCR2 to 1. To set up the tile addressing mode for the destination image, set the DCTE bit in CMRCR2 to 1.

To set the stride in tile addressing mode, set the corresponding bits in DSTR, SSTR, and SSTRn to a value equal to one quarter of the actual memory stride.

56.3.7 Supported data format and data location in Memory

This module supports YUV422 format and YUV420 format for the input/output image. Besides, each format supports interleaved format and semi-planar format. It is also possible to process only the Y plane or only the UV plane. The combinations of the supported formats and the relevant register settings are shown below. The combinations other than following table are prohibited.

Table 56.13 Combinations of the supported input/output format and the relevant register settings

Input Format	Output Format	CMRCR2			CMRCR				
		YUV422E	YUVSEMI	UVC	YISM	UVS	YCM	YOM	When EFPE=1, following bits of TRIMR register are use.
YUV422 Interleave*2	YUV422 Interleave	1	0	0	0	0	0	0	SHFE/SHFVAL*1 Both Y and UV shift
	YUV422 Semi-planar	1	0	0	1	0	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
	Y Plane Only	1	0	0	1	0	0	1	SHFE/SHFVAL*1 Y-only shift
YUV422 Semi-planar*2	YUV422 Interleave	0	1	0	0	0	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
	YUV422 Semi-planar	0	1	0	1	0	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
	YUV420 Semi-planar*4	0	1	1	1	0	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
YUV420 Semi-planar*2	YUV422 Interleave*5	0	1	1	0	1	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
	YUV422 Semi-planar*5	0	1	1	1	1	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
	YUV420 Semi-planar *6	0	1	0	1	1	0	0	SHFE/SHFVAL UVSHFE/UVSHFVAL
Y Plane Only (Semi-planar format)	Y Plane Only*3 (Semi-planar format)	0	0	0	0	0	0	0	SHFE/SHFVAL*1 Y-only shift
UV Plane Only (YUV422 Semi-planar format)	UV Plane Only*3 (YUV422 Semi-planar format)	0	0	0	0	0	1	0	SHFE/SHFVAL*1 UV-only shift
	UV Plane Only*3 *4 (YUV420 Semi-planar format)	0	0	1	0	0	1	0	SHFE/SHFVAL*1 UV-only shift
UV Plane Only (YUV420 Semi-planar format)	UV Plane Only*3 *5 (YUV422 Semi-planar format)	0	0	1	0	1	1	0	SHFE/SHFVAL*1 UV-only shift
	UV Plane Only*3 *7 (YUV420 Semi-planar format)	0	0	0	0	1	1	0	SHFE/SHFVAL*1 UV-only shift

Notes: 1. Set UVSHFE=0 and UVSHFVAL=0 when not using these bits.

2. Set RSCR.RSE=0 when using these formats. These formats read Y data and UV data simultaneously.

3. These output from the IMR-LX6 basic function block are input to Rotator & Scaler extension when RSCR.RSE = 1.

4. For these IMR basic block's outputs, IMR-LX6 hardware automatically change the output Y-coordinate to half (1/2) of the input Y-coordinate for UV plane.

5. For these IMR basic block's outputs, IMR-LX6 hardware automatically change the output v-coordinate to half (1/2) of the input v-coordinate for UV plane.

6. For these IMR basic block's outputs, IMR-LX6 hardware automatically change the output Y- and v-coordinates to half (1/2) of the input Y-and v-coordinates for UV plane.

7. For these IMR basic block's outputs, IMR-LX6 hardware automatically change the output Y- and v-coordinates to half (1/2) of the input Y-and v-coordinates for UV plane. For the Rotator & Scaler extension, when processing uv420 plane only with UVS=1, from the sub-divided area of 4 rows, only 2 rows from the top can be output as described in Figure 56.40. Therefore, the output data in one line corresponds to the image of two pixels in vertical direction. User needs to double the Y and v coordinate for the original UV420 data and destination to generate the coordinates for the TRI command. IMR-LX6 hardware automatically halves the Y and v coordinates when outputting to Rotator & Scaler function, so drawing 128x128 or 64x128 pixels writes to one sub-divided area 128 x 64 or 64 x 64 units.

The supported bit depth and the relevant settings are as below. Any operations performed using settings other than those listed in this table cannot be guaranteed. If the bit depth is 8bpp, the data will be stored in 1-byte unit, otherwise, it will be stored in 2-byte unit with bottom alignment. For example, if the bit depth is 12bpp, the upper 4-bits of 2-byte data are always 0.

There may be restrictions regarding the combinations of bit depth of Y plane and UV plane, so please refer to the detailed description of each format.

Table 56.14 Supported bit depth and the relevant register settings (Y plane, input)

Bit depth (Y plane)	CMRCR		
	SY1416	SY12	SY10
8bpp	00	0	0
10bpp	00	0	1
12bpp	00	1	0
14bpp*1	10	0	0
16bpp*1	11	0	0

Note: *1 This bit depth setting is supported only when using the extended filtering pipeline.

Table 56.15 Supported bit depth and the relevant register settings (UV plane, input)

Bit depth (UV plane)	CMRCR	
	SUV1416	SUV
8bpp	00	00
10bpp	00	01
12bpp	00	10
14bpp*1	10	00
16bpp*1	11	00

Note: *1 This bit depth setting is supported only when using the extended filtering pipeline.

Table 56.16 Supported bit depth and the relevant register settings (Y plane, output)

Bit depth (Y plane)	CMRCR		
	DY1416	Y12	Y10
8bpp	00	0	0
10bpp	00	0	1
12bpp	00	1	0
14bpp*1	10	0	0
16bpp*1	11	0	0

Note: *1 This bit depth setting is supported only when using the extended filtering pipeline.

Table 56.17 Supported bit depth and the relevant register settings (UV plane, output)

Bit depth (UV plane)	CMRCR	
	DUV1416	DUV
8bpp	00	00
10bpp	00	01
12bpp	00	10
14bpp*1	10	00
16bpp*1	11	00

Note: *1 This bit depth setting is supported only when using the extended filtering pipeline.

The details of each format and the memory allocation in Linear Addressing Mode are described below. Tile Addressing Mode will also be described at the last part of the section.

56.3.7.1 YUV422 Interleaved format

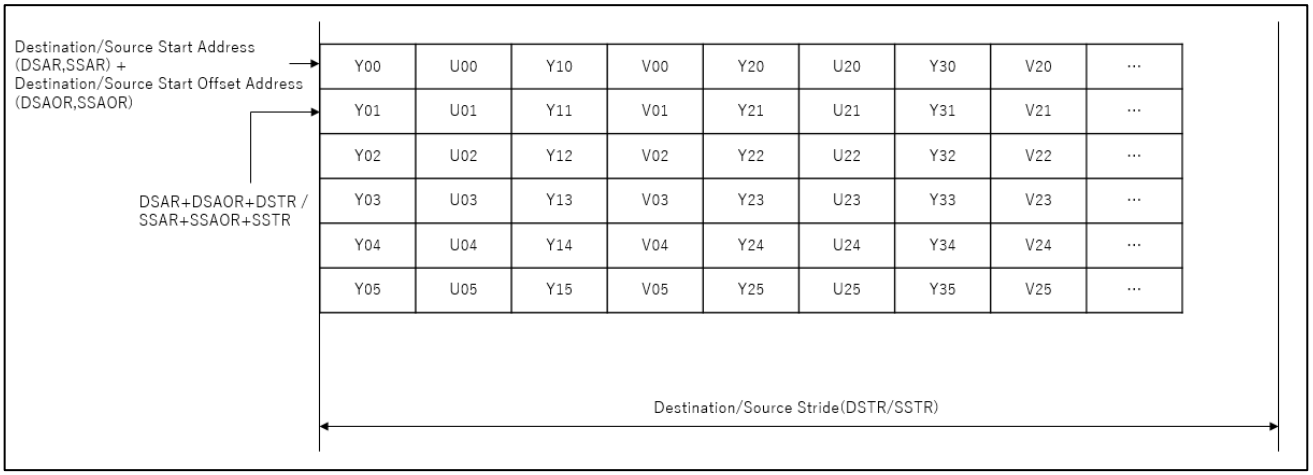

Figure 56.14 Allocation of YUV Data to Memory (YUV422 Interleaved Output, YCFORM = 0 or YUV422 Interleaved Input, YUV422FORM = 0)

In YUV422 Interleaved format, YUV data is arranged in the memory in the order of Y data, U data, Y data, and V data. The vertical direction on the screen follows the memory stride used to handle memory data in two-dimension state. The pixels one line below on the screen are placed at the stride-added address. The YUV data is handled in 16-bit and 32-bit unit for Y and U/V respectively.

The start address from which input data is read is obtained by adding SSAR and SSAOR. Also, the start address to which output data is written is obtained by adding DSAR and DSAOR. Memory stride is set using SSTR for input data and DSTR for output data.

If the order of Y and U/V is changed, use the YCFORM bit of TRICR register for output and the YUV422FORM bit of CMRCR2 for input. Memory allocation in this case is shown in the figure below.

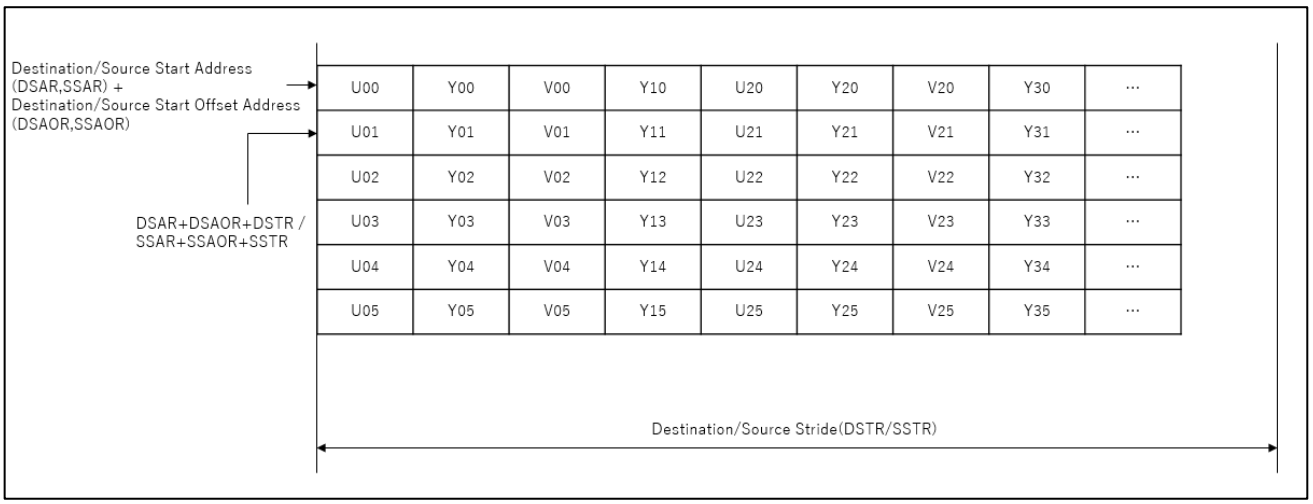

Figure 56.15 Allocation of YUV Data to Memory (YUV422 Interleaved Output, YCFORM = 1 or YUV422Interleaved Input, YUV422FORM = 1)

To change the order of the input U and V, set UVFORM bit of CMRCR2 to 1. The order of the output U and V cannot be changed. The order of the output follows the order changed according to the setting of UVFORM of CMRCR2.

For YUV422 Interleaved format, the bit depth (bpp) of Y plane and UV plane should be the same for input or output. Otherwise, the operation cannot be guaranteed.

56.3.7.2 YUV422 Semi-planar format

For YUV422 Semi-planar format, the YUV data has the Y plane and the UV plane placed separately in the memory. The UV plane is placed in the memory in the order of U data, V data, U data, and V data. The vertical direction on the screen follows the memory stride used to handle memory data in two-dimension state. The pixels one line below on the screen are placed at the stride-added address. The Y/UV data is handled in 8-bit or 16-bit unit.

For the YUV422 Semi-planar format for input or output, set the Y plane bit depth (bpp) greater than or equal to the UV plane bit depth. Otherwise, the operation cannot be guaranteed.

Create the vertex data on DL based on Y plane for both the input and output data.

(1) Input data

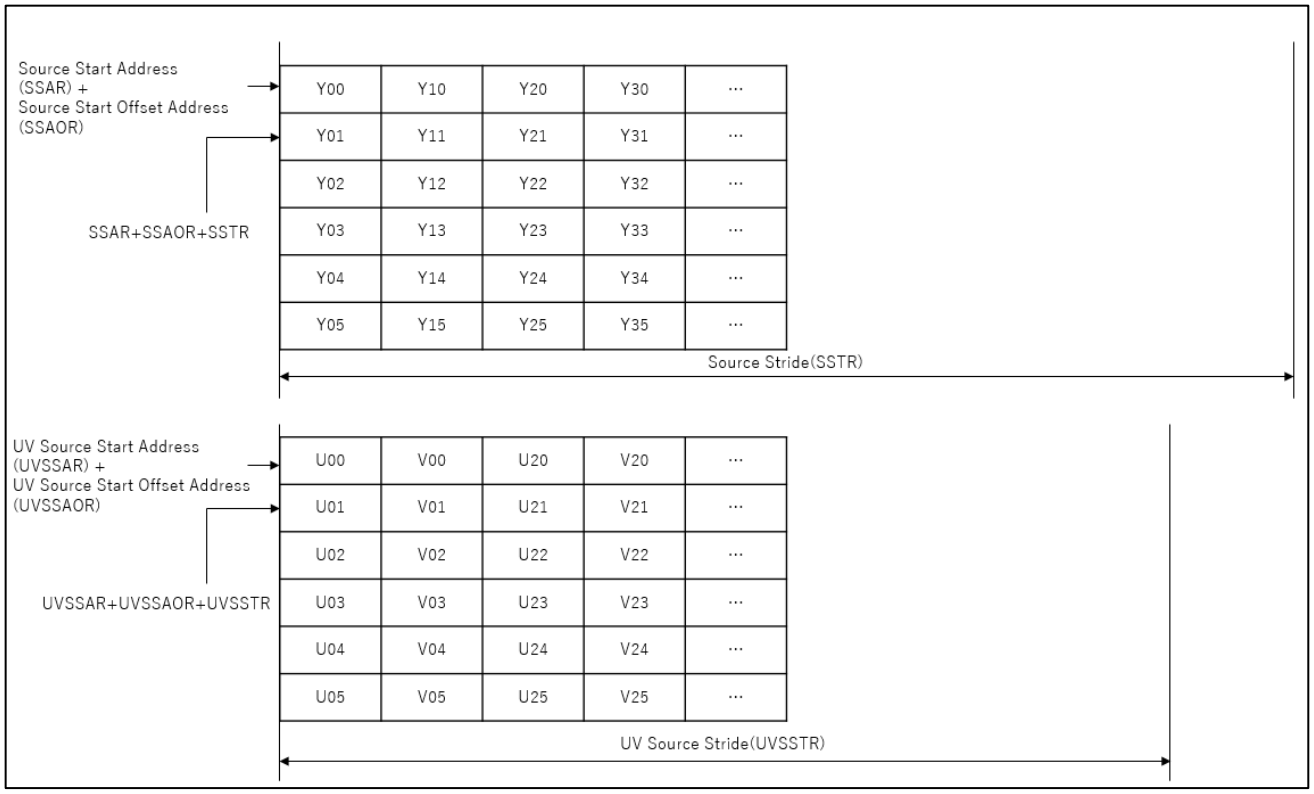

Figure 56.16 Allocation of YUV Data to Memory (YUV422 Semi-planar, Input)

The figure above shows the memory allocation of the input in YUV422 Semi-planar format. The start address from which the input data is read is obtained by adding SSAR and SSAOR for Y plane, and is obtained by adding UVSSAR and UVSSAOR for UV plane. The memory stride is set using SSTR for Y plane and UVSSTR for UV plane.

To change the order of the input U and V, set UVFORM of CMRCR2 to 1.

(2) Output data

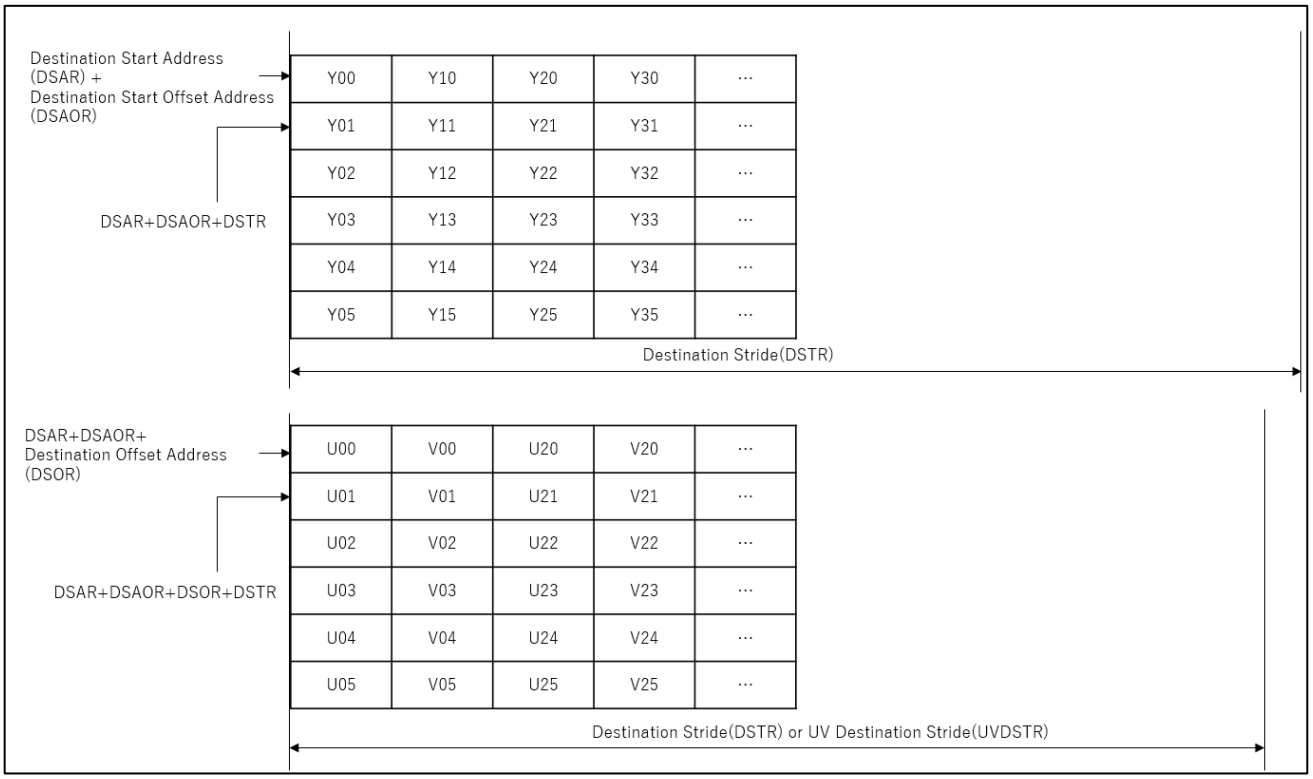

Figure 56.17 Allocation of YUV Data to Memory (YUV422 Semi-planar, Output)

The figure above shows the memory allocation of the output in YUV422 Semi-planar format. The start address to which output data is written is obtained by adding DSAR and DSAOR for Y plane, and is obtained by adding DSAR, DSAOR and DSOR for UV plane. The memory stride is set using DSTR for Y plane. The UV plane is set using DSTR when UVDSTSEL of DCCR is 0, and using UVDSTR when UVDSTSEL is 1.

The order of the output U and V cannot be changed. The order of the output follows the order changed according to the setting of UVFORM of CMRCR2.

56.3.7.3 YUV420 Semi-planar format

In the YUV420 Semi-planar format, the YUV data has the Y plane and the UV plane placed separately in the memory. The UV plane is placed in the memory in the order of U data, V data, U data, and V data. The vertical direction on the screen follows the memory stride used to handle memory data in two-dimension state. The pixels one line below on the screen are placed at the stride-added address. The Y/UV plane is handled in 8-bit or 16-bit unit. Besides, the UV plane is halved in the vertical direction compared to the YUV422 Semi-planar format.

For the YUV420 Semi-planar format for input or output, set the Y plane bit depth (bpp) greater than or equal to the UV plane bit depth. Otherwise, the operation cannot be guaranteed.

Create the vertex data on DL based on Y plane for both the input and output data.

(1) Input data

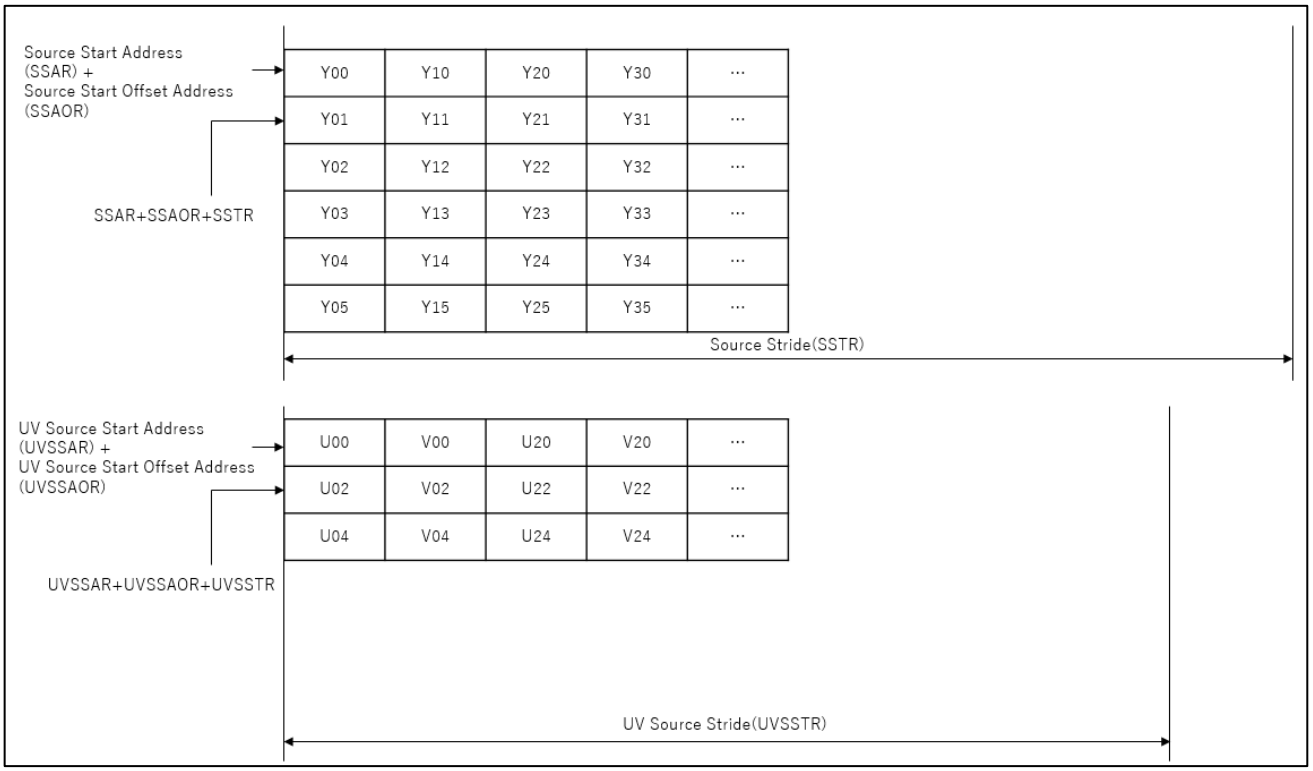

Figure 56.18 Allocation of YUV Data to Memory (YUV420 Semi-planar, Input)

The figure above shows the memory allocation of the input in YUV420 Semi-planar format. The start address from which the input data is read is obtained by adding SSAR and SSAOR for Y plane, and is obtained by adding UVSSAR and UVSSAOR for UV plane. The memory stride is set using SSTR for Y plane and UVSSTR for UV plane.

To change the order of the input U and V, set UVFORM of CMRCR2 to 1.

(2) Output data

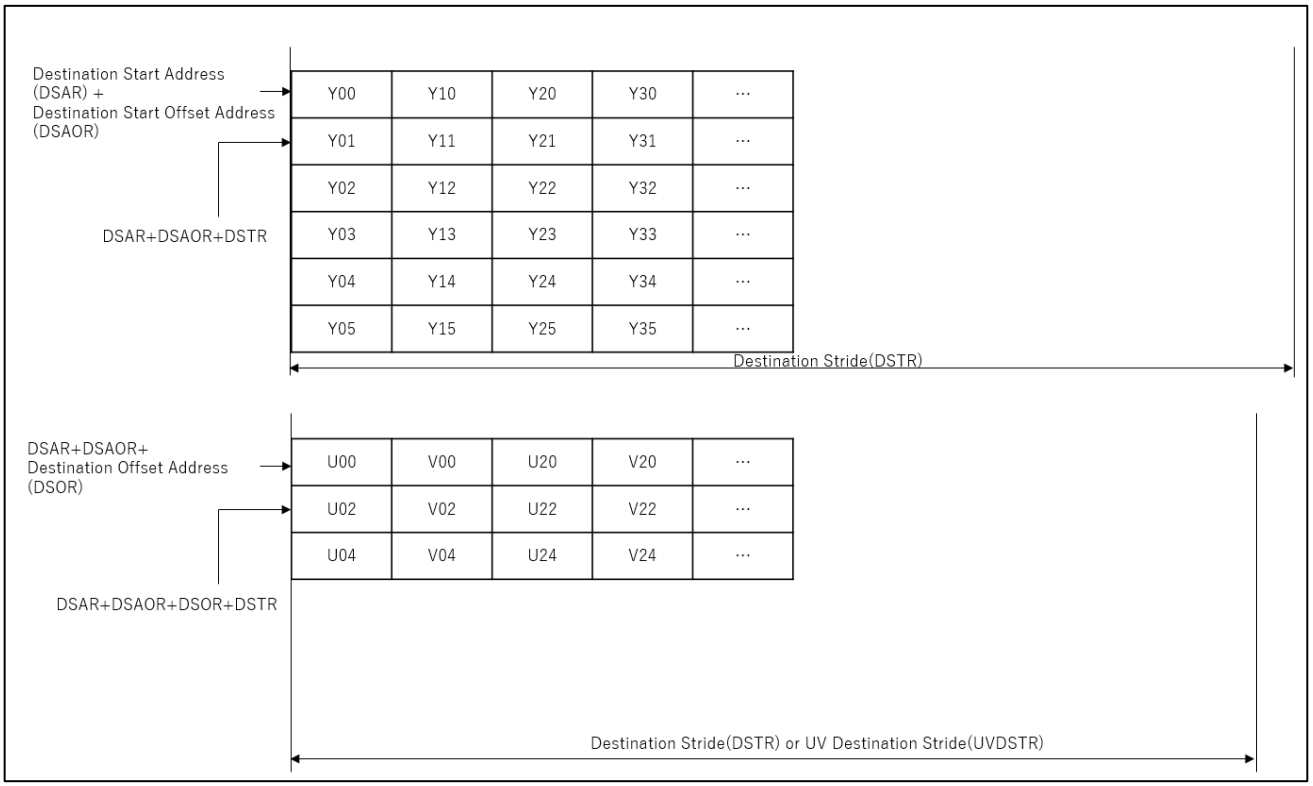

Figure 56.19 Allocation of YUV Data to Memory (YUV420 Semi-planar, Output)

The figure above shows the memory allocation of the output in YUV420 Semi-planar format. The start address to which output data is written is obtained by adding DSAR and DSAOR for Y plane, and is obtained by adding DSAR, DSAOR and DSOR for UV plane. The memory stride is set using DSTR for Y plane. The UV plane is set using DSTR when UVDSTSEL of DCCR is 0, and using UVDSTR when UVDSTSEL is 1.

The order of the output U and V cannot be changed. The order of the output follows the order changed according to the setting of UVFORM of CMRCR2.

56.3.7.4 Y Plane Only format

For the Y Plane Only format, only Y data is processed while UV data is ignored. The vertical direction on the screen follows the memory stride used to handle memory data in two-dimension state. The pixels one line below on the screen are placed at the stride-added address. The data is handled in 8-bit or 16-bit unit.

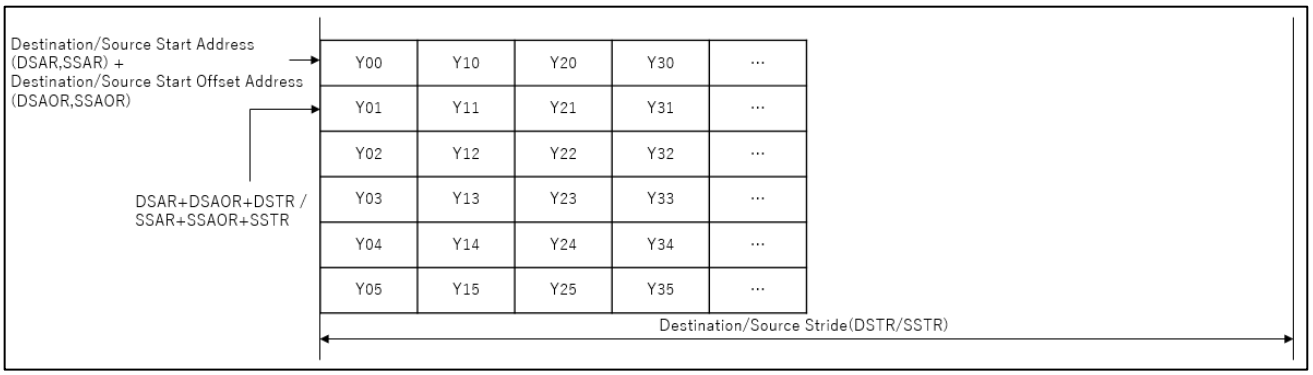

Figure 56.20 Allocation of YUV Data to Memory (Y Plane Only)

The figure above shows the memory allocation of the output in Y Plane Only format. The start address from which input data is read is obtained by adding SSAR and SSAOR. Also, the start address to which output data is written is obtained by adding DSAR and DSAOR. Memory stride is set using SSTR for input data and DSTR for output data.

56.3.7.5 UV Plane Only format

For the UV Plane Only format, only UV data is processed while Y data is ignored. The vertical direction on the screen follows the memory stride used to handle memory data in two-dimension state. The pixels one line below on the screen are placed at the stride-added address. The data is handled in 8-bit or 16-bit unit.

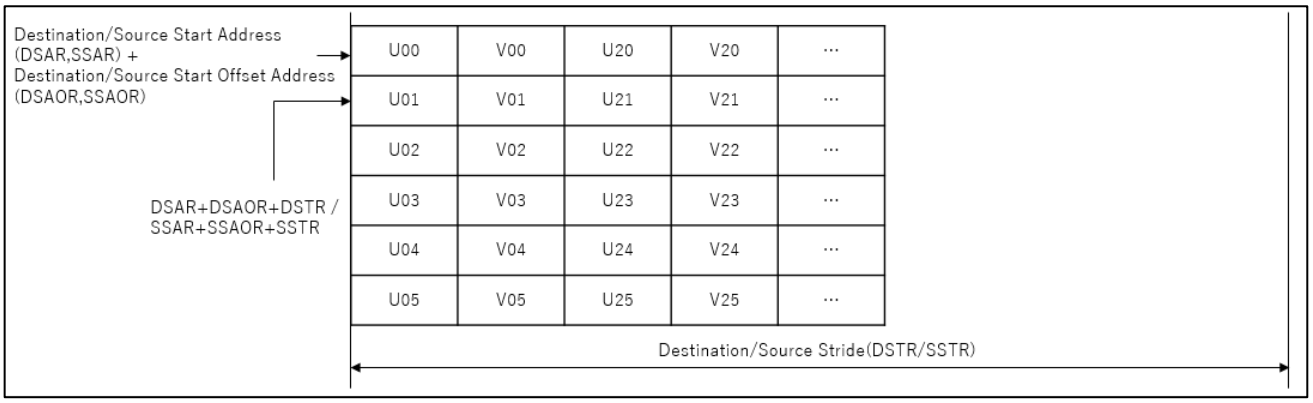

Figure 56.21 Allocation of YUV Data to Memory (UV Plane Only)

The figure above shows the memory allocation of the output in UV Plane Only format. The start address from which input data is read is obtained by adding SSAR and SSAOR. Also, the start address to which output data is written is obtained by adding DSAR and DSAOR. Memory stride is set using SSTR for input data and DSTR for output data.

56.3.7.6 Tile Addressing Mode

This module supports not only linear addressing where the two-dimensional image data are arranged like raster in memory but also a tile addressing mode where the data are arranged like tile.

In tile addressing mode, continuous memory addresses are interleaved with data for multiple Y coordinates, thus improving the cache-hit ratio for vertical access to the image data (e.g., for rotation of an image) and also improving processing performance.

In tile addressing mode, the data are stored with the Y coordinate incremented in 16-byte units within 64-byte sections. An example where 8-bpp Y data are exclusively output is shown below. (x, y) in the figure below indicate the x and y coordinates of pixels.

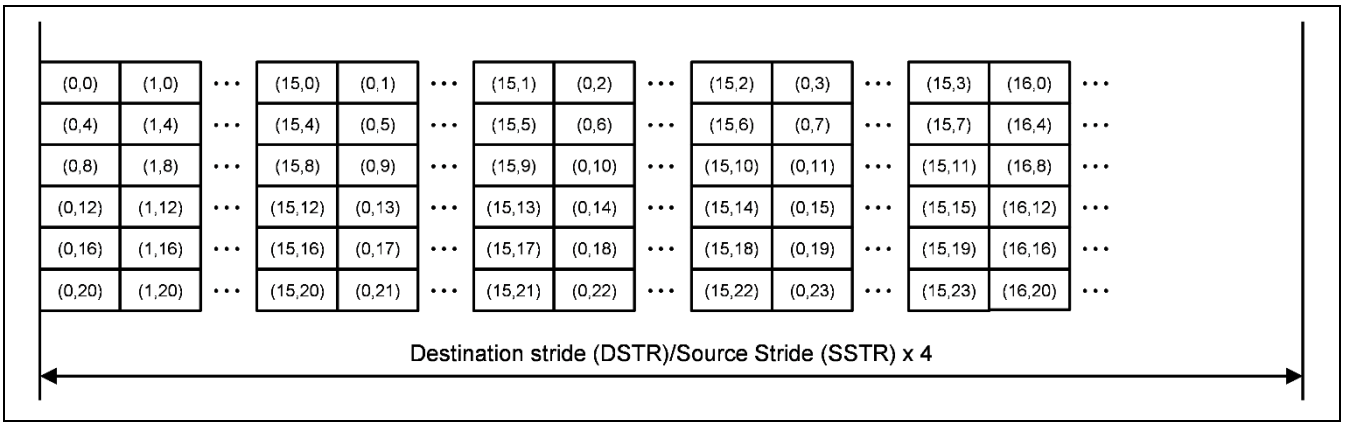

Figure 56.22 Data in Memory in Tile addressing mode (Y Exclusive, 8 bpp)

The tile addressing mode can be set up individually for source and destination images. To set up the tile addressing mode for the source image, set the TCTE bit in CMRCR2 to 1. To set up the tile addressing mode for the destination image, set the DCTE bit in CMRCR2 to 1.

To set the stride in tile addressing mode, set the corresponding bits in DSTR and SSTR, SSTR, SSTRn, UVSSTR, and UVSSTRn to a value equal to one quarter of the actual memory stride.

56.3.7.7 How to use the address offset register

This module includes offset address register for each start address register. As explained in section 56.3.7, the start address is obtained by summing the setting of each start address register and the offset address register.

These offset address registers can be used, for example, when dividing a screen and when using one DL in different memory spaces.

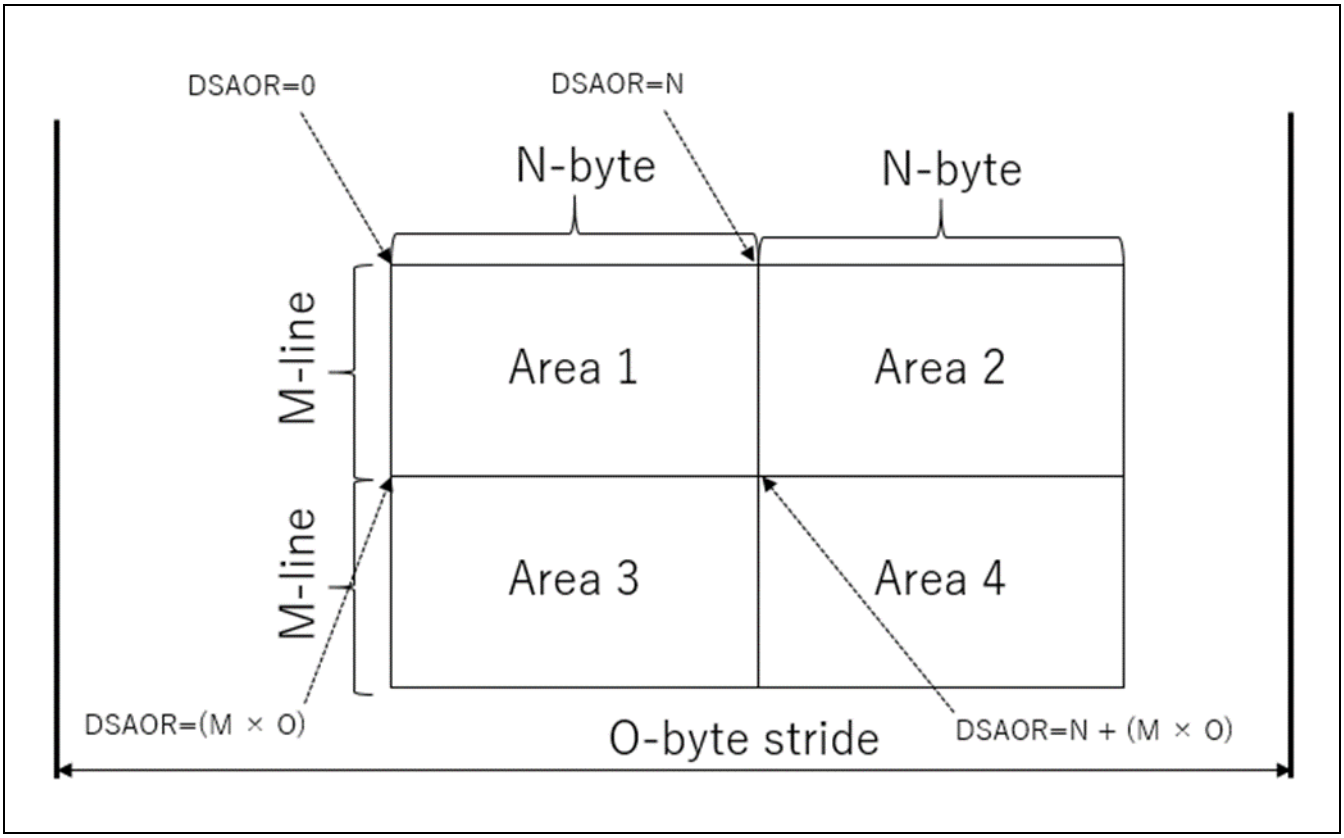

Figure 56.23 Example of offset address register utilization

Figure 56.23 shows an example of dividing the screen into four parts and rendering it. The width of each divided area is N bytes, the height is M lines, and the stride of the whole screen is O bytes.

When rendering these four areas using one DL, it is necessary to rewrite the destination start address register three or four times inside the DL. If the memory allocation area for this screen rendering is different from when the DL is initially created, it is necessary to rewrite and update all the destination start address registers on the DL.When using the offset address register, describe it in DL so that the offset address register of Area 1 in this figure is 0, Area 2 is N, Area 3 is MxO, Area 4 is N+(MxO). After the memory allocation area is determined, set this address to the destination start address register via the register access from the CPU. By doing so, it is possible to update the address of all the divided areas using one register setting.

For the Rotator & Scaler Extension function which will be described later, since the screen dividing process is required, it is possible to make better use of the offset address register.

56.3.8 Luminance/Hue Correction

After texture mapping using the TRI instruction, luminance and hue correction can be performed on the image data by using scale and offset values. This makes it possible to correct for factors such as differences in luminance at the center and periphery of the camera lens or differences in the hue characteristics of multiple cameras.

Luminance correction is enabled when the LUCE bit in the CMRCR register is set to 1. The scale value is set either in a register (the YLCPR register), when the LUSM bit in the CMRCR register is set to 1, or in the DL for each vertex, when the LUSM bit is cleared to 0. The offset is set either in a register (the YLCPR register), when the LUOM bit in the CMRCR register is set to 1, or in the DL for each vertex, when the LUOM bit is cleared to 0. (For information on specifying values in the DL, see section 56.5, Display List.) Scale values should be specified as unsigned, and offset values as signed, 8-bit data.

The luminance correction is calculated according to the following equation, with Y designating the luminance value after texture mapping and Y' the luminance value after luminance correction.

$$Y' = ((Y \times lscal) >> YLDPO) + lofst$$

Here YLDPO is the value specified by the YLDPO field in the CPDPOR register. For each pixel, lscal and lofst are calculated as scale and offset values for each vertex of a triangle and mapped to the triangle in the same manner as texture coordinates.

If the value calculated for Y' is less than the value specified in the YLMINR register, Y' is clamped to the YLMINR value. Conversely, if the value calculated for Y' is greater than the value specified in the YLMAXR register, Y' is clamped to the YLMAXR value.

When the scale or offset values are specified in registers, the register values are applied uniformly to all vertexes. Scale and offset values may not be omitted from the DL if they are specified in registers. In that case, make sure to insert dummy values in the DL. If scale and offset values are specified in registers and setting in TRIMR.DIDL bit is 1, do not need to insert dummy parameters in DL.

Hue correction is enabled when the CLCE bit in the CMRCR register is set to 1. The scale values are set either in registers (the UBCPR and VRCPR registers), when the CLSM bit in the CMRCR register is set to 1, or in the DL for each vertex, when the CLSM bit is cleared to 0. The offset values for each vertex are set either in registers (the UBCPR and VRCPR registers), when the CLOM bit in the CMRCR register is set to 1, or in the DL for each vertex, when the CLOM bit is cleared to 0. (For information on specifying values in the DL, see section 56.5, Display List.) Scale vales should be specified as unsigned, and offset values as signed, 8-bit data.

The hue correction is calculated according to the following equation, with U and V designating the hue values after texture mapping and U' and V' the hue values after hue correction.

$$U' = ((U + ubofs) \times ubscl) >> UBDPO$$

$$V' = ((V + vrofs) \times vrscl) >> VRDPO$$

Here UBDPO and VRDPO are the values specified by the UBDPO and VRDPO fields in the CPDPOR register. For each pixel, ubscl, ubofs, vrscl, and vrofs are calculated as scale and offset values for each vertex of a triangle and mapped to the triangle in the same manner as texture coordinates.

If the value calculated for U' is less than the value specified in the UBMINR register, U' is clamped to the UBMINR value. Conversely, if the value calculated for U' is greater than the value specified in the UBMAXR register, U' is clamped to the UBMAXR value. In like manner, V' is clamped to VRMINR if it is less than VRMINR and to VRMAXR if it is greater than VRMAXR.

When the scale or offset values are specified in registers, the register values are applied uniformly to all vertexes. Scale and offset values may not be omitted from the DL if they are specified in registers. In that case, make sure to insert dummy values in the DL. If scale and offset values are specified in registers and setting in TRIMR.DIDL bit is 1, do not need to insert dummy value in DL.

56.3.9 Luminance Correction Using Lookup Table (LUT)

By using the LUT, luminance can be converted from 10 bpp or 12 bpp to 8 bpp.

In 12 to 8 bpp conversion, the upper 10 bits are converted to 8 bits using the LUT.

Luminance conversion using the LUT is carried out after bilinear processing, and is followed by luminance correction. This function is enabled when the LUTE bit in the CMRCR2 register is 1.

Before using this function, set 8-bit data corresponding to luminance to the LUTDR registers (0 to 1,023) at addresses H'1000 to H'1FFC.

The LUTDRn registers can be set from the CPU and DL. When using the DL to set data, use the WTL2 instruction.

When using the LUT to set data, output data should be 8 bits; set the Y12 and Y10 bits in the CMRCR register to 0.

Note that Conversion by the LUT is not support for Extended Filtering Pipeline and DYP mode.

56.3.10 Extended Filtering Pipeline
